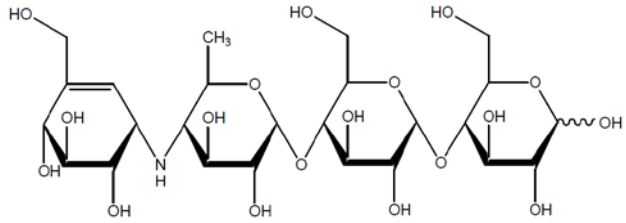
Monographs, Part I
(Related to Article 2 Subparagraph 3)

Acarbose
아카르보스



$C_{25}H_{43}NO_{18}$: 645.60

(2*R*,3*R*,4*R*,5*S*,6*R*)-5-{[(2*R*,3*R*,4*R*,5*S*,6*R*)-5-{[(2*R*,3*R*,4*S*,5*S*,6*R*)-3,4-dihydroxy-6-methyl-5-{[(1S,4S,5S,6S)-4,5,6-trihydroxy-3-(hydroxymethyl)cyclohex-2-en-1-yl]amino}oxan-2-yl]oxy}-3,4-dihydroxy-6-(hydroxymethyl)oxan-2-yl]oxy}-6-(hydroxy-methyl)oxane-2,3,4-triol [*56180-94-0*]

Acarbose is created by a number of strains of *Actinoplanes utahensis*.

Acarbose contains NLT 95.0% and NMT 102. 0% acarbose ($C_{25}H_{43}NO_{18}$), calculated on the anhydrous basis.

Description Acarbose occurs as a white or yellow non-crystalline powder.
It is hygroscopic.
It is very soluble in water, soluble in methanol and practically insoluble in dichloromethane.

Identification (1) Determine the infrared spectra of Acarbose and acarbose RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) The major peak of the test solution under the Assay has the same retention time as the major peak of the standard solution.

Optical rotation $[\alpha]_D^{20}$: Between +168° and + 183° (0.1 g calculated on the anhydrous basis, 10 mL of water, 100 mm).

pH Dissolve Acarbose in water to make 50 mg/mL; the pH of the solution is between 5.5 and 7.5.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Acarbose according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).
(2) ***Related substances***—Weigh accurately 0.2 g of Acarbose, dissolve in water, add water to make 10 mL, and use this solution as the test solution. Pipet 1.0 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Pipet 10 μL each of the test solution and the standard solution and perform the test as directed under the Liquid Chromatography according to the following conditions. Measure the peak area *A*i of the peak area of each related substance from the test solution and the peak area *A*s of acarbose from the standard solution to determine the amount of related substances, related substance I{*O*-4,6-dideoxy-4-[[(1*S*,4R,5*S*,6*S*)-4,5,6-trihydroxy-3-(hydroxymethyl)cyclohex-2-enyl]amino]-α-D-glucopyranosil-(1→4)-*O*-α-D-glucopyranosyl-(1→4)-D-arabino-hex-2-europyranose} is NMT 0.6%, related substance II {(1*R*,4*R*,5*S*,6*R*)-4,5,6-trihydroxy-2-(hydroxymethyll)cyclohex-2-enyl4-*O*-[4,6-dideoxy-4-[[(1*S*,4*R*,5*S*,6*S*)-4,5,6-trihydroxy-3-(hydroxymethyl)cyclohex-2-enyl]amino]-α-D-glucopyranosil]-α-D-glucopyranoside} is NMT 0.5%, related substance III{α-D-glucopyranosil 4-*O*-[4,6-dideoxy-4-[[(1*S*,4*R*,5*S*,6*S*)-4,5,6-trihydroxy-3-(hydroxymethyl)cyclohex-2-enyl]amino]-α-D-glucopyranosil]-α-D-glucopyranoside} is NMT 1.5%, related substance IV{4-*O*-[4,6-dideoxy-4-[[(1*S*,4*R*,5*S*,6*S*)-4,5,6-trihydroxy-3-(hydroxymethyl)cyclohex-2-enyl]amino]-α-D-glucopyranosil]-D-glucopyranose} is NMT 1.0%, related substance V{*O*-4,6-dideoxy-4-[[(1*S*,4*R*,5S,6S)-4,5,6-trihydroxy-3-(hydroxymethyl)cyclohex-2-enyl]amino]-α-D-glucopyranosil-(1→4)-*O*-α-D-glucopyranosil-(1→4)-*O*-α-D-glucopyranosil-(1→4)-D-arabino-hex-2-europyranose (4-*O*-α-acarbosyl-D-frutcopyranose)} is NMT 0.2%, related substance VI{*O*-4,6-dideoxy-4-[[(1S,4R,5S,6S)-4,5,6-trihydroxy-3-(hydroxymethyl)cyclohex-2-enyl]amino]-α-D-glucopyranosil-(1→4)-*O*-α-D-glucopyranosil-(1→4)-*O*-α-D-glucopyranosil-(1→4)-D-glucopyranose (4-*O*-α-acarbosyl-D-glucopyranose)} is NMT 0.3%, related substance VII{α-D-glucopyranosil*O*-4,6-dideoxy-4-[[(1S,4R,5S,6S)-4,5,6-trihydroxy-3-(hydroxymethyl)cyclohex-2-enyl]amino]-α-D-glucopyranosil-(1→4)-*O*-α-D-glucopyranosil-(1→4)-*O*-α-D-glucopyranoside(α-D-glucopyranosil α-acarbosyde)} is NMT 0.3%, related substance VIII{*O*-4,6-dideoxy-4-[[(1S,4R,5S,6S)-4,5,6-trihydroxy-3-(hydroxymethyl)cyclohex-2-enyl]amino]-α-D-glucopyranosil-(1→4)-*O*-6-deoxy-α-D-glucopyranosil-(1→4)-D-glucopyranose} is NMT 0.2%, other individual related substances are NMT 0.2%, and total amount of related substances is NMT 3.0%. The peak areas of related substances II, IV, V, VI and VII are calculated by dividing the area obtained by the automatic integration method by the correction factor, 1.6, 1.33, 0.8, 0.8 and 0.8, respectively.

$$\text{Content (\%) of each related substance} = \frac{A_i}{A_S}$$

Operating conditions

For the detector, column, column temperature, mobile phase and flow rate, proceed as directed under the operating conditions in the Assay.

System suitability

Relative retention time: The relative retention times of related substances I, II, III, IV, V, VI, VII and VIII are about 0.9, 0.8, 1.2, 0.5, 1.7, 1.9, 2.2 and 0.6, respectively.

Water NMT 4.0% (0.300 g, volumetric titration, direct titration).

Residue on ignition NMT 0.2% (1.0 g).

Assay Weigh accurately about 200 mg of acarbose, dissolve in water, and add water to make exactly 10 mL, and use this solution as the test solution. Separately, weigh accurately about 0.1 g of acarbose RS, add 5 mL of water, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of acarbose in each solution.

$$\text{Amount (mg) of acarbose } (C_{25}H_{43}NO_{18}) = \frac{A_T}{A_S} \times C \times 10$$

C: Concentration (μg/mL) of acarbose in the standard solution

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 210 nm).

Column: A stainless steel column about 4.0 mm in internal diameter and about 25 cm in length, packed with aminopropylsilyl silica gel for liquid chromatography (3 μm to 10 μm in particle diameter).

Column temperature: A constant temperature of about 35 °C.

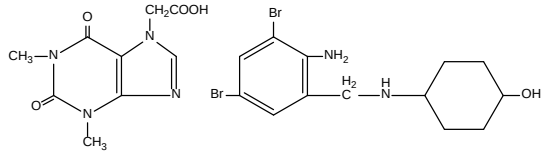
Mobile phase: A mixture of acetonitrile and phosphate buffer solution (750 : 250).

Flow rate: 1.0 mL/min

Phosphate buffer solution: Dissolve 0.6 g of potassium dihydrogen phosphate and 0.35 g of sodium monohydrogen phosphate in 900 mL of water, and then add water to make 1000 mL.

Packaging and storage Preserve in tight containers.

Acebrophylline
아세브로필린



$C_{22}H_{28}Br_2N_6O_5$: 616.30

1,2,3,6-Tetrahydro-1,3-dimethyl-2,6-dioxo-7*H*-purine-7-acetic acid with trans-4-[[(2-amino-3,5-dibromophenyl)methyl]amino]cyclohexanol, [*96989-76-3*]

Acebrophylline, when dried, contains NLT 98.0% and NMT 101.0% of acebrophylline ($C_{22}H_{28}Br_2N_6O_5$: 616.30), NLT 60.12% and NMT 62.57% of ambroxol ($C_{13}H_{18}Br_2N_4O_2$: 378.11) and NLT 37.87% and NMT 39.42% of theophylline-7-acetic acid ($C_9H_{10}N_4O_4$: 238.20).

Description Acebrophylline occurs as a white to pale white powder.
It is sparingly soluble in water and slightly soluble in ethanol(95).

Identification (1) Determine the infrared spectra of Acebrophylline and acebrophylline RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) Dissolve 0.1 g of Acebrophylline in water to make 100 mL. Take 2 mL of this solution and add water to make 100 mL. Determine the absorption spectra of this solution as directed under the Ultraviolet-visible Spectroscopy; it exhibits maxima at the wavelengths of around 306 nm, 242 nm and 273 nm.

(3) Weigh 0.2 g each of Acebrophylline and acebrophylline RS, dissolve in 10 mL of a mixture of ethanol and water (1: 1), and use these solutions as the test solution and the standard solution, respectively. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel 60 F_{254} for thin-layer chromatography (with a fluorescent indicator). Develop the plate with a mixture of ethyl acetate, methanol, acetic acid(100) and water (15 : 5 : 5 : 1) as the developing solvent to a distance of about 15 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots from the test solution and the standard solution are the same in R_f value.

(4) The retention time of major peak of the test solution and the standard solution for Assay is the same.

Melting point Between 216 and 220 ºC.

pH Between 5.0 and 6.0 (1% aqueous solution).

Purity (1) ***Free ambroxol***—Weight 1.0 g of Acebrophylline, transfer to a flask with a glass stopper, add 50 mL of toluene, and stir for 30 minutes. Add 30 mL of toluene, filter this solution after stirring for 30 minutes, and concentrate the filtrate at below 40 ˚C under reduced pressure. Dissolve the residue in 10 mL of ethanol(95) and use this solution as the test solution. Separately, weigh 50 mg of ambroxol RS, dissolve in ethanol(95) to make 100 mL, and use this solution as the standard solution. With these solutions, perform the test as directed

under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel 60 F_{254} with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of 1-butanol-acetic acid(100)-water (2 : 1 : 1) as the developing solvent to a distance of about 15 cm, and air-dry the plate. Apply ultraviolet light (main wavelength: 254 nm) to the plate; the spots other than the principal spots obtained from the test solution are not larger or more intense than the spots from the standard solution (0.5%).

(2) ***cis ambroxol***—Weigh accurately about 0.5 g of Acebrophylline, dissolve in 100 mL of the mobile phase, and use this solution as the test solution. Separately, weigh accurately about 5 mg of *cis* ambroxol RS and add the mobile phase to make exactly 100 mL. Pipet 10 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the amount of related substances; the amount is NMT 0.1%.

$$\text{Content (\%) of cis ambroxol} = (A_T / A_S) \times (W_S / W_T) \times (1 / 10) \times 100$$

A_T: Peak area of *cis* ambroxol in the test solution

A_S: Peak area of *cis* ambroxol in the standard solution

10: Dilution factor

W_S: Amount (mg) of *cis* ambroxol RS taken

W_T: Amount (mg) of Acebrophylline taken

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 244 nm).

Column: A stainless steel column about 4 mm in internal diameter and 12.5 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: Dissolve 23 g of phosphoric acid in the 1000 mL of water and add 180 mL of acetonitrile to 820 mL of this solution.

Flow rate: 1.3 mL/min

Loss on drying NMT 1.0% (2 g, 105 ℃, constant mass).

Assay (1) ***Acebrophylline*—**Weigh accurately about 0.4 g of Acebrophylline, dissolve in 50 mL of water, and titrate with 0.1 mol/L potassium hydroxide VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L potassium hydroxide VS
= 61.63 mg of $C_{22}H_{28}Br_2N_6O_5$

(2) ***Ambroxol and theophylline-7-acetic acid*—**Weigh accurately about 0.1 g each of Acebrophylline and acebrophylline RS, dissolve in water to make exactly 100 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with exactly 20 mL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_{T1}, A_{T2}, A_{S1} and A_{S2} of ambroxol and theophylline-7-acetic acid, respectively.

$$\text{Amount (mg) of ambroxol } (C_{13}H_{18}Br_2N_4O_2) = \text{Amount (mg) of acebrophylline RS} \times (A_{T1} / A_{S1}) \times (61.35 / 100)$$

$$\text{Amount (mg) of theophylline-7-acetic acid } (C_9H_{10}N_4O_4) = \text{Amount (mg) of acebrophylline RS} \times (A_{T2} / A_{S2}) \times (38.65 / 100)$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 244 nm).

Column: A stainless steel column about 4 mm in internal diameter and 12.5 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: Dissolve 1 g of ammonium tetraborate in 1000 mL of water and add 570 mL of acetonitrile to 430 mL of this solution.

Flow rate: 1.2 mL/min

System suitability

System performance: Proceed with 20 μL of the standard solution under the above operating conditions; theophylline-7-acetic acid and ambroxol are eluted in this order.

Packaging and storage Preserve in tight containers.

Acebrophylline Capsules
아세브로필린 캡슐

Acebrophylline Capsules contain NLT 95.0% and NMT 105.0% of the labeled amount of acebrophylline ($C_{22}H_{28}Br_2N_6O_5$: 616.30).

Method of preparation Prepare as directed under Capsules, with Acebrophylline.

Identification The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of the content of NLT 20 Acebrophylline Capsules. Weigh accurately the

amount equivalent to about 0.1 g of acebrophylline ($C_{22}H_{28}Br_2N_6O_5$: 616.30) and add 50% ethanol to make exactly 100 mL. Use this solution as the test solution. Separately, weigh accurately about 0.1 g of acebrophylline RS, add 50% ethanol to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of ambroxol in each solution.

Amount (mg) of acebrophylline ($C_{22}H_{28}Br_2N_6O_5$)
= Amount (mg) of acebrophylline RS × (A_T / A_S) × (61.35 / 100) × 1.63

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 244 nm).

Column: A stainless steel column about 4 mm in internal diameter and 12.5 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: Dissolve 1 g of ammonium carbonate in 1000 mL of water, and add 570 mL of acetonitrile to 430 mL of this solution.

Flow rate: 1.0 mL/min

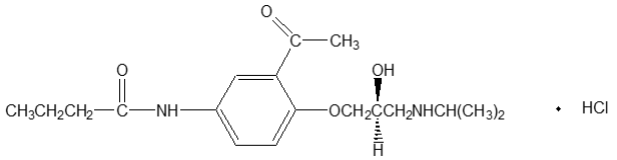
System suitability

System performance: Proceed with 10 μL of the standard solution according to the above conditions; theophylline-7-acetic acid and ambroxol are eluted in this order with the resolution between these peaks being NLT 2.0.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution under the above conditions; the relative standard deviation of the peak areas of theophylline-7-acetic acid and ambroxol are NMT 2.0%.

Packaging and storage Preserve in tight containers.

Acebutolol Hydrochloride
아세부톨롤염산염



and enantiomer

$C_{18}H_{28}N_2O_4 \cdot HCl$: 372.89

N-[3-Acetyl-4-[2-hydroxy-3-(propan-2-yl-amino)propoxy]phenyl]butanamide monohydrochloride [*34381-68-5*]

Acebutolol Hydrochloride, when dried, contains NLT 98.0% and NMT 102.0% of acebutolol hydrochloride ($C_{18}H_{28}N_2O_4 \cdot HCl$).

Description Acebutolol Hydrochloride occurs as white to pale yellowish white crystals or a crystalline powder.
It is freely soluble in water, methanol, ethanol(95) or acetic acid(100) and practically insoluble in ether.
An aqueous solution of Acebutolol Hydrochloride (1 in 20) shows no optical rotation.

Identification (1) Determine the absorption spectra of solutions of Acebutolol Hydrochloride and acebutolol hydrochloride RS in 0.01 mol/L hydrochloric acid TS (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectrum of Acebutolol Hydrochloride and acebutolol hydrochloride RS as directed in the potassium bromide disk method under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) An aqueous solution of Acebutolol Hydrochloride (1 in 100) responds to the Qualitative Analysis for chloride.

Melting point Between 141 and 145 ºC.

Purity (1) ***Heavy metals*—**Proceed with 1.0 g of Acetylspiramycin according to Method 2 and perform the test. Prepare the control solution with 1.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Arsenic*—**Prepare the test solution with 1.0 g of Acebutolol Hydrochloride according to Method 3 and perform the test (NMT 2 ppm).

(3) ***Related substances*—**Dissolve 40 mg of Acebutolol Hydrochloride in 2 mL of methanol and use this solution as the test solution. Pipet 1 mL of this solution and add methanol to make exactly 25 mL. Pipet 1 mL of this solution, add methanol to make exactly 20 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of water, 1-butanol and acetic acid(100) (5 : 4 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Observe the plate under ultraviolet light (main wavelength: 365 nm); the spots other than the principal spot from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 1.0% (0.5 g, 105 ℃, 3 hours).

Residue on ignition NMT 0.2% (1 g).

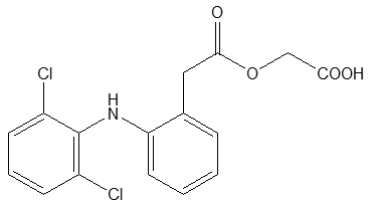
Assay Weigh accurately about 0.25 g of Acebutolol Hydrochloride, previously dried, dissolve in 20 mL of acetic acid(100), add 80 mL of acetic anhydride, and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration

under Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 37.289 mg of $C_{18}H_{28}N_2O_4 \cdot HCl$

Packaging and storage Preserve in tight containers.

Aceclofenac
아세클로페낙



$C_{16}H_{13}Cl_2NO_4$: 354.19
2-{2-[2-(2,6-Dichloroanilino)phenyl]acetyl} oxyacetic acid [*89796-99-6*]

Aceclofenac, when dried, contains NLT 99.0% and NMT 101.0% of aceclofenac ($C_{16}H_{13}Cl_2NO_4$).

Description Aceclofenac occurs as a white crystalline powder.
It is freely soluble in of ammonium peroxydisulfate or acetone, soluble in methanol or ethanol(95), and practically insoluble in water.

Identification (1) Dissolve 10 mg of Aceclofenac in 10 mL of ethanol(95), and add 0.2 mL of a mixture of freshly prepared potassium ferricyanide solution (6 in 1000) and iron(III) chloride solution (9 in 1000) (1 : 1) to 1 mL of this solution. Allow to stand in the dark for five minutes, add 3 mL of the hydrochloric acid solution (10 in 1000), allow to stand in the dark again for 15 minutes; the solution exhibits a blue color and a precipitate is produced.

(2) Dissolve 50 mg of Aceclofenac in 100 mL of methanol, and to 2 mL of this solution, add methanol to make 50 mL. Determine the absorption spectrum of this solution as directed under the Ultraviolet-visible Spectroscopy at the wavelength of 220 nm - 230 nm); it exhibits a maximum absorption at the wavelength of 275 nm. The specific absorbance at this absorption maximum wavelength is between 320 nm and 350 nm.

(3) Determine the infrared spectra of Aceclofenac and aceclofenac RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both exhibit similar intensities of absorption at the same wavenumbers.

Purity (1) ***Heavy metals***—Proceed with 2.0 g of Aceclofenac according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Related substances***—Weigh accurately 0.1 g of Aceclofenac, dissolve in 50 mL of the mobile phase, and use this solution as the test solution. Dissolve an amount of diclofenac sodium RS, equivalent to 5 ml of diclofenac, in 50 mL of the mobile phase, and use this solution as the standard solution (1). To 2 mL of the standard solution (1), add the mobile phase to make exactly 50 mL, and use this solution as the standard solution (2). To 5 mL of the standard solution (1), add 0.25 mL of the test solution, add the mobile phase to make exactly 50 mL, and use this solution as the standard solution (3). Perform the test with 10 μL each of the test solution and the standard solution (2) as directed under the Liquid Chromatography according to the following conditions. Determine each peak area of these solutions; any peak area other than the major peak from the test solution is not greater than the major peak area from the standard solution (2) (0.2%). The sum of all peak areas other than the major peak from the test solution is not greater than 2.5 times the major peak area from the standard solution (2) (0.5%). When determining the peak areas from the test solution, disregard any peak areas NMT 0.2 times the major peak area from the standard solution (2).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 275 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 15 cm in length, packed with butylsilyl silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: Add sodium hydroxide TS to the a mixture of acetic acid(100) (12 in 10000), acetonitrile and tetrahydrofuran (550 : 225 : 225) and adjust the pH to 3.5.

Flow rate: 1 mL/min

System suitability

Detection sensitivity: Adjust the detection sensitivity so that the peak heights of aceclofenac and diclofenac obtained from the standard solution (3) are about 50% of the full scale.

System performance: Proceed with 10 μL each of the standard solution (3) under the above operating conditions; aceclofenac and diclofenac are eluted in this order with the resolution between these peaks being NLT 8.0.

Time span of measurement: About 10 times the retention time of aceclofenac.

Loss on drying NMT 0.5% (1.0 g, between 100 and 105 °C, constant mass).

Residue on ignition NMT 0.1% (1.0 g).

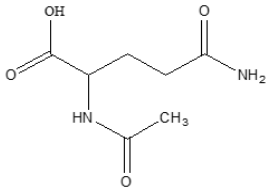
Assay Weigh accurately about 0.3 g of Aceclofenac, previously dried, dissolve in 40 mL of methanol, and titrate with 0.1 mol/L sodium hydroxide VS (potentiometric titration under the Titrimetry). Perform a blank test

in the same manner and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS
= 35.419 mg of $C_{16}H_{13}Cl_2NO_4$

Packaging and storage Preserve in light-resistant, well-closed containers.

Aceglutamide
아세글루타미드



$C_7H_{12}N_2O_4$: 188.18

N-Acetyl-L-glutamine, [*2490-97-3*]

Aceglutamide, when dried, contains NLT 98.0% and NMT 101.0% of aceglutamide ($C_7H_{12}N_2O_4$).

Description Aceglutamide occurs as a white crystalline powder.
It is odorless.

Melting point About 199 °C.

Identification (1) Add 5 mL of 1 mol/L sodium hydroxide to 0.1 g of Aceglutamide, and heat the mixture; it gives an ammonia odor and changes a wet red litmus paper to blue.

(2) Determine the infrared spectra of Aceglutamide and aceglutamide RS, previously dried for 24 hours in a desiccator with phosphorus pentoxide in vacuum, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Optical rotation $[\alpha]_D^{20}$: Between -11° and -13° (2% aqueous solution).

Purity (1) ***Free amino acids***—Weigh accurately 20 mg of Aceglutamide, dissolve in 5 mL of water, and transfer this solution to a test tube. To the test tube, add 0.5 mL of 1.0% ninhydrin TS and mix, and let it stand for exactly 5 minutes on a steam bath. Observe the solution; it does not exhibit a blue color.

(2) ***Chloride***—Weigh 1 g of Aceglutamide, dissolve in water to make 40 mL, and perform the test as directed under the Chloride. Prepare the control solution with 0.1 mL of 0.02 mol/L hydrochloric acid VS (NMT 0.007%).

(3) ***Sulfate***—Weigh 2.5 g of Aceglutamide, dissolve in water to make 40.0 mL, and perform the test as directed under the Sulfate. Prepare the control solution with 0.15 mL of 0.01 mol/L sulfuric acid VS (NMT 0.006%).

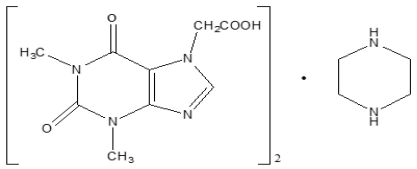
Loss on drying NMT 1.0% (1.0 g, 105 °C, 2 hours).

Assay Weigh accurately about 0.25 g of Aceglutamide, previously dried, dissolve in 50 mL of water, add 0.5 mL of 1% phenolphthalein ethanol TS as an indicator, and titrate with 0.1 mol/L sodium hydroxide VS. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS
= 18.82 mg of $C_7H_{12}N_2O_4$

Packaging and storage Preserve in tight containers.

Acepifylline
아세피필린



$C_{22}H_{30}N_{10}O_8$: 562.54

1,2,3,6-Tetrahydro-1,3-dimethyl-2,6-dioxo-7*H*-purine-7-acetic acid piperazine, [*18833-13-1*]

Acepifylline, when dried, contains NLT 75.0% and NMT 78.0% of acepifylline ($C_9H_{10}N_4O_4$: 238.20) and NLT 22.0% and NMT 25.0% of anhydrous piperazine ($C_4H_{10}N_2$: 86.14).

Description Acepifylline occurs as a white powder. It is odorless, and has a bitter taste.
It is freely soluble in water and sparingly soluble in ethanol(95).
The pH of an aqueous solution of Acepifylline (1 in 10) is between 6.5 and 7.0.

Identification (1) Dissolve 0.25 g of Acepifylline in 25 mL of water, take 10 mL of this solution, and add 30 mL of saturated solution of picric acid; a yellow precipitate develops (piperazine).

(2) Dissolve 0.25 g of Acepifylline in 25 mL of water, take 10 mL of this solution, add 10 mL of diluted citric acid (3 in 100) and 10 mL of ammonium reineckate TS, and cool with ice; a red fine precipitate develops.

(3) Weigh 10 mg of Acepifylline, dissolve in 2 mL of 2 mol/L acetic acid, and use this solution as the test solution. Weigh about 20 mg of acepifylline RS, dissolve in 2 mL of 2 mol/L acetic acid, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a

mixture of methanol and ammonia water (20 : 3) as the developing solvent, and air-dry the plate. Spray evenly hexachloroplatinate-potassium iodide TS on the plate; the R_f value and the color of the spots obtained from the test solution and the standard solution are the same.

(4) Weigh 25 mg of Acepifylline, dissolve by adding 10 mL of 0.1 mol/L hydrochloric acid, add water to make 100 mL, and determine the absorption spectrum of the solution as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum at the wavelength between 271 nm and 275 nm.

Purity (1) ***Clarity and color of solution*** —To 5 mL of the aqueous solution of Acepifylline (1 in 10), add 1 mL of strong ammonia water, put 1 mL of silver nitrate TS, and shake to mix; no gelatinous mass is formed.

(2) ***Heavy metals*** —Proceed with 1.0 g of Acepifylline according to Method 3 under the Heavy Metals and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Arsenic*** —Proceed with 0.2 g of Acepifylline according to Method 3 under the Arsenic and perform the test (NMT 10 ppm).

Loss on drying NMT 2.5% (1 g, 105 °C, 3 hours).

Residue on ignition NMT 0.15% (1 g).

Assay (1) ***Acepifylline***—Weigh accurately about 0.25 g of Acepifylline, previously dried, dissolve by adding 1 mL of water, and add 20 mL of ethanol(99.5) (neutralized with 0.1 mol/L potassium hydroxide-ethanol VS). Add 2 to 3 drops of thymolphthalein TS to this solution, and titrate with 0.1 mol/L potassium hydroxide-ethanol VS until the color of the solution changes to blue. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L potassium hydroxide-ethanol VS
= 23.82 mg of $C_9H_{10}N_4O_4$

(2) ***Piperazine***—Weigh accurately about 0.15 g of Acepifylline, previously dried, dissolve by adding 30 mL of acetic acid(100) for nonaqueous titration, and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 4.307 mg of $C_4H_{10}N_2$

Packaging and storage Preserve in tight containers.

Acepifylline Tablets
아세피필린 정

Acepifylline Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of acepifylline ($C_{22}H_{30}N_{10}O_8$: 562.54).

Method of preparation Prepare Acepifylline Tablets as directed under Tablets, with Acepifylline.

Identification (1) ***Acepifylline—***Weigh an amount of Acepifylline Tablets, equivalent to about 20 mg of acepifylline according to the labeled amount. Add 10 mL of water and 2 mL of dilute hydrochloric acid, shake occasionally to mix in iced water, add 5 mL of bromine TS, and evaporate to dryness on a steam bath; a yellow precipitate is formed. Expose the precipitate to ammonia vapor; it turns violet.

(2) ***Piperazine—***Weigh an amount of Acepifylline Tablets, equivalent to about 20 mg of acepifylline, according to the labeled amount, add water to make 50 mL, and use this solution as the test solution.

(i) Take 10 mL of the test solution, and add 30 mL of saturated solution of picric acid; a yellow precipitate is formed.

(ii) Take 10 mL of the test solution, add 5 mL of diluted citric acid solution (3 in 100) and 5 mL of ammonium reineckate TS, and cool in iced water; a fine red precipitate is formed.

Dissolution Perform the test with 1 tablet of Acepifylline Tablets at 50 revolutions per minute according to Method 2, using 900 mL of water as the dissolution medium. Take the dissolved solution 30 minutes after starting the Dissolution, and filter. Pipet 5 mL of this solution, add water to make exactly 20 mL, and use this solution as the test solution. Separately, weigh accurately about 70 mg of acepifylline RS, and dissolve in water to make exactly 100 mL. Pipet 10 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Take exactly 10 μL each of the test solution and the standard solution, perform the test as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of acepifylline of each solution. Meets the requirements if the dissolution rate of Acepifylline Tablets in 30 minutes is NLT 85%.

Dissolution rate (%) with respect to the labeled amount of acepifylline ($C_{22}H_{30}N_{10}O_8$)
$= W_S \times (A_T / A_S) \times (1 / C) \times 360$

W_S: Amount (mg) of acepifylline RS
C: Labeled amount (mg) of acepifylline ($C_{22}H_{30}N_{10}O_8$) per tablet

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 273 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: A mixture of acetate buffer solution (pH 3.5) and acetonitrile (9 : 1).

Flow rate: 0.8 mL/min

System suitability

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution under the above operating conditions; the relative standard deviation of the peak areas of acepifylline is NMT 2.0%.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 tablets of Acepifylline Tablets, and powder them. Weigh accurately an amount equivalent to about 5 mg of acepifylline ($C_{22}H_{30}N_{10}O_8$), dissolve in water to make exactly 100 mL, filter, and use the filtrate as the test solution. Separately, weigh accurately about 50 mg of acepifylline RS, dissolve in water, and make exactly 100 mL. Pipet 10 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Pipet 10 μL each of the test solution and the standard solution, perform the test as directed under the Liquid Chromatography, and determine the peak areas, A_T and A_S, of the test solution and the standard solution.

Amount (mg) of acepifylline ($C_{22}H_{30}N_{10}O_8$)
= Amount (mg) of acepifylline RS × (A_T / A_S) × (1 / 10)

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 273 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of acetate buffer solution (pH 3.5) and acetonitrile (9 : 1).

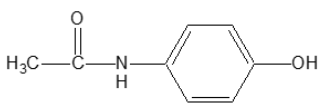
Flow rate: 0.8 mL/min

System suitability

System repeatability: Repeat the test 6 times with 10 μL of the standard solution under the above conditions, the relative standard deviation of the peak areas of acepifylline is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Acetaminophen
아세트아미노펜



Paracetamol $C_8H_9NO_2$: 151.16

N-(4-Hydroxyphenyl)acetamide [*103-90-2*]

Acetaminophen contains NLT 98.0% and NMT 101.0% of acetaminophen ($C_8H_9NO_2$), calculated on the dried basis.

Description Acetaminophen occurs as white crystals or a crystalline powder.
It is freely soluble in methanol or ethanol(95), sparingly soluble in water and very slightly soluble in ether.
It dissolves in sodium hydroxide TS.

Identification Determine the infrared spectra of Acetaminophen and acetaminophen RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit the same intensities of absorption at the same wavenumbers.

Melting point Between 169 and 172 ℃.

Purity (1) ***Chloride***—Dissolve 4.0 g of Acetaminophen in 100 mL of water by heating, cool in iced water by shaking to mix, and allow to stand until it reaches ordinary temperature. Add water to make 100 mL and filter. To 25 mL of the filtrate, add 6 mL of dilute nitric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 0.40 mL of 0.01 mol/L hydrochloric acid (NMT 0.014%).

(2) ***Sulfate***—To 25 mL of the filtrate obtained in (1), add 1 mL of dilute hydrochloric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 0.40 mL of 0.005 mol/L sulfuric acid (NMT 0.019%).

(3) ***Heavy metals***—Proceed with 2.0 g of Acetaminophen according to Method 4 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(4) ***Arsenic***—Proceed with 1.0 g of Acetaminophen according to Method 3 and perform the test (NMT 2 ppm).

(5) ***Related substances***—Dissolve 50 mg of Acetaminophen in 1 mL of methanol, add the mobile phase to make 50 mL, and use this solution as the test solution. Pipet 1 mL of this solution, add the mobile phase to make exactly 200 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak area of each solution by the automatic integration method; the total area of peaks other than acetaminophen from the test solution is not greater than the peak area of acetaminophen from the standard solution.

(6) ***4-Aminophenol***—Weigh accurately about 2.5 g of Acetaminophen, dissolve in methanol to make exactly 100 mL and use this solution as the test solution. Separately, weigh accurately about 5.0 mg of 4-aminophenol RS and add methanol to make exactly 100 mL. Take exactly 5 mL of this solution, add methanol to make exactly 200 mL, and use this solution as the standard solution.

Perform the test with 5 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions; the amount of 4-aminophenol with the relative retention time to acetaminophen of 0.6 is NMT 0.005%.

$$\text{Content (\%) of 4-aminophenol} = (A_T/A_S) \times (C_S/C_T) \times 100$$

A_T: Peak area of 4-aminophenol in the test solution

A_S: Peak area of 4-aminophenol in the standard solution

C_S: Concentration (mg/mL) of 4-aminophenol in the standard solution

C_T: Concentration (mg/mL) of acetaminophen in the test solution

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 230 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 10 cm in length, packed with octylsilyl silica gel for liquid chromatography (about 3.5 μm in particle diameter).

Column temperature: A constant temperature of about 35 °C.

Mobile phase: Control the gradient elution or stepwise by mixing the mobile phase A, B as directed under the following table.

Mobile phase A: Dissolve 1.7 g of potassium dihydrogen phosphate and 1.8 g of anhydrous sodium monohydrogen phosphate in water to make exactly 1000 mL.

Mobile phase B: Methanol

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0.0 → 3.0	99	1
3.0 → 7.0	99 → 19	1 → 81
7.0 → 7.1	19 → 99	81 → 1
7.1 → 10.0	99	1

Flow rate: 1.0 mL/min

System suitability

System repeatability: Repeat the test 6 times according to the above conditions with 5 μL each of the standard solution; the relative standard deviation of the peak area is NMT 5.0%.

Loss on drying NMT 0.3% (0.5 g, 105 ℃, 2 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 20 mg each of Acetaminophen and acetaminophen RS, previously dried, dissolve in 2 mL of methanol, add water to make exactly 100 mL. Pipet 3 mL of these solutions, add water to make exactly 100 mL, and use these solutions as the test solution and the standard solution, respectively. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, using water as the blank, at the wavelength of 244 nm as directed under the Ultraviolet-visible Spectroscopy.

$$\text{Amount (mg) of acetaminophen } (C_8H_9NO_2) = \text{Amount (mg) of acetaminophen RS} \times \frac{A_T}{A_S}$$

Packaging and storage Preserve in light-resistant, tight containers.

Acetaminophen Tablets
아세트아미노펜 정

Paracetamol Tablets

Acetaminophen Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of acetaminophen ($C_8H_9NO_2$: 151.17).

Method of preparation Prepare as directed under Tablets, with Acetaminophen.

Identification (1) The retention times of the major peaks from the test solution and the standard solution obtained under the Assay are the same.

(2) Weigh an amount of Acetaminophen Tablets, previously powdered, equivalent to 50 mg of acetaminophen according to the labeled amount, add 50 mL of methanol, shake to mix, and filter. Use the filtrate as the test solution. Separately, weigh 5 mg of acetaminophen RS, add methanol to make 5 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of methylene chloride and methanol (4 : 1) to a distance of about 10 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the principal spot of the test solution exhibits an R_f value corresponding to that of the standard solution.

Purity ***Related substances***—Weigh accurately the mass of NLT 10 tablets of Acetaminophen Tablets and powder. Dissolve an amount of acetaminophen ($C_8H_9NO_2$) equivalent to about 350 mg in diluent to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 21.0 mg each of acetaminophen RS and 4-aminophenol RS and dissolve in diluent to make exactly 100 mL, respectively. Pipet 5 mL each of these solutions exactly, combine into a 200-mL volumetric flask, add diluent to make exactly 200 mL, and use this solution as the standard solution. Perform the test

with 25 mL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, measure the peak areas of each solution by automatic integration method; the amount of 4-aminophenol and each related substance is NMT 0.15%, and the amount of all related substances other than acetaminophen is NMT 0.60%.

$$\text{Content (\%) of 4-aminophenol} = (A_T/A_S) \times (C_S/C_T) \times 100$$

A_T: Peak area of 4-aminophenol obtained from the test solution

A_S: Peak area of 4-aminophenol obtained from the standard solution

C_S: Concentration (mg/mL) of 4-aminophenol obtained from the standard solution

C_T: Concentration (mg/mL) of acetaminophen obtained from the test solution

$$\text{Amount of related substances (\%)} = (A_T/A_S) \times (C_S/C_T) \times 100$$

A_T: Peak area of each related substance obtained from the test solution

A_S: Peak area of acetaminophen obtained from the standard solution

C_S: Concentration (mg/mL) of acetaminophen in the standard solution

C_T: Concentration (mg/mL) of acetaminophen in the test solution

Diluent—A mixture of buffer solution and methanol (95 : 5).

Buffer solution—Weigh accurately 1.9 g of ammonium formate, dissolve in water to make 1000 mL, and add 1 mL of formic acid.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 272 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (about 3 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: Control the gradient elution or stepwise by mixing the mobile phase A, B and C as directed under the following table.

Mobile phase A: Dissolve 3.1 g of ammonium acetate in water to make 1000 mL and add 1 mL of trifluoroacetic acid.

Mobile phase B: A mixture of acetonitrile, methanol and water (10 : 75 : 15).

Mobile phase C: Dissolve 3.1 g of ammonium acetate in mobile phase B to make 1000 mL and add 1 mL of trifluoroacetic acid.

Time (min)	Mobile phase A (%)	Mobile phase C (%)
0.0 → 5.0	97 → 70	3 → 30
5.0 → 10.0	70 → 10	30 → 90
10.0 → 11.0	10	90

Flow rate: 0.9 mL/min

System suitability

Test for required detectability: Weigh accurately about 7.0 mg of 4-aminophenol RS and dissolve in diluent to make exactly 100 mL. Pipet 1 mL of this solution exactly, add diluent to make exactly 20 mL, pipet 1 mL of this solution again, and add diluent to make exactly 20 mL. Perform the test with 25 μL each of this solution; the signal-to-noise ratio of 4-aminophenol is NLT 10.

System repeatability: Repeat the test 6 times with 25 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak areas of acetaminophen and 4-aminophenol is NMT 5.0%.

Dissolution Perform the test with 1 tablet of Acetaminophen Tablets at 50 revolutions per minute according to Method 2 under the Dissolution, using 900 mL of phosphate buffer solution, pH 5.8, as the dissolution medium. Take the dissolved solution 30 minutes after starting the test, filter, dilute the filtrate with the dissolution medium if necessary, and use this solution as the test solution. Separately, weigh accurately a suitable amount of acetaminophen RS, previously dried in a desiccator (silica gel) for 18 hours, and dissolve in the dissolution medium to the same concentration as the test solution. Use this solution as the standard solution. Perform the test with the test solution and the standard solution as directed under the Ultraviolet-visible Spectroscopy, and determine the absorbance at the absorbance maximum wavelength of about 243 nm.

Meets the requirements if the dissolution rate of Acetaminophen Tablet in 30 minutes is NLT 80%.

Phosphate buffer solution, pH 5.8—To 50 mL of 0.2 mol/L potassium dihydrogen phosphate TS, add 3.6 mL of 0.2 mol/L sodium hydroxide TS and water to make 200 mL.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately and powder NLT 20 tablets of Acetaminophen Tablets. Weigh accurately an amount of the powder, equivalent to about 0.1 g of acetaminophen ($C_8H_9NO_2$), add 100 mL of the mobile phase, shake to mix for 10 minutes, then shake vigorously for 5 minutes, and add the mobile phase to make exactly 200 mL. Pipet 5 mL of this solution, add the mobile phase to make 250 mL, and filter through a membrane filter with a pore size not exceeding 0.5 μm. Discard the first 10 mL of the filtrate and use the subsequent filtrate as the test solution.

Separately, weigh accurately about 20 mg of acetaminophen RS, previously dried at 105 ºC for 2 hours, and dissolve in the mobile phase to make exactly 100 mL. Pipet 5 mL of the solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with each 10 μL of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions and determine the peak areas, A_T and A_S, of acetaminophen from the solutions.

$$\text{Amount (mg) of acetaminophen } (C_8H_9NO_2) = \text{Amount (mg) of acetaminophen RS} \times \frac{A_T}{A_S} \times 5$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 243 nm).

Column: A stainless steel column about 4 mm in internal diameter and 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (about 5 to 10 μm in particle diameter).

Mobile phase: A mixture of water and methanol (3 : 1).

Flow rate: 1.5 mL/min

System suitability

System performance: Proceed with 10 μL of the standard solution under the above operating conditions; the symmetry factor is NMT 2.0.

System repeatability: Repeat the test 6 times according to the above conditions with 10 μL each of the standard solution; the relative standard deviation of the peak area is NMT 2.0%

Packaging and storage Preserve in tight containers.

Acetaminophen and DL-Methionine Tablets
아세트아미노펜·DL-메티오닌 정

Acetaminophen and DL-Methionine Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of acetaminophen ($C_8H_9NO_2$: 151.16) and NLT 90.0% and NMT 130.0% of the labeled amount of DL-methionine ($C_5H_{11}NO_2S$: 149.21).

Method of preparation Prepare as directed under Tablets, with Acetaminophen and DL-Methionine

Identification The retention times of major peaks from the test solution and standard solution prepared as directed under the Assay are the same.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay (1) ***Acetaminophen*—**Weigh accurately NLT 20 tablets of Acetaminophen and DL-Methionine Tablets and powder. Weigh accurately an amount of the powder, equivalent to about 30 mg of acetaminophen ($C_8H_9NO_2$), dissolve in ethanol(95) to make exactly 20 mL, and use this solution as the test solution. Separately, weigh accurately 0.15 g of acetaminophen RS, dissolve in ethanol(95) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with each 10 μL of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions and determine the peak areas, A_T and A_S, of acetaminophen from the test solution and the standard solution.

$$\text{Amount (mg) of acetaminophen } (C_8H_9NO_2) = \text{Amount (mg) of acetaminophen RS} \times (A_T / A_S) \times (1 / 5)$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 275 nm).

Column: A stainless steel column about 4.0 mm in internal diameter and about 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 to 10 μm in particle diameter).

Mobile phase: A mixture of 0.0025 mol/L sodium octanesulfonate and methanol (17 : 3).

Flow rate: 1.0 mL/min

System suitability

System repeatability: Perform the test 6 times with each 10 μL of the standard solution according to the above operating conditions; the relative standard deviation of the acetaminophen peak area is NMT 2.0%.

(2) ***DL-Methionine*—**Weigh accurately 20 tablets of Acetaminophen and DL-Methionine Tablets, power, and perform the test as directed under the Identification and Assay for Amino Acids.

Packaging and storage Preserve in light-resistant, tight containers.

Acetaminophen, Pseudoephedrine Hydrochloride and Chlorpheniramine Maleate Tablets
아세트아미노펜·슈도에페드린염산염·클로르페니라민말레산염 정

Acetaminophen, Pseudoephedrine Hydrochloride and Chlorpheniramine Maleate Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of acetaminophen ($C_8H_9NO_2$: 151.16), pseudoephedrine hydrochloride ($C_{10}H_{15}NO \cdot HCl$: 201.69) and chlorpheniramine maleate ($C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$: 390.86).

Method of preparation Prepare as directed under Tablets, with Acetaminophen, Pseudoephedrine Hydrochlo-

ride and Chlorpheniramine Maleate.

Identification The retention times of major peaks obtained from the test solution and the standard solution prepared as directed under the Assay are the same.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 tablets of Acetaminophen, Pseudoephedrine Hydrochloride and Chlorpheniramine Maleate Tablets, and powder. Weigh accurately an amount of Acetaminophen, Pseudoephedrine Hydrochloride and Chlorpheniramine Maleate Tablets, equivalent to about 500 mg of acetaminophen ($C_8H_9NO_2$) [about 30 mg of pseudoephedrine hydrochloride ($C_{10}H_{15}NO \cdot HCl$), about 2 mg of chlorpheniramine maleate ($C_{16}H_{19}Cl\ N_2 \cdot C_4H_4O_4$)], add water to make exactly 100 mL, sonicate for 5 minutes, and filter through a membrane filter with a pore size of 0.45 μm. Discard the first 10 mL of the filtrate, take exactly 10 mL of the subsequent filtrate, add water to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 50 mg of acetaminophen RS, transfer to a 100-mL volumetric flask, add about 30 mg of pseudoephedrine hydrochloride RS to the flask, and add water to make exactly 100 mL. Pipet 10 mL of the solution, add about 20 mg of chlorpheniramine maleate RS, and add water to make exactly 100 mL. Pipet 1 mL of the solution, add water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with each 20 μL of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions, and determine the peak areas, A_{T1}, A_{T2}, A_{T3}, A_{S1}, A_{S2} and A_{S3}, of each solution.

Amount (mg) of acetaminophen ($C_8H_9NO_2$)
= Amount (mg) of acetaminophen RS
$$\times \frac{A_{T1}}{A_{S1}} \times 10$$

Amount (mg) of pseudoephedrine hydrochloride ($C_{10}H_{15}NO \cdot HCl$)
= Amount (mg) of pseudoephedrine hydrochloride RS
$$\times \frac{A_{T2}}{A_{S2}}$$

Amount (mg) of chlorpheniramine maleate RS ($C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$)
= Amount (mg) of chlorpheniramine maleate RS
$$\times \frac{A_{T3}}{A_{S3}} \times \frac{1}{10}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 30 °C.

Mobile phase: Control the mixing ratio of mobile phase A and mobile phase B stepwise or via the gradient elution as follows.

Mobile phase A: Mix 900 mL of 0.1% trifluoroacetic acid and 100 mL of 0.1% trifluoroacetic acid in methanol.

Mobile phase B: Mix 100 mL of 0.1% trifluoroacetic acid and 900 mL of 0.1% trifluoroacetic acid in methanol.

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0.0 - 3.0	95	5
3.0 - 15.0	95 → 30	5 → 70
15.0 - 16.0	30 → 0	70 → 100
16.0 - 16.1	0 → 95	100 → 5
16.1 - 26.0	95	5

Flow rate: 1.0 mL/min

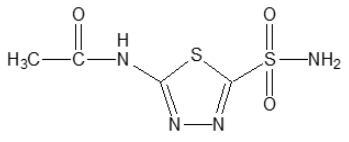
System suitability

System performance: Perform the test with 20 μL of the standard solution according to the above operating conditions; acetaminophen, pseudoephedrine hydrochloride and chlorpheniramine maleate are eluted in this order with the resolution between the peaks of acetaminophen and pseudoephedrine hydrochloride being NLT 4.3.

System repeatability: Perform the test 6 times with each 20 μL of the standard solution according to the above operating conditions; the relative standard deviation of the peak area of acetaminophen, pseudoephedrine hydrochloride and chlorpheniramine maleate is NMT 2.0%.

Packaging and storage Preserve in tight containers.

Acetazolamide
아세타졸아미드



$C_4H_6N_4O_3S_2$: 222.25

5-Acetamido-1,3,4-thiadiazole-2-sulfonamide [*59-66-5*]

Acetazolamide contains NLT 98.0% and NMT 102.0% of acetazolamide ($C_4H_6N_4O_2S_2$), calculated on the dried basis.

Description Acetazolamide occurs as a white to pale yellowish white crystalline powder, is odorless and has a slightly bitter taste.
It is slightly soluble in ethanol(95), very slightly soluble in water, and practically insoluble in ether.

Melting point—About 255 °C (with decomposition).

Identification (1) Dissolve 0.1 g of Acetazolamide in 5 mL of sodium hydroxide TS, and add 5 mL of a solution prepared by dissolving 0.1 g of hydroxylamine hydrochloride and 50 mg of copper(II) sulfate pentahydrate in 10 mL of water; the resulting solution exhibits a pale yellow color and this color slowly darkens when heated for another 5 minutes.

(2) Add 2 mL of dilute hydrochloric acid to 20 mg of Acetazolamide, boil for 10 minutes, cool, and add 8 mL of water; the resulting solution responds to the Qualitative Analysis for primary aromatic amines.

(3) To 0.2 g of Acetazolamide, add 0.5 g of granular zinc and 5 mL of diluted hydrochloric acid (1 in 2); the gas produced changes the color of moistened lead acetate paper into black.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Acetazolamide in 10 mL of sodium hydroxide TS; the solution is clear, and is colorless to pale yellow.

(2) ***Chloride***—Dissolve 1.5 g of Acetazolamide in 75 mL of water and warm at 70 ℃ for 20 minutes with occasional shaking. After cooling, filter the solution, and add 6 mL of dilute nitric acid and water to 25 mL of to the filtrate to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 0.20 mL of 0.01 mol/L hydrochloric acid (NMT 0.014%).

(3) ***Sulfate—***Take 25 mL of the filtrate obtained from (2), add 1 mL of dilute hydrochloric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 0.40 mL of 0.005 mol/L sulfuric acid (NMT 0.038%).

(4) ***Heavy metals—***Proceed with 1.0 g of Acetazolamide according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(5) ***Silver reducing substances—***Wet Acetazolamide with 5 mL of aldehyde-free ethanol, add 125 mL of water and 10 mL of nitric acid, and add again exactly 5 mL of 0.1 mol/L silver nitrate solution. Stir to mix for 30 minutes, protected against light, filter through a glass filter (G 3), wash the residue on the filter with 10 mL of water twice, and combine the washings with the filtrate. Add 5 mL of ammonium iron(III) sulfate TS and titrate with 0.1 mol/L ammonium thiocyanate VS; the volume consumed is NLT 4.8 mL.

(6) ***Selenium***—Weigh 0.2 g of Acetazolamide and combust as directed under the Oxygen Flask Combustion with 25 mL of diluted nitric acid (1 in 30) as an absorbent. Proceed the combustion with a combustion flask with a volume of 1000 mL, wash the stopper and the inner wall of the flask with 10 mL of water, and transfer the solution in the combustion flask into a 150-mL beaker with about 20 mL of water. Heat gently to boiling, boil for 10 minutes, cool to room temperature, and use this solution as the test solution. Separately, pipet 6.0 mL of the standard selenium stock solution, add 25 mL of diluted nitric acid (1 in 30) and 25 mL of water, and use this solution as the standard solution. Add diluted ammonia water(28) (1 in 2) to each of the test and standard solutions, adjust the pH to 0.2, respectively, and dilute with water to make 60 mL. transfer into a separatory funnel with 10 mL of water, and then, wash the separatory funnel with 10 mL of water. Add 0.2 g of hydroxylamine hydrochloride, dissolve by stirring, add 5.0 mL of 2,3-diaminonaphthalene TS, and put a stopper on the funnel. Stir to mix, and then allow to stand at room temperature for 100 minutes. Add 5.0 mL of cyclohexane, shake well for two minutes, and allow to stand. If the layer is separated, remove the water layer, centrifuge cyclohexane extract to remove water, and take the cyclohexane layer. With these solutions, perform the test as directed under the Ultraviolet-visible Spectroscopy, using a solution prepared in the same manner by adding 25 mL of water to 25 mL of diluted nitric acid (1 in 30) as the control solution. Determine the absorption at the absorption maximum wavelength of around 380 nm; the absorption of the solution from the test solution is not larger than the absorption from the standard solution (NMT 30 ppm).

(7) ***Related substances***—Dissolve 100 mg of Acetazolamide in a mixture of acetone and methanol (1:1) to make 10 mL, and use this solution as the test solution. Pipet 2 mL of the test solution, add a mixture of acetone and methanol (1 : 1) to make 100 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 20 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of 1-propanol and 1 mol/L ammonia water (88 : 12) as the developing solvent to a distance of about 15 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelengths: 254 nm and 366 nm); the spots other than the principal spot obtained from the test solution are not larger or more intense than those from the standard solution (NMT 2.0%).

Loss on drying NMT 0.5% (0.5 g, 105 ℃, 3 hours).

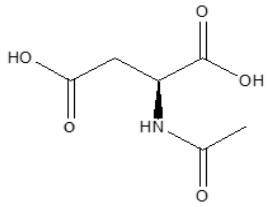
Residue on ignition NMT 0.1% (0.5 g).

Assay Weigh accurately about 0.15 g of Acetazolamide, add 400 mL of water, dissolve by heating on a steam bath, cool it down, and add water to make exactly 1000 mL. Take exactly 5 mL of this solution, add 10 mL of 1 mol/L hydrochloric acid TS, add water to make exactly 100 mL. Perform the test with this solution as directed under the Ultraviolet-visible Spectroscopy, and determine the absorbance, *A*, at the absorbance maximum wavelength of about 265 nm.

Amount (mg) of acetazolamide ($C_4H_6N_4O_3S_2$)
$$= \frac{A}{474} \times 200000$$

Packaging and storage Preserve in light-resistant, well-closed containers.

N-Acetyl-L-aspartic Acid
N-아세틸-L-아스파르트산



$C_6H_9NO_5$: 175.14
N-Acetyl-L-aspartic acid, [997-55-7]

N-Acetyl-L-aspartic Acid, when dried, contains NLT 97.0% and NMT 101.0% of N-acetyl-L-aspartic acid ($C_6H_9NO_5$).

Description N-Acetyl-L-aspartic Acid occurs as a white crystalline powder.
It is odorless.
Its aqueous solution is acidic.
It is freely soluble in water and insoluble in ethanol(95) and most organic solvents.

Identification Dissolve 1 g of N-Acetyl-L-aspartic Acid in water to make 100 mL, and use this solution as the test solution. Dissolve 1 g of N-acetyl-L-aspartic acid RS in water to make 100 mL, and use this solution as the standard solution. With the test solution and the standard solution, perform the test as directed under the Paper Chromatography. Spot the test solution and the standard solution on the paper for chromatography. Next, develop the paper with a mixture of phenol and water (4 : 1) as the developing solvent, and air-dry the filter paper. Spray 0.01% congo red solution on the paper; the test solution and the standard solution exhibit blood blue spots on a red background at the same R_f value.

Melting point Between 140 and 141 ºC.

Purity (1) ***Sulfate***—Transfer 1 g of N-Acetyl-L-aspartic Acid into a Nessler test tube, add water to make 50 mL, and use this solution as the test solution. Prepare the control solution with 2.0 mL of 0.005 mol/L sulfuric acid VS (NMT 0.1%).

(2) ***Chloride***—Transfer 1 g of N-Acetyl-L-aspartic Acid into a Nessler test tube, add water to make 50 mL, and use this solution as the test solution. Prepare the control solution with 2.8 mL of 0.01 mol/L hydrochloric acid VS (NMT 0.1%).

(3) ***Heavy metals***—To 10 mL of 5% aqueous solution of N-Acetyl-L-aspartic Acid, add 2 mL of hydrogen sulfide TS; the resulting solution does not change to brown.

(4) ***Iron***—Transfer 0.4 g of N-Acetyl-L-aspartic Acid into a Nessler test tube, add 45 mL of water, add 5 mL of 0.1 mol/L ammonium thiocyanate, and dissolve (test solution). Separately, dissolve 86.5 mg of ammonium ferrous sulfate in 10 mL of 0.25 mol/L sulfuric acid, and add water to make 1000 mL. Transfer the resulting solution into a Nessler test tube, add 45 mL of water and 5 mL of 0.1 mol/L ammonium thiocyanate, and use this solution as the control solution. The color of the test solution is not more intense than that of the control solution.

Loss on drying NMT 0.5% (105 ºC, four hours, constant mass).

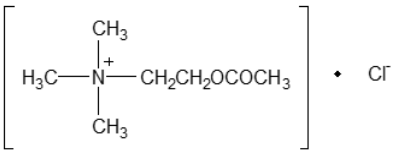
Residue on ignition NMT 0.2% (1 g).

Assay Weigh accurately about 0.2 g of N-Acetyl-L-aspartic Acid, previously dried, dissolve in 40 mL of water, and titrate with 0.1 mol/L sodium hydroxide VS using phenolphthalein as an indicator. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS
= 8.757 mg of $C_6H_9NO_5$

Packaging and storage Preserve in light-resistant, tight containers.

Acetylcholine Chloride for Injection
주사용 아세틸콜린염화물



$C_7H_{16}ClNO_2$: 181.66

Acetylcholine Chloride for Injection is a preparation for injection which is dissolved before use. Acetylcholine Chloride for Injection contains NLT 98.0% and NMT 102.0% of acetylcholine chloride ($C_7H_{16}ClNO_2$) and NLT 19.3% and NMT 19.8% of chlorine (Cl: 35.45), calculated on the dried basis. Acetylcholine Chloride for Injection contains NLT 93.0% and NMT 107.0% of the labeled amount of acetylcholine chloride ($C_7H_{16}ClNO_2$).

Method of preparation Prepare as directed under Injections.

Description Acetylcholine Chloride for Injection occurs as white crystals or a crystalline powder.

It is very soluble in water and freely soluble in ethanol(95).
It is highly hygroscopic.

Identification (1) Determine the infrared spectra of Acetylcholine Chloride for Injection and acetylcholine chloride for injection RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) An aqueous solution of Acetylcholine Chloride for Injection (1 in 10) responds to the Qualitative Analysis (2) for chloride.

Melting point Between 149 and 152 ℃. Dry Acetylcholine Chloride for Injection and a capillary tube at 105 ℃ for 3 hours, seal the capillary tube filled with Acetylcholine Chloride for Injection, and measure the melting point.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Ipratropium Bromide Hydrate in 10 mL of water; the solution is clear and colorless.

(2) ***Acid***—Dissolve 1.0 g of Acetylcholine Chloride for Injection in 10 mL of freshly boiled and cooled water, add 1 drop of bromthymol blue TS, and use this solution as the test solution. To the test solution, add 0.30 mL of 0.01 mol/L sodium hydroxide VS; the solution is blue.

(3) ***Heavy metals*—**Proceed with 2.0g of Acetylcholine Chloride for Injection according to Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

Loss on drying NMT 1.0% (1 g, 105 ℃, 3 hours).

Residue on ignition NMT 0.1% (1 g).

Sterility Meets the requirements.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay (1) ***Acetylcholine chloride*—**Weigh accurately the contents of NLT 10 units of Acetylcholine Chloride for Injections. Weigh accurately about 0.5 g of the contents, dissolve in 15 mL of water, then add exactly 40 mL of 0.1 mol/L sodium hydroxide VS, stopper loosely and heat on a steam bath for 30 minutes. Cool quickly and titrate the excess sodium hydroxide with 0.05 mol/L sulfuric acid VS (indicator: 3 drops of phenolphthalein TS). Perform a blank test in the same manner and make any necessary correction.

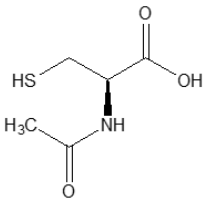
Each mL of 0.1 mol/L sodium hydroxide VS
= 18.166 mg of $C_7H_{16}ClNO_2$

(2) ***Chlorine*—**Titrate the solution, which has been titrated in (1), with 0.1 mol/L silver nitrate VS (indicator: 3 drops of fluorescein sodium TS).

Each mL of 0.1 mol/L silver nitrate VS
= 3.5453 mg of Cl

Packaging and storage Preserve in hermetic containers.

Acetylcysteine
아세틸시스테인



$C_5H_9NO_3S$: 163.20
(2R)-2-Acetamido-3-sulfanylpropanoic acid [*616-91-1*]

Acetylcysteine, when dried, contains NLT 98.0% and NMT 102.0% of acetylcysteine ($C_5H_9NO_3S$).

Description Acetylcysteine occurs as a white crystalline powder.
It is freely soluble in water or ethanol(95) and practically insoluble in dichloromethane.

Identification Determine the infrared spectra of Acetylcysteine and acetylcysteine RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Optical rotation $[\alpha]_D^{20}$: Between + 21° and + 27°. Weigh accurately 1.25 g of Acetylcysteine, calculated on the dried basis, dissolve in 1 mL of ethylenediaminetetraacetic acid disodium salt solution (1 in 100) and 7.5 mL of sodium hydroxide solution (1 in 25), and add pH 7.0 phosphate buffer solution, pH 7.0 to make 25 mL. Determine the optical rotation of this solution.

pH 7.0 phosphate buffer solution—Transfer 50 mL of 1 mol/L potassium dihydrogen phosphate TS and 29.5 mL of 1 mol/L sodium hydroxide solution into a volumetric flask to mix, add water, adjust the pH to 7.0, and add water again to make 100 mL.

pH Dissolve 1.0 g of Acetylcysteine in 100 mL of freshly boiled and cooled water; the pH of this solution is between 2.0 and 2.8.

Purity ***Heavy metals*—**Proceed with 2.0 g of Acetylcys-

teine according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

Loss on drying NMT 0.1% (1 g, in vacuum, NMT 0.67 kPa, 70 ℃, 4 hours).

Residue on ignition NMT 0.5% (2 g, 600 ℃).

Assay Weigh accurately about 1.0 g of Acetylcysteine, previously dried, and dissolve by adding freshly prepared sodium metabisulfite (1 in 2000) to make exactly 100 mL. Pipet 10 mL of this solution, add exactly 10 mL of the internal standard solution, put sodium metabisulfite solution (1 in 2000) to make exactly 200 mL, and use this solution as the test solution. Separately, weigh accurately about 1.0 g of acetylcysteine RS, and dissolve by adding sodium metabisulfite solution (1 in 2000) to make exactly 100 mL. Pipet 10 mL of this solution, add exactly 10 mL of the internal standard solution, put sodium metabisulfite solution (1 in 2000) to make exactly 200 mL, and use this solution as the standard solution. Perform the test with 5 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the peak area ratios, Q_T and Q_S, of acetylcysteine to the internal standard, respectively.

$$\text{Amount (mg) of acetylcysteine } (C_5H_9NO_3S) = \text{Amount (mg) of acetylcysteine RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—Dissolve 1 g of *dl*-phenylalanine in freshly prepared sodium metabisulfite (1 in 2000) to make 200 mL.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 214 nm).

Column: A stainless steel column about 3.9 mm in internal diameter and about 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 μm to 10 μm in particle diameter).

Mobile phase: pH 3.0 potassium dihydrogen phosphate solution (68 in 10000).

Flow rate: 1.5 mL/min

System suitability

System performance: Proceed with 5 μL of the standard solution according to the above conditions; acetylcysteine and *dl*-phenylalanine are eluted in this order with the resolution being NLT 6.0.

System repeatability: Repeat the test 6 times with 5 μL each of the standard solution according to the above conditions; the relative standard deviation is NMT 2.0%.

Packaging and storage Preserve in tight containers.

Acetylcysteine capsules
아세틸시스테인 캡슐

Acetylcysteine Capsules contain NLT 90.0% and NMT 110.0% of the labeled amount of acetylcysteine ($C_5H_9NO_3S$: 163.20).

Method of preparation Prepare as directed under Capsules, with Acetylcysteine.

Identification The retention time and the ultraviolet absorption spectrum at 190 nm to 300 nm of the major peaks obtained from the test solution and the reference standard from the Assay are the same.

Dissolution Perform the test with 1 Acetylcysteine Capsule at 100 revolutions per minute according to Method 1 under the Dissolution, using 900 mL of water as the dissolution medium. Take the dissolved solution 30 minutes after starting the dissolution test and filter it. Discard the first 10 mL of the filtrate, pipet *V* mL of the subsequent filtrate, add water to make exactly *V'* mL so that each mL contains about 20 μg of acetylcysteine according to the labeled amount, and use this solution as the test solution. Separately, weigh accurately about 20 mg of acetylcysteine RS, and dissolve in water to make 100 mL. Pipet 10 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. However, keep the temperature of the solution at 5 ℃ during the procedure. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of acetylcysteine ($C_5H_9NO_3S$) in each solution. Meets the requirements if the dissolution rate of Acetylcysteine Capsules in 30 minutes is NLT 75%.

$$\text{Dissolution rate (\%) of the labeled amount of acetylcysteine } (C_5H_9NO_3S) = W_S \times (V'/V) \times (A_T/A_S) \times (1/C) \times 90$$

W_S: Amount (mg) of acetylcysteine RS

C: Labeled amount (mg) of acetylcysteine ($C_5H_9NO_3S$) per capsule

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 214 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 ℃.

Sample temperature: A constant temperature of about 5 ℃.

Mobile phase: 0.05 mol/L potassium dihydrogen phosphate TS (pH 3.0).

Flow rate: 1.0 mL/min

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of the content of NLT 20 Acetylcysteine Capsules. Weigh accurately an amount equivalent to about 1.0 g of acetylcysteine ($C_5H_9NO_3S$), add sodium bisulfite solution (1 in 2000), and shake to dissolve. Add sodium bisulfite solution (1 in 2000) to make exactly 100 mL and filter. Take 10.0 mL of the filtrate and 10.0 mL of the internal standard solution and dilute it with a sodium bisulfite solution (1 in 2000) to make exactly 200 mL. Use this solution as the test solution. Separately, weigh accurately about 1.0 g of the acetylcysteine RS, proceed in the same way as in the preparation of the test solution, and use this solution as the standard solution. Perform the test with 5 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the ratios, Q_T and Q_S, of the peak areas of acetylcysteine to that of internal standard, respectively.

Amount (mg) of acetylcysteine ($C_5H_9NO_3S$)
= Amount (mg) of acetylcysteine RS × (Q_T / Q_S)

Internal standard solution—Dissolve 1 g of DL-phenylalanine in 200 mL of sodium bisulfite solution (1 in 2000) prepared before use.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 214 nm). However, use a photo-diode array detector (190 nm to 300 nm) when performing the Identification.

Column: A stainless steel column about 3.9 mm in internal diameter and about 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography.

Mobile phase: Phosphate buffer solution, pH 3.0.

Flow rate: 1.5 mL/min

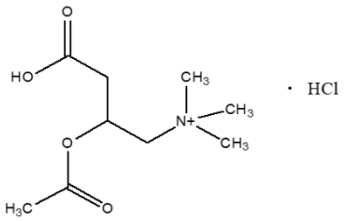
System suitability

System performance: Proceed with 5 μL of the standard solution according to the above conditions; the resolution of acetylcysteine and DL-phenylalanine are NLT 6.0.

System repeatability: Repeat the test 6 times with 5 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak areas of acetylcysteine RS is NMT 2.0%.

Packaging and storage Preserve in well-closed containers.

Acetyl-L-carnitine Hydrochloride
아세틸-L-카르니틴염산염



$C_9H_{17}NO_4 \cdot HCl$: 239.70

(2*R*)-2-Acetyloxy-3-carboxy-*N*,*N*,*N*-trimethyl-1-propanaminium chloride (1:1), [*5080-50-2*]

Acetyl-L-carnitine Hydrochloride contains NLT 97.0% and NMT 102.0% of acetyl-L-carnitine hydrochloride ($C_9H_{17}NO_4 \cdot HCl$), calculated on the anhydrous basis.

Description Acetyl-L-carnitine Hydrochloride occurs as a white fine crystalline powder.
It has a characteristic odor.
It is very soluble in water, soluble in methanol or ethanol(95) and practically insoluble in acetone or ether.

Identification Determine the infrared spectra of Acetyl-L-carnitine Hydrochloride and acetyl-L-carnitine hydrochloride RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Purity (1) ***Clarity and color of solution***—An 1% aqueous solution of Acetyl-L-carnitine Hydrochloride is clear and colorless.

(2) ***Heavy metals***—Proceed with 1.0 g of Acetyl-L-carnitine Hydrochloride according to Method 1 and perform the test. Prepare the control solution with 1.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Related substances***—Weigh accurately about 0.1 g of Acetyl-L-carnitine Hydrochloride, dissolve in the mobile phase to make exactly 10 mL, and use this solution as the test solution. Separately, weigh accurately about 10 mg of L-carnitine hydrochloride RS, dissolve in the mobile phase to make 100 mL, and use this solution as the standard solution of L-carnitine hydrochloride. Separately, weigh accurately about 10 mg of crotonoylbetaine hydrochloride RS and dissolve in the mobile phase to make 100 mL. Pipet 5.0 mL of this solution, add the mobile phase to make 25 mL, and use this solution as the standard solution of the crotonoylbetaine hydrochloride. Perform the test with 25 μL each of the test solution, the standard solution of L-carnitine hydrochloride and the standard solution of the crotonoylbetaine hydrochlorideas directed under the Liquid Chromatography according to the following conditions. Determine the peak area of each solution by the automatic integration method and calculate the amount of related substances; the amounts of L-carnitine hydrochloride and crotonoylbetaine hydrochloride are NMT 1.0% and NMT 0.2%, respectively.

Content (%) of related substances

$$= 100 \times \frac{C_S}{C_T} \times \frac{A_i}{A_S}$$

C_s: Concentration (mg/mL) of each related substance in the standard solution

C_T: Concentration (mg/mL) of Acetyl-L-carnitine Hydrochloride in the test solution

A_i: Peak area of each related substance obtained from the test solution

A_s: Peak area of each related substance obtained from the standard solution

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 205 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 30 cm in length, packed with aminopropylsilanized silica gel for liquid chromatography (5 μmto10 μm in particle diameter).

Mobile phase: A mixture of acetonitrile and 0.05 mol/L potassium dihydrogen phosphate TS, pH 4.7 (65 : 35).

Flow rate: 1.0 mL/min

pH Between 2.3 and 2.6 (1% aqueous solution).

Optical rotation $[\alpha]_D^{20}$: Between -26.5° and -28.0° (0.1 g, water, 100 mL, 100 mm).

Water NMT 1.0% (1 g, volumetric titration, direct titration).

Assay Weigh accurately about 40 mg each of Acetyl-L-carnitine Hydrochloride and acetyl-L-carnitine hydrochloride RS, and add the mobile phase to make 50 mL. Pipet 1.0 mL of these solutions, add the mobile phase to make 10 mL, filter through 0.45 μm filters, and use the filtrate as the test solution and the standard solution, respectively. Perform the test with 5 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of acetyl-L-carnitine hydrochloride in each solution.

Amount (mg) of acetyl-L-carnitine hydrochloride ($C_9H_{17}NO_4$·HCl)
= Amount (mg) of acetyl-L-carnitine hydrochloride RS $\times \frac{A_T}{A_S}$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 205 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 30 cm in length, packed with aminopropylsilanized silica gel for liquid chromatography (5 μm to 10 μm in particle diameter).

Mobile phase: A mixture of acetonitrile and 0.05 mol/L potassium dihydrogen phosphate TS, pH 4.7 (65 : 35).

Flow rate: 1.0 mL/min

Packaging and storage Preserve in light-resistant, tight containers.

Acetyl-L-carnitine Hydrochloride Tablets
아세틸-L-카르니틴염산염 정

Acetyl-L-carnitine Hydrochloride Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of acetyl-L-carnitine hydrochloride ($C_9H_{17}NO_4$·HCl : 239.70).

Method of preparation Prepare Acetyl-L-carnitine Hydrochloride Tablets as directed under Tablets, with Acetyl-L-carnitine Hydrochloride.

Identification The retention time of major peak of the test solution and the standard solution for Assay is the same.

Dissolution Take one tablet of Acetyl-L-carnitine Hydrochloride Tablets, and perform the test at 100 revolutions per minute according to Method 2 using 900 mL of phosphate buffer solution, pH 7.5 as the dissolution medium. Take the medium 120 minutes after starting the dissolution test to filter, discard the first 10 mL of the filtrate, and use the subsequent filtrate as the test solution. Separately, weigh accurately about 0.2 g of acetyl-L-carnitine hydrochloride RS, dissolve in phosphate buffer solution, pH 7.5 to have the same concentration as the test solution, and use this solution as the standard solution. Perform the test with the test solution and the standard solution as directed under the operating conditions under the Assay. It meets the requirements if the dissolution rate of Acetyl-L-carnitine Hydrochloride Tablets in 120 minutes is NLT 90%.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 tablets of Acetyl-L-carnitine Hydrochloride Tablets, and powder. Weigh accurately an amount equivalent to about 0.1 g of acetyl-L-carnitine hydrochloride ($C_9H_{17}NO_4$·HCl), add water to make exactly 100 mL, filter, and use the filtrate as the test solution. Separately, weigh accurately about 0.1 g of acetyl-L-carnitine hydrochloride RS, add water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of acetyl-L-carnitine hydrochloride in each solution.

Amount (mg) of acetyl-L-carnitine hydrochloride ($C_9H_{17}NO_4$·HCl)

= Amount (mg) of acetyl-L-carnitine hydrochloride RS

$$\times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 205 nm).

Column: A stainless steel column about 3.9 mm in internal diameter and 30 cm in length, packed with aminopropylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

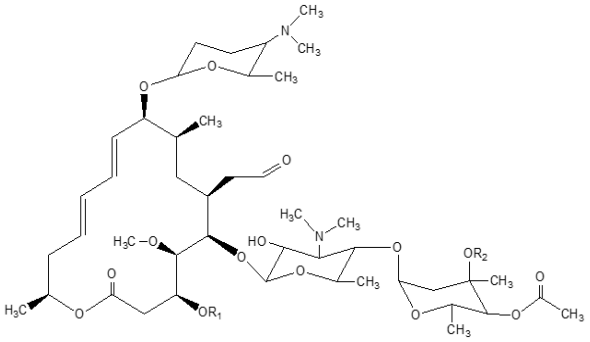
Column temperature: A constant temperature of about 30 °C.

Mobile phase: A mixture of acetonitrile and 0.05 mol/L potassium dihydrogen phosphate (pH 4.7) (65 : 35).

Flow rate: 1.0 mL/min

Packaging and storage Preserve in well-closed containers.

Acetylspiramycin
아세틸스피라마이신



Acetylspiramycin II : R_1=$COCH_3$ R_2=H
$C_{47}H_{78}N_2O_{16}$: 927.13

Acetylspiramycin III : R_2=$COCH_2CH_3$ R_2=H
$C_{48}H_{80}N_2O_{16}$: 941.16

Acetylspiramycin IV : R_1=$COCH_3$ R_2=$COCH_3$
$C_{49}H_{80}N_2O_{17}$: 969.17

Acetylspiramycin V : R_1=$COCH_2CH_3$ R_2=$COCH_3$
$C_{50}H_{82}N_2O_{17}$: 983.19

Acetylspiramycin VI : R_1=H R_2=H
$C_{45}H_{76}N_2O_{15}$: 885.09

acetylspiramycin II:
(4*R*,5*S*,6*R*,7*R*,9*R*,10*R*,11*E*,13*E*,16*R*)-4-Acetyloxy-10-{[(2*R*,5*S*,6*R*)-5-(dimethylamino)-6-methyltetrahydro-2H-pyran-2-yl]oxy}-9,16-dimethyl-5-methoxy-2-oxo-7-(2-oxoethyl)oxacyclohexadeca-11,13-dien-6-yl 3,6-dideoxy-4-O-(4-O-acetyl-6-deoxy-3-C-methyl-α-L-ribo-hexopyranosyl)-3-(di-methyl-amino)-α-D-glucopyranoside

acetylspiramycin III:
(4*R*,5*S*,6*R*,7*R*,9*R*,10*R*,11*E*,13*E*,16*R*)-10-{[(2R,5S,6R)-5-(Dimethylamino)-6-methyltetrahydro-2H-pyran-2-yl]oxy}9,16-dimethyl-5-methoxy-2-oxo-7-(2-oxoethyl)-4-(propanoyl-oxy)oxacyclohexadeca-11,13-dien-6-yl 3,6-dideoxy-4-O-(4-O-acetyl-6-deoxy-3-C-methyl-α-L-ribo-hexopyranosyl)-3-(dimethylamino)-α-D-glucopyranoside

acetylspiramycin IV:
(4*R*,5*S*,6*R*,7*R*,9*R*,10*R*,11*E*,13*E*,16*R*)-4-Acetyloxy-10-{[(2R,5S,6R)-5-(dimethylamino)-6-methyltetrahydro-2H-pyran-2-yl]oxy}-9,16-dimethyl-5-methoxy-2-oxo-7-(2-oxoethyl)oxacyclohexadeca-11,13-dien-6-yl 3,6-dideoxy-4-O-(3,4-di-O-acetyl-6-deoxy-3-C-methyl-α-L-ribo-hexopyranosyl)-3-(dimethylamino)-α-D-glucopyranoside

acetylspiramycin V: (4*R*,5*S*,6*R*,7*R*,9*R*,10*R*,11*E*,13*E*,16*R*)-10-{[(2R,5S,6R)-5-(Dimethylamino)-6-methyltetrahydro-2H-pyran-2-yl]oxy}-9,16-dimethyl-5-methoxy-2-oxo-7-(2-oxoethyl)-4-(propanoyloxy)oxacyclohexadeca-11,13-dien-6-yl 3,6-dideoxy-4-O-(3,4-di-O-acetyl-6-deoxy-3-C-methyl-α-L-ribo-hexopyranosyl)-3-(dimethylamino)-α-D-glucopyranoside

acetylspiramycin VI:
(4*R*,5*S*,6*R*,7*R*,9*R*,10*R*,11E,13E,16*R*)-10-{[(2*R*,5*S*,6*R*)-5-(Dimethylamino)-6-methyltetrahydro-2H-pyran-2-yl]oxy}-4-hydroxy-9,16-dimethyl-5-methoxy-2-oxo-7-(2-oxoethyl)oxacyclohexadeca-11,13-dien-6-yl 3,6-dideoxy-4-O-(4-O-acetyl-6-deoxy-3-C-methyl-α-L-ribo-hexopyranosyl)-3-(dimethylamino)-α-D-glucopyranoside

Acetylspiramycin is a mixture derivative of macrolide substances having antibacterial activity produced by the growth of S*treptomyces ambofaciens.*

Acetylspiramycin contains NLT 900 μg and NMT 1450 μg (potency) of acetylspiramycin per mg, calculated on the dried basis. The potency of Acetylspiramycin is expressed as the amount of acetylspiramycin II ($C_{47}H_{78}N_2O_{16}$: 927.13) in terms of the mass (potency) of acetylspiramycin, and 1 mg (potency) of acetylspiramycin is equivalent to 0.7225 mg of acetylspiramycin II ($C_{47}H_{78}N_2O_{16}$).

Description Acetylspiramycin occurs as a white to pale yellowish white powder.
It is very soluble in methanol or acetonitrile, freely soluble in ethanol(99.5) and practically insoluble in water.

Identification (1) Determine the absorption spectra of solutions of Acetylspiramycin and acetylspiramycin RS in methanol (1 in 50000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Acetylspiramycin and acetylspiramycin RS as directed in the potassium bromide disk method under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Content ratio Dissolve 25 mg of Acetylspiramycin in 25 mL of the mobile phase and use this solution as the test solution. Perform the test with 5 μL of the test solution as directed under the Liquid Chromatography according to the following conditions, and determine peak areas, A_{II}, A_{III}, A_{IV}, A_V, A_{VI} and A_{VII}, of acetylspiramycin

III, acetylspiramycin IV, acetylspiramycin V, acetylspiramycin VI and acetylspiramycin VII, and calculate the ratios of A_{II} and A_{IV}, and the ratio of the sum of A_{III} and A_V to the sum of the peak areas; the ratios of A_{II}, A_{IV} and the sum of A_{III} and A_V are between 30% and 45%, between 30% and 45%, and NMT 25%, respectively. The relative retention time of acetylspiramycin III, acetylspiramycin IV, acetylspiramycin V, acetylspiramycin VI and acetylspiramycin VII to that of acetylspiramycin II is 1.3, 1.7, 2.3, 0.85 and 1.4, respectively.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 231 nm).

Column: A stainless steel column about 6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 μm in particle diameter).

Column temperature: A constant temperature of about 35 °C.

Mobile phase: A mixture of acetonitrile, 0.02 mol/L potassium dihydrogen phosphate TS and dibasic potassium phosphate (87 in 25000) (26 : 7 : 7).

Flow rate: Adjust the flow rate so that the retention time of acetylspiramycin II is about 10 minutes.

System suitability

System performance: Dissolve 25 mg of acetonitrile II RS in the mobile phase to make 100 mL. Proceed with 5 μL of this solution under the above operating conditions; the number of theoretical plates and symmetry factor of the peak of acetonitrile II are NLT 14500 and NMT 2.0, respectively.

System repeatability: Repeat the test 6 times with 5 μL each of the test solutions according to the above conditions; the relative standard deviation of the peak area of acetonitrile II is NMT 2.0%.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Acetylspiramycin according to Method 2 and perform the test. Prepare the control solution with 1.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Arsenic***—Proceed with 2.0 g of Acetylspiramycin according to Method 3 and perform the test (NMT 1 ppm).

Loss on drying NMT 3.0% (1 g, in vacuum, phosphorus pentoxide, 60 ℃, 3 hours).

Residue on ignition NMT 0.5% (1 g).

Assay ***Cylinder plate method*** (1) Medium: Agar media for seed and base layer-Use the medium in (i) (2) (a) ① ⓐ under the Microbial Assays for Antibiotics.

(2) Test organism: Use *Bacillus subtilis* ATCC 6633 as the test organism.

(3) Weigh accurately an amount of Acetylspiramycin, equivalent to about 50 mg (potency), dissolve in 20 mL of methanol, and add 0.1 mol/L phosphate buffer solution, pH 8.0, for antibiotics to make exactly 50 mL. Take accurately an appropriate amount of this solution, dilute it with 0.1 mol/L phosphate buffer solution, pH 8.0, for antibiotics to make solutions containing 80 μg (potency) and 20 μg (potency) per mL, and use these solutions as the high concentration test solution and low concentration test solution, respectively. Weigh accurately about 50 mg (potency) of acetylspiramycin II RS, dissolve in 20 mL of methanol, add 0.1 mol/L phosphate buffer solution, pH 8.0, for antibiotics to make exactly 50 mL, and use this solution as the standard stock solution. Store the standard stock solution at below 5 °C and use it within 3 days. Pipet an appropriate amount of this standard stock solution and dilute with 0.1 mol/L phosphate buffer solution, pH 8.0 for antibiotics to make solutions containing 80 μg (potency) and 20 μg (potency) per mL, and use these solutions as the high concentration standard solution and the low concentration standard solution, respectively. With these solutions, perform the test according to (i)(8) under the Microbial Assays for Antibiotics.

Packaging and storage Preserve in tight containers.

Acetylspiramycin Tablets
아세틸스피라마이신 정

Acetylspiramycin Tablets contain NLT 90.0% and NMT 120.0% of the labeled amount of acetylspiramycin.

Method of preparation Prepare Acetylspiramycin Tablets as directed under Tablets, with Acetylspiramycin.

Identification (1) To 20 mg (potency) of Acetylspiramycin Tablets, dissolve in 2 mL of diluted methanol (1 in 2), and add 1 to 2 drops of Mayer's TS; a yellow to yellowish white precipitate is formed.

(2) Dissolve 20 mg (potency) of Acetylspiramycin Tablets in 2 mL of diluted methanol (1 in 2), and add 1 to 2 drops of iodine TS; a brown precipitate is formed.

(3) Weigh 10 mg (potency) of Acetylspiramycin Tablets, and dissolve in diluted methanol (1 in 5) to make exactly 1000 mL. Determine the absorption spectrum of this solution as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum between 230 nm and 234 nm.

(4) Weigh an appropriate amount of Acetylspiramycin Tablets and acetylspiramycin RS, respectively, dissolve in chloroform to make solutions containing 200 μg (potency) per mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with these solutions as directed under the Thin Layer Chromatography. Spot the test solution and the standard solution on a plate made of silica gel for thin-layer chromatography, and develop the plate with the mixture of methanol and ethyl acetate (1 : 1) as the developing solvent. Spray evenly diluted sulfuric acid (1 in 10) on the

thin-layer chromatographic plate, heat at 110 ℃ to 120 ℃ for about 10 minutes, and compare the purplish brown spots of the test solution and standard solution; the R_f values are the same.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Loss on drying NMT 5.0% (0.1 g, 0.7 kPa, 60 ℃, 3 hours).

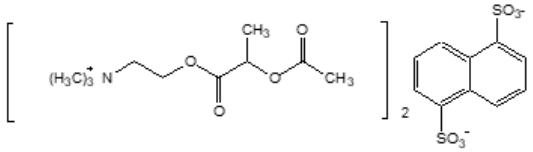
Assay ***Cylinder plate method*—**(1) Medium: Agar media for seed and base layer Use the medium in (i) (2) (a) ① ⓐ under the Microbial Assays for Antibiotics.

(2) Test organism: Use *Bacillus subtilis* ATCC 6633 as the test organism.

(3) Weigh accurately the mass of NLT 20 tablets of Acetylspiramycin Tablets, and powder them. Weigh accurately about 0.25 g (potency) according to the labeled potency, add methanol, shake vigorously to mix, and make exactly 100 mL. Filter or centrifuge, if necessary. Take exactly an appropriate amount of this solution, dilute with 0.1 mol/L phosphate buffer solution, pH 8.0, to make solutions so that each mL contains 80.0 μg and 20.0 μg (potency) per mL, respectively, and use these solutions as the high concentration test solution and the low concentration test solution, respectively. Separately, weigh accurately about 50 mg (potency) of acetylspiramycin RS, dissolve in 20 mL of methanol, add 0.1 mol/L phosphate buffer solution (pH 8.0) to prepare a standard stock solution containing 1 mg (potency) per mL. Keep the standard stock solution below 5 ℃ and use it within 3 days. For assay, pipet an appropriate amount of the standard stock solution, dilute with 0.1 mol/L phosphate buffer solution (pH 8.0) to obtain solutions containing 80.0 μg and 20.0 μg (potency) per mL, and use these solutions as the high-concentration standard solution and the low-concentration standard solution, respectively. With these solutions, perform the test according to (i) (8) under the Microbial Assays for Antibiotics.

Packaging and storage Preserve in tight containers.

Aclatonium Napadisilate
아클라토늄나파디실산염



$C_{30}H_{46}N_2O_{14}S_2$: 722.82

2-[2-(Acetyloxy)-1-oxopropoxy]-*N*,*N*,*N*-trimethylethanaminium 1,5-naphthalenedisulfonate (2:1), [*55077-30-0*]

Aclatonium Napadisilate, when dried, contains NLT 98.0% and NMT 101.1% of aclatonium napadisilate ($C_{30}H_{46}N_2O_{14}S$).

Description Aclatonium Napadisilate occurs as white tablets or a crystalline powder. It is odorless or has a slight characteristic odor and a bitter taste.
It is very soluble in water, freely soluble in methanol and practically insoluble in ethanol(95) or ether.
An aqueous solution of Aclatonium Napadisilate (1 in 10) shows no optical rotation.

Identification (1) Add 1 mL of hydroxylamine hydochloride solution (1 in 10) and 2 mL of sodium hydroxide TS to aqueous solution of Aclatonium Napadisilate, mix, and add 2 mL of dilute hydrochloric acid and 0.5 mL of dilute ferric chloride TS; the solution exhibits a reddish purple color.

(2) Add 2 g of sodium hydroxide to 5 mL of aqueous solution (1 in 10) of Aclatonium Napadisilate, and heat; the solution emits an amine odor and the gas changes the red litmus paper to blue.

(3) Determine the absorbance spectra of an aqueous solution (1 in 25000) of Aclatonium Napadisilate as directed under the Ultraviolet-visible Spectroscopy; it exhibits maxima between 275 nm and 279 nm, between 285 nm and 289 nm, between 296 nm and 300 nm and between 317 nm and 321 nm. Determine the absorbance spectra of an aqueous solution (1 in 20000) of Aclatonium Napadisilate as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum between 224 nm and 228 nm.

(4) Add 1 mL of barium chloride TS to 5 mL of the aqueous solution of Aclatonium Napadisilate (1 in 10), shake to mix, and allow it to stand; a white precipitate is formed.

Melting point Between 188 and 192 ℃.

Purity (1) ***Clarity and color of solution*—**Dissolve 1 g of Aclatonium Napadisilate in 5 mL of water; the solution is colorless and clear.

(2) ***Chloride*—**Perform the test with 2.0 g of Aclatonium Napadisilate as directed under the Chloride. Prepare the control solution with 0.40 mL of 0.01 mol/L hydrochloric acid (NMT 0.007%).

(3) ***Heavy metals*—**Proceed with 2.0g of Aclatonium Napadisilate according to Method 1, and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(4) ***Arsenic*—**Perform the test with 1.0 g of Aclatonium Napadisilate according to Method 1 under the Arsenic (NMT 2 ppm).

(5) ***Related substances*—**Weigh 0.5 g of Aclatonium Napadisilate, add methanol to make 10 mL, and use this solution as the test solution. Prepare before use. Separately, weigh 50 mg of Aclatonium Napadisilate, dissolve in 5 mL methanol, add 4 mL of dilute sodium hy-

droxide TS, and heat on a steam bath for 30 minutes with a reflux condenser. Cool it, add methanol to make 200 mL, and use this solution as the standard solution. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of cellulose for thin-layer chromatography. Develop the plate with a mixture of 1-butanol, water and acetic acid (5 : 4 : 1) to a distance of about 10 cm, and air-dry the plate. Spray evenly Dragendorff's TS on the plate; the spots from the test solution corresponding to the positions of the spots from the standard solution are not more intense than the spots from the standard solution.

Loss on drying NMT 1.0% (1 g, 105℃, 3 hours).

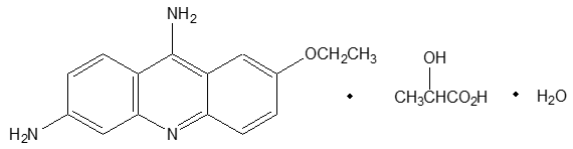
Residue on ignition NMT 0.10% (1 g).

Assay Weigh accurately about 0.25 g of Aclatonium Napadisilate, previously dried, dissolve in 25 mL of methanol, add exactly 20 mL of 0.1 mol/L sodium hydroxide solution, and heat on a steam bath for 30 minutes with a reflux condenser. Stopper and rapidly cool, and then titrate the excess sodium hydroxide solution with 0.1 mol/L hydrochloric acid VS (indicator: 3 drops of phenolphthalein TS). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS
= 18.07 mg of $C_{30}H_{46}N_2O_{14}S_2$

Packaging and storage Preserve in tight containers.

Acrinol Hydrate
아크리놀수화물



Ethacridine Lactate $C_{15}H_{15}N_3O \cdot C_3H_6O_3 \cdot H_2O$: 361.39
7-Ethoxyacridine-3,9-diamine 2-hydroxypropanoate monohydrate [*1837-57-6*]

Acrinol Hydrate contains NLT 98.5% and NMT 101.0% of acrinol ($C_{15}H_{15}N_3O \cdot C_3H_6O_3$: 348.38), calculated on the anhydrous basis.

Description Acrinol Hydrate occurs as a yellow crystalline powder.
It is sparingly soluble in water, methanol or ethanol(99.5).
The pH of the aqueous solution (1 in 100) of Acrinol Hydrate is between 5.5 and 7.0.

Melting point—About 245 °C (with decomposition).

Identification (1) Determine the absorption spectra of aqueous solutions of Acrinol Hydrate and acrinol hydrate RS (3 in 250000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Acrinol Hydrate and acrinol hydrate RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Add 5 mL of dilute sulfuric acid to 5 mL of aqueous solution of Acrinol Hydrate (1 in 100), shake well to mix, allow to stand at room temperature for 5 minutes, and then filter; the filtrate responds to the Qualitative Analysis for lactate.

Purity (1) ***Chloride***—Add 80 mL of water to 1.0 g of Acrinol Hydrate, warm on a steam bath to dissolve, and cool. Add 10 mL of sodium hydroxide TS and water to make 100 mL, shake well to mix, allow to stand for 30 minutes. Filter the solution, take 40 mL of the filtrate, add 7 mL of dilute nitric acid and water to make 50 mL. Use this solution as the test solution and perform the test. For the control solution, add 4 mL of sodium hydroxide TS, 7 mL of dilute nitric acid and water to 0.30 mL of 0.01 mol/L hydrochloric acid to make 50 mL (NMT 0.026%).

(2) ***Heavy metals*—**Proceed with 1.0 g of Acrinol Hydrate according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Volatile fatty acids***—Add 20 mL of water and 5 mL of dilute sulfuric acid to 0.5 g of Acrinol Hydrate, shake well to mix, filter, and warm; no odor of volatile fatty acids is perceptible.

(4) ***Related substances***—Dissolve 10 mg of Acrinol Hydrate in 25 mL of mobile phase and use this solution as the test solution. Pipet 1 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution (1). Pipet 1 mL of the standard solution (1), add the mobile phase to make exactly 10 mL, and use this solution as the standard solution (2). Perform the test with 10 μL each of the test solution, the standard solution (1) and the standard solution (2) as directed under the Liquid Chromatography according to the following conditions. Determine the peak area of each solution by automatic integration method; the peak area other than the peak of acrinol from the test solution is not greater than 3 times the peak area of acrinol from the standard solution (2). Also, the sum of the peak areas other than acrinol from the test solution is not greater than the peak area of acrinol from standard solution (1).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 268 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: Dissolve 7.8 g of sodium dihydrogen phosphate dihydrate in 900 mL of water, adjust the pH to 2.8 with phosphoric acid, and add water to make 1000 mL. Add 300 mL of acetonitrile for liquid chromatography to 700 mL of this solution, and then dissolve 1.0 g of sodium octanesulfonate.

Flow rate: Adjust the flow rate so that the retention time of acrinol is about 15 minutes.

System suitability

Test for required detectability: Confirm that the peak area of acrinol from 10 μL of the standard solution (2) is equivalent to 7 to 13% of the peak area of acrinol obtained from the standard solution (1).

System performance: Proceed with 10 μL of the standard solution (2) according to above operating conditions; the number of theoretical plates and symmetry factor of acrinol are NLT 5000 and NMT 2.0, respectively.

System repeatability: Repeat the test 6 times with 10 μL of the standard solution (1) according to the above conditions; the relative standard deviation of the peak area for acrinol is NMT 1.5%.

Time span of measurement: About 3 times the retention time of acrinol after the solvent peak.

Water Between 4.5% and 5.5% (0.2 g, volumetric titration, direct titration).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.27 g of Acrinol Hydrate, dissolve in 5 mL of formic acid, add 60 mL of a mixture of acetic anhydride and acetic acid(100) (1 : 1), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 34.34 mg of $C_{15}H_{15}N_3O \cdot C_3H_6O_3 \cdot H_2O$

Packaging and storage Preserve in light-resistant, tight containers.

Acrinol, Berberine Chloride and Scopolia Extract Capsules
아크리놀·베르베린염화물·스코폴리아엑스 캡슐

Acrinol, Berberine Chloride and Scopolia Extract Capsules contain 90.0% to 110.0% of acrinol hydrate ($C_{15}H_{15}N_3O \cdot C_3H_6O_3 \cdot H_2O$: 361.39) and berberine chloride ($C_{20}H_{18}ClNO_4$: 371.81), and contain 0.90% to 1.09% of the total alkaloids [hyoscyamine ($C_{17}H_{23}NO_3$: 289.37) and scopolamine ($C_{17}H_{21}NO_4$: 303.35)] in scopolia extract.

Method of preparation Prepare as directed under Capsules, with Acrinol Hydrate, Berberine Chloride and Scopolia Extract.

Identification (1) ***Acrinol hydrate and berberine chloride*—**Weigh an amount of Acrinol, Berberine Chloride and Scopolia Extract Capsules, equivalent to 20 mg of acrinol hydrate (an amount equivalent to 30 mg of berberine chloride) according to the labeled amount, add 20 mL of water, shake well to mix, and centrifuge. Use the clear supernatant as the test solution. Weigh 20 mg of acrinol hydrate RS and 30 mg of berberine chloride RS, respectively, add 20 mL of water, shake to dissolve, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot the test solution and the standard solution on a thin-layer chromatographic plate made using silica gel for thin-layer chromatography. Develop the plate with a mixture of 1-butanol, water and acetic acid(100) (7 : 1 : 1) as the developing solvent, and air-dry the plate. Spray evenly hexachloroplatinic(IV) acid-potassium iodide TS on the plate; the colors and the Rf values obtained from the test solution and the standard solution are the same.

(2) ***Scopolia extract*—**Weigh an amount of Acrinol, Berberine Chloride and Scopolia Extract Capsules equivalent to 2.0 g of scopolia rhizome, add 20 mL of methanol, attach a reflux condenser, and reflux it for 30 minutes. After cooling, filter, wash the residue twice with 10 mL of methanol, combine the filtrate and the washings, and concentrate in vacuum. Dissolve the residue in 25 mL of sulfuric acid (1 in 50), filter, and transfer the filtrate to a separatory funnel. Add 10 mL of ether, and shake well to mix. Take the water layer, add ammonia TS to make it slightly alkaline, add 30 mL of chloroform, and shake to mix. Add 2.0 g of anhydrous sodium sulfate to the chloroform layer, shake to mix, and filter when the solution is clear. Concentrate the filtrate in vacuum, dissolve the residue in 1 mL of ethanol(95), and use this solution as the test solution. Separately, proceed in the same manner as in the preparation of the test solution with 2.0 g of Scopolia Rhizome, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Develop the plate with a mixture of chloroform, methanol, acetone and ammonia water(28) (73 : 15 : 10 : 2) as the developing solvent, and heat the plate at 105 ℃ for 10 minutes. Spray Dragendorff's TS on the plate; the colors and R_f values of the spots obtained from the test solution and the standard solution are the same.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay (1) ***Acrinol hydrate and berberine chloride*—** Weigh accurately the contents of NLT 20 Acrinol, Berberine Chloride and Scopolia Extract Capsules, and powder. Weigh accurately an amount equivalent to about 20 mg of acrinol hydrate ($C_{15}H_{15}N_3O \cdot C_3H_6O_3 \cdot H_2O$) [an amount equivalent to about 30 mg of berberine chloride ($C_{20}H_{18}ClNO_4$)], dissolve in the mobile phase to make exactly 50 mL, and filter. Pipet 5 mL of the filtrate, add exactly 25 mL of the internal standard solution, add the mobile phase to make exactly 50 mL, and use this solution as the test solution. Separately, weigh accurately about 20 mg of acrinol hydrate and about 30 mg of berberine chloride hydrate RS (previously measure water), respectively, and dissolve in the mobile phase to make exactly 50 mL. Pipet 5 mL of this solution, add exactly 25 mL of the internal standard solution, add the mobile phase to make exactly 50 mL, and use this solution as the standard solution. Perform the test with 15 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak areas of acrinol hydrate, berberine chloride and internal standard in each solution by the automatic integration method, and calculate the ratio of the peak areas, Q_{T1}, Q_{S1}, Q_{T2} and Q_{S2}, of the acrinol hydrate and berberine chloride to that of the internal standard in each solution.

Amount (mg) of acrinol hydrate ($C_{15}H_{15}N_3O \cdot C_3H_6O_3 \cdot H_2O$) = Amount (mg) of acrinol hydrate RS × (Q_{T1} / Q_{S1})

Amount (mg) of berberine chloride ($C_{20}H_{18}ClNO_4$) = Amount (mg) of berberine chloride RS × (Q_{T2} / Q_{S2})

Internal standard solution—Weigh accurately about 50 mg of atenolol, and dissolve in the mobile phase to make 50 mL.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 280 nm).

Column: A stainless steel column about 4.0 mm in internal diameter and about 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 μm to 10 μm in particle diameter).

Column temperature: Ordinary temperature

Mobile phase: A mixture of methanol and 0.02 mol/L ammonium monohydrogen phosphate (9 : 1).

Flow rate: 2.0 mL/min

(2) ***Total alkaloid in scopolia extract [hyoscyamine and scopolamine]*—**Weigh accurately the contents of NLT 20 Acrinol, Berberine Chloride and Scopolia Extract Capsules, and weigh accurately an amount equivalent to about 0.4 mg of total alkaloids [hyoscyamine and scopolamine] in scopolia extract. Put it in a centrifugal test tube with a stopper, add 15 mL of ammonia TS, and shake to mix. Add 25 mL of ether, cover it with the stopper, and shake for 15 minutes. Centrifuge, and separate the ether layer. For the water layer, repeat this procedure twice using 25 mL of ether. Combine all the extracts and evaporate ether on a steam bath. Dissolve the residue in exactly 5 mL of the mobile phase, add exactly 3 mL of the internal standard solution, and add the mobile phase again to make exactly 25 mL. Filter this solution through filter paper with a pore size of NMT 0.8 μm, discard the first 2 mL of the filtrate, and use the subsequent filtrate as the test solution. Separately, weigh accurately about 25 mg of atropine sulfate RS (previously determine the loss on drying), dissolve in the mobile phase to make exactly 25 mL, and use this solution as the standard stock solution (1). In addition, weigh accurately about 25 mg of scopolamine hydrobromide RS (previously determine the loss on drying), dissolve in the mobile phase to make exactly 25 mL, and use this solution as the standard stock solution (2). Take exactly 5 mL of the standard stock solution (1) and 1 mL of the standard stock solution (2), add exactly 3 mL of the internal standard solution, add the mobile phase again to make exactly 25 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak area ratios, Q_{TS} and Q_{SA}, of hyoscyamine (atropine), and the peak area ratios, Q_{TS} and Q_{SS}, of scopolamine to the peak area of the internal standard in each solution. Then, calculate the amounts of hyoscyamine and scopolamine using the following formula, and use their sum as the total amount of alkaloids.

Amount (mg) of hyoscyamine ($C_{17}H_{23}NO_3$) = Amount (mg) of atropine sulfate RS, calculated on the dried basis × (Q_{TS} / $Q_{SA)}$ × (1 / 5) × 0.8551

Amount (mg) of scopolamine ($C_{17}H_{21}NO_4$) = Amount (mg) of scopolamine hydrobromide RS, calculated on the dried basis × (Q_{TS} / $Q_{SS)}$ × (1 / 25) × 0.7894

Internal standard solution—Mobile phase of brucine (1 in 2500).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 210 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of a solution, prepared by dissolving 6.8 g of potassium dihydrogen phosphate in 900 mL of water, adding 10 mL of triethylamine, adding phosphoric acid to adjust the pH to 3.5, and add water to make 1000 mL, and acetonitrile (9 : 1).

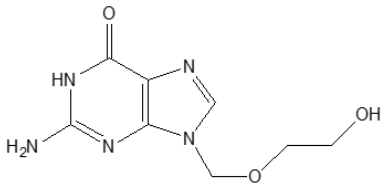
Flow rate: Adjust the flow rate so that the retention time of scopolamine is about 8 minutes.

Selection of column: Proceed with 10 μL of the standard solution according to the above conditions; scopolamine, atropine, and the internal standard are eluted in

this order, and each peak is completely separated.

Packaging and storage Preserve in well-closed containers.

Acyclovir
아시클로버



$C_8H_{11}N_5O_3$: 225.21

2-Amino-1,9-dihydro-9-((2-hydroxyethoxy) methyl)-6H-purin-6-one [*59277-89-3*]

Acyclovir contains NLT 98.0% and NMT 101.0% of acyclovir ($C_8H_{11}N_5O_3$), calculated on the anhydrous basis.

Description Acyclovir occurs as a white crystalline powder.
It is freely soluble in dimethylsulfoxide, slightly soluble in water, and very slightly soluble in ethanol(95).
It dissolves in dilute hydrochloric acid.

Identification (1) Determine the infrared spectra of Acyclovir and acyclovir RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) The retention times of the major peaks obtained from the test solution and the standard solution in the Assay are the same.

Purity (1) ***Clarity and color of solution***—Dissolve 0.5 g of Acyclovir in 20 mL of dilute sodium hydroxide TS; the solution is clear and the color is not more intense than the following control solution.
Control solution—To 2.5 mL of Matching Fluid for Color F, add diluted dilute hydrochloric acid (1 in 10) to make 100 mL.

(2) ***Heavy metals***—Proceed with 1.0 g of Acyclovir according to Method 2 under the Heavy Metals and perform the test. Prepare the control solution with 1.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Related substances***—Use the test solution obtained in the Assay as the test solution. Separately, weigh accurately about 25 mg of guanine RS, dissolve in 50 mL of dilute sodium hydroxide TS, and add the mobile phase to make exactly 100 mL. Pipet 2 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak areas of guanine of each solution, A_T and A_S, and calculate the amount of guanine by the following equation; it is NMT 0.7%. Determine each peak area from the test solution by the automatic integration method, and calculate the amount of each related substance other than acyclovir and guanine by the percentage peak area method: it is NMT 0.2%. Furthermore, the sum of the amount of each related substance determined by the percentage peak area method and the amount of guanine calculated above is NMT 1.5%.

$$\text{Content (\%) of guanine} = \frac{W_S}{W_T} \times \frac{A_T}{A_S} \times \frac{2}{5}$$

W_S: Amount (mg) of guanine RS taken
W_T: Amount (mg) of Acyclovir taken

Operating conditions

For the detector, column, column temperature, mobile phase and flow rate, proceed as directed under the operating conditions in the Assay.

System suitability

System performance: Proceed as directed under the system suitability in the Assay.

Test for required detectability: Pipet 1 mL of the test solution, add the mobile phase to make exactly 100 mL, and use this solution as the system suitability solution. Pipet 1 mL of the system suitability solution and add the mobile phase to make exactly 10 mL. Confirm that the peak area of acyclovir obtained with 10 μL of this solution is equivalent to 7% to 13% of that with 10 mL of the system suitability solution.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area of acyclovir is NMT 2.0%.

Time span of measurement: About 8 times the retention time of acyclovir after the solvent peak.

Water NMT 6.0% (0.5 g, volumetric titration, direct titration).

Residue on ignition NMT 0.1% (1.0 g).

Assay Weigh accurately about 20 mg each of Aciclovir and aciclovir RS (previously determine the water in the same manner as Aciclovir), dissolve each in 1 mL of dilute sodium hydroxide TS, add the mobile phase to make exactly 20 mL each, and use these solutions as the test solution and the standard solution, respectively. Perform the test with exactly 10 μL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of acyclovir in each solution.

$$\text{Amount (mg) of acyclovir } (C_8H_{11}N_5O_3)$$

= Amount (mg) of acyclovir RS, as calculated on the anhydrous basis $\times \frac{A_T}{A_S}$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 10 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 μm in particle diameter).

Column temperature: A constant temperature of about 20 °C.

Mobile phase: Dissolve 1.0 g of sodium 1-decanesulfonate and 6.0 g of sodium dihydrogen phosphate dihydrate in 1000 mL of water, and adjust the pH to 3.0 with phosphoric acid. To this solution, add 40 mL of acetonitrile.

Flow rate: Adjust the flow rate so that the retention time of acyclovir is about 3 minutes.

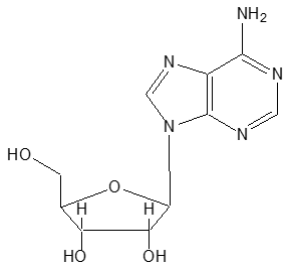
System suitability

System performance: Dissolve 0.1 g of Acyclovir in 5 mL of dilute sodium hydroxide TS, add 2 mL of a solution of guanine in dilute sodium hydroxide TS (1 in 4000), and add the mobile phase to make 100 mL. Proceed with 10 μL of this solution under the above operating conditions; acyclovir and guanine are eluted in this order with the resolution being NLT 17.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area of acyclovir is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Adenosine
아데노신



$C_{10}H_{13}N_5O_4$: 267.24

(2*R*,3*R*,4*S*,5*R*)-2-(6-Amino-9*H*-purin-9-yl)-5-(hydroxymethyl)oxolane-3,4-diol [*58-61-7*]

Adenosine contains NLT 99.0% and not more 101.0% of adenosine ($C_{10}H_{13}N_5O_4$), calculated on the dried basis.

Description Adenosine occurs as a colorless crystalline powder and produces adenine and D-ribose by hydrolysis. It is freely soluble in cold water, sparingly soluble in warm water and slightly soluble in ethanol(95).

Identification Determine the infrared spectra of Adenosine and Adenosine RS as directed in the paste method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Melting point Between 233 and 238 ℃.

Optical rotation $[\alpha]_D^{20}$: Between -68° and -72° (after drying, 0.4 g, sodium hydroxide solution (1 in 10), 20 mL, 100 mm).

Purity (1) ***Acidity or alkalinity***—Suspend 1 g of Adenosine in 20 mL of water, shake it for 30 seconds and filter. To 10 mL of the filtrate, add 0.1 mL of Bromocresol purple TS, then add 0.01 mol/L of sodium hydroxide solution until it turns bluish purple; the volume of sodium hydroxide solution consumed is NMT 0.3 mL. To 10 mL of the filtrate, add 0.1 mL of Bromocresol purple TS, then add 0.01 mol/L of hydrochloric acid until it turns yellow; the volume of hydrochloric acid consumed is NMT 0.1 mL.

(2) ***Chloride***—Suspend 0.2 g of Adenosine in 10 mL of water, shake it for 30 seconds, and filter. Use the filtrate as the test solution. Add water to 1.0 mL of 0.0231% sodium chloride solution to make exactly 100 mL, and use this solution as the control solution. Add 1 mL of nitric acid and 1 mL of silver nitrate TS to 10 mL of the test solution and the control solution, respectively, add water to make 40 mL, mix well, and allow to stand for 5 minutes while protected from light. Compare both solutions against a black background; the test solution is not more turbid than the control solution (NMT 0.007%).

(3) ***Sulfate***—Suspend 0.75 g of Adenosine in 15 mL of water, shake it for 30 seconds, and filter. Use the filtrate as the test solution. Add 0.15 mL of 0.01 mol/L sulfuric acid to 15 mL of water and use this solution as the control solution. Add 2 mL of barium chloride TS and 1 mL of 3 mol/L hydrochloric acid to the test solution and the control solution, respectively, add water to make 30 mL, mix well, and allow to stand for 5 minutes; the test solution is not more turbid than the control solution (NMT 0.02%).

(4) ***Ammonia***—Suspend 0.5 g of Adenosine in 10 mL of water. Stir for 30 seconds, pass through a coarse filter. Add water to the filtrate to make 15 mL and use this solution as the test solution. Add water to 0.1 mL of 0.0314% ammonium chloride solution to make exactly 100 mL. To 2.0 mL of this solution, add 13 mL of water and use this solution as the control solution. Add 0.3 mL of Nessler's TS to the test solution and the control solution, respectively, stopper them and allow to stand for about 5 minutes; the yellow color of the test solution is not more intense than that of the control solution (NMT 0.0004%).

(5) ***Heavy metals***—Proceed with 1.0 g of Adenosine

according to Method 2 and perform the test. Prepare the control solution with 1.0 mL of lead standard solution (NMT 10 ppm).

(6) ***Related substances***—Weigh accurately about 25 mg of Adenosine, dissolve in the mobile phase to make exactly 25 mL, and use this solution as the test solution. Perform the test with 20 μL of the test solution as directed under the percentage peak area method under the Liquid Chromatography according to the following conditions; the amounts of guanosine, inosine and uridine are NMT 0.1%, respectively, the amount of adenine is NMT 0.2%, and the total amount of substances is NMT 0.5%, all of which are obtained from the test solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of sulfate buffer solution and sodium azide solution (1 in 10000) (60 : 40).

Flow rate: 1.5 mL/min

System suitability

System performance: Weigh 20 mg of adenosine and 20 mg of inosine and dissolve in the mobile phase to make 100 mL. Proceed with 20 μL of this solution under the above operating conditions; the resolution between the peaks of adenosine and inosine is NLT 9.0, and the symmetry factor is NLT 2.5.

System repeatability: Weigh 20 mg of adenosine and 20 mg of inosine and dissolve in the mobile phase to make 100 mL. Repeat the test 5 times with 20 μL each of these solutions under the above operating conditions; the relative standard deviation of the peak area is NMT 2.0%.

Time span of measurement: About 2 times the retention time of the major peak obtained from the test solution.

Sulfate buffer solution—Dissolve 6.8 g of potassium hydrogen sulfate and 3.4 g of tetrabutylammonium hydrogen sulfate in water to make 1000 mL. Adjust the pH to 6.5 with 2 mol/L potassium hydroxide TS.

Loss on drying NMT 0.5% (1 g, 105 ℃, 2 hours).

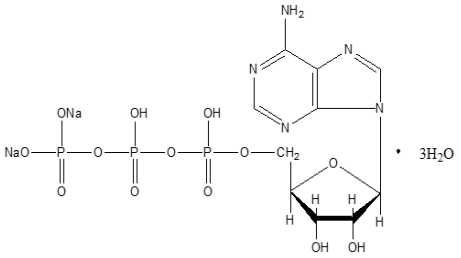
Residue on ignition NMT 0.1%. (1 g).

Assay Weigh accurately about 0.5 g of Adenosine, dissolve in 50 mL of acetic acid(100), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 26.724 mg of $C_{10}H_{13}N_5O_4$

Packaging and storage Preserve in tight containers.

Adenosine Disodium Triphosphate Trihydrate
아데노신트리포스페이트이나트륨삼수화물



$C_{10}H_{14}N_5O_{13}P_3Na_2 \cdot 3H_2O$: 605.22

5'-(Tetrahydrogen triphosphate) adenosine disodium salt trihydrate, [*987-65-5, anhydride*]

Adenosine Disodium Triphosphate Trihydrate contains NLT 97.0% of adenosine disodium triphosphate ($C_{10}H_{14}N_5O_{13}P_3Na_2$: 551.14), calculated on the anhydrous basis.

Description Adenosine Disodium Triphosphate Trihydrate occurs as a white crystalline powder, which is odorless and has a slightly acidic taste.
It is freely soluble in water and practically insoluble in ethanol or in ether.

Identification (1) To 3 mL aqueous solution of Adenosine Disodium Triphosphate Trihydrate (3 in 1000), add 0.2 mL of a solution of orcinol in ethanol (1 in 10), add 3 mL of ammonium ferric sulfate solution (1 in 1000), then warm on a steam bath for 10 minutes; the resulting solution exhibits a green color.

(2) An aqueous solution of Adenosine Disodium Triphosphate Trihydrate (1 in 100) responds to the Qualitative Analysis for sodium salt.

(3) An aqueous solution of Adenosine Disodium Triphosphate Trihydrate (1 in 100) responds to the Qualitative Analysis for phosphate.

(4) Determine the absorption spectrum as directed under the Ultraviolet-visible Spectroscopy with a solution of Adenosine Disodium Triphosphate Trihydrate in 0.1 mol/L phosphate buffer solution (pH 7.0) (1 in 80000); it exhibits the maximum absorption at the wavenumber of about 260 nm. Absorbances at the wavelengths of 250 nm, 260 nm and 280 nm are calculated as follows:

E250/E260 = 0.80 ± 0.2
E280/E260 = 0.15 ± 0.2

pH Dissolve 5 g of Adenosine Disodium Triphosphate Trihydrate in water to make 1000 mL; the pH of this solution is between 2.5 and 3.5.

Purity (1) ***Clarity and color of solution***—Dissolve 0.1 g

of Adenosine Disodium Triphosphate Trihydrate in 20 mL of water; the resulting solution is clear and colorless.

(2) ***Heavy metals***—Weigh 1.0 g of Adenosine Disodium Triphosphate Trihydrate and perform the test according to Method 2 as directed under the Heavy Metals. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Related substances***—Perform the test with Adenosine Disodium Triphosphate Trihydrate according to Section (2) as directed under the Assay; the total amount of related substances other than adenosine disodium triphosphate is NMT 3.0%.

$$\text{Amount of related substances (\%)} = \frac{0.671 \times T_1 + 0.855 \times T_2 + T_X}{0.671 \times T_1 + 0.855 \times T_2 + T_3 + T_X}$$

Water Put 50 mL of a mixture of ethylene glycol for water determination and methanol for water determination (3 : 2) in a dried titration flask, add Karl Fischer TS to the extent slightly exceeding, then titrate to the endpoint with water and the standard methanol VS. Next, weigh accurately 0.1 g of Adenosine Disodium Triphosphate Trihydrate, place quickly into a titration flask, add a known excess volume of Karl Fischer TS, and shake well to mix for 30 minutes. Titrate it while shaking; the water content is between 6.0% and 12.0%.

Assay (1) ***Total amount of nucleotides***—Weigh accurately about 0.1 of Adenosine Disodium Triphosphate Trihydrate, dissolve in 0.1 mol/L phosphate buffer solution (pH 7.0) to make exactly 200 mL. Pipet 5 mL of this solution and add 0.1 mol/mL phosphate buffer solution (pH 7.0) to make exactly 200 mL. Perform the test with this solution as directed under the Ultraviolet-visible Spectroscopy, and determine the absorbance of this solution, *A*, at wavelength of 259 nm.

$$\text{Total amount (mg) of nucleotides} = \frac{A}{27.94} \times 8000$$

(2) ***Mass ratio of adenosine disodium triphosphate***—Weigh accurately about 0.2 g of Adenosine Disodium Triphosphate Trihydrate, add the mobile phase, dissolve it to make exactly 50 mL. Use this solution as the test solution. Perform the test with 10 μL of the test solution as directed under the Liquid Chromatography according to the following conditions, and calculate the mass ratio of adenosine disodium triphosphate equivalent to the total amount of nucleotides according to the following equation with the peak area T_1 of adenosine monophosphate, the peak area T_2 of adenosine diphosphate, the peak area T_3 of adenosine triphosphate, and the peak area T_X of other related substances.

$$\text{Mass ratio of adenosine disodium triphosphate equivalent to the total amount of nucleotides} = \frac{T_3}{0.671 \times T_1 + 0.855 \times T_2 + T_3 + T_X}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 259 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 5 cm in length, packed with totally porous spherical silica gel of 3 μm in particle diameter, chemically bonded to a weak base ion exchanger.

Column temperature: A constant temperature of about 35 °C.

Mobile phase: Adjust the pH of 0.25 mol/L sodium monohydrogen phosphate TS to 7.0 with 0.25 mol/L potassium dihydrogen phosphate TS.

Flow rate: Adjust the flow rate so that the retention time of adenosine triphosphate is about 10 minutes.

Selection of column: Weigh 40 mg of adenosine monophosphate, 0.1 mg of adenosine 5'-diphosphate sodium and 0.3 g of adenosine disodium triphosphate, respectively, and dissolve in the mobile phase to make 1000 mL. Proceed with 10 μL of this solution under the above operating conditions. At this time, use a column from which adenosine monophosphate, adenosine 5'-diphosphate sodium, adenosine disodium triphosphate are eluted in this order with the resolution between these peaks being NLT 3.

Time span of measurement: About 2 times the retention time of adenosine disodium triphosphate.

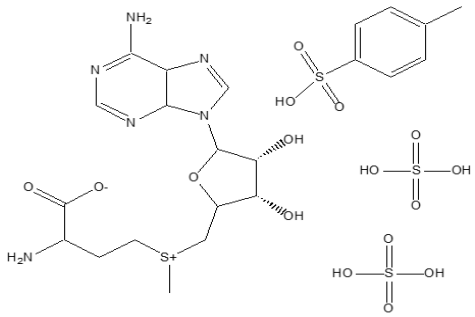
$$\text{Amount (mg) of adenosine disodium triphosphate} = f_T \times f_R$$

f_T: Total amount (mg) of nucleotides obtained from the Procedure (1).

f_R: Mass ratio of adenosine disodium triphosphate obtained from the Procedure (2).

Packaging and storage Preserve in tight containers in a cold place.

S-Adenosyl-L-methionine Sulfate Tosilate
S-아데노실-L-메티오닌황산토실산염



$C_{15}H_{22}N_6O_5S \cdot 2(H_2SO_4) \cdot C_7H_8SO_3$: 766.78

5'-[[(3*S*)-3-Amino-3-carboxypropyl]methylsulfonio]-5'-

deoxy-adenosine disulfate 4-methylbenzenesulfonate, [*97540-22-2*]

S-Adenosyl-L-methionine Sulfate Tosilate contains NLT 49.5% and NMT 54.7% of S-adenosyl-L-methionine ($C_{15}H_{22}N_6O_5S$: 398.44), NLT 24.3% and NMT 26.7% of sulfuric acid (H_2SO_4: 98.08), and NLT 21.3% and NMT 23.5% of p-tosylic acid ($C_7H_7SO_3H$: 172.20).

Method of preparation If there is any possibility of alkyl (methyl, ethyl, isopropyl, etc.) toluenesulfonate esters to be included as impurities in the manufacturing process of *S*-Adenosyl-L-methionine Sulfate Tosilate, precautions must be taken in controlling the starting materials, manufacturing process and intermediates to minimize the residue of impurities in consideration of risk assessment results. If necessary, the manufacturing process may be verified by the test data proving that no quality risk exists in the final drug substance.

Description *S*-Adenosyl-L-methionine Sulfate Tosilate occurs as a white crystalline powder and is water-absorbing.
It is freely soluble in water, and practically insoluble in organic solvents.

Identification (1) The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

(2) Weigh 125 mg of *S*-Adenosyl-L-methionine Sulfate Tosilate, dissolve in 5 mL of water, and use this solution as the test solution. Weigh 70 mg of *S*-adenosyl-L-methionine RS and dissolve in 5 mL of water. Separately, dissolve 37 mg of p-tosylic acid RS in 5 mL of water. Use these solutions as the standard solutions. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 2 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of *n*-butanol, acetic acid(100) and water (60 : 25 : 15) as the developing solvent to a distance of about 12 cm, and air-dry the plate. Examine the plate under ultraviolet rays; the R*f* value and color of the spots obtained from the test solution and the standard solution are the same.

Purity Dissolve 125 mg of *S*-Adenosyl-L-methionine Sulfate Tosilate in 5 mL of water, and use this solution as the test solution. Weigh 62.5 mg of methylthioadenosine RS, dissolve in water to make 500 mL, and use this solution as the standard solution. Weigh 62.5 mg of homoserine RS, dissolve in water to make 500 mL, and use this solution as the standard solution. Weigh 62.5 mg of adenine RS, dissolve in water to make 500 mL, and use this solution as the standard solution. Weigh 115.5 mg of 2-anmino-4-butyrolactone-hydrobromic acid RS, dissolve in water to make 500 mL, and use this solution as the standard solution. Weigh 62.5 mg of adenosine RS, dissolve in water to make 500.0 mL, and use this solution as the standard solution. With 2 μL each of these solutions, perform the test as directed under the Thin Layer Chromatography. Spot the test solution and the standard solution on a thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Develop the plate with a mixture of *n*-butanol, acetic acid(100) and water (60 : 25 : 15) as the developing solvent to a distance of about 12 cm, and air-dry the plate. Examine the plate under ultraviolet rays to identify spots, then spray (methyladenosine, adenine, adenosine) 0.2% methanolic ninhydrin solution, and heat at 110 °C for 10 minutes; the Rf value and color of the spots obtained from the test solution and the standard solution are the same.

Water NMT 2.0% (1 g, volumetric titration, direct titration).

Residue on ignition NMT 0.5% (1 g).

Assay (1) ***S-adenosyl-L-methionine***—Weigh accurately about 50 mg of S-Adenosyl-L-methionine Sulfate Tosilate, dissolve by adding the mobile phase to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 50 mg of *S*-adenosyl-L-methionine RS, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Take exactly 5 μL each of the test solution and the standard solution, perform the test as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas A_T and A_S of *S*-adenosyl-L-methionine for each solution.

Amount (mg) of *S*-adenosyl-L-methionine ($C_{15}H_{22}N_6O_5S$)
= Amount (mg) of *S*-adenosyl-L-methionine RS
× (A_T/ A_S)

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 260 nm).

Column: A stainless steel column, 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (about 5 μm to 10 μm in particle diameter).

Mobile phase A: A mixture of a solution in which formic acid is added to 0.2 mol/L ammonium formate to adjust the pH to 4.0 and methanol (9 : 1).

Flow rate: 1.0 mL/min

System suitability

System performance: Proceed with 5 μL of each standard solution under the above operating conditions; the number of theoretical plates for *S*-adenosyl-L-methionine is NLT 15000.

System repeatability: Repeat the test 6 times with 5 μL of each standard solution according to the above operating conditions; the relative standard deviation of the peak area for *S*-adenosyl-L-methionine is NMT 2.0%.

(2) ***p-tosylic acid***—Weigh accurately about 250 mg

of *S*-Adenosyl-L-methionine Sulfate Tosilate, transfer to a separatory funnel, dissolve in 10 mL of water, and elute it to a column filled with 50W × 8 (H form, 100 to 200 mesh) of the ion-exchange resin, diatomaceous earth up to about 10 cm in height in a glass column (1 cm in internal diameter, 20 cm in length). Put each 10 mL of water into the separatory funnel, elute three times, and collect the effluent. Add water to the effluent to make exactly to 50 mL, and use this solution as the test solution. Separately, weigh accurately about 50 mg of *p*-tosylic acid RS, add water to make 100 mL, and use this solution as the standard solution. Perform the test with the test solution and the standard solution as directed under the Liquid Chromatography under the same conditions as in the Assay of S-adenosyl-L-methionine, and determine the peak areas, A_T and A_S of each solution.

Amount (mg) of *p*-tosylic acid ($C_7H_7SO_3H$)
= Amount (mg) of *p*-tosylic acid RS$\times \frac{A_T}{A_S} \times \frac{1}{2}$

(3) ***Sulfuric acid***—Take 25.0 mL of the test solution under the Assay of *p*-tosylic acid in (2) and titrate with 0.1 mol/L sodium hydroxide VS (potentiometric titration). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1mol/L sodium hydroxide VS
= 4.904 mg of H_2SO_4

Packaging and storage Preserve in tight containers.

S-Adenosyl-L-methionine Sulfate Tosilate Tablets
S-아데노실-L-메티오닌황산토실산염 정

S-Adenosyl-L-methionine Sulfate Tosilate Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of *S*-adenosyl-L-methionine ($C_{15}H_{22}N_6O_5S$: 398.44).

Method of preparation Prepare as directed under Tablets, with *S*-Adenosyl-L-methionine Sulfate Tosilate.

Identification (1) ***S-Adenosyl-L-methionine*—**The retention times of the major peaks from the test solution and the standard solution are the same.

(2) ***p-Tosilic acid*—**Weigh an amount of *S*-Adenosyl-L-methionine Sulfate Tosilate Tablets according to the labeled amount, equivalent to about 310 mg of S-adenosyl-L-methionine sulfate tosilate, and transfer to a separatory funnel. Dissolve in a small amount of water and elute the column prepared by packing a glass column with an internal diameter of 1 cm and a length of 20 cm with ion exchange resin diatomaceous earth 50W×8 (H form, 100 to 200 mesh) up to about 10 cm in height. Elute the separatory funnel with a small amount of water to obtain 50 mL of eluate and use the solution as the test solution. Separately, dissolve about 60 mg of *p*-tosilic acid RS to make 50 mL and use this solution as the standard solution. Perform the test with the test solution and the standard solution as directed under the Liquid Chromatography according to the operating conditions described in the Assay under *S*-Adenosyl-L-Methionine; the retention times of the major peaks from the test solution and the standard solution are the same.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately 20 tablets of *S*-Adenosyl-L-methionine Sulfate Tosilate Tablets and make into powder. Weigh accurately an amount of the powder, equivalent to 50 mg of *S*-adenosyl-L-methionine ($C_{15}H_{22}N_6O_5S$), add the mobile phase to make exactly 100 mL, filter, and use the filtrate as the test solution. Separately, weigh accurately 10 mg of *S*-adenosyl-L-methionine RS, add the mobile phase to make exactly 20 mL, and use this solution as the standard solution. Perform the test with each 5 μL of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions and determine the peak areas, A_T and A_S, of *S*-adenosyl-L-methionine for each solution.

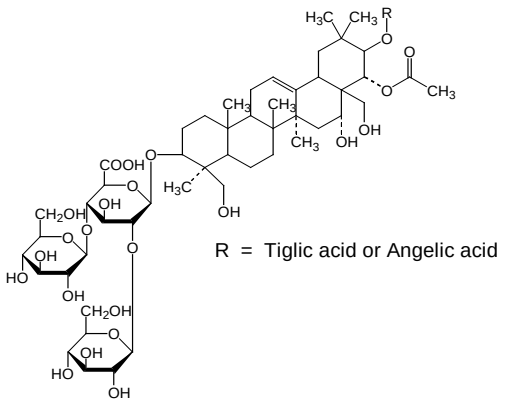
Amount (mg) of *S*-adenosyl-L-methionine ($C_{15}H_{22}N_6O_5S$)
= Amount (mg) of *S*-adenosyl-L-methionine RS
× (A_T / A_S) × 5

Operating conditions

For the detector, column, mobile phase, flow rate, and system suitability, proceed as directed under the Assay (1) under *S*-Adenosyl-L-Methione Sulfate Tosilate.

Packaging and storage Preserve in tight containers.

Aescin
무정형에스신



$C_{55}H_{86}O_{24}\cdot 2H_2O$: 1167.29
3-(4-*O*-β-glucopyranosyl-2-*O*-β-*D*-xylopyranosyl-β-*D*-glucopyranuronoside), 3-hydroxy-2-methylbutyrate escigenin acetate, [*6805-41-0*]

Aescin is prepared from crystalline aescin, a triterpene glycoside mixture isolated from *Aesculus hippocastanum* (horse chestnuts), by a special process, and it contains NLT 97.0% and NMT 100.0% of aescin ($C_{55}H_{86}O_{24}$: 1131.26), calculated on the anhydrous basis.

Description Aescin occurs as an amorphous white powder and has a pungent bitter taste.
The X-ray diffraction pattern of the amorphous form of Aescin does not exhibit a crystal lattice structure in contrast to the crystalline aescin.
It is freely soluble in methanol or in water, soluble in ethanol and practically insoluble in acetone, in ether, in chloroform or in petroleum ether.

Identification Dissolve 0.1 g of Aescin in methanol to make 10 mL and use this solution as the test solution. Separately, dissolve 0.1 g of aescin RS in methanol to make 10 mL and use this solution as the standard solution. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of ethyl acetate, propanol, and water (9 : 7 : 4) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Spray a solution of 20% antimony trichloride in chloroform on the plate and heat it at 105 ℃ for 15 minutes; the R_f values and color of the spots obtained from the test and standard solutions are the same.

Melting point Between 223 and 226 °C.

Optical rotation $[\alpha]_D^{20}$: Between -26° and -28° (0.5 g, calculated on the anhydrous basis, methanol, 10 mL, 100 mm).

Purity (1) ***Clarity and color of solution***—To 0.2 g of Aescin, add 10 mL of water and stir at 20 ℃ for 20 minutes; the resulting solution is clear. Immediately, transfer this solution into a test tube and allow it to stand in a thermostat at 20 ± 1 ℃; the resulting solution remains clear for at least 60 minutes.

(2) ***Heavy metals***—Proceed with 2.0 g of Aescin as directed under Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

Water NMT 3.5%.

Residue on ignition NMT 0.1% (2 g).

Assay Weigh accurately about 0.325 g of Aescin, dissolve in 15 mL of water, and titrate with 0.1 mol/L sodium hydroxide VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS
= 113.7 mg of $C_{54}H_{84}O_{23}\cdot 2H_2O$

Packaging and storage Preserve in well-closed containers.

Afloqualone Tablets
아플로쿠알론 정

Afloqualone Tablets contain NLT 93.0% and NMT 107.0% of the labeled amount of afloqualone ($C_{16}H_{14}FN_3O$: 283.30).

Method of preparation Prepare as directed under Tablets, with Afloqualone.

Identification (1) Weigh an amount of Afloqualone Tablets, equivalent to 10 mg of afloqualone, according to the labeled amount. Add 10 mL of anhydrous ethanol, shake to mix, dissolve, and filter. To 2 mL of the filtrate, add 1 mL of dilute hydrochloric acid and 4 mL of water; the solution responds to the Qualitative Analysis for primary aromatic amine.

(2) Weigh an amount of Afloqualone Tablets equivalent to 10 mg of afloqualone, add 10 mL of anhydrous ethanol, shake well to mix, and filter. Examine the filtrate under ultraviolet light (360 nm); the solution exhibits a blue fluorescence.

(3) ***Purity***—Perform the test as directed under the Thin Layer Chromatography for the related substances; the R_f values of the spots obtained from the test solution and the standard solution D are the same.

Purity ***Related substances*—**Perform the test while protected from light. Weigh an amount of Afloqualone Tablets equivalent to 50 mg of afloqualone, and add 5.0 mL of a mixture of anhydrous ethanol and chloroform (1 : 1). After shaking well to mix, centrifuge at 3000 rpm for 10 minutes, and use the clear supernatant as the test solution. Separately, weigh accurately about 1.0 mg, 2.0 mg and 3.0 mg of afloqualone RS, respectively, dissolve in a mixture of anhydrous ethanol and chloroform (1 : 1) to make exactly 100 mL, and use these solutions as the standard solutions A, B and C. Again, weigh 50 mg of afloqualone RS, dissolve in 5.0 mL of a mixture of anhydrous ethanol and chloroform (1 : 1), and use this solution as the standard solution D. Spot 10 μL each of the test solution and the standard solutions A, B, C and D on a thin-layer chromatographic plate made using silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of hexane and ethyl acetate (1 : 1) as the developing solvent to a distance of about 12 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots appearing in the test solution are a single spot, or

the total amount of spots is NMT 0.3% for afloqualone as compared to those obtained from the standard solutions A, B and C, even if other spots appear.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the contents of NLT 20 tablets of Azathioprine Tablets, and powder. Weigh accurately an amount equivalent to about 25 mg of afloqualone ($C_{16}H_{14}FN_3O$), and add methanol to make exactly 100 mL. Pipet 5 mL of this solution, add 5 mL of the internal standard solution, add methanol to make exactly 50 mL, and use this solution as the test solution. Separately, weigh accurately about 25 mg of afloqualone RS, and add methanol to make 100 mL. Pipet 5 mL of this solution, add 5 mL of the internal standard solution, add methanol to make exactly 50 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak area of each internal standard and afloqualone, and calculate the ratio of peak area, Q_T and Q_S, of afloqualone to the peak area of the internal standard in each solution.

$$\text{Amount (mg) of afloqualone } (C_{16}H_{14}FN_3O) = \text{Amount (mg) of afloqualone RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of anhydrous caffeine in methanol (1 in 4000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 3.9 mm in internal diameter and about 30 cm in length, packed with porous silica gel for liquid chromatography (10 μm in particle diameter).

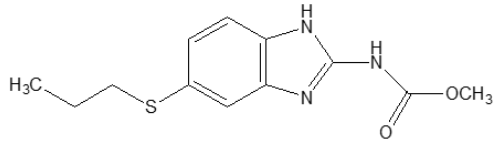
Column temperature: A constant temperature of about 40 °C.

Mobile phase: A mixture of methanol and water (45 : 55).

Flow rate: 1.0 mL/min

Packaging and storage Preserve in light-resistant, tight containers.

Albendazole
알벤다졸



$C_{12}H_{15}N_3O_2S$: 265.33

Methyl *N*-(6-propylsulfanyl-1*H*-benzimidazol-2-yl)carbamate [*54965-21-8*]

Albendazole, when dried, contains NLT 98.0% and NMT 102.0% of Albendazole.

Description Albendazole occurs as a white to pale yellow powder.

It is freely soluble in anhydrous formic acid, very slightly soluble in ether or methylene chloride and practically insoluble in water or in ethanol(95).

Identification (1) Perform the test as directed under the testing for related substances; the principal spots from the test solution and the standard solution show the same R_f value.

(2) Determine the infrared spectra of Albendazole and albendazole RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Purity ***Related substances***—Dissolve 50 mg of Albendazole in 3 mL of acetic acid(100), add acetic acid(100) to make 5 mL, and use this solution as the test solution. Separately, weigh accurately a suitable portion of albendazole RS, dissolve in the acetic acid(100) so that the solution contains 5 mg of albendazole per mL, and use this solution as the standard solution (1). Pipet 1.0 mL of the standard solution, dilute with acetic acid(100) to make exactly 100 mL, and use this solution as the standard solution (2). With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solutions (1) and (2) on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of chloroform, acetic acid(100) and ether (60 : 10 : 10) as the developing solvent to a distance of about 15 cm. and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); any spots other than the principal spot from the test solution are not larger and more intense than the principal spot from the standard solution (2). (NMT 0.5%)

Loss on drying NMT 0.5% (105 ℃, 4 hours).

Residue on ignition NMT 0.2% (1.0 g).

Assay Weigh accurately about 0.25 g of Albendazole, previously dried, and dissolve in 100 mL of acetic acid(100), and warm if necessary. After cooling, add 1 drop of solvent blue 19 in acetic acid(100) (1 in 200), and titrate with 0.1 mol/L perchloric acid VS. The endpoint of the titration is when the solution exhibits a purple color. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS

= 26.533 mg of $C_{12}H_{15}N_3O_2S$

Packaging and storage Preserve in well-closed containers.

Albumin Tannate
알부민탄닌산염

Tannarubin

Albumin Tannate is a compound of tannic acid and protein.

The label states the origin of the protein of Albumin Tannate.

Description Albumin Tannate occurs as a pale brown powder. It is odorless or has a faint, characteristic odor.
It is practically insoluble in water or ethanol(95).
It dissolves in sodium hydroxide TS with turbidity.

Identification (1) To 0.1 g of Albumin Tannate, add 10 mL of ethanol(95), and heat on a steam bath for 3 minutes while shaking. After cooling, filter and add 1 drop of iron(III) chloride TS to 5 mL of the filtrate; the solution exhibits a bluish purple to black blue color. And allow to stand; blackish blue precipitates are produced.

(2) To 0.1 g of Albumin Tannate, add 5 mL of nitric acid; an orange yellow color develops.

Purity (1) ***Acid***—To 1.0 g of Albumin Tannate, add 50 mL of water, shake for 5 minutes, and filter. To 25 mL of the filtrate, add 1.0 mL of 0.1 mol/L sodium hydroxide TS and 2 drops of phenolphthalein TS; a red color develops.

(2) ***Fats***—To 2.0 g of Albumin Tannate, add 20 mL of petroleum benzine, shake vigorously for 15 minutes, and filter. Evaporate 10 mL of the filtrate on a steam bath; the residue is NMT 50 mg.

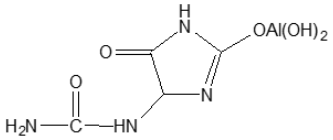
Loss on drying NMT 6.0% (1 g, 105 ℃, 3 hours).

Residue on ignition NMT 1.0% (0.5 g).

Digestive power To 1.00 g of Albumin Tannate, add 0.25 g of saccharated pepsin and 100 mL of water, shake well to mix, and allow to stand for 20 minutes at 40 ± 1 ºC on a steam bath. Add 1.0 mL of dilute hydrochloric acid, shake to mix, and allow to stand for 3 hours at 40 ± 1 ºC on a steam bath. Cool rapidly to ordinary temperature and filter. Wash the residue with 10 mL of water three times and dry in a desiccator (silica gel) for 18 hours and then dry at 105 ºC for 5 hours; the amount is 0.50 g to 0.58 g.

Packaging and storage Preserve in light-resistant, tight containers.

Aldioxa
알디옥사



Dihydroxialuminum Allantoinate $C_4H_7AlN_4O_5$: 218.10
Aluminium hydroxide 4-(carbamoylamino)-5-oxo-4,5-dihydro-1*H*-imidazol-2-olate (1:2:1) [*5579-81-7*]

Aldioxa is a condensation product of allantoin and aluminum hydroxide.

Aldioxa, when dried, contains NLT 65.3% and NMT 74.3% of allantoin ($C_4H_6N_4O_3$: 158.12) and NLT 11.1% and NMT 13.0% of aluminum (Al: 26.98).

Description Aldioxa occurs as a white powder. It is odorless and tasteless.
It is practically insoluble in water, ethanol(95) or ether.
It dissolves in dilute hydrochloric acid or dilute nitric acid.

Melting point—About 230 ℃ (with decomposition).

Identification (1) To 0.2 g of Aldioxa, add 10 mL of dilute hydrochloric acid, boil for 5 minutes, and add 10 mL of phenylhydrazinium hydrochloride (1 in 100). After cooling, add 0.5 mL of potassium hexacyanoferrate(III), mix well, add 1 mL of hydrochloric acid, and shake well to mix; the resulting solution exhibits a red color.

(2) To 0.2 g of Aldioxa, add 10 mL of dilute hydrochloric acid, dissolve by warming, and cool; the resulting solution responds to the Qualitative Analysis for aluminum salt.

Purity (1) ***Chloride***—To 0.01 g of Aldioxa, add 6 mL of dilute nitric acid, and dissolve by boiling for 5 minutes while shaking to mix. After cooling, add water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 0.40 mL of 0.01 mol/L hydrochloric acid (NMT 0.142%).

(2) ***Nitrate***—To 0.10 g of Aldioxa, carefully add 5 mL of water and 5 mL of sulfuric acid, and dissolve by shaking well to mix. After cooling, superimpose 2 mL of iron(II) sulfate TS; no brown band appears at the interface.

(3) ***Sulfate***—To 0.20 g of Aldioxa, add 6 mL of dilute hydrochloric acid, and dissolve by boiling for 5 minutes while shaking to mix. After cooling, add water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 1.0 mL of 0.005 mol/L sulfuric acid (NMT 0.240%).

(4) ***Heavy metals***—To 1.0 g of Aldioxa, add 3 mL of hydrochloric acid and 3 mL of water, heat gently to boiling while shaking to mix, and evaporate to dryness on a water bath. Add 30 mL of water to the residue, warm while shaking to mix, cool, and filter. To the filtrate, add

2 mL of dilute acetic acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution by evaporating to dryness 3 mL of hydrochloric acid and 3 mL of water, and adding 2.0 mL of lead standard solution, 2 mL of dilute acetic acid and water to make 50 mL (NMT 20 ppm).

(5) ***Arsenic***—Proceed with 1.0 g of Aldioxa according to Method 2 and perform the test (NMT 2 ppm).

Loss on drying NMT 4.0% (1 g, 105 ℃, 2 hours).

Assay (1) ***Allantoin*—**Weigh accurately 0.1 g of Aldioxa, previously dried, dissolve in 50 mL of dilute sulfuric acid by heating, cool, and add water to make exactly 100 mL. Pipet 10 mL of this solution, and perform the test according to the Nitrogen Determination.

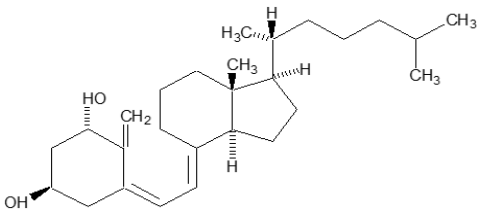
Each mL of 0.005 mol/L sulfuric acid VS
= 0.39529 mg of $C_4H_6N_4O_3$

(2) ***Aluminum*—**Weigh accurately 0.2 g of Aldioxa, previously dried, dissolve in 50 mL of dilute hydrochloric acid by heating gently, cool, and add dilute hydrochloric acid to make exactly 100 mL. Pipet 4 mL of this solution, add water to make exactly 25 mL, and use this solution as the test solution. Separately, pipet an appropriate amount of aluminum standard stock solution, dilute with water to make a solution containing 16.0 μg to 64.0 μg of aluminum (Al: 26.98), and use this solution as the standard solution. Determine the absorbances of the test solution and the standard solution as directed under the Atomic Absorption Spectroscopy according to the following conditions, and calculate the content of aluminum in the test solution using the calibration curve obtained from the absorbances of the standard solution.

Gas: Nitrous oxide–acetylene
Lamp: Aluminum hollow cathode lamp
Wavelength: 309.2 nm.

Packaging and storage Preserve in well-closed containers.

Alfacalcidol
알파칼시돌



$C_{27}H_{44}O_2$: 400.64

(1*R*,3*S*,5*Z*)-5-[(2*E*)-2-[(1*R*,3a*S*,7a*R*)-7a-Methyl-1-[(2*R*)-6-methylheptan-2-yl]-2,3,3a,5,6,7-hexa-hydro-1*H*-inden-4-ylidene]ethylidene]-4-methylidene-cyclohexane-1,3-diol [*41294-56-8*]

Alfacalcidol contains NLT 97.0% and NMT 102.0% of Alfacalcidol ($C_{27}H_{44}O_2$).

Description Alfacalcidol occurs as white crystals.
It is freely soluble in ethanol(95), soluble in fatty oils and practically insoluble in water.
It is easily affected by air, heat or light.
It reversibly isomerizes to pre-alfacalcidol in solution, and both compounds contribute to the isomerization activity.

Identification (1) Determine the infrared spectra of Alfacalcidol and alfacalcidol RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

Purity ***Related substances***—Calculate the amount of related substances other than pre-alfacalcidol eluted within twice the retention time of alfacalcidol with the peak areas obtained from the test solution by the percentage peak area method under the Assay; the amount of each related substance is NMT 0.5%, and the total area of these peaks is NMT 1.0%. However, exclude any peaks smaller than 0.1%.

Assay Perform the test as rapidly as possible while protected from light and air. Weigh accurately about 1.0 mg of Alfacalcidol, dissolve in the mobile phase to make exactly 10 mL, and use this solution as the test solution. Separately, weigh accurately 1.0 mg of alfacalcidol RS, dissolve in the mobile phase without heating to make exactly 10 mL, and use this solution as the standard solution (1). To 1.0 mL of the standard solution (1), add the mobile phase to make exactly 100 mL, and use this solution as the standard solution (2). Heat 2 ml of the standard solution (1) on a steam bath at 80 ºC with a reflux condenser for 2 hours, cool, and use this solution as the standard solution (3). Perform the test with 100 μL each of the test solution and the standard solutions (1) and (2) as directed under the Liquid Chromatography according to the following conditions and determine the peak area, A_T and A_S, of alfacalcidol.

Amount (mg) of alfacalcidol ($C_{27}H_{44}O_2$)
$= \text{Amount (mg) of alfacalcidol RS} \times \frac{A_T}{A_S}$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 265 nm).

Column: A stainless steel column about 4 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm

in particle diameter).

Mobile phase: A mixture of acetonitrile, water and 9 mol/L ammonia water (800 : 200 : 1).

Flow rate: 2.0 mL/min

System suitability

System performance: Perform the test with 100 μL of the standard solution (3) according to the above operating conditions; the relative retention time of prealfacalcidol to Alfacalcidol is about 1.3 with the resolution being NLT 4.0.

System repeatability: Perform the test six times with 100 μL of the standard solution (3) according to the above operating conditions; the relative standard deviation of the peak area of alfacalcidol is NMT 1.0%.

Packaging and storage Preserve in light-resistant, tight containers at 2 ºC to 8 ºC under nitrogen atmosphere. The contents of an opened container are to be used immediately.

Alfacalcidol capsules
알파칼시돌 캡슐

Alfacalcidol Capsules contain NLT 90.0% and NMT 130.0% of the labeled amount of alfacalcidol ($C_{27}H_{44}O_2$: 400.64).

Method of preparation Prepare as directed under Capsules, with Alfacalcidol.

Identification The retention time of the major peak obtained from the test solution and the standard solution under the Assay and the ultraviolet absorption spectrum between 200 and 400 nm are the same.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of the content of NLT 20 Alfacalcidol Capsules. Weigh accurately an amount equivalent to about 10 μg of alfacalcidol ($C_{27}H_{44}O_2$), transfer into a 10-mL volumetric flask, add ethanol to make exactly 10 mL and use this solution as the test solution. Separately, weigh accurately about 5.0 mg of alfacalcidol RS, and dissolve in ethanol to make 50 mL. Pipet 1.0 mL of this solution, transfer into a 100-mL volumetric flask, add ethanol to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 30 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas or heights, A_T and A_S, of each solution.

Amount (mg) alfacalcidol ($C_{27}H_{44}O_2$)
= Amount (mg) alfacalcidol RS
× A_T / A_S × 1 / 500 × 1000

Operating conditions

Detector: An ultraviolet absorption photometer (264 nm). However, use a photo-diode array detector (200 nm to 400 nm) when performing the Identification.

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 30 ℃.

Sample temperature: A constant temperature of about 5 ℃.

Mobile phase: A mixture of water, acetonitrile and ammonia water(28) (200 : 800 : 1).

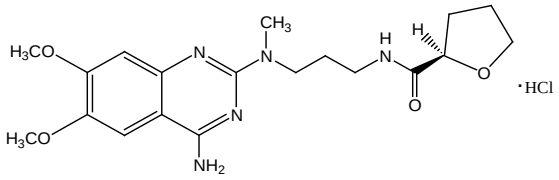
Flow rate: 1.0 mL/min

System suitability

System repeatability: Repeat the test 6 times with 30 μL of the standard solution according to the above conditions; the relative standard deviation of the peak areas of alfacalcidol is NMT 2.0%.

Packaging and storage Preserve in well-closed containers.

Alfuzosin Hydrochloride
알푸조신염산염



and enantiomer

$C_{19}H_{28}ClN_5O_4$: 425.91

N-{3-[(4-Amino-6,7-dimethoxy-quinazolin-2-yl)methylamino]propyl}tetrahydrofuran-2-carboxamide hydrochloride [*81403-68-1*]

Alfuzosin Hydrochloride contains NLT 98.5% and NMT 101.0% of Alfuzosin Hydrochloride ($C_{19}H_{28}ClN_5O_4$), calculated on the anhydrous basis.

Description Alfuzosin Hydrochloride occurs as a white crystalline powder.
It is freely soluble in water, sparingly solution in ethanol(95) and practically insoluble in dichloromethane.
It is hygroscopic.

Identification (1) Determine the infrared spectra of Alfuzosin Hydrochloride and alfuzosin hydrochloride RS as directed in potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) Dissolve 0.5 g of Alfuzosin Hydrochloride in 25

mL of water, take 1 mL of the solution, and put 1 mL of water; the resulting solution responds to the Qualitative Analysis (2) for chlorides.

Optical rotation $[\alpha]_D^{20}$: Between -0.10° and + 0.10° (0.2 g calculated on the anhydrous basis, water, 10 mL, 100 mm).

pH Dissolve 0.5 g of Alfuzosin Hydrochloride in water free from carbon dioxide; the pH of the solution ranges between 4.0 and 5.5.

Purity ***Related substances***—Weigh accurately 20.0 mg of Alfuzosin Hydrochloride, dissolve in the mobile phase to make exactly 100 mL, and use this solution as the test solution. Pipet 1.0 mL of the test solution and add the mobile phase to make exactly 50 mL. Pipet 5.0 mL of this solution, add the mobile phase to make exactly 20 mL, and use this solution as the standard solution (1). Separately, weigh accurately 5 mg of alfuzosin related substance I {*N*-[3-[(4-Amino-6,7-dimethoxyquinolin-2-yl)(methyl)amino] propyl]furan-2-carboxamide} RS, and dissolve in the mobile phase to make 25 mL. Pipet 1 mL of this solution, add 1 mL of the test solution, and then add the mobile phase to make exactly 100 mL. Use this solution as the standard solution (2). Perform the test with exactly 20 μL each of the test and the standard solution (2) as directed under the Liquid Chromatography according to the following conditions and determine each peak area by the automatic integration method; the peak area other than the major peak from the test solution is not greater than 0.6 times the area of the major peak from the standard solution (1) (0.3%); the total area of all peaks other than the major peak is not greater than the area of the major peak from the standard solution (1) (0.5%). Disregard any peak with an area less than 0.025 times the area of the major peak from the standard solution (1).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of sodium perchlorate, acetonitrile and tetrahydrofuran (80 : 20 : 1).

Flow rate: 1.5 mL/min

System suitability

System performance: Perform the test with 20 μL of the standard solution (2) according to the above conditions, and adjust the sensitivity so that the height of the two peaks is NLT 50% of the full scale; the resolution between alfuzosin and alfuzosin related substance I is NLT 3.0.

Sodium perchlorate solution—Mix 5 mL of perchloric acid and 900 mL of water, add 8.5 w/v% sodium hydroxide solution to adjust pH to 3.5, and add water to make 1000 mL.

Water NMT 0.5**%** (0.5 g, volumetric titration, direct titration).

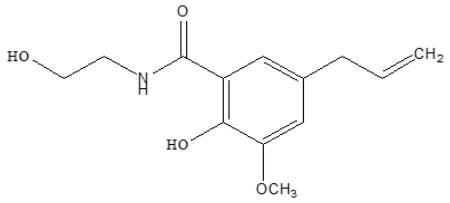
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.3 g of Alfuzosin Hydrochloride, dissolve in the mixture of 40 mL of acetic acid(100) and 40 mL of acetic anhydride, and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

0.1 mL of 1 mol/L perchloric acid VS
= 42.59 mg of $C_{19}H_{28}ClN_5O_4$

Packaging and storage Preserve in light-resistant, tight containers.

Alibendol
알리벤돌



$C_{13}H_{17}NO_4$: 251.28

2-Hydroxy-*N*-(2-hydroxyethyl)-3-methoxy-5-(2-propenyl)benzamide; 5-Allyl-2-hydroxy-*N*-(2-hydroxyethyl)-*m*-anisamide, [*26750-81-2*]

Alibendol, when dried, contains NLT 98.0% and NMT 101.0% of alibendol ($C_{13}H_{17}NO_4$: 251.28).

Description Alibendol occurs as a white powder.
It is freely soluble in chloroform, alcohol, acetone and sparingly soluble in water.

Melting point—Between 98.5 and 101.5 °C.

Identification (1) Weigh 5 mg of Alibendol, dissolve in 5 mL of ethanol, and add 0.1 mL of 10% ferric chloride solution; the color of the solution turns blue.

(2) Weigh 20 mg of Alibendol, dissolve in 20 mL of ethanol, add 2 mL of a solution of 20% *ρ*-tosylate in ethanol, and allow it to stand on a steam bath at 60 °C for 10 minutes; the resulting solution exhibits a blue fluorescence.

(3) Weigh 0.1 g of Alibendol, dissolve in ethanol to make 10 mL, and use this solution as the test solution. Weigh 0.1 g of alibendol RS, dissolve in ethanol to make 10 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot the test solution

and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography (with a fluorescent indicator). Develop the plate with a mixture of toluene, acetone and acetic acid(100) (9 : 1 : 1) as the developing solvent, and air-dry the plate. Examine the plate under iodine vapor and ultraviolet light (main wavelength: 254 nm); the spot of the test solution exhibits an Rf value and color corresponding to that of the standard solution.

(4) Determine the infrared spectra of Alibendol and alibendol RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Absorbance $E_{1cm}^{1\%}$(315 nm): Between 150 and 158 (10 mg, anhydrous ethanol, 2000 mL).

Purity (1) ***Clarity and color of solution***—Take 1 g of Alibendol, and dissolve in 10 mL of ethanol and 10 mL of acetone; the solution is colorless to pale yellow and clear.

(2) ***Ethanolamine***—Transfer 0.1 g of Alibendol to a test tube, add 0.1 mL of ethanol, 2 mL of nitromethane and 2 mL of a solution of 0.05% *ρ*-dimethylaminocinnamaldehyde in nitromethane, allow it to stand in a boiling water bath for 25 minutes, cool, and add nitromethane to make 10 mL. Allow it to stand overnight, and use this solution as the test solution. Separately, take 0.1 mL of a solution of 0.1% ethanolamine in ethanol, proceed in the same manner as in the preparation of the test solution, and use this solution as the control solution. Compare the color of the test solution and the control solution; the color of the test solution is not more intense than the color of the control solution (NMT 0.1%).

(3) ***Related substances***—Weigh 0.1 g of Alibendol, dissolve in ethanol to make 10 mL, and use this solution as the test solution. Weigh 0.1 g of alibendol RS, dissolve in ethanol to make 10 mL, take 1.0 mL of this solution, and add ethanol to make 100 mL. Use this solution as the standard solution. Perform the test as directed under the Thin Layer Chromatography in the Identification; the spots other than the principal spot obtained from the test solution are not more intense than the spots from the standard solution (NMT 1.0%).

(4) ***Heavy metals***—Proceed with 1.0 g of Alibendol according to Method 3 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(5) ***Nitrogen***—Weigh accurately about 0.5 g of Alibendol, and perform the test according to Nitrogen Determination (between 5.4% and 5.7%).

Loss on drying NMT 1.0% (0.5 g, in vacuum, 60 ℃, 3 hours).

Residue on ignition NMT 0.2% (1 g).

Assay Weigh accurately about 0.15 g of Alibendol, dissolve in 100 mL of methanol, and titrate potentiometrically with a solution of 0.1 mol/L potassium hydroxide in methanol. Perform a blank test in the same manner and make any necessary correction.

Each mL of a solution of 0.1 mol/L potassium hydroxide in methanol
= 25.130 mg of $C_{13}H_{17}NO_4$

Packaging and storage Preserve in well-closed containers.

Alibendol Tablets
알리벤돌 정

Alibendol Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of alibendol ($C_{13}H_{17}NO_4$: 251.28).

Method of preparation Prepare as directed under Tablets, with Alibendol.

Identification (1) Take 1 tablet of Alibendol Tablets, dissolve in 10 mL of ethanol(95), and filter. To 2 mL of this filtrate, add 0.1 mL of 10% iron(III) chloride solution; the color of the solution turns blue. Separately, add 2 mL of 20% *ρ*-tosylic acid-ethanol solution to 2 mL of the above filtrate, and allow it to stand on a steam bath at 60 °C for 10 minutes; the resulting solution exhibits a blue fluorescence.

(2) Weigh an amount of Alibendol Tablets, equivalent to 0.1 g of alibendol, according to the labeled amount, add ethanol(95), dissolve to make 10 mL, and filter. Use the filtrate as the test solution. Weigh 0.1 g of alibendol RS, dissolve in ethanol(95), and make 10 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 20 μL each of the test solution and the standard solution on a thin-layer chromatographic plate made using silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, acetic acid(100) and acetone (9 : 4 : 1) as the developing solvent, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the colors and the Rf values obtained from the test solution and the standard solution are the same.

Dissolution Perform the test with 1 tablet of Alibendol Tablets at 100 revolutions per minute according to Method 2 under the Dissolution, using 900 mL of water as the dissolution medium. Take and filter the dissolved solution 45 minutes after starting the test, and use this solution as the test solution. Separately, weigh accurately about 11 mg of alibendol RS, add water to make exactly 100 mL, and use this solution as the standard solution. Pipet 10 μL each of the test solution and the standard

solution, perform the test as directed under the Liquid Chromatography, and determine the peak areas of alibendol, A_T and A_S, of each solution. Meets the requirements if the amount dissolved of Alibendol Tablets in 45 minutes is NLT 80%.

Amount dissolved (%) of the labeled amount of alibendol ($C_{13}H_{17}NO_4$)

$$= W_S \times (A_T / A_S) \times (1 / C) \times 900$$

*W*s: Amount (mg) of alibendol RS

C: Labeled amount (mg) of alibendol ($C_{13}H_{17}NO_4$) per tablet

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 316 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 30 °C.

Mobile phase: A mixture of 0.05 mol/L acetate buffer solution (pH 4.0) and methanol (1 : 1).

Flow rate: 1 mL/min

System suitability

System repeatability: Repeat the test 6 times with 10 μL of the standard solution according to the above conditions; the relative standard deviation of the peak areas of alibendol is NMT 1.0%.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the contents of NLT 20 tablets of Alibendol Tablets, and powder. Weigh accurately an amount equivalent to about 100 mg of alibendol ($C_{13}H_{17}NO_4$), add the mobile phase, sonicate for 15 minutes, and add the mobile phase to make exactly 100 mL. Filter this solution, take accurately 2 mL of the filtrate, add the mobile phase to make exactly 50 mL, and use this solution as the test solution. Separately, weigh accurately about 40 mg of alibendol RS, and dissolve in the mobile phase to make exactly 100 mL. Pipet 10 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Pipet 10 μL each of the test solution and the standard solution, perform the test as directed under the Liquid Chromatography, and determine the peak areas, A_T and A_S, of the test solution and the standard solution.

Amount (mg) of alibendol ($C_{13}H_{17}NO_4$)

$$= \text{Amount (mg) of alibendol RS} \times (A_T / A_S)$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 316 nm).

Column: A stainless steel column 4.6 mm in internal diameter and 150 mm in length with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 30 °C.

Mobile phase: A mixture of 0.05 mol/L sodium acetate buffer solution (pH 4.0) and methanol (1 : 1).

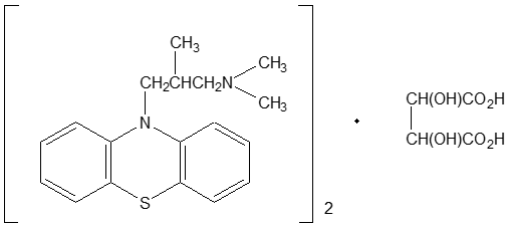
Flow rate: 1 mL/min

System suitability

System repeatability: Perform the test 6 times according to the above conditions with 10 μL of the test solution; the relative standard deviation of the peak areas of alibendol is NMT 1.0%.

Packaging and storage Preserve in well-closed containers.

Alimemazine Tartrate
알리메마진타르타르산염



Alimemazine Tartrate $(C_{18}H_{22}N_2S)_2 \cdot C_4H_6O_6$: 746.98

bis-(N,N,2-Trimethyl-3-phenothiazin-10-yl)propan-1-amine (2R,3R)-2,3-dihydroxybutanedioate [*4330-99-8*]

Alimemazine Tartrate, when dried, contains NLT 98.0% and NMT 101.0% of alimemazine tartrate [$(C_{18}H_{22}N_2S)_2 \cdot C_4H_6O_6$].

Description Alimemazine Tartrate occurs as a white powder. It is odorless and has a bitter taste.
It is freely soluble in water or acetic acid(100), sparingly soluble in ethanol(95), and practically insoluble in ether.
Dissolve 1.0 g of Alimemazine Tartrate in 50 mL of water; the pH of this solution is between 5.0 and 6.5.
It is gradually colored by light.

Identification (1) To 2 mL of an aqueous solution of Alimemazine Tartrate (1 in 100), add 1 drop of iron(III) chloride TS; the resulting solution exhibits a reddish brown color, and immediately a yellow precipitate forms.

(2) Dissolve 1 g of Alimemazine Tartrate in 5 mL of water, add 3 mL of sodium hydroxide TS, and extract with two 10-mL portions of ether. [Use the water layer for the Identification (4)]. Combine the ether extracts, add 3 g of anhydrous sodium sulfate, shake to mix, and filter. Evaporate the ether by passing air through the filtrate, and dry the residue in vacuum in a desiccator (phosphorus pentoxide) for 16 hours; the melting point is between 66 and 70 °C.

(3) Determine the absorption spectra of solutions of

Alimemazine Tartrate and alimemazine tartrate RS (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(4) Neutralize the water layer obtained from (2) with dilute acetic acid; this solution responds to the Qualitative Analysis (1) and (2) for tartrate.

Melting point Between 159 and 163 ℃.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Alimemazine Tartrate in 20 mL of water; the resulting solution is colorless and clear.

(2) ***Heavy metals*—**Proceed with 1.0 g of Alimemazine Tartrate according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Arsenic***—Proceed with 1.0 g of Alimemazine Tartrate according to Method 3 and perform the test. Use a solution of magnesium nitrate in ethanol(95) (1 in 5) (NMT 2 ppm).

Loss on drying NMT 0.5% (1 g, 105 ℃, 3 hours).

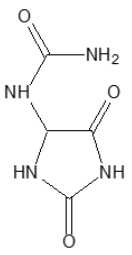
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.8 g of Alimemazine Tartrate, previously dried, dissolve in 50 mL of acetic acid(100), and titrate with 0.1 mol/L perchloric acid VS (indicator: 2 mL of 1-naphtholbenzein TS). However, the endpoint of the titration is when this solution changes from red through brown to greenish brown. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 37.349 mg of $(C_{18}H_{22}N_2S)_2 \cdot C_4H_6O_6$

Packaging and storage Preserve in light-resistant, tight containers.

Allantoin
알란토인



$C_4H_6N_4O_3$: 158.12

(2,5-Dioxoimidazolidin-4-yl)urea [*97-59-6*]

Allantoin, when dried, contains NLT 98.5% and NMT 101.0% of allantoin ($C_4H_6N_4O_3$).

Description Allantoin occurs as a white or almost white, crystalline powder.

It is slightly soluble in water and very slightly soluble in ethanol(95).

It dissolves in sodium hydroxide TS.

Melting point—About 225 ℃ (with decomposition).

Identification (1) Dissolve about 20 mg of Allantoin in a mixture of 1 mL of 2 mol/L sodium hydroxide TS and 1 mL of water, heat to boiling, cool, add 1 mL of 2 mol/L hydrochloric acid, and mix. To 0.1 mL of this solution, add 0.1 mL of potassium bromide (1 in 10), 0.1 mL of resorcinol solution (1 in 50), 3 mL of sulfuric acid, and heat on a steam bath for 5 to 10 minutes; the resulting solution exhibits a dark blue color. After cooling, add 10 mL of water; the color turns red.

(2) Determine the infrared spectra of Allantoin and allantoin RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) The R_f values of the principal spots obtained from the test solution (2) and from the standard solution (1) are the same.

Optical rotation $[\alpha]_D^{20}$: Between -0.10° and +0.10° (0.2 g, water, 20 mL, 100 mm).

Purity (1) ***Acidity or alkalinity***—Dissolve 50 mg of Allantoin in 10 mL of water, add 0.1 mL of methyl red TS and 0.2 mL of 0.01 mol/L sodium hydroxide TS; the resulting solution exhibits a yellow color. To this solution, add 0.4 mL of 0.01 mol/L hydrochloric acid TS; the color turns red.

(2) ***Potassium permanganate reducing substances***—To 1.0 g of Allantoin, add 10 mL of water, shake to mix for 2 minutes, and filter. To the filtrate, add 1.5 mL of potassium permanganate TS; the resulting solution exhibits a violet color for NLT 10 minutes.

(3) ***Related substances***—Weigh accurately 0.10 g of Allantoin, and dissolve in 5 mL of water by heating, cool, add methanol to make exactly 10 mL, and use this solution as the test solution (1). To 1 mL of the test solution (1), add a mixture of methanol and water (1 : 1) to make exactly 10 mL, and use this solution as the test solution (2). Separately, weigh accurately 10 mg of allantoin RS, dissolve in a mixture of methanol and water (1 : 1) to make exactly 10 mL, and use this solution as the standard solution (1). Weigh accurately 10 mg of urea RS, and dissolve in water to make exactly 10 mL. To 1 mL of this solution, add methanol to make exactly 10 mL, and use this solution as the standard solution (2). Mix 1mL of the standard solution (1) and 1mL of the standard solution (2), and use this solution as the standard solution (3). With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 1 μL of the test solution (1), 5 μL each of the test solution (2), the standard solution (1), the standard solution (2), and the stand-

ard solution (3) on the thin-layer chromatographic plate made of cellulose for thin-layer chromatography. Next, develop the plate with a mixture of 1-butanol, water and acetic acid(100) (60 : 25 : 15) as the developing solvent to a distance of about 10 cm, spray evenly a solution prepared by dissolving 0.1 g of 4-dimethylaminobenzaldehyde in 20 mL of a mixture of methanol and hydrochloric acid (3 : 1), dry the plate with hot air, and observe the plate after 30 minutes; the spots other than the principal spot obtained from the test solution (1) are not more intense than the spots from the standard solution (2) (0.5%). However, this test is valid when the principal spots obtained from the standard solution (3) clearly separate.

Loss on drying NMT 0.1% (2 g, 105 ℃, constant mass).

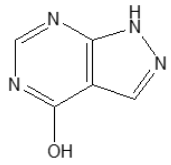
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately 1.2 g of Allantoin, previously dried, dissolve in 40 mL of water, and titrate with 0.1 mol/L sodium hydroxide VS (potentiometric titration under the Titrimetry). Separately, perform a blank test and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS
= 15.812 mg of $C_4H_6N_4O_3$

Packaging and storage Preserve in well-closed containers.

Allopurinol
알로푸리놀



$C_5H_4N_4O$: 136.11
1,2-Dihydro-4H-pyrazolo[3,4-d]pyrimidin-4-one [*315-30-0*]

Allopurinol, when dried, contains NLT 98.0% and NMT 101.0% of allopurinol ($C_5H_4N_4O$).

Description Allopurinol occurs as white to pale yellowish white crystals or a crystalline powder.
It is slightly soluble in *N*,*N*-dimethylformamide and very slightly soluble in water and ethanol(99.5).
It dissolves in ammonia TS.

Identification (1) Determine the absorption spectra of solutions of Allopurinol and allopurinol RS (1 in 200000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Allopurinol and allopurinol RS, previously dried, as directed in the potassium bromide disk method under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Purity (1) ***Clarity and color of solution***—Dissolve 0.5 g of Allopurinol in 10 mL of sodium hydroxide TS; the solution is clear, and the color of the solution is not more intense than that of the Matching Fluid for Color D.

(2) ***Sulfate***—Dissolve 2.0 g of Allopurinol in 100 mL of water, boil for 5 minutes, cool, add water to make 100 mL, and filter. To 25 mL of the filtrate, add 1 mL of dilute hydrochloric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 0.40 mL of 0.005 mol/L sulfuric acid (NMT 0.038%).

(3) ***Heavy metals***—Proceed with 1.0 g of Allopurinol according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(4) ***Arsenic***—Procced with 1.0 g of Allopurinol according to Method 3 and perform the test (NMT 2 ppm).

(5) ***Hydrazine***—Weigh accurately about 0.25 g of Allopurinol, dissolve in 5.0 mL of a mixture of sodium hydroxide TS and methanol (1 : 1), add 4 mL of benzaldehyde TS, and allow to stand at room temperature for 2.5 hours. Add 5.0 mL of hexane, shake to mix for 1 minute, allow the layers to separate, take the hexane layer, and use this solution as the test solution. Separately, pipet 5.0 mL each of hydrazine TS and a mixture of 2 mol/L sodium hydroxide TS and methanol (1 : 1), proceed in the same manner as in the preparation of the test solution, and use these solutions as the test solution and the blank test solution. Perform the test with 20 μL each of the test solution, the standard solution and the blank test solution as directed under the Liquid Chromatography according to the following conditions; the amount of hydrazine is NMT 10 ppm.

$$\text{Amount (ppm) of hydrazine} = 1000 \times \frac{32.05}{130.12} \times \frac{C_S}{C_T} \times \frac{A_T}{A_S}$$

32.05: Molecular weight of hydrazine
130.12: Molecular weight of hydrazinium sulfate
C_S: Concentration (μg/mL) of hydrazinium sulfate in hydrazine TS
C_T: Concentration (mg/mL) of allopurinol in the test solution
A_T: Peak area of benzalazine obtained from the test solution
A_S: Peak area of benzalazine obtained from the standard solution

Operating conditions
Detector: An ultraviolet absorption photometer (wavelength: 310 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 25 m in length, packed with nitrated silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 30 °C.

Mobile phase: A mixture of hexane and 2-propanol (95 : 5).

Flow rate: 1.5 mL/min

System suitability

System performance: Proceed with 20 μL of the standard solution under the above operating conditions; the relative retention time of benzalazine to benzaldehyde is 0.8 with the resolution between these peaks being NLT 2.0.

System repeatability: Repeat the test 6 times with 20 μL each of the standard solution; the relative standard deviation of the peak area of benzalazine is NMT 15.0%.

(6) ***Related substances***—Dissolve 50 mg of Allopurinol in 10 mL of ammonia TS, and use this solution as the test solution. Pipet 1 mL of this solution, add ammonia TS to make exactly 200 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with ammonia TS-saturated 1-butanol as the developing solvent to a distance of about 10 cm, and air-dry the plate. Observe the plate under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 0.5% (1 g, 105 ℃, 4 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.16 g of Allopurinol, previously dried, and dissolve in 70 mL of *N*,*N*-dimethylformamide by warming. After cooling, titrate with 0.1 mol/L tetramethylammonium hydroxide VS (potentiometric titration under the Titrimetry). Separately, add 12 mL of water to 70 mL of dimethylformamide, and perform a blank test with this solution in the same manner and make any necessary correction.

Each mL of 0.1 mol/L tetramethylammonium hydroxide VS
= 13.611 mg of $C_5H_4N_4O$

Packaging and storage Preserve in tight containers.

Allopurinol Tablets
알로푸리놀 정

Allpurinol Tablets contain NLT 93.0% and NMT 107.0% of the labeled amount of allopurinol ($C_5H_4N_4O$: 136.11).

Method of preparation Prepare Allopurinol Tablets as directed under Tablets, with Allopurinol.

Identification The retention times of the major peaks and the ultraviolet absorption spectra between 190 nm and 300 nm obtained from the test solution and the standard solution in the Assay are the same.

Dissolution Perform the test with 1 tablet of Ciprofloxacin Hydrochloride Tablets at 75 revolutions per minute according to Method 2 under the Dissolution, using 900 mL of 0.1 mol/L hydrochloric acid as the dissolution medium. Take the dissolved solution 45 minutes after starting the dissolution test, filter, and add the dissolution medium. After diluting, use this solution as the test solution. Separately, weigh accurately an appropriate amount of allopurinol RS, dissolve in the dissolution medium to make the same concentration with the test solution, and use this solution as the standard solution. Perform the test with the test solution and the standard solution as directed under the Ultraviolet-visible Spectroscopy and determine the absorbances at the absorbance maximum wavelength at about 250 nm.
Meets the requirements if the dissolution rate of Allopurinol Tablets in 45 minutes is NLT 75%.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 tablets of Allopurinol Tablets, and powder. Weigh accurately a portion of the powder, equivalent to about 50 mg of allopurinol ($C_5H_4N_4O$), add exactly 10 mL of 0.1 mol/L sodium hydroxide VS, shake for 10 minutes and add water to make exactly 50 mL (perform the following assay as soon as possible). After centrifugation, discard 10 mL of the first filtrate, collect exactly 4 mL of the subsequent filtrate, add exactly 2.0 mL of the internal standard solution and the mobile phase to make exactly 200 mL and use this solution as the test solution. Separately, weigh accurately about 50 mg of Allopurinol RS, previously dried at 105 ℃ in vacuum for 5 hours, dissolve in 10 mL of 0.1 mol/L sodium hydroxide VS, mix in shaker for 10 minutes and add water to make exactly 50 mL. To exactly 4 mL of this solution, add exactly 2 mL of the internal standard solution and the mobile phase to make 200 mL and use this solution as the standard solution (prepare freshly when used). Perform the test with 15 μL each of the test solution and the standard solution as directed under Liquid Chromatography according to the following conditions and calculate the ratios, Q_T and Q_S, of the peak area of Allopurinol to that of the internal standard for the

test solution and the standard solution, respectively.

$$\text{Amount (mg) of allopurinol } (C_5H_4N_4O) = \text{Amount (mg) of allopurinol RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of 50 mg of hypoxantin and 10 mL of 0.1 mol/L sodium hydroxide VS, mix in shaker, add water to make exactly 50 mL. Prepare this solution before use.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm). However, use a photo-diode array detector (190 to 300 nm) when the Identification is performed.

Column: A stainless steel column about 4 mm in internal diameter and about 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm to 10 μm in particle diameter).

Mobile phase: 0.05 mol/L ammonium dihydrogen phosphate solution.

Flow rate: 1.5 mL/min

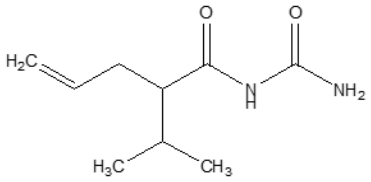
System suitability

System performance: Proceed with 15 μL of the standard solution according to the above conditions; hypoxanthine and allopurinol are eluted in this order with the resolution being NLT 5.

System repeatability: Repeat the test 6 times with 15 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area ratio is NMT 3.0%.

Packaging and storage Preserve in well-closed containers.

Allylisopropylacetylurea
알릴이소프로필아세틸우레아



$C_9H_{16}N_2O_2$: 184.24

N-(Aminocarbonyl)-2-(1-methylethyl)-4-pentenamide; (2-Isopropyl-4-pentenoyl) urea, [*528-92-7*]

Allylisopropylacetylurea, when dried, contains NLT 98.0% and NMT 101.0% of allylisopropylacetylurea ($C_9H_{16}N_2O_2$: 184.24).

Description Allylisopropylacetylurea occurs as white crystals or a crystalline powder. It is tasteless and odorless. It is freely soluble in acetic acid(100), sparingly soluble in methanol, ethanol(95) and chloroform, slightly soluble in ether and boiling water, and very slightly soluble in water.

Melting point—Between 192 and 196 °C.

Identification (1) Transfer 0.3 g of Allylisopropylacetylurea into an evaporating dish, add 1.0 g of anhydrous sodium carbonate, mix, and gently warm; the resulting vapor turns moistened red litmus paper to blue. Cover the evaporating dish with a beaker containing water, and continuously heat; a white sublimate forms at the bottom of the beaker, and the melting point of the sublimate is between 106 and 110 ℃.

(2) To 10 mL of a solution of Allylisopropylacetylurea in ethanol (1 in 100), add 0.5 mL of bromine TS; the yellowish brown color of bromine TS disappears.

(3) To 10 mL of a solution of Allylisopropylacetylurea in ethanol (1 in 100), add 0.1 mL of potassium permanganate TS; the resulting solution exhibits a yellow color.

Purity (1) ***Acid***—Add 1.5 g of Allylisopropylacetylurea to 75 mL of water, boil for 1 minute, cool, and filter. To 10 mL of the filtrate, add 5 drops of bromothymol blue TS; the resulting solution exhibits a yellow to green color and turns blue on adding 0.2 mL of 0.01 mol/L sodium hydroxide TS.

(2) ***Chloride***—Perform the test with 20 mL of the filtrate in (1) as the test solution. Prepare the control solution with 0.4 mL of 0.01 mol/L hydrochloric acid (NMT 0.036%).

(3) ***Sulfate***—Perform the test with 20 mL of the filtrate in (1) as the test solution. Prepare the control solution with 0.4 mL of 0.005 mol/L sulfuric acid (NMT 0.048%).

(4) ***Heavy metals***—Proceed with 2.0 g of Allylisopropylacetylurea according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(5) ***Readily carbonizable substances***—Weigh 0.5 g of Allylisopropylacetylurea, and perform the test; the color of the solution is not more intense than that of the Matching Fluid C.

(6) ***Arsenic***—Proceed with 1.0 g of Allylisopropylacetylurea according to Method 3 under the Arsenic and perform the test (NMT 2 ppm).

Loss on drying NMT 0.5% (0.5 g, in vacuum, phosphorus pentoxide, 4 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.2 g of Allylisopropylacetylurea, previously dried, transfer into a stoppered Erlenmeyer flask, dissolve by adding 30 mL of acetic acid(100), and add 20 mL of potassium bromide (3 in 20) and 10 mL of hydrochloric acid. Again, add exactly 25 mL of 1/60 mol/L potassium bromate while shaking vig-

orously to mix, immediately stopper the flask, and shake vigorously to mix. Add 10 mL of potassium iodide TS and 50 mL of water, and titrate with 0.1 mol/L sodium thiosulfate VS (indicator: 1 mL of starch TS). Perform a blank test in the same manner and make any necessary correction.

Each mL of 1/60 mol/L potassium bromate VS
= 9.212 mg of $C_9H_{16}N_2O_2$

Packaging and storage Preserve in tight containers.

Almagate
알마게이트

$Al_2Mg_6C_2H_{14}O_{20}\cdot 4H_2O$: 630.00
Aluminum trimagnesium carbonate heptahydroxide dihydrate [*66827-12-1*]

Almagate contains NLT 15.0% and NMT 17.0% of aluminum oxide (Al_2O_3: 101.96), NLT 36.0% and NMT 40.0% of magnesium oxide (MgO: 40.30), and NLT 12.5% and NMT 14.5% of carbon dioxide (CO_2 :44.01).

Description Almagate occurs as a white fine crystalline powder.
It is practically insoluble in water, ethanol(95) or dichloromethane.
It dissolves in dilute mineral acid, foaming with heat.

Identification (1) Determine the infrared spectra of Almagate and almagate RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) Dissolve 0.15 g of Almagate in dilute hydrochloric acid to make 20 mL. To 2 mL of this solution, add about 0.5 mL of dilute hydrochloric acid and about 0.5 mL of thioacetamide TS; no precipitate forms. To this solution, drop 2 mol/L sodium hydroxide TS; a white gelatinous precipitate is produced, and the precipitate dissolves on more addition of 2 mol/L sodium hydroxide TS. Gradually add ammonium chloride TS; a gelatinous precipitate reappears.

(3) Dissolve 0.15 g of Almagate in dilute hydrochloric acid to make 20 mL. To 2 mL of this solution, add 1 mL of ammonia TS; a white participate forms, and the precipitate dissolves on adding 1 mL of ammonium chloride TS. Add 1 mL of disodium hydrogen phosphate dodecahydrate solution (9 in 100); a white crystalline precipitate forms.

pH Disperse 4.0 g of Almagate in 100 mL of water without carbon dioxide, mix for 2 minutes, and filter; the pH of the filtrate is between 8.4 and 10.4.

Purity (1) ***Chloride***—Dissolve 0.33 g of Almagate in 5 mL of dilute nitric acid, add water to make 100 mL, and use this solution as the test solution. Prepare the control solution with 10 mL of chloride standard solution, 0.7 mL of dilute nitric acid and 5 mL of water. To 15 mL each of the test solution and the standard solution, add 1 mL of dilute nitric acid TS and 1 mL of silver nitrate TS, allow these solutions to stand for 5 minutes without exposure to daylight, and compare the turbidity of both solutions by observing them in Nessler tubes against a black background; the turbidity of the test solution is not more intense than that of the control solution (NMT 0.1%).

Chloride standard solution—Weigh accurately 0.824 g of sodium chloride, add water to make exactly 1000 mL, and to 1 mL of this solution, add water to make exactly 100-mL before use.

(2) ***Sulfate***—Dissolve 0.25 g of Almagate in 5 mL of dilute hydrochloric acid, add water to make 100 mL, and use this solution as the test solution. Prepare the control solution with 15 mL of sulfate standard solution and 0.8 mL of dilute hydrochloric acid. To 3 mL of barium chloride TS, add 4.5 mL of sulfate standard solution, mix, and allow it to stand for 1 minute. Add 2.5 mL of this solution to 15 mL each of the test solution and the control solution, and add 0.5 mL of acetic acid(31). Allow these solutions to stand for 5 minutes, and compare the turbidity; the turbidity produced in the test solution is not more intense than that produced in the control solution.

Sulfate standard solution—Dissolve 0.181 g of potassium sulfate in water to make exactly 100 mL. Pipet 1 mL of this solution and add water to make exactly 100 mL. Proceed this solution before use.

(3) ***Sodium***—Dissolve 0.25 g of Almagate in 50 mL of 3 mol/L hydrochloric acid TS, and use this solution as the test solution. Separately, weigh accurately 3.050 g of sodium chloride (standard reagent), previously dried at 130 ℃ for 2 hours, dissolve in water to make exactly 1000 mL, and prepare a solution containing 1.20 mg of sodium per mL, and use this solution as the standard solution. If necessary, dilute with 3 mol/L hydrochloric acid TS. With the test and standard solutions, perform the test as directed under the Atomic Absorption Spectroscopy according to the following conditions, and determine the potassium content in the test solution using the calibration curve obtained from the standard solution (NMT 1000 ppm).

Gas: Air–acetylene
Lamp: Potassium hollow cathode lamp
Wavelength: 589.0 nm

(4) ***Heavy metals***—Weigh 1.0 g of Almagate, and add dilute hydrochloric acid to make 20 mL. Take 12 mL of this solution, and use this solution as the test solution. Separately, to 10 mL of diluted lead standard solution, add 2mL of the test solution, and use this solution as the

control solution. Also, to 10 mL of water, add 2 mL of the test solution, and use this solution as the blank test solution. To 12 mL each of the test solution, the control solution and the blank test solution, add 2 mL of acetate buffer solution, pH 3.5, mix, add 1.2 mL of thioacetamide TS, and mix immediately. Allow this solution to stand for 2 minutes; the brown color produced from the test solution is not more intense than the brown color from the control solution (NMT 10 ppm).

Diluted lead standard solution—Before use, take exactly 5mL of the lead standard solution, and add water to make exactly 50 mL.

System suitability—The control solution exhibits a faint brown color compared to the blank test solution.

Loss on ignition Between 43.0% and 49.0% (1 g, 900 ± 50 ℃).

Microbiological examination of non-sterile products The total aerobic microbial count is NMT 1000 CFU, and the total combined yeasts/molds count is NMT 100 CFU per g of Almagate. Also, *Escherichia coli* and *Pseudomonas aeruginosa* are not detected.

Acid-neutralizing capacity Weigh accurately 0.5 g of Almagate, disperse in 100 mL of water, warm at 37 ± 2 ℃, add 100 mL of 0.1 mol/L hydrochloric acid, previously warmed at 37 ± 2 ℃, and continuously stir. This solution maintains pH between 3.0 and 4.5 for 5 to 20 minutes. Add 10 mL of 0.5 mol/L hydrochloric acid, previously warmed at 37 ± 2 ℃, and stir for 1 hour on a steam bath at 37 ± 2 ℃. Titrate until the pH of this solution becomes 3.5; NMT 20 mL of 0.1 mol/L of sodium hydroxide VS is consumed.

Assay (1) ***Aluminum***—Weigh accurately about 1.0 g of Almagate, and dissolve in 5 mL of hydrochloric acid. If necessary, heat. After cooling to room temperature, add water to make exactly 100 mL. Take 10 mL of this solution, transfer into a 250-mL Erlenmeyer flask, add 25 mL of 0.05 mol/L ethylenediaminetetraacetic acid disodium salt solution, 20 mL of acetate buffer solution, pH 3.5, 40 mL of ethanol(95) and 2 mL of dithizone TS prepared immediately before use. Titrate excess ethylenediaminetetraacetic acid disodium salt with 0.05 mol/L zinc sulfate VS until the greenish purple color of the solution becomes pink.

Each mL of 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS
= 2.549 mg of Al_2O_3

(2) ***Magnesium***—Weigh accurately about 1.0 g of Almagate, and dissolve in 5 mL of hydrochloric acid. If necessary, heat. After cooling to room temperature, add water to make exactly 100 mL. Pipet 10 mL of this solution, transfer into a 500 mL of Erlenmeyer flask, add 200 mL of water and 20 mL of 2,2',2″-nitrilotriethanol (95) with mixing, and add 10 mL of ammonium chloride buffer solution, pH 10.0, and 50 mg of eryochrome black T-sodium chloride indicator. Titrate this solution with 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS until the violet color of the solution becomes blue.

Each mL of 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS
= 2.015 mg of MgO

(3) ***Carbonate***—Weigh accurately about 200 mg of Almagate, transfer into the flask (B), and add 50 mL of water. To flask (B), add 2 to 3 drops of methyl orange TS. Add a boiling stone, connect the funnel (A) and the flask (B), and close the control valve (F). Separately, to the flask (J), add 25 mL of 0.1 mol/L sodium hydroxide TS, immediately add 300 mL of barium chloride solution (1 in 100), stir, and connect the flask (J) and the flask (H). Use a rubber tube to connect the control valve (F) and flask (H), and open the control valve (F). Rapidly proceed with this process. To the funnel (A), add 50 mL of 1 mol/L hydrochloric acid TS, open the rotary valve (L), heat the flask (B) until the solution begins to boil, and continue heating for 10 minutes. Immediately after heating is complete, close the control valve (F) and the rotary valve (L), and separate the rubber tube (D_2) and the glass column (E). Separate the flask (J) and the flask (H), vigorously shake them up and down for 2 minutes to mix, allow them to stand at room temperature for 10 minutes, and open the control valve (F) and the rotary valve (L). Filter the solution in flask (J) in vacuum, add 2 to 3 drops of methyl orange TS, and titrate with 0.1 mol/mL hydrochloric acid VS until the pale orange color of the solution becomes red. Perform a blank test in the same manner and make any necessary correction.

$$\text{Content (\%) of carbonate} = \frac{(a-b)\times f}{Amount\ (mg)\ of\ sample\ taken} \times 2.200 \times 100$$

Each mL of 0.1 mol/L hydrochloric acid VS
= 2.200 mg of CO_2

a: Volume (mL) of 0.1 mol/L hydrochloric acid VS consumed for titration in the blank test

b: Volume (mL) of 0.1 mol/L hydrochloric acid VS consumed for titration in the test

f: Titrimetric factor of 0.1 mol/L hydrochloric acid

Almagate Suspension
알마게이트 현탁액

Almagate Suspension contains NLT 15.0% and NMT 17.0% of aluminum oxide (Al_2O_3 : 101.96) and NLT 36.0% and NMT 40.0% of magnesium oxide (MgO : 40.30) of the labeled amount of almagate (on the dried basis).

Method of preparation Prepare as directed under Suspensions, with Almagate.

Identification (1) Shake Almagate Suspension to mix, take an amount equivalent to about 2.0 g of almagate, add 30 mL of 3 mol/L hydrochloric acid TS, and 5 drops of methyl red TS. Heat to boil. Add ammonia TS until it turns to an intense yellow color, boil for 2 more minutes, and filter. The filtrate responds to the Qualitative Analysis (1) for magnesium salt.

(2) Add ammonium chloride solution (1 in 50) to the precipitate obtained in (1) to wash, and dissolve the precipitate with hydrochloric acid. The solution responds to the Qualitative Analysis (1) and (2) for aluminum salt.

pH NLT 8.5.

Acid-neutralizing capacity Shake Almagate Suspension to mix, pipet an amount equivalent to about 0.2 g of almagate (on the dried basis), and perform the test as directed under the Acid-neutralizing Capacity. Each gram of almagate (calculated on the dried basis) consumes NLT 260 mL of 0.1 mol/L hydrochloric acid.

Assay (1) ***Aluminum oxide***—Shake Almagate Suspension to mix, take exactly an amount equivalent to about 2.0 g of almagate (on the dried basis), dissolve in 10 mL of hydrochloric acid and water to make 200 mL, and use this solution as the test solution. Take 20.0 mL of the test solution, add 20 mL of water, 25.0 mL of 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS and 20 mL of acetic acid-ammonium acetate buffer solution (pH 4.8), and boil for 5 minutes. After cooling, add 50 mL of ethanol and 2 mL of dithizone TS and titrate with 0.05 mol/L zinc sulfate VS. However, the endpoint of titration is when the reddish purple color of the solution turns to a pale red color. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS
= 2.5490 mg of Al_2O_3

(2) ***Magnesium oxide***—Pipet 10.0 mL of the test solution obtained in (1), add 20 mL of water, 20 mL of triethanolamine, 15 mL of ethanol and 20 mL of ammonia-ammonium chloride buffer solution (pH 10.7), and titrate with 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS (indicator: 40 mg of eriochrome black T-sodium chloride indicator). However, the endpoint of titration is when the bluish purple color of the solution turns to a completely blue color. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS
= 2.0152 mg of MgO

Packaging and storage Preserve in well-closed containers.

Almagate Tablets
알마게이트 정

Almagate Tablets contain aluminum oxide (Al_2O_3: 101.96) equivalent to NLT 15.0% and NMT 17.0% and NLT 36.0% and NMT 40.0% of magnesium oxide (MgO: 40.30) of the labeled amount of almagate, calculated on the dried basis.

Method of preparation Prepare Almagate Tablets as directed under Tablets, with Almagate.

Identification (1) Weigh 0.7 g of Almagate Tablets, previously powdered, add 10 mL of 3 mol/L hydrochloric acid TS, add 5 drops of methyl red TS, and heat to boil. Add ammonia TS until the solution turns dark yellow, boil for 2 minutes, and filter. The filtrate responds to the Qualitative Analysis (1) for magnesium salt.

(2) Wash the precipitate obtained from (1) with ammonium chloride solution (1 in 50), and dissolve the precipitate in hydrochloric acid. This solution responds to the Qualitative Analysis (1) and (2) for aluminum salt.

Acid-neutralizing capacity Weigh accurately the mass of NLT 20 tablets of Almagate Tablets, and powder. Weigh accurately an amount of Almagate Tablets, equivalent to about 0.2 g of almagate, calculated on the dried basis, according to the labeled amount, and perform the test as directed under the Acid-neutralizing Capacity. Each gram of almagate, calculated on the dried basis, consumes NLT 260 mL of 0.1 mol/L hydrochloric acid.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay (1) ***Aluminum oxide***—Weigh accurately the mass of NLT 20 tablets of Almagate Tablets, and powder. Weigh accurately an amount equivalent to about 2.0 g of almagate, calculated on the dried basis, dissolve in 10 mL of hydrochloric acid and water to make 200 mL, and use this solution as the test solution. Take 20.0 mL of the test solution, add 20 mL of water, 25 mL of 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS and 20 mL of acetic acid-ammonium acetate buffer solution (pH 4.8), and boil for 5 minutes. After cooling, add 50 mL of ethanol and 2 mL of dithizone TS and titrate with 0.05 mol/L zinc sulfate VS. The endpoint of titration is when the reddish purple color of the solution changes to pale red. Perform a blank test in the same manner and make any necessary correction.

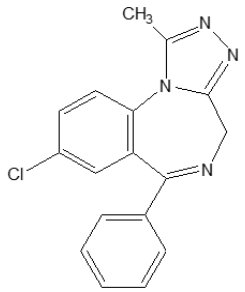
Each mL of 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS
= 2.5490 mg of Al_2O_3

(2) ***Magnesium oxide***—Take 10.0 mL of the test solution obtained from (1), add 20 mL of water, 20 mL of triethanolamine, 15 mL of ethanol and 20 mL of ammonia-ammonium chloride buffer solution (pH 10.7), and titrate with 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS. (indicator: 40 mg of eriochrome black T-sodium chloride indicator). The endpoint of titration is when the bluish purple color of the solution changes to blue. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS
= 2.0152 mg of MgO

Packaging and storage Preserve in well-closed containers.

Alprazolam
알프라졸람



$C_{17}H_{13}ClN_4$: 308.77
8-Chloro-1-methyl-6-phenyl-4*H*-[1,2,4]triazolo[4,3-a][1,4]benzodiazepine [*28981-97-7*]

Alprazolam, when dried, contains NLT 98.5% and NMT 101.0% of alprazolam ($C_{17}H_{13}ClN_4$).

Description Alprazolam occurs as a white or almost white, crystalline powder.
It is freely soluble in chloroform, soluble in methanol or ethanol(95), sparingly soluble in acetic anhydride and practically insoluble in water.
It dissolves in dilute nitric acid.

Identification (1) Determine the absorption spectrum of a solution of Alprazolam in ethanol(95) (1 in 200000) as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum absorption at around 222 nm.

(2) Dissolve 50 mg of Alprazolam in 0.7 mL of deuterated chloroform for nuclear magnetic resonance spectroscopy and measure the ^1H spectrum using tetramethylsilane for nuclear magnetic resonance spectroscopy as the internal standard as directed under the Nuclear Magnetic Resonance Spectroscopy; it exhibits a singlet signal A at δ 2.6 ppm, doublet signals B and C at δ 4.0 ppm and δ 5.4 ppm, and a broad signal D spanning from δ 7.1 ppm to δ 7.96 ppm, and the area intensity ratio of each signal, A : B : C : D, is about 3 : 1 : 1 : 8.

(3) Perform the test with Alprazolam as directed under the Flame Coloration (2); a green color appears.

Melting point Between 228 and 232 ºC.

Purity (1) ***Chloride***—Dissolve 0.5 g of Alprazolam in 10 mL of dilute nitric acid, add water to make 50 mL, and use this solution as the test solution. Prepare the control solution with 0.20 mL of 0.01 mol/L hydrochloric acid (NMT 0.014%).

(2) ***Heavy metals***—Proceed with 2.0 g of Alprazolam according to Method 4 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Related substances***—Dissolve 50 mg of Alprazolam in 10 mL of methanol and use this solution as the test solution. Pipet 1 mL of this solution and add methanol to make exactly 100 mL. Pipet 1 mL of Alprazolam, add methanol to make exactly 10 mL, and use this solution as the standard solution. Spot 10 mL each of these solutions on a plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of acetone, hexane, ethyl acetate andethanol (95) (4: 2 : 2 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 0.5% (1 g, in vacuum not exceeding 0.67 kPa, 60 ℃, 4 hours).

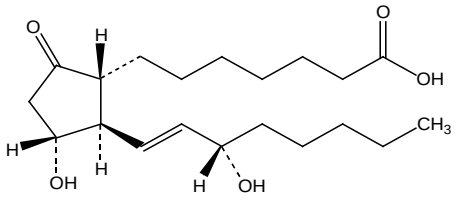
Residue on ignition NMT 0.1% (1.0 g).

Assay Weigh accurately about 0.25 g of Alprazolam, previously dried, dissolve in 100 mL of acetic anhydride, and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 15.438 mg of $C_{17}H_{13}ClN_4$

Packaging and storage Preserve in tight containers.

Alprostadil
알프로스타딜



Prostaglandin E_1 $C_{20}H_{34}O_5$: 354.48
7-{(1*R*,2*R*,3*R*)-3-Hydroxy-2-[(1*E*,3*S*)-3-hydroxy-oct-1-enyl]-5-oxocyclopent-1-yl}heptanoic acid [*745-65-3*]

Alprostadil, when dried, contains NLT 97.0% and NMT 103.0% of Alprostadil ($C_{20}H_{34}O_5$).

Description Alprostadil occurs as white crystals or a crystalline powder.
It is freely soluble in ethanol(99.5) or tetrahydrofuran, slightly soluble in acetonitrile and practically insoluble in water.

Identification (1) To 10 mL each of solutions of Alprostadil and alprostadil RS in ethanol(99.5) (1 in 100000), add 1 mL of potassium hydroxide-ethanol TS, and allow to stand away for 15 minutes. Determine the absorption spectra of the solutions as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Alprostadil and alprostadil RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy, respectively; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Optical rotation $[\alpha]_D^{20}$: Between 53° and -61° (25 mg after drying, tetrahydrofuran, 5 mL, 100 mm).

Melting point Between 114 and 232 ºC.

Purity ***Related substances***—Dissolve 4 mg of Alprostadil in 2 mL of a mixture of acetonitrile and water (9 : 1) and use this solution as the test solution. Pipet 0.5 mL of this solution, add a mixture of acetonitrile and water (9 : 1) to make exactly 10 mL. Pipet 2.0 mL of this solution, add a mixture of acetonitrile and water (9 : 1) to make exactly 10 mL, and use this solution as the standard solution. Perform the test with 5 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine each peak area by the automatic integration method; the peak area with the relative retention time of 0.7 and 1.26 to the peak of alprostadil from the test solution is not larger than 0.5 times the peak area of alprostadil obtained from the standard solution, the peak area with the relative retention time of 0.88 and 1.18 to the peak of alprostadil from the test solution is not larger than the peak of alprostadil from the standard solution, and the peak area other than the alprostadil peak from the test solution and the above is not larger than 0.1 times the peak area of alprostadil from the standard solution. The total area of all peaks other than alprostadil of the solution is not larger than 2 times the peak area of alprostadil from the standard solution.

Operating conditions

For the detector, column, column temperature, mobile phase and flow rate, proceed as directed under the operating conditions in the Assay.

System suitability

Test for required detectability: Take 2 mL of the standard solution and add a mixture of acetonitrile and water (9 : 1) to make 20 mL. Confirm that the peak area of alprostadil obtained from 5 μL of this solution is within the range of 7% to 13% of that of alprostadil from the standard solution.

System performance: Proceed as directed under the system suitability under the Assay.

System repeatability: Perform the test six times with 5 μL of the standard solution according to the above operating conditions; the relative standard deviation of the peak area of alfacalcidol is NMT 1.5%.

Time span of measurement: About 5 times the retention time of the alprostadil peak after the solvent peak

Loss on drying NMT 1.0% (0.1 g, in vacuum, phosphorus pentoxide, 4 hours).

Assay Weigh accurately about 5 mg each of Alprostadil and alprostadil RS, previously dried, dissolve in exactly 5 mL of the internal standard solution, add a mixture of acetonitrile and water (9 : 1) to make exactly 50 mL, and use the solutions as the test solution and the standard solution, respectively. Perform the test with 5 mL of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the ratios of the peak area, Q_T and Q_S, of Alprostadil to that of the internal standard.

$$\text{Amount (mg) of alprostadil } (C_{20}H_{34}O_5) = \text{Amount (mg) of alprostadil RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of dimethyl phthalate in a mixture of acetonitrile and water (9 : 1) (1 in 10000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 196 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: Dissolve 9.07 g of potassium dihydrogen phosphate in water to make 1000 mL. To this, add the solution prepared by dissolving 9.46 g of anhydrous sodium dihydrogen phosphate in water to make 1000 mL, and adjust the pH to 6.3. To this solution, add water to dilute to 10 times. To 360 mL of this solution, add 110 mL of acetonitrile and 30 mL of methanol and mix.

Flow rate: Adjust the flow rate so that the retention time of alprostadil peak is about 10 minutes.

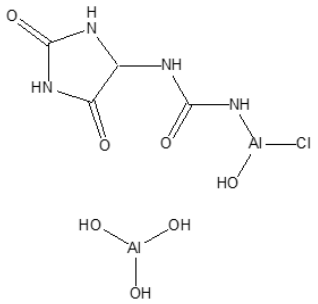
System suitability

System performance: Perform the test with 5 μL of the standard solution according to the above operating conditions; alprostadil and the internal standard are eluted in this order with the resolution being NLT 9.

System repeatability: Perform the test 6 times with 5 μL each of the standard solution according to the above operating conditions; the relative standard deviation of the peak area ratio of alprostadil to that of the internal standard is NMT 1.0%.

Packaging and storage Preserve in light-resistant, tight containers at below 5 °C.

Aluminum Chlorohydroxy Allantoinate
알란토인클로로히드록시 알루미늄



$C_4H_9Al_2ClN_4O_7$: 314.55

Chloro[*N*-(2,5-dioxo-4-imidazolidinyl)ureato]tetrahydroxydi-aluminum, [*1317-25-5*]

Aluminum Chlorohydroxy Allantoinate, when dried, contains NLT 36.0% and NMT 44.0% of allantoin ($C_4H_6N_4O_3$: 158.12) and NLT 25.0% and NMT 31.0% of aluminum oxide (Al_2O_3: 101.96).

Description Aluminum Chlorohydroxy Allantoinate occurs as a white powder. It is odorless and has an astringent taste.

Identification (1) Add 0.2 g of Aluminum Chlorohydroxy Allantoinate to 10 mL of dilute hydrochloric acid, boil for 5 minutes, add 1 mL of phenylhydrazine hydrochloride solution (1 in 100), and cool. Add 0.5 mL of potassium ferricyanide TS and 1 mL of hydrochloric acid; the resulting solution exhibits a red color.

(2) Dissolve 0.2 g of Aluminum Chlorohydroxy Allantoinate in 10 mL of water by heating, and cool; the resulting solution responds to the Qualitative Analysis for aluminum salt and chloride.

Purity (1) ***Clarity and color of solution***—Dissolve 0.1 g of Aluminum Chlorohydroxy Allantoinate in 10 mL of water by heating; the solution is colorless and almost clear.

(2) ***Heavy metals***—Add 2.0 g of Aluminum Chlorohydroxy Allantoinate to 5 mL of sulfuric acid and 5 mL of nitric acid, and gently heat. Occasionally add 2 to 3

mL of nitric acid, and continue heating until the solution becomes colorless to pale yellow. After cooling, add 10 mL of saturated ammonium oxalate, and concentrate the solution by heating until white smoke appears. After cooling, add water to make 50 mL, and use this solution as the test solution. Take 25 mL of the test solution, and perform the test. Prepare the control solution with 1.0 mL of lead standard solution (NMT 10 ppm).

Loss on drying NMT 7% (2 g, 105 ℃, 2 hours).

Assay (1) ***Allantoin***—Weigh accurately about 0.7 g of Aluminum Chlorohydroxy Allantoinate, previously dried, and perform the test according to the Nitrogen Determination (Method 2).

Each mL of 0.05 mol/L sulfuric acid VS
= 3.953 mg of $C_4H_6N_4O_3$

(2) ***Aluminum oxide***—Weigh accurately about 0.5 g of Aluminum Chlorohydroxy Allantoinate, previously dried, dissolve in 20 mL of dilute nitric acid by heating, and add water to make about 250 mL. To this solution, add 1 g of ammonium chloride and 3 drops of methyl red TS, heat to boiling, and slowly add ammonia TS until the solution becomes yellow. Filter the precipitate, collect the residue, and wash well with ammonium nitrate solution (1 in 400). After drying, ignite to a constant mass with the filter paper, and weigh.

Packaging and storage Preserve in tight containers.

Aluminum Hydroxide Gel
수산화알루미늄 겔

$Al(OH)_3$: 78.00

Aluminum Hydroxide Gel, as an aluminum hydroxide suspension, contains NLT 3.6% and NMT 4.4% of aluminum oxide (Al_2O_3 : 101.96). Mint oil, glycerin, sorbitol, sucrose, saccharin or other appropriate fragrances and appropriate antiseptics may be added to Aluminum Hydroxide Gel.

Description Aluminum Hydroxide Gel occurs as a white, viscous suspension. When it is allowed to stand, a small amount of water is separated from it.

Identification Dissolve 5 mL of Aluminum Hydroxide Gel in 10 mL of dilute hydrochloric acid and lightly warm to dissolve. The solution responds to the Qualitative Analysis for aluminum salt.

pH Between 5.5 and 8.0.

Purity (1) ***Chloride***—Place 10 g of Aluminum Hydroxide Gel in a porcelain dish, add 0.1 mL of potassium chromate TS and 25 mL of water, stir to mix, and add 0.1 mol/L of silver nitrate solution until the resulting solution exhibits a pale red color; the consumed amount is NMT 8.0 mL (NMT 0.28%).

(2) ***Sulfate***—To 5 g of Aluminum Hydroxide Gel, add 5.0 mL of 3 mol/L hydrochloric acid, and heat to dissolve. After cooling, add water to make 250 mL. Filter if necessary. To 20 mL of the filtrate, add 1 mL of dilute hydrochloric acid, and add water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 0.40 mL of 0.005 mol/L sulfuric acid (NMT 0.05%).

(3) ***Arsenic***—To 1.2 g of Aluminum Hydroxide Gel, add 10 mL of dilute sulfuric acid, shake well to mix, and heat until it boils. After cooling, add water to make 20 mL, and filter. Use 10 mL of the filtrate as the test solution and perform the test (NMT 0.6 ppm).

(4) ***Heavy metals***—To 5.0 g of Aluminum Hydroxide Gel, add 5 mL of dilute hydrochloric acid, shake to mix, and heat until it boils. Then, evaporate to dryness on a steam bath. To the residue, add 30 mL of water, warm with shaking to mix. After cooling, filter. To the filtrate, add 2 mL of dilute acetic acid, and add water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution by evaporating 5 mL of dilute hydrochloric acid to dryness on a steam bath, adding 2.5 mL of lead standard solution and 2 mL of dilute acetic acid, and adding water to make 50 mL (NMT 5 ppm).

Acid-neutralizing capacity Stir Aluminum Hydroxide Gel well to mix, transfer about 1.5 mL of it in a flask with a glass stopper, previously measured in the mass, weigh accurately the mass, and perform the test; the consumed amount of 0.1 mol/L hydrochloric acid VS per 1.0 g of Aluminum Hydroxide Gel is between 12.5 mL and 25.0 mL.

Microbiological examination of non-sterile products The total aerobic microbial count is NMT 100 CFU per mL of Aluminum Hydroxide Gel, and *Escherichia coli* is not detected.

Assay Weigh accurately about 25 g of Aluminum Hydroxide Gel, place in a beaker, add 15 mL of hydrochloric acid, and slowly heat to completely dissolve. After cooling, transfer to a 500-mL volumetric flask, add water to the gauge line, and shake to mix. Place exactly 20 mL of this solution in a 250-mL beaker. While continuously stirring to mix, add 25.0 mL of 0.05 mol/L ethylenediaminetetraacetic acid disodium salt solution and 20 mL of pH 4.8 acetic acid-ammonium acetate buffer solution, and heat for 5 minutes until it nearly boils. After cooling, add 50 mL of ethanol and 2 mL of dithizone TS, and titrate with 0.05 moL/L zinc sulfate solution until the greenish purple color of the resulting solution turns to a red color. Perform a blank test in the same manner.

Each mL of 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS

= 2.5490 mg of Al_2O_3

Packaging and storage Preserve in tight containers, avoiding it from being frozen.

Aluminum Hydroxide and Magnesium Carbonate Codried Gel
수산화알루미늄·탄산마그네슘혼합건조 겔

Aluminum Hydroxide and Magnesium Carbonate Codried Gel contains NLT 40.0% of aluminum oxide (Al_2O_3 : 101.96) and NLT 6.0% of magnesium oxide (MgO : 40.30).

Description Aluminum Hydroxide and Magnesium Carbonate Codried Gel occurs as a fine white powder.
It is odorless, tasteless, and free of foreign matter.

Identification (1) Weigh 1 g of Aluminum Hydroxide and Magnesium Carbonate Codried Gel and dissolve in 10 mL of 3 mol/L hydrochloric acid; the resulting solution responds to the Qualitative Analysis for aluminum salt and magnesium salt.

(2) Aluminum Hydroxide and Magnesium Carbonate Codried Gel responds to the Qualitative Analysis (1) for carbonate.

pH Between 8.8 and 9.8 [suspension (1 in 25)].

Purity (1) ***Chloride***—Weight 1.42 g of Aluminum Hydroxide and Magnesium Carbonate Codried Gel, dissolve in 30 mL of 2 mol/L nitric acid, and heat. Add water to make exactly 100 mL, filter, and perform the test using the filtrate as the test solution. Prepare the control solution with 0.2 mL of 0.02 mol/L hydrochloric acid (NMT 0.2%).

(2) ***Sulfate***—Weight 0.66 g of Aluminum Hydroxide and Magnesium Carbonate Codried Gel, dissolve in 15 mL of 3 mol/L hydrochloric acid, and heat. Add water to make 250 mL, filter, and perform the test using the filtrate as the test solution. Prepare the control solution with 0.40 mL of 0.04 mol/L sulfuric acid (NMT 0.3%).

(3) ***Heavy metal***—Proceed with 4.0 g of Aluminum Hydroxide and Magnesium Carbonate Codried Gel according to Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 5 ppm).

(4) ***Arsenic***—Weight 2.4 g of Aluminum Hydroxide and Magnesium Carbonate Codried Gel, dissolve in 80 mL of 3.5 mol/L sulfuric acid, and add water to make 220 mL. Perform the test using 36 mL of this solution (NMT 5 ppm).

Acid-neutralizing capacity Weight accurately about 0.25 g of Aluminum Hydroxide and Magnesium Carbonate Codried Gel, transfer into a stoppered Erlenmeyer flask, add 100.0 mL of 0.1 mol/L hydrochloric acid, close the stopper, and warm at 37 ± 2 °C for 1 hour while shaking to mix. Pipet 50 mL of this solution, and titrate the excess hydrochloric acid with 0.1 mol/L sodium hydroxide VS to pH 3.5 using the potentiometric titration. 1.0 g of Aluminum Hydroxide and Magnesium Carbonate Codried Gel consumes NLT 260 mL of 0.1 mol/L hydrochloric acid.

Assay (1) ***Aluminum oxide***—Weigh accurately about 1 g of Aluminum Hydroxide and Magnesium Carbonate Codried Gel, dissolve in 15 mL of dilute hydrochloric acid, add water to make 100.0 mL, and use this solution as the test solution. Pipet 10.0 mL of the test solution, add 25.0 mL of 0.05 mol/L ethylenediaminetetraacetic acid disodium salt and 20 mL of acetic acid-sodium acetate buffer solution, pH 4.5, boil for 5 minutes, and then cool to room temperature. Add 50 mL of ethanol and 2 mL of dithizone TS, and titrate with 0.05 mol/L zinc sulfate VS. The endpoint of titration is when the greenish purple color turns bright red. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS
= 2.5490 mg of Al_2O_3

(2) ***Magnesium oxide***—Take 25.0 mL of the test solution obtained in (1), add 20 mL of triethanolamine, and mix. Add 20 mL of Ammonia-ammonium chloride buffer solution, pH 10.7, and 40 mg of eryochrome black T-sodium chloride indicator, and titrate with 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS. The endpoint of titration is when the violet in the bluish purple color completely disappears and turns into blue. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS
= 2.015 mg of MgO

Packaging and storage Preserve in well-closed containers.

Aluminum Hydroxide, Magnesium Carbonate and Calcium Carbonate Coprecipitate
수산화알루미늄·탄산마그네슘·탄산칼슘공침물

Aluminum Hydroxide, Magnesium Carbonate and Calcium Carbonate Coprecipitate is a coprecipitate dry product of aluminum hydroxide, magnesium carbonate and calcium carbonate, with a molar ratio of about 2 : 1 : 2. Aluminum Hydroxide, Magnesium Carbonate and Cal-

cium Carbonate Coprecipitate contains NMT 19.5% and NLT 24.5% of aluminum oxide (Al_2O_3 : 101.96), NMT 9.5% and NLT 14.5% of magnesium oxide (MgO : 40.30), and NMT 21.5% and NLT 26.5% of calcium oxide (CaO : 56.08), calculated on the dried basis.

Description Aluminum Hydroxide, Magnesium Carbonate and Calcium Carbonate Coprecipitate occurs as a white powder or granule, which is odorless and tasteless. It is practically insoluble in water or ethanol(95).
It dissolves in dilute hydrochloric acid with effervescence.

Identification (1) To 0.5 g of Aluminum Hydroxide, Magnesium Carbonate and Calcium Carbonate Coprecipitate, add 10 mL of dilute hydrochloric acid and warm to dissolve. Cool and add 20 mL of water and ammonia TS to make it neutral. Filter the precipitate formed. Use the filtrate in the Identification (2). Dissolve the residue in dilute hydrochloric acid; the solution responds to the Qualitative Analysis for aluminum salt.

(2) Add ammonium oxalate TS to the filtrate in (1), filter the resulting precipitate, and add dilute hydrochloric acid to the residue; the resulting solution responds to the Qualitative Analysis for calcium salt.

(3) Add sodium monohydrogen phosphate TS to a portion of the filtrate obtained from (2); a white crystalline precipitate is formed. In addition, add sodium hydroxide TS to a portion of the filtrate from (2); a white gel precipitate is formed. Even when an excess of sodium hydroxide TS is added, the precipitate does not dissolve, but when iodine TS is added, the precipitate turns dark brown (magnesium salt).

(4) Add dilute hydrochloric acid to Aluminum Hydroxide, Magnesium Carbonate and Calcium Carbonate Coprecipitate; gas is generated as it effervesces. When this gas is passed through calcium hydroxide TS, a white precipitate is immediately formed (carbonate).

Purity (1) ***Soluble salt*—**Dissolve 2.0 g of Aluminum Hydroxide, Magnesium Carbonate and Calcium Carbonate Coprecipitate in 100 mL of water, shake to mix, and heat to boiling. Cool it, add water to make 100.0 mL, and filter it. Take 50.0 mL of the filtrate, evaporate on a steam bath to dryness, and dry the residue at 120 °C for 3 hour. The mass of the residue is NMT 30 mg.

(2) ***Chloride*—**Add 30 mL of dilute nitric acid to 1.0 g of Aluminum Hydroxide, Magnesium Carbonate and Calcium Carbonate Coprecipitate and heat to boiling to dissolve. Cool, add water to make 100 mL and filter it. Take 5 mL of the filtrate, add water to make 50 mL, and use this solution as the test solution. Perform the test according to the Chloride. Prepare the control solution with 0.4 mL of 0.01 mol/L hydrochloric acid (NMT 0.284%).

(3) ***Sulfate*—**Add 15 mL of dilute hydrochloric acid to 1.0 g of Aluminum Hydroxide, Magnesium Carbonate and Calcium Carbonate Coprecipitate and heat to boiling to dissolve. Cool, add water to make 100 mL, and filter it. Pipet 10 mL of the filtrate, add 1 mL of dilute hydrochloric acid and water to make 50 mL. Use this solution as the test solution, and perform the test according to the Sulfate. Prepare the control solution with 1.0 mL of 0.005 mol/L sulfuric acid (NMT 0.48%).

(4) ***Heavy metals*—**Add 12 mL of dilute hydrochloric acid to 1.0 g of Aluminum Hydroxide, Magnesium Carbonate and Calcium Carbonate Coprecipitate, dissolve by warming, and filter after cooling. Add 12 mL of sodium acetate TS, 2 mL of dilute acetic acid and water to the filtrate to make 50 mL and perform the test according to the Heavy Metals. Prepare the control solution by evaporating 12 mL of dilute hydrochloric acid to dryness and adding 2 mL of dilute acetic acid, 2.0 mL of lead standard solution and water to make 50 mL (NMT 20 ppm).

(5) ***Iron*—**Take 1.0 g of Aluminum Hydroxide, Magnesium Carbonate and Calcium Carbonate Coprecipitate, add 20 mL of dilute nitric acid, and dissolve by warming. Cool it, add water to make 250.0 mL, and filter it. Take 25.0 mL of the filtrate, add 20 mL of water, 50 mg of ammonium persulfate and 5 mL of ammonium thiocyanate TS, shake to mix, and allow to stand for 5 minutes; the color of the solution should be not more intense than the color of the following control solution. Prepare the control solution by adding 3.0 mL of iron standard solution, 5 drops of dilute nitric acid and water to make 50 mL, and proceed in the same manner as the test solution.

(6) ***Arsenic*—**Add 5 mL of dilute hydrochloric acid to 0.2 g of Aluminum Hydroxide, Magnesium Carbonate and Calcium Carbonate Coprecipitate, warm to dissolve, cool, and use this solution as the test solution. Perform the test according to the Arsenic (NMT 10 ppm).

Loss on drying NMT 17.0% (1 g, 105 °C, 3 hours).

Acid-neutralizing capacity Weigh accurately an amount, equivalent to about 0.25 g of Aluminum Hydroxide, Magnesium Carbonate and Calcium Carbonate Coprecipitate, transfer into a flask with a stopper, and add exactly 100 mL of 0.1 mol/L hydrochloric acid. With the stopper closed, shake to mix at 37 ± 2 ℃ for 1 hour and then filter. Pipet 50 mL of the filtrate, and titrate the excess hydrochloric acid with 0.1 mol/L sodium hydroxide VS while shaking well to mix until the pH becomes 3.5. The volume of 0.1 mol/L hydrochloric acid consumed for 1 g of Aluminum Hydroxide, Magnesium Carbonate and Calcium Carbonate Coprecipitate, calculated on the dried basis, is NLT 220 mL.

Assay (1) ***Aluminum oxide***—Weigh accurately about 0.4 g of Aluminum Hydroxide, Magnesium Carbonate and Calcium Carbonate Coprecipitate, and dissolve in 10 mL of dilute hydrochloric acid and 5 mL of dilute nitric acid by warming. Cool it, add water to make exactly 250 mL, and use it as the test solution. Pipet 25 mL of the test solution and adjust the pH to 3.0 by adding 75 mL of water, 30 mL of acetic acid-ammonium acetate buffer solution and pH 3.0 and ammonia TS. Add 0.4 mL of Cu-Pan TS and heat the solu-

tion until it is almost boiling. Titrate with 0.01 mol/L ethylenediaminetetraacetic acid disodium salt VS. The endpoint of the titration is when the color of the solution changes from red to yellow persisting for NLT 1 minute. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.01 mol/L ethylenediaminetetraacetic acid disodium salt VS
= 0.5098 mg of Al_2O_3

(2) ***Calcium oxide*—**Pipet 25 mL of the test solution obtained from (1) and put 175 mL of water, 10 mL of triethanolamine (1 in 2) and 1.0 mL of 8 mol/L potassium hydroxide. After allowing to stand for 5 minutes, titrate slowly with 0.01 mol/L ethylenediaminetetraacetic acid disodium salt VS (indicator: 0.1 g of NN indicator). The endpoint of titration is when the reddish purple color of the solution turns into a blue color. Perform a blank test in the same way and make any necessary correction.

Each mL of 0.01 mol/L ethylenediaminetetraacetic acid disodium salt VS
= 0.5608 mg of CaO

(3) ***Magnesium oxide*—**Pipet 50 mL of the test solution obtained in (1), add 60 mL of water and 10 mL of triethanolamine solution (1 in 2) and 10 mL of ammonium chloride buffer solution (pH 10.7), and titrate with 0.01 mol/L ethylenediaminetetraacetic acid disodium salt VS (indicator: 40 mg of eriochrome black T-sodium chloride indicator). The endpoint of titration is when the reddish purple color of the solution turns into a blue color. Perform a blank test in the same way and make any necessary correction. In addition, from the amount of 0.01 mol/L ethylenediaminetetraacetic acid disodium salt VS consumed, subtract the amount of 0.01 mol/L ethylenediaminetetraacetic acid disodium salt VS, equivalent to the amount of calcium oxide (CaO) consumed in the Assay (2), which is the consumption corresponding to magnesium oxide (MgO).

Each mL of 0.01 mol/L ethylenediaminetetraacetic acid disodium salt VS
= 0.4030 mg of MgO

Packaging and storage Preserve in tight containers.

Dried Aluminum Hydroxide Gel
건조수산화알루미늄 겔

Dried Aluminum Hydroxide Gel contains NLT 50.0% of aluminum oxide (Al_2O_3 : 101.96).

Description Dried Aluminum Hydroxide Gel occurs as a white, amorphous powder.
It is odorless and tasteless.
It is practically insoluble in water, ethanol(95) or ether.
It mostly dissolves in dilute hydrochloric acid or sodium hydroxide TS.

Identification Add 20 mL of dilute hydrochloric acid to 0.2 g of Dried Aluminum Hydroxide Gel, dissolve by warming, centrifuge, and take the clear supernatant; this solution responds to the Qualitative Analysis for aluminum salt.

Purity (1) ***Alkali***—To 1.0 g of Dried Aluminum Hydroxide Gel, add 25 mL of water, shake well to mix, and centrifuge; the clear supernatant is neutral.

(2) ***Chloride***—To 1.0 g of Dried Aluminum Hydroxide Gel, add 30 mL of dilute nitric acid, and heat gently to boiling while shaking well to mix. After colling, add water to make 100 mL, and centrifuge. To 5 mL of the clear supernatant, add 6 mL of dilute nitric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 0.4 mL of 0.01 mol/L hydrochloric acid (NMT 0.284%).

(3) ***Nitrate***—To 1.0 g of Dried Aluminum Hydroxide Gel, add 5 mL of water, carefully put 5 mL of sulfuric acid, and dissolve by shaking well to mix, cool, and superimpose 2 mL of iron(II) sulfate TS; a brown rim is not formed at the interface of the two solutions.

(4) ***Sulfate***—To 1.0 g of Dried Aluminum Hydroxide Gel, add 15 mL of dilute hydrochloric acid, heat gently to boiling while shaking well to mix, cool, add water to make 250 mL, and centrifuge. To 25 mL of the clear supernatant, add 1 mL of dilute hydrochloric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 1.0 mL of 0.005 mol/L sulfuric acid (NMT 0.480%).

(5) ***Heavy metals***—Dissolve 2 g of Dried Aluminum Hydroxide Gel in 10 mL of dilute hydrochloric acid by warming, filter the solution if necessary, and add water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution by evaporating 10 mL of dilute hydrochloric acid to dryness, and adding 2.0 mL of lead standard solution, 2 mL of dilute acetic acid and water to make 50 mL (NMT 10 ppm).

(6) ***Arsenic***—To 0.8 g of Dried Aluminum Hydroxide Gel, add 10 mL of dilute sulfuric acid, heat gently to boiling while shaking well to mix, cool, and filter. Take 5 mL of the filtrate as the test solution and perform the test (NMT 5 ppm).

Acid-neutralizing capacity Weight accurately about 0.2 g of Dried Aluminum Hydroxide Gel, and perform the test; the volume of 0.1 mol/L hydrochloric acid consumed for about 1 g of Dried Aluminum Hydroxide Gel is NLT 250 mL.

Assay Weigh accurately about 2 g of Dried Aluminum Hydroxide Gel, add 15 mL of hydrochloric acid, heat on a steam bath for 30 minutes while shaking to mix, cool,

and add water to make exactly 500 mL. Pipet 20 mL of this solution, add exactly 30 mL of 0.05 mol/L ethylenediaminetetraacetic acid disodium salt, add 20 mL of pH 4.8 acetic acid-ammonium acetate buffer solution, and then boil for 5 minutes. After cooling, add 55 mL of ethanol(95), and titrate with 0.02 mol/L zinc sulfate VS (indicator: 2 mL of dithizone TS). The endpoint of the titration is when the pale dark green color of this solution turns to pale red. Perform a blank test in the same manner.

Each mL of 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS
= 2.5490 mg of Al_2O_3

Packaging and storage Preserve in tight containers.

Dried Aluminum Hydroxide Gel Fine Granules
건조수산화알루미늄겔 세립

Dried Aluminum Hydroxide Gel Fine Granules contain NLT 47.0% of aluminum oxide (Al_2O_3: 101.96).

Method of preparation Prepare as directed under Powders, with Dried Aluminum Hydroxide Gel.

Identification Add 20 mL of dilute hydrochloric acid to 0.2 g of Dried Aluminum Hydroxide Gel Fine Granules, followed by warming, centrifuge, and take the clear supernatant; this solution responds to the Qualitative Analysis for aluminum salt.

Particle size distribution estimation by analytical sieving Meets requirements.

Acid-neutralizing capacity Perform the test as directed under the Acid-neutralizing Capacity of Dried Aluminum Hydroxide Gel. The volume of 0.1 mol/L of hydrochloric acid VS consumed is NLT 235 mL per g of Aluminum Hydroxide Gel.

Assay Proceed as directed under the Assay of Dried Aluminum Hydroxide Gel.

Each mL of 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS
= 2.5490 mg of Al_2O_3

Packaging and storage Preserve in tight containers.

Dried Aluminum Hydroxide Gel, Magnesium Carbonate and Oxethazaine Tablets
건조수산화알루미늄겔·탄산마그네슘·옥세타자인 정

Dried Aluminum Hydroxide Gel, Magnesium Carbonate and Oxethazaine Tablets contain aluminum oxide (Al_2O_3 : 101.96) NLT 50.0% of the labeled amount of dried aluminum hydroxide gel, magnesium oxide (MgO : 40.30) corresponding to NLT 38.0% and NMT 46.0% of the labeled amount of magnesium carbonate, and NLT 90.0% and NMT 110.0% of the labeled amount of oxethazaine ($C_{28}H_{41}N_3O_3$: 467.70).

Method of preparation Prepare as directed under Tablets, with Dried Aluminum Hydroxide Gel, Magnesium Carbonate and Oxethazaine.

Identification (1) ***Dried aluminum hydroxide gel***—Weigh about 1 g of Dried Aluminum Hydroxide Gel, Magnesium Carbonate and Oxethazaine Tablets and carbonize. After cooling, add 30 mL of dilute hydrochloric acid to the residue, warm on a steam bath for 10 minutes, add water to make 50 mL, and filter. Add 1 drop of methyl orange TS to the filtrate, and add ammonia TS until the solution turns yellow. Perform the test with a precipitate produced by warming on a steam bath under the Qualitative Analysis (1) and (4) for aluminum salt.

(2) ***Magnesium carbonate***—Warm the filtrate in (1) on a steam bath, add 5 mL of thermosaturated ammonium oxalate TS, and allow to stand for 1 hour on a steam bath to complete precipitation. Filter while hot and wash with hot water. With these solutions, perform the test as directed under the Qualitative Analysis for magnesium salt.

(3) ***Oxethazaine***—Determine the absorption spectra of Dried Aluminum Hydroxide Gel, Magnesium Carbonate and Oxethazaine Tablets as directed under the Ultraviolet-visible Spectroscopy under the Assay; the test solution and the standard solution exhibit a maximum at the same wavelength.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Acid-neutralizing capacity Weigh accurately the mass of NLT 20 tablets of Dried Aluminum Hydroxide Gel, Magnesium Carbonate and Oxethazaine Tablets, and powder. The amount of 0.1 mol/L hydrochloric acid consumed for daily dose (4 tablets) as directed under the Acid-neutralizing Capacity is NLT 110 mL.

Assay (1) ***Dried aluminum hydroxide gel***—Weigh accurately the mass of NLT 20 tablets of Dried Aluminum Hydroxide Gel, Magnesium Carbonate and Oxethazaine Tablets, and powder. Weigh accurately an amount,

equivalent to about 0.5 g of dried aluminum hydroxide gel, and carbonize. After cooling, add 30 mL of dilute hydrochloric acid to the residue, warm on a steam bath for 10 minutes, cool, then add water to make 100.0 mL. Filter and use the filtrate as the test solution. To 10.0 mL of the filtrate, add 30.0mL of 0.05 mol/L ethylenediaminetetraacetic acid disodium salt, add 20 mL of acetic acid-ammonium acetate buffer solution, pH 4.8, and then boil for 5 minutes. After cooling, add 55 mL of ethanol, and titrate with 0.05 mol/L zinc acetate VS (indicator: 2 mL of dithizone TS). The endpoint of the titration is when the color of the solution changes from pale green to pale red. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS
= 2.5490 mg of Al_2O_3

(2) ***Magnesium carbonate***—Take 50.0 mL of the test solution obtained in (1), add 2 drops of methyl orange TS, 2 g of ammonium chloride, and add ammonia TS until a yellow color is observed. Warm on a steam bath, filter, and wash. Warm the filtrate and the washings on a steam bath, add 5 mL of thermosaturated ammonium oxalate TS, and allow to stand for 1 hour on a steam bath to complete precipitation. Filter while it is hot, add barium chloride TS to the washings, and wash until no white precipitate is produced. To the filtrate and the washings, add 3 mL of triethanolamine, 2 mL of potassium cyanide TS (5 in 100) and 10 mL of ammonia-ammonium chloride buffer solution (pH 10.7), and titrate with 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS (indicator: 1 drop of eryochrome black T-sodium chloride indicator). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS
= 2.0152 mg of MgO

(3) ***Oxethazaine***—Weigh accurately the mass of NLT 20 tablets of Dried Aluminum Hydroxide Gel, Magnesium Carbonate and Oxethazaine Tablets, and powder. Weigh accurately an amount, equivalent to about 20 mg of oxethazaine ($C_{28}H_{41}N_3O_3$), put in a glass-stoppered Erlenmeyer flask, add 50.0 mL of anhydrous ethanol, stir with a stirrer for 30 minutes, and allow to stand for 10 minutes. Transfer the clear supernatant to a glass-stoppered centrifuge tube, centrifuge at about 3000 rpm for 30 minutes, take 10.0 mL of the clear supernatant, add 2.0 mL of dilute hydrochloric acid, and shake to mix. Use this solution as the test solution. Separately, weigh accurately about 20 mg of oxethazaine RS, put in a glass-stoppered Erlenmeyer flask, and dissolve in 50.0 mL of anhydrous ethanol. To 10.0 mL of this solution, add 2.0 mL of dilute hydrochloric acid, shake to mix, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, at the wavelength of 259 nm as directed under the Ultraviolet-visible Spectroscopy, using a mixture of 10 mL of anhydrous ethanol and 2.0 mL of dilute hydrochloric acid as a control solution.

Amount of oxethazaine ($C_{28}H_{41}N_3O_3$)
= Amount (mg) of oxethazaine RS $\times \frac{A_T}{A_S}$

Packaging and storage Preserve in tight containers.

Labeling description Describe the amounts of aluminum oxide and magnesium oxide.

Dried Aluminum Hydroxide Gel, Magnesium Hydroxide and Oxethazaine Oral Suspension

건조수산화알루미늄겔·수산화마그네슘·옥세타자인 현탁액

Dried Aluminum Hydroxide Gel, Magnesium Hydroxide and Oxethazaine Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of aluminum oxide in dried aluminum hydroxide gel (Al_2O_3 : 101.96), magnesium oxide [$Mg(OH)_2$: 58.32] and oxethazaine ($C_{28}H_{41}N_3O_3$: 467.70).

Method of preparation Prepare as directed under Suspensions, with Dried Aluminum Hydroxide Gel, Magnesium Hydroxide and Oxethazaine.

Identification (1) ***Dried aluminum hydroxide gel—*** Take 1 g of dried aluminum hydroxide gel according to the labeled amount of Dried Aluminum Hydroxide Gel, Magnesium Hydroxide and Oxethazaine Oral Suspension and carbonize. After cooling, add 30 mL of dilute hydrochloric acid to the residue, warm on a steam bath for 10 minutes, add water to make 50 mL, and filter. To the filtrate, add 1 drop of methyl orange TS and add ammonia TS until it exhibits a yellow color. Warm on a steam bath, take the formed precipitate, and perform the test with it as directed under the Qualitative Analysis (1) and (4).

(2) ***Magnesium hydroxide—***Take 5 g of Dried Aluminum Hydroxide Gel, Magnesium Hydroxide and Oxethazaine Oral Suspension, add 25 mL of 1 mol/L sulfuric acid, mix, and allow to stand for 5 minutes. To this solution, add 25 mL of ethanol, mix, allow to stand in an ice bath for 30 minutes, and filter. To the filtrate, add 5 drops of methyl red TS and boil. Add 6 mol/L ammonium hydroxide solution until the resulting solution turns to a yellow color, and continue to boil for 2 more minutes, and filter. To the filtrate, add ammonium carbonate TS in the presence of ammonium chloride; no more precipitate is formed. To this, add sodium monohydrogen phosphate TS; a white crystalline precipitate is formed. To this, add

6 mol/L ammonium hydroxide solution; the precipitate is not dissolved.

(3) ***Oxethazaine*—**Determine the absorption spectrum of Dried Aluminum Hydroxide Gel, Magnesium Hydroxide and Oxethazaine Oral Suspension as directed under the Ultraviolet-visible Spectroscopy; the spectra of the test solution and the standard solution exhibit similar intensities of absorption at the same wavelengths.

pH Between 7.5 and 9.5.

Assay (1) ***Aluminum oxide in dried aluminum hydroxide gel***—Weigh accurately Dried Aluminum Hydroxide Gel, Magnesium Hydroxide and Oxethazaine Oral Suspension in the amount equivalent to about 0.20 g of aluminum oxide (Al_2O_3) and carbonize. After cooling, add 30 mL of dilute hydrochloric acid to the residue, and warm on a steam bath for 10 minutes. After cooling, add water to make 100.0 mL, filter, and use the filtrate as the test solution. Take 20.0 mL of the filtrate, add 30.0 mL of 0.05 mol/L ethylenediaminetetraacetic acid disodium salt solution and 20 mL of acetic acid-ammonium acetate buffer solution (pH 4.8), and boil for 5 minutes. After cooling, add 55 mL of ethanol and titrate with 0.05 mol/L zinc acetate VS (indicator: 2 mL of dithizone TS). However, the endpoint of titration is when the pale dark green color of the solution turns to a pale red color. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS
= 2.5490 mg of Al_2O_3

(2) ***Magnesium hydroxide*—**Weigh accurately an amount of Dried Aluminum Hydroxide Gel, Magnesium Hydroxide and Oxethazaine Oral Suspension, equivalent to about 0.8 g as magnesium hydroxide, add 20 mL of water, and mix. Slowly add 40 mL of 3 mol/L hydrochloric acid, melt with slow heating, if necessary, cool, and add water to make 200.0 mL. Take 10.0 mL of this solution, add 200 mL of water and 20 mL of triethanolamine, and mix well. Add 50 mL of ammonia-ammonium chloride buffer solution (pH 10.7) and 2 drops of eryochrome black T indicator (prepared by dissolving 200 mg of eryochrome black T in 15 mL of triethanolamine and 5 mL of dehydrated alcohol). Allow to stand in an ice bath to cool to 3 to 4 ℃ and titrate with 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS until the resulting solution turns to a blue color. Perform a blank test using 10 mL of water instead of the test solution and make any necessary correction.

Each mL of 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS
= 2.9160 mg of $Mg(OH)_2$

(3) ***Oxethazaine*—**Weigh accurately an amount of Dried Aluminum Hydroxide Gel, Magnesium Hydroxide and Oxethazaine Oral Suspension, equivalent to about 20 mg of oxethazaine ($C_{28}H_{41}N_3O_3$), put in an Erlenmeyer flask with a glass stopper, and add 50.0 mL of anhydrous ethanol. Stir with a stirrer for 30 minutes and allow to stand for 10 minutes. Take the clear supernatant, put in a centrifuge column with a glass stopper, and centrifuge at 3000 rpm for 30 minutes. Take 10.0 mL of the clear supernatant, add 2.0 mL of dilute hydrochloric acid, shake to mix, and use this solution as the test solution. Separately, weigh accurately about 20 mg of oxethazaine RS, put in an Erlenmeyer with a glass stopper, and dissolve in 50.0 mL of anhydrous ethanol. Take 10.0 mL of this solution, add 2.0 mL of dilute hydrochloric acid, shake to mix, and use this solution as the standard solution. Perform the test with the test solution and the standard solution as directed under the Ultraviolet-visible Spectroscopy, using a mixture of 10 mL of anhydrous ethanol and 2.0 mL of dilute hydrochloric acid as the control solution, and determine the absorbances, A_T and A_S, respectively, at the wavelength of 259 nm.

Amount (mg) of oxethazaine ($C_{28}H_{41}N_3O_3$)
= Amount (mg) of oxethazaine RS $\times \frac{A_T}{A_S}$

Packaging and storage Preserve in tight containers.

Labeling The amount of aluminum oxide is indicated.

Colloidal Aluminum Phosphate
콜로이드성알루미늄인산염

$AlPO_4$: 121.95
Phosphoric acid, aluminum salt, [*98499-64-0*]

Colloidal Aluminum Phosphate contains NLT 20.0% and NMT 25.0% of aluminum phosphate ($AlPO_4$).

Description Colloidal Aluminum Phosphate occurs as a white to milky white, viscous suspension. It is insoluble in water, and soluble in dilute hydrochloric acid.

pH Between 5.0 and 7.2 (1 in 2 aqueous solution).

Identification Weigh 2 g of Colloidal Aluminum Phosphate, add 20 mL of dilute hydrochloric acid, heat to boiling to dissolve, and filter; the filtrate responds to the Qualitative Analysis for aluminum salt and phosphate.

Purity (1) ***Chloride***—Weigh 1.0 g of Colloidal Aluminum Phosphate, add 15 mL of dilute nitric acid, dissolve by boiling, cool, and add water to make 200 mL. Filter and take 25 mL of the filtrate, if needed, and perform the test. Prepare the control solution with 1.0 mL of 0.01 mol/L hydrochloric acid (NMT 0.28%).

(2) ***Sulfate***—Weigh 5.0 g of Colloidal Aluminum Phosphate, add 30 mL of dilute hydrochloric acid, dissolve by boiling, cool, and add water to make 100 mL.

Take 10 mL of this solution and perform the test. Prepare the control solution with 1.25 mL of 0.01 mol/L sulfuric acid (NMT 0.12%).

(3) ***Soluble phosphate***—Filter 8 g of Colloidal Aluminum Phosphate. Wash the residue with 30 mL of water, combine the filtrate and washings, add 2 mL of nitric acid, and heat to 60 ℃. Add 20 mL of ammonium molybdate TS, heat for 30 minutes at 50 ℃, and filter. Wash the precipitate with diluted nitric acid (1 in 36), then wash with potassium nitrate solution (1 in 100) until the filtrate becomes neutral. Dissolve the precipitate in 50.0 mL of 0.1 mol/L sodium hydroxide VS, add phenolphthalein TS, and titrate with 0.1 mol/L hydrochloric acid VS. Perform a blank test in the same manner and make any necessary correction (NMT 0.2%).

Each mL of 0.1 mol/L sodium hydroxide VS
= 0.413 mg of PO_4

(4) ***Heavy metal***—Weigh 1.0 g of Colloidal Aluminum Phosphate, dissolve in 10 mL of water and 0.5 mL of hydrochloric acid, filter if needed, neutralize with 2 mol/L sodium hydroxide TS, add water to make 50 mL, and perform the test. Prepare the control solution with 4.0 mL of lead standard solution (NMT 40 ppm).

(5) ***Arsenic***—Dissolve 1.0 g of Colloidal Aluminum Phosphate in 5 mL of water and 5 mL of hydrochloric acid. Take 5 mL of this solution and perform the test (NMT 4 ppm).

Acid-neutralizing capacity Weigh accurately about 0.5 g of Colloidal Aluminum Phosphate, add 50.0 mL of 0.1 mol/L hydrochloric acid, heat for 30 minutes at 37 ℃, shake occasionally, cool, and titrate to pH 3.5 using 0.1 mol/L sodium hydroxide VS. The volume of 0.1 mol/L hydrochloric acid consumed per 1.0 g of aluminum phosphate ($AlPO_4$) in Colloidal Aluminum Phosphate is NLT 50 mL.

Assay Weigh accurately about 0.5 g of Colloidal Aluminum Phosphate, add 15 mL of dilute nitric acid, and heat to dissolve. After cooling, add 25.0 mL of disodium ethylenediaminetetraacetate VS, boil on a steam bath for 5 minutes, and cool. To this solution, add 20 mL of acetic acid-sodium acetate buffer solution, pH 4.5, and 50 mL of ethanol, add 1 mL of dithizone TS and back-titrate with 0.05 mol/L zinc sulfate VS until the color changes from bluish green to bright violet. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.05 mol/L disodium ethylenediaminetetraacetate VS
= 6.098 mg of $AlPO_4$

Packaging and storage Preserve in tight containers.

Natural Aluminum Silicate
천연규산알루미늄

Description Natural Aluminum Silicate occurs as a white or slightly colored powder, and is odorless and tasteless.
It is practically insoluble in water, ethanol(95) or ether.
To 1 g of Natural Aluminum Silicate, add 20 mL of sodium hydroxide solution (1 in 5) and heat; it is partially decomposed to dissolve, but it mostly remains undissolved.

Identification (1) To 0.5 g of Natural Aluminum Silicate, add 3 mL of diluted sulfuric acid (1 in 3), heat until white fumes are produced, cool, add 20 mL of water and filter. Render the filtrate slightly acidic with ammonia TS; the solution responds to the Qualitative Analysis for aluminum salt.

(2) Prepare a bead by fusing sodium ammonium phosphate tetrahydrate on a platinum loop. Place the bead in contact with Natural Aluminum Silicate and fuse again; an infusible mass appears in the bead, and the bead becomes opaque upon cooling, and a web-like shape appears.

Purity (1) ***Acidity or alkalinity***—Add 5.0 g of Natural Aluminum Silicate in 100 mL of water, shake to mix and centrifuge; the clear supernatant obtained is neutral.

(2) ***Chloride***—To 5.0 g of Natural Aluminum Silicate, add 100 mL of water, boil gently for 15 minutes while shaking well to mix, then cool, add water to make 100 mL and centrifuge. To 10 mL of the clear supernatant, add 6 mL of dilute nitric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid (NMT 0.021%).

(3) ***Sulfate***—To the residue obtained from (6), add 3 mL of dilute hydrochloric acid, heat on a steam bath for 10 minutes, dilute with 50 mL of water and filter. To 2.0 mL of the filtrate, add 1 mL of dilute hydrochloric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 1.0 mL of 0.005 mol/L sulfuric acid (NMT 0.480%).

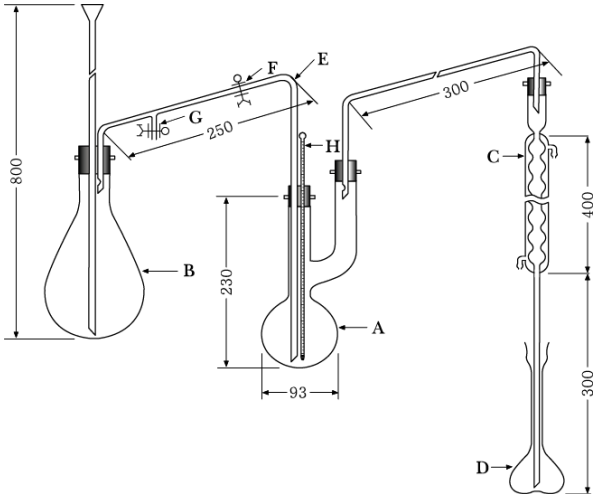
(4) ***Heavy metals***—To 1.5 g of Natural Aluminum Silicate, add 50 mL of water and 5 mL of hydrochloric acid, boil gently for 20 minutes while shaking well to mix, then cool, centrifuge, take the clear supernatant, wash the residue twice with 10 mL each of water and centrifuge each time. Combine the washings with the clear supernatant, and add ammonia water(28) dropwise until precipitate is formed slightly. Add dilute hydrochloric acid dropwise with vigorous shaking and redissolve the precipitate. Heat this solution with 0.45 g of hydroxylamine hydrochloride, cool and add 0.45 g of sodium acetate trihydrate, 6 mL of dilute acetic acid and water to make 150 mL. Perform the test with 50 mL of this solution as the test solution. Prepare the control solution with 2.0 mL of lead standard solution, 0.15 g of hydrox-

ylamine hydrochloride, 0.15 g of sodium acetate trihydrate, 2 mL of dilute acetic acid and water to make 50 mL (NMT 40 ppm).

(5) ***Arsenic***—To 1.0 g of Natural Aluminum Silicate, add 5 mL of dilute hydrochloric acid, heat gently to boil while shaking well to mix, cool rapidly and centrifuge. Add 5 mL of dilute hydrochloric acid to the residue, shake well to mix, and centrifuge. Add 10 mL of water again to perform the same procedure, add all the extracts, and heat to concentrate on a steam bath to make 5 mL. Use this solution as the test solution (NMT 2 ppm).

(6) ***Soluble Salts***—Evaporate 50 mL of the clear liquid obtained from (1) on a steam bath to dryness and ignite the residue at 700 ºC for 2 hours; the amount (mg) of the ignited residue is NMT 40 mg.

(7) ***Fluoride***—(i) Apparatus: Use an apparatus as illustrated in the figure. The apparatus is made of hard glass and ground-glass joints may be used.



*Numbers are indicated in mm.

A: Distilling flask of about 300-mL capacity
B: Steam generator of about 1000-mL capacity
Add a boiling stone to prevent bumping.
C: Condenser
D: Receiver, 200-mL volumetric flask
E: Steam-introducing tube about 8 mm in internal diameter
F, G: Rubber tube with a pinch-coke
H: Thermometer

(ii) Procedure: Transfer 5.0 g of Natural Aluminum Silicate to the distilling flask A using 20 mL of water, and add about 1 g of glass wool and 50 mL of diluted purified sulfuric acid (1 in 2). Connect A to the distillation apparatus, previously washed with steam through the steam-introducing tube E. Add 10 mL of 0.01 mol/L sodium hydroxide solution and 10 mL of water into the receiver D, and immerse the lower end of condenser C in this solution. Heat A gradually until the temperature of the solution reaches 130 ºC, then open the rubber tube F, close the rubber tube G, and pass the steam in the steam generator B by boiling water vigorously. At the same time, heat A to maintain the temperature of the solution in A between 135 and 145 ºC. Adjust the distilling rate to about 10 mL per minute. Collect about 170 mL of the distillate, then stop the distillation, wash C with a small quantity of water, combine the washings with the distillate, and add water to make exactly 200 mL. Use this solution as the test solution, and perform the test with the test solution as directed under the fluoride assay under the Oxygen Flask Combustion. Calculate the amount of fluoride (F) in the test solution according to the following formula; the amount is NMT 0.01%. However, no corrective solution is prepared.

$$\text{Amount (mg) of fluoride (F: 19.00) in the test solution} = \text{Amount (mg) of fluoride in 5 mL of the standard solution} \times \frac{A_T}{A_S} \times \frac{200}{V}$$

Loss on drying NMT 20.0% (1 g, 105 ºC, 3 hours).

Adsorptive power To 0.10 g of Natural Aluminum Silicate, add 20 mL of methylene blue solution (3 in 2000), shake for 15 minutes to mix, allow to stand for 5 hours at 37 ± 2 ºC and centrifuge. Take 1.0 mL of the clear supernatant, and add water to make 200 mL. Place 50 mL of the solution in a Nessler tube and observe horizontally or vertically against a white background; the color of the solution is not more intense than that of the following control solution.

Control solution—Dilute 1.0 mL of a solution of methylene blue (3 in 2000) with water to make 400 mL, and use 50 mL of this solution.

Packaging and storage Preserve in well-closed containers.

Synthetic Aluminum Silicate
합성규산알루미늄

Description Synthetic Aluminum Silicate occurs as a white powder.
It is odorless and tasteless.
It is practically insoluble in water, ethanol(95), or ether.
To 1 g of Synthetic Aluminum Silicate, add 20 mL of sodium hydroxide solution (1 in 5), and heat; it dissolves, leaving behind slight insoluble substances.

Identification Perform the test as directed under the Identification of Natural Aluminum Silicate.

Purity (1) ***Acidity or alkalinity***—To 1.0 g of Synthetic Aluminum Silicate, add 20 mL of water, shake to mix, and centrifuge; the clear supernatant is neutral.

(2) ***Chloride—***Perform the test as directed in Purity (2) under Natural Aluminum Silicate.

(3) ***Sulfate***—Take 2.0 mL of the clear liquid from

(2), and add 1 mL of dilute hydrochloric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 1.0 mL of 0.005 mol/L sulfuric acid (NMT 0.480%).

(4) ***Heavy metals***—Proceed with 3.0 g of Synthetic Aluminum Silicate according to Purity (4) of Natural Aluminum Silicate and perform the test. However, prepare the control solution with 3.0 mL of lead standard solution (NMT 30 ppm).

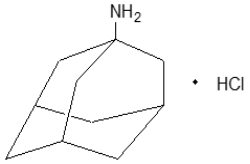
(5) ***Arsenic***—To 1.0 g of Synthetic Aluminum Silicate, add 10 mL of dilute hydrochloric acid, perform the test according to Purity (5) of Natural Aluminum Silicate (NMT 2 ppm).

Loss on drying NMT 20.0% (1 g, 105 ℃, 3 hours)

Acid-neutralizing capacity Weigh accurately about 1 g of Synthetic Aluminum Silicate, transfer into a stoppered flask, add exactly 200 mL of 0.1 mol/L hydrochloric acid, close the stopper, shake to mix for 1 hour at 37 ± 2 ℃, and filter. Pipet 50 mL of the filtrate, and titrate the excess hydrochloric acid while stirring well, with 0.1 mol/L sodium hydroxide VS until the pH becomes 3.5. The volume of 0.1 mol/L hydrochloric acid consumed for 1 g of Synthetic Aluminum Silicate is NLT 50.0 mL.

Packaging and storage Preserve in well-closed containers.

Amantadine Hydrochloride
아만타딘염산염



$C_{10}H_{17}N \cdot HCl$: 187.71

Adamantan-1-amine hydrochloride [*665-66-7*]

Amantadine Hydrochloride, when dried, contains NLT 99.0% and NMT 101.0% of amantadine hydrochloride ($C_{10}H_{17}N \cdot HCl$).

Description Amantadine Hydrochloride occurs as a white crystalline powder, which is odorless and has a bitter taste.

It is very soluble in formic acid, freely soluble in water, methanol or ethanol(95), and practically insoluble in ether.

Identification (1) Add 1 mL of pyridine and 0.1 mL of acetic anhydride to 0.1 g of Amantadine Hydrochloride, boil for 1 minute to dissolve, add 10 mL of dilute hydrochloric acid, and cool in iced water. Take the precipitated crystals by filtering, wash with water, and dry at 105 °C for 1 hour; the melting point is between 147 and 151 °C.

(2) Determine the infrared spectra of Amantadine Hydrochloride and amantadine hydrochloride RS, previously dried, as directed in the potassium chloride disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) An aqueous solution of Amantadine Hydrochloride (1 in 50) responds to the Qualitative Analysis for chloride.

pH Dissolve 1.0 g of Amantadine Hydrochloride in 5 mL of water; the pH of this solution is between 4.0 and 6.0.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Amantadine Hydrochloride in 10 mL of water; the solution is clear and colorless.

(2) ***Heavy metals***—Proceed with 2.0 g of Amantadine Hydrochloride according to Method 4 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Arsenic***—Proceed with 1.0 g of Amantadine Hydrochloride according to Method 3 and perform the test (NMT 2 ppm).

(4) ***Related substances***—Dissolve 0.50 g of Amantadine Hydrochloride in 10 mL of water, add 10 mL of sodium hydroxide TS and 10 mL of chloroform, and shake to mix well. Filter the chloroform layer through a funnel where 3 g of anhydrous sodium sulfate is placed on absorbent cotton ball and use the filtrate as the test solution. Pipet 1 mL of this solution, add chloroform to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 2 μL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak area of each solution according to the automatic integration method; each peak area other than the major peak from the test solution is not greater than 1/3 of the major peak area from the standard solution. Also, the sum of each peak area is not greater than the major peak area from the standard solution.

Operating conditions

Detector: A flame ionization detector

Column: A glass column, about 3 mm in inside diameter and about 2 m in length, filled with diatomaceous earth for gas chromatography (150 to 180 μm in particle diameter) coated with petroleum-based hexamethyltetracosane branched hydrocarbon mixture for gas chromatography (L) and potassium hydroxide at the ratio of 2% and 1%, respectively.

Column temperature: Inject at a constant temperature of about 125 °C, keep this temperature for 5 minutes, then raise to 150 °C at a rate of 5 °C per minute, and keep at a constant temperature of about 150 °C for 15 minutes.

Carrier gas: Nitrogen

Flow rate: Adjust the flow rate so that the retention time of amantadine is about 11 minutes.

System suitability

Detection sensitivity: Adjust the sensitivity so that the peak height of amantadine from 2 μL of the standard solution is about 10% of the full scale.

System performance: Dissolve 0.15 g of naphthalene in 5 mL of the test solution and add chloroform to make 100 mL. Proceed with 2 μL of this solution under the above operating conditions; naphthalene and amantadine are eluted in this order with the resolution being NLT 2.5.

Time span of measurement: About 2 times the retention time of amantadine beginning after the solvent peak.

Loss on drying NMT 0.5% (1 g, 105 ℃, 3 hours).

Residue on ignition NMT 0.2% (1 g).

Assay Weigh accurately about 0.2 g of Amantadine Hydrochloride, previously dried, dissolve in 2 mL of formic acid, add exactly 15 mL of 0.1 mol/L perchloric acid and heat on a steam bath for 30 minutes. After cooling, add acetic acid(100) to make 70 mL and titrate the exceeding amount of perchloric acid with 0.1 mol/L sodium acetate VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner.

Each mL of 0.1 mol/L perchloric acid VS
= 18.771 mg of $C_{10}H_{17}N \cdot HCl$

Packaging and storage Preserve in well-closed containers.

Ambroxol Hydrochloride Injection
암브록솔염산염 주사액

Ambroxol Hydrochloride Injection contains NLT 93.0% and NMT 107.0% of the labeled amount of ambroxol hydrochloride ($C_{13}H_{18}Br_2N_2O \cdot HCl$: 414.56).

Method of preparation Prepare Ambroxol Hydrochloride Injection as directed under Injections, with Ambroxol Hydrochloride.

Identification Take an amount of Ambroxol Hydrochloride Injection equivalent to 30 mg of ambroxol hydrochloride according to the labeled amount, add water to make 10 mL, and use this solution as the test solution. Separately, weigh accurately about 30 mg of ambroxol hydrochloride RS, dissolve in 10 mL of water, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of toluene, isopropanol and strong ammonia water (80 : 20 : 0.2) as the developing solvent and air-dry the plate. Examine the plate under ultraviolet light (main wavelength 254 nm); the R_f values and colors of the spots obtained from the test solution and the standard solution are the same.

pH Between 4.0 and 6.0.

Sterility Meets the requirements.

Bacterial endotoxins Less than 1 EU per mg of ambroxol hydrochloride.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Extractable volume of injections Meets the requirements.

Assay Pipet an amount of Ambroxol Hydrochloride Injection equivalent to 30 mg of ambroxol hydrochloride ($C_{13}H_{18}Br_2N_2O \cdot HCl$) according to the labeled amount. Place in a 100-mL separatory funnel, add 10 mL of 2 mol/L sodium hydroxide TS, and extract 2 times with 45 mL of ether. Combine the ether layers and place in a 250-mL separatory funnel, and wash 2 times with 10 mL of water. Place anhydrous sodium sulfate on the filter paper, filter the ether layer, and evaporate the filtrate to dryness. Add 0.1 mol/L methanolic hydrochloric acid TS to the residue to make 100 mL, and filter. Take 10.0 mL of the filtrate, add 0.1 mol/L methanolic hydrochloric acid TS to make 50 mL, and use this solution as the test solution. Separately, weigh accurately about 30 mg of ambroxol hydrochloride RS, transfer to a 100-mL separatory funnel, proceed in the same manner as the test solution, and use this solution as the standard solution. With the test solution and the standard solution, perform the test as directed under the Ultraviolet-visible Spectroscopy using 0.1 mol/L methanolic hydrochloric acid TS as the control solution, and determine the absorbances, A_T and A_S, at 313 nm.

Amount (mg) of ambroxol hydrochloride ($C_{13}H_{18}Br_2N_2O \cdot HCl$)
$= \text{Amount (mg) of ambroxol hydrochloride RS} \times \frac{A_T}{A_S}$

Packaging and storage Preserve in hermetic containers.

Ambroxol Hydrochloride Syrup
암브록솔염산염 시럽

Ambroxol Hydrochloride Syrup contains NLT 93.0% and NMT 107.0% of the labeled amount of am-

broxol hydrochloride ($C_{13}H_{18}Br_2N_2O \cdot HCl$: 414.56).

Method of preparation Prepare as directed under Syrups, with Ambroxol Hydrochloride.

Identification Weigh accurately an amount of Ambroxol Hydrochloride Syrup, equivalent to 30 mg of ambroxol hydrochloride according to the labeled amount, and transfer to a separatory funnel. Add 10 mL of 1 mol/L sodium hydroxide TS and extract 2 times with each 45 mL of ether. Combine the ether layers, transfer to a 250-mL separatory funnel, and wash 2 times with each 10 mL of water. Filter the ether extracts through a layer of anhydrous sodium sulfate and evaporate the filtrate to dryness. Dissolve the residue in 10 mL of water and use the solution as the test solution. Separately, weigh accurately 45 mg of ambroxol hydrochloride RS and dissolve in 15 mL of water. Take 10 mL of the solution, transfer to a separatory funnel, proceed in the same manner as for the preparation of the test solution, and use the resulting solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot each 5 μL of the test solution and the standard solution on a thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate using a mixture of toluene, isopropanol and ammonia water(28) (40 : 10 : 0.1) as a developing solvent, and air-dry the plate. Examine the plate under ultraviolet light (principal wavelength 254 nm); the spots of the test solution exhibit an R_f values and color corresponding to that of the standard solution.

pH Between 2.0 and 4.0.

Uniformity of dosage units (distribution) Meets the requirements.

Assay Shake Ambroxol Hydrochloride Syrup to mix, pipet an amount equivalent to 30 mg of ambroxol hydrochloride ($C_{13}H_{18}Br_2N_2O \cdot HCl$: 414.56). Place in a 100-mL separatory funnel, add 10 mL of 2 mol/L sodium hydroxide TS, and extract 2 times with 45 mL of ether. Combine the ether layers, transfer to a 250-mL separatory funnel, and wash 2 times with each 10 mL of water. Place anhydrous sodium sulfate on the filter paper, filter the ether layer, and evaporate the filtrate to dryness. To the residue, add 0.1 mol/L methanolic hydrochloric acid TS to make exactly 100 mL, and filter. Pipet 10 mL of this solution, add 0.1 mol/L methanolic hydrochloric acid TS to make exactly 50 mL, and use the solution as the test solution. Separately, weigh accurately about 0.15 g of ambroxol hydrochloride RS and add water to make exactly 50 mL. Pipet 10 mL of the solution, transfer to a 100-mL separatory funnel, proceed in the same manner as for the preparation of the test solution, and use the resulting solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution at the wavelength of 313 nm as directed under the Ultraviolet-visible Spectroscopy.

Amount (mg) of ambroxol hydrochloride ($C_{13}H_{18}Br_2N_2O \cdot HCl$)
= Amount (mg) of ambroxol hydrochloride RS
$\times (A_T / A_S) \times (1 / 5)$

Packaging and storage Preserve in tight containers.

Ambroxol Hydrochloride Tablets
암브록솔염산염 정

Ambroxol Hydrochloride Tablets contain NLT 93.0% and NMT 107.0% of ambroxol hydrochloride ($C_{13}H_{18}Br_2N_2O$ HCl : 414.56) of the labeled amount.

Method of preparation Prepare Ambroxol Hydrochloride Tablets as directed under Tablets, with Ambroxol Hydrochloride.

Identification Weigh an amount of Ambroxol Hydrochloride Tablets, equivalent to about 40 mg of ambroxol hydrochloride, according to the labeled amount, and transfer to a 100-mL separatory funnel. Add 5 mL of water and 0.5 mL of 0.5 mol/L sodium hydroxide TS, and extract with 10 mL of ether. Filter the ether extract, and use the filtrate as the test solution. Separately, weigh accurately 40 mg of ambroxol hydrochloride RS, transfer to a 100-mL separatory funnel, proceed in the same manner as for the test solution, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of toluene, isopropanol and strong ammonia water (80 : 20 : 0.2) as the developing solvent, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the R_f value and color of the spots obtained from the test solution and the standard solution are the same.

Dissolution Perform the test with 1 tablet of Ambroxol Hydrochloride Tablets at 50 revolutions per minute according to Method 2, using 900 mL of water as the dissolution medium. Take the dissolved solution 30 minutes after starting the dissolution test, filter and use the filtrate as the test solution. Separately, weigh accurately about 30 mg of ambroxol hydrochloride RS, and add water to make 100 mL. Take 5.0 mL of this solution, add water to make 100 mL, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at the wavelength of 313 nm as directed under the Ultraviolet-visible Spectroscopy. The acceptable dissolution criterion is NLT 80% of Ambroxol Hydrochloride Tablets dissolved in 30 minutes.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 tablets of Ambroxol Hydrochloride Tablets, and powder. Weigh accurately an amount, equivalent to about 15 mg of ambroxol hydrochloride ($C_{13}H_{18}Br_2N_2O$·HCl), transfer to a 100-mL volumetric flask, add 60 mL of methanol and extract for 15 minutes. Add methanol to make 100 mL, and filter. Transfer 50.0 mL of the filtrate to a 100-mL volumetric flask, add 10 mL of 0.1 mol/L methanolic hydrochloric acid TS, add methanol to make 100 mL, and use this solution as the test solution. Separately, weigh accurately about 75 mg of ambroxol hydrochloride RS, transfer to a 100-mL volumetric flask, and add 0.1 mol/L methanolic hydrochloric acid TS to make 100 mL. Take 10.0 mL of this solution, add 0.1 mol/L methanolic hydrochloric acid TS to make 100 mL, and use this solution as the standard solution. With the test solution and the standard solution, perform the test as directed under the Ultraviolet-visible Spectroscopy using 0.1 mol/L methanolic hydrochloric acid TS as a control solution; determine the absorbances, A_T and A_S, at the wavelength of 313 nm.

$$\text{Amount (mg) of ambroxol hydrochloride } (C_{13}H_{18}Br_2N_2O\cdot HCl) = \text{Amount (mg) of ambroxol hydrochloride} \times \frac{A_T}{A_S} \times \frac{1}{5}$$

Packaging and storage Preserve in well-closed containers.

Ambroxol Hydrochloride and Clenbuterol Hydrochloride Syrup
암브록솔염산염·클렌부테롤염산염 시럽

Ambroxol Hydrochloride and Clenbuterol Hydrochloride Syrup contains NLT 90.0% and NMT 110.0% of ambroxol hydrochloride ($C_{13}H_{18}Br_2N_2O$ ·HCl : 414.56) and clenbuterol hydrochloride ($C_{12}H_{18}Cl_2N_2O$ ·HCl : 313.65), according to the labeled amount.

Method of preparation Prepare as directed under Syrups, with Ambroxol Hydrochloride and Clenbuterol Hydrochloride.

Identification (1) ***Ambroxol hydrochloride***—Weigh accurately an amount of Ambroxol Hydrochloride and Clenbuterol Hydrochloride Syrup, equivalent to 30 mg of ambroxol hydrochloride according to the labeled amount, and transfer to a separatory funnel. Add 10 mL of 1 mol/L sodium hydroxide TS and extract 2 times with each 45 mL of ether. Combine the ether layers, transfer to a 250-mL separatory funnel, and wash 2 times with each 10 mL of water. Filter the ether extracts through anhydrous sodium sulfate placed on a filter paper and evaporate the filtrate to dryness. Dissolve the residue in 10 mL of water and use this solution as the test solution. Separately, weigh 45 mg of ambroxol hydrochloride RS and dissolve in 15 mL of water. Take 10 mL of the solution, transfer to a separatory funnel, proceed in the same manner as for the preparation of the test solution, and use the resulting solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot each 5 μL of the test solution and the standard solution on a thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate using a mixture of toluene, isopropanol and ammonia water(28) (40 : 10 : 0.1) and air-dry the plate. Expose the plate to ultraviolet rays (main wavelength: 254 nm); the R_f values and the colors of the spots obtained from the test solution and the standard solution are the same.

(2) ***Clenbuterol hydrochloride***—Weigh an amount of Ambroxol Hydrochloride and Clenbuterol Hydrochloride Syrup, equivalent to 0.1 mg of clenbuterol hydrochloride, transfer to a 250-mL separatory funnel, and add 50 mL of water to mix. Next, add 5 mL of 2 mol/L sodium hydroxide to make the solution alkaline and extract 3 times with each 50 mL of ether. Combine the extracts, wash with 50 mL of water, remove water by filtering through anhydrous sodium sulfate placed on a filter paper, and evaporate to dryness on a steam bath. Dissolve the residue in 0.5 mL of methanol and use this solution as the test solution. Separately, dissolve 10 mg of clenbuterol hydrochloride RS in 50 mL of methanol and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography (with fluorescent indicator). Next, develop the plate with a mixture of toluene, isopropanol, and ammonia (80 : 20 : 1) and air-dry the plate. Expose the plate to ultraviolet rays (main wavelength: 254 nm); the R_f values and the colors of the spots obtained from the test solution and the standard solution are the same.

(3) The retention times of the major peaks obtained from the test solution and the standard solution under the Assay are the same.

pH Between 4.0 and 6.0.

Uniformity of dosage units (distribution) Meets the requirements.

Assay (1) ***Ambroxol hydrochloride***—Weigh accurately an amount of Ambroxol Hydrochloride and Clenbuterol Hydrochloride Syrup, equivalent to 10 mg of ambroxol hydrochloride ($C_{13}H_{18}Br_2N_2O$ ·HCl), transfer to a 250-mL separatory funnel, and add 50 mL of water to mix. Add 10 mL of 2 mol/L sodium hydroxide solution to make it alkaline, shake well to mix 5 times with 30 mL each of ether using a shaker, collect the ether layer, and wash with 30 mL of water. Put anhydrous sodium sulfate on a filter paper, filter the collected ether layer, and evap-

orate the filtrate to dryness. To the residue, add 0.1 mol/L methanolic hydrochloric acid TS to make exactly 100 mL. Filter the solution, take exactly 10 mL of the filtrate, add 0.1 mol/L methanolic hydrochloric acid TS to make exactly 50 mL, and use the solution as the test solution. Separately, weigh accurately about 50 mg of ambroxol hydrochloride RS and add water to make exactly 50 mL. Take exactly 10 mL of the solution, transfer to a separatory funnel, proceed in the same manner as for the preparation of the test solution, and use the resulting solution as the standard solution. Perform the test with each 20 μL of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions and determine the peak areas, A_T and A_S, of ambroxol hydrochloride from the test solution and the standard solution.

Amount (mg) of ambroxol hydrochloride ($C_{13}H_{18}Br_2N_2O$·HCl)
= Amount (mg) of ambroxol hydrochloride RS × (A_T / A_S) × 1/5

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 30 cm in length, packed with cyanosilyl silica gel for liquid chromatography (5 μm to 10 μm in particle diameter).

Mobile phase: Adjust the pH of a mixture of 0.15% sodium 1-heptanesulfonate, methanol and isopropanol (40 : 9 : 1) to 3.0 with acetic acid(100).

Flow rate: 1.2 mL/min

(2) ***Clenbuterol hydrochloride***—Weigh accurately an amount of Ambroxol Hydrochloride and Clenbuterol Hydrochloride Syrup, equivalent to 0.1 mg of clenbuterol hydrochloride ($C_{12}H_{18}Cl_2N_2O$·HCl), transfer to a 500-mL separatory funnel, and add 50 mL of water to mix. Add 5 mL of 2 mol/L sodium hydroxide to make the solution basic, extract 5 times with each 40 mL of ether while mixing well with a shaker, collect the ether layers, and wash with 30 mL of water. Extract the washed ether layer 2 times with each 10 mL of 1 mol/L, collect the water layers into a 25-mL volumetric flask, add 1 mol/L hydrochloric acid TS to make exactly 25 mL, and use the solution as the test solution. Separately, weigh accurately about 25 mg of clenbuterol hydrochloride RS and add 1 mol/L hydrochloric acid TS to make exactly 250 mL. Pipet 1 mL of the solution, add 1 mol/L hydrochloric acid TS to make exactly 25 mL and use this solution as the standard solution. Pipet each 25 μL of the test solution and the standard solution and perform the test according to the operating conditions in (1) Ambroxol hydrochloride under the Assay.

Amount (mg) of clenbuterol hydrochloride ($C_{12}H_{18}Cl_2N_2O$·HCl)
= Amount (mg) of clenbuterol hydrochloride RS × (A_T / A_S) × 1/250

Packaging and storage Preserve in tight containers.

Ambroxol Hydrochloride and Clenbuterol Hydrochloride Tablets
암브록솔염산염·클렌부테롤염산염 정

Ambroxol Hydrochloride and Clenbuterol Hydrochloride Tablets contain NLT 90.0% and NMT 110.0% of the labeled amounts of ambroxol hydrochloride ($C_{13}H_{18}Br_2N_2O$·HCl : 414.56) and clenbuterol hydrochloride ($C_{12}H_{18}Cl_2N_2O$ HCl : 313.65).

Method of preparation Prepare Ambroxol Hydrochloride and Clenbuterol Hydrochloride Tablets as directed under Tablets, with Ambroxol Hydrochloride and Clenbuterol Hydrochloride.

Identification The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay (1) ***Ambroxol hydrochloride***—Weigh accurately the mass of NLT 20 tablets of Ambroxol Hydrochloride and Clenbuterol Hydrochloride Tablets, and powder. Weigh accurately an amount equivalent to about 10 mg of ambroxol hydrochloride ($C_{13}H_{18}Br_2N_2O$ HCl) and transfer to a 250-mL separatory funnel, add 50 mL of water, and mix. Add 10 mL of 2 mol/L sodium hydroxide solution to make it alkaline, shake well to mix 5 times each with 30 mL of ether using a shaker, collect the ether layer, and wash with 30 mL of water. Place anhydrous sodium sulfate on the filter paper, filter the ether layer, and evaporate the filtrate to dryness. Add 0.1 mol/L methanolic hydrochloric acid TS to the residue to make exactly 100 mL. Filter this solution, take exactly 10 mL of the filtrate, add 0.1 mol/L methanolic hydrochloric acid TS to make exactly 50 mL, and use this solution as the test solution. Separately, weigh accurately about 50 mg of ambroxol hydrochloride RS, and add water to make exactly 50 mL. Take exactly 10 mL of this solution, transfer to a separatory funnel, proceed in the same manner as the test solution, and use this solution as the standard solution. Pipet 20 μL each of the test solution and the standard solution, and perform the test as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S of ambroxol hydrochloride of each solution.

Amount (mg) of ambroxol hydrochloride ($C_{13}H_{18}Br_2N_2O$·HCl)
= Amount (mg) of ambroxol hydrochloride RS

$$\times (A_T / A_S) \times 1/5$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 30 cm in length, packed with cyanosilyl silica gel for liquid chromatography (5 μm to 10 μm in particle diameter).

Mobile phase: A mixture of 0.15% sodium 1-heptanesulfonate solution, methanol, and isopropanol (40 : 9 : 1) adjusted to pH 3.0 with acetic acid(100).

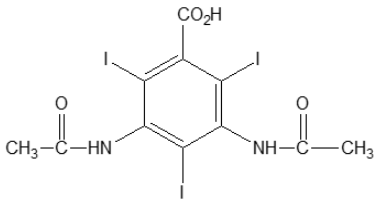
Flow rate: 1.2 mL/min

(2) ***Clenbuterol hydrochloride*—**Weigh accurately the mass of NLT 20 tablets of Ambroxol Hydrochloride and Clenbuterol Hydrochloride Tablets, and powder. Weigh accurately an amount equivalent to about 0.1 mg of clenbuterol hydrochloride ($C_{12}H_{18}Cl_2N_2O \cdot HCl$), transfer to a 500-mL separatory funnel, add 50 mL of water, and mix. Next, add 5 mL of 2 mol/L sodium hydroxide TS to make it alkaline, shake to mix 5 times each with 40 mL of ether using a shaker, collect the ether layer, and wash with 30 mL of water. Extract the washed ether layer twice each with 10 mL of 1 mol/L hydrochloric acid TS, add 1 mol/L hydrochloric acid TS to the water layer to make exactly 25 mL, and use this solution as the test solution. Separately, weigh accurately about 25 mg of clenbuterol hydrochloride RS, and add 1 mol/L hydrochloric acid TS to make exactly 250 mL. Pipet 1 mL of this solution, add 1 mol/L hydrochloric acid TS to make exactly 25 mL, and use this solution as the standard solution. Pipet 25 μL each of the test solution and the standard solution, and perform the test according to the operating conditions as directed in (1) Ambroxol hydrochloride under Assay.

Amount (mg) of clenbuterol hydrochloride ($C_{12}H_{18}Cl_2N_2O \cdot HCl$)
= Amount (mg) of clenbuterol hydrochloride RS
$\times (A_T / A_S) \times 1/250$

Packaging and storage Preserve in well-closed containers.

Amidotrizoic Acid
아미도트리조산



$C_{11}H_9I_3N_2O_4$: 613.91

3,5-Diacetamido-2,4,6-triiodobenzoic acid [*117-96-4*]

Amidotrizoic Acid contains NLT 98.0% and NMT 101.0% of amidotrizoic acid ($C_{11}H_9I_3N_2O_4$), calculated on the dried basis.

Description Amidotrizoic Acid occurs as a white crystalline powder and is odorless.
It is slightly soluble in ethanol(95), very slightly soluble in water and practically insoluble in ether.
It dissolves in sodium hydroxide TS.

Identification (1) Heat 0.1 g of Amidotrizoic Acid directly over flame; a violet gas is produced.

(2) Determine the infrared spectra of Amidotrizoic Acid and amidotrizoic acid RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Amidotrizoic Acid in 10 mL of 0.2 mol/L sodium hydroxide TS; the resulting solution is colorless and clear.

(2) ***Primary aromatic amines*—**Dissolve 0.20 g of Amidotrizoic Acid in 5 mL of water and 1 mL of sodium hydroxides TS, add 4 mL of a sodium nitrite solution (1 in 100) and 10 mL of 1 mol/L hydrochloric acid TS, shake to mix, and allow to stand for 2 minutes. Next, add 5 mL of ammonium sulfamate TS, shake well to mix, allow to stand for 1 minute, and add 0.4 mL of a solution of 1-naphthol in ethanol (1 in 10), 15 mL of sodium hydroxide TS and water to make exactly 50 mL. Perform the test as directed under the Ultraviolet-visible Spectroscopy using the blank test solution prepared in the same manner as the control solution; the absorbance at 485 nm is NMT 0.15.

(3) ***Soluble halides*—**Dissolve 2.5 g of Amidotrizoic Acid in 20 mL of water and 2.5 mL of ammonia TS, add 20 mL of dilute nitric acid and water to make 100 mL, allow to stand for 15 minutes with occasional shaking, and filter. Discard the first 10 mL of the filtrate, transfer the subsequent 25 mL of the filtrate to a Nessler tube, and add ethanol(95) to make 50 mL. Proceed as directed under the Chloride using this solution as the test solution. Prepare the control solution as follows: to 0.10 mL of 0.01 mol/L hydrochloric acid TS, add 6 mL of dilute nitric acid and water to make 25 mL, and add ethanol(95) to make 50 mL.

(4) ***Iodine*—**Dissolve 0.20 g of Amidotrizoic Acid in 2.0 mL of sodium hydroxide TS, add 2.5 mL of 0.5 mol/L sulfuric acid TS, allow to stand for 10 minutes with occasional shaking, add 5 mL of chloroform, shake well to mix, and allow to stand; the chloroform layer is colorless.

(5) ***Heavy metals***—Proceed with 2.0 g of Amidotrizoic Acid according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(6) **Arsenic**—Prepare the test solution with 0.6 g of Amidotrizoic Acid according to Method 3 and perform

the test (NMT 3.3 ppm).

Loss on drying NMT 7.0% (1 g, 105 ℃, 4 hours).

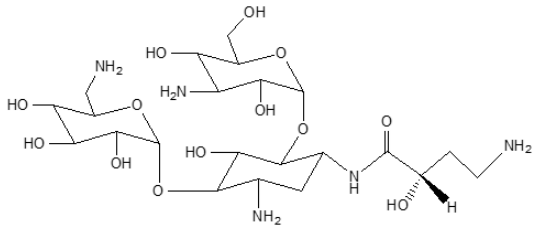
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.5 g of Amidotrizoic Acid, transfer it into a flask, dissolve in 40 mL of sodium hydroxide TS, and add 1 g of zinc powder. After connecting the flask to a reflux condenser, boil for 30 minutes, cool, and filter. Wash the flask and the filter paper with 50 mL of water and combine the solution used for washings with the filtrate. Add 5 mL of acetic acid(100) to this solution and titrate with 0.1 mol/L silver nitrate VS (indicator: 1 mL of Tetrabromophenolphthalein ethyl ester TS). However, the endpoint of the titration is when the color of the precipitate is changed from yellow to green.

Each mL of 0.1 mol/L silver nitrate VS
= 20.464 mg of $C_{11}H_9I_3N_2O_4$

Packaging and storage Preserve in light-resistant, tight containers.

Amikacin
아미카신



$C_{22}H_{43}N_5O_{13}$: 585.60

(2*S*)-4-Amino-*N*-[(1*R*,2*S*,3*S*,4*R*,5*S*)-5-amino-2-{[(2*S*,3*R*,4*S*,5*S*,6*R*)-4-amino-3,5-dihydroxy-6-(hydroxymethyl)oxan-2-yl]oxy}-4-{[(2*R*,3*R*,4*S*,5*S*,6*R*)-6-(aminomethyl)-3,4,5-trihydro-xy-oxan-2-yl]oxy}-3-hydroxycyclohexyl]-2-hydroxybutanamide [*37517-28-5*]

Amikacin contains NLT 900 μg (potency) of amikacin ($C_{22}H_{43}N_5O_{13}$) per mg, calculated on the anhydrous basis.

Description Amikacin occurs as a white to pale grayish white, wool-like powder.

Identification (1) Weigh about 60 mg each of Amikacin and amikacin RS, dissolve each in water to obtain solutions having known concentrations of 6 mg per mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with these solutions as directed under the Thin Layer Chromatography. Spot 3 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Develop the plate with a mixture of methanol, ammonia water(28) and chloroform (60:35:25) as the developing solvent for 5 hours and 30 minutes in a 230 x 230 x 90 mm developing chamber. Before the start of the development, fold a 200 x 30 mm Whatman filter paper No. 3 or a filter paper strip made of the same material in the length-wise direction, hang it over the front end of the developing chamber, and place the plate in such a way that it protrudes about 10 mm from the end of the developing chamber to make the silica gel layer slanted forward. Cover all the open areas, except for the filter paper area, for which the developing chamber is closed with a lid for the developing chamber having a hole of 200 × 6 mm, with adhesive tape. After the development is completed, air-dry the plate. Spray evenly the mixture of 100 mL of 1% ninhydrin-butanol solution and 1 mL of pyridine on the plate and heat the plate at 110 °C for 15 minutes to develop a color; the R_f values of the spots obtained from the test solution and the standard solution are the same.

(2) The retention times of the major peaks obtained from the test solution and the standard solution under the Assay are the same.

Crystallinity Meets the requirements.

Optical rotation $[\alpha]_D^{25}$: Between +97° and +105° (0.5 g, calculated on the anhydrous basis, water, 25 mL, 100 mm).

pH Dissolve 0.1 g of Amikacin in 10 mL of water; the pH of this solution is between 9.5 and 11.5.

Water NMT 8.5% (0.1 g, volumetric titration, direct titration).

Residue on ignition NMT 1.0% (1 g). However, moisten the carbonized residue with 2 mL of nitric acid and 5 drops of sulfuric acid.

Assay ***The cylinder-plate method***—(1) Medium Agar medium for seed and base layer Use the medium in (A) (2) (a) ① ⓑ under the Microbial Assays for Antibiotics.

(2) Test organism Use *Bacillus subtilis* ATCC 6633 as the test organism.

(3) Weigh accurately about 15 mg (potency) of Amikacin and dissolve it in sterile distilled water to obtain a solution having a known concentration of 400 μg (potency) per mL. Pipet a suitable amount of this solution, add 0.1 mol/L phosphate buffer (pH 8.0) to obtain solutions having a known concentrations of 20.0 μg (potency) and 5.0 μg (potency) per mL., and use these solutions as the high-concentration test solution and the low-concentration test solution, respectively. Separately, weigh accurately about 15 mg (potency) of amikacin sulfate RS, dissolve in 0.05 mol/L phosphate buffer (pH 6.0) to obtain a solution having a known concentration of 400 μg (potency) per mL, and use the solution as the standard

stock solution. Keep this standard stock solution at between 5 and 15 °C, and use it within 30 days. For the assay, pipet a suitable amount of the standard stock solution, add 0.1 mol/L phosphate buffer (pH 8.0) to obtain solutions having a known concentrations of 20.0 μg (potency) and 5.0 μg (potency) per mL, and use these solutions as the high-concentration standard solution and the low-concentration standard solution, respectively. With these solutions, perform the test according to (A)(8) under the Microbial Assays for Antibiotics.

Packaging and storage Preserve in tight containers.

Amikacin Injection
아미카신 주사액

Amikacin Injection contains NLT 90.0% and NMT 120.0% of the labeled amount of amikacin ($C_{22}H_{43}N_5O_{13}$: 585.61).

Method of preparation Prepare as a liquid injection by adding sulfuric acid to Amikacin as directed under Injections.

Description Amikacin Injection occurs as a colorless to pale yellow liquid.

Identification Proceed as directed under the Identification under Amikacin.

pH Between 3.5 and 5.5.

Sterility Meets the requirements.

Bacterial endotoxins Less than 0.33 EU per mg (potency) of amikacin.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Extractable volume of injections Meets the requirements.

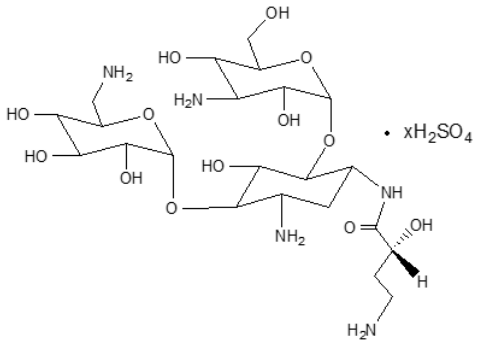
Assay ***Nephelometry***—(1) Medium: Use the liquid medium for suspending a test organism described in (B) (2) under the Microbial Assays for Antibiotics.

(2) Test organism and test organism suspension: Use *Staphylococcus aureus* ATCC 6538P as the test organism. Add 0.1 mL of the cell suspension to 100 mL of the liquid medium for suspending the test organism and use it as the test organism suspension.

(3) Weigh accurately an amount of Amikacin Injection, dilute with sterile purified water to a suitable concentration, pipet an appropriate amount of the solution, and dilute with sterile purified water to obtain a solution having a known concentration of 10.0 μg (potency) per mL, and use this solution as the test solution. Separately, weigh accurately an appropriate amount of amikacin sulfate RS, and dissolve in a sufficient amount of sterile purified water to obtain a solution having known concentration of 1 mg (potency) per mL. Use this solution as the standard stock solution. Store the standard stock solution at a temperature NLT 5 °C and use it within 14 days. Pipet an appropriate volume of the standard stock solution, dilute with sterile purified water to obtain a solution having known concentrations of 8.0, 8.9, 10.0, 11.2, and 12.5 μg (potency) per mL and use these solutions as the standard solutions. Perform the test with these solutions as directed in (B) (6) under the Microbial Assays for Antibiotics.

Packaging and storage Preserve in hermetic containers.

Amikacin Sulfate
아미카신황산염



$C_{22}H_{43}N_5O_{13}·xH_2SO_4$

4-Amino-*N*-[5-amino-2-[4-amino-3,5-dihydroxy-6-(hydroxymethyl)oxan-2-yl]oxy-4-[6-(amino-methyl)-3,4,5-trihydroxyoxan-2-yl]oxy-3-hydroxy-cyclohexyl]-2-hydroxybutanamide; sulfuric acid [*39831-55-5*]

Amikacin Sulfate is a sulfate of amikacin derivatives.

Amikacin Sulfate contains NLT 691 μg and NMT 791 μg (potency) of amikacin ($C_{22}H_{43}N_5O_{13}$: 585.60) per mg, calculated on the dried basis.

Description Amikacin Sulfate occurs as a white to yellowish white powder.

It is very soluble in water and practically insoluble in ethanol(95).

Identification (1) Determine the infrared spectra of Amikacin Sulfate and amikacin sulfate RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) Weigh 0.1 g each of Amikacin Sulfate and ami-

kacin sulfate RS, dissolve in 4 mL of water, and use these solutions as the test solution and the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 2 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of water, ammonia water(28), methanol, and tetrahydrofuran (1:1:1:1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Spray evenly ninhydrin-citric acid-acetic acid TS on the plate, and heat at 100 ℃ for 10 minutes; the spots obtained from the test solution and the standard solution show a purple color, and the R_f values are the same.

(3) The aqueous solution of Amikacin Sulfate (1 in 100) responds to the Qualitative Analysis (1) for sulfate.

Optical rotation $[\alpha]_D^{20}$: Between +76° and +84° (1 g, calculated on the dried basis, water, 100 mL, 100 mm).

pH Dissolve 1.0 g of Amikacin Sulfate in 100 mL of water; the pH is between 6.0 and 7.5.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Amikacin Sulfate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Related substances***—Dissolve 0.1 g of Amikacin Sulfate in 4 mL of water, and use this solution as the test solution. Pipet 1 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 2 μL each of the test solutions and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of water, ammonia water(28), methanol, and tetrahydrofuran (1:1:1:1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Spray evenly ninhydrin-citric acid-acetic acid TS on the plate, and heat at 100 ℃ for 10 minutes; the spots other than the principal spot obtained from the test solution are not more intense than the spots from the standard solution.

Sterility It meets the requirements when used in a sterile preparation. However, it is excluded in cases where there is a final sterilization process in the manufacturing of sterile preparations.

Bacterial endotoxins Less than 0.50 EU per mg (potency) of amikacin when used for the manufacturing of sterile preparations.

Loss on drying NMT 4.0% (1 g, in vacuum, 60 ℃, 3 hours).

Assay Weigh accurately about 20 mg (potency) of Amikacin Sulfate, and add water to make exactly 100 mL. Pipet 10 mL of this solution, add water to make 100 mL, and use this solution as the test solution. Separately, weigh accurately 20 mg (potency) of amikacin sulfate RS, and add water to make exactly 100 mL. Pipet 10 mL of this solution, add water to make 100 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak areas, A_T and A_S, of the test solution and the standard solution, according to the automatic integration method.

$$\text{Potency (mg) of amikacin } (C_{22}H_{43}N_5O_{13}) = \text{Potency (mg) of amikacin sulfate RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: Electrochemical detector

Current		Time (ms)
No.	Voltage	
E1	0.04	200
E2	0.8	190
E3	-0.8	190

Column: A plastic column about 4 mm in internal diameter and about 25 cm in length, packed with 10 μm porous trimethylamine-substituted anion-exchange resin for liquid chromatography (pore size: 8 μm). Use a guard column packed with porous trimethylamine-substituted anion-exchange resin for liquid chromatography.

Mobile phase: 0.115 mol/L sodium hydroxide.

Flow rate: 0.5 mL/min

System suitability

System performance: Weigh accurately about 20 mg (potency) of amikacin sulfate RS and 8 mg (potency) of kanamycin sulfate, and add water to make exactly 100 mL. Pipet 10 mL of this solution, add water to make exactly 100 mL, and proceed with the resulting solution according to the above conditions; the relative retention time of kanamycin and amikacin is 0.8 and 1.0, respectively, with the resolution being NLT 3.

System repeatability: Repeat the test 6 times with 20 mL each of the standard solutions; the relative standard deviation of the peak area of amikacin is NMT 3.0%.

Packaging and storage Preserve in hermetic containers.

Amikacin Sulfate Injection
아미카신황산염 주사액

Amikacin Sulfate Injection is an aqueous injection and contains NLT 90.0% and NMT 115.0% of the labeled amount of amikacin ($C_{22}H_{43}N_5O_{13}$: 585.60).

Method of preparation Prepare as directed under Injections, with Amikacin Sulfate.

Description Amikacin Sulfate Injection occurs as a colorless to a pale yellow, clear liquid.

Identification Weigh an amount of Amikacin Sulfate Injection, equivalent to 0.1 g (potency) of amikacin sulfate according to the labeled amount, add water to make 4 mL, and use this solution as the test solution. Separately, dissolve an amount of amikacin sulfate RS, equivalent to 25 mg (potency), in 1 mL of water and use this solution as the standard solution. Perform the test as directed under the Identification (2) of Amikacin Sulfate.

pH Between 6.0 and 7.5.

Sterility Meets the requirements.

Bacterial endotoxins Less than 0.50 EU per mg (potency) of amikacin

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Extractable volume of injections Meets the requirements.

Assay Pipet an amount of Amikacin Sulfate Injection, equivalent to about 20 mg (potency) of amikacin sulfate according to the labeled amount and add water to make exactly 100 mL. Pipet 10 mL of this solution, add water to make 100 mL, and use this solution as the test solution. Separately, weigh accurately about 20 mg (potency) of amikacin sulfate RS, and add water to make exactly 100 mL. Pipet 10 mL of this solution, add water to make 100 mL, and use this solution as the standard solution. Perform the test with each 20 μL of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions. Determine the peak areas, A_T and A_S, in the chromatograms of the test solution and standard solution by the automatic integration method.

$$\text{Potency (mg) of amikacin } (C_{22}H_{43}N_5O_{13}) = \text{Potency (mg) of amikacin sulfate RS} \times \frac{A_T}{A_S}$$

Operating conditions

Aminocaproic Acid
아미노카프로산

$H_2NCH_2CH_2CH_2CH_2CO_2H$

$C_6H_{13}NO_2$: 131.17

6-Aminohexanoic acid [*60-32-2*]

Aminocaproic Acid contains NLT 98.5% and NMT 101.5% of aminocaproic acid ($C_6H_{13}NO_2$), calculated on the anhydrous basis.

Description Aminocaproic Acid occurs as a white crystalline, fine powder and is almost odorless.

It is freely soluble in water, in acid or in alkali, slightly soluble in methanol or in ethanol(95) and practically insoluble in chloroform or in ether.

An aqueous solution of Aminocaproic Acid is neutral.

Melting point—About 205 °C.

Identification Determine the infrared spectra of Aminocaproic Acid and Aminocaproic acid RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Purity ***Heavy metals***—Proceed with 1.0 g of Aminocaproic Acid according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

Water NMT 0.5% (1 g, volumetric titration, direct titration).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.12 g of Aminocaproic Acid and add water to make exactly 10 mL. To 5.0 mL of this solution, add 2.0 mL of the internal standard solution and water to make exactly 100 mL and use this solution as the test solution. Separately, weigh accurately about 0.12 g of aminocaproic acid RS, previously dried at 105 ºC for 30 minutes and dissolve in water to make exactly 10 mL. To 5.0 mL of this solution, add 2.0 mL of the internal standard solution and water to make exactly 100 mL and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the peak area ratios, Q_T and Q_S, of aminocaproic acid to the internal standard, respectively.

Potency (μg) of aminocaproic acid ($C_6H_{13}NO_2$)
= Potency (μg) of aminocaproic acid RS × $\frac{Q_T}{Q_S}$

Internal standard solution—Weigh accurately 25.0 mg of methionine and dissolve in 20 mL of water.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 210 nm).

Column: A stainless steel column, about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm to 10 μm in particle diameter).

Column temperature: A constant temperature of about 30 °C.

Mobile phase: Dissolve 0.55 g of sodium 1-heptanesulphonate in water to make 1000 mL and use this solution as solution A. Dissolve 10 g of potassium dihydrogen phosphate in 300 mL of solution A, add 250 mL of methanol, then add another 300 mL of solution A, and shake to mix. Adjust the pH of this mixture to 2.2 with phosphoric acid and add solution A to make 1000 mL.

Flow rate: 0.7 mL/min

System suitability

System performance: Proceed with 20 μL of the standard solution according to the above conditions; aminocaproic acid and methionine are eluted in this order with the resolution between these peaks being NLT 2.0.

System repeatability: Repeat the test 6 times with 20 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area ratio is NMT 2.0%.

Packaging and storage Preserve in tight containers.

Aminocaproic Acid Tablets
아미노카프로산 정

Aminocaproic Acid Tablets contain NLT 95.0% and NMT 105.0% of aminocaproic acid ($C_6H_{13}NO_2$: 131.17).

Method of preparation Prepare as directed under Tablets, with Aminocaproic Acid.

Identification Powder 2 tablets of Aminocaproic Acid Tablets, add 10 mL of water, shake well to mix, and filter to 100 mL of acetone and filter. Shake well the mixture and allow to stand for 15 minutes until crystals are formed. Filter the crystals through a glass filter (G4), wash with 25 mL of acetone, and remove the solvent under reduced pressure. Dry at 105 ℃ for 30 minutes and cool. Proceed with the residue as directed under the Identification under Aminocaproic Acid and perform the test.

Dissolution Perform the test with 1 tablet of Aminocaproic Acid Tablets at 100 revolutions per minute according to Method 1 under the Dissolution, using 900 mL of water as dissolution medium. Take the dissolved solution after 45 minutes after starting the test and use this solution as the test solution. Separately, weigh accurately an appropriate amount of aminocaproic acid RS, previously dried at 105 ºC for 30 minutes, dissolve in water to obtain a solution having known concentration of about 500 μg of aminocaproic acid per mL, and use this solution as the standard solution. To each 1 mL of the test solution and the standard solution, add 20.0 mL of borate buffer solution, pH 9.5, and 3.0 mL of freshly prepared sodium β-naphthoquinone-4-sulfonate (1 in 500), shake to mix, and allow to stand on a steam bath at 65 ± 5 ºC for 45 minutes. After cooling, add water to each to make exactly 50 mL and mix. Determine the absorbances of these solutions at the absorbance maximum wavelength (λmax), about 460 nm, as directed under the Ultraviolet-visible Spectroscopy, using the blank test solution as the control solution.

It meets the requirements if the dissolution of Aminocaproic Acid Tablets in 45 minutes is NLT 75%.

Borate buffer solution, pH 9.5—Dissolve 6.185 g of boric acid and 7.930 g of potassium chloride in water, add 60 mL of 0.1 mol/L of sodium hydroxide, and add water to make 2000 mL. Adjust the pH to 9.5 ± 0.1 with 0.1 mol/L sodium hydroxide, if necessary.

Uniformity of dosage units Meets the requirements.

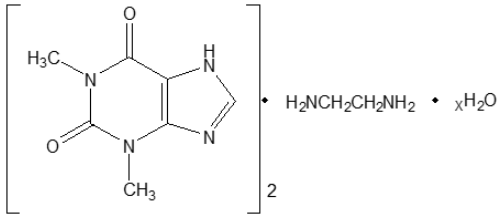
Assay Weigh accurately and powder NLT 20 tablets of Aminocaproic Acid Tablets. Weigh accurately an amount of the powder, equivalent to about 0.5 g of aminocaproic acid ($C_6H_{13}NO_2$), add 100 mL of acetic acid(100), dissolve by heating, and cool. Titrate with 0.1 mol/L perchloric acid-1,4-dioxane VS until a blue color develops [indicator: 10 drops of methylrozaniline chloride in chlo-

robenzene (1 in 500)]. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid-1,4-dioxane VS
= 13.12 mg of $C_6H_{13}NO_2$

Packaging and storage Preserve in tight containers.

Aminophylline Hydrate
아미노필린수화물



Aminophylline $C_{14}H_{16}N_8O_4 \cdot C_2H_8N_2 \cdot xH_2O$
bis(1,3-Dimethyl-2,3,6,7-tetrahydro-1*H*-purine-2,6-dione) ethane-1,2-diamine hydrate [*76970-41-7*]

Aminophylline Hydrate contains NLT 84.0% and NMT 86.0% of theophylline ($C_7H_8N_4O_2$: 180.16) and NLT 14.0% and NMT 15.0% of ethylenediamine ($C_2H_8N_2$: 60.10), calculated on the anhydrous basis.

Description Aminophylline Hydrate occurs as a white to pale yellow granule or a powder. It is odorless or has a slight ammonia-like odor and has a bitter taste.
It is soluble in water, slightly soluble in methanol and practically insoluble in ethanol(95) or in ether.
To 1 g of Aminophylline Hydrate, add 5 mL of water and shake; it dissolves almost completely and crystallization begins in 2 to 3 minutes. These crystals are dissolved again with the addition of a small amount of ethylenediamine.
It is gradually colored by light and gradually loses ethylenediamine, if left in the air.

Identification (1) Weigh 0.75 g of Aminophylline Hydrate, dissolve in 30 mL of water, and use this solution as the test solution. To 20 mL of the test solution, add 1 mL of dilute hydrochloric acid; a precipitate is gradually formed. Filter and collect the precipitate, recrystallize from water, and dry at 105 ºC for 1 hour; the melting point of the crystals so obtained is between 271 and 275 ºC.

(2) Dissolve 0.1 g of the crystals obtained in (1) in 50 mL of water. To 2 mL of this solution, add tannic acid TS dropwise; a white precipitate is formed, which is dissolved upon more dropwise addition of tannic acid TS.

(3) To 10 mg of the crystals obtained in (1), add 10 drops of hydrogen peroxide TS and 1 drop of hydrochloric acid and evaporate on a steam bath to dryness; the resulting residue exhibits a yellowish red color. Transfer this residue into a vessel containing 2 to 3 drops of ammonia TS; the color of the residue changes to purple, which disappears upon the addition of 2 to 3 drops of sodium hydroxide TS.

(4) Dissolve 10 mg of the crystals obtained in (1) in 5 mL of water, add 3 mL of ammonia-ammonium chloride buffer (pH 8.0) and 1 mL of cupric sulfate-pyridine TS, and mix. Add 5 mL of chloroform to the mixture and shake; the chloroform layer exhibits a green color.

(5) To 5 mL of the test solution obtained in (1), add 2 drops of copper(II) sulfate TS; the resulting solution exhibits a violet color. Thereto, add 1 mL of copper(II) sulfate TS; the color of the solution changes to blue, and if is allowed to stand, a green precipitate is formed.

pH Dissolve 1.0 g of Aminophylline Hydrate in 25 mL of water; the pH of this solution is between 8.0 and 9.5.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Aminophylline Hydrate in 10 mL of hot water; the resulting solution is colorless to pale yellow and clear.

(2) ***Heavy metals***—Proceed with 1.0 g of Aminophylline Hydrate according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

Water NMT 7.9% (0.3 g, volumetric titration, direct titration).

Residue on ignition NMT 0.1% (1 g).

Assay (1) ***Theophylline***—Weigh accurately about 0.25 g of Aminophylline Hydrate and dissolve in 50 mL of water and 8 mL of ammonia TS by gentle warming on a steam bath. Add exactly 20 mL of 0.1 mol/L silver nitrate VS, warm on a steam bath for 15 minutes, allow to stand between 5 and 10 ºC for 20 minutes, collect the precipitate by filtration with suction, and wash the precipitate three time each time with 10 mL of water. Combine the filtrate and the solution used for washing, add dilute nitric acid to neutralize, add another 3 mL of dilute nitric acid, and titrate the excess silver nitrate with 0.1 mol/L ammonium thiocyanate VS (indicator: 2 mL of ammonium iron(III) sulfate TS). Perform a blank test in the same manner.

Each mL of 0.1 mol/L silver nitrate VS
= 18.016 mg of $C_7H_8N_4O_2$

(2) ***Ethylenediamine***—Weigh accurately about 0.5 g of Aminophylline Hydrate, dissolve in 30 mL of water, and titrate with 0.1 mol/L hydrochloric acid VS (indicator: 3 drops of bromophenol blue TS).

Each mL of 0.1 mol/L hydrochloric acid VS
= 3.0049 mg of $C_2H_8N_2$

Packaging and storage Preserve in light-resistant, tight containers.

Aminophylline Injection
아미노필린 주사액

Aminophylline Injection is an aqueous injection and contains NLT 75.0% and NMT 86% of theophylline ($C_7H_8N_4O_2$: 180.16) and NLT 13.0% and NMT 20.0% of ethylenediamine ($C_2H_8N_2$: 60.10) according to the labeled amount of Aminophylline.

The concentration of Aminophylline Injection is expressed as the quantity of aminophylline hydrate ($C_{16}H_{24}N_{10}O_4 \cdot 2H_2O$: 456.46).

Method of preparation Prepare as directed under Injections, with Aminophylline. Aminophylline Injection, may be prepared with theophylline and an equivalent amount of Ethylenediamine, instead of Aminophylline.
NMT 60 mg of Ethylenediamine, as a stabilizer, per g of Aminophylline may be added to Aminophylline Injection.

Description Aminophylline Injection occurs as a colorless and clear liquid with a slightly bitter taste.
It gradually changes in color by light.
pH—Between 8.0 and 10.0.

Identification Weigh an amount of Aminophylline Injection, equivalent to 0.75 g of Aminophylline according to the labeled amount, and add water to make 30 mL. Proceed with this solution as directed under the Identification under Aminophylline and perform the test.

Sterility Meets the requirements.

Bacterial endotoxins Less than 0.6 EU per mg of aminophylline.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Extractable volume of injections Meets the requirements.

Assay (1) ***Theophylline***—Weigh accurately an amount of Aminophylline Injection, equivalent to about 39.4 mg of theophylline ($C_7H_8N_4O_2$) (about 50 mg of aminophylline hydrate), add water to make exactly 50 mL, and use this solution as the test solution. Separately, weigh accurately about 40 mg of theophylline RS, previously dried at 105 °C for 4 hours, dissolve in water to make exactly 50 mL, and use this solution as the standard solution. Perform the test with each 5 μL of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions and determine the peak areas, A_T and A_S, of theophylline in the test solution and the standard solution.

$$\text{Amount (mg) of theophylline } (C_7H_8N_4O_2) = \text{Amount (mg) of theophylline RS} \times \frac{A_T}{A_S}$$

Operating conditions
Detector: An ultraviolet absorption photometer (wavelength: 270 nm).
Column: A stainless steel column 6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silical gel for liquid chromatography (5 μm in particle diameter).
Column temperature: A constant temperature of about 40 °C.
Mobile phase: A mixture of diluted acetic acid(100) (1 in 100) and methanol (4 : 1).
Flow rate: Adjust the flow rate so that the retention time of theophylline is about 5 minutes.
System performance
Proceed with 5 μL of the standard solution according to the above operating conditions; the number of theoretical plates and symmetry factor of the theophylline peak are NLT 8000 and NMT 1.5, respectively.
System repeatability: Repeat the test 6 times with 5 μL each of the standard solution under the above operating conditions; the relative standard deviation of the peak areas of theophylline is NMT 1.0%.

(2) ***Ethylenediamine***—Weigh accurately an amount of Aminophylline Injection, equivalent to about 30 mg of ethylenediamine ($C_2H_8N_2$) (about 0.2 g of aminophylline), add water to make 30 mL, and titrate with 0.1 mol/L hydrochloric acid VS (indicator: 2 to 3 drops of bromphenol blue TS).

$$\text{Each mL of 0.1 mol/L hydrochloric acid VS} = 3.0049 \text{ mg of } C_2H_8N_2$$

Packaging and storage Preserve in light-resistant, well-closed containers.

Aminophylline Tablets
아미노필린 정

Aminophylline Tablets contain NLT 75.0% and NMT 86.0% of the labeled amount of theophylline ($C_7H_8N_4O_2$: 180.16) and NLT 12.0% and NMT 14.0% of the labeled amount of ethylenediamine ($C_2H_8N_2$: 60.10).
The amount of Aminophylline Tablets is expressed as the quantity of aminophylline hydrate ($C_{16}H_{24}N_{10}O_4 \cdot 2H_2O$: 456.46).

Method of preparation Prepare as directed under Tablets, with Aminophylline Hydrate.

Identification (1) Weigh an amount of Aminophylline Tablets, previously powdered, according to the labeled amount, equivalent to about 0.5 g of aminophylline, add 25 mL of water, shake well to mix, and filter. This filtrate changes the color of a wet litmus paper from red to blue. Mix the filtrate with 1 mL of 3 mol/L of hydrochloric acid and shake to mix; a theophylline precipitate is formed. Cool, if necessary, and precipitate. Filter and collect the precipitate (The filtrate is used for the Identification (2).), wash with a small amount of cold water, and dry at 105 ºC for 1 hour. Proceed with these crystals as directed under the Identification (3) under Aminophylline Hydrate. Recrystallize these crystals with water and dry at 105 ºC for 1 hour; the melting point of the resulting crystals is between 270 and 274 ℃.

(2) To the filtrate from (1), add 0.5 mL of benzenesulfonyl chloride and 5 mL of 1 mol/L sodium hydroxide to obtain an alkaline solution and shake for 10 minutes. Acidify by adding 5 mL of 3 mol/L hydrochloric acid and collect ethylenediamine disulfonamide precipitates. Wash the precipitates with water, recrystallize, and dry at 105 ℃ for 1 hour; the melting point is between 164 and 171 ℃.

Dissolution This test applies to uncoated tablets. Perform the test with 1 tablet of Aminophylline Tablets at 50 revolutions per minute according to Method 2 under the Dissolution Test, using 900 mL of water as the dissolution medium. Take the dissolved solution 45 minutes after starting the test, filter, dilute if necessary, and use this solution as the test solution. Separately, weigh accurately an appropriate amount of theophylline RS, previously dried at 105 ℃ for 4 hours, dissolve in the dissolution medium to the same concentration as the test solution, and use this solution as the standard solution. Determine the absorbances of the test solution and the standard solution at 269 nm, the absorbance maximum wavelength (λmax), as directed under the Ultraviolet-visible Spectroscopy.
It meets the requirements when the dissolution rate of theophylline in 45 minutes.

Uniformity of dosage units Meets the requirements.

Assay (1) ***Theophylline***—Weigh accurately and powder NLT 20 tablets of Aminophylline Tablets. Weigh accurately an amount of the powder, equivalent to about 2 g of aminophylline hydrate ($C_{16}H_{24}N_{10}O_4 \cdot 2H_2O$), add 50 mL of water and 15 mL of ammonia TS, shake occasionally, and if necessary, warm to 50 ℃. Allow to stand for 30 minutes. Cool to room temperature if warmed and add water to make exactly 200 mL. Take 50 mL of this solution, centrifuge, transfer an amount of the clear supernatant, exactly equivalent to about 0.2 g of theophylline, into a Erlenmeyer flask, and add water to make about 40 mL. Then, add 8 mL of ammonia TS and 20 mL of 0.1 mol/L silver nitrate VS, warm on a steam bath for 15 minutes, cool at 5 to 10 ℃ for 20 minutes, and filter the precipitate using a glass filter (G4). Wash 3 times with each 10 mL of water. Combine the filtrate and the washings, acidify by adding nitric acid, and add 3 mL of nitric acid. After cooling, titrate the excess silver nitrate with 0.1 mol/L ammonium thiocyanate VS (indicator: 2 mL of ammonium iron(III) sulfate TS).

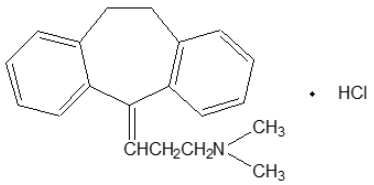
Each mL of 0.1 mol/L silver nitrate VS
= 18.016 mg of $C_7H_8N_4O_2$

(2) ***Ethylenediamine***—Weigh accurately and powder NLT 20 tablets of Aminophylline Tablets. Weigh accurately an amount of the powder, equivalent to about 0.35 g of aminophylline hydrate ($C_{16}H_{24}N_{10}O_4 \cdot 2H_2O$), transfer into an Erlenmeyer flask, add 200 mL of water, and decompose at 50 ℃ for 30 minutes by occasionally shaking. After cooling, filter this solution to another Erlenmeyer flask, wash with water repeatedly to ensure that the last washing is neutral with a litmus paper, and titrate with 0.1 mol/L hydrochloric acid VS (indicator: 2 to 3 drops of methyl orange TS).

Each mL of 0.1 mol/L hydrochloric acid VS
= 3.0049 mg of $C_2H_8N_2$

Packaging and storage Preserve in tight containers.

Amitriptyline Hydrochloride
아미트리프틸린염산염



$C_{20}H_{23}N \cdot HCl$: 313.86

N,*N*-Dimethyl-3-[tricyclo[9.4.0.03,8]pentadeca-1(11),3(8),4,6,12,14-hexaen-2-ylidene]propanamine hydrochloride [*549-18-8*]

Amitriptyline Hydrochloride, when dried, contains NLT 99.0% and NMT 101.0% of amitriptyline hydrochloride ($C_{20}H_{23}N \cdot HCl$).

Description Amitriptyline Hydrochloride occurs as colorless crystals or a white to pale yellow crystalline powder. It has a bitter taste, and numbs the tongue.
It is freely soluble in water, ethanol(95) or acetic acid(100), soluble in acetic anhydride, and practically insoluble in ether.

pH—Dissolve 1.0 g of Amitriptyline Hydrochloride in 20 mL of water; the pH is between 4.0 and 5.0.

Identification (1) Dissolve 5 mg of Amitriptyline Hydrochloride in 3 mL of sulfuric acid; the resulting solution exhibits a red color. Add 5 drops of potassium dichromate TS to this solution; the resulting solution turns

dark brown.

(2) Add 0.5 mL of dilute nitric acid to 1 mL of the aqueous solution of Amitriptyline Hydrochloride (1 in 500) to make it acidic, and add 1 drop of silver nitrate TS; a white precipitate is produced.

(3) Determine the absorption spectra of the aqueous solutions of Amitriptyline Hydrochloride and amitriptyline hydrochloride RS (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

Melting point Between 195 and 222 ºC.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Amitriptyline Hydrochloride in 20 mL of water; the solution is clear and colorless.

(2) ***Heavy metals***—Proceed with 2.0 g of Amitriptyline Hydrochloride according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Related substances***—Weigh accurately an appropriate amount of Amitriptyline Hydrochloride, dissolve in the mobile phase to prepare a solution containing 1 mg in 1 mL, and use this solution as the test solution. Separately, weigh accurately an appropriate amount of dibenzosuberone RS, dissolve in methanol to prepare a solution containing 1 mg per mL, and use this solution as the standard stock solution (1). Separately, weigh accurately an appropriate amount of amitriptyline hydrochloride RS, amitriptyline RS, cyclobenzaprine hydrochloride RS, and nortriptyline hydrochloride RS, respectively, dissolve in the mobile phase to prepare solutions containing 0.4 mg, 0.6 mg, 0.6 mg, and 0.6 mg in 1 mL, respectively. Use these solutions as the standard stock solution (2). Pipet an appropriate amount of the standard stock solutions (1) and (2), add the mobile phase to make a solution containing 1 μg of per amitriptyline hydrochloride, 0.5 μg of dibenzosuberone, 1.5 μg of amitriptyline, 1.5 μg of cyclobenzaprine hydrochloride, and 1.5 μg of nortriptyline hydrochloride per mL, respectively, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the amount of each related substance according to the following equation; dibenzosuberone is NMT 0.05%, amitriptyline, nortriptyline, and cyclobenzaprine are NMT 0.15%, respectively, other individual related substances are NMT 0.10%, and the total amount of the related substances is NMT 1.0%. However, peaks with a relative retention time for amitriptyline of less than 0.22 are excluded.

$$\text{Content (\%) of related substances} = 100 \times \frac{C_S}{C_T} \times \frac{A_T}{A_S}$$

C_S: Concentration (mg/mL) of each specified related substance in the standard solution

C_T: Concentration (mg/mL) of amitriptyline hydrochloride in the test solution

A_T: Peak area of each specified related substance in the test solution

A_S: Peak area of each specified related substance in the standard solution

$$\text{Content (\%) of each related substance} = 100 \times \frac{C_S}{C_T} \times \frac{A_i}{A_S}$$

C_S: Concentration (mg/mL) of amitriptyline hydrochloride in the standard solution

C_T: Concentration (mg/mL) of amitriptyline hydrochloride in the test solution

A_T: Peak area of each related substance in the test solution

A_S: Peak area of amitriptyline hydrochloride in the standard solution

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 215 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octylsilane silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 45 °C.

Mobile phase: Dissolve 1.42 g of sodium hydrogen phosphate docahydrate in 1000 mL of water, and add dilute phosphoric acid (1 in 10) to adjust pH to 7.7. Take 300 mL of this solution and add 700 mL of methanol.

Flow rate: About 1.5 mL/min.

System suitability

System performance: Proceed with 20 μL of the standard solution under the above conditions; the resolution between amitriptyline and nortriptyline is NLT 1.5, and the relative retention time of dibenzosuberone, amitriptyline, nortriptyline hydrochloride, and cyclobenzaprine hydrochloride with respect to amitriptyline hydrochloride is approximately 0.35, 0.52, 0.60, and 0.76, respectively.

System repeatability: Weigh accurately an appropriate amount of amitriptyline hydrochloride RS, dissolve in the mobile phase to prepare a solution containing 0.2 mg in 1 mL, and repeat the test 6 times according to the above conditions; the relative standard deviation of the peak area of amitriptyline is NMT 2.0%.

Loss on drying NMT 0.5% (1 g, 105 °C, 2 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.5 g of Amitriptyline Hydrochloride, previously dried, dissolve in 50 mL of a mixture of acetic anhydride and acetic acid(100) (7:3), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 31.386 mg of $C_{20}H_{23}N \cdot HCl$

Packaging and storage Preserve in light-resistant, tight containers.

Amitriptyline Hydrochloride Tablets
아미트리프틸린염산염 정

Amitriptyline Hydrochloride Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of amitriptyline hydrochloride ($C_{20}H_{23}N \cdot HCl$: 313.86).

Method of preparation Prepare as directed under Tablets, with Amitriptyline Hydrochloride.

Identification (1) Weigh an amount of Amitriptyline Hydrochloride Tablets, previously powdered, equivalent to 0.1 g of amitriptyline hydrochloride according to the labeled amount, shake well to mix, and filter. Concentrate the filter to about 2 mL in the water bath, add ether until the solution becomes turbid, and allow to stand. Filter and collect the crystals using a glass filter (G4) and proceed as directed in the identification (1) and (2) under Amitriptyline Hydrochloride.

(2) Dissolve the crystals obtained in (1) in water (1 in 100000) and determine the absorption spectrum of the solution as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum between 238 nm and 240 nm and a minimum between 228 nm and 230 nm.

Dissolution Perform the test with 1 tablet of Amitriptyline Hydrochloride Tablets at 50 revolutions per minute according to Method 2 under the Dissolution, using 900 mL of diluted phosphate buffer solution, pH 6.8 (1 in 2) with the dissolution solution. Take NLT 20 mL of the dissolved solution 60 minutes after starting the test and filter through a membrane filter with a pore size not exceeding 0.8 μm. Discard the first 10 mL of the filtrate, pipet *V* mL of the subsequent filtrate, and add diluted phosphate buffer solution, pH 6.8 (1 in 2) to make exactly *V'* mL of a solution having known concentration of about 11 μg of amitriptyline hydrochloride ($C_{20}H_{23}N \cdot HCl$) per mL according to the labeled amount. Use this solution as the test solution. Separately, weigh accurately about 55 mg of amitriptyline hydrochloride RS, previously dried at 105 ℃ for 2 hours, and dissolve in diluted phosphate buffer solution, pH 6.8, (1 in 2) to make exactly 250 mL. Pipet 5 mL of the solution, add diluted phosphate buffer solution, pH 6.8, (1 in 2) to make exactly 100 mL and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at the wavelength of 239 nm as directed under the Ultraviolet-visible Spectroscopy.
Meets the requirements if the dissolution rate of Amitriptyline Hydrochloride Tablets in 60 minutes is NLT 70%.

Dissolution rate (%) with respect to the labeled amount of amitriptyline hydrochloride ($C_{20}H_{23}N \cdot HCl$)

$$= W_S \times \frac{A_T}{A_S} \times \frac{V'}{V} \times \frac{1}{C} \times 18$$

W_S: Amount (mg) of amitriptyline hydrochloride RS
C: Labeled amount (mg) of amitriptyline hydrochloride ($C_{20}H_{23}N \cdot HCl$) per tablet

Uniformity of dosage units Meets the requirements.

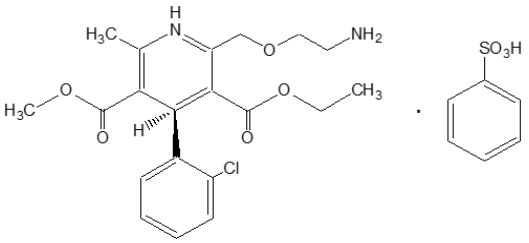
Assay Weigh accurately and powder NLT 20 tablets of Amitriptyline Hydrochloride Tablets. Weigh accurately an amount of the powder, equivalent to about 50 mg of amitriptyline hydrochloride ($C_{20}H_{23}N \cdot HCl$), add the mobile phase to make exactly 250, and filter. Discard the first 20 mL of the filtrate and use the subsequent filtrate as the test solution. Separately, weigh accurately about 50 mg of amitriptyline hydrochloride RS, previously dried at 60 ℃ and 0.67 kPa to a constant weight, dissolve in the mobile phase to make exactly 250 mL, and use this solution as the standard solution. Perform the test with each 20 μL of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions and determine the peak areas, A_T and A_S, of amitriptyline hydrochloride from each solution.

Amount (mg) of amitriptyline hydrochloride ($C_{20}H_{23}N \cdot HCl$)
= Amount (mg) of amitriptyline hydrochloride RS $\times \frac{A_T}{A_S}$

Operating conditions
Detector: An ultraviolet absorption photometer (wavelength: 254 nm).
Column: A stainless steel column about 4 mm in internal diameter and 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 to 10 μm in particle diameter).
Mobile phase: To 11.04 g of sodium dihydrogen phosphate dihydrate, dissolve in 900 mL of water, adjust the pH to 2.5 ± 0.5 by adding phosphoric acid, and add water to make 100 mL. Mix this solution with acetonitrile (58 : 42).
Flow rate: 2 mL/min
System suitability
System performance: Proceed with 20 μL of the standard solution according to the above operating conditions; the symmetry factor is NMT 2.0.
System repeatability: Repeat the test 6 times with each 20 μL the standard solution according to the above conditions; the relative standard deviation of the peak area is NMT 2.0%

Packaging and storage Preserve in tight containers.

Amlodipine Besylate
암로디핀베실산염



and enantiomer

$C_{20}H_{25}N_2O_5Cl \cdot C_6H_6O_3S$: 567.05

3-Ethyl 5-methyl 2-(2-aminoethoxymethyl)-4-(2-chlorophenyl)-6-methyl-1,4-dihydropyridine-3,5-dicarboxylate benzenesulfonate [*111470-99-6*]

Amlodipine Besylate contains NLT 97.0% and NMT 102.0% of amlodipine besylate ($C_{20}H_{25}N_2O_5Cl \cdot C_6H_6O_3S$), calculated on the anhydrous basis.

Method of preparation If there is a possibility that alkyl (methyl, ethyl, isopropyl, etc.) benzenesulfonate esters may be introduced as potential impurities in the manufacturing process of Amlodipine Besylate, pay attention to the control of starting materials, manufacturing processes, and intermediates to minimize residuals of impurities by considering the results of the risk assessment. If necessary, the manufacturing process may be verified by the test data proving that no quality risk exists in the final drug substance.

Description Amlodipine Besylate occurs as a white or almost white powder.
It is freely soluble in methanol, sparingly soluble in ethanol(95), and slightly soluble in water or 2-propanol.

Identification (1) To 30 mg of Amlodipine Besylate, add 0.1 g of sodium nitrate and 0.1 g of anhydrous sodium carbonate, mix, and gradually incinerate. After cooling, dissolve the residue in 2 mL of dilute hydrochloric acid and 10 mL of water, and filter if necessary. To the filtrate, add barium chloride TS; a white precipitate is formed.

(2) Dissolve 5.0 mg each of Amlodipine Besylate and amlodipine besylate RS in an 1 vol% methanol solution of 0.1 mol/L hydrochloric acid TS to make 100 mL. Determine the absorption spectra of both solutions as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared spectra of Amlodipine Besylate and amlodipine besylate RS, as directed in the paste method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(4) The color and R_f value of the principal spots obtained from the test solution (2) of Related substances (A) and the standard solution (2) are the same.

Optical rotation $[\alpha]_D^{20}$: Between -0.10° and +0.10° (0.25 g, methanol, 25 mL, 100 mm).

Purity (1) ***Heavy metals*—**Proceed with 1.0 g of Amlodipine Besylate according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Related substances*—**(i) Dissolve 0.140 g of Amlodipine Besylate in methanol to make exactly 2 mL and use this solution as the test solution (1). To 1.0 mL of this solution, add methanol to make exactly 10 mL, and use this solution as the test solution (2). Separately, dissolve 70.0 mg of amlodipine besylate RS in 1.0 mL of methanol, and use this solution as the standard solution (1). To 0.5 mL of the standard solution (1), add methanol to make 5 mL, and use this solution as the standard solution (2). To 3.0 mL of the standard solution (2), add methanol to make 100 mL, and use this solution as the standard solution (3). To 1.0 mL of the standard solution (2), add methanol to make 100 mL, and use this solution as the standard solution (4). With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of these solutions on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with the upper layer of a mixture of 4-methyl-2-pentanone, water and acetic acid(100) (2 : 1 : 1) to a distance of about 15 cm, and dry the plate at 80 °C for 15 minutes. Examine under ultraviolet light (dominant wavelengths: 254 nm and 366 nm); the spots other than the principal spot obtained from the test solution (1) is not more intense than the principal spot from the standard solution (3) (NMT 0.3%) and the number of spots more intense than the spots obtained from the standard solution (4) is NMT 2 (NMT 0.1%). This test is valid when two minor spots obtained by proceeding with the standard solution (1) in the same manner are clearly separated with R_f values of about 0.18 and 0.22, respectively.

(ii) Dissolve 50.0 mg of Amlodipine Besylate in the mobile phase to make exactly 50 mL, and use this solution as the test solution (1). To 5.0 mL of the test solution (1), add the mobile phase to make exactly 100 mL, and use this solution as the test solution (2). Separately, dissolve 50.0 mg of amlodipine besylate RS in the mobile phase to make exactly 50 mL. To 5.0 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution (1). To 3.0 mL of the test solution (1), add the mobile phase to make exactly 100 mL. To 5.0 mL of this solution, add the mobile phase to make exactly 50 mL, and use this solution as the standard solution (2). Dissolve 5 mg of Amlodipine Besylate in 5 mL of hydrogen peroxide(30), heat at 70 °C for 45 minutes, and use this solution as the standard solution (3). Perform the test with 10 μL each of the test solutions and the standard solutions as directed under the

Liquid Chromatography according to the following conditions; the content (%) of amlodipine besylate related substance I {3-Ethyl-5-methyl-2-[(2-aminoethoxy)methyl]-4-(2-chlorophenyl)-6-methylpyridine-3,5-dicarboxylate} obtained from the test solution is NMT the area of the major peak from the standard solution (2) (0.3%), and the total area of all the other related substances is not lager than the area of the major peak from the standard solution (2) (0.3%). However, disregard any peak due to benzene sulfonate with the relative retention time being about 0.2 and any peak NMT 0.1 times the area of the major peak obtained from the standard solution (2).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 237 nm).

Column: A stainless steel column about 3.9 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: Dissolve 7.0 mL of triethylamine in 1000 mL of water and adjust to pH 3.0 ± 0.1 with phosphoric acid. Mix 50 volumes of this solution, 35 volumes of methanol and 15 volumes of acetonitrile.

Flow rate: 1.0 mL/min

System suitability

Proceed with 10 μL of the standard solution (3) according to the above operating conditions; the resolution between the peaks of amlodipine and related substance I is NLT 4.5. The relative retention time of related substance I to amlodipine (retention time of about 7 minutes) is about 0.5. Calculate the content of the related substance I by multiplying its peak area by 2.

Time span of measurement: About 3 times the retention time of amlodipine

Water NMT 0.5% (3.0 g, volumetric titration, direct titration).

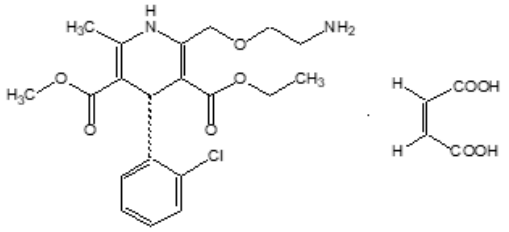
Residue on ignition NMT 0.2% (1 g).

Assay Perform the test with the test solution (2) and the standard solution (1) in Related substances (ii) according to the above operating conditions in Related substances (ii) and determine the peak areas, A_T and A_S, of amlodipine besylate.

Amount (mg) of amlodipine besylate ($C_{20}H_{25}N_2O_5Cl \cdot C_6H_6O_3S$)
= Amount (mg) of amlodipine besylate RS $\times \frac{A_T}{A_S}$

Packaging and storage Preserve in light-resistant, tight containers.

Amlodipine Maleate
암로디핀말레산염



$C_{20}H_{25}ClN_2O_5 \cdot C_4H_4O_4$: 524.95

3-Ethyl 5-methyl 2-[(2-aminoethoxy)methyl]-4-(2-chlorophenyl)-1,4-dihydro-6-methyl-3,5-pyridinedicarboxylic acid ester (2*Z*)-2-butenedioate (1:1), [*88150-47-4*]

Amlodipine Maleate, when dried, contains NLT 99.0% and NMT 101.0% of amlodipine maleate ($C_{20}H_{25}ClN_2O_5 \cdot C_4H_4O_4$).

Description Amlodipine Maleate occurs as a white or off-white crystalline powder.

It is freely soluble in acetic acid(100), soluble in methanol, sparingly soluble in ethanol(95), and practically insoluble in water, chloroform or ether.

Melting point—Between 163 and 170 °C.

Identification (1) The retention times of the major peak of the test solution correspond to those of the standard solution, as obtained in the Assay.

(2) Determine the infrared spectra of Amlodipine Maleate and amlodipine maleate RS, previously dried at 105 °C for 3 hours, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Optical rotation $[\alpha]_D^{20}$: Between -10.0° and + 10.0° (0.25 g, methanol, 25 mL, 100 mm).

Purity (1) ***Heavy metals***—Proceed with 2.0 g of Amlodipine Maleate according to Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Related substances***—(i) Dissolve 0.14 g of Amlodipine Maleate in methanol to make exactly 2 mL, and use this solution as the test solution. Pipet 1 mL of the test solution, add methanol to make exactly 10 mL, and use this solution as the standard solution (1). Pipet 3 mL of the standard solution (1), add methanol to make exactly 100 mL, and use this solution as the standard solution (2). Pipet 1 mL of the standard solution (1), add methanol to make exactly 100 mL, and use this solution as the standard solution (3). With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solutions (1), (2) and (3) on the thin-layer chromatographic

plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with the supernatant of a mixture of methyl isobutyl ketone, water and acetic acid(100) (2 : 1 : 1) to a distance of about 15 cm, and dry the plate at 80 °C for 15 minutes. Examine under ultraviolet light (main wavelengths: 254 nm and 366 nm); the spots other than the principal spot obtained from the test solution is not more intense than the spots obtained from the standard solution (2) (0.3%) and the number of spots which are more intense than the spot obtained from the standard solution (3) is NMT 2 (0.1%).

(ii) Dissolve 50 mg of Amlodipine Maleate in the mobile phase to make exactly 50 mL, and use this solution as the test solution. Separately, dissolve about 50 mg of amlodipine maleate RS in the mobile phase to make exactly 50 mL, and use this solution as the standard solution (a). Pipet 3 mL of the test solution, add the mobile phase to make exactly 100 mL. Pipet 5 mL of this solution, add the mobile phase to make exactly 50 mL, and use this solution as the standard solution (b). Perform the test with 10 μL each of the test solution and the standard solutions (a) and (b) as directed under the Liquid Chromatography according to the following conditions. Determine the peak areas of each solution by the automatic integration method; the value obtained by multiplying the correction factor 3.03 to the peak area of related substance D obtained from the test solution is not larger than the area of the major peak obtained from the standard solution (b) (0.3%). The individual related substances other than the related substance D are not larger than one third of the area of the major peak obtained from the standard solution (b) (0.1%). Also, the total area of the peaks of individual related substances other than the related substance D is not larger than the area of the major peak obtained from the standard solution (b) (0.3%). However, disregard any peak due to maleic acid (relative retention time of about 0.2 to amlodipine) and any peak NMT 0.1 times the peak area of amlodipine from the standard solution (b).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 237 nm).

Column: A stainless steel column about 3.9 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 30 °C.

Mobile phase: A mixture of pH 3.0 buffer solution, acetonitrile and methanol (10 : 3 : 7).

Time span of measurement: About 3 times the retention time of amlodipine.

System suitability

System performance: Weigh accurately 5 mg of Amlodipine Maleate, add 10 mL of hydrogen peroxide solution, and heat the solution at 70 °C for 45 minutes. Proceed with 20 μL of this solution according to the above operating conditions; the retention time of the amlodipine peak is about 10 minutes, and the resolution between this peak and related substance D (relative retention time: about 0.45) is NLT 4.5.

Related substance D—3-ethyl-5-methyl-2-[(2-aminoethoxy)methyl]-4-(2-chlorophenyl)-6-methyl pyridine-3,5-dicarboxylate

pH 3.0 buffer solution—Take 7.0 mL of triethylamine, dilute to 1000 mL with purified water, and adjust to pH 3.0 with phosphoric acid.

Loss on drying NMT 0.5% (1 g, 105 °C, 3 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately 50 mg of Amlodipine Maleate, add the mobile phase to make exactly 50 mL. Pipet 5 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 50 mg of amlodipine maleate RS, add the mobile phase to make exactly 50 mL. Pipet 5 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the conditions directed in the related substances test, and determine the peak areas, A_T and A_S, of amlodipine maleate from each solution.

Amount (mg) of amlodipine maleate ($C_{24}H_{29}ClO_9$)
= Amount (mg) of amlodipine maleate RS × (A_T / A_S)

Packaging and storage Preserve in light-resistant, tight containers.

Ammonia Water
암모니아수

Azanium hydroxide

Ammonia Water contains NLT 9.5 w/v% and NMT 10.5 w/v% of ammonia (NH_3 : 17.03).

Description Ammonia Water occurs as a clear, colorless liquid and has a strong pungent, characteristic odor.
Ammonia Water, alkaline.
Specific gravity d_{20}^{20}: Between 0.95 and 0.96,

Identification (1) Hold a glass rod moistened with hydrochloric acid near the surface of Ammonia Water; dense white fumes are produced.

(2) Hold moistened red litmus paper near the surface of Ammonia Water; the paper turns blue.

Purity (1) ***Residue on evaporation***—Evaporate 10.0 mL of Ammonia Water evaporate to dryness the residue at

105 ºC for 1 hour; the weight of the residue is NMT 2.0 mg.

(2) ***Heavy metals***—Evaporate 5.0 mL of Ammonia Water to dryness on a steam bath, add 1 mL of dilute hydrochloric acid to the residue, and evaporate to dryness. Dissolve the residue in 2 mL of dilute acetic acid, add water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution by mixing 2.5 mL of lead standard solution, 2 mL of dilute acetic acid and water to make 50 mL (NMT 5 ppm).

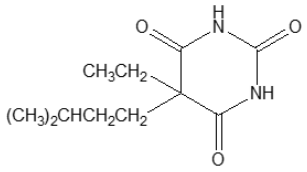
(3) ***Potassium permanganate reducing substances***—To 10.0 mL of Ammonia Water, add 40 mL of dilute sulfuric acid while cooling, and add 0.10 mL of 0.02 mol/L potassium permanganate; the red color of the resulting solution does not disappear within 10 minutes.

Assay Take exactly 5 mL of Ammonia Water, add 25 mL of water, and titrate with 0.5 mol/L sulfuric acid VS (indicator: 2 drops of methyl red TS).

Each mL of 0.5 mol/L sulfuric acid VS
= 17.031 mg of NH_3

Packaging and storage Preserve in tight containers at below 30 ℃.

Amobarbital
아모바르비탈



$C_{11}H_{18}N_2O_3$: 226.27

5-Ethyl-5-(3-methylbutyl)pyrimidine-2,4,6(1*H*,3*H*,5*H*)-trione [*57-43-2*]

Amobarbital, when dried, contains NLT 99.0% and NMT 101.0% of amobarbital ($C_{11}H_{18}N_2O_3$).

Description Amobarbital occurs as white crystals or a crystalline powder, which is odorless and has a slightly bitter taste.
It is freely soluble in ethanol(95), acetone and ether, sparingly soluble in chloroform and practically insoluble in water.
It is soluble in sodium hydroxide TS or sodium carbonate TS.
The pH of a saturated solution of Amobarbital is between 5.0 and 5.6.

Identification (1) Add 10 mL of sodium hydroxide TS to 0.2 g of Amobarbital and boil; the gas produced changes the moistened red litmus paper to blue.

(2) Add 2 or 3 drops of ammonia·ammonium chloride buffer solution, pH 10.7 and 5 mL of diluted pyridine solution (1 in 10) to 50 mg of Amobarbital to dissolve, and put 5 mL of chloroform and 0.3 mL of cooper sulfate TS; purple precipitates are formed in the water layer. Shake to mix; the chloroform layer develops a purple color.

(3) To 0.4 g of Amobarbital, add 0.1 g of anhydrous sodium carbonate and 4 mL of water, and shake well to mix, and add a solution prepared by dissolving 0.3 g of 4-nitrobenzyl chloride in 7 mL of ethanol(95). Connect the reflux condenser, heat on a steam bath for 30 minutes, and allow to stand for 1 hour. Filter the precipitated crystals, wash with 7 mL of sodium hydroxide TS and a small amount of water, recrystalize with ethanol(95), and dry at 105 ℃ for 30 minutes; the melting point is between 168and 173℃, or between 150and 154℃.

Melting point Between 157 and 160 ºC.

Purity (1) ***Clarity and color of solution***—Dissolve 0.5 g of Amobarbital in 5 mL of water; the resulting solution is clear and colorless.

(2) ***Chloride***—Dissolve 0.30 g of Amobarbital in 20 mL of acetone and add 6 mL of dilute nitric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Add 20 mL of acetone, 6 mL of dilute nitric acid and water to 0.30 mL of 0.01 mol/L hydrochloric acid to make 50 mL (NMT 0.035%), and use this solution as the control solution.

(3) ***Sulfate***—Dissolve 0.40 g of Amobarbital in 20 mL of acetone and add 1 mL of dilute hydrochloric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Add 20 mL of acetone, 1 mL of dilute hydrochloricacid and water to 0.40 mL of 0.005 mol/L sulfuric acid to make 50 mL (NMT 0.048%), and use this solution as the control solution.

(4) ***Heavy metals***—Proceed with 1.0 g of Amobarbital according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(5) ***Readily carbonizable substances***—Proceed with 0.5 g of Amobarbital and perform the test. This color of this solution is not more intense than that of the Matching Fluid for Color A.

Loss on drying NMT 1.0% (1 g, 105 ℃, 4 hours).

Residue on ignition NMT 0.1% (1 g).

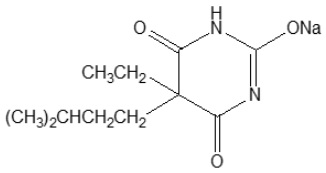
Assay Weigh accurately about 0.5 g of Amobarbital, previously dried, dissolve in 5 mL of ethanol(95) and 50 mL of chloroform, and titrate with 0.1 mol/L potassium hydroxide-ethanol VS (indicator: 1 mL of Alizarin Yellow GG-thymolphthalein TS). The endpoint of the titration is when the yellow color of this solution turns to pale blue and then finally to purple. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L potassium hydroxide-ethanol VS

= 22.627 mg of $C_{11}H_{18}N_2O_3$

Packaging and storage Preserve in well-closed containers.

Amobarbital Sodium for Injection
주사용 아모바르비탈나트륨



$C_{11}H_{17}N_2NaO_3$: 248.25

Amobarbital Sodium for Injection is a preparation for injection, which is dissolved before use. Amobarbital Sodium for Injection, when dried, contains NLT 98.5% and NMT 101.0% of amobarbital sodium ($C_{11}H_{17}N_2NaO_3$) and NLT 92.5% and NMT 107.5% of the labeled amount of amobarbital sodium ($C_{11}H_{17}N_2NaO_3$).

Method of preparation Prepare as directed under Injections.

Description Amobarbital Sodium for Injection occurs as odorless white crystals or a crystalline powder and has a bitter taste.
It is freely soluble in water or ethanol(95) and practically insoluble in ether or chloroform.
Dissolve 1 g of Amobarbital Sodium for Injection in 10 mL of water; the pH of the solution is between 10.0 and 11.0.
It is hygroscopic.

Identification (1) Dissolve 1.5 g of Amobarbital Sodium for Injection in 20 mL of water and add 10 mL of dilute hydrochloric acid, stirring to mix; a white precipitate is formed. Collect the precipitate, wash 4 times with each 10mL of water, and dry at 105 ºC for 3 hours; the melting point is 157 ºC to 160 ºC. With this precipitate, proceed again as directed under the Identification under Amobarbital.

(2) Ignite 0.5 g of Amobarbital Sodium for Injection, cool, and dissolve the residue in 10 mL of water; the solution responds to the Qualitative Analysis (1) for sodium salt.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Amobarbital Sodium for Injection in 10 mL of freshly boiled and cooled water; the solution is clear and colorless.

(2) ***Chloride***—Dissolve 1.0 g of Amobarbital Sodium for Injection in 49 mL of water, add 1 mL of acetic acid(100), shake, and filter. Discard the first 10 mL of the filtrate, add 6 mL of dilute nitric acid to the subsequent 30 mL of the filtrate, and add water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution by mixing 0.30 mL of 0.01 mol/L hydrochloric acid, 0.5 mL of ethanol(100), 6 mL of dilute nitric acid and water to make 50 mL (NMT 0.018%).

(3) ***Sulfate***—Dissolve 2.0 g of Amobarbital Sodium for Injection in 49 mL of water, add 1 mL of acetic acid(100), shake and filter. Discard the first 10 mL of the filtrate, add 2.5 mL of dilute hydrochloric acid to the subsequent 25 mL of the filtrate, and add water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution by mixing 0.40 mL of 0.005 mol/L sulfuric acid, 0.5 mL of acetic acid(100), 1 mL of dilute hydrochloric acid and water to make 50 mL (NMT 0.019%).

(4) ***Heavy metals***—Dissolve 2.0 g of Amobarbital Sodium for Injection in 45 mL of water, add 5 mL of dilute hydrochloric acid, shake vigorously and warm on a steam bath for 2 minutes with occasional shaking. Cool, add 30 mL of water, shake and filter. Discard the first 10 mL of the filtrate, add 1 drop of phenolphthalein TS to the subsequent 40 mL of the filtrate, and add ammonia TS until the solution exhibits a slight red color. Add 2.5 mL of dilute acetic acid and water to make 50 mL. Use this solution as the test solution and perform the test. To 2.5 mL of dilute hydrochloric acid, Add 1 drop of phenolphthalein TS, add ammonia TS until the solution exhibits a slight red color, add 2.5 mL of dilute acetic acid and 2.0 mL of lead standard solution, and add water to make 50 mL (NMT 20 ppm). Use this solution as the control solution.

(5) ***Neutral or basic substances***—Dissolve about 1 g of Amobarbital Sodium for Injection, accurately weighed, in 10 mL of water and 5 mL of sodium hydroxide TS, then add 40 mL of chloroform and shake well. Separate the chloroform layer, wash with two 5mL volumes of water and filter. Evaporate the filtrate on a steam bath to dryness and dry the residue at 105 ºC for 1 hour: the weight of the residue is NMT 0.30%.

(6) ***Readily carbonizable substances***—Proceed with 0.5 g of Amobarbital Sodium for Injection and perform the test. The color of this solution is not more intense than that of the control solution for Color A.

Sterility Meets the requirements.

Bacterial endotoxins Less than 0.4 EU per mg of amobarbital sodium.

Loss on drying NMT 1.0% (1 g, 105 ℃, 4 hours).

Uniformity of dosage units Meets the requirements.

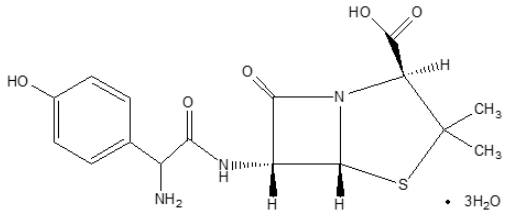
Assay Weigh accurately NLT 10 units of Amobarbital Sodium for Injection. Weigh accurately about 0.5 g of the contents, previously dried, transfer to a separatory funnel, dissolve in 20 mL of water, add 5 mL of ethanol(95) and

10 mL of dilute hydrochloric acid, and extract with 50 mL of chloroform, Then extract with three 25-mL volumes of chloroform. Combine the chloroform extracts, wash with two 5-mL volumes of water and extract the washings with two 10-mL volumes of chloroform. Filter the combined chloroform extracts into a Erlenmeyer flask. Wash the filter paper 3 times with each 5 mL of chloroform, combine the filtrate and the washings, add 10 mL of ethanol(95), and titrate with 0.1 mol/L potassium hydroxide-ethanol VS (indicator: 2 mL of Alizarin Yellow GG-thymolphthalein TS). The endpoint of the titration is when the color of the solution changes from yellow through pale blue to purple. Perform a blank test in the same manner with a solution of 30 mL of ethanol(95) in 160 mL of chloroform and make any necessary correction.

Each mL of 0.1 mol/L potassium hydroxide-ethanol VS
= 24.825 mg of $C_{11}H_{17}N_2NaO_3$

Packaging and storage Preserve in hermetic containers.

Amoxicillin Hydrate
아목시실린수화물



Amoxicillin $C_{16}H_{19}N_3O_5S \cdot 3H_2O$: 419.45
(3*S*)-6*b*-[(2*R*)-2-amino-2-(4-hydroxyphenyl) acetamido]-2,2-dimethylpenam-3-carboxylic acid trihydrate [*61336-70-7*]

Amoxicillin Hydrate contains NLT 950 μg (potency) and NMT 1010 μg (potency) of amoxicillin ($C_{16}H_{19}N_3O_5S$: 365.40) per mg, calculated on the anhydrous basis.

Description Amoxicillin Hydrate occurs as white to pale yellowish white crystals or a crystalline powder.
It is slightly soluble in water or methanol and very slightly soluble in ethanol(95).

Identification Determine the infrared spectra of Amoxicillin Hydrate and amoxicillin RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Crystallinity Meets the requirements.

Optical rotation $[\alpha]_D^{20}$: Between +290° and +315° (0.1 g, calculated on the anhydrous basis, water, 100 mL, 100 mm).

pH Dissolve 20 mg of Amoxicillin Hydrate in 10 mL of water; the pH of this solution is between 3.5 and 6.0.

Purity (1) ***Heavy metals***—Weigh 0.1 g of Amoxicillin Hydrate, add 2 mL of a solution of magnesium sulfate heptahydrate (1 in 4), mix, heat on a steam bath, and evaporate to dryness. Carbonize the residue by gently heating. After cooling, add 1 mL of sulfuric acid, heat carefully, and then heat at 500 to 600 °C to incinerate. After cooling, add 1 mL of hydrochloric acid to the residue and warm it on a steam bath to evaporate it to dryness. To the residue, add 10 mL of water and warm on a steam bath to dissolve. After cooling, adjust the pH to 3 to 4 with ammonia TS, add 2 mL of dilute acetic acid, filtrate, if necessary, and wash with 10 mL of water. Transfer the filtrate and the solution used for washing into a Nessler tube, and add water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution as follows: to 2.0 mL of lead standard solution, add 2 mL of a solution of magnesium sulfate heptahydrate (1 in 4), and proceed in the same manner as in the preparation of the test solution (NMT 20 ppm).

(2) ***Arsenic***—Prepare the test solution with 1.0 g of Amoxicillin Hydrate according to Method 4 and perform the test (NMT 2 ppm).

(3) ***Related substances***—Dissolve 0.10 g of Amoxicillin Hydrate in 50 mL of a solution of sodium tetraborate decahydrate (1 in 200) and use this solution as the test solution. Pipet 1 mL of the test solution, add a solution of sodium tetraborate decahydrate (1 in 200) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions, and determine the peak areas from each solution by calculating each peak area from each solution with the automatic integration method; the area of each peak other than the peak of amoxicillin obtained from the test solution is not larger than the peak area of amoxicillin from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and 30 cm in length, packed with 10 μL of octadecylsilanized silica gel for liquid chromatography.

Column temperature: A constant temperature of about 25 °C.

Mobile phase A: Dissolve 1.36 g of sodium acetate trihydrate in 750 mL of water, adjust the pH to 4.5 with acetic acid(31), and add water to make 1000 mL. To 950 mL of this solution, add 50 mL of methanol.

Flow rate: Adjust the flow rate so that the retention time of amoxicillin is about 8 minutes.

System suitability

Test for required detectability: Pipet 1 mL of the standard solution and add a solution of sodium tetraborate decahydrate (1 in 200) to make exactly 10 mL. Confirm that the peak area of amoxicillin obtained from 10 μL of this solution is equivalent to 7 to 13% of that from 10 μL of the standard solution.

System performance: Proceed with 10 mL of the standard solution according to the above conditions; the number of theoretical plates and the symmetry factor of the peak of amoxicillin are NLT 2500 and NMT 1.5, respectively.

System repeatability: Repeat the test 6 times with 10 mL each of the standard solutions according to the above conditions; the relative standard deviation of the peak areas of amoxicillin is NMT 1.0%.

Time span of measurement: About 4 times the retention time of amoxicillin

(4) ***Dimethylaniline***—Weigh accurately about 1.0 g of Amoxicillin Hydrate, add 5 mL of 1 mol/L sodium hydroxide TS, shake to dissolve, add 1 mL of the internal standard solution, shake vigorously for 1 minute to mix, centrifuge, and use the clear supernatant as the test solution. Separately, weigh accurately about 50 mg of dimethylaniline, dissolve in 25 mL of 1 mol/L hydrochloric acid, and add water to make 50 mL. Pipet 5.0 mL of this solution and add water to make exactly 250 mL. Pipet 1.0 mL of this solution, add 5.0 mL of 1 mol/L sodium hydroxide TS and 1.0 mL of the internal standard solution, shake vigorously for 1 minute to mix, centrifuge, and use the clear supernatant as the standard solution. Perform the test with 1 μL each of the test solution, the standard solution as directed under the Gas Chromatography according to the following conditions, and calculate the peak area ratio, Q_T and Q_S, of dimethylaniline to the internal standard from the test solution and the standard solution, respectively (NMT 20 ppm).

$$\text{Content (ppm) of dimethylaniline} = \text{Amount (mg) of dimethylaniline taken} \times \frac{Q_T}{Q_S} \times \frac{Purity\ (\%)\ of\ dimethylaniline}{Amount\ (mg)\ of\ Amoxicillin\ Hydrate\ taken} \times 4$$

Internal standard solution—Dissolve about 50 mg of naphthalene in cyclohexane to make 50 mL. Take 5.0 mL of this solution, add cyclohexane to make 100 mL, and use this solution as the internal standard solution.

Operating conditions

Detector: A hydrogen flame ionization detector

Column: A column about 0.53 mm in internal diameter and about 30 m in length, of which the inner surface is coated with 35% phenyl-65% dimethylpolysiloxane for gas chromatography (1.0 μm in thickness).

Column temperature: Inject the sample at a constant temperature of about 110 °C, hold the temperature for 4 minutes, then raise the temperature at a rate of 8 °C per minute until it reaches 200 °C, and hold the temperature at a constant temperature of about 200 °C for 5 minutes.

Temperatures of the sample injection port and the detector : 250 °C

Carrier gas: Helium

Flow rate: 30 cm/sec

Split ratio: About 1:10.

System suitability

System performance: Proceed with 1 μL of the standard solution according to the above conditions; the relative retention time of naphthalene with respect to dimethylaniline is about 1.3 with the signal to noise ratio of dimethylaniline being NLT 10.

Water Between 11.5% and 15.0% (0.1 g, volumetric titration, direct titration).

Assay Weigh accurately 30 mg (potency) each of Amoxicillin Hydrate and amoxicillin RS, dissolve each in a solution of boric acid (1 in 200) to make exactly 100 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the peak areas, A_T and A_S, of amoxicillin from each solution.

$$\text{Potency (μg) of amoxicillin } (C_{16}H_{19}N_3O_5S) = \text{Potency (μg) of amoxicillin RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 230 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Flow rate: Adjust the flow rate so that the retention time of amoxicillin is about 8 minutes.

Mobile phase A: Dissolve 1.361 g of sodium acetate trihydrate in 750 mL of water, adjust the pH to 4.5 with acetic acid(31), and add more water to make 1000 mL. To 950 mL of this solution, add 50 mL of methanol.

System suitability

System performance: Proceed with 10 μL of the standard solution according to the above conditions; the number of theoretical plates of amoxicillin is NLT 2500.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solutions according to the above conditions; the relative standard deviation of the peak areas of amoxicillin is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Amoxicillin Capsules
아목시실린 캡슐

Amoxicillin Capsules contain NLT 92.0% and NMT 105.0% of the labeled amount of amoxicillin ($C_{16}H_{19}N_3O_5S$: 365.40).

Method of preparation Prepare as directed under Capsules, with Amoxicillin Hydrate.

Identification Take the content of Amoxicillin Capsules, weigh the amount equivalent to 8 mg (potency) of amoxicillin hydrate according to the labeled amount, add 2 mL of 0.01 mol/L hydrochloric acid TS, and shake to mix for 30 minutes. Filter, and use the filtrate as the test solution. Separately, dissolve an amount equivalent to 8 mg (potency) of amoxicillin RS in 2 mL of 0.01 mol/L hydrochloric acid TS, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of tetrahydrofuran, water and formic acid (50 : 5 : 2) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Spray evenly a solution of ninhydrin in ethanol(95) (1 in 20) on the plate, and heat at 110 ℃ for 15 minutes; the principal spots obtained from the test solution and the standard solution exhibit a purple color, and have the same R_f values.

Purity ***Related substances*—**Take the content of Amoxicillin Capsules, weigh an amount equivalent to 0.1 g (potency) of amoxicillin according to the labeled amount, add 30 mL of boric acid solution (1 in 200), and shake to mix for 15 minutes. Add boric acid solution (1 in 200) to make 50 mL. Centrifuge this solution and use the supernatant as the test solution. Pipet 1 mL of this solution, add boric acid solution (1 in 200) to make exactly 100 mL, and use this solution as the standard solution. Pipet 10 μL each of the test solution and the standard solution, and perform the test as directed under the Liquid Chromatography according to the following conditions. Determine the peak area of each solution by the automatic integration method; the peak areas other than amoxicillin in the test solution are not greater than the peak area of amoxicillin in the standard solution.

Operating conditions

Proceed according to the operating conditions as directed in Purity (3) of Amoxicillin Hydrate.

System suitability

For confirmation of detection and system repeatability, perform the test as directed under the System suitability under Purity (3) of Amoxicillin Hydrate.

System performance: Proceed with 10 μL of the standard solution under the above conditions; the number of theoretical plates and the symmetry factor of the peak of amoxicillin are NLT 2500 and NMT 1.5, respectively.

Water NMT 15.0% (0.1 g, volumetric titration, direct titration).

Dissolution Perform the test with 1 Amoxicillin Capsule at 100 revolutions per minute according to Method 2 under the Dissolution, with a sinker using 900 mL of water as the dissolution medium. Take NLT 20 mL of the dissolved solution 60 minutes after starting the test and filter through a membrane filter with a pore size of NMT 0.45 μm. Discard the first 10 mL of the filtrate, pipet the subsequent filtrate of V mL, add the water to make exactly V' mL, containing about 56 μg (potency) of amoxicillin ($C_{16}H_{19}N_3O_5S$) per mL, according to the labeled amount, and use this solution as the test solution. Separately, weigh accurately an amount equivalent to about 28 mg (potency) of amoxicillin RS, and dissolve in the water to make exactly 100 mL. Pipet 5 mL of this solution, add water to make exactly 25 mL, and use this solution as the standard solution. Perform the test with 50 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of amoxicillin. Meets the requirements if the dissolution rate of Amoxicillin Capsules in 60 minutes is NLT 75%.

Dissolution rate (%) of the labeled amount of amoxicillin ($C_{16}H_{19}N_3O_5S_2$)

$$= \text{Potency (mg) of amoxicillin RS} \times \frac{A_T}{A_S} \times \frac{V'}{V} \times \frac{1}{C} \times 180$$

C: Labeled amount [mg (potency)] of amoxicillin ($C_{16}H_{19}N_3O_5S$) per capsule

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 230 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: Dissolve 1.361 g of sodium acetate trihydrate in 750 mL of water, adjust the pH to 4.5 with acetic acid(31), and add water to make 1000 mL. Add 50 mL of methanol to 950 mL of this solution and mix.

Flow rate: Adjust the flow rate so that the retention time of the amoxicillin peak is about 8 minutes.

Column temperature: A constant temperature of about 25 ℃.

System suitability

System performance: Proceed with 50 μL of the standard solution under the above conditions; the number of theoretical plates and the symmetry factor are NLT 2500 plates and NMT 2.0, respectively.

System repeatability: Repeat the test 6 times with 50 μL each of the standard solutions according to the above conditions; the relative standard deviation of

the peak areas of amoxicillin is NMT 1.5%.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of the content NLT 20 Amoxicillin Capsules. Weigh accurately an amount equivalent to about 0.1 g (potency) of amoxicillin hydrate according to the labeled potency, add 70 mL of water, shake to mix for 15 minutes, and add water to make exactly 100 mL. Centrifuge, and use the supernatant as the test solution. Separately, weigh accurately an amount equivalent to about 20 mg (potency) of amoxicillin RS, dissolve in water to make exactly 20 mL, and use this solution as the standard solution. Perform the test with each 10 μL of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions, and determine the peak areas, A_T and A_S, of amoxicillin in the test solution and the standard solution.

$$\text{Potency (μg) of amoxicillin } (C_{16}H_{19}N_3O_5S) = \text{Potency (μg) of amoxicillin RS} \times \frac{A_T}{A_S} \times 5$$

Operating conditions

For the column temperature, mobile phase and flow rate, proceed as directed in the operating conditions under the Assay of Amoxicillin Hydrate.

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 μm in particle diameter).

System suitability

System performance: Proceed with 10 μL of the standard solution according to the above conditions; the number of theoretical plates and the symmetry factor of the peak of amoxicillin are NLT 2500 and NMT 1.5, respectively.

System repeatability: Repeat the test 6 times with 10 μL of the standard solution according to the above conditions; the relative standard deviation of the peak area of amoxicillin is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Amoxicillin for Syrup
시럽용 아목시실린

Amoxicillin for Syrup is a preparation for syrup, which is dissolved before use, and contains NLT 90.0% and NMT 120.0% of the labeled amount of amoxicillin ($C_{16}H_{19}N_3O_5S$: 365.40).

Method of preparation Prepare as directed under Syrups, with Amoxicillin Hydrate.

Identification (1) Dissolve an amount of Amoxicillin for Syrup, equivalent to about 0.2 g of amoxicillin, and about 0.2 g of amoxicillin RS in 0.1 mol/L hydrochloric acid TS to make 50 mL and use the solutions as the test solution and the standard solution, respectively. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot each 10 μL of the test solution and the standard solution on a thin-layer chromatographic plate of silica gel for thin-layer chromatography. Develop the plate using a mixture of methanol, chloroform, water and pyridine (9 : 8 : 3 : 1) as the developing solvent and air-dry the plate. Spray evenly a solution prepared by dissolving 0.3 g of ninhydrin in 100 mL of methanol on the plate and heat at 110 ℃ for 15 minutes; the R_f values of the spots from the test solution and the standard solution are the same.

pH Dissolve Amoxicillin for Syrup according to the label; the pH of the resulting solution is between 5.0 and 7.5.

Water NMT 3.0% (0.2 g, volumetric titration, direct titration).

Uniformity of dosage units (distribution) Meets the requirements.

Assay Weigh accurately an amount of Amoxicillin for Syrup, equivalent to about 0.1 g (potency) according to the labeled potency, dissolve in water, add 15.0 mL of the internal standard solution and water to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 0.1 g (potency) of amoxicillin RS, dissolve in water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with each 20 mL of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions and determine the ratios, Q_T and Q_S, of the peak area of amoxicillin to that of the internal standard for the test solution and standard solution.

$$\text{Potency (μg) of amoxicillin } (C_{16}H_{19}N_3O_5S_2) = \text{Potency (μg) of amoxicillin RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—Weigh accurately about 0.7 g of sodium benzoate and dissolve it in water to make exactly 1000 mL.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 230 nm).

Column: A stainless steel column, about 4 mm in internal diameter and about 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography.

Flow rate: Adjust the flow rate so that the retention time of the internal standard is about 1.5 minutes.

Mobile phase: Dissolve 6.3 g of ammonium formate in 750 mL of water, adjust the pH to 6.0 with formic acid or ammonia TS, add 30 mL of methanol, and add water to make exactly 1000 mL.

System suitability

System performance: Proceed with 10 μL of the standard solution according to the above operating conditions and perform the test; the internal standard and amoxicillin are eluted in this order, with the resolution being NLT 2.0.

Packaging and storage Preserve in tight containers.

Amoxicillin Tablets
아목시실린 정

Amoxicillin Tablets contain NLT 90.0% and NMT 120.0% of the labeled amount of amoxicillin ($C_{16}H_{19}N_3O_5S$: 365.40).

Method of preparation Prepare as directed under Tablets, with Amoxicillin Hydrate.

Identification Proceed with Amoxicillin Tablets, previously powdered, as directed under the Identification under Amoxicillin for Syrup.

Water NMT 9.0% for 50 mg (potency) of tablets (0.1 g, volumetric titration, direct titration); NMT 13.0% for 0.125 g (potency) and 0.25 g (potency) of tablets (0.1 g, volumetric titration, direct titration).

Dissolution Perform the test with 1 tablet of Amoxicillin Tablets at 75 revolutions per minute according to Method 2 under the Dissolution, using 900 mL of water as the dissolution medium. Take NLT 20 mL of the dissolved solution 30 minutes after starting the test and filter through a membrane filter with a pore size not exceeding 0.5 μm. Discard the first 10 mL of the filtrate, pipet *V* mL of the subsequent filtrate, add water to make *V'* mL according to the labeled amount to obtain a solution having a known concentration of about 45 μg (potency) of amoxicillin ($C_{16}H_{19}N_3O_5S$) per mL, and use this solution as the test solution. Separately, weigh accurately an appropriate amount of amoxicillin RS, dissolve in pH 5.0 buffer solution to the same concentration as the test solution, and use this solution as the standard solution. Use the test solution and the standard solution within 6 hours. Perform the test with each 10 μL of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions and determine the amoxicillin peak areas, A_T and A_S. It meets the requirements if the dissolution rate of Amoxicillin Tablets in 30 minutes is NLT 75% (Q).

Dissolution rate (%) with respect to the labeled amount of amoxicillin ($C_{16}H_{19}N_3O_5S_2$)

$$= C_S \times \frac{A_T}{A_S} \times \frac{V'}{V} \times \frac{1}{C} \times 90000$$

Cs: Concentration [mg (potency)/mL] of the standard solution

C: Labeled amount [mg (potency)] of amoxicillin ($C_{16}H_{19}N_3O_5S$) in 1 tablet

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 230 nm).

Column: A stainless steel column about 3.9 mm in internal diameter and about 300 mm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: Filter a mixture of pH 5.0 phosphate buffer solution and acetonitrile (3900 : 100) through a membrane filter with a pore size not exceeding 0.5 μm and use the filtrate as the mobile phase.

Flow rate: 0.7 mL/min

Column temperature: A constant temperature of about 40 °C.

System suitability

System performance: Proceed with 10 μL of the standard solution according to the above operating conditions and perform the test; the mass distribution ratio is between 1.1 and 2.8; the number of theoretical plates and symmetry factor are NLT 1700 and NMT 2.5, respectively.

System repeatability: Repeat the test 5 times with 10 μL each of the standard solutions according to the above conditions; the relative standard deviation of the peak areas of amoxicillin is NMT 1.5%.

Phosphate buffer solution, pH 5.0—Dissolve 27.2 g of potassium dihydrogen phosphate in about 3000 mL of water. Adjust the pH to 5.0 ± 0.1 with 45% (w/w) potassium hydroxide solution and add water to make 4000 mL.

Uniformity of dosage units Meets the requirements

Assay Weigh accurately NLT 20 tablets of Amoxicillin Tablets and powder it. Weigh an amount, equivalent to about 0.1 g (potency) according to the labeled potency, add a solution of sodium borate (1 in 200), and shake to mix for about 10 minutes. Add a solution of sodium borate (1 in 200) to make exactly 50 mL, filter, and use the filtrate as the test solution. Separately, weigh accurately about 0.1 g (potency) of amoxicillin RS, proceed in the same manner as in the preparation of the test solution, and use this solution as the standard solution. Perform the test with each 10 μL of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions, and determine the peak areas, A_T and A_S, of amoxicillin in the test solution and the standard solution.

Potency (μg) of amoxicillin ($C_{16}H_{19}N_3O_5S_2$)

$$= \text{Potency } (\mu g) \text{ of amoxicillin RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 μm in particle diameter).

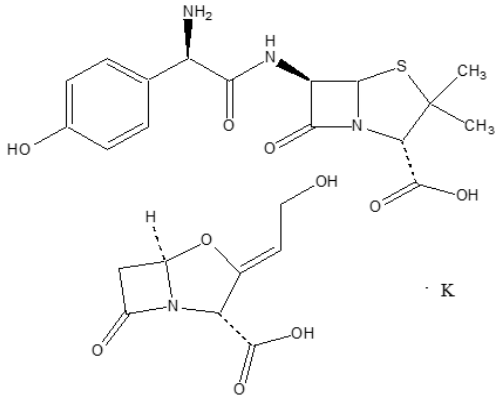
Mobile phase: Dissolve 1.361 g of sodium acetate trihydrate in 750 mL of water, adjust the pH to 4.5 with acetic acid(100), and add water to make 1000 mL. To 950 mL of this solution, add 50 mL of ethanol(95) and mix.

Flow rate: Adjust the flow rate so that the retention time of amoxicillin is about 8 minutes.

Selection of column: Proceed with 10 μL of the standard solution under the above operating conditions and perform the test; the number of theoretical plates of the amoxicillin peak is NLT 2500.

Packaging and storage Preserve in tight containers.

Amoxicillin·Clavulanate Potassium
아목시실린·클라불란산칼륨



$C_{16}H_{19}N_3O_5S \cdot C_8H_9NO_5 \cdot K$: 603.66

(2*R*,3*Z*,5*R*)-3-(2-Hydroxyethylidene)-7-oxo-4-oxa-1-azabicyclo[3.2.0]heptane-2-carboxylic acid potassium salt with (2*S*,5*R*,6*R*)-6-[[(2*R*)-2-amino-2-(4-hydroxyphenyl)acetyl]amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid (1:1) mixture, [*74469-00-4*]

Amoxicillin·Clavulanate Potassium occurs as a white powder obtained by mixing amoxicillin and clavulanate potassium at a ratio of 2 : 1, 4 : 1 or 7 :1 (potency). Amoxicillin·Clavulanate Potassium contains NLT 530 μg and NMT 590 μg (potency) of amoxicillin ($C_{16}H_{19}N_3O_5S$: 365.41) and NLT 265 μg and NMT 295 μg (potency) of clavulanic acid ($C_8H_9NO_5$: 199.16) per mg (1) when amoxicillin and clavulanate potassium are mixed at a ratio of 2 : 1 (potency); NLT 640 μg and NMT 700 μg (potency) of amoxicillin ($C_{16}H_{19}N_3O_5S$: 365.41) and NLT 160 μg and NMT 175 μg (potency) of clavulanic acid ($C_8H_9NO_5$: 199.16) per mg (2) when amoxicillin and clavulanate potassium are mixed at a ratio of 4 : 1 (potency); NLT 697 μg and NMT 770 μg (potency) of amoxicillin ($C_{16}H_{19}N_3O_5S$: 365.41) and NLT 99.5 μg and NMT 110 μg (potency) of clavulanic acid ($C_8H_9NO_5$: 199.16) per mg (3) when amoxicillin and clavulanate potassium are mixed at a ratio of 7 : 1 (potency).

Identification The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

pH The pH of 0.2% aqueous solution of Amoxicillin·Clavulanate Potassium is between 3.7 and 5.7.

Ratio of amoxicillin and clavulanate potassium (1) The ratio of amoxicillin and clavulanate potassium is between 1.9 : 1 and 2.1 : 1 when tested as directed under the Assay if they are mixed at a ratio of 2 : 1 (potency).

(2) The ratio of amoxicillin and clavulanate potassium is between 3.8 : 1 and 4.2 : 1 when tested as directed under the Assay if they are mixed at a ratio of 4 : 1 (potency).

(3) The ratio of amoxicillin and clavulanate potassium is between 6.65 : 1 and 7.35 : 1 when tested as directed under the Assay if they are mixed at a ratio of 7 : 1 (potency).

Water (1) Between 7.5% and 9.5% when amoxicillin and clavulanate potassium are mixed at a ratio of 2 : 1 (potency).

(2) Between 9.0% and 11.5% when amoxicillin and clavulanate potassium are mixed at a ratio of 4 : 1 (potency).

(3) NMT 14.5% when amoxicillin and clavulanate potassium are mixed at a ratio of 7 : 1 (potency) (0.1 g, volumetric titration, direct titration).

Assay ***Amoxicillin and clavulanate potassium***

(1) When amoxicillin and clavulanate potassium are mixed at a ratio of 2 : 1 (potency)

Weigh accurately an amount of Amoxicillin·Clavulanate Potassium, equivalent to about 0.1 g (potency) of amoxicillin ($C_{16}H_{19}N_3O_5S$) {an amount equivalent to about 50 mg of clavulanic acid ($C_8H_9NO_5$)}, dissolve in water, and add 15 mL of the internal standard solution and water to make exactly 100 mL. Use this solution as the test solution. Separately, weigh accurately about 0.1 g (potency) of amoxicillin RS and about 50 mg (potency) of clavulanic acid RS, dissolve them in water, and add 15 mL of the internal standard solution and water to make exactly 100 mL. Use this solution as the test solution.

(2) When amoxicillin and clavulanate potassium are mixed at a ratio of 4 : 1 (potency)

Weigh accurately Amoxicillin·Clavulanate Potassium in an amount equivalent to about 0.1 g (potency) as amoxicillin ($C_{16}H_{19}N_3O_5S$)) {an amount to about 25 mg

as clavulanic acid ($C_8H_9NO_5$)}, dissolve it in water, then add 15 mL of the internal standard solution and water to make exactly 100 mL. Use this solution as the test solution. Separately, weigh accurately about 0.1 g (potency) of amoxicillin RS and about 25 mg (potency) of clavulanic acid RS, dissolve them in water, then add 15 mL of the internal standard solution and water to make exactly 100 mL. Use this solution as the test solution.

(3) When amoxicillin and clavulanate potassium are mixed at a ratio of 7 : 1 (potency)

Weigh accurately an amount of Amoxicillin·Clavulanate Potassium, equivalent to about 0.1 g (potency) of amoxicillin ($C_{16}H_{19}N_3O_5S$)) {an amount, equivalent to about 14 mg as clavulanic acid ($C_8H_9NO_5$)}, dissolve in water, and add 15 mL of the internal standard solution and water to make exactly 100 mL. Use this solution as the test solution. Separately, weigh accurately about 0.1 g (potency) of amoxicillin RS and about 14 mg (potency) of clavulanic acid RS, dissolve them in water, and add 15 mL of the internal standard solution and water to make exactly 100 mL. Use this solution as the test solution.

Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the ratio of peak areas of amoxicillin and clavulanic acid, Q_{T1}, Q_{S1}, Q_{T2} and Q_{S2}, to that of the internal standard in each solution.

Amount [potency (μg)] of amoxicillin ($C_{16}H_{19}N_3O_5S$)
= Amount [potency (mg)] of amoxicillin RS
× (Q_{T1} / Q_{S1})× 1000

Amount [potency (μg)] of clavulanic acid ($C_8H_9NO_5$)
= Amount [potency (mg)] of clavulanic acid RS
× (Q_{T2} / Q_{S2}) × 1000

Internal standard solution—Weigh accurately about 0.7 g of sodium benzoate, dissolve in water, and make exactly 1000 mL.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 230 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography.

Flow rate: Adjust the flow rate so that the retention time of the internal standard is about 1.5 minutes.

Mobile phase: Dissolve 6.3 g of ammonium formate in 750 mL of water, adjust the pH to 6.0 with formic acid or ammonia TS, add 30 mL of methanol and add water to make exactly 1000 mL.

System suitability

Selection of column: Repeat the test with 10 μL of the standard solution according to the above operating conditions; clavulanic acid, the internal standard and amoxicillin are eluted in this order with the resolution between the peaks of internal standard and clavulanic acid being 3.9 and the resolution between the peaks of internal standard and amoxicillin being NLT 2.0.

Packaging and storage Preserve in tight containers.

Amoxicillin·Clavulanate Potassium for Syrup
시럽용 아목시실린·클라불란산칼륨

Amoxicillin·Clavulanate Potassium for Syrup is a preparation for syrup, which is dissolved before use, and contains NLT 90.0% and NMT 120.0% of the labeled amount of amoxicillin ($C_{16}H_{19}N_3O_5S$: 365.40) and clavulanic acid ($C_8H_9NO_5$: 199.16).

Method of preparation Prepare as directed under Syrups to contain Amoxicillin and Clavulanate Potassium in the ratio of 4 : 1 (potency), 7 : 1 (potency) or 14 : 1 (potency).

Identification (1) The retention times of the major peaks obtained from the test solution and the standard solution prepared as directed under the Assay are the same.

pH Dissolve Amoxicillin·Clavulanate Potassium for Syrup according to the label; the pH of the resulting solution is between 4.0 and 6.0.

Water NMT 8.0% if the ratio of amoxicillin to potassium clavulanate is 4 : 1 (potency), NMT 9.0% if the ratio of amoxicillin to potassium clavulanate is 7 : 1 (potency), and NMT 11.0% if the ratio of amoxicillin to potassium clavulanate is 14 : 1 (potency) (0.1 g, volumetric titration, direct titration).

Uniformity of dosage units (distribution) Meets the requirements.

Assay Proceed as directed under the Assay under Amoxicillin Clavulanate Potassium Tablets. Weigh accurately an amount of Amoxicillin ·Clavulanate Potassium for Syrup, equivalent to about 50 mg (potency) of amoxicillin according to the labeled potency, add about 70 mL of water, shake well to dissolve for 60 minutes, and add water to make exactly 100 mL. Filter if necessary and use the solution as the test solution. Separately, weigh accurately about 50 mg (potency) of amoxicillin RS and 12.5 mg (4 : 1), 7.1 mg (7 : 1) or 3.6 mg (14 : 1) of clavulanic acid RS, add about 70 mL of water, shake well to dissolve for 60 minutes, add water to make 100 mL, and use this solution as the standard solution.

Packaging and storage Preserve in tight containers.

Amoxicillin·Clavulanate Potassium Tablets
아목시실린·클라불란산칼륨 정

Amoxicillin·Clavulanate Potassium Tablets contain NLT 90.0% and NMT 120.0% of the labeled amounts of amoxicillin ($C_{16}H_{19}N_3O_5S$: 365.40) and clavulanic acid ($C_8H_9NO_5$: 199.16).

Method of preparation Prepare as directed under Tablets to contain Amoxicillin and Clavulanate Potassium in the ratio of 2 : 1 (potency), 4 : 1 (potency) or 7 : 1 (potency).

Identification (1) The retention times of the major peaks obtained from the test solution and the standard solution prepared as directed under the Assay are the same.

Water (1) NMT 7.0% if the ratio of amoxicillin to clavulanate potassium is 2 : 1 (potency),

(2) NMT 9.0% if the ratio of amoxicillin to clavulanate potassium is 4 : 1 (potency),

(3) NMT 11.0% if the ratio of amoxicillin to potassium clavulanate is 7 : 1 (potency) (0.1 g, volumetric titration, direct titration).

Dissolution Perform the test with 1 tablet of Amoxicillin·Clavulanate Potassium Tablets at 75 revolutions per minute according to Method 2 under the Dissolution, using 900 mL of water as the dissolution medium. Take the dissolved solution after 30 minutes after starting the test and filter. Discard the first 10 mL of the filtrate and use the subsequent filtrate as the test solution. Separately, weigh accurately an appropriate amount of amoxicillin RS and clavulanic acid RS, dissolve each in water to the same concentration as the test solution, and use these solutions as the standard solutions. Perform the test with each 20 μL of the test solution and the standard solutions as directed under the Assay, and determine the peak areas, A_T and A_S, of amoxicillin and clavulanic acid. It meets the requirements when the dissolution rates of amoxicillin and clavulanic acid in 30 minutes are NLT 85% (Q) and 80% (Q), respectively.

Dissolution rate (%) with respect to the labeled amount of amoxicillin ($C_{16}H_{19}N_3O_5S$) or clavulanic acid ($C_8H_9NO_5$).

$$= C_S \times \frac{A_T}{A_S} \times \frac{1}{C} \times 90000$$

C_S: Concentration [mg (potency)/mL] of amoxicillin or clavulanic acid in the standard solution

C: Labeled amount [mg (potency)] of amoxicillin ($C_{16}H_{19}N_3O_5S$) or clavulanic acid ($C_8H_9NO_5$) per tablet

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately NLT 10 tablets of Amoxicillin·Clavulanate Potassium Tablets, dissolve in a sufficient amount of water by shaking to mix to obtain a solution having a known concentration of 1.25 mg (potency) of amoxicillin per mL according to the labeled potency, filter, if necessary, and use as the test stock solution. Pipet 40 mL of the test stock solution, add water to make 100 mL, and use this solution as the test solution. Use the test solution within 1 hour. Separately, weigh accurately about 50 mg (potency) of amoxicillin RS and 25 mg (2 : 1), 12.5 mg (4 : 1) or 7.1 mg (7 : 1) of clavulanic acid RS, add about 70 mL of water, shake to mix well for 60 minutes to dissolve, add water to make 100 mL, and use this solution as the standard solution. Perform the test with each 20 μL of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions and determine the peak areas, A_{T1} and A_{S1}, A_{T2} and A_{S2}, of amoxicillin and clavulanic acid from test solution and the standard solution, respectively.

Potency (μg) of amoxicillin ($C_{16}H_{19}N_3O_5S$)
$$= \text{Potency (μg) of amoxicillin RS} \times \frac{A_{T1}}{A_{S1}}$$

Potency (μg) of clavulanic acid ($C_8H_9NO_5$)
$$= \text{Potency (μg) of clavulanic acid RS} \times \frac{A_{T2}}{A_{S2}}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

Column: A stainless steel column about 4 mm in internal diameter and 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 to 10 μm in particle diameter).

Mobile phase: Filter a mixture of pH 4.4 phosphate buffer solution and methanol (95 : 5) through a membrane filter with a pore size not exceeding 0.5 μm and use the filtrate as the mobile phase.

Flow rate: 2 mL/min

System suitability

System performance: Proceed with 20 μL of the standard solution according to the above operating conditions and perform the test; the resolution of amoxicillin and clavulanic acid is NLT 3.5, and the number of theoretical plates and symmetry factor are NLT 550 and NMT 1.5, respectively.

System repeatability: Repeat the test 5 times according to the above conditions with each 20 μL of the standard solution; the relative standard deviation of the peak area is NMT 2.0%

Phosphate buffer solution, pH 4.4—Dissolve 7.8 g of sodium dihydrogen phosphate dihydrate in 900 mL of water, adjust the pH to 4.4 ± 0.1 with phosphoric acid or 10 mol/L sodium hydroxide solution, and add water to make 1000 mL.

Packaging and storage Preserve in tight containers.

Amoxicillin·Clavulanate Potassium Tablets for Oral Suspension
아목시실린·클라불란산칼륨 현탁용 정

Amoxicillin·Clavulanate Potassium Tablets for Oral Suspension contain NLT 90.0% and NMT 120.0% of the labeled amount of amoxicillin ($C_{16}H_{19}N_3O_5S$: 365.41) and clavulanic acid ($C_8H_9NO_5$: 199.16).

Method of preparation Prepare as directed under Tablets to contain Amoxicillin and Clavulanate Potassium in the ratio of 4 : 1 (potency).

Identification The retention times of major peaks obtained from the test solution and the standard solution prepared as directed under the Assay are the same.

Disintegration Perform the test as directed under the Disintegration; disintegration occurs within 3 minutes after starting the test. Use water as the disintegration medium and maintain the temperature at 20 ± 5 ℃.

Uniformity of dosage units Meets the requirements.

Water NMT 9.0% (0.1 g, volumetric titration, direct titration).

Assay Weigh accurately NLT 20 tablets of Amoxicillin·Clavulanate Potassium Tablets for Oral Suspension and powder. Weigh accurately an amount equivalent to about 50 mg (potency) of amoxicillin ($C_{16}H_{19}N_3O_5S$) and about 12.5 mg (potency) of clavulanic acid ($C_8H_9NO_5$), and dissolve in about 70 mL of water by shaking well for 60 minutes. Add exactly 15 mL of the internal standard solution, add water to make exactly 100 mL, filter if necessary, and use this solution as the test solution. Separately, weigh accurately about 50 mg (potency) of amoxicillin RS and 12.5 mg (potency) of clavulanic acid RS, dissolve in about 70 mL of water by shaking well for 60 minutes, and add 15 mL of the internal standard solution. Add water to make exactly 100 mL and use this solution as the standard solution. Perform the test with each 10 μL of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions and determine the peak area ratios, Q_{T1} and Q_{S1}, Q_{T2} and Q_{S2}, of amoxicillin and clavulanic acid to the internal standard, respectively, from the test and the standard solution.

Amount [mg (potency)] of amoxicillin ($C_{16}H_{19}N_3O_5S$)
= Amount [mg (potency)] of amoxicillin RS
× (Q_{T1} / Q_{S1})

Amount [mg (potency)] of clavulanic acid ($C_8H_9NO_5$)
= Amount [mg (potency)] of clavulanic acid RS
× (Q_{T2} / Q_{S2})

Internal standard solution—Weigh accurately about 0.7 g of sodium benzoate and dissolve in water to make exactly 1000 mL.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 230 nm).

Column: A stainless steel column about 4 mm in internal diameter and 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 μm in particle diameter).

Mobile phase: Dissolve 6.3 g of ammonium formate in 750 mL of water, adjust the pH to 6.0 with formic acid or ammonia TS, and add 30 mL of methanol. Add water again to make exactly 1000 mL.

Flow rate: Adjust the flow rate so that the retention time of the internal standard is about 1.5 minutes.

System suitability

Column performance: Proceed with 10 μL of the standard solution according to the above operating conditions and perform the test; clavulanic acid, the internal standard and amoxicillin are eluted in this order with the resolutions between the peaks of the internal standard and clavulanic acid and between the peaks of the internal standard and amoxicillin being NLT 3.9 and 2.0, respectively.

Packaging and storage Preserve in tight containers.

Amoxicillin·Sulbactam Pivoxil Tablets
아목시실린·설박탐피복실 정

Amoxicillin·Sulbactam Pivoxil Tablets contain NLT 90.0% and NMT 120.0% of the labeled amount of amoxicillin ($C_{16}H_{19}N_3O_5S$: 365.41) and sulbactam ($C_8H_{11}NO_5S$: 233.24).

Method of preparation Prepare as directed under Tablets to contain Amoxicillin and Sulbactam Pivoxil at a ratio of 1 :1 (potency).

Identification The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay ***Amoxicillin and sulbactam pivoxil***—Weigh accurately the mass of NLT 20 tablets of Amoxicillin·Sulbactam Pivoxil Tablets, and powder. Weigh accurately an amount equivalent to about 50 mg (potency) of amoxicillin ($C_{16}H_{19}N_3O_5S$) {about 50 mg of sulbactam ($C_8H_{11}NO_5S$)} according to the labeled potency, and add a mixture of water and methanol (1 :1) to make exactly 100 mL. Filter and use the filtrate as the test solution. Separately, weigh accurately about 50 mg (potency) of

amoxicillin RS and about 50 mg (potency) of sulbactam pivoxil RS, dissolve them in a mixture of methanol and water (1 : 1) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions and determine the peak areas of amoxicillin and sulbactam pivoxil, A_{T1}, A_{S1}, A_{T2},and A_{S2} in each solution.

$$\text{Potency (μg) of amoxicillin } (C_{16}H_{19}N_3O_5S) = \text{Potency (μg) of amoxicillin RS} \times \frac{A_{T1}}{A_{S1}}$$

$$\text{Potency (μg) of sulbactam } (C_8H_{11}NO_5S) = \textit{Potency (μg) of sulbactam pivoxil RS} \times \frac{A_{T2}}{A_{S2}}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 230 nm).

Column: A stainless steel column about 4 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 μm in particle diameter).

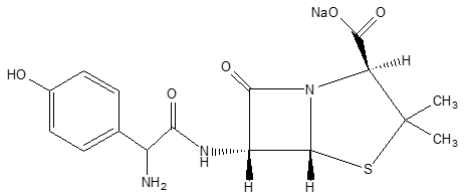
Mobile phase: A mixture of acetonitrile, water and 0.1 mol/L phosphoric acid (50 : 49.2 : 0.8).

Column temperature: 40 °C

Flow rate: 1.0 mL/min

Packaging and storage Preserve in tight containers.

Amoxicillin Sodium
아목시실린나트륨



$C_{16}H_{18}N_3NaO_5S$: 387.39

Sodium (3*S*)-6*b*-[(2*R*)-2-amino-2-(4-hydroxyphenyl)acetamido]-2,2-dimethylpenam-3-carboxylate [*34642-77-8*]

Amoxicillin Hydrate contains NLT 840 μg (potency) of amoxicillin ($C_{16}H_{19}N_3O_5S$: 365.40) per mg, calculated on the anhydrous basis.

Description Amoxicillin Sodium occurs as a white to milky white powder and is odorless or has a slight odor. It is very soluble in water or in methanol, soluble in ethanol(95) and practically insoluble in chloroform or in ether.

Identification Determine the infrared spectra of Amoxicillin Sodium and amoxicillin RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) Dissolve about 0.1 g (potency) each of Amoxicillin Sodium and amoxicillin RS in 0.1 mol/L phosphate buffer solution (pH 7.0)[1)] to make 100 mL, and use these solutions as the test solution and the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 1 μL each of these solutions on the thin-layer chromatographic plate of silica gel for thin-layer chromatography and develop the plate with a mixture of 2-methyl-1-propanol, methylene chloride, formic acid and water (10 : 1 : 1 : 1) as the developing solution. Warm the plate at 100 to 110 °C for 30 minutes, cool at room temperature, and spray evenly a solution obtained by dissolving 0.5 g of fast red GG in 100 mL of 0.1 mol/L sodium hydroxide TS, on the plate and develop the plate in a developing chamber saturated with 25% ammonia water; an orange spot appears on a pale yellow background, and the R_f values of the spots obtained from the test solution and the standard solution are the same.

(3) Amoxicillin Sodium responds to the Qualitative Analysis (1) for sodium salt.

Optical rotation $[\alpha]_D^{20}$: Between +255° and +285° (0.5 g, calculated on the anhydrous basis, 0.02 mol/L potassium hydrogen phthalate solution, 50 mL).

pH Dissolve 0.3 g of Amoxicillin Sodium in 20 mL of water; the pH of this solution is between 8.5 and 9.5.

Purity (1) ***Clarity and color of solution***—Weigh accurately about 1 g (potency) of Amoxicillin Sodium, transfer into a 50-mL Erlenmeyer flask, dissolve in exactly 20 mL of purified water, and filter. Five minutes after dissolving the filtrate, determine the absorbance of the filtrate at the wavelength of 425 nm as directed under the Ultraviolet-visible Spectroscopy, using purified water as the control solution (the absorbance is NMT 0.1).

(2) ***Heavy metals***—Proceed with 1.0 g of Amoxicillin Sodium according to Method 2 under the Heavy Metals and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Iodine-consuming substances***—Weigh accurately about 0.1 g (potency) of Amoxicillin Sodium, transfer into a 50-mL glass-stoppered flask, add 5 mL of 0.05 mol/L potassium hydrogen phthalate TS and 20.0 mL of 0.005 mol/L iodine VS, and allow to stand in the dark for 10 minutes. Titrate the excess iodine with 0.01 mol/L sodium thiosulfate VS (A mL) (indicator: 1 mL of starch TS). Separately, put 5 mL of 0.05 mol/L potassium hydrogen phthalate TS and 20.0 mL of 0.005 mol/L iodine VS into a 50-mL glass-stoppered flask, and, without allowing it to stand, titrate the iodine with 0.01 mol/L sodium thiosulfate VS (B mL) (NMT 6.0%).

$$\text{Content (\%) of iodine-consuming substances} = \frac{(B - A) \times 0.372}{Amount\ (mg) of\ Amoxicillin\ Sodium\ taken} \times 100$$

0.372: Amount (mg) of iodine-consuming substances corresponding to Each mL of 0.01 mol/L sodium thiosulfate VS

(4) ***Chloride (as sodium chloride)***—Weigh accurately about 1 g of Amoxicillin Sodium, transfer into a 100-mL beaker, dissolve in 50 mL of distilled water and 5 mL of 4 mol/L nitric acid VS, and titrate potentiometrically with silver nitrate TS (NMT 2.0%).

$$\text{Content (\%) of chloride (as sodium chloride)} = \frac{A \times 5.84}{Amount\ (mg)\ of\ Amoxicillin\ Sodium\ taken} \times 100$$

A: Amount (mL) of silver nitrate TS consumed

(5) ***Dimethylaniline***—Weigh accurately about 1.0 g of Amoxicillin Sodium, add 5 mL of 1 mol/L sodium hydroxide TS and 1 mL of the internal standard solution, centrifuge, if necessary, and use the supernatant as the test solution. Separately, weigh accurately about 50 mg of dimethylaniline, add 2.0 mL of hydrochloric acid, and add water to make 50 mL. Pipet 5.0 mL of this solution and add water to make exactly 250 mL. Pipet 1.0 mL of this solution, add 5.0 mL of 1 mol/L sodium hydroxide TS, add 1.0 mL of the internal standard solution, centrifuge, if necessary, and use the supernatant as the standard solution. Perform the test with 1 μL each of the test solution and the standard solution as directed under the Gas Chromatography according to the following conditions, and calculate the peak area ratios, Q_T and Q_S, of dimethylaniline to the internal standard from the test solution and the standard solution, respectively (NMT 20 ppm).

$$\text{Content (ppm) of dimethylaniline} = \text{Amount (mg) of dimethylaniline taken} \times \frac{Q_T}{Q_S} \times \frac{Purity\ (\%)\ of\ dimethylaniline}{Amount\ (mg)\ of\ Amoxicillin\ Sodium\ taken} \times 4$$

Internal standard solution—Dissolve 50.0 mg of naphthalene in cyclohexane to make 50 mL. To 5.0 mL of this solution, add cyclohexane to make 100 mL and use this solution as the internal standard solution.

Operating conditions

Detector: A hydrogen flame ionization detector

Column: A column about 2 mm in internal diameter and about 2 m in length, packed with silylated diatomaceous earth for gas chromatography, which is coated with 50% phenyl-50% methylpolysiloxane for gas chromatography equivalent to 3% of the mass of the diatomaceous earth.

Column temperature: 120 °C

Temperatures of the sample injection port and the detector: 150 °C

Carrier gas: Nitrogen

Flow rate: 30 mL/min

(6) ***2-Ethylhexanoic acid***—Dissolve 0.3 g of Amoxicillin Sodium in 4.0 mL of 33% hydrochloric acid, add 1.0 mL of the internal standard solution, shake vigorously for 1 minute to mix, allow the layers to separate, and use the supernatant as the test solution. Dissolve 75.0 g of 2-ethylhexanoic acid in the internal standard solution to make 50 mL. Pipet 1.0 mL of this solution, add 4.0 mL of 33% hydrochloric acid, shake vigorously for 1 minute to mix, allow the layers to separate, and use the supernatant as the standard solution. Perform the test with 1 μL each of the test solution and the standard solution as directed under the Gas Chromatography according to the following conditions, and calculate the peak area ratios, Q_T and Q_S, of 2-ethylhexanoic acid to the internal standard, respectively; the amount of 2-ethylhexanoic acid is NMT 0.8%.

$$\text{Content (\%) of 2-ethylhexanoic acid} = \frac{Q_T}{Q_S} \times \frac{W_S}{W_T} \times 2$$

*W*s: Amount (g) of Amoxicillin Sodium taken

W_T: Amount (g) of 2-ethylhexanoic acid in the standard solution

Internal standard solution—Weigh accurately 0.1 g of 3-cyclohexyl propionic acid and dissolve in cyclohexane to make 100 mL.

Operating conditions

Detector: A hydrogen flame ionization detector

Column: A glass column about 0.53 mm in internal diameter and about 10 m in length, of which the inner surface is coated with polyethylene glycol 20000-2-nitroterephthalate for gas chromatography (1 μm in thickness).

Column temperature: Maintain at 40 °C for the first 2 minutes, raise the temperature at the rate of 30 °C per minute, keep the temperature constant at 200 °C at 7.3 minutes, and maintain it at 200 °C until at 10.3 minutes.

Sample injection port temperature: 200 °C

Detector temperature: 300 °C

Carrier gas: Helium

Flow rate: 10 mL/min

System suitability

System performance: Proceed with 1 μL each of the test solution and the standard solution according to the above conditions; 2-ethylhexanoic acid and the internal standard are eluted in this order with the resolution between these peaks being NLT 2.0.

Water NMT 3.5% (0.2 g, volumetric titration, direct titration).

Sterility It meets the requirements when Amoxicillin Sodium is used for manufacturing sterile preparations, except for when there is a final sterilization process in the manufacturing process of sterile preparations.

Bacterial endotoxins Less than 0.25 EU/mg (potency) of amoxicillin, when Amoxicillin Sodium is used for manufacturing sterile preparations.

Assay Weigh accurately about 0.15 g (potency) of Amoxicillin Sodium, dissolve in 5 mL of 0.5 mol/L phosphate buffer solution (pH 7.0) and 5 mL of methanol, add water to make exactly 50 mL, and use this solution as the test solution. Separately, weigh accurately about 0.15 g (potency) of amoxicillin RS, proceed in the same manner as in the test solution, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the peak areas, A_T and A_S, of amoxicillin from the test solution and the standard solution, respectively.

$$\text{Potency (μg) of amoxicillin } (C_{16}H_{19}N_3O_5S_2) = \text{Potency (μg) of amoxicillin RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and 20 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 μm in particle diameter).

Mobile phase: A mixture of 0.05 mol/L phosphate buffer solution (pH 4.5) and acetonitrile (85 : 15).

Packaging and storage Preserve in tight containers.

Amoxicillin sodium for Injection
주사용 아목시실린나트륨

Amoxicillin Sodium for Injection is an injection to be dissolved before use. Amoxicillin Sodium for Injection contains NLT 90.0% and NMT 120.0% of the labeled amount of amoxicillin ($C_{16}H_{19}N_3O_5S$: 365.41).

Method of preparation Prepare as directed under Injections, with Amoxicillin Sodium.

Description Amoxicillin Sodium for Injection occurs as a white to milky white powder.

Identification Weigh an amount of Amoxicillin Sodium for Injection, equivalent to 0.1 g (potency) of amoxicillin according to the labeled amount and about 0.1 g (potency) of amoxicillin RS and perform the test as directed under the Identification (2) under Amoxicillin Sodium.

pH Dissolve an amount of Amoxicillin Sodium for Injection, equivalent to 1.5 g (potency) of amoxicillin, in 100 mL of water; the pH of the solution is between 8.5 and 9.5.

Sterility Meets the requirements.

Bacterial endotoxins Less than 0.25 EU per mg (potency) of amoxicillin.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Uniformity of dosage units Meets the requirements.

Water NMT 3.5% (0.2 g, volumetric titration, direct titration).

Assay Proceed as directed under the Assay under Amoxicillin Sodium. Weigh accurately an amount of Amoxicillin Sodium for Injection, equivalent to 0.15 g (potency) of amoxicillin according to the labeled potency, dissolve in 5 mL of 0.5 mol/L phosphate buffer solution (pH 7.0), add water to make exactly 50 mL, and use this solution as the test solution.

Packaging and storage Preserve in hermetic containers.

Amoxicillin Sodium·Clavulanate Potassium
아목시실린나트륨·클라불란산칼륨

Amoxicillin Sodium·Clavulanate Potassium occurs as a white powder mixed with amoxicillin sodium and clavulanate potassium in a ratio of 5 : 1 (potency). Amoxicillin Sodium·Clavulanate Potassium contains NLT 640 μg (potency) and NMT 775 μg (potency) of amoxicillin ($C_{16}H_{19}N_3O_5S$: 365.41) per mg and NLT 125 μg (potency) and NMT 151 μg (potency) of clavulanic acid ($C_8H_9NO_5$: 199.16) per mg.

Identification (1) Weigh accurately an amount of Amoxicillin Sodium·Clavulanate Potassium, equivalent to about 0.4 g (potency) of amoxicillin ($C_{16}H_{19}N_3O_5S$) {about 80 mg (potency) of clavulanic acid ($C_8H_9NO_5$)}, add 0.1 mol/L phosphate buffer solution (pH 7.0) to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 0.4 g (potency) of amoxicillin RS and about 80 mg (potency) of clavulanic acid RS, dissolve them in 0.1 mol/L phosphate buffer solution (pH 7.0) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with the test solution and the standard solution as directed un-

der the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate, prepared by suspending silica gel for thin-layer chromatography (with a fluorescent indicator) in 0.1% ethylenediaminetetraacetic acid disodium salt dihydrate 5% sodium dihydrogen phosphate buffer solution (pH 4.0) and then applying it to a uniform thickness of 0.25 mm, and develop the plate in a developing chamber saturated with a mixture of acetic acid-n-butyl, acetic acid(100), 0.1% ethylenediaminetetraacetic acid disodium salt dihydrate5% sodium dihydrogen phosphate buffer solution (pH 4.0) and n-butanol (10 : 6 : 2 : 1) as the developing solution to a distance of about 10 cm. After air-drying the plate, heat it at 150 °C for 10 minutes, spray evenly iodine starch TS on the plate, and heat it again at 150 °C for 10 minutes; the R_f values of each spot obtained from the test solution and the standard solution are the same.

(2) The retention times of major peaks obtained from the test solution and the standard solution under the Assay are the same.

pH The pH of the 10% solution of Amoxicillin Sodium·Clavulanate Potassium is between 8.0 and 10.0.

Ratio of amoxicillin and clavulanic acid Proceed as directed under the Assay; the potency ratio of amoxicillin and clavulanic acid is between 4.80 : 1 and 5.45 : 1.

Sterility It meets the requirements when Amoxicillin Sodium·Clavulanate Potassium is used for manufacturing sterile preparations, except for when there is a terminal sterilization process in the manufacturing process of sterile preparations.

Bacterial endotoxins Less than 2.5 EU/mL of amoxicillin when tested as directed in the kinetic chromogenic assay. For this test, weigh an appropriate amount of Amoxicillin Sodium·Clavulanate Potassium, add water for bacterial endotoxins, shake vigorously for 30 minutes to mix to obtain a concentration of 10.0 mg (potency) per mL, and use this solution as the test solution.

Water NMT 2.2% (0.5 g, volumetric titration, direct titration).

Assay ***Amoxicillin Sodium and Clavulanate Potassium***—Weigh accurately an amount of Amoxicillin Sodium·Clavulanate Potassium equivalent to about 0.1 g (potency) of amoxicillin ($C_{16}H_{19}N_3O_5S$) {about 20 mg (potency) of clavulanic acid ($C_8H_9NO_5$)}, dissolve in water to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 0.1 g (potency) of amoxicillin RS and about 20 mg (potency) of clavulanic acid RS, dissolve in water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_{T1} and A_{S1}, of amoxicillin and A_{T2} and A_{S2}, of clavulanic acid, from each solution.

$$\text{Potency (μg) of amoxicillin } (C_{16}H_{19}N_3O_5S) = \text{Potency (μg) of amoxicillin RS} \times \frac{A_{T1}}{A_{S1}}$$

$$\text{Potency (μg) of clavulanic acid}(C_8H_9NO_5) = \text{Potency (μg) of clavulanic acid RS} \times \frac{A_{T2}}{A_{S2}}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

Column: A stainless steel column about 3.9 mm in internal diameter and about 300 mm in length, packed with octadecylsilanized silica gel for liquid chromatography.

Column temperature: Room temperature

Mobile phase: To 950 mL of 0.1 mol/L phosphate buffer solution (pH 4.0), add 50 mL of methanol.

Flow rate: 2 mL/min

Packaging and storage Preserve in tight containers.

Amoxicillin Sodium·Clavulanate Potassium for Injection
주사용 아목시실린나트륨·클라불란산칼륨

Amoxicillin Sodium·Clavulanate Potassium for Injection is an injection to be dissolved before use. Amoxicillin Sodium·Clavulanate Potassium for Injection contains NLT 90.0% and NMT 120.0% of the labeled amounts of amoxicillin ($C_{16}H_{19}N_3O_5S$: 365.41) and clavulanic acid ($C_8H_9NO_5$: 199.16).

Method of preparation Prepare as directed under Injections, with Amoxicillin Sodium and Potassium Clavulanate.

Description Amoxicillin Sodium·Clavulanate Potassium for Injection occurs as a white to yellowish white powder.

Identification (1) The retention times of the major peaks obtained from the test solution and the standard solution prepared as directed under the Assay are the same.

pH Dissolve an amount of Amoxicillin Sodium·Clavulanate Potassium for Injection, equivalent to 1.0 g (potency) of amoxicillin in 10 mL of water; the pH of the solution is between 8.0 and 10.0.

Water NMT 4.0% (0.2 g, volumetric titration, direct titration).

Sterility Meets the requirements.

Bacterial endotoxins Less than 0.25 EU per mg (potency) of amoxicillin.

Particulate contamination: Visible particles Meets the requirements.

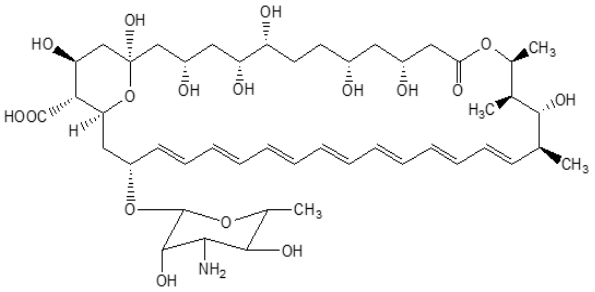
Insoluble particulate matter in injections Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Proceed as directed under the Assay under Amoxicillin Sodium·Clavulanate Potassium Tablets. Weigh accurately an amount of Amoxicillin Sodium·Clavulanate Potassium for Injection, equivalent to about 50 mg (potency) of amoxicillin according to the labeled potency, add about 70 mL of water, shake well for 60 minutes to dissolve, and add water to make exactly 100 mL. Filter, if necessary, and use the solution as the test solution. Separately, weigh accurately about 50 mg (potency) of amoxicillin RS and about 10 mg (potency) of clavulanic acid RS, add about 70 mL of water, shake well for 60 minutes to dissolve, and add water to make exactly 100 mL. Use this solution as the standard solution.

Packaging and storage Preserve in hermetic containers.

Amphotericin B
암포테리신B



$C_{47}H_{73}NO_{17}$: 924.08

(1*R*,3*S*,5*R*,6*R*,9*R*,11*R*,15*S*,16*R*,17*R*,18*S*,19*E*,21*E*,23*E*,25*E*,27*E*,29*E*,31*E*,33*R*,35*S*,36*R*,37*S*)-33-[(3-Amino-3,6-dideoxy-β-D-mannopyranosyl)oxy]-1,3,5,6,9,11,17,37-octahydroxy-15,16,18-trimethyl-13-oxo-14,39-dioxabicyclo[33.3.1]nonatriaconta-19,21,23,25,27,29,31-heptaene-36-carboxylic acid [*1397-89-3*]

Amphotericin B is a polyene macrolide substance having antifungal activity produced by culturing *Streptomyces nodosus*.

Amphotericin B contains NLT 840 μg (potency) of amphotericin B ($C_{47}H_{73}NO_{17}$) per mg, calculated on the dried basis.

Description Amphotericin B occurs as a yellow to orange powder.

It is freely soluble in dimethylsulfoxideand practically insoluble in water or ethanol(95).

Identification (1) Dissolve 5 mg of Amphotericin B in 10 mL of dimethylsulfoxide. To 1 mL of this solution, add 5 mL of phosphoric acid; a blue color develops between the two layers, and the solution becomes blue by shaking. And to this solution, add 15 mL of water, and shake to mix; the solution exhibits a yellow to pale yellowish brown color.

(2) Weigh about 25 mg each of Amphotericin B and amphotericin B RS, dissolve in 5 mL of dimethylsulfoxide, and add methanol to make 50 mL. To 1 mL each of these solutions add methanol to make 50 mL. Determine the absorption spectra of these solutions as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

pH Suspend 0.3 g of Amphotericin B in 10 mL of water; the pH of this suspension is between 3.5 and 6.0.

Purity ***Amphotericin A***—Weigh accurately about 50 mg each of Amphotericin B and amphotericin B RS, dissolve each in exactly 10 mL of dimethylsulfoxide, and add methanol to make exactly 50 mL. Pipet accurately 4 mL each of these solutions, add methanol to make exactly 50 mL, and use these solutions as the test solution and the standard solution (1), respectively. Separately, weigh accurately about 20 mg of nystatin RS, dissolve in 40 mL of dimethylsulfoxide, and add methanol to make exactly 200 mL. Pipet accurately 4 mL of this solution, add methanol to make exactly 50 mL, and use this solution as the standard solution (2). Perform the test as directed under the Ultraviolet-visible Spectroscopy, using a blank test solution prepared in the same manner as the test solution without the addition of Amphotericin B as the control solution. Determine the absorbances at 282 nm and 304 nm from these solutions, and calculate the amount of amphotericin B by the following equation; the amount of amphotericin B for injection is NMT 5%. However, the content (%) of amphotericin B not used for injection is NMT 15%.

$$\text{Content (\%) of amphotericin A} = \frac{W_S \times \{(A_{Sa1} \times A_{T2}) - (A_{Sa2} \times A_{T1})\} \times 25}{W_T \times \{(A_{Sa1} \times A_{Sb2}) - (A_{Sa2} \times A_{Sb1})\}}$$

W_S: Amount (mg) of nystatin RS

W_T: Amount (mg) of Amphotericin B

A_{Sa1}: Absorbance at 282 nm of the standard solution (1)

A_{Sb1}: Absorbance at 282 nm of the standard solution (2)

A_{Sa2}: Absorbance at 304 nm of the standard solution (1)

A_{Sb2}: Absorbance at 304 nm of the standard solution (2)

A_{T1}: Absorbance at 282 nm of the test solution

A_{T2}: Absorbance at 304 nm of the test solution

Loss on drying NMT 5.0% (0.1 g, in vacuum, 60 ℃, 3 hours).

Residue on ignition NMT 0.5% (1 g).

Sterility It meets the requirements when Amphotericin B is used in sterile preparations. However, it is excluded in cases where there is a final sterilization process in the manufacturing of a sterile preparation.

Bacterial endotoxins Less than 1.0 EU per mg (potency) of amphotericin B, when Amphotericin B is used in sterile preparations.

Assay Weigh accurately about 50 mg (potency) of Amphotericin B according to the labeled potency, and dissolve in water to make a solution containing 5 mg (potency) per mL. Pipet a suitable amount of this solution, add the mobile phase to make a solution containing 8 μg (potency) per mL, and use this solution as the test solution. Separately, weigh accurately about 50 mg (potency) of amphotericin B RS, dissolve in methanol to make a solution containing 0.2 mg (potency) per mL, and use this solution as the standard stock solution. Pipet a suitable amount of the standard stock solution, add the mobile phase to make a solution containing 8 μg (potency) per mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of amphotericin B from the test solution and standard solution.

$$\text{Amount [μg (potency)] of amphotericin B}(C_{47}H_{73}NO_{17}) = \text{Amount [μg (potency)] of amphotericin B RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 405 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of 10 mol/L potassium phosphate solution and acetonitrile (66 : 34) (pH 4.8 ± 0.2)

Flow rate: 1.0 mL/min

Packaging and storage Preserve in light-resistant, tight containers and store in a cold place.

Amphotericin B for Injection
주사용 암포테리신B

Amphotericin B for Injection is a preparation for injection which is dissolved before use, and contains NLT 90.0% and NMT 120.0% of the labeled amount of amphotericin B ($C_{47}H_{73}NO_{17}$: 924.08).

Method of preparation Prepare as directed under Injections, with Amphotericin B.

Description Amphotericin B for Injection occurs as a yellow to orange powder or a mass.

Identification Weigh 25 mg (potency) of Amphotericin B for Injection, dissolve in 5 mL of dimethylsulfoxide, and add methanol to make 50 mL. To 1 mL of this solution, add methanol to make 50 mL. Filter as needed. Determine the absorption spectra of this solution as directed under the Ultraviolet-visible Spectroscopy; it exhibits maxima between 361 nm and 365 nm, between 380 nm and 384 nm, and between 403 nm and 407 nm.

pH Dissolve an amount of Amphotericin B for Injection equivalent to 1 mg (potency) of amphotericin B, and dissolve in 10 mL of water; the pH of this solution is between 7.2 and 8.0. However, for colloid injectable suspensions, dissolve an amount equivalent to 0.1 g (potency) in 20 mL of water; the pH of this solution is between 6.0 and 7.8.

Purity Clarity and color of solution Dissolve an amount of Amphotericin B for Injection equivalent to 50 mg (potency) of amphotericin B according to the labeled amount in 10 mL of water; the solution is clear and yellow to orange.

Loss on drying NMT 8.0% (0.3 g, in vacuum, 60 ℃, 3 hours). For colloid injectable suspensions, NMT 2.5% (0.1 g, 0.7 kPa, 60 ℃, 3 hours).

Sterility Meets the requirements.

Bacterial endotoxins Less than 3.0 EU per mg (potency) of amphotericin B.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Proceed as directed under the Assay under Amphotericin B.

Packaging and storage Preserve in light-resistant, hermetic containers (in a cold place).

Liposomal Amphotericin B for injection
주사용 리포좀화암포테리신B

Liposomal Amphotericin B for injection is an injection, which is suspended before use. Liposomal Amphotericin B for injection contains NLT 90.0% and NMT 120.0% of the labeled amount of amphotericin B ($C_{47}H_{73}NO_{17}$: 924.08).

Method of preparation Prepare as directed under Injections, with Liposomal Freeze Dried Amphotericin B.

Description Liposomal Amphotericin B for injection occurs as a yellow powder or a mass.

Identification The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

Light scattering factor Add 12 mL of water for injection in Liposomal Amphotericin B for injection, shake to dissolve for NLT 30 seconds, remove the bubbles, and use this solution as the test solution. With this solution, determine the absorbance as directed under the Ultraviolet-visible Spectroscopy at 600 nm to 750 nm for at least every 10 nm. Draw a graph as a straight line regression having the log value of the wavelength as the horizontal axis and the log value of the absorbance as the vertical axis, calculate the absolute value of the slope and use as the scattering factor; the value is NLT 3.6.

pH Dissolve Liposomal Amphotericin B for injection in water to make 4.0 mg (potency) per mL; the pH of the solution is between 5.0 and 6.0.

Sterility Meets the requirements.

Bacterial endotoxins Less than 5.0 EU per mg (potency) of Liposomal Amphotericin B for injection.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Uniformity of dosage units Meets the requirements.

Water NMT 2.0% (0.5 g, volumetric titration, direct titration).

Assay Weigh accurately an amount of Liposomal Amphotericin B for injection equivalent to 2 mg (potency) of amphotericin B, dissolve in methanol to obtain a solution having known concentration of 20 μg (potency) per mL, and use this solution as the test solution. Separately, weigh an amount of the amphotericin B RS equivalent to about 40 mg (potency) of the amphotericin B, add dimethylsulfoxide, shake well to mix, and prepare a standard stock solution containing 0.4 mg (potency) per mL. Pipet an appropriate amount of this standard stock solution, add methanol to obtain a solution having known concentration of 20 μg (potency) per mL and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions and calculate the peak areas A_T and A_S of amphotericin B from the test solution and the standard solution, respectively.

$$\text{Potency (μg) of amphotericin B } (C_{47}H_{73}NO_{17}) = \text{Potency (μg) of amphotericin B RS} \times \frac{A_T}{A_S} \times \frac{1}{20}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 405 nm).

Column: A stainless-steel column about 4.6 mm in internal diameter and about 250 mm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

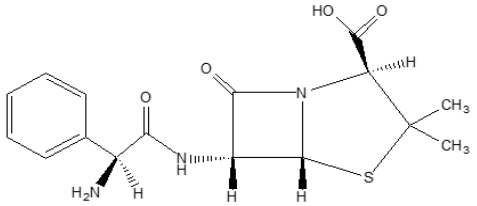
Mobile phase: A mixture of methanol, 2.5 mmol/L ethylenediaminetetraacetic acid disodium salt and acetonitrile (50 : 30 : 25).

Flow rate: 1.5 mL/min

Selection of column: Perform the test according to the above conditions with 20 μL of the standard solution; only use the symmetry factor NMT 2.

Packaging and storage Preserve in hermetic containers.

Anhydrous Ampicillin
암피실린무수물



$C_{16}H_{19}N_3O_4S$: 349.40

(3*S*,5*R*,6*R*)-6-[(2R)-2-Amino-2-phenylacetamido]-2,2-dimethylpenam-3-carboxylic acid [*69-53-4*]

Anhydrous Ampicillin contains NLT 960 μg (potency) and NMT 1005 μg (potency) of ampicillin ($C_{16}H_{19}N_3O_4S$: 349.40) per mg, calculated on the anhydrous basis.

Description Anhydrous Ampicillin occurs as white to pale yellowish white crystals or a crystalline powder.
It is sparingly soluble in water, slightly soluble in methanol, very slightly soluble in ethanol(95), and practically insoluble in acetonitrile.

Identification Determine the infrared spectra of Anhydrous Ampicillin and ampicillin RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Optical rotation $[\alpha]_D^{20}$: Between +280° and +305°(0.5 g calculated on the anhydrous basis, water, 100 mL, 100 mm).

pH Dissolve 1.0 g of Anhydrous Ampicillin in 400 mL of water; the pH of this solution is between 4.0 and 5.5.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Anhydrous Ampicillin according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Arsenic***—Proceed with 1.0 g of Anhydrous Ampicillin according to Method 3, and perform the test (NMT 2 ppm).

(3) ***Related substances***—Dissolve 0.05 g of Anhydrous Ampicillin in the mobile phase to make exactly 50 mL, and use this solution as the test solution. Pipet 1 mL of the test solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas of each solution by the automatic integration method; the area of each peak other than ampicillin from the test solution is not larger than the peak area of ampicillin from the standard solution.

Operating conditions

For the detector, column, column temperature, mobile phase and flow rate, proceed according to the operating conditions in the Assay.

System suitability

Test for required detectability: Pipet 1 mL of the standard solution, and add the mobile phase to make exactly 10 mL. Confirm that the peak area of ampicillin obtained from 10 μL of this solution is equivalent to 7 to 13% of the peak area of ampicillin from the standard solution.

System performance: Proceed as directed under the Assay.

System repeatability: Proceed as directed under the Assay.

Time span of measurement: About 10 times the retention time of ampicillin.

(4) ***Dimethylaniline***—Weigh accurately about 1.0 g of Anhydrous Ampicillin, add 5 mL of 1 mol/L sodium hydroxide TS and 1 mL of the internal standard solution, centrifuge if necessary, and use the clear supernatant as the test solution. Separately, weigh accurately about 50 mg of dimethylaniline, and add 2.0 mL of hydrochloric acid and water to make 50 mL. Pipet accurately 5.0 mL of this solution and add water to make exactly 250 mL. Pipet accurately 1.0 mL of this solution, add 5.0 mL of 1 mol/L sodium hydroxide TS and 1.0 mL of the internal standard solution, centrifuge if necessary, and use the clear supernatant as the standard solution Perform the test with 1 μL each of the test solution and the standard solution as directed under the Gas Chromatography according to the following conditions, and calculate the ratios, Q_T and Q_S, of the peak area of dimethylaniline to that of the internal standard from each solution (NMT 20 ppm).

$$\text{Content (ppm) of dimethylaniline} = \text{Amount (mg) of dimethylaniline taken} \times \frac{Q_T}{Q_S} \times \frac{Purity\ (\%)\ of\ dimethylaniline}{Amount\ (mg)\ of\ Anhydrous\ Ampicillin} \times 4$$

Internal standard solution—Dissolve 50.0 mg of naphthalene in cyclohexane to make 50 mL. To 5.0 mL of this solution, add cyclohexane to make 100 mL, and use this solution as the internal standard solution.

Operating conditions

Detector: A flame ionization detector

Column: A column about 2 mm in internal diameter and 2 m in length, packed with diatomaceous earth for gas chromatography coated with 50% phenyl-50% methylpolysiloxane for gas chromatography equivalent to 3% mass of the diatomaceous earth.

Column temperature: 120 °C

Sample injection port, detector temperature: 150 °C

Carrier gas: Nitrogen

Flow rate: 30 mL/min

Water NMT 2.0% (2.5 g, volumetric titration, direct titration).

Sterility It meets the requirements when Anhydrous Ampicillin is used in sterile preparations. However, it is excluded in cases where there is a final sterilization process in the manufacturing of a sterile preparation.

Bacterial endotoxins Less than 0.15 EU per mg (potency) of ampicillin, when Anhydrous Ampicillin is used in sterile preparations.

Assay Weigh accurately about 50 mg (potency) each of Anhydrous Ampicillin and ampicillin RS, dissolve each in exactly 5 mL of the internal standard solution, add the mobile phase to make 50 mL, and use these solutions as the test solution and standard solution, respectively. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the ratios, Q_T and Q_S, of the peak area of ampicillin to that of the internal standard from each solution.

Potency (μg) of ampicillin ($C_{16}H_{19}N_3O_4S$)

$$= \text{Potency } (\mu g) \text{ of ampicillin RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of guaifenesin in the mobile phase (1 in 200).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 230 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: Dissolve 5.94 g of dibasic ammonium phosphate in 850 mL of water, add 100 mL of acetonitrile, adjust the pH to 5.0 with phosphoric acid, and add water to make exactly 1000 mL.

Flow rate: Adjust the flow rate so that the retention time of ampicillin is about 6 minutes.

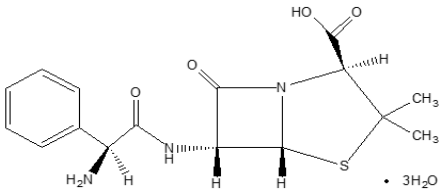
System suitability

System performance: Proceed with 10 μL of the standard solution under the above operating conditions; ampicillin and the internal standard are eluted in this order with the resolution being NLT 40.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solutions under the above operating conditions; the relative standard deviation of the ratios of the peak area of ampicillin to that of internal standard is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Ampicillin Hydrate
암피실린수화물



Aminobenzylpenicillin

Ampicillin $C_{16}H_{19}N_3O_4S \cdot 3H_2O$: 403.45

(3*S*,5*R*,6*R*)-6-[(2R)-2-amino-2-phenylacetamido]-2,2-dimethylpenam-3-carboxylic acid trihydrate [*7177-48-2*]

Ampicillin Hydrate contains NLT 960 μg and NMT 1005 μg (potency) of ampicillin ($C_{16}H_{19}N_3O_4S$: 349.40) per mg, calculated on the anhydrous basis.

Description Ampicillin Hydrate occurs as white to pale yellowish white crystals or a crystalline powder.

It is sparingly soluble in water, slightly soluble in methanol, very slightly soluble in ethanol(95), and practically insoluble in acetonitrile.

Identification Determine the infrared spectra of Ampicillin Hydrate and ampicillin RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Crystallinity Meets the requirements.

Optical rotation $[\alpha]_D^{20}$: Between +280° and +305° (0.5 g calculated on the anhydrous basis, water, 100 mL, 100 mm).

pH Dissolve 1.0 g of Ampicillin Hydrate in 400 mL of water; the pH of this solution is between 3.5 and 5.5.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Ampicillin Hydrate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Arsenic***—Proceed with 1.0 g of Ampicillin Hydrate according to Method 3, and perform the test (NMT 2 ppm).

(3) ***Related substances***—Dissolve 50 mg of Ampicillin Hydrate in the mobile phase to make exactly 50 mL, and use this solution as the test solution. Pipet 1 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak areas of each solution by the automatic integration method; the area of each peak other than ampicillin from the test solution is not larger than the peak area of ampicillin from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 230 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: Dissolve 5.94 g of dibasic ammonium phosphate in 850 mL of water, add 100 mL of acetonitrile, adjust the pH to 5.0 with phosphoric acid, and add water to make exactly 1000 mL.

Flow rate: Adjust the flow rate so that the retention time of ampicillin is about 6 minutes.

System suitability

Test for required detectability: Pipet 1 mL of the standard solution, and add the mobile phase to make exactly 10 mL. Confirm that the peak area of ampicillin obtained from 10 μL of this solution is equivalent to 7% to 13% of the peak area of ampicillin from 10 mL of the standard solution.

System performance: Weigh accurately 50 mg

(potency) of ampicillin RS, dissolve in 10 mL of the mobile phase, add 5 mL of a solution of guaifenesin in the mobile phase (1 in 200), add the mobile phase to make 50 mL, and use this solution as the system suitability solution. Proceed with 10 μL of this solution under the above operating conditions; ampicillin and guaifenesin are eluted in this order with the resolution being NLT 40.

System repeatability: Repeat the test 6 times with 10 μL each of the system suitability solution under the above operating conditions; the relative standard deviation of the ratios of the peak area of ampicilin to that of guaifenesin is NMT 1.0%.

Time span of measurement: About 10 times the retention time of ampicillin.

(4) ***Dimethylaniline***—Weigh accurately about 1.0 g of Ampicillin Hydrate, add 5 mL of 1 mol/L sodium hydroxide TS and 1 mL of the internal standard solution, centrifuge if necessary, and use the clear supernatant as the test solution. Separately, weigh accurately about 50 mg of dimethylaniline, and add 2.0 mL of hydrochloric acid and water to make 50 mL. Pipet accurately 5.0 mL of this solution and add water to make exactly 250 mL. Pipet accurately 1.0 mL of this solution, add 5.0 mL of 1 mol/L sodium hydroxide TS and 1.0 mL of the internal standard solution, centrifuge if necessary, and use the clear supernatant as the standard solution Perform the test with 1 μL each of the test solution and the standard solution as directed under the Gas Chromatography according to the following conditions, and calculate the ratios, Q_T and Q_S, of the peak area of dimethylaniline to that of the internal standard from each solution (NMT 20 ppm).

$$\text{Content (ppm) of dimethylaniline} = \text{Amount (mg) of dimethylaniline taken} \times \frac{Q_T}{Q_S} \times \frac{Purity\ (\%)\ of\ dimethylaniline}{Amount\ (mg)\ of\ Ampicillin\ Hydrate} \times 4$$

Internal standard solution—Dissolve 50.0 mg of naphthalene in cyclohexane to make 50 mL. To 5.0 mL of this solution, add cyclohexane to make 100 mL, and use this solution as the internal standard solution.

Operating conditions

Detector: A flame ionization detector

Column: A column about 2 mm in internal diameter and 2 m in length, packed with diatomaceous earth for gas chromatography coated with 50% phenyl-50% methylpolysiloxane for gas chromatography equivalent to 3% mass of the diatomaceous earth.

Column temperature: 120 °C

Sample injection port, detector temperature: 150 °C

Carrier gas: Nitrogen

Flow rate: 30 mL/min

Water Between 12.0% and 15.0% (0.1 g, volumetric titration, direct titration).

Sterility It meets the requirements when used in the manufacturing of sterile preparations. However, it is excluded in cases where there is a terminal sterilization process in the manufacturing of sterile preparations.

Bacterial endotoxins Less than 0.15 EU per mg (potency) of ampicillin when used in the manufacturing of sterile preparations.

Assay Weigh accurately about 50 mg (potency) each of Ampicillin Hydrate and ampicillin RS, dissolve each in a suitable amount of the mobile phase, add exactly 5 mL of the internal standard solution, add the mobile phase to make 50 mL, and use these solutions as the test solution and standard solution, respectively. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the ratios, Q_T and Q_S, of the peak area of ampicillin to that of the internal standard from each solution.

$$\text{Potency (μg) of ampicillin } (C_{16}H_{19}N_3O_4S) = \text{Potency (μg) of ampicillin RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of guaifenesin in the mobile phase (1 in 200).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 230 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: Dissolve 5.94 g of dibasic ammonium phosphate in 850 mL of water, add 100 mL of acetonitrile, adjust the pH to 5.0 with phosphoric acid, and add water to make exactly 1000 mL.

Flow rate: Adjust the flow rate so that the retention time of ampicillin is about 6 minutes.

System suitability

System performance: Proceed with 10 μL of the standard solution under the above operating conditions; ampicillin and the internal standard are eluted in this order with the resolution being NLT 40.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution under the above operating conditions; the relative standard deviation of the ratios of the peak area of ampicillin to that of internal standard is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Ampicillin Capsules
암피실린 캡슐

Ampicillin Capsules contain NLT 90.0% and NMT 120.0% of the labeled amount of ampicillin ($C_{16}H_{19}N_3O_4S$: 349.41).

Method of preparation Prepare as directed under Capsules, with Ampicillin.

Identification (1) Take an amount of the contents of Ampicillin Capsules, equivalent to about 10 mg of ampicillin, suspend in 1 mL of water, and add 2 mL of a mixture of 2 mL of Fehling's TS and 6 mL of water; it immediately exhibits a purple color. However, when it contains probenecid, weigh an appropriate amount of Ampicillin Capsules, wash it with chloroform, discard the chloroform layer, and perform the test with the residue.

(2) To 2 mL of a solution of Ampicillin Capsules containing 1 mg of ampicillin per mL, add 0.5 mL of phenol and 5 mL of sodium hypochlorite TS; it gives a persistent odor of benzaldehyde, and an orange precipitate forms within 3 to 5 minutes. However, when it contains probenecid, weigh an appropriate amount of Ampicillin Capsules, wash it with chloroform, discard the chloroform layer, and perform the test with the residue.

Water **Anhydride:** NMT 4.0%. **Hydrate:** Between 10.0% and 15.0% (0.1 g, volumetric titration, direct titration).

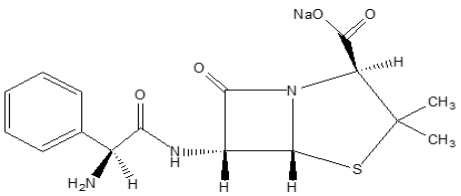
Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Proceed as directed under the Assay under Ampicillin Hydrate. Take NLT 20 capsules of Ampicillin Capsules, weigh accurately the mass of the contents, equivalent to about 50 mg (potency) according to the labeled potency, dissolve in an appropriate amount of the mobile phase, add exactly 5 mL of the internal standard solution, add the mobile phase to make 50 mL, and use this solution as the test solution.

Packaging and storage Preserve in tight containers.

Ampicillin Sodium
암피실린나트륨



Aminobenzylpenicillin Sodium $C_{16}H_{18}N_3NaO_4S$: 371.39
Sodium (3*S*,5*R*,6*R*)-6-[(2R)-2-amino-2-phenylcetamido]-2,2-dimethylpenam-3-carboxylate [*69-52-3*]

Ampicillin Sodium contains NLT 850 μg (potency) and NMT 950 μg (potency) of ampicillin ($C_{16}H_{19}N_3O_4S$: 349.40) per mg, calculated on the anhydrous basis.

Description Ampicillin Sodium occurs as white to pale yellowish white crystals or a crystalline powder.
It is very soluble in water, and sparingly soluble in ethanol(99.5).

Identification (1) Determine the infrared spectra of Ampicillin Sodium and ampicillin sodium RS, previously dried in a desiccator (NMT 0.67 kPa, 60 °C) for 3 hours, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wave numbers.

(2) Ampicillin Sodium responds to the Qualitative Analysis (1) for sodium salt.

Crystallinity Meets the requirements. However, this does not apply to freeze-dried ampicillin sodium.

Optical rotation $[\alpha]_D^{20}$: Between +246° and +272° (1.0 g calculated on the anhydrous basis, water, 100 mL, 100 mm).

pH Dissolve 1.0 g of Ampicillin Sodium in 10 mL of water; the pH of this solution is between 8.0 and 10.0.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Ampicillin Sodium in 10 mL of water; the solution is clear and colorless to pale yellow.

(2) ***Heavy metals***—Proceed with 1.0 g of Ampicillin Sodium according to Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Arsenic***—Proceed with 1.0 g of Ampicillin Sodium according to Method 1 and perform the test (NMT 2 ppm).

(4) ***Related substances***—Dissolve 50 mg of Ampicillin Sodium in 50 mL of the mobile phase and use this solution as the test solution. Pipet 1 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak areas of each solution by the automatic integration method; the area of each peak other than ampicillin from the test solution is not larger than the peak area of ampicillin from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 230 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 15 cm in length, packed with octa-

decylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: Dissolve 5.94 g of dibasic ammonium phosphate in 850 mL of water, add 100 mL of acetonitrile, adjust the pH to 5.0 with phosphoric acid, and add water to make exactly 1000 mL.

Flow rate: Adjust the flow rate so that the retention time of ampicillin is about 6 minutes.

System suitability

Test for required detectability: Pipet 1 mL of the standard solution and add the mobile phase to make exactly 10 mL. Confirm that the peak area of ampicillin obtained from 10 μL of this solution is equivalent to 7 to 13% of the peak area of ampicillin from 10 μL of the standard solution.

System performance: Weigh accurately 50 mg of ampicillin RS, dissolve in 10 mL of the mobile phase, add 5 mL of a solution of guaifenesin in the mobile phase (1 in 200), add the mobile phase again to make 50 mL, and use this solution as the system suitability solution. Proceed with 10 μL of this solution under the above operating conditions; ampicillin and guaifenesin are eluted in this order with the resolution being NLT 35.

System repeatability: Repeat the test 6 times with 10 μL each of the system suitability solutions under the above operating conditions; the relative standard deviation of the ratios of the peak area of ampicillin to that of guaifenesin is NMT 1.0%.

Time span of measurement: About 10 times the retention time of ampicillin.

(5) ***Dimethylaniline***—Weigh accurately about 1.0 g of Ampicillin Sodium, add 5 mL of 1 mol/L sodium hydroxide TS, and shake to dissolve. Add 1 mL of the internal standard solution, mix vigorously for 1 minute, centrifuge, and use the clear supernatant as the test solution. Separately, weigh accurately about 50 mg of dimethylaniline, dissolve in 25 mL of 1 mol/L hydrochloric acid, and add water to make 50 mL. Pipet 5.0 mL of this solution and add water to make exactly 250 mL. Pipet accurately 1.0 mL of this solution, add 5.0 mL of 1 mol/L sodium hydroxide TS and 1.0 mL of the internal standard solution, mix vigorously for 1 minute, centrifuge, and use the clear supernatant as the standard solution. Perform the test with 1 μL each of the test solution and the standard solution as directed under the Gas Chromatography according to the following conditions, and calculate the ratios, Q_T and Q_S, of the peak area of dimethylaniline to that of the internal standard from each solution (NMT 20 ppm).

$$\text{Content (ppm) of dimethylaniline} = \text{Amount (mg) of dimethylaniline taken} \times \frac{Q_T}{Q_S} \times \frac{Purity\ (\%)\ of\ dimethylaniline}{Amount\ (mg)\ of\ Ampicillin\ Sodium} \times 4$$

Internal standard solution—Dissolve about 50 mg of naphthalene in cyclohexane to make 50 mL. To 5.0 mL of this solution, add cyclohexane to make 100 mL, and use this solution as the internal standard solution.

Operating conditions

Detector: A flame ionization detector

Column: A column about 0.53 mm in internal diameter and about 30 m in length, coated the inside with 35% phenyl-65% dimethylpolysiloxane for gas chromatography in a thickness of 1.0 μm.

Column temperature: Inject the solution at a constant temperature of about 110 °C, maintain the temperature for 4 minutes, and raise the temperature at the rate of 8 °C per minute to 200 °C, and maintain at a constant temperature of about 200 °C for 5 minutes.

Sample injection port, detector temperature: 250 °C

Carrier gas: Helium

Flow rate: 30 cm/sec

Split ratio: About 1:10.

System suitability

System performance: Proceed with 1 μL of the standard solution according to the above operating conditions; the relative retention time of naphthalene to dimethylaniline is about 1.3, and the signal-to-noise ratio for dimethylaniline is NLT 10.

Water NMT 2.0% (0.2 g, volumetric titration, direct titration).

Sterility It meets the requirements when used in the manufacturing of sterile preparations. However, it is excluded in cases where there is a final sterilization process in the manufacturing of a sterile preparation.

Bacterial endotoxins Less than 0.15 EU per mg (potency) of ampicillin when used in the manufacturing of sterile preparations.

Assay Perform the test as directed under the Assay of Ampicillin Hydrate. However, weigh accurately about 50 mg (potency) of Ampicillin Sodium, dissolve in a suitable amount of the mobile phase, add exactly 5 mL of the internal standard solution, add the mobile phase to make 50 mL, and use this solution as the test solution.

System suitability

System performance: Proceed with 10 μL of the standard solution under the above operating conditions; ampicillin and the internal standard are eluted in this order with the resolution being NLT 35.

System repeatability: Repeat the test 6 times with 10 μL of the standard solution under the above operating conditions; the relative standard deviation of the ratios of the peak area of ampicillin to that of internal standard is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Ampicillin Sodium for Injection
주사용 암피실린나트륨

Ampicillin Sodium for Injection is a preparation for injection which is dissolved before use, and contains NLT 90.0% and NMT 110.0% of the labeled amount of ampicillin ($C_{16}H_{19}N_3O_4S$: 349.41).

Method of preparation Prepare as directed under Injections, with Ampicillin Sodium.

Description Ampicillin Sodium for Injection occurs as pale yellowish white crystals or a crystalline powder.

Identification Perform the test as directed under the Identification for Ampicillin Sodium.

Osmolality Meets the requirements.

pH Dissolve an amount of Ampicillin Sodium for Injection equivalent to 1.0 g (potency) of ampicillin; the pH of this solution is between 8.0 and 10.0.

Purity ***Clarity and color of solution***—Dissolve an amount of Ampicillin Sodium for Injection equivalent to 0.25 g (potency) of ampicillin sodium in 0.75 mL of water; the solution is clear. The absorbance of this solution measured at wavelength 400 nm as directed under the Ultraviolet-visible Spectroscopy is NMT 0.40.

Water NMT 3.0% (0.2 g, volumetric titration, direct titration).

Sterility Meets the requirements.

Bacterial endotoxins Less than 0.075 EU per mg (potency) of ampicillin.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately NLT 10 of Ampicillin Sodium for Injection, and weigh accurately the amount equivalent to about 50 mg (potency) according to the labeled potency, add exactly 5 mL of the internal standard solution and then the mobile phase to make exactly 50 mL, and use this solution as the test solution. Separately, weigh accurately about 50 mg (potency) of ampicillin sodium RS, proceed in the same manner as for the test solution, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the ratios of the peak area, Q_T and Q_S of ampicillin to that of the internal standard.

$$\text{Potency (μg) of ampicillin } (C_{16}H_{19}N_3O_4S) = \text{Potency (μg) of ampicillin RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of guaifenesin in the mobile phase (1 in 200).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 230 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: Add 850 mL of water and 100 mL of acetonitrile to 5.9 g of ammonium monohydrogen phosphate, adjust pH to 5.0 by adding phosphoric acid, and add water to make 1000 mL.

Flow rate: Adjust the flow rate so that the retention time of ampicillin is about 6 minutes.

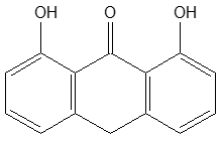
System suitability

System performance: Proceed with 10 μL of the standard solution under the above conditions; ampicillin and the internal standard are eluted in this order with the resolution between these peaks being NLT 26.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution under the above conditions; the relative standard deviation of the peak area ratios of ampicillin to that of the internal standard is NMT 1.0%.

Packaging and storage Preserve in hermetic containers.

Anthralin
안트랄린



Dithranol $C_{14}H_{10}O_3$: 226.23

1,8-Dihydroxy-10*H*-anthracen-9-one [*1143-38-0*]

Anthralin contains NLT 97.0% and NMT 102.0% of anthralin ($C_{14}H_{10}O_3$), calculated on the dried basis.

Description Anthralin occurs as a yellowish-brown, odorless and tasteless crystalline powder.

It is freely soluble in acetone, chloroform and benzene, sparingly soluble in ethanol(95), ether or acetic acid(100) and insoluble in water. It dissolves in sodium hydroxide

TS.

Identification (1) Determine the absorption spectra of solutions of Anthralin and anthralin RS in chloroform (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Anthralin and anthralin RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Melting point Between 178 and 181 ℃ (Method 1).

Purity (1) ***Acidity or alkalinity***—Filtrate of Anthralin suspended in water is neutral when tested with Litmus paper.

(2) ***Chloride***—Weigh 1.0 g of Anthralin and dissolve in 15 mL of water, then filter. Take 5 mL of the filtrate and add nitric acid to make acidic, then add 2 to 3 drops of silver nitrate TS; the distillate of this solution is not thicker than 5 mL of the filtrate which is taken separately and to which nothing is added.

(3) ***Sulfate***—Take 5 mL of the filtrate of (2) and add 3 drops of 3 mol/L hydrochloric acid and 5 drops of barium chloride TS; the suspension of the solution that forms is not thicker than 5 mL of the filtrate which is taken separately and to which nothing is added.

Loss on drying NMT 0.5% (1 g, silica gel, 4 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.25 g of Anthralin, and dissolve in dichloromethane to make exactly 100 mL. Pipet 10 mL of this solution, add dichloromethane to make exactly 100 mL, and mix. Pipet 5 mL of this solution, add 5.0 mL of the internal standard solution, then add the mobile phase to make exactly 25 mL, and use this solution as the test solution. Separately, weigh accurately an appropriate amount of anthralin RS and dissolve in dichloromethane to make a solution containing 250 μg per mL. Pipet 5 mL of this solution, add 5.0 mL of the internal standard solution, add the mobile phase to make exactly 25 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the ratios, Q_T and Q_S, of the peak area of anthralin to that of the internal standard.

$$\text{Amount (mg) of anthralin } (C_{14}H_{10}O_3) = C \times \frac{Q_T}{Q_S}$$

C: Concentration of the standard solution (μg/mL)

Internal standard solution—Take a sufficient amount of *o*-nitroaniline and dissolve in a small amount of dichloromethane, then add *n*-hexane to make a solution containing 500 μg per mL.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 354 nm).

Column: A stainless tube about 4.6 mm in internal diameter and about 25 cm in length, packed with porous silica for liquid chromatography (5 to 10 μm in particle diameter).

Mobile phase: A mixture of *n*-hexane, dichloromethane and acetic acid(100) (82 : 12 : 6).

Flow rate: 2 mL/min

System suitability

System performance: Weigh 10 mg of anthralin RS and 20 mg of danthron and dissolve in dichloromethane to make 100 mL. To 5 mL of this solution, add 5 mL of *n*-hexane and the mobile phase to make 25 mL. Proceed with 10 μL of this solution under the above operating conditions; anthralin and danthron are eluted in this order with the resolution being NLT 1.3.

System repeatability: Repeat the test 6 times with 10 μL of the standard solution according to the above conditions; the relative standard deviation of the peak area ratio is NMT 2.0%.

Packaging and storage Preserve in light-resistant, tight containers.

Anthralin Ointment
안트랄린 연고

Dithranol Ointment

Anthralin Ointment contains NLT 90.0% and NMT 115.0% of the labeled amount of anthralin ($C_{14}H_{10}O_3$: 226.23) when labeled amount of Anthralin in Anthralin Ointment is NLT 0.1%. Anthralin Ointment contains NLT 90.0% and NMT 130.0% of the labeled amount of anthralin ($C_{14}H_{10}O_3$: 226.23) when the labeled amount of Anthralin in Anthralin Ointment is NMT 0.1%.

Method of preparation Prepare as directed under Ointments, with Anthralin.

Identification The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

Assay Weigh accurately about 5 g of Anthralin Ointment, place in a 100-mL beaker, and disperse the ointment by adding 20 mL of dichloromethane and 10 mL of acetic acid(100). Filter the content with dichloromethane using Whatman filter paper No. 4 to 100-mL volumetric flask. Completely wash the precipitate using dichloromethane, then fill with dichloromethane to the gauge line. Pipet an amount equivalent to about 0.5 g of anthralin

($C_{14}H_{10}O_3$), add 2.0 mL of the internal standard solution, then add the mobile phase to make exactly 25 mL, and use this solution as the test solution. Separately, weigh accurately an appropriate amount of anthralin RS and dissolve in dichloromethane to prepare a solution containing 0.25 mg per mL. Pipet 2 mL of this solution, add 2.0 mL of the internal standard solution, add the mobile phase to make exactly 25 mL, and use this solution as the standard solution. Perform the test solution with the test solution and the standard solution as directed under the Assay under Anthralin.

$$\text{Amount (mg) of anthralin } (C_{14}H_{10}O_3) = 200 \times \frac{C}{V} \times \frac{Q_T}{Q_S}$$

C: Concentration (mg/mL) of the standard solution
V: Amount (mL) taken of sample

Packaging and storage Preserve in light-resistant, well-closed containers.

Arbekacin Sulfate Injection
아르베카신황산염 주사액

Arbekacin Sulfate Injection is an aqueous injection. It contains NLT 90.0% and NMT 110.0% of the labeled amount of arbekacin ($C_{22}H_{44}N_6O_{10}$: 552.62).

Method of preparation Prepare as directed under Injections, with Arbekacin Sulfate.

Description Arbekacin Sulfate Injection occurs as a clear, colorless liquid.

Identification To 0.2 mL of Arbekacin Sulfate Injection, add 1 mL of water and use this solution as the test solution. Dissolve 10 mg of arbekacin sulfate RS in 1 mL of water and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 2 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of ammonia water(28), methanol, chloroform and ethanol(95) (7 : 6 : 4 : 1) to a distance of about 12 cm, and air-dry the plate. Spray evenly 0.2% ninhydrin-water saturated 1-butanol TS on the plate and heat at 80 °C for 10 minutes; the principal spots obtained from the test solution and the standard solution are purplish brown and have the same R_f values.

Osmolality Between 0.8 and 1.2 (Injections for intramuscular administration).

pH Between 6.0 and 8.0.

Sterility Meets the requirements.

Bacterial endotoxins Less than 0.50 EU per mg (potency) of amikacin.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Extractable volume of injections Meets the requirements.

Assay ***Cylinder plate method***—(1) Use Bacillus subtilis ATCC 6633 as the test organism.

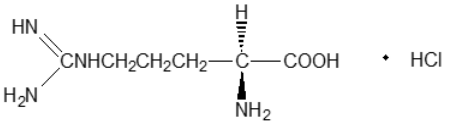
(2) Medium: Agar media for seed and base layer Use the culture medium in (A) (2) (a) ① ⓐ under the Microbial Assays for Antibiotics. In this case, adjust the pH to 7.8 to 8.0 after sterilization.

(3) Standard solution: Weigh accurately about 20 mg (potency) of arbekacin sulfate RS, previously dried, dissolve in diluted phosphate buffer solution (pH 6.0) (1 in 2) to make exactly 50 mL, and use this solution as the standard stock solution. Keep the standard stock solution at 5 to 15 °C and use within 30 days. Pipet an appropriate amount of the standard stock solution, add 0.1 mol/L phosphate buffer solution (pH 8.0), dilute to obtain a solution containing 20 μg (potency) and 5 μg (potency) in 1 mL, and use these solutions as the high concentration standard solution and the low concentration standard solution, respectively.

(4) Test solution: Take exactly equivalent to about 20 mg (potency) of an amount of Arbekacin Sulfate according to the labeled amount, and add water to make exactly 50 mL. Pipet an appropriate amount of this solution, add 0.1 mol/L phosphate buffer solution (pH 8.0), dilute to obtain a solution containing 20 μg (potency) and 5 μg (potency) in 1 mL, and use these solutions as the high concentration test solution and the low concentration test solution, respectively. With these solutions, perform the test according to (A)(8) under the Microbial Assays for Antibiotics.

Packaging and storage Preserve in hermetic containers.

L-Arginine Hydrochloride
L-아르기닌염산염



Arginine Hydrochloride $C_6H_{14}N_4O_2 \cdot HCl$: 210.66
Arginine hydrochloride [*1119-34-2*]

L-Arginine Hydrochloride, when dried, contains NLT 98.5% and NMT 101.0% of L-arginine hydrochloride ($C_6H_{14}N_4O_2 \cdot HCl$).

Description L-Arginine Hydrochloride occurs as white crystals or a crystalline powder, which is odorless and has a faint, characteristic taste.
It is freely soluble in water or formic acid, very slightly soluble in ethanol(95), and practically insoluble in ether.

Identification (1) Determine the infrared spectra of L-Arginine Hydrochloride and Arginine hydrochloride RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) An aqueous solution of L-Arginine Hydrochloride (1 in 50) responds to the Qualitative Analysis for chloride.

pH Dissolve 1.0 g of L-Arginine Hydrochloride in 10 mL of water; the pH of this solution is between 4.7 and 6.2.

Optical rotation $[\alpha]_D^{20}$: Between + 21.5° and + 23.5° (2 g, after drying, 6 mol/L hydrochloric acid TS, 25 mL, 100 mm).

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of L-Arginine Hydrochloride in 10 mL of water; the solution is clear and colorless.

(2) ***Sulfate***—Perform the test with 0.6 g of L-Arginine Hydrochloride. Prepare the control solution with 0.35 mL of 0.005 mol/L sulfuric acid (NMT 0.028%).

(3) ***Ammonium***—Perform the test with 0.25 g of L-Arginine Hydrochloride. Prepare the control solution with 5 mL of the ammonium standard solution. However, this test is done as directed under the vacuum distillation method.

(4) ***Heavy metals***—Weigh and proceed with 1.0 g of L-Arginine Hydrochloride according to Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(5) ***Arsenic***—Proceed with 1.0 g of L-Arginine Hydrochloride according to Method 1 and perform the test (NMT 2 ppm).

(6) ***Related substances***—Dissolve 0.20 g of L-Arginine Hydrochloride in 10 mL of water, and use this solution as the test solution. Pipet 1 mL of this solution and add water to make exactly 10 mL. Pipet 1 mL of this solution, add water to make exactly 25 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on a plate made of silica gel for thin-layer chromatography. Develop the plate with a mixture of ethanol(99.5), water, 1-butanol and ammonia water (2 : 1 : 1 : 1) as the developing solvent to a distance of about 10 cm. Dry the thin-layer chromatographic plate at 100 °C for 30 minutes. Spray evenly a solution of ninhydrin in acetone (1 in 50) on the plate and heat at 80 ℃ for 5 minutes; the spots other than the principal spot obtained from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 0.2% (1 g, 105 ℃, 3 hours).

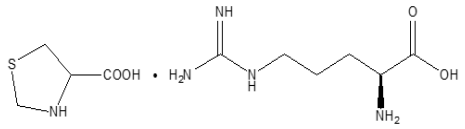
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.1 g of L-Arginine Hydrochloride, previously dried, dissolve in 2 mL of formic acid, add exactly 15 mL of 0.1 mol/L perchloric acid and heat on a steam bath for 30 minutes. After cooling, add 45 mL of acetic acid(100) and titrate the exceeding amount of perchloric acid with 0.1 mol/L sodium acetate VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner.

Each mL of 0.1 mol/L perchloric acid VS
= 10.533 mg of $C_6H_{14}N_4O_2 \cdot HCl$

Packaging and storage Preserve in tight containers.

Arginine Thiazolidine Carboxylate
아르기닌티아졸리딘카르복실산염



$C_{10}H_{21}N_5O_4S$: 307.37
L-Arginine (*R*)-4-thiazolidinecarboxylic acid (1:1), [*97358-56-0*]

Arginine Thiazolidine Carboxylate, when dried, contains NLT 95.0% of arginine thiazolidine carboxylate ($C_{10}H_{21}N_5O_4S$) and NLT 9.89% and NMT 10.94% of sulfur (S: 32.07).

Description Arginine Thiazolidine Carboxylate occurs as a white powder.

Identification Weigh 0.4 g of Arginine Thiazolidine Carboxylate, add water to make 200 mL, filter, and use this solution as the test solution. Dissolve 80 mg of thiazolidinedicarboxylic acid RS and 0.1 g of arginine RS in water to make 100 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot the test solution and the standard solution on a thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of methanol, chloroform, water and 27% ammonia (40 : 40 : 10 : 10) as the developing solvent to a distance of

about 10 cm, and air-dry the plate. Spray a mixture of a solution prepared by dissolving 300 mg of ninhydrin, 10 mL of acetic acid(100) and 2 mL of collidine in 100 mL of 50% isopropanol aqueous solution, as the coloring agent (should be prepared immediately before use), in this order, as well as 3 mL of 1% copper nitrate-ethanol solution; the R_f value and color of spots obtained from the test solution and the standard solution are the same.

Melting point Between 175 and 185 ℃.

Purity (1) ***Clarity and color of solution***—Dissolve 20 g of Arginine Thiazolidine Carboxylate in water to make 100 mL; the solution is clear and colorless.

(2) ***Formaldehyde***—Weigh accurately about 0.1 g of Arginine Thiazolidine Carboxylate, dissolve in 5 mL of water, add 5 mg of chromotropic acid and 5 mL of sulfuric acid. Use this solution as the test solution. Separately, take 20 μg of formaldehyde, proceed in the same manner as the test solution, and use it as the control solution. Compare the color of the test solution and the control solution; the test solution is not more intense than that of the control solution. If needed, perform the test with the test solution and the standard solution under the Ultraviolet-visible Spectroscopy, determine the absorbances at 570 nm, and compare the results (NMT 0.02%).

(3) ***Free thiazolidinedicarboxylic acid***—Weigh accurately 2.0 g of Arginine Thiazolidine Carboxylate, suspend in 100 mL of dimethylformamide, shake well to mix. Again, shake to mix on a steam bath for 10 to 15 minutes and allow to stand for a while. Filter with the G3 glass filter and wash with 30 mL of dimethylformamide several times. To the filtrate, add 50 mL of water and 0.5 mL of phenolphthalein TS, then titrate with 0.1 mol/L sodium hydroxide solution VS. Separately, take 100 mL of dimethylformamide as the blank test solution and proceed with it in the same manner as the test solution to perform the test. Obtain the amount of free thiazolidinedicarboxylic acid (NMT 3.0%).

Each mL of 0.1 mol/L sodium hydroxide
= 13.318 mg of $C_{10}H_{21}N_5O_4S$

pH Between 7.0 and 8.0 (20% aqueous solution).

Loss on drying NMT 1.0% (1.0 g, 40 °C, in vacuum).

Residue on ignition NMT 0.1% (5.0 g).

Assay (1) ***Arginine thiazolidine carboxylate***—Weigh exactly about 0.15 g of Arginine Thiazolidine Carboxylate, previously dried, dissolve in 40 mL of a mixture acetic anhydride and acetic acid(100) for non-aqueous titration (7 : 3), and titrate with 0.1 mol/L perchloric acid VS (indicator: 2 drops of methyl violet red TS). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid
= 10.240 mg of $C_{10}H_{21}N_5O_4S$

(2) ***Sulfur***—Weigh accurately about 0.15 g of Arginine Thiazolidine Carboxylate, previously dried, and perform the test as directed under the Oxygen Flask Combustion with a mixture of 0.1 mL of hydrogen peroxide and 10 mL of water as the absorbent.

Each mL of 0.005 mol/L barium perchlorate VS
= 0.16033 mg of S

Packaging and storage Preserve in tight containers.

Arginine Thiazolidine Carboxylate capsules
아르기닌티아졸리딘카르복실산염 캡슐

Arginine Thiazolidine Carboxylate Tablets contain NLT 95.0% and NMT 105.0% of arginine thiazolidine carboxylate ($C_{10}H_{21}N_5O_4S$: 307.37) of the labeled amount.

Method of preparation Prepare as directed under Capsules, with Arginine Thiazolidine Carboxylate.

Identification Weigh an amount equivalent to 0.4 g of arginine thiazolidine carboxylate according to the labeled amount of Arginine Thiazolidine Carboxylate Capsules, add water to make exactly 200 mL, filter, and use the filtrate as the test solution. Separately, dissolve about 80 mg of thiazolidine carboxylic acid RS and about 0.1 g of arginine RS in water to make 100 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Develop the plate with a mixture of methanol, chloroform, water and ammonia water(28) (4 : 4 : 1 : 1), and air-dry the plate. Spray on the plate a mixture of a solution prepared by dissolving 0.3 g of ninhydrin, 10 mL of acetic acid(100) and 2 mL of collidine in 100 mL of 50% isopropanol aqueous solution, as the coloring agent (should be prepared immediately before use), in this order, as well as 3 mL of 1% copper nitrate-ethanol solution; the R_f value and color of spots obtained from the test solution and the standard solution are the same.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

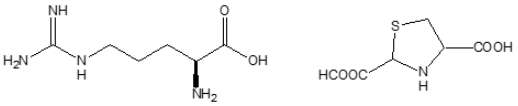
Assay Weigh accurately the mass of the contents of NLT 20 capsules of Arginine Thiazolidine Carboxylate Capsules. Weigh accurately an amount equivalent to about 0.8 g of arginine thiazolidine carboxylate ($C_{10}H_{21}N_5O_4S$), add acetic acid(100), shake well to mix and make exactly 50 mL, and filter the mixture. Pipet 10 mL of the filtrate

and titrate with 0.1 mol/L perchloric acid VS (indicator: 2 drops of methylrosaniline chloride TS). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 10.24 mg of $C_{10}H_{21}N_5O_4S$

Packaging and storage Preserve in tight containers.

Arginine Tidiacicate
아르기닌티디아시케이트



$C_{11}H_{21}O_6N_5S$: 351.38
L-Arginine 1,3-thiazolane-2,4-dicarboxylic acid (1:1), [*30097-06-4*]

Arginine Tidiacicate, when dried, contains NLT 98.5 of argininetidiacicate ($C_{11}H_{21}O_6N_5S$).

Description Arginine Tidiacicate occurs as a white to pale yellow powder.
It is soluble in water, acid and alkali, sparingly soluble in ethanol, and practically insoluble in ether and chloroform

Melting point About 185 °C (with decomposition).

Optical rotation $[a]_D^{20}$: Between -33.0° and -37.5° (after drying, 1 g, 6 mol/L hydrochloric acid, 20 mL, 200 mm).

Identification (1) Put 1 mg of Arginine Tidiacicate in the test tube, add 10 drops of water and 1 mL of 0.02% naphthol ethanol solution (should be prepared immediately before use), then shake to mix well. Next, add 1 mL of 20% sodium hydroxide solution, 20 mg of *N*-bromosuccinimide and 3 mL of water, then shake to mix well. The resulting solution immediately turns orange.

(2) Dissolve 0.2 g of Arginine Tidiacicate in 10 mL of water, and use this solution as the test solution. Separately, dissolve 0.2 g of arginine tidiacicate RS in 10 mL of water and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot the test solution and standard solution on a thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Develop the plate with a mixture of *n*-propanol and 20% ammonium hydroxide solution as the developing solvent, and air-dry the plate. Spray a solution obtained by adding 5 mL of 10% acetic acid and ethanol(95) to 0.1 g of ninhydrin to make 50 mL; the R_f value and color of spots obtained from the test solution and the standard solution are the same.

(3) Determine the absorption spectrum of 0.2% aqueous solution of Arginine Tidiacicate as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum absorption at the wavenumbers of between 245 and 250 nm.

pH Between 3.5 and 4.6 (5% aqueous solution).

Purity (1) ***Sulfate***—Dissolve 1 g of Arginine Tidiacicate in hot water, cool it, and then perform the test according to the Sulfate limit test; the resulting solution is not more turbid than the control solution. Add 1 mL of 0.005 mol/L sulfuric acid to the control solution (NMT 0.048%).

(2) ***Arsenic***—Proceed with 1 g of Arginine Tidiacicate according to Method 1 and perform the test (NMT 2 ppm).

(3) ***Heavy metals***—Proceed with 1 g of Arginine Tidiacicate according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

Loss on drying NMT 0.5% (1.0 g, 80 °C, in vacuum, constant mass).

Residue on ignition NMT 0.1% (1.0 g).

Assay Weigh accurately about 30 mg of Arginine Tidiacicate, and titrate according to the Sulfur assay under the Oxygen Flask Combustion with a mixture of 20 mL of water and 5 drops of hydrogen peroxide as an absorbent. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.005 mol/L barium perchlorate VS
= 1.757 mg of $C_{11}H_{21}O_6N_6S$

Packaging and storage Preserve in tight containers.

Arginine Tidiacicate Capsules
아르기닌티디아시케이트 캡슐

Arginine Tidiacicate Capsules contain NLT 95.0% and NMT 105.0% of arginine tidiacicate ($C_{11}H_{21}O_6N_5S$: 351.38) of the labeled amount.

Method of preparation Prepare as directed under Capsules, with Arginine Tidiacicate.

Identification Weigh an amount of Arginine Tidiacicate Capsules, equivalent to 40 mg of arginine tidiacicate, according to the labeled amount. Wash with about 15 mL of ethyl acetate, transfer quantitatively to a glass-stoppered centrifuge tube, add 20 mL of water, shake vigorously for 10 minutes to extract., and centrifuge for 10 minutes at NLT 3,500 rpm. Collect the water layer, and use this solution as the test solution. Separately, dissolve 20 mg of arginine tidiacicate RS in 10 mL of water,

and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot the test solution and the standard solution on the thin-layer chromatographic plate made of cellulose with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of phenol, water and ammonia water (75 : 23 : 2) as the developing solvent, and air-dry the plate. Examine the plate under ultraviolet light; the R_f values and colors of the spots from the test solution and the standard solution are the same.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of the content NLT 20 Arginine Tidiacicate Capsules, and then weigh accurately the amount equivalent to about 40 mg of arginine tidiacicate. Wash with about 20 mL of ethyl ether, transfer quantitatively, add exactly 20 mL of water, and shake vigorously for 10 minutes to extract. Centrifuge at NLT 3,500 rpm for 10 minutes. Collect the water layer, and use this solution as the test solution. Separately, weigh accurately about 40 mg of arginine tidiacicate RS, dissolve in water to make exactly 20 mL, and use this solution as the standard solution. Perform the test with the test solution and the standard solution as directed under the Ultraviolet-visible Spectroscopy using water as a control solution and determine the absorbances, A_T and A_S, at the wavelength of 245 nm.

Amount (mg) of arginine tidiacicate ($C_{11}H_{21}O_6N_5S$)
= Amount (mg) of arginine tidiacicate RS × (A_T / A_S)

Packaging and storage Preserve in well-closed containers.

Arginine Tidiacicate, Thiamine Hydrochloride, Riboflavin and Ascorbic Acid capsules
아르기닌티디아시케이트·티아민염산염·리보플라빈·아스코르브산 캡슐

Arginine Tidiacicate, Thiamine Hydrochloride, Riboflavin and Ascorbic Acid Capsules contain 90.0% to 110.0% of the labeled amount of arginine tidiacicate ($C_{11}H_{21}O_6N_5S$: 351.38) and 90.0% to 150.0% of the labeled amount of thiamine hydrochloride ($C_{12}H_{17}ClN_4OS \cdot HCl$: 337.27), riboflavin ($C_{17}H_{20}N_4O_6$: 376.37) and ascorbic acid ($C_6H_8O_6$: 176.12).

Method of preparation Prepare as directed under Capsules, with Arginine Tidiacicate, Thiamine Hydrochloride, Riboflavin and Ascorbic Acid.

Identification (1) ***Arginine Tidiacicate***—Weigh accurately an amount of Arginine Tidiacicate, Thiamine Hydrochloride, Riboflavin and Ascorbic Acid Capsules, equivalent to 40 mg of arginine tidiacicate, according to the labeled amount. Wash with about 15 mL of chloroform, transfer quantitatively to a glass-stoppered centrifuge tube, add 20.0 mL of water, and shake vigorously for 10 minutes to extract. Then centrifuge at NLT 3,500 rpm for 10 minutes, collect the water layer, and use this solution as the test solution. Separately, dissolve 20 mg of arginine tidiacicate RS in 10 mL of water, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot the test solution and the standard solution on the thin-layer chromatographic plate made of cellulose with fluorescent indicator for thin-layer chromatography. Then, develop the plate with a mixture of phenol, water and ammonia water (75 : 23 : 2) as the developing solvent, and air-dry the plate. Examine the plate under ultraviolet light; the R_f values and colors of the spots from the test solution and the standard solution are the same.

(2) ***Thiamine Hydrochloride, Riboflavin and Ascorbic Acid***—Perform the test with the content of Arginine Tidiacicate, Thiamine Hydrochloride, Riboflavin and Ascorbic Acid Capsules as directed under the Analysis for Vitamins.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay (1) ***Arginine Tidiacicate***—Weigh accurately the mass of the content of NLT 20 Arginine Tidiacicate, Thiamine Hydrochloride, Riboflavin and Ascorbic Acid Capsules, and weigh accurately the amount equivalent to about 40 mg of arginine tidiacicate. Wash with about 15 mL of chloroform, transfer quantitatively to a glass-stoppered centrifuge tube, add 20.0 mL of water, and shake vigorously for 10 minutes to extract. Centrifuge at NLT 3,500 rpm for 10 minutes. Collect the water layer, and use this solution as the test solution. Separately, weigh accurately about 40 mg of arginine tidiacicate RS, dissolve in water to make 20 mL, and use this solution as the standard solution. Perform the test with the test solution and the standard solution as directed under the Ultraviolet-visible Spectroscopy using water as a control solution and determine the absorbances, A_T and A_S, at the wavelength of 245 nm.

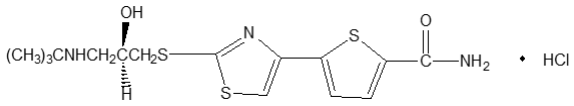
Amount (mg) of arginine tidiacicate ($C_{11}H_{21}O_6N_5S$)
= Amount (mg) of arginine tidiacicate RS × $\frac{A_T}{A_S}$

(2) ***Thiamine Hydrochloride, Riboflavin and Ascorbic Acid Capsules***—Weigh accurately the mass of the content of NLT 20 Arginine Tidiacicate, Thiamine Hydrochloride, Riboflavin and Ascorbic Acid Capsules, and perform the test as directed under the Analysis for

Vitamins.

Packaging and storage Preserve in tight containers.

Arotinolol Hydrochloride
아로티놀롤염산염



and enantiomer

$C_{15}H_{21}N_3O_2S_3 \cdot HCl$: 408.00

5-[2-[3-(*tert*-Butylamino)-2-hydroxypropyl] sulfanyl-1,3-thiazol-4-yl]thiophene-2-carboxamide hydrochloride [*68377-91-3*]

Arotinolol Hydrochloride, when dried, contains NLT 99.0% and NMT 101.0% of arotinolol hydrochloride ($C_{15}H_{21}N_3O_2S_3 \cdot HCl$).

Description Arotinolol Hydrochloride occurs as a white or pale yellow crystalline powder.
It is freely soluble in dimethylsulfoxide, slightly soluble in water or methanol, very slightly soluble in ethanol(99.5) and practically insoluble in ether.
A solution of Arotinolol Hydrochloride in methanol (1 in 125) shows no optical rotation.

Identification (1) Determine the absorption spectra of Arotinolol Hydrochloride and Arotinolol hydrochloride RS in methanol (1 in 75000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectrum of Arotinolol Hydrochloride and Arotinolol hydrochloride RS as directed in the potassium bromide disk method under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) An aqueous solution of Arotinolol Hydrochloride (1 in 200) responds to the Qualitative Analysis (2) for chloride.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Arotinolol Hydrochloride according to Method 2 and perform the test. Prepare the control solution with 1.0 mL of lead standard solution (NMT 10 ppm).

(2) **Related substances**—Dissolve 50 mg of Arotinolol Hydrochloride in 10 mL of methanol and use this solution as the test solution. Pipet 1 mL of this solution and add methanol to make exactly 100 mL. Pipet 1 mL of this solution, add methanol to make exactly 10 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 40 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of chloroform, methanol, acetone and ammonia water(28) (30 : 10 : 10 : 1) as the developing solvent to a distance of about 12 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 0.2% (1 g, in vacuum, 105 °C, 4 hours).

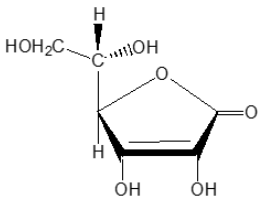
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 1.5 g of Arotinolol Hydrochloride, previously dried, and dissolve in dimethylsulfoxide to make exactly 25 mL. Pipet 5 mL of this solution, add 100 mL of water and 5 mL of sodium hydroxide TS, and extract with 50 mL of dichloromethane three times. Filter the dichloromethane extract solution through a funnel where anhydrous sodium is placed on cotton wool every time. Combine all the dichloromethane extract solution and evaporate to dryness under reduced pressure. Dissolve the residue in 70 mL of acetic acid(100) and titrate with 0.05 mol/L of perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.05 mol/L perchloric acid VS
= 20.400 mg of $C_{15}H_{21}N_3O_2S_3 \cdot HCl$

Packaging and storage Preserve in light-resistant, tight containers.

Ascorbic Acid
아스코르브산



Vitamin C $C_6H_8O_6$: 176.12

(5*R*)-5-[(1*S*)-1,2-Dihydroxyethyl]-3,4-dihydroxy-2,5-dihydrofuran-2-one [*50-81-7*]

Ascorbic Acid, when dried, contains NLT 99.0% and NMT 101.0% of L-ascorbic acid ($C_6H_8O_6$).

Description Ascorbic Acid occurs as white crystals or a crystalline powder. It is odorless and has a sour taste.
It is freely soluble in water, sparingly soluble in ethanol(95), and practically insoluble in ether.

Melting point—About 190 °C (with decomposition).

Identification (1) Take 5 mL each of the aqueous solution of Ascorbic Acid (1 in 50), and add 1 drop of potassium permanganate TS or 1 to 2 drops of 2,6-dichlorophenolindophenol sodium TS; the color of all test solutions disappears immediately.

(2) Dissolve 0.1 g of Ascorbic Acid in 100 mL of metaphosphoric acid solution (1 in 50). Take 5 mL of this solution, add iodine TS until the solution exhibits a slightly yellow color, add 1 drop of copper sulfate solution (1 in 1000) and 1 drop of pyrrole, and warm at 50 ℃ for 5 minutes; the resulting solution exhibits a blue color.

Optical rotation $[\alpha]_D^{20}$: Between +20.5 and +21.5° (2.5 g, water, 25 mL, 100 mm).

pH Dissolve 1.0 g of Ascorbic Acid in 20 mL of water; the pH of this solution is between 2.2 and 2.5

Purity (1) ***Clarity and color of solution*—**Dissolve 1.0 g of Ascorbic Acid in 20 mL of water; the solution is clear and colorless.

(2) ***Heavy metals*—**Weigh 2.0 g of Ascorbic Acid, and add water to make 20 mL. Take 12 mL of this solution, and use this solution as the test solution. Separately, add 2 mL of the test solution to 10 mL of diluted lead standard solution, and use this solution as the control solution. Separately, add 2 mL of the test solution to 10 mL of water, and use this solution as the blank test solution. To 12 mL each of the test solution, the control solution and the blank test solution, add 2 mL of acetate buffer solution (pH 3.5), mix, put 1.2 mL of thioacetamide TS, and mix immediately. Allow it to stand for 2 minutes; the color of the test solution is not more intense than that of the control solution (NMT 10 ppm).

Diluted lead standard solution—Immediately before use, pipet 5 mL of the lead standard solution, and add water to make 50 mL.

System suitability—The control solution exhibits a faint brown color compared to the blank test solution.

(3) ***Copper*—**Weigh 2.0 g of Ascorbic Acid, dissolve in 2 mL of 0.1 mol/L nitric acid, and add 25.0 mL of 0.1 mol/L nitric acid to dilute. Take an appropriate amount of the copper standard solution, dilute with 0.1 mol/L nitric acid, make 0.2, 0.4, and 0.6 ppm, and use these solutions as the standard solution (1), standard solution (2), and standard solution (3). Perform the test with the test solution, the standard solution (1), the standard solution (2), and the standard solution (3) as directed under the Atomic Absorption Spectroscopy, according to the following conditions, and calculate the content of copper in the test solution, using the calibration curve obtained from the standard solution (NMT 5 ppm). Use 0.1 mol/L nitric acid as the blank test solution.

Gas: Air–acetylene
Lamp: Copper hollow cathode lamp
Wavelength: 324.8 nm

Loss on drying NMT 0.2% (1 g, silica gel, 24 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.2 g of Ascorbic Acid, previously dried, dissolve in 50 mL of metaphosphoric acid solution (1 in 50), and titrate with 0.05 mol/L iodine VS (indicator: 1 mL of starch TS).

Each mL of 0.05 mol/L iodine VS
= 8.806 mg of $C_6H_8O_6$

Packaging and storage Preserve in light-resistant, tight containers.

Ascorbic Acid Injection
아스코르브산 주사액

Vitamin C Injection

Ascorbic Acid Injection is an aqueous solution for injection. Ascorbic Acid Injection contains NLT 95.0% and NMT 115.0% of the labeled amount of ascorbic acid ($C_6H_8O_6$: 176.12).

Method of preparation Prepare as directed under Injections, with Ascorbic Acid.

Description Ascorbic Acid Injection occurs as a clear, colorless liquid.

Identification (1) Take an amount of Ascorbic Acid Injection, equivalent to 0.5 g of ascorbic acid according to the labeled amount, add water to make 25 mL, and perform the test with each 5 mL of the solution as directed under the Identification (1) under Ascorbic Acid.

(2) Take an amount of Ascorbic Acid Injection, equivalent to 5 mg of ascorbic acid according to the labeled amount, add metaphosphoric acid (1 in 50) to make 5 mL, and perform the test with this solution as directed under the Identification (2) under Ascorbic Acid.

(3) Ascorbic Acid Injection responds to the Qualitative Analysis (1) for sodium salt.

pH Between 5.6 and 7.4.

Purity ***Oxalate*—**Take an amount of Ascorbic Acid Injection, equivalent to 50 mg of ascorbic acid, and add water to make 5 mL. Add 0.2 mL of acetic acid(31) and 0.5 mL of calcium chloride TS and allow to stand for 1 minute; it exhibits no turbidity.

Sterility Meets the requirements.

Bacterial endotoxins Less than 0.15 EU per mg of

ascorbic acid.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Extractable volume of injections Meets the requirements.

Assay Pipet an amount of Ascorbic Acid Injection, equivalent to about 0.1 g of L-ascorbic acid ($C_6H_8O_6$), previously diluted with a mixture of metaphosphoric acid and acetic acid TS, if necessary, and add a mixture of metaphosphoric acid and acetic acid TS to make exactly 200 mL. Pipet 2 mL of this solution and proceed as directed under the Assay under Ascorbic Acid Powder.

Each mL of 2,6-dichloroindophenol sodium TS for titration
= A mg of $C_6H_8O_6$

Packaging and storage Preserve in hermetic containers filled with nitrogen.

Ascorbic Acid Powder
아스코르브산 산

Vitamin C Powder

Ascorbic Acid Powder contains NLT 95.0% and NMT 120.0% of the amount of L-ascorbic acid ($C_6H_8O_6$: 176.12).

Method of preparation Prepare as directed under Powders, with Ascorbic Acid Powder.

Identification (1) Weigh an amount equivalent to 0.5 g of ascorbic acid according to the labeled amount of Ascorbic Acid Powder, add 30 mL of water, shake to mix for 1 minute, and filter. Take 5 mL each of filtrate, and perform the test as directed under the Identification (1) of Ascorbic Acid Powder.

(2) Weigh an amount equivalent to 10 mg of amount of Ascorbic Acid Powder, add 10 mL of metaphosphoric acid solution (1 in 50), shake for 1 minute to mix, and filter. Perform the test with 5 mL of filtrate as directed under the Identification (2) of Ascorbic Acid Powder.

Purity ***Rancidity***—Ascorbic Acid Powder has no unpleasant or rancid odor and taste.

Particle size distribution estimation by analytical sieving Meets the requirements.

Uniformity of dosage units (distribution) Meets the requirements.

Assay Weigh accurately an amount equivalent to about 0.1 g of L-ascorbic acid ($C_6H_8O_6$) of Ascorbic Acid Powder, repeat the extraction with metaphosphoric acid-acetic acid TS, combine all the extracts, and filter. Wash with metaphosphoric acid-acetic acid TS, combine filtrate and washings, and add metaphosphoric acid-acetic acid TS again to make exactly 200 mL. Pipet 2 mL of this solution, add 8 mL of metaphosphoric acid-acetic acid TS and 2 mL of hydrogen peroxide TS, shake to mix, and titrate with 2,6-dichlorophenolindophenol sodium TS until a pale red color persists for 5 seconds. Perform a blank test in the same manner and make any necessary correction.

Each mL of 2,6-dichloroindophenol sodium TS for titration
= A mg of $C_6H_8O_6$

However, A is decided by the following standardization of 2,6-dichlorophenolindophenol sodium TS.

2,6-dichlorophenolindophenol sodium TS— Preparation: Dissolve 42 mg of sodium bicarbonate in 50 mL of water, dissolve 50 mg of 2,6-dichlorophenolindophenol sodium, add water to make 200 mL, and filter. This preparation is prepared before use.

Standardization—Weigh accurately about 50 mg of ascorbic acid RS, previously dried in a desiccator (silica gel) for 24 hours, dissolve by adding metaphosphoric acid-acetic acid TS to make 100 mL, pipet 2 mL of this solution, and add 8 mL of metaphosphoric acid-acetic acid TS and 2 mL of hydrogen peroxide TS. Shake to mix, and titrate with 2,6-dichlorophenolindophenol sodium TS for titration until a pale red color persists for 5 seconds. Perform a blank test in the same manner, make any necessary correction, and calculate A mg, the amount of L-Ascorbic acid ($C_6H_8O_6$) equivalent to 1 mL of this test solution.

Packaging and storage Preserve in tight containers.

Ascorbic Acid Tablets
아스코르브산 정

Vitamin C Tablets

Ascorbic Acid Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of L-ascorbic acid ($C_6H_8O_6$: 176.12).

Method of preparation Prepare Ascorbic Acid Tablets as directed under Tablets, with Ascorbic Acid.

Identification (1) Weigh an amount of Ascorbic Acid Tablets, previously powdered, equivalent to 0.5 g of ascorbic acid, according to the labeled amount, add 30 mL of water, shake to mix for 1 minute, and filter. Take 5

mL each of the filtrate, and perform the test as directed under the Identification (1) of Ascorbic Acid.

(2) Take 2 mL of the filtrate obtained from (1), add sodium hydroxide TS to make it neutral, and add 2 drops of uranyl acetate TS; the resulting solution exhibits reddish-brown. Add additional 2 mL of sodium hydroxide TS; the color of the solution turns yellow.

(3) Weigh an amount of Ascorbic Acid Tablets, previously powdered, equivalent to 10 mg of ascorbic acid, according to the labeled amount, add 10 mL of metaphosphoric acid (1 in 50), shake for 1 minute to mix, and filter. Perform the test with 5 mL of the filtrate as directed under the Identification (2) of Ascorbic Acid.

Dissolution Perform the test with 1 tablet of Ascorbic Acid Tablets at 50 revolutions per minute according to Method 2 under the Dissolution, using 900 mL of water as the dissolution medium. Take NLT 20 mL of the dissolution medium 45 minutes immediately after the start the Dissolution, and filter through a membrane filter with a pore size of not exceeding 0.8 μm. Take the filtrate and quantify it according to the Assay.

It meets the requirements if the dissolution rate of Ascorbic Acid Tablets in 45 minutes is NLT 75%.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 tablets of Ascorbic Acid Tablets, and powder. Weigh accurately an amount, equivalent to about 0.1 g of L-ascorbic acid ($C_6H_8O_6$), and perform the test as directed under the Assay of Ascorbic Acid.

Packaging and storage Preserve in light-resistant, tight containers.

Ascorbic Acid and Calcium Pantothenate Tablets
아스코르브산·판토텐산칼슘 정

Ascorbic Acid Tablets

Ascorbic Acid and Calcium Pantothenate Tablets contain NLT 90.0% and NMT 150.0% of the labeled amount of ascorbic acid ($C_6H_8O_6$: 176.12) and calcium pantothenate ($C_{18}H_{32}CaN_2O_{10}$: 476.53).

Method of preparation Prepare Ascorbic Acid and Calcium Pantothenate Tablets as directed under Tablets, with Ascorbic Acid and Calcium Pantothenate.

Identification Ascorbic Acid and Calcium Pantothenate Perform the test with Ascorbic Acid and Calcium Pantothenate Tablets as directed under the Analysis for Vitamins.

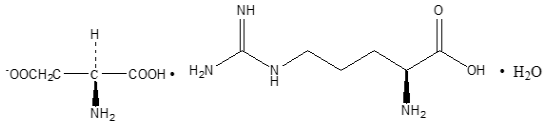
Disintegration Meets the requirements.

Uniformity of dosage units (distribution) Meets the requirements.

Assay Ascorbic Acid and Calcium Pantothenate Weigh accurately the mass of NLT 20 tablets of Ascorbic Acid and Calcium Pantothenate Tablets, and perform the test as directed under the Analysis for Vitamins.

Packaging and storage Preserve in well-closed containers.

L-Aspartate-L-Arginine Hydrate
L-아스파르트산-L-아르기닌수화물



$C_{10}H_{21}N_5O_6 \cdot H_2O$: 325.32

L-Aspartic acid with L-arginine monohydrate (1:1), [*7675-83-4*, anhydrous]

L-Aspartate-L-Arginine Hydrate contains NLT 98.5% and NMT 101.0% of L-arginine-L-aspartate ($C_{10}H_{21}N_5O_6$: 307.30), calculated on the anhydrous basis.

Description L-Aspartate-L-Arginine Hydrate occurs as a white crystalline powder and is absorptive.
It is odorless or has a slightly characteristic odor.
It is freely soluble in water, soluble in hydrochloric acid TS or sodium hydroxide TS, and insoluble in ethanol(95).
The pH of a 10% aqueous solution of L-Aspartate-L-Arginine Hydrate is about 7.

Melting point—Between 225 and 229 ℃ (with decomposition).

Optical rotation $[\alpha]_D^{20}$: Between +25.4° and +27.4° (4 g after drying, 100 mL of 6 mol/L hydrochloric acid, 100 mm).

Identification (1) To 10 mL of a 0.2% aqueous solution of L-Aspartate-L-Arginine Hydrate, add 1 mL of 0.4% ninhydrin-acetone solution, and heat on a steam bath; the resulting solution exhibits a violet color.

(2) Perform the test with L-Aspartate-L-Arginine Hydrate as directed under the Identification and Assay for Amino Acids.

Purity (1) ***Arsenic*—**Proceed with 1.0 g of L-Aspartate-L-Arginine Hydrate according to Method 2 under the Arsenic and perform the test (NMT 2 ppm).

(2) ***Lead*—**Perform the test with 1.0 g of L-Aspartate-L-Arginine Hydrate as directed under the Lead in United States Pharmacopeia (USP) (NMT 20 ppm).

(3) ***Sulfate*—**Perform the test with 1.0 g of L-Aspartate-L-Arginine Hydrate as directed under the Sulfate. Prepare the control solution with 0.1 mL of 0.005

mol/L sulfuric acid (NMT 0.005%).

(4) ***Chloride***—Perform the test with 1.0 g of L-Aspartate-L-Arginine Hydrate as directed under the Chloride. Prepare the control solution with 0.14 mL of 0.01 mol/L hydrochloric acid (NMT 0.05%).

(5) ***Ammonium***—Perform the test with 0.1 g of L-Aspartate-L-Arginine Hydrate as directed under the Ammonium. Prepare the control solution with 2.0 mL of ammonium standard solution (NMT 20 ppm).

(6) ***Iron***—Prepare the test solution with 2.0 g of L-Aspartate-L-Arginine Hydrate according to Method 1 and perform the test according to Method A. Prepare the control solution with 2.0 mL of iron standard solution (NMT 10 ppm).

(7) ***Other amino acids***—Perform the test with L-Aspartate-L-Arginine Hydrate as directed under the Paper Chromatography; the obtained number of spots is the same as the number of spots in the standard solution with no other spots appearing.

Loss on drying NMT 5.5% (1 g, 105 ℃, constant mass).

Assay Weigh accurately about 0.1 g of L-Aspartate-L-Arginine Hydrate, previously dried, dissolve in 20 mL of acetic acid(100) for non-aqueous titration, and titrate with 0.1 mol/L perchloric acid VS (indicator: 2 to 3 drops of methylrosaniline chloride TS). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 10.24 mg of $C_{10}H_{21}N_5O_6$

Packaging and storage Preserve in tight containers.

L-Aspartate-L-Arginine Solution
L-아스파르트산-L-아르기닌 액

L-Aspartate-L-Arginine Solution contains NLT 90.0% and NMT 130.0% of the labeled amount of L-aspartate-L-arginine hydrate ($C_{10}H_{21}N_5O_6 \cdot H_2O$: 325.32).

Method of preparation Prepare as directed under Liquids, with L-Aspartate-L-Arginine Hydrate.

Identification Pipet 1 mL of L-Aspartate-L-Arginine Solution, add water to make 100 mL, and use this solution as the test solution. Separately, dissolve about 0.1 g of L-arginine-L-aspartate RS and dissolve in water to make 50 mL. Use this solution as the standard solution. Spot 5 μL each of the test solution and the standard solution on the plate made of silica gel for thin-layer chromatography. Develop the plate with a saturated vapor of a mixture of n-propyl alcohol and 27% ammonia (64 : 36) as the developing solvent to a distance of about 15 cm, and air-dry the plate. Evenly spray the plate with ninhydrin TS and heat for 5 minutes at 100 ℃; the two spots from the test solution and the standard solution have the same R_f value and same color (R_f value 0.55 : aspartate, R_f value 0.4 : arginine).

pH Between 5.5 and 7.5.

Assay Pipet an amount of L-Aspartate-L-Arginine Solution equivalent to 0.2 g of L-arginine-L-aspartate ($C_{10}H_2N_5O_6$), elute by passing through a Sep-pak C_{18} previously treated by passing 5 mL of methanol and 5 mL of water, add 10 mL of water and elute again. Combine the eluate, add 30 mL of the mobile phase, and add water to make 50.0 mL. Pipet 5.0 mL of L-Aspartate-L-Arginine Solution and add water to make 25.0 mL. Use this solution as the test solution. Separately, weigh accurately about 0.2 g of L-arginine-L-aspartate RS (Dried at 105 ℃ for 4 hours), dissolve in 30 mL of the mobile phase, and add water to make 50.0 mL. Pipet 5.0 mL of this solution, add water to make 25.0 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of L-arginine-L-aspartate.

Amount (mg) of L-arginine-L-aspartate ($C_{10}H_2N_5O_6$)
= Amount (mg) of L-arginine-L-aspartate RS $\times \frac{A_T}{A_S}$

A_T: Sum of peak areas of L-arginine-L-aspartate in the test solution

A_S: Sum of peak areas of L-arginine-L-aspartate in the standard solution

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 200 nm).

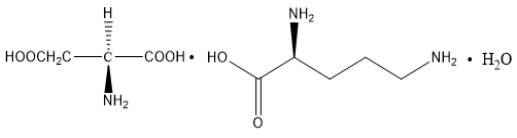
Column: A stainless steel column about 4.6 mm in internal diameter and about 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: 0.02 mol/L potassium dihydrogen phosphate solution.

Flow rate: 1 mL/min

Packaging and storage Preserve in tight containers.

L-Aspartate-L-Ornithine Hydrate
L-아스파르트산-L-오르니틴수화물



$C_5H_{12}N_2O_2 \cdot C_4H_6NO_4 \cdot H_2O$: 283.28

L-Aspartate with L-ornithine hydrate (1:1), [*3230-94-2*, anhydrous]

L-Aspartate-L-Ornithine Hydrate contains NLT 98.0% and NMT 101.0% of L-ornithine-L-aspartate ($C_9H_{19}N_3O_6$: 265.26), calculated on the anhydrous basis.

Description L-Aspartate-L-Ornithine Hydrate occurs as a white powder. It is odorless or has a slightly characteristic odor.
It is very soluble in water and practically insoluble in methanol or ethanol(95).
The pH of an aqueous solution (1 in 20) of L-Aspartate-L-Ornithine Hydrate is about 6.

Identification To 0.1 g each of L-Aspartate-L-Ornithine Hydrate and L-ornithine-L-aspartate RS, dissolve respective 10 mL of water, use these solutions as the test solution and the standard solution and perform the test as directed under the Paper Chromatography. Spot 5 μL each of the test solution and the standard solution on the paper for chromatography, develop the paper with a mixture of phenol and dilute ammonia TS (3 in 10) (4 : 1) as the developing solvent to a distance of about 20 cm, and air-dry the paper. Spray evenly a solution of ninhydrin in acetone (2 in 100) on the paper, and dry the paper at 90 ℃ for 10 minutes; the spots obtained from the test solution are the same as the spots obtained from the standard solution.

Optical rotation $[\alpha]_D^{20}$: Between +25.0° and +28.0° (2.0 g, calculated on the anhydrous basis, 6 mol/L hydrochloric acid, 25 mL, 200 mm).

Purity (1) ***Clarity and color of solution***—To 0.10 g of L-Aspartate-L-Ornithine Hydrate, dissolve in 10 mL of water; the resulting solution is colorless and practically clear.

(2) ***Chloride***—Perform the test with 0.4 g of L-Aspartate-L-Ornithine Hydrate as directed under the Chloride. Prepare the control solution with 0.7 mL of 0.01 mol/L hydrochloric acid (NMT 0.06%).

(3) ***Sulfate***—Perform the test with 0.5 g of L-Arginine-L-Aspartate-L-Ornithine Hydrate as directed under the Sulfate. Prepare the control solution with 0.5 mL of 0.005 mol/L sulfuric acid (NMT 0.048%).

(4) ***Ammonium***—Perform the test with 0.01 g of L-Aspartate-L-Ornithine Hydrate as directed under the Ammonium. Prepare the control solution with 2.0 mL of ammonium standard solution placed in a flask and proceed in the same manner (NMT 0.05%).

(5) ***Heavy metals***—Proceed with 1.0 g of L-Aspartate-L-Ornithine Hydrate as directed under Method 1 and perform the test. Prepare the control solution with 1.0 mL of lead standard solution (NMT 10 ppm).

(6) ***Arsenic***—Proceed with 1.0 g of L-Aspartate-L-Ornithine Hydrate according to Method 2 under the Arsenic and perform the test (NMT 2 ppm).

Water Between 4.0% and 7.0% (0.5 g, water determination, volumetric titration, direct titration).

Residue on ignition NMT 0.2% (1 g).

Assay Weigh accurately about 0.2 g of L-Aspartate-L-Ornithine Hydrate, and dissolve in 0.5 mL of water. Add 100 mL of acetic acid(100), shake well to mix, and titrate with 0.1 mol/L perchloric acid VS (indicator: 10 drops of α-naphtholbenzein TS). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 8.842 mg of $C_5H_{12}N_2O_2 \cdot C_4H_6NO_4$

Packaging and storage Preserve in tight containers.

L-Aspartate-L-Ornithine Injection
L-아스파르트산-L-오르니틴 주사액

L-Aspartate-L-Ornithine Injection contains NLT 90.0% and NMT 130.0% of the labeled amount of L-aspartate-L-ornithine hydrate ($C_9H_{19}N_3O_6 \cdot H_2O$: 283.28).

Method of preparation Prepare as directed under Injections, with L-Aspartate-L-Ornithine Hydrate.

Identification Perform the test with L-Aspartate-L-Ornithine Injection as directed under the Identification and Assay for Amino Acids.

pH Between 5.0 and 7.0.

Assay Pipet an amount of L-Aspartate-L-Ornithine Injection equivalent to 0.1 g of L-ornithine-L-aspartate and perform the test as directed under the Identification and Assay for Amino Acids.

Sterility Meets the requirements.

Bacterial endotoxins Less than 7.5 EU per g of L-ornithine-L-aspartate.

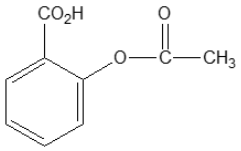
Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Extractable volume of injections Meets the requirements.

Packaging and storage Preserve in hermetic containers.

Aspirin
아스피린



Acetylsalicylic Acid $C_9H_8O_4$: 180.16
2-Acetyloxybenzoic acid [*50-78-2*]

Aspirin, when dried, contains NLT 99.5% and NMT 101.0% of aspirin ($C_9H_8O_4$).

Description Aspirin occurs as a white crystal, grain or a powder. It is odorless and has a slight acidic taste.
It is freely soluble in ethanol(95) or acetone, soluble in ether, and slightly soluble in water.
It dissolves in sodium hydroxide TS or sodium carbonate TS.
It gradually hydrolyzes in moist air to salicylic acid and acetic acid.

Melting point—About 136 °C (bath fluid is heated at 130 °C previously).

Identification (1) Put 0.1 g of Aspirin in 5 mL of water, boil for 5 to 6 minutes, cool, and add 1 to 2 drops of iron(III) chloride TS; the resulting solution exhibits a purple color.

(2) Put 10 mL of sodium carbonate TS in 0.5 g of Aspirin in, boil for 5 minutes, and add 10 mL of dilute sulfuric acid; the odor of acetic acid is perceptible, and a white precipitate is produced. Filter this solution, discard the precipitate, add 3 mL of ethanol(95) and 3 mL of sulfuric acid to the filtrate, and heat; the odor of ethyl acetate is perceptible.

Purity (1) ***Clarity and color of solution***—Dissolve 0.5 g of Aspirin in 10 mL of warm sodium carbonate TS; the solution is clear.

(2) ***Salicylic acid***—Dissolve 2.5 g of Aspirin in ethanol(95) to make 25 mL, add 1.0 mL of this solution to a solution prepared by transferring 1 mL of a freshly prepared dilute ammonium iron(III) sulfate TS to a Nessler tube and diluting with water to 50 mL, and allow to stand for 30 seconds; the color of the solution is not more intense than that of the following control solution.

Control solution—Dissolve 0.100 g of salicylic acid in water, and add 1 mL of acetic acid(100) and water to make 1000 mL. Take 1.0 mL of this solution, add to a solution prepared by transferring 1 mL of freshly prepared dilute ammonium iron(III) sulfate TS and 1 mL of ethanol(95) to a Nessler tube and diluting with water to 50 mL, and allow to stand for 30 seconds.

(3) ***Chloride***—Put 75 mL of water in 1.8 g of Aspirin, boil for 5 minutes, cool, add water to make 75 mL, and filter. To 25 mL of the filtrate, add 6 mL of dilute nitric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 0.25 mL of 0.01 mol/L hydrochloric acid (NMT 0.015%).

(4) ***Sulfate***—To 25 mL of the filtrate obtained in (3), add 1 mL of dilute hydrochloric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 0.50 mL of 0.005 mol/L sulfuric acid (NMT 0.040%).

(5) ***Heavy metals***—Dissolve 2.5 g of Aspirin in 30 mL of acetone, add 2 mL of dilute acetic acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution by adding 2.5 mL of lead standard solution, 30 mL of acetone, 2 mL of dilute acetic acid and water to make 50 mL (NMT 10 ppm).

(6) ***Readily carbonizable substances***—Weigh 0.5 g of Aspirin, and perform the test. The color of the solution is not more intense than that of the Matching Fluid for Color Q.

Loss on drying NMT 0.5% (3 g, silica gel, 5 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 1.5 g of Aspirin, previously dried, add exactly 50 mL of 0.5 mol/L sodium hydroxide, and boil gently for 10 minutes under a reflux condenser with a carbon dioxide-absorbing tube (soda lime). Cool, and titrate immediately the excess sodium hydroxide with 0.25 mol/L sulfuric acid VS (indicator: 3 drops of phenolphthalein TS). Perform a blank test in the same manner.

Each mL of 0.5 mol/L sodium hydroxide VS
= 45.04 mg of $C_9H_8O_4$

Packaging and storage Preserve in well-closed containers.

Aspirin Tablets
아스피린 정

Acetylsalicylic Acid Tablets

Aspirin Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of aspirin ($C_9H_8O_4$: 180.16).

Method of preparation Prepare Aspirin Tablets as directed under Tablets, with Aspirin.

Identification (1) Weigh an amount of Aspirin Tablets, previously powdered, equivalent to 0.1 g of Aspirin according to the labeled amount, add 10 mL of water, boil for 5 to 6 minutes, cool, and filter. Add 1 to 2 drops of iron(III) chloride TS to the filtrate; it exhibits a purple color.

(2) Weigh an amount of Aspirin Tablets, previously powdered, equivalent to 0.5 g of Aspirin, according to the labeled amount, and extract twice with 10 mL each of

warm ethanol by shaking to mix. Then combine the extracts, and filter. Evaporate the filtrate to dryness, add 10 mL of sodium carbonate TS to the residue, and boil for 5 minutes. Then perform the test as directed under the Identification (2) of Aspirin.

Purity ***Salicylic Acid***—Weigh accurately the mass of NLT 20 tablets of Aspirin Tablets, and powder. Weigh accurately the amount, equivalent to about 1.0 g of aspirin, dissolve in the mobile phase to make exactly 100 mL. Use this solution as the test solution. Separately, weigh exactly about 15 mg of salicylic acid RS and dissolve in the mobile phase to make exactly 100 mL. Pipet 5 mL of this solution, add the mobile phase to make exactly 50 mL. Use this solution as the standard solution. Perform the test with the test solution and the standard solution as directed under the Assay (NMT 0.15%).

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 tablets of Aspirin Tablets, and powder. Weigh accurately an amount equivalent to about 0.25 g of aspirin ($C_9H_8O_4$), add the mobile phase, shake well to mix, add the mobile phase to make exactly 200 mL, and filter. Discard first 10 mL of the filtrate and pipet 2 mL of the subsequent filtrate, add 4.0 mL of the internal standard solution, add the mobile phase to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 25 mg of aspirin RS, previously dried in a desiccator (silica gel) for 5 hours, and dissolve in mobile phase to make exactly 20 mL. Pipet 2 mL of this solution, put 4.0 mL of the internal standard solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the ratios, Q_T and Q_S of the peak areas of aspirin to those of the internal standard.

$$\text{Amount (mg) of aspirin } (C_9H_8O_4) = \text{Amount (mg) of aspirin RS} \times \frac{Q_T}{Q_S} \times 10$$

Internal standard solution—Weigh accurately about 10 mg of theophylline RS, dissolve in the mobile phase to make exactly 100 mL.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 280 nm).

Column: A stainless steel column about 4 mm in internal diameter and 15 cm to 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (about 5 to 10 μm in particle diameter).

Column temperature: A constant temperature of about 30 °C.

Mobile phase: A mixture of 0.085% phosphoric acid and methanol (60 : 40).

Flow rate: 1.0 mL/min

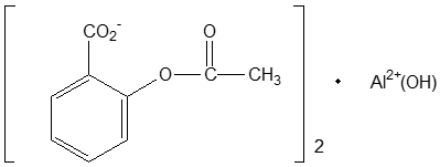
System suitability

System performance: Proceed with 10 μL of the standard solution according to the above conditions; the internal standard and aspirin are eluted in this order with the resolution being NLT 3.0.

System repeatability: Repeat the test 6 times with 10 μL of the standard solution according to the above conditions; the relative standard deviation of the peak area ratio is NMT 2.0%.

Packaging and storage Preserve in well-closed containers.

Aspirin Aluminium
아스피린알루미늄



Acetylsalicylic Acid Aluminium

Aluminum acetylsalicylic acid $C_{18}H_{15}AlO_9$: 402.29

Aluminum 2-acetyloxybenzoate hydroxide [*23413-80-1*]

Aspirin Aluminum contains NLT 83.0% and NMT 90.0% of aspirin ($C_9H_8O_4$: 180.16), and NLT 6.0% and NMT 7.0% of aluminum (Al: 26.98), calculated on the anhydrous basis.

Description Aspirin Aluminum occurs as a white, crystalline powder. It is odorless or has a slight acetic acid odor.

It is practically insoluble in water, methanol, ethanol(95) or ether.

It dissolves, with decomposition, in sodium hydroxide TS or sodium carbonate TS.

Identification (1) Put 10 mL of sodium hydroxide TS in 0.1 g of Aspirin Aluminum, and dissolve by warming, if necessary. Neutralize 2 mL of the solution with hydrochloric acid, and add 1 to 2 drops of iron(III) chloride TS; the resulting solution exhibits a purple color.

(2) Determine the absorption spectrum of the test solution obtained in the Assay (1) as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum between 277 nm and 279 nm.

(3) Put 2 g of Aspirin Aluminum in a platinum crucible, and ignite until charred. To the residue, add 1 g of anhydrous sodium carbonate, and ignite for 20 minutes. After cooling, add 15 mL of dilute hydrochloric acid to the residue, shake to mix, and filter. The filtrate responds

to the Qualitative Analysis for aluminum salt.

Purity (1) ***Salicylate***—Using A_{T2} and A_{S2} obtained in the Assay (1), calculate the amount of salicylate [as salicylic acid ($C_7H_6O_3$: 138.12)] by the following equation; salicylate content is NMT 7.5%, calculated on the anhydrous basis.

$$\text{Amount (mg) of salicylic acid } (C_7H_6O_3) = \text{Amount (mg) of salicylic acid RS} \times \frac{A_{T2}}{A_{S2}} \times \frac{1}{4}$$

(2) ***Heavy metals***—Put 2.0 g of Aspirin Aluminum in a porcelain crucible, cover the crucible loosely, and heat at a low temperature until charred. After cooling, add 2 mL of nitric acid and 1 mL of sulfuric acid to the content of the crucible, heat gently the crucible until white fumes are no longer evolved, then ignite at 500 to 600 °C to incinerate. When the incineration is not completed, add 2 mL of nitric acid and 1 mL of sulfuric acid, and heat gently in the same manner, then ignite at 500 °C to 600 °C to incinerate completely. After cooling, add 2 mL of hydrochloric acid, proceed as directed in Method 2, and perform the test. Prepare the control solution with the same amount as in the preparation of the test solution, and add 2.0ml of lead standard solution and water to make 50 mL (NMT 10 ppm).

(3) ***Arsenic***—Dissolve 1.0 g of Aspirin Aluminum in 15 mL of sodium hydroxide TS, add 1 drop of phenolphthalein TS, and stir to mix until the red color of the solution disappears while adding dropwise hydrochloric acid. Then add again 2 mL of hydrochloric acid, cool with occasional shaking for 10 minutes, and filter with a glass filter (G3). Wash the residue with 5 mL of 1 mol/L hydrochloric acid TS twice, and combine the filtrate and the washings. Use this solution as the test solution, and perform the test (NMT 2 ppm).

Water NMT 4.0% (0.15 g, volumetric titration, direct titration).

Assay (1) ***Aspirin***—Weigh accurately about 0.1 g of Aspirin Aluminum, add 40 mL of sodium fluoride TS, and shake to mix for 5 minutes. Allow the solution to stand for 10 minutes with occasional shaking. Extract the solution with each 20 mL of chloroform six times. Combine all chloroform extracts, and add chloroform to make exactly 200 mL. Pipet 10 mL of this solution, add chloroform to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 90 mg of salicylic acid RS, previously dried in a desiccator (silica gel) for 3 hours, dissolve in chloroform to make exactly 200 mL. Pipet 5 mL of this solution, add chloroform to make exactly 200 mL, and use this solution as the standard solution (1). Then, weigh accurately about 90 mg of aspirin RS, previously dried in a desiccator (silica gel) for 5 hours, and dissolve in chloroform to make exactly 200 mL. Pipet 10 mL of this solution, add chloroform to make exactly 100 mL, and use this solution as the standard solution (2). Perform the test with these solutions as directed under the Ultraviolet-visible Spectroscopy, and determine the absorbances, A_{T1} and A_{S1}, of the test solution and the standard solution (1) at 278 nm, and absorbances, A_{T2} and A_{S2}, of these solutions, at 308 nm, respectively. Then determine the absorbance A_{S3} of the standard solution (2) at 278 nm.

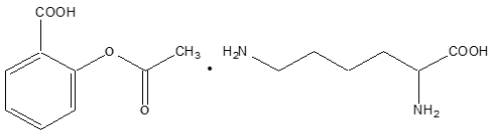
$$\text{Amount (mg) of aspirin } (C_9H_8O_4) = \text{Amount (mg) of aspirin RS} \times \left[\frac{A_{T1} - \frac{A_{T2} \times A_{S1}}{A_{S2}}}{A_{S3}}\right]$$

(2) ***Aluminum***—Weigh accurately about 0.4 g of Aspirin Aluminum, and dissolve in 10 mL of sodium hydroxide TS, and add dropwise 1 mol/L hydrochloric acid TS to adjust the pH to about 1. Add 20 mL of acetic acid-ammonium acetate buffer solution, pH 3.0, and 0.5 mL of Cu-PAN TS to boil, and titrate with 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS. The endpoint is when the color of the solution changes from red to yellow and persists for 1 minute. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.05 mol/L Ethylenediaminetetraacetic acid disodium salt VS
= 1.3491 mg of Al

Packaging and storage Preserve in well-closed containers.

Aspirin DL-Lysine
아스피린리신



$C_6H_{14}N_2O_2 \cdot C_9H_8O_4$: 326.35
2-Acetyloxybenzoate L-lysine (1:1), [62952-06-1]

Aspirin DL-Lysine, when dried, contains NLT 97.0% and NMT 101.0% of aspirin DL-lysine ($C_6H_{14}N_2O_2 \cdot C_9H_8O_4$).

Description Aspirin DL-Lysine occurs as white crystals or a crystalline powder. It is odorless and has a slightly bitter taste.
It is freely soluble in water, slightly soluble in methanol and practically insoluble in ethanol or ether.
An aqueous solution of Aspirin DL-Lysine (1 in 10) shows no optical rotation.

Identification (1) Put 0.2 g of Aspirin DL-Lysine in 5 mL of water, boil for 5 to 6 minutes, cool, and add 1 to 2 drops of iron(II) chloride TS; the resulting solution exhib-

its a reddish purple color.

(2) Add 1 mL of ninhydrin TS to 5 mL of the aqueous solution (1 in 1000) of Aspirin DL-Lysine and heat on a water bath for 2 minutes; the resulting solution exhibits a reddish purple color.

(3) To 1 g of Aspirin DL-Lysine, add 5 mL of dilute hydrochloric acid, shake to mix for 1 minute, filter, and wash the residue on the filter paper with water. Dissolve the residue in 10 mL of sodium carbonate TS, boil for 5 minutes, and add 10 mL of dilute sulfuric acid; the odor of acetic acid is perceptible and a white precipitate is produced. Next, filter the precipitate, add 3 mL of ethanol and 3 mL of sulfuric acid to the filtrate and heat; the odor of ethyl acetate is perceptible.

pH Dissolve 1.0 g of Aspirin DL-Lysine in 10 mL of water; the pH of this solution is between 4.5 and 6.5.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Aspirin DL-Lysine in 5 mL of water; the solution is clear and colorless.

(2) ***Salicylic acid***—Weigh accurately about 0.1 g of Aspirin DL-Lysine, previously dried, dissolve in 20 mL of a mixture of water, methanol and acetic acid(100) (5 : 3 : 1), and add 10.0 mL of internal standard solution. Then, add again a mixture of water, methanol and acetic acid(100) (5 : 3 : 1) to make 50 mL, and use this solution as the test solution. Separately, weigh accurately about 0.05 g of salicylic acid RS, previously dried, and dissolve in methanol to make 50 mL. Pipet 1.0 mL of this solution, add 10.0 mL of the internal standard solution, and add a mixture of water, methanol and acetic acid(100) (5 : 3 : 1) to make 50 mL. Use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid chromatography according to the following conditions, and determine the peak area ratios, QT and QS, of salicylic acid to the peak area of the internal standard, and calculate by the following equation; the amount of salicylic acid is NMT1.0%.

$$\text{Amount (mg) of salicylic acid } (C_7H_6O_3) = \text{Amount (mg) of salicylic acid RS} \times \frac{Q_T}{Q_S} \times \frac{1}{50}$$

◦ *Internal standard solution*—A solution of ethyl paraoxybenzoate in methanol (1 in 1250).

Operating conditions

Detector: Ultraviolet absorption photometer (wavelength: 274 nm).

Column: A stainless steel column with an internal diameter of about 4 mm and a length of about 15 to 30 cm, packed with octadecylsilanized silica gel for liquid chromatography (5 to 10 μm in particle diameter).

Column temperature: A constant temperature of about 30 °C.

Mobile phase: A mixture of water, methanol and acetic acid(100) (97 : 97 : 6).

Flow rate: Adjust the flow rate so that the retention time of salicylic acid is about 8 minutes.

Selection of column: Proceed with 10 μL of the standard solution according to the above conditions; salicylic acid and the internal standard are eluted in this order, and each peak is completely separated.

(3) ***Ammonium***—Proceed with 0.25 g of Aspirin DL-Lysine according to the Ammonium and perform the test. Prepare the control solution with 5.0 mL of the ammonium standard solution (NMT 0.02%).

(4) ***Heavy metals***—Proceed with 2.0 g of Aspirin DL-Lysine according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(5) ***Arsenic***—Proceed with 2.0 g of Aspirin DL-Lysine according to the Arsenic and perform the test. (NMT 1 ppm).

(6) ***DL-ε-N-acetyllysine***—Dissolve 2.0 g of Aspirin DL-Lysine and 0.026 g of DL-ε-N-acetyllysine RS in water, respectively, to make 100.0 mL, and use these solutions as the test solution and the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of methanol and water (63 : 37) to a distance of about 10 cm, and air-dry the plate. Spray evenly ninhydrin acetone solution (1 in 50), heat at 80 °C for 5 minutes; the spot of the test solution with the same Rf value as that of the spot from the standard solution is not more intense than the spot from the standard solution.

Loss on drying NMT 1.0% (2 g, silica gel, 24 hours).

Residue on ignition NMT 0.1% (1.0 g).

Particle size estimation by analytical sieving Meets the requirements.

Assay Weigh accurately about 0.1 g of Aspirin DL-Lysine, previously dried, and dissolve in 1 in 20 mL a mixture of water, methanol and acetic acid(100) (5 : 3 : 1). Add 10.0 mL of the internal standard solution, add a mixture of water, methanol and acetic acid(100) (5 : 3 : 1) again to make 50.0 mL, and use this solution as the test solution. Separately, weigh accurately about 0.06 g of aspirin RS, previously dried in a desiccator (silica gel) for 5 hours, dissolve in 10.0 mL of the internal standard solution, add a mixture of water, methanol and acetic acid(100) (5 : 3 : 1) to make 50.0 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid chromatography according to the following conditions, and determine the peak area ratios, QT and QS, of aspirin to the peak area of the internal standard.

Amount (mg) of aspirin DL-lysine (C6H14N2O2·C9H8O4)
= Amount (mg) of aspirin DL-lysine RS × $\frac{Q_T}{Q_S}$ × 1.8114

◦ *Internal standard solution*—A solution of ethyl paraoxybenzoate in methanol (1 in 1250).

Operating conditions

Detector: Ultraviolet absorption photometer (wavelength: 274 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 15 cm to 30 cm in length, packed with octadecylsilanized silical gel for liquid chromatography (5 μm to 10 μm in particle diameter).

Column temperature: A constant temperature of about 30 °C.

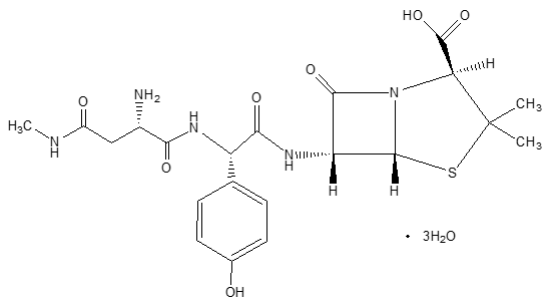
Mobile phase: A mixture of water, methanol and acetic acid(100) (97 : 97 : 6).

Flow rate: Adjust the flow rate so that the retention time of aspirin is about 5 minutes.

Selection of column: Proceed with 10 μL of the standard solution according to the above conditions; aspirin and the internal standard are eluted in this order, and each peak is completely separated.

Packaging and storage Preserve in light-resistant, tight containers at below 6 ℃.

Aspoxicillin Hydrate
아스폭시실린수화물



Aspoxicillin $C_{21}H_{27}N_5O_7S \cdot 3H_2O$
(3*S*,5*R*,6R)-6-{(2*R*)-2-[(2*R*)-2-Amino-4-(methylamino)-4-oxobutanamido]-2-(4-hydroxy-phenyl)acetamido}-2,2-dimethylpenam-3-carboxylic acid trihydrate [*117774-38-6*]

Aspoxicillin Hydrate contains NLT 950 μg (potency) and NMT 1020 μg (potency) of aspoxicillin ($C_{21}H_{27}N_5O_7S$: 493.53) per mg, calculated on the anhydrous basis.

Description Aspoxicillin Hydrate occurs as white crystals or a crystalline powder.
It is freely soluble in *N*,*N*-dimethylformamide, sparingly soluble in water, and practically insoluble in acetonitrile, methanol and ethanol(95).

Identification (1) Determine the absorption spectra of solutions of Aspoxicillin Hydrate and aspoxicillin hydrate RS (1 in 4000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelength.

(2) Determine the infrared absorption spectrum of Aspoxicillin Hydrate and aspoxicillin hydrate RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers

Optical rotation $[\alpha]_D^{20}$: Between +170° and +185° (0.2 g, calculated on the anhydrous basis, water, 20 mL, 100 mm).

pH Dissolve 1.0 g (potency) of Aspoxicillin Hydrate in 50 mL of water; the pH of this solution is between 4.2 and 5.2.

Purity (1) ***Clarity and color of solution*—**Dissolve 1.0 g of Aspoxicillin Hydrate in 50 mL of water; the solution is clear and colorless.

(2) ***Heavy metals*—**Proceed with 2.0 g of Aspoxicillin Hydrate according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Arsenic*—**Proceed with 2.0 g of Aspoxicillin Hydrate according to Method 5 and perform the test (NMT 1 ppm).

(4) ***Related substances***—Dissolve 0.05 g of Aspoxicillin Hydrate in 10 mL of the mobile phase and use this solution as the test solution. Pipet 1 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions. Calculate the peak area of each solution by the automatic integration method; the each peak area other than aspoxicillin from the test solution is NMT 3/10 of the peak area of aspoxicillin from the standard solution. The sum of peak areas other than aspoxicillin from the test solution is NMT the peak area of aspoxicillin from the standard solution.

Operating conditions

For the detector, column, column temperature, mobile phase and flow rate, proceed as directed under the operating conditions in the Assay.

System suitability

Test for required detectability: Pipet 2 mL of the standard solution and add the mobile phase to make exactly 10 mL. Confirm that the peak area of aspoxicillin obtained from 10 μL of this solution is equivalent to 15 to 25% of the peak area of aspoxicillin obtained from the standard solution.

System performance: Proceed as directed under the system suitability in the Assay.

System repeatability: Repeat the test 6 times

with 10 μL each of the standard solutions according to the above conditions; the relative standard deviation of the peak areas of aspoxicillin is NMT 5%.

Time span of measurement: About 6 times of the retention time of aspoxicillin.

Water NLT 9.5% and NMT 13.0% (0.2 g, volumetric titration, direct titration).

Sterility It meets the requirements when used in sterile preparations. However, it is exempt from the requirements when there is a terminal sterilization process in the manufacturing process of sterile preparations.

Bacterial endotoxins Less than 0.50 EU per mg of aspoxicillin (potency) when used in the manufacturing of sterile preparations.

Assay Weigh accurately an amount of Aspoxicillin and aspoxicillin RS, equivalent to about 0.1 g (potency), dissolve each in a suitable amount of water, add exactly 10 mL of the internal standard solution, add 6.5 mL of acetonitrile and water to make 50 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 10 μL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the ratios the peak area, Q_T and Q_S of aspoxicillin to that of the internal standard.

$$\text{Potency (μg) of aspoxicillin } (C_{21}H_{27}N_5O_7S) = \text{Potency (μg) of aspoxicillin RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—*N*-(3-Hydroxyphenyl)acetamide (1 in 1000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 280 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: To 130 mL of acetonitrile, add potassium dihydrogen phosphate TS, pH 3.0, to make 1000 mL.

Flow rate: Adjust the flow rate so that the retention time of aspoxicillin is about 3 minutes.

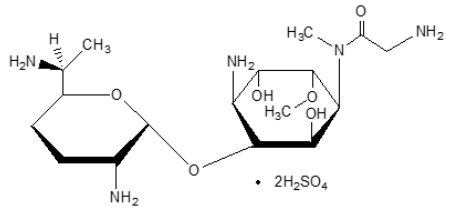
System suitability

System performance: Proceed with 10 μL of the standard solution according to the above conditions; aspoxicillin and the internal standard are eluted in this order with the resolution being NLT 8.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solutions according to the above operating conditions; the relative standard deviation of the ratios of the peak area of aspoxicillin to that of the internal standard is NMT 0.8%.

Packaging and storage Preserve in tight containers.

Astromicin Sulfate
아스트로마이신황산염



$C_{17}H_{35}N_5O_6 \cdot 2H_2SO_4$: 601.65

2-Amino-*N*-[(1*S*,2*R*,3*R*,4*S*,5*S*,6*R*)-4-amino-3-[(2*R*,3*R*,6*S*)-3-amino-6-(1-aminoethyl)oxan-2-yl]oxy-2,5-dihydroxy-6-methoxycyclohexyl]-N-methylacetamide disulfate [*72275-67-3*]

Astromicin Sulfate is the sulfate of aminoglycoside substances having antibacterial activity produced by cultivating *Micromonospora olivasterospora*.

Astromicin Sulfate contains NLT 610 μg and NMT 680 μg (potency) of astromicin ($C_{17}H_{35}N_5O_6$: 405.49) per mg, calculated on the anhydrous basis.

Description Astromicin Sulfate occurs as a white to pale yellowish powder or a mass. It is very soluble in water, sparingly soluble in ethylene glycol, and practically insoluble in methanol or ethanol(99.5).
It is hygroscopic.

Identification (1) To 2 mL of an aqueous solution of Astromicin Sulfate (1 in 100), add 2 to 3 drops of barium chloride TS; a white precipitate develops, and it does not dissolve even when dilute nitric acid is added.

(2) Dissolve 10 mg each of Astromicin Sulfate and astromicin sulfate RS in 10 mL of water. To 5 mL of these solutions, add water to make 100 mL, and use these solutions as the test solution and the standard solution. Take 10 μL each of the test solution and the standard solution, and perform the test as directed under the Liquid Chromatography according to the following conditions; the retention time of the astromycin peak obtained from the test solution is the same as that from the standard solution.

Operating conditions

Perform the test with the detector, column, column temperature, reaction coil, reaction coil temperature, mobile phase, reaction reagents, reaction temperature, mobile phase flow rate, and reaction reagent flow rate, following the operating conditions of the Purity (3).

Optical rotation $[\alpha]_D^{20}$: Between +90° and +110° (0.25

g, calculated on the anhydrous basis, water, 25 mL, 100 mm).

pH Dissolve 1.0 g of Astromicin Sulfate in 10 mL of water; the pH of this solution is between 4.5 and 6.5.

Purity (1) ***Clarity and color of solution*—**Dissolve 1.0 g of Astromicin Sulfate in 10 mL of water; the solution is clear and colorless to pale yellow.

(2) ***Heavy metals*—**Proceed with 1.0 g of Astromicin Sulfate according to Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Related substances*—**Dissolve 0.10 g of Astromicin Sulfate in 100 mL of water, and use this solution as the test solution. Pipet 2 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak area of each solution according to the automatic integration method; the peak areas of the related substances with relative retention times of about 0.1 and about 1.2, relative to the astromycin peak, are not greater than the peak area of the astromycin in the standard solution, and the peak area of the related substance with the relative retention time of about 0.8 is not greater than 2.0 times the peak area of the astromycin in the standard solution. The total area of peaks other than the peak of astromicin is not greater than 3.5 times the peak area of astromicin from the standard solution.

Operating conditions

Detector: A fluorometer (excitation wavelength: 340 nm, fluorescence wavelength: 430 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Reaction coil: A stainless steel column of 0.25 mm in internal diameter and 150 cm in length.

Reaction coil temperature: 50 ℃

Mobile phase: Dissolve 25 mL of sodium 1-heptanesulfonate solution (1 in 1000) and 1 mL of acetic acid(100) in 800 mL of anhydrous sodium sulfate solution (71 in 2000), and add water to make 1000 mL.

Reaction reagents: Dissolve 11.2 g of potassium hydroxide, 0.458 g of polyoxyethylene (23) lauryl ether, 0.300 g of *o*-phthalaldehyde, and 1 mL of 2-mercaptoethanol in 400 mL of boric acid solution (31 in 1000), and add water to make 500 mL.

Reaction temperature: 50 ℃

Mobile phase flow rate: 0.7 mL/min

Reaction reagent flow rate: 0.2 mL/min

System suitability

Test for required detectability: Take 5 mL of the test solution, add water to make 100 mL, and use this solution as the system suitability solution. Pipet 2 mL of this solution, and add water to make exactly 100 mL. Confirm that the peak area of astromicin obtained from 10 μL of this solution is between 1.5% and 2.5% of the peak area of astromicin from the system suitability solution.

System performance: Take 5 mL of the test solution and 2 mL of L-valine solution (1 in 5000), and add 100 mL of water. Proceed with 10 μL of this solution according to the above conditions; L-valine and astromicin are eluted in this order with the resolution being NLT 1.5. Proceed with 10 μL of the system suitability solution according to the above conditions; the symmetry factor for the astromicin peak is NMT 2.0.

System repeatability: Repeat the test 6 times with 10 μL of the system suitability solution according to the above conditions; the relative standard deviation of the peak area of astromicin is NMT 2.0%.

Time span of measurement: About 2 times the retention time of astromicin.

Water NMT 8.0% (0.2 g, volumetric titration, back titration. However, use a mixture of methanol for water determination and ethylene glycol for water determination (1 : 1) instead of methanol for water determination).

Sterility It meets the requirements when used in a sterile preparation. However, it is excluded in cases where there is a final sterilization process in the manufacturing of sterile preparations.

Bacterial endotoxins It is less than 0.50 EU per mg of astromicin (potency) when used in the manufacturing of sterile preparations.

Assay ***Cylinder plate method*** (1) Use *Bacillus subtilis* ATCC 6633 as the test organism.

(2) Medium Agar media for seed and base layer Use the culture medium in A) (2) (A) ① (a) under the Microbial Assays for Antibiotics.

(3) Weigh accurately about 25 mg (potency) of each Astromicin Sulfate, and dissolve in a 0.1 mol/L phosphate buffer solution for antibiotics (pH 8.0) to make exactly 25 mL. Pipet an appropriate amount of this solution, add 0.1 mol/L phosphate buffer solution for antibiotics (pH 8.0), dilute it to contain 4 μg (potency) and 1 μg (potency) per mL, and use these solutions as the high concentration test solution and the low concentration test solution, respectively. Separately, weigh accurately about 25 mg (potency) of astromicin sulfate RS, dissolve in diluted hydrochloric acid (1 in 1000) to make exactly 25 mL, and use this solution as the standard stock solution. Store the standard stock solution at 5 °C to 15 °C, and use it within 30 days. Pipet an appropriate amount of the standard stock solution, add 0.1 mol/L phosphate buffer solution for antibiotics (pH 8.0), dilute to contain 4 μg (potency) and 1 μg (potency) in 1 mL, and use these solu-

tions as the high concentration standard solution and the low concentration standard solution, respectively. With these solutions, perform the test according to A)(8) under the Microbial Assays for Antibiotics.

Packaging and storage Preserve in tight containers.

Astromicin Sulfate for Injection
주사용 아스트로마이신황산염

Astromicin Sulfate for Injection is a preparation for injection which is dissolved before use, and contains NLT 90.0% and NMT 120.0% of the labeled amount of astromicin ($C_{17}H_{35}N_5O_6$: 405.49).

Method of preparation Prepare as directed under Injections, with Astromicin Sulfate.

Description Astromicin Sulfate for Injection occurs as a white to pale yellow powder.

Identification (1) Add 1 mL of ninhydrin TS to 5 mL of aqueous solution of Astromicin Sulfate for Injection (1 in 200), and heat on a steam bath for 5 minutes; the solution exhibits a violet color.

(2) Weigh an appropriate amount of Astromicin Sulfate for Injection, dissolve in water to obtain a solution containing 5 mg (potency) per mL, and use this solution as the test solution. Separately, weigh an appropriate amount of astromicin sulfate RS and dissolve in water to obtain a solution containing 5 mg (potency) per mL, and use this solution as the standard solution. Perform the test with these solutions as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography, develop the plate with the pellet of a mixture of strong ammonia water, methanol and chloroform (1:1:1) as the developing solvent, and air-dry the plate. Spray the plate evenly with an acetone solution of ninhydrin (1 in 500), and heat at 100 ℃ for 10 minutes; the R_f values of the spots obtained from the test solution and the standard solution are the same.

pH Dissolve Astromicin Sulfate for Injection in water to prepare a solution of 0.1 g (potency) / mL; the pH of the solution is between 5.0 and 7.0.

Sterility Meets the requirements.

Bacterial endotoxins Less than 0.50 EU per mg (potency) of astromicin.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Uniformity of dosage units Meets the requirements.

Water NMT 5.0% (0.1 g, volumetric titration, direct titration). However, as the solvent, use a mixture of methanol for water determination and ethylene glycol instead of methanol for water determination.

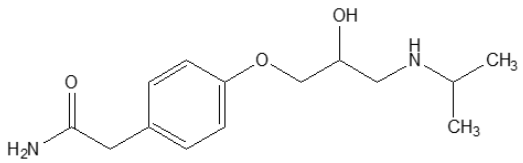
Assay Cylinder plate method (1) Agar media for seed and base layer Use the medium in (A) (1) (a) ① ⓐ under the Microbial Assays for Antibiotics.

(2) ***Test organism***—Use *Bacillus subtilis* ATCC 6633 as the test organism.

(3) Weigh accurately about 0.1 g (potency) according to the labeled potency of Astromicin Sulfate for Injection, dissolve in 0.1 mol/L phosphate buffer (pH 8.0) to prepare a solution containing 1 mg (potency) per mL. Then, pipet an appropriate amount of this solution, dilute with 0.1 mol/L phosphate buffer (pH 8.0) to 4.0 μg and 1.0 μg (potency) per mL, and use these solutions as the high-concentration test solution and the low-concentration test solution, respectively. Separately, weigh accurately about 25 mg (potency) of astromicin sulfate RS, dissolve in diluted hydrochloric acid (1 in 1000) to prepare a standard solution stock solution containing 1 mg (potency) per mL. Keep this standard solution stock solution at 5 °C to 15 °C, and use within 30 days. Pipet an appropriate amount of this standard solution stock solution and dilute with 0.1 mol/L phosphate buffer (pH 8.0) to 4.0 μg and 1.0 μg (potency) per mL, and use these solutions as the high-concentration standard solution and the low-concentration standard solution, respectively. With these solutions, perform the test according to (A) (8) under the Microbial Assays for Antibiotics.

Packaging and storage Preserve in hermetic containers.

Atenolol
아테놀롤



and enantiomer

$C_{14}H_{22}N_2O_3$: 266.34

2-[4-[2-Hydroxy-3-(propan-2-ylamino)propoxy] phenyl]acetamide [*29122-68-7*]

Atenolol, when dried, contains NLT 99.0% and NMT 101.0% of atenolol ($C_{14}H_{22}N_2O_3$).

Description Atenolol occurs as a white to pale yellowish

white crystalline powder.
It is freely soluble in methanol or acetic acid(100), sparingly soluble in ethanol(99.5) and slightly soluble in water.
A solution of Atenolol in methanol (1 in 25) shows no optical rotation.

Identification (1) Determine the absorption spectra of atenolol and atenolol RS in methanol (5 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar maxima and minima of absorption at the same wavelengths.

(2) Determine the infrared spectrum of Atenolol and atenolol RS, previously dried, as directed in the potassium bromide disk method under the mid-infrared absorption spectrophotometry; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Melting point Between 152 and 156 ºC.

Purity (1) ***Chloride*—**Dissolve 1.0 g of Atenolol in 100 mL of 0.15 mol/L nitric acid solution. Use this solution as the test solution. For the control solution, dissolve 1.4 mL of 0.02 mol/L hydrochloric acid TS in 100 mL of 0.15 mol/L nitric acid solution. Add 1 mL of silver nitrate TS to the test solution and control solution and allow to stand for 5 minutes; the turbidity of the test solution is not greater than that of the control solution (NMT 0.1%).

(2) ***Heavy metals*—**Proceed with 1.0 g of Atenolol according to Method 2 under the Heavy Metals and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Related substances*—**Dissolve 50 mg of Atenolol in 25 mL of the mobile phase and use this solution as the test solution. Pipet 1 mL of this solution, add the mobile phase to make exactly 200 mL and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak area of each solution by the automatic integration method; each peak area other than the peak of atenolol from the test solution is not greater than 0.5 times the peak area of atenolol from the standard solution. The total area of the peaks other than the peak of atenolol from the test solution is not greater than the peak area of atenolol from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 226 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: Dissolve 3.4 g of sodium dihydrogen phosphate dihydrate in 1000 mL of water and adjust the pH to 3.0 with phosphoric acid. To 40 mL of this solution, add 9 mL of methanol and 1 mL of tetrahydrofuran. Dissolve 1.0 g of sodium octanesulfonate and 0.4 g of tetrabutylammonium hydrogen sulfate to 1000 mL of this solution.

Flow rate: Adjust the flow rate so that the retention time of atenolol is about 8 minutes.

System suitability

Test for required detectability: Pipet 10 mL of the standard solution and add the mobile phase to make exactly 50 mL. The peak area of atenolol from 10 μL of this solution is between 14% and 26% of the peak area of atenolol from the standard solution.

System performance: Proceed with 10 μL of the standard solution under the above operating conditions; the number of theoretical plates and the symmetry factor of the peak of atenolol are NLT 5000 and NMT 1.5, respectively.

System repeatability: Repeat the test 6 times with 10 μL each of standard solution (1) under the above operating conditions; the relative standard deviation of the peak area of atenolol is NMT 1.0%.

Time span of measurement: About 4 times the retention time of atenolol.

Loss on drying NMT 0.5% (1 g, 105 ℃, 3 hours).

Residue on ignition NMT 0.2% (1 g).

Assay Weigh accurately about 0.1 g each of Atenolol and atenolol RS, previously dried, and dissolve in the mobile phase, respectively to make exactly 100 mL. Pipet 5 mL of each solution, add the mobile phase to make exactly 50 mL, then pipet 5 mL of each solution, add the mobile phase to make exactly 50 mL, and use these solutions as the test solution and the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions and determine the peak areas, A_T and A_S, of atenolol.

$$\text{Amount (mg) of atenolol } (C_{14}H_{22}N_2O_3) = \text{Amount (mg) of atenolol RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 226 nm).

Column: A stainless steel column about 3.9 mm in internal diameter and about 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 to 10 μm in particle diameter).

Mobile phase: Add 1.1g of sodium 1-heptanesulfonate and 0.71 g of anhydrous sodium dihydrogen phosphate to 700 mL of water and dissolve, add 2 mL of dibutylamine, and adjust to pH 3.0 using 0.8 mol/L phosphoric acid. Add 300 mL of methanol and mix well.

Flow rate: 1.7 mL/min

System suitability

System performance: Proceed with 10 μL of the standard solution under the above operating conditions; the number of theoretical plates and the symmetry factor are NLT 5000 and NMT 2.0, respectively.

System repeatability: Repeat the test 6 times with 10 μL of the standard solution according to the above conditions; the relative standard deviation of the peak area is NMT 2.0%

Packaging and storage Preserve in tight containers.

Atenolol Tablets
아테놀롤 정

Atenolol Tablets contain NLT 90.0% and NMT 110.0% of labeled amount of atenolol ($C_{14}H_{22}N_2O_3$: 266.34).

Method of preparation Prepare Atenolol Tablets as directed under Tablets, with Atenolol.

Identification (1) Take an amount of Atenolol Tablets, previously powdered, equivalent to 0.1 g of atenolol, according to the labeled amount, add 15 mL of methanol, mix well and shake for 5 minutes while heating to 50 °C. Filter this solution, evaporate the obtained filtrate to dryness on a steam bath, add 0.1 mol/L hydrochloric acid to the residue, shake while heating, and filter. Add a sufficient amount of 1 mol/L sodium hydroxide TS to the filtrate to make it alkaline, extract with 10 mL of chloroform, remove water from the chloroform layer with anhydrous sodium sulfate, and filter. Evaporate the filtrate to dryness on a steam bath, and dry the residue at 105 °C for 1 hour, and use this as the sample. With the sample and atenolol RS, make them into a fine powder in the same manner, and determine the infrared spectra as directed in the potassium bromide disk method as directed under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) The retention times of the major peaks obtained from the test solution and the standard solution in the Assay are the same.

Dissolution Perform the test with 1 tablet of Atenolol Tablets at 50 revolutions per minute according to Method 2 under the Dissolution, using 900 mL of water as the dissolution medium. Take NLT 20 mL of the dissolved solution after 30 minutes from the start of the dissolution test, and filter through a membrane filter with a pore size of NMT 0.8 μm. Add phosphoric acid solution (1 in 1000) to the filtrate so that each mL contains 10 μg of atenolol ($C_{14}H_{22}N_2O_3$) according to the labeled amount, and use this solution as the test solution. Perform the test with the test solution and the standard solution obtained from the Assay as directed under the Assay, and determine A_T and A_S.

Meets the requirements if the dissolution rate of Atenolol Tablets in 30 minutes is NLT 80%.

Dissolution rate (%) with respect to the labeled amount of atenolol ($C_{14}H_{22}N_2O_3$)

$$= \text{Amount (mg) of atenolol RS} \times 900 \times C \times D \times \frac{A_T}{A_S}$$

C: Concentration (mg/mL) of atenolol in the standard solution

D: Dilution factor of the test solution

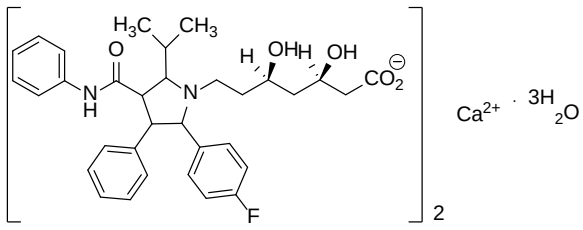
Uniformity of dosage units Meets the requirements.

Assay Weigh accurately NLT 20 tablets of Atenolol Tablets, and powder. Weigh accurately an amount equivalent to about 0.25 g of atenolol ($C_{14}H_{22}N_2O_3$), add the mobile phase, and sonicate for 15 minutes. Make exactly 1000-mL by adding mobile phase, then centrifuge, take exactly 2 mL of the clear supernatant, add the mobile phase to make 50 mL, and use this solution as the test solution. Separately, weigh accurately about 25 mg of atenolol RS and add the mobile phase to make 100 mL. Take exactly 2 mL of this solution, add the mobile phase to make 50 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL each of the test solution and the standard solution as directed under the Assay of Atenolol.

$$\text{Amount (mg) of atenolol } (C_{14}H_{22}N_2O_3) = \text{Amount (mg) of atenolol RS} \times \frac{A_T}{A_S} \times 10$$

Packaging and storage Preserve in tight containers.

Atorvastatin Calcium Hydrate
아토르바스타틴칼슘수화물



$C_{66}H_{68}CaF_2N_4O_{10}\cdot 3H_2O$: 1209.39

Calcium *bis*{(3*R*,5*R*)-7-[2-(4-fluorophenyl)-5-(1-methylethyl)-3-phenyl-4-(phenylcarbamoyl-1*H*-pyrrol-1-yl]-3,5-dihydydroxyheptanoate} trihydrate [*344423-98-9*]

Atorvastatin Calcium Hydrate contains NLT 98.0% and NMT 102.0% of atorvastatin calcium hydrate ($C_{66}H_{68}N_2O_{10}$: 1155.34), calculated on the anhydrous basis.

Description Atorvastatin Calcium Hydrate occurs as a white to pale yellowish crystalline powder.

It is very soluble in methanol, freely soluble in dimethylsulfoxide, and very slightly soluble in water or ethanol(99.5).
It is gradually changed to a yellowish white color by light.
It shows polymorphism.

Identification (1) Determine the absorption spectra of Atorvastatin Calcium Hydrate and atorvastatin calcium hydrate RS in methanol (1 in 62500) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Atorvastatin Calcium Hydrate and avorstatin calcium hydrate RS according to the potassium bromide disk method as directed under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers. If there is a difference between the spectra of Atorvastatin Calcium Hydrate and avorstatin calcium hydrate RS, recrystallize each, filter and dry the crystals, and repeat measurement using these crystals.

(3) Avostatin Calcium Hydrate made into a paste by adding a small amount of dilute hydrochloric acid responds to the Qualitative Analysis 1) for calcium salt. Further, a mixture of Avostatin Calcium Hydrate with methanol and water (7 : 3) (1 in 250) responds to the Qualitative Analysis (3) for calcium salt.

Optical rotation $[\alpha]_D^{25}$: Between -7° and -10° (0.2 g calculated on the anhydrous basis, dimethylsulfoxide, 100 mm).

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Avorstatin Calcium Hydrate and perform the test according to Method 4. Prepare the control solution with 1.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Related substances***—Dissolve 20 mg of Avorstatin Calcium Hydrate in a mixture of acetonitrile and water (1 : 1) to make 20 mL, and use this solution as the test solution. Pipet 1 mL of this solution, add a mixture of water and acetonitrile (1 : 1) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions. Measure the peak area of each solution according to the automatic integration method and determine the amounts of related substances; the area of peaks whose relative retention time compared to atorvastatin in the test solution is about 0.8 is NMT 0.3 times the peak area of atorvastatin from the standard solution. Further, the peak areas of atorvastatin in the test solution and peaks other than those whose relative retention time compared to astorvastatin is 0.8 is NMT 0.1 times the peak area of atorvastatin from the standard solution, and the sum of peak areas other than atorvastatin in the test solution is not greater than the atorvastatin peak area from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silical gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: Control the mixing ratio of mobile phase A and mobile phase B stepwise or via the gradient elution as follows.

Mobile phase A: Weigh 10.5 g of citric acid monohydrate, dissolve in 900 mL of water, adjust the pH to 5.0 with ammonia water(28), and add water to make 1000 mL. Add 100 mL of acetonitrile and 100 mL of tetrahydrofuran to 400 mL of this solution.

Mobile phase B: A mixture of acetonitrile and tetrahydrofuran (1 : 1).

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 - 40	93	7
40 - 80	93 in 60	7 in 40

Flow rate: Adjust the flow rate so that the retention time of atorvastatin is about 16 minutes.

System suitability

Test for required detectability: Take 5 mL of the standard solution and add a mixture of water and acetonitrile (1 : 1) to make exactly 100 mL. Confirm that the peak area of atorvastatin obtained with 20 μL of this solution is equivalent to NLT 3.5% and NMT 6.5% of the peak area of atorvastatin in the standard solution.

System performance: When the procedure is run with 20 μL of the standard solution under the above operating conditions, the number of theoretical plates and symmetry factor of the peak of atorvastatin are NLT 8000 and NMT 1.5, respectively.

System repeatability: Repeat the test 6 times with 20 μL of the standard solution according to the above conditions; the relative standard deviation of the peak area for atorvastatin is NMT 2.0%.

Time span of measurement: About 5 times the retention time of atorvastatin after the solvent peak.

Isomer Weigh 10 mg of Avostatin Calcium Hydrate and dissolve in 2.0 mL of methanol, add 2.0 mL of ethanol(99.5), then add hexane to make exactly 10 mL, and use this solution as the test solution. Perform the test with 20 μL of this solution as directed under the Liquid Chromatography according to the following conditions to determine the amount of atorvastatin enantiomer; it is NMT 0.3%.

$$\text{Content (\%) of Atorvastatin enantiomer} = \frac{A_i}{A_T} \times 100$$

A_i: Peak area of atorvastatin enantiomer

A_T: Sum of peak areas of atorvastatin enantiomer and atorvastatin

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with amylose tris(3,5-dimethylphenylcarbamate)-coated silica gel for liquid chromatography (5 μm to 10 μm in particle diameter).

Mobile phase: A mixture of hexane, ethanol(99.5) and trifluoroacetic acid (940 : 60 : 1).

Flow rate: 1.0 mL/min

System suitability

System performance: Dissolve an appropriate amount of atorvastatin calcium RS and atorvastatin enantiomer RS in methanol to make concentrations of 5 mg/mL and 37.5 μg/mL, respectively. Take 2.0 mL of this solution, add 2.0 mL of ethanol(99.5), add hexane to make exactly 10 mL, and use this solution as the system suitability solution. Proceed with the system suitability solution according to the above conditions; the resolution between the atorvastatin enantiomer and atorvastatin is NLT 2.0.

Water Between 3.5% and 5.5% (50 mg, coulometric titration).

Assay Weigh accurately about 20 mg each of Atorvastatin Calcium Hydrate and atorvastatin RS (previously measure water in the same manner as Atorvastatin Calcium Hydrate), dissolve by adding a mixture of water and acetonitrile (1 : 1), add exactly 10 mL of the internal standard solution, and then add a mixture of water and acetonitrile (1 : 1) to make 50 mL. Use these solutions as the test solution and the standard solution, respectively. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, Q_T and Q_S of the atorvastatin to the peak area of the internal standard.

Amount (mg) of atorvastatin calcium ($C_{66}H_{68}CaF_2N_4O_{10}$)
= Amount (mg) of atorvastatin calcium RS,
calculated on the anhydrous basis $\times \frac{Q_T}{Q_S}$

Internal standard solution—Solution of butyl parahydroxybenzoate in a mixture of acetonitrile and water (1 : 1) (1 in 1500).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: Dissolve 10.5 g of citric acid monohydrate in 900 mL of water, adjust the pH to 4.0 with ammonia water(28), and add water to make 1000 mL. Add 270 mL of acetonitrile and 200 mL of tetrahydrofuran to 530 mL of this solution.

Flow rate: Adjust the flow rate so that the retention time of atorvastatin is about 10 minutes.

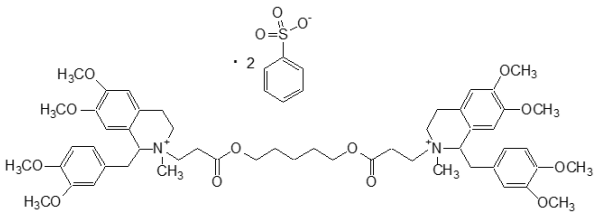
System suitability

System performance: Proceed with 10 μL of the standard solution under the above conditions; the internal standard and atorvastatin are eluted in this order with the resolution being NLT 5.

System repeatability: Repeat the test 6 times with 10 μL of the standard solution under the above conditions; the relative standard deviation of the peak area of atorvastatin to that of the internal standard is NMT 1.0%.

Packaging and storage Preserve in light-resistant, tight containers.

Atracurium Besylate
아트라쿠륨베실산염



$C_{53}H_{72}N_2O_{12}\cdot 2C_6H_5O_3S_2$: 1243.48

2,2'-{1,5-Pentanediyl*bis*[oxy(3-oxo-3,1-propanediyl)]}bis[1-(3,4-dimethoxybenzyl)-6,7-dimethoxy-2-methyl-1,2,3,4-tetrahydroiso-quinolinium] dibenzenesulphonate [*64228-81-5*]

Atracurium Besylate contains NLT 96.0% and NMT 102.0% of atracurium besylate ($C_{53}H_{72}N_2O_{12}\cdot 2C_6H_5O_3S_2$), calculated on the anhydrous basis.

Method of preparation If there is any possibility of alkyl (methyl, ethyl, isopropyl, etc.) benzenesulfonate esters to be included as impurities in the manufacturing process of Atracurium Besylate, precautions must be taken in controlling the starting materials, manufacturing process and intermediates in order to minimize the residue amounts of these impurities in consideration of risk assessment results. If necessary, the manufacturing process may be verified by the test data proving that no quality risk exists in the final drug substance.

Description Atracurium Besylate occurs as a white to yellowish white solid.

It is very soluble in ethanol(95), acetonitrile or dichloromethane and soluble in water.
It is hygroscopic.

Identification (1) Determine the infrared spectra of Atracurium Besylate and atracurium besylate RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) The retention times of the major peaks obtained from the 3 isomers obtained from the test solution of the Assay correspond to the retention times of the respective major peaks from the standard solution.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Atracurium Besylate and perform the test according to Method 2. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Methyl benzene sulfonate***—Weigh accurately 0.10 g of Atracurium Besylate and dissolve in mobile phase A of the Assay to make exactly 10 mL, and use this solution as the test solution. Separately, weigh accurately about 20.0 mg of methyl benezen sulfonate RS and dissolve in the acetonitrile to make exactly 100 mL. Pipet 1.0 mL of this solution, add the mobile phase A to make exactly 200 mL, and the use this solution as the standard solution. Perform the test with 100 μL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions. The peak area of methyl benzene sulfonate from the test solution is not larger than the peak area from the standard solution (0.01%).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 217 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with base-deactivated octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: Control the mixing ratio of mobile phase A and mobile phase B stepwise or via the gradient elution as follows.

Mobile phase A and mobile phase B: Follow the conditions as directed under the Assay.

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0	80	20
0 - 5	80	20
5 - 15	80 → 75	20 → 25
15 - 25	75	25
25 - 30	75 → 55	25 → 45
30 - 38	55 → 0	45 → 100
38 - 45	0	100

Flow rate: 1.0 mL/min

System suitability

System performance: Take 1 mL of test solution and 5 mL of 0.02% acetonitrile solution of methyl benzene sulfonate, and add the mobile phase A to make 100 mL. Proceed with this solution according to the above conditions; the resolution between the trans-trans isomer peaks and the methyl benzene sulfonate peaks is NLT 12.0.

System repeatability: Repeat the test 2 times according to the above conditions with the standard solution; the relative standard deviation of the peak area is NMT 12%.

(3) ***Toluene substances***—Weigh accurately about 0.20 g of Atracurium Besylate, dissolve in acetonitrile to make exactly 10 mL, and use this solution as the test solution. Separately, weigh accurately about 0.1 g of toluene RS, dissolve in acetonitrile to make exactly 100 mL, then add acetonitrile to 5.0 mL of this solution to make exactly 50 mL, and use this solution as the standard solution. Perform the test with 1 μL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions. The peak area of toluene from the test solution is not larger than the toluene peak area from the standard solution (NMT 0.5%).

Operating conditions

Detector: A flame ionization detector

Column: A stainless steel column about 0.25 mm in internal diameter and about 30 cm in length, packed with 5% phenylmethylsilicone polymer for gas chromatography (0.25 μm in particle diameter).

Column temperature: Inject the sample, hold for 5 minutes at 30 ℃, then heat at a rate of 8 ℃ per minute to 175 ℃. Then heat to 260 ℃ at a rate of 35 ℃ per minute, and hold for NLT 5 minutes at 260 ℃.

Sample injection port temperature: A constant temperature of about 200 ℃.

Detector temperature: A constant temperature of about 260 ℃.

Carrier gas: Helium

Flow rate: 1.0 mL/sec

System suitability

System performance: Weigh accurately 1-butanol, toluene, methanol and 1-propanol, and dissolve in acetonitrile to make 12.0, 7.6, 1.6 and 1.2 μg per mL, respectively. Proceed with 1 μL of this solution according to the above operating conditions; the resolution between the peaks of the two components is NLT 1.0.

System reproducibility: Weigh accurately 1-butanol, toluene, methanol and 1-propanol, and dissolve in acetonitrile to make 12.0, 7.6, 1.6 and 1.2 μg per mL, respectively. Repeat the test with 1 μL each of these solutions according to the above conditions; the relative standard deviation of the peak areas is NMT 15%.

(4) ***Related substances***—Use the test solution in the Assay as the test solution. Add the mobile phase A of

Assay to 1.0 mL of the standard solution of Assay to make exactly 100 mL, and use this solution as the standard solution. Take 20 μL each of the test solution and the standard solution, perform the test as directed under the Liquid Chromatography according to the conditions in Assay, and measure the peak areas other than the three major peaks to calculate the amount of each related substance according to the following equation; the amount of laudonasine having the relative retention time of about 0.3 is NMT 0.5%, the amount of other individual related substances is NMT 1.0%, and the amount of total related substances is NMT 3.5%. However, the peak area for laudanosine is obtained by dividing the calculated area by the sensitivity coefficient of 1.9.

$$\text{Content (\%) of each related substance} = 10000 \times \frac{C}{W} \times \frac{A_T}{A_S}$$

A_i: Peak area of each related substance obtained from the test solution

A_S: Peak area of cis-cis isomer obtained from the standard solution

C: Concentration of cis-cis isomer in the standard solution (mg/mL)

W: Weight (mg) of sample taken

System suitability

Repeat the test 2 times with 20 μL each of the standard solution under the conditions of Assay; the relative standard deviation of the peak area of cis-cis isomer is NMT 10%.

Water NMT 5.0% (1 g, volumetric titration, direct titration).

Residue on ignition NMT 0.2% (1 g).

Assay Weigh accurately about 0.1 g each of Atracurium Besylate and atracurium besylate RS, dissolve in mobile phase A to make exactly 100 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the total areas, A_T and A_S for the three isomer peaks.

$$\text{Amount (mg) of atracurium besylate } (C_{53}H_{72}N_2O_{12}\cdot 2C_6H_5O_3S_2) = \text{Amount (mg) of atracurium besylate RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 280 nm).

Column: A stainless tube about 4.6 mm in internal diameter and about 25 cm in length, packed with base-deactivated octadecylsilanized silica gel for liquid chromatography (3 to 10 μm in particle diameter).

Mobile phase: Control the mixing ratio of mobile phase A and mobile phase B stepwise or via the gradient elution as follows.

Mobile phase A: Mixture of buffer solution, acetonitrile and methanol (75 : 20 : 5).

Mobile phase B: Mixture of buffer solution, methanol and acetonitrile (50 : 30 : 20).

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0	80	20
0 - 5	80	20
5 - 15	80 in 40	20 in 60
15 - 25	40	60
25 - 30	40 in 0	60 in 100

Flow rate: 1.0 mL/min

System suitability

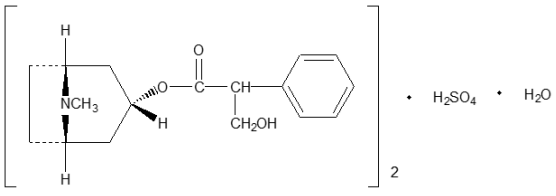
System performance: Perform the test with the standard solution according to the above conditions; the relative retention times for the trans-trans, cis-trans and cis-cis isomer peaks are about 0.8, about 0.9 and 1.0, respectively, and the resolution of the trans-trans isomer peak and cis-trans isomer peak and the resolution of the cis-trans isomer peak and the cis-cis isomer peak are NLT 1.1.

System repeatability: Repeat the test 5 times according to the above conditions with the standard solution; the relative standard deviation of the peaks areas of the isomers is NMT 2.0%.

Buffer solution—Weigh 10.2 g of potassium dihydrogen phosphate, dissolve in 950 mL of water, adjust the pH to 3.1 with phosphoric acid, and add water to make exactly 1000 mL.

Packaging and storage Preserve in light-resistant, tight containers. Preserve in a cold place.

Atropine Sulfate Hydrate
아트로핀황산염수화물



Atropine Sulfate $(C_{17}H_{23}NO_3)_2\cdot H_2SO_4\cdot H_2O$: 694.83

bis[(8-Methyl-8-azabicyclo[3.2.1]oct-3-yl) 3-hydroxy-2-phenylpropanoate] sulfate monohydrate [*5908-99-6*]

Atropine Sulfate Hydrate contains NLT 98.0% and NMT 101.0% of atropine sulfate ($C_{17}H_{23}NO_3\cdot H_3PO_2$),

calculated on the anhydrous basis.

Description Atropine Sulfate Hydrate occurs as a colorless or white, odorless crystalline powder.
It is very soluble in water or acetic acid(100), freely soluble in ethanol(95) and practically insoluble in ether.

Melting point—Dry at between 188 and 194 ℃ (with decomposition), and heat at a rate of about 3 ℃ per minute from 180 ℃.
It is affected by light.

Identification (1) Add 3 drops of fuming nitric acid to 1 mg of Atropine Sulfate Hydrate, evaporate it to dryness on a steam bath, dissolve the residue in 1 mL of *N*,*N*-dimethyl formamide, and add 5 to 6 drops of tetraethylammonium hydroxide TS; the resulting solution exhibits a purple color.

(2) Add 4 to 5 drops of hexchloroplatinic(IV) acid TS to 2 mL of aqueous solution of Atropine Sulfate Hydrate (1 in 50); a non-glossy yellowish white precipitate is formed.

(3) Add 2 mL of ammonia TS to 5 mL of aqueous solution of Atropine Sulfate Hydrate (1 in 25), allow to stand for 2 to 3 minutes, then filter the precipitated crystals, wash it with water, and dry for 4 hours in a desiccator (in vacuum, silica gel); the melting point is 115 ℃ - 118 ℃.

(4) An aqueous solution of Atropine Sulfate Hydrate (1 in 20) responds to the Qualitative Analysis for sulfate.

Optical rotation $[\alpha]_D^{25}$: Between -0.60 and +0.05° (1 g, water, 20 mL).

Purity (1) ***Clarity and color of solution***—Dissolve 0.5 g of Atropine Sulfate Hydrate in 10 mL of water; the solution is clear and colorless.

(2) ***Sulfate***—Dissolve 1.0 g of Atropine Sulfate Hydrate in 20 mL of water, add 0.30 mL of 0.02 mol/L sodium hydroxide TS and 1 drop of methyl red - methylene blue TS; the color of the solution is green.

(3) ***Related substances***—Dissolve 0.25 g of Atropine Sulfate Hydrate in 1 mL of diluted hydrochloric acid (1 in 10), then add water to make 15 mL and use this solution as the test solution.

(i) Add 2 to 3 drops of hexachloroplatinic(IV) acid TS to 5 mL of the test solution; no precipitate forms.

(ii) Add 2mL of ammonia TS to 5 mL of the test solution and shake vigorously; the resulting solution is not more turbid than the following control solution.

Control solution—Add 6 mL of dilute nitric acid and water to 0.30 mL of 0.01 mol/L hydrochloric acid to make 50 mL, then add 1 mL of silver nitrate TS; take 7mL of the resulting solution and allow to stand for 5 minutes.

(4) **Hyoscyamine**—Weigh accurately about 1 g of Atropine Sulfate Hydrate, previously dried, and dissolve in water to make exactly 10 mL. Measure the optical rotation at the layer length of 100 mm with this solution; $[\alpha]_D^{20}$ is between -0.60° and + 0.10°.

(5) ***Readily carbonizable substances***—Proceed with 0.20 g of Atropine Sulfate Hydrate and perform the test. The color of this solution is not more intense than that of the Matching Fluid for Color A.

Water Between 2.0% and 4.0% (0.5 g, volumetric titration, direct titration).

Residue on ignition NMT 0.1% (0.5 g).

Assay Weigh accurately about 0.25 g of Atropine Sulfate Hydrate, add 30 mL of acetic acid(100), dissolve by heating, if necessary, and titrate with 0.05 mol/L perchloric acid VS (indicator: 3 drops of methylrosaniline chloride TS) The endpoint of the titration is when the violet color of this solution turns to blue and then finally to bluish green. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.05 mol/L perchloric acid VS
= 33.841 mg of $(C_{17}H_{23}NO_3)_2 \cdot H_2SO_4$

Packaging and storage Preserve in light-resistant, tight containers.

Atropine Sulfate Injection
아트로핀황산염 주사액

Atropine Sulfate Injection is a water-based injection and contains NLT 93.0% and NMT 107.0% of the labeled amount of atropine sulfate hydrate [$(C_{17}H_{23}NO_3)_2 \cdot H_2SO_4 \cdot H_2O$: 694.83].

Method of preparation Prepare as directed under Injections, with Atropine Sulfate Hydrate.

Description Atropine Sulfate Injection occurs as a clear, colorless liquid.

pH—Between 4.0 and 6.0.

Identification (1) Take an amount of Atropine Sulfate Injection equivalent to 1 mg of atropine sulfate hydrate according to the labeled amount, evaporate it to dryness on a steam bath, and perform the test as directed under the Identification (1) of Atropine Sulfate Hydrate.

(2) Pipet an amount of Atropine Sulfate Injection equivalent to 5 mg of atropine sulfate hydrate according to the labeled amount, evaporate to it dryness on a steam bath, cool, dissolve the residue in 1 mL of ethanol(95) and use this solution as the test solution. If insoluble solids remain, pulverize the residue and allow to stand, and use the clear supernatant as the test solution. Separately, weigh 10 mg of atropine sulfate hydrate RS, dissolve in 2 mL of ethanol(95), and use this solution as the standard

solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of acetone, water and ammonia water(28) (90 : 7 : 3) as the developing solvent to a distance of about 10 cm, and dry the plate at 80 °C for 10 minutes. After cooling, spray evenly Dragendorff TS for spraying; the spots from the test solution and the standard solution exhibit an orange color, and have the same R_f value.

(3) Atropine Sulfate Injection responds to the Qualitative Analysis for sulfate.

Sterility Meets the requirements.

Bacterial endotoxins Less than 75 EU per mg of atropine sulfate hydrate.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Extractable volume of injections Meets the requirements.

Assay Pipet an amount of Atropine Sulfate Injection equivalent to about 5 mg of atropine sulfate hydrate $[(C_{17}H_{23}NO_3)_2{\cdot}H_2SO_4{\cdot}H_2O]$, add exactly 3 mL of the internal standard solution, then add water to make 50 mL, and use this solution as the test solution. Separately, weigh accurately about 25 mg of atropine sulfate RS (measure loss on drying beforehand according to the same conditions as for atropine sulfate) and dissolve in water to make exactly 50 mL. Pipet 10 mL of this solution, add 3 mL of the internal standard solution, add water to make exactly 50 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the peak area ratios, Q_T and Q_S, of atropine to that of the internal standard, respectively.

Amount (mg) of atropine sulfate hydrate $[(C_{17}H_{23}NO_3)_2{\cdot}H_2SO_4{\cdot}H_2O]$ = Amount (mg) of atropine sulfate RS, calculated on the dried basis $\times \frac{Q_T}{Q_S} \times \frac{1}{5} \times 1.0266$

Internal standard solution—Etilefrine hydrochloride solution (1 in 1000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 210 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: Dissolve 0.4 g of sodium lauryl sulfate in 500 mL of diluted phosphoric acid (1 in 1000), and adjust pH to 3.0 using sodium hydroxide TS.

Flow rate: Adjust the flow rate so that the retention time of atropine is about 16 minutes.

System suitability

System performance: Proceed with 20 μL of the standard solution according to the above conditions; the internal standard and atropine are eluted in this order with the resolution being NLT 3.

System repeatability: Repeat the test 6 times with 20 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area ratio of atropine to the internal standard is NMT 1.5%.

Packaging and storage Preserve in light-resistant, hermetic containers.

Atropine Sulfate Tablets
아트로핀황산염 정

Atropine Sulfate Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of atropine sulfate hydrate $[(C_{17}H_{23}NO_3)_2{\cdot}H_2SO_4{\cdot}H_2O$: 694.83].

Method of preparation Prepare Atropine Sulfate Tablets as directed under Tablets, with Atropine Sulfate Hydrate.

Identification (1) Weigh an amount of Atropine Sulfate Tablets, previously powdered, equivalent to 1 mg of atropine sulfate hydrate, according to the labeled amount, add 1 drop of ammonia water(28) and 2 mL of chloroform and mix. Take the chloroform layer separately and evaporate the chloroform on a steam bath. With the residue, perform the test as directed under the Identification (1) of Atropine Sulfate Hydrate.

(2) Weigh an amount of Atropine Sulfate Tablets, previously powdered, equivalent to 5 mg of atropine sulfate hydrate, according to the labeled amount, add 5 mL of ethanol(95), shake to mix, filter using a glass filter, and use the filtrate as the test solution. Separately, weigh 50 mg of atropine sulfate hydrate RS, dissolve in ethanol(95) to make 10 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 50 μL of the test solution and 10 μL of the standard solution on a plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of chloroform and diethylamine (9 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Spray hexachloroplatinic(IV) acid-potassium iodide TS evenly

on the plate; the spots obtained from the test solution and the standard solution exhibit a violet color and their R_f values are the same.

(3) Atropine Sulfate Tablets responds to the Qualitative Analysis for sulfate.

Disintegration Meets the requirements. However, the time span of test is 15 minutes.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 tablets of Azathioprine Tablets, and powder. Weigh accurately an amount equivalent to about 1.0 mg of atropine sulfate hydrate [$(C_{17}H_{23}NO_3)_2 \cdot H_2SO_4 \cdot H_2O$], put it into a separatory funnel containing 5 mL of buffer solution, pH 9.0, and add 2.0 mL of internal standard solution. Add 1 mol/L sodium hydroxide TS to adjust the pH to 9.0, and extract twice with 10 mL each of dichloromethane. Filter the dichloromethane layer through 1 g of anhydrous sodium sulfate on a pledget of absorbent cotton, evaporate the filtrate with the aid of nitrogen current to dryness, dissolve the residue in 2.0 mL of dichloromethane and use this solution as the test solution. Separately, weigh accurately about 10 mg of Atropine Sulfate Hydrate RS, previously dried at 120 ºC for 4 hours and dissolve in water to make exactly 100 mL. Prepare this solution before use. Transfer exact 10 mL of this solution to a separator, add 2.0 mL of the internal standard solution and 5.0 mL of a pH 9.0 buffer solution and adjust to a pH of 9.0 with 1 mol/L sodium hydroxide. Extract with two 10 mL volumes of dichloromethane, filter the extracts through 1 g of anhydrous sodium sulfate on a pledget of absorbent cotton, evaporate the filtrate with the aid of nitrogen current to dryness, dissolve the residue in 2.0 mL of dichloromethane and use this solution as the standard solution. Perform the test with 1 µL each of the test and the standard solution as directed under Gas Chromatography according to the following conditions and calculate the ratios, Q_T and Q_S, of the peak area of atropine sulfate to that of the internal standard for the test solution and the standard solution, respectively.

$$\text{Amount (mg) of atropine sulfate hydrate } [(C_{17}H_{23}NO_3)_2 \cdot H_2SO_4 \cdot H_2O = \frac{W}{10} \times \frac{Q_T}{Q_S} \times 1.0266$$

W: Amount (mg) of RS, calculated on the dried basis

Internal standard solution—Homatropine hydrobromide solution (5 in 10000); prepare this solution before use.

Operating conditions

Detector: A hydrogen flame ionization detector

Column: A column about 2 mm in internal diameter and about 1.8 m in length, packed with diatomaceous earth for gas chromatography, coated at a rate of 3% with 50% phenyl and 50% methylpolysiloxane.

Column temperature: 225 °C

Carrier gas: Nitrogen

Flow rate: 25 mL/min

System suitability

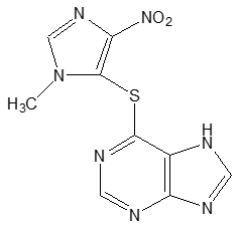
System performance: When the procedure is run with 1 µL of the standard solution under the above operating conditions with the resolution. being NLT 4.0 and with the symmetry factor being NMT 2.0.

System repeatability: Repeat the test 6 times with 1 µL each of the standard solution according to the above conditions; the relative standard deviation of the peak area ratio is NMT 2.0%.

pH 9.0 Phosphate buffer solution—Dissolve 34.8 g of dibasic potassium phosphate in 900 mL of water, and add 3 mol/L hydrochloric acid TS or 1 mol/L sodium hydroxide TS to adjust the pH to 9.0.

Packaging and storage Preserve in light-resistant, tight containers.

Azathioprine
아자티오프린



$C_9H_7N_7O_2S$: 277.26

6-[(1-methyl-4-nitro-1*H*-imidazol-5-yl)sulfanyl]-7*H*-purine [*446-86-6*]

Azathioprine, when dried, contains NLT 98.5% and NMT 101.0% of azathioprine ($C_9H_7N_7O_2S$).

Description Azathioprine occurs as pale yellow crystals or a crystalline powder. It is odorless.

It is sparingly soluble in *N*,*N*-dimethylformamide and pyridine, very slightly soluble in water and ethanol(99.5), and practically insoluble in chloroform and ether.

It dissolves in sodium hydroxide TS or ammonia TS.

It is gradually colored by light.

Melting point—About 240 °C (with decomposition).

Identification (1) Add 50 mL of water to 10 mg of Azathioprine, and dissolve by warming. To 5 mL of this solution, add 1 mL of dilute hydrochloric acid and 10 mg of zinc powder, and allow to stand for 5 minutes; the resulting solution exhibits a yellow color. Filter this solution; the filtrate responds to the Qualitative Analysis for primary aromatic amines. However, the solution exhibits a red color.

(2) Add 50 mL of water to 10 mg of Azathioprine, and dissolve by warming. To 1 mL of this solution, add 0.5 mL of phosphotungstic acid TS and 0.5 mL of dilute hydrochloric acid; a white precipitate forms.

(3) Prepare the test solution by proceeding with 30 mg of Azathioprine as directed under the Oxygen Flask Combustion, using 20 mL of water as the absorbent. The test solution responds to the Qualitative Analysis (1) for sulfate.

(4) Dissolve 10 mg of Azathioprine in 2 mol/L hydrochloric acid TS to make 100 mL. To 5 mL of this solution, add water to make 50 mL, and determine the absorption spectrum of the resulting solution as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum between 278 nm and 282 nm.

Purity (1) ***Clarity and color of solution***—Dissolve 0.5 g of Azathioprine in 50 mL of *N*,*N*-dimethylformamide; the solution shows a pale yellow color and is clear.

(2) ***Acid or alkali***—Add 100 mL of water to 2.0 g of Azathioprine, shake well to mix for 15 minutes, centrifuge for 5 minutes at 10,000 revolutions per minute, and filter. Discard the first 20 mL of the filtrate, add 2 drops of methyl red TS to 40 mL of the subsequent filtrate, and use this solution as the test solution (i) To 20 mL of the test solution, add 0.10 mL of 0.02 mol/L hydrochloric acid; the solution exhibits a red color.

(ii) To 20 mL of the test solution, add 0.10 mL of 0.02 mol/L sodium hydroxide; the solution exhibits a yellow color.

(3) ***Sulfate***—To 25 mL of the filtrate obtained in (2), add 1 mL of dilute hydrochloric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 0.40 mL of 0.005 mol/L sulfuric acid (NMT 0.038%).

(4) ***Heavy metals***—Proceed with 2.0 g of Azathioprine according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(5) ***Arsenic***—Prepare the test solution with 1.0 g of Azathioprine according to Method 3 and perform the test (NMT 2 ppm).

(6) ***Related substances***—Add 80 mL of the mobile phase to 10 mg of Azathioprine, dissolve by warming, cool, add the mobile phase to make 100 mL, and use this solution as the test solution. Pipet 1 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak area of each solution by the automatic integration method; the sum of pear areas other than azathioprine from the test solution is not larger than 1/2 of the peak area of azathioprine from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 296 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: Adjust the pH of 0.05 mol/L potassium dihydrogen phosphate TS (1 in 2) to 2.5 with diluted phosphoric acid (3 in 2000). Add 200 mL of methanol to 800 mL of this solution.

Flow rate: Adjust the flow rate so that the retention time of azathioprine is about 8 minutes.

System suitability

Detection sensitivity: Pipet 5 mL of the standard solution and add water to make exactly 50 mL. Adjust the detection sensitivity so that the peak area of azathioprine obtained from 20 μL of this solution is 8 to 12% of the peak area of azathioprine obtained from the standard solution.

System performance: Dissolve 0.010 g of Azathioprine in 80 mL of water by warming, cool, and add water to make 100 mL. To 2 mL of this solution, add 2 mL of a solution, separately prepared by dissolving 60 mg of benzoic acid in 3 mL of methanol and diluting with water to make 10 mL, and add the mobile phase to make 25 mL. Proceed with 20 μL of this solution under the above operating conditions; azathioprine and benzoic acid are eluted in this order with the resolution being NLT 9.

System repeatability: Repeat the test 6 times with 20 μL each of the standard solution according to the above operating conditions; the relative standard deviation of the peak area of azathioprine is NMT 2.0%.

Time span of measurement: About 3 times the retention time of azathioprine after the solvent peak.

Loss on drying NMT 0.5% (1 g, 105 °C, 5 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.5 g of Azathioprine, previously dried, add 80 mL of *N*,*N*-dimethylformamide, and dissolve by warming. After cooling, titrate with 0.1 mol/L tetramethylammonium hydroxide VS (indicator: 1 mL of thymol blue-dimethylformamide TS). The endpoint of the titration is when the color of the solution changes from yellow through yellowish green to bluish green. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L tetramethylammonium hydroxide VS
= 27.726 mg of $C_9H_7N_7O_2S$

Packaging and storage Preserve in light-resistant, well-closed containers.

Azathioprine Tablets
아자티오프린 정

Azathioprine Tablets contain NMT 95.0% and NLT 105.0% of the labeled amount of azathioprine ($C_9H_7N_7O_2S$: 277.26).

Method of preparation Prepare Azathioprine Tablets as directed under Tablets, with Azathioprine.

Identification (1) Weigh an amount of Azathioprine Tablets, previously powdered, equivalent to 10 mg of azathioprine, according to the labeled amount, add 50 mL of water, and warm. Shake well to mix, and filter. Perform the test with 5 mL of the filtrate as directed under the Identification (1) of Azathioprine.

(2) With 1 mL of the filtrate from (1), perform the test as directed under the Identification (2) of Azathioprine.

(3) Determine the absorption spectrum of the test solution obtained from the Assay as directed under Ultraviolet-visible Spectroscopy: it exhibits a maximum between 278 nm and 282 nm.

(4) Weigh an amount of Azathioprine Tablets, previously powdered, equivalent to 0.1 g of azathioprine, according to the labeled amount, add 10 mL of ammonia water(28) in methanol (1 in 10). Shake well to mix, filter, and use the filtrate as the test solution. Separately, dissolve 0.1 g of azathioprine RS in 10 mL of ammonia water(28) in methanol (1 in 10), and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of chloroform, ammonia water(28) in methanol (1 in 10), *n*-butyl formate and 1,2-dichloroethane (15 : 10 : 5 : 2) as the developing solvent to a distance of about 15 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the R_f values of the spots obtained from the test solution and the standard solution are the same.

Disintegration Meets the requirements.

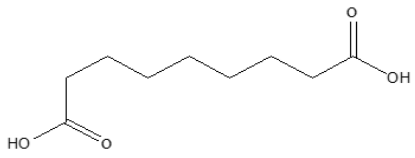
Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 tablets of Azathioprine Tablets, and powder. Weigh accurately an amount equivalent to about 0.1 g of azathioprine ($C_9H_7N_7O_2S$), add 20 mL of dimethylsulfoxide, shake well to mix, add 0.1 mol/L hydrochloric acid TS to make exactly 500 mL, and filter. Discard the first 20 mL of the filtrate, pipet 3 mL of the subsequent filtrate, add 0.1 mol/L hydrochloric acid TS to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 0.1 g of azathioprine RS, previously dried at 105 ℃ for 5 hours, dissolve in 20 mL of dimethylsulfoxide, and add 0.1 mol/L hydrochloric acid TS to make exactly 500 mL. Pipet 3 mL of this solution, add 0.1 mol/L hydrochloric acid TS to make exactly 100 mL, and use this solution as the standard solution. Perform the test with the test solution and standard solution as directed under the Ultraviolet-visible Spectroscopy and determine the absorbances, A_T and A_S, of each solution at the wavelength of 280 nm as directed under the Ultraviolet-visible Spectroscopy.

$$\text{Amount (mg) of azathioprine } (C_9H_7N_7O_2S) = \text{Amount (mg) of azathioprine RS} \times \frac{A_T}{A_S}$$

Packaging and storage Preserve in light-resistant, tight containers.

Azelaic Acid
아젤라산



$C_9H_{16}O_4$: 188.22

Nonanedioic acid, [*123-99-9*]

Azelaic Acid contains NLT 98.0% and NMT 102.0% of azelaic acid ($C_9H_{16}O_4$), calculated on the anhydrous basis.

Description Azelaic Acid occurs as a white crystalline powder.
It is freely soluble in ethanol(95), methanol and hot water.

Identification Determine the absorption spectra of Azelaic Acid and azelaic acid RS as directed in the paste method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Melting point Between 105 and 110 ℃.

Purity (1) ***Clarity and color of solution*—**Dissolve 5.0 g of Azelaic Acid in 25 mL of a mixture of tetrahydrofuran and methanol (7 : 3); the solution is colorless and clear.

(2) ***Heavy metals*—**Proceed with 1.0 g of Azelaic Acid as directed under Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Related substances*—**Weigh 0.5 g of Azelaic Acid and place in a 50-mL round bottom flask, add 5 mL of toluene and 5.0 mL of boron trifluoride and methanol complex, and chill with a reflux condenser for 5 minutes.

Next, wash the inner wall of the condenser using 5.0 mL of toluene, add 5.0 mL of saturated sodium chloride solution, and shake vigorously to mix. Perform the test with 1 μL of the organic solvent layer as directed under the Gas Chromatography according to the following conditions, and determine each peak area by the automatic integration method; the respective related substances to the total peak area are NMT 2.0%.

Operating conditions

Detector: A flame ionization detector

Column: A glass column about 2 mm in internal diameter and about 1.2 m in length, packed with 125 μm to 149 μm diatomaceous earth for gas chromatography coated at 1% with 33% phenylmethylsilicone polymer.

Column temperature: Between 100 and 210 ℃.

Heating rate: 10 ℃/min.

Carrier gas: Nitrogen

(4) ***Acetone*—**Weigh 5.0 g of Azelaic Acid, add 5.0 mL of internal standard solution, then add dimethylformamide to make 100 mL, and use this solution as the test solution. Separately, weigh accurately 0.2 g of acetone, and add dimethylformamide to make 50 mL. Pipet 5.0 mL of this solution, add 5.0 mL of the internal standard solution, then add dimethylformamide to make 100 mL, and use this solution as the standard solution. Perform the test with 1 μL each of the test solution and the standard solution as directed under the Gas Chromatography according to the following conditions. Determine the peak area ratios, Q_T and Q_S of acetone to the peak area of the internal standard for each solution; these are NMT 0.5%.

Amount (mg) of acetone in sample
= Amount (mg) of acetone RS × (Q_T / Q_S) × (1 / 10)

Internal standard solution—Solution of dimethylformamide in ethyl benzene (1 in 10000).

Operating conditions

Detector: A flame ionization detector

Column: A glass column about 4 mm in internal diameter and about 1.9 m in length, packed with 80 to 100 mesh diatomaceous earth for gas chromatography coated at 10% with polyethylene glycol 1500.

Column temperature: 85 ℃

Carrier gas: Nitrogen

Flow rate: 45 mL/min

Selection of column: Proceed with 1 μL of the standard solution according to the above conditions; acetone and ethyl benzene are eluted in this order and the peaks are completely separated.

Water NMT 0.5% (1 g, volumetric titration, direct titration).

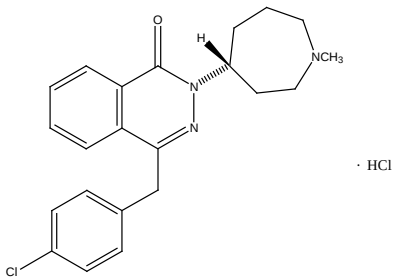
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 1 g of Azelaic Acid, and add 50 mL of a mixture of water and methanol (1 : 1), and dissolve by warming for 5 minutes on a steam bath. Cool and titrate with 0.5 mol/L potassium hydroxide-ethanol VS. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.5 mol/L potassium hydroxide-ethanol VS
= 47.06 mg of $C_9H_{16}O_4$

Packaging and storage Preserve in light-resistant, tight containers.

Azelastine Hydrochloride
아젤라스틴염산염



and enantiomer

Azelastine HCl $C_{22}H_{24}ClN_3O \cdot HCl$: 418.36

4-[(4-Chlorophenyl)methyl]-2-(1-methylazepan-4-yl)phthalazin-1-one hydrochloride [*79307-93-0*]

Azelastine Hydrochloride contains NLT 98.5% and NMT 101.0% of azelastine hydrochloride ($C_{22}H_{24}ClN_3O \cdot HCl$), calculated on the dried basis.

Description Azelastine Hydrochloride occurs as a white crystalline powder.

It is soluble in ethanol(99.5), slightly soluble in water and practically insoluble in ether, *n*-hexane or toluene.

Identification (1) Determine the infrared spectra of Azelastine Hydrochloride and azelastine hydrochloride RS as directed in the potassium chloride disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) A solution of Azelastine Hydrochloride (1 in 50) responds to the Qualitative Analysis (2) for chloride.

Optical rotation $[\alpha]_D^{20}$: Between -0.05 and +0.05° (after drying, 1.0 g, dichloromethane, 20 mL, 100 mm).

Purity (1) ***Acidity and alkali*—**Add 0.2 mL of bromothymol blue TS to 10 mL of aqueous solution of Azelastine Hydrochloride (1 in 100), and then add 0.1 mol/L hydrochloric acid or 0.1 mol/L sodium hydroxide; the solution does not change in color.

(2) ***Heavy metals*—**Proceed with 1.0 g of Azelastine Hydrochloride according to Method 2 and perform the

test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Arsenic*—**Proceed with 1.0 g of Azelastine Hydrochloride according to Method 3 and perform the test (NMT 2 ppm).

(4) ***1-methyl-4-(2-benzoylhydrazino)azepan*—** Weigh accurately 0.1 g of Azelastine Hydrochloride, dissolve in 12 mL of methanol, and add water to make exactly 20 mL. Use this solution as the test solution. Separately, weigh accurately 5.0 mg of 1-methyl-4-(2-benzoylhydrazino) azepan RS, dissolve in 60% methanol to make exactly 100 mL, then add 60% methanol to 5.0 mL of the solution to make exactly 50 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. The area of the peak for 1-methyl-4-(2-benzoylhydrazino)azepan from the test solution is not greater than the major peak area from the standard solution (NMT 0.1%).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 μm in particle diameter).

Mobile phase: Dissolve sodium octanesulfonate in a mixture of methanol, water and acetic acid(100) (60 : 40 : 1) to make 0.02 mol/L.

Flow rate: 1.5 mL/min

(5) ***Related substances*—**Weigh 50 mg of Azelastine Hydrochloride, dissolve exactly in 100 mL of the mobile phase, and use this solution as the test solution. Pipet 1 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak area of each solution by the automatic integration method; each peak area other than the peak of azelastine from the test solution is not greater than 1/10 of the peak area of azelastine from the standard solution. Additionally, the sum of the peaks other than the peak of azelastine in the test solution is not greater than 1/2 of the peak area of azelastine from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 240 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 35 °C.

Mobile phase: A mixture of water, acetonitrile and perchloric acid (660 : 340 : 1).

Flow rate: Adjust the flow rate so that the retention time of azelastine is about 10 minutes.

System suitability

Test for required detectability: Pipet 5 mL of the standard solution, add the mobile phase to make exactly 50 mL, and use this solution as the system suitability solution. Confirm that the peak area of azelastine obtained from 20 μL of this solution is within the range between 7% and 13% of the peak area of azelastine in the standard solution.

System performance: Proceed with 20 μL of the standard solution under the above operating conditions; the number of theoretical plates and symmetry factor of the peak of azelastine are NLT 5000 and NMT 1.5, respectively.

System repeatability: Repeat the test 6 times with 20 μL each of the standard solutions; the relative standard deviation of the peak area of azelastine is NMT 1.0%.

Loss on drying NMT 1.0% (1 g, 105 ℃, constant mass).

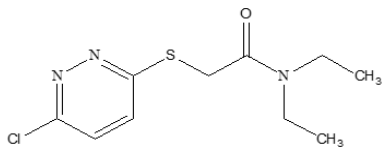
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.3 g of Azelastine Hydrochloride, dissolve in 5 mL of anhydrous formic acid, add 30 mL of acetic anhydride and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 41.84 mg of $C_{22}H_{24}ClN_3O \cdot HCl$

Packaging and storage Preserve in light-resistant, tight containers.

Azintamide
아진타미드



$C_{10}H_{14}ClN_3OS$: 259.76

2-[(6-Chloro-3-pyridazinyl)thio]-*N*,*N*-diethylacetamide, [*1830-32-6*]

Azintamide contains NLT 98.0% and NMT 101.0% of azintamide ($C_{10}H_{14}ClN_3 \cdot 2HCl$: 259.76), calculated on the anhydrous basis.

Description Azintamide occurs as a white, crystalline powder. It is odorless.

It is freely soluble in alcohol, acetone and benzene, and slightly soluble in water.

Melting point—Between 98 and 100 ℃.

Identification (1) Use a solution of Azintamide in 4% ethanol as the test solution. Use 4% ethanol solution of azintamide RS as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography (with a fluorescent indicator). Next, develop the plate with a mixture of chloroform and ethanol(95) (20 : 1) as the developing solvent, and air-dry the plate. Spray with a mixture of 10 mL of 0.1% potassium permanganate solution and 1 mL of 0.1 mol/L sodium hydroxide or expose to ultraviolet rays (main wavelength 250 nm); the spot of the test solution exhibits an Rf value and color corresponding to that of the standard solution.

(2) Suspend a small amount of Azintamide in 5 mL of water, add dimethylaminobenzaldehyde TS (saturated solution of 1% hydrochloric acid), and boil; the solution changes color.

Purity (1) ***Clarity and color of solution***—The color of a 10% ethanol solution of Azintamide is not more intense than the color of a mixture prepared by adding 15 μL of the standard iron(III) chloride solution and 5 μL of the standard ferric chloride cobalt solution to 10 mL of 1% hydrochloric acid.

(2) ***Heavy metals***—Proceed with 1.0 g of Azintamide and perform the test according to Method 2. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Sulfate***—Proceed with 1.0 g of Azintamide, and perform the test according to Sulfate. Prepare the control solution with 0.63 mL of 0.005 mol/L sulfuric acid (NMT 0.03%).

(4) ***Chloride***—Dissolve 2.0 g of Azintamide in water to make 100 mL; take 25 mL of this solution, and perform the test according to the Chloride. Prepare the control solution with 0.5 mL of 0.01 mol/L hydrochloric acid (NMT 0.035%).

(5) ***Other organic substances***—Perform the test according to the Identification (1); there are no spots other than the principal spot (amount spotted: 0.5 μL).

Water NMT 0.5% (1 g, volumetric titration, direct titration).

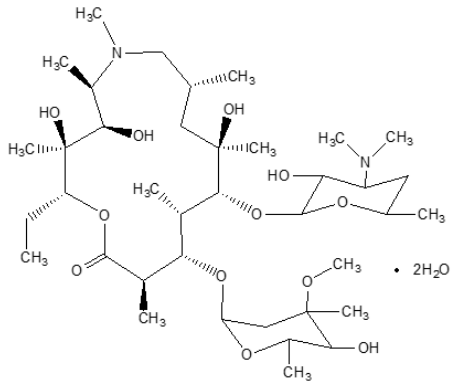
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.2 g of Azintamide, add ethanol(95), and shake to dissolve, and then add ethanol(95) to make exactly 250 mL. Pipet 5 mL of this solution, and add ethanol(95) to make exactly 100 mL. Pipet 25 mL of this solution, add ethanol(95) to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 0.2 g of azintamide RS, proceed as directed within the same manner as the test solution, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, at 250 nm as directed under the Ultraviolet-visible Spectroscopy, using ethanol(95) as the control solution.

Amount (mg) of azintamide ($C_{10}H_{14}ClN_3OS$)
= Amount (mg) of azintamide RS × (A_T / A_S)

Packaging and storage Preserve in tight containers.

Azithromycin Hydrate
아지트로마이신수화물



Azithromycin $C_{38}H_{72}N_2O_{12}\cdot 2H_2O$: 785.02
(2*R*,3*S*,4*R*,5*R*,8*R*,10*R*,11*R*,12*S*,13*S*,14*R*)-2-Ethyl-3,4,10-trihydroxy-3,5,6,8,10,12,14-heptamethyl-15-oxo-11-{[3,4,6-trideoxy-3-(dimethyl-amino)-β-D-xylo]oxy}-1-oxa-6-azacyclo-pentadec-13-yl 2,6-dideoxy-3-C-methyl-3-O-methyl-α-L-ribo-hexopyranoside dihydrate [*117772-70-0*]

Azithromycin Hydrate is a derivative of erythromycin.

Azithromycin Hydrate contains NLT 945 μg and NMT 1030 μg (potency) of azithromycin ($C_{38}H_{72}N_2O_{12}$: 748.98) per mg, calculated on the anhydrous basis.

Description Azithromycin Hydrate occurs as a white crystalline powder.
It is freely soluble in methanol or ethanol(99.5) and practically insoluble in water.

Identification Determine the infrared spectra of Azithromycin Hydrate and azithromycin RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit the same intensities of absorption at the same wave numbers.

Crystallinity Meets the requirements, except where it is labeled as amorphous, most of the particles do not exhibit birefringence and extinction positions.

Optical rotation $[\alpha]_D^{20}$: Between -45° and -49° (0.4 g, calculated on the anhydrous ethanol basis, ethanol(99.5), 20 mL, 100 mm).

pH Dissolve 0.2 g of Azithromycin Hydrate in 10 mL of 50% methanol solution; the pH of this solution is between 9.0 and 11.0.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Azithromycin Hydrate and perform the test according to Method 2. Prepare the control solution with 1.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Related substances***—(i) Total related substances: Test as directed under the Assay. The test solution and operating conditions are as follows: Weigh accurately about 33 mg of Azithromycin Hydrate, dissolve by adding 5 mL of acetonitrile, and then add a mixture of 0.02 mol/L potassium dihydrogen phosphate solution and acetonitrile (71 : 29) adjusted the pH to 8.0 with 10 mol/L potassium hydroxide TS to make 100 mL. Use this solution as the test solution. Take 50 μL of the test solution and perform the test as directed under the Liquid Chromatography according to the following conditions, and measure the peak areas of azithromycin and the respective related substances (total related substances NMT 5.5%).

$$\text{Total content (\%) of related substances} = \frac{Sum\ of\ total\ peak\ areas\ other\ than\ the\ principal\ peak}{Sum\ of\ total\ peak\ areas} \times 100$$

Operating conditions

Mobile phase: Adjust the pH of the mixture of 0.02 mol/L potassium dihydrogen phosphate solution and acetonitrile (75 : 25) to 11.0 using 10 mol/L potassium hydroxide TS.

Flow rate: 1.2 mL/min

Time span of measurement: About 80 min.

(ii) Erythromycin A iminoether: Weigh an appropriate amount of Azithromycin Hydrate, dissolve in a mixture of chloroform and methanol (1 :1) to make 25 mg per mL, and use this solution as the test solution. Separately, weigh accurately 2.5 mg of erythromycin A iminoether RS, dissolve in a mixture of chloroform and methanol (1 : 1) to make 0.125 mg per mL, and use this solution as the standard solution. Perform the test with these solutions as directed under the Thin Layer Chromatography. Spot 50 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, hexane and diethylamine (15 : 5 : 2) as the developing solvent, then heat the plate at 100 ℃ for 10 minutes. Spray evenly a solution of 1.5 mL sulfuric acid added to 3 g of vanillin dissolved in 100 mL of ethanol(95), then heat again at 100 ℃ for 10 minutes; the spots other than the principal spot from the test solution are not more intense than the principal spot from the standard solution.

Water Between 4.0% and 5.0% (0.4 g, volumetric titration, direct titration).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 50 mg (potency) each of Azithromycin Hydrate and azithromycin RS, dissolve each in a mixture of methanol and water (4 : 1), add exactly 2 mL each of internal standard solution, and then add a mixture of methanol and water (4 : 1) to make 50 mL. Use these solutions as the test solution and the standard solution, respectively. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the ratios of the peak area, Q_T and Q_S, of azithromycin to that of the internal standard.

$$\text{Potency (μg) of azithromycin } (C_{38}H_{72}N_2O_{12}) = \text{Potency (μg) of azithromycin RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of 4,4'-bis(diethylamino)benzophenone in methanol (3 in 8000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 215 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 50 °C.

Mobile phase: Dissolve 1.11 g of potassium dihydrogen phosphate and 5.88 g of dibasic potassium phosphate in 750 mL of water, adjust pH to 7.5 with potassium hydroxide TS, then add water to make 1000 mL. Add 800 mL of methanol to 200 mL of this solution.

Flow rate: 1.0 mL/min

System suitability

System performance: Proceed with 10 μL of the standard solution according to the above conditions; the internal standard and azithromycin are eluted in this order with the resolution being NLT 2.0.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solutions under the above operating conditions; the relative standard deviation of the peak area ratios of azithromycin to that of the internal standard is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Azithromycin for Syrup
시럽용 아지트로마이신

Azithromycin for Syrup is a preparation for Syrup, which is suspended before use, and contains NLT 90.0% and NMT 120.0% of the labeled amount of Azithromycin ($C_{38}H_{72}N_2O_{12}$: 748.99).

Method of preparation Prepare as directed under Syrups, with Azithromycin Hydrate.

Identification (1) The retention time of the major peak obtained in the test solution corresponds to that in the standard solution, as obtained in the Assay.

(2) Weigh accurately an appropriate amount each of the contents of Azithromycin for Syrup and azithromycin RS, dissolve in a mixture of chloroform and methanol (1 : 1) to obtain a solution containing 1 mg (potency) per mL, and use these solutions as the test solution and the standard solution, respectively. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 50 μL each of the test solution and the standard solution on a thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of hexane, ethyl acetate and diethylamine (150 : 50 : 20), and heat the plate at 100 ℃ for 10 minutes. Then, dissolve 3 g of vanillin in 100 mL of ethanol(95). Spray the solution which contains 1.5 mL of sulfuric acid and 100 mL of ethanol with 3 g of vanillic acid dissolved in it evenly on the plate and heat the plate again at 100 ℃ for 10 minutes; the black spot of the test solution shows the same Rf value as the spot obtained from the standard solution.

pH Dissolve an amount of Azithromycin for Syrup, equivalent to 0.4 g (potency) of azithromycin in 10 mL of water; the pH of the solution is 9.0 to 11.0.

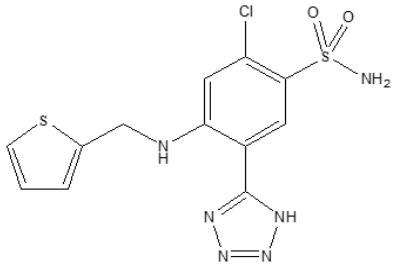
Water NMT 1.5% (0.5 g, volumetric titration, direct titration).

Uniformity of dosage units (distribution) Meets the requirements.

Assay Proceed as directed under the Assay under Azithromycin Hydrate. Weigh accurately a suitable amount of Azithromycin for Syrup, equivalent to 50 mg (potency) of azithromycin, dissolve in a mixture of methanol and water (4 : 1), add exactly 2 mL of the internal standard solution, and add a mixture of methanol and water (4 : 1) to make exactly 50 mL. Use this solution as the test solution. Separately, weigh accurately 50 mg (potency) of azithromycin RS, dissolve in a mixture of methanol and water (4 : 1), add exactly 2 mL of the internal standard solution, and add a mixture of methanol and water (4 : 1) to make exactly 50 mL. Use this solution as the standard solution.

Packaging and storage Preserve in tight containers.

Azosemide
아조세미드



$C_{12}H_{11}ClN_6O_2S_2$: 370.84

2-Chloro-5-(1*H*-tetrazol-5-yl)-4-[(2-thienylmethyl)amino]benzenesulfon amide; 2-Chloro-5-(2*H*-tetrazol-5-yl)-N^4-2-thenylsulfanilamide, [*27589-33-9*]

Azosemide, when dried, contains NLT 99.0% and NMT 101.0% of azosemide ($C_{12}H_{11}ClN_6O_2S_2$: 370.84).

Description Azosemide occurs as a white to yellowish white crystalline powder.
It is odorless and has a bitter taste.
It is freely soluble in dimethyl formamide, slightly soluble in methanol or ethanol(95), very slightly soluble in ether, and practically insoluble in water.
It dissolves in sodium hydroxide TS.
It is gradually changed to yellow by light.

Melting point—About 220 ℃ (with decomposition).

Identification (1) Weigh 10 mg of Azosemide, and dissolve in 10 mL of methanol, then add 10 mL of 2 mol/L hydrochloric acid to 1 mL of this solution, heat for 15 minutes on a steam bath with a reflex condenser, and cool; the solution responds to the Qualitative Analysis for primary aromatic amines. However, the solution exhibits a red to reddish purple color.

(2) Add 0.5 g of sodium carbonate to 0.1 g of Azosemide, mix, and carefully dissolve. The gas generated changes moistened red litmus paper to blue. Break down the cooled melt with a rod, add 10 mL of water, and mix, then filter. Take 4 mL of the filtrate, and add 2 drops of hydrogen peroxide(30), 5 mL of dilute hydrochloric acid (1 in 9) and 2 to 3 drops of barium chloride TS; a white precipitate is formed.

(3) Take 4 mL of the filtrate of (2), and add 5 mL of dilute nitric acid and 3 drops of silver nitrate TS; a white precipitate is formed.

(4) Dissolve 30 mg of Azosemide in dilute sodium hydroxide TS to make 100 mL. Pipet 2 mL of this solution, add dilute sodium hydroxide TS to make 100 mL, and determine the absorption spectra as directed under the Ultraviolet-visible Spectroscopy; it exhibits maxima

between 235 nm and 237 nm, between 272 nm and 276 nm, and between 324 nm and 330 nm.

Purity (1) ***Clarity and color of solution***—Dissolve 0.5 g of Azosemide in 50 mL of dilute sodium hydroxide TS; the solution is colorless to light yellow and clear. Determine the absorbance using this solution at wavelength 400 nm; it is NMT 0.1.

(2) ***Chloride***—Weigh 1.0 g of Azosemide, and add 60 mL of dilute sodium hydroxide TS, warm to dissolve, then add 0.5 mL nitric acid, and filter. Pipet 30 mL of the filtrate, add 6 mL of dilute nitric acid and water to make 50 mL. Use this solution as the test solution and perform the test as directed in Chloride. Prepare the control solution by adding 6 mL of dilute nitric acid and water to 0.45 mL of 0.01 mol/L hydrochloric acid solution to make 50 mL (NMT 0.032%).

(3) ***Sulfate***—Weigh 0.15 g of Azosemide, and dissolve in 10 mL of dilute sodium hydroxide TS, then add 1 mL nitric acid, and filter. Add 2 mL of barium chloride TS to the filtrate, and allow it to stand for 10 minutes; the solution does not become turbid.

(4) ***Heavy metals***—Proceed with 1.0 g of Azosemide according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(5) ***Arsenic***—Proceed with 2.0 g of Azosemide as directed under Method 3 under the Arsenic and perform the test (NMT 1 ppm).

(6) ***Primary aromatic amines***—Weigh 20 mg of Azosemide, dissolve in 5 mL of dimethylformamide, add 12 mL of water, 1.0 mL of sodium nitrite solution (1 in 200) and 2.0 mL of dilute hydrochloric acid (1 in 10), and shake to mix while cooling in iced water. Allow it to stand for 3 minutes, add 1.0 mL of ammonium sulfamate TS, shake thoroughly to mix, and then allow to stand for 3 minutes. Add 1.0 mL of *N*-naphthylethylenediamine hydrochloride (1 in 200), shake well to mix, add dimethylformamide to make exactly 50 mL, and use this solution as the test solution. Separately, take 5 mL of dimethylformamide, cool, and then proceed in the same way as the test solution. Use this solution as the control solution. Perform the test as directed under the Ultraviolet-visible Spectroscopy and determine the absorbance at the wavelength of 540 nm within 60 minutes; the absorbance is NMT 0.15 (NMT 0.34%).

Loss on drying NMT 0.5% (1 g, 105 ℃, 3 hours).

Residue on ignition NMT 0.1% (1 g).

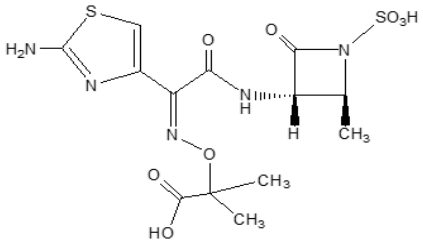
Assay Weigh accurately about 0.6 g of Azosemide, previously dried, dissolve in 50 mL of dimethylformamide, and titrate with 0.1 mol/L potassium hydroxide-ethanol VS (indicator: 10 drops of thymol blue-dimethylformamide TS). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L potassium hydroxide-ethanol VS

= 37.08 mg of $C_{12}H_{11}ClN_6O_2S_2$

Packaging and storage Preserve in light-resistant, tight containers.

Aztreonam
아즈트레오남



$C_{13}H_{17}N_5O_8S_2$: 435.43

2-({[(1*Z*)-1-(2-Amino-1,3-thiazol-4-yl)-2-{[(2*S*,3*S*)-2-methyl-4-oxo-1-sulfoazetidin-3-yl]amino}-2-oxoethylidene]amino}oxy)-2-methyl-propanoic acid [*78110-38-0*]

Aztreonam contains NLT 920 μg and NMT 1030 μg (potency) of aztreonam ($C_{13}H_{17}N_5O_8$: 435.43) per mg, calculated on the anhydrous basis.

Description Aztreonam occurs as a white to yellowish white crystalline powder.
It is freely soluble in dimethylsulfoxide, slightly soluble in water or methanol, and very slightly soluble in ethanol(95).

Identification (1) Determine the absorption spectra of aqueous solutions of Aztreonam and aztreonam RS (3 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelength.

(2) With deuterated methyl sulfoxide solution of Aztreonam (1 in 10), measure ^1H according to Nuclear Magnetic Resonance Spectroscopy; multiplet signals are exhibited at around 1.5 ppm and singlet signals are exhibited at around 7.0 ppm, and the area intensity ratio of each signal is 9 : 1.

Optical rotation $[\alpha]_D^{20}$: Between -26° and -32° (0.25 g calculated on the anhydrous basis, 50 mL of water, 100 mm).

pH Dissolve 0.1 g (potency) of Aztreonam in 20 mL of water; the pH of this solution is between 2.2 and 2.8.

Purity (1) ***Clarity and color of solution***—Dissolve 0.1 g of Aztreonam in 20 mL of water; the solution is clear, and colorless to pale yellow.

(2) ***Heavy metals***—Proceed with 2.0 g of Aztreonam according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard

solution (NMT 10 ppm).

(3) ***Arsenic***—Prepare the test solution with 1.0 g of Aztreonam according to Method 3 and perform the test (NMT 2 ppm).

(4) ***Related substances***—Weigh accurately about 40 mg (potency) of Aztreonam, dissolve in water to make 100 mL, and use this solution as the test solution. Pipet 2 mL of this solution, dissolve in the water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 25 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions. Determine the peak area of each peak from the test solution and the standard solution; the area of each peak other than for aztreonam in the test solution is not greater than the peak area for aztreonam in the standard solution. The total area of the peaks other than the peak of aztreonam from the test solution is not greater than 2.5 times the peak area of aztreonam from the standard solution.

Operating conditions

For the detector, column, column temperature, mobile phase and flow rate, proceed as directed under the operating conditions in the Assay.

System suitability

Test for required detectability: Pipet 5 mL of the standard solution and add water to make exactly 10 mL. Use this solution as the system suitability solution. Pipet 1 mL of the system suitability solution and add water to make exactly 10 mL; confirm that the peak area of aztreonam from 25 μL of this solution is 7% to 13% of the peak area of aztreonam from the system suitability solution.

Detection sensitivity: Adjust so that the height of the aztreonam peak is 10 mm to 20 mm when testing using 25 μL of the standard solution.

System performance: Proceed with 25 μL of the standard solution of the Assay according to the above conditions; the internal standard and aztreonam are eluted in this order with the resolution being NLT 4.

System repeatability: Repeat the test 6 times with 25 μL each of the standard solutions according to the above conditions; the relative standard deviation of the peak area for aztreonam is NMT 2.0%.

Time span of measurement: About 4 times the retention time of aztreonam after the solvent peak

Water NMT 2.0% (0.5 g, volumetric titration, direct titration).

Residue on ignition NMT 0.1% (1 g).

Sterility It meets the requirements when used in a sterile preparation (excluding cases wherein a terminal sterilization step is included in the preparation process for the sterile preparation). Provided, dissolve 8g of arginine in 200 mL of washings, heat, and autoclave at 121 ℃, and then cool. To this solution, add 10.0 g of Aztreonam and use this solution as the test solution.

Bacterial endotoxins Less than 0.10 EU per mg (potency) of aztreonam when used in the manufacturing of sterile preparations.

Assay Weigh accurately about 20 mg (potency) each of Aztreonam and aztreonam RS, dissolve in 70 mL water, add exactly 10 mL of internal standard solution, and then add water to make 100 mL. Use these solutions as the test solution and the standard solution. Perform the test with 25 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the ratios of peak area, Q_T and Q_S, of the aztreonam to that of the internal standard.

$$\text{Potency (μg) of aztreonam } (C_{22}H_{22}N_5O_8S_2) = \text{Potency (μg) of aztreonam RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—4-aminobenzoic acid solution (1 in 6250).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 280 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: Dissolve 1.7 g of tetrabutylammonium hydrogen sulfate in 300 mL of water, adjust the pH to 3.0 with dibasic sodium phosphate TS, and add water to make 1000 mL. Add 350 mL of methanol to 650 mL of this solution.

Flow rate: Adjust the flow rate so that the retention time of aztreonam is about 8 minutes.

System suitability

System performance: Proceed with 25 μL of the standard solution according to the above conditions; the internal standard and aztreonam are eluted in this order with the resolution being NLT 4.

System repeatability: Repeat the test 6 times with 25 μL each of the standard solutions as directed under the above conditions. The relative standard deviation of the peak area ratio of aztreonam to the internal standard is NMT 1.5%.

Packaging and storage Preserve in light-resistant, tight containers.

Aztreonam for Injection
주사용 아즈트레오남

Aztreonam for Injection is a preparation for injec-

tion which is dissolved before use, and contains NLT 93.0% and NMT 107.0% of the labeled amount of aztreonam ($C_{13}H_{17}N_5O_8S_2$: 435.43).

Method of preparation Prepare as directed under Injections, with Aztreonam.

Description Aztreonam for Injection occurs as a white to yellowish white mass or a powder.

Identification (1) Dissolve an amount of Aztreonam for Injection equivalent to 6 mg (potency) of aztreonam according to the labeled amount, dissolve in 1 mL of hydroxylamine hydrochloride-ethanol TS, allow to stand for 3 minutes, and add 1mL of acidic ammonium iron(III) sulfate TS and shake to mix; the solution exhibits a reddish brown color.

(2) Dissolve an amount of Aztreonam for Injection equivalent to 3 mg (potency) of aztreonam according to the labeled amount in 100 mL of water. Determine the absorption spectrum of this solution as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum between 289 nm and 293 nm.

pH Dissolve an amount of Aztreonam for Injection equivalent to 1.0 g (potency) of aztreonam according to the labeled amount in 10 mL of water; the pH of this solution is between 4.5 and 7.0.

Purity ***Clarity and color of solution***—Dissolve an amount of Aztreonam for Injection equivalent to 1.0 g (potency) of aztreonam according to the labeled amount in 10 mL of water; the solution is clear. Perform the test as directed under the Ultraviolet-visible Spectroscopy; the absorbance of the solution at 450 nm is NMT 0.06.

Water NMT 2.0% (0.5 g, volumetric titration, direct titration).

Sterility Meets the requirements.

Bacterial endotoxins Less than 0.10 EU per mg (potency) of aztreonam.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Uniformity of dosage units Meets the requirements.

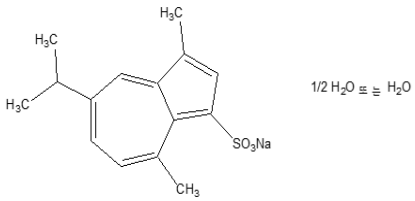
Assay Take a number of units equivalent to about 5 g (potency) of aztreonam, dissolve the contents of each in water, and transfer to a 100-mL volumetric flask. Wash each container with water, combine the washings and the solution prepared previously, and add water to make exactly 100 mL. Pipet 10 mL of this solution, and add water to make exactly 50 mL. Pipet 2 mL of this solution, add exactly 10 mL of the internal standard solution, add water to make exactly 100 mL, and use this solution as the standard solution. Separately, weigh accurately about 20 mg (potency) of aztreonam RS, dissolve in water, add 10 mL of the internal standard solution, add water to make exactly 100 mL, and use this solution as the standard solution. Perform the test as directed under the Assay for Aztreonam below.

$$\text{Potency (mg) of aztreonam } (C_{13}H_{17}N_5O_8S_2) = \text{Potency (mg) of aztreonam RS} \times \frac{Q_T}{Q_S} \times 250$$

Internal standard solution—4-aminobenzoic acid solution (1 in 6250).

Packaging and storage Preserve in light-resistant, well-closed containers.

Soluble Azulene
수용성아줄렌



Azulene Sodium Sulfonate

$C_{15}H_{17}NaO_3S \cdot 1/2H_2O$: 309.35

$C_{15}H_{17}NaO_3S \cdot H_2O$: 318.36

3,8-Dimethyl-5-(1-methylethyl)-1-azulenesulfonic acid sodium salt, [*6223-35-4, inorganic*]

Soluble Azulene, when dried, contains NLT 98.5% and NMT 101.5% of sodium azulenesulfonate ($C_{15}H_{17}NaO_3S \cdot 1/2H_2O$).

Description Soluble Azulene occurs as dark blue crystals or a crystalline powder, and is odorless and tasteless. It is soluble in methanol, sparingly soluble in water or acetic acid(100), slightly soluble in ethanol, and practically insoluble in acetic anhydride, ether or hexane.

Identification (1) To 5 mL of a aqueous solution of Soluble Azulene (1 in 200), add 1 mL of barium chloride TS; a blue precipitate is produced.

(2) To 1 mL of an aqueous solution of Soluble Azulene (1 in 200), add 0.5 mL of hydrochloric acid; the solution gradually changes to a pale yellow color or is decolorized.

(3**)** With phosphate buffer solution, pH 7.0, of Soluble Azulene, determine the absorption spectrum as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum at the wavelengths of between 567 nm and 571 nm.

pH Between 6.0 and 9.0 (0.5% aqueous solution).

Absorbance $E_{1cm}^{1\%}$: Between 19.85 and 20.65 (20 mg, after drying, phosphate buffer solution (pH 7.0), 100 mL).

Purity (1) ***Clarity and color of solution***—To 0.1 g of Soluble Azulene, add 20 mL of water, shake to mix for 5 minutes, and filter; there is no residue on the filter paper.

(2) ***Heavy metals***—Proceed with 1.0 g of Soluble Azulene according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Arsenic***—Proceed with 0.40 g of Soluble Azulene according to Method 3 and perform the test (NMT 5 ppm).

(4) ***Guaiazulene***—Add 10 mL of hexane to 0.10 g of Soluble Azulene, shake to mix for 5 minutes, and filter. With the filtrate, determine the transmission rate as directed under the Ultraviolet-visible Spectroscopy at a wavelength of 605 nm; it is NLT 95.0%.

Loss on drying NMT 3.5% (0.5 g, silica gel, 24 hours).

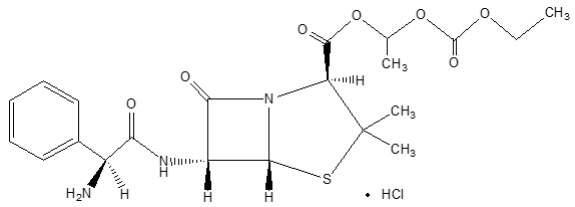
Water Between 2.5% and 3.5% (after drying, 2 g).

Assay Weigh accurately about 0.3 g of Soluble Azulene, previously dried, dissolve in 25 mL of acetic acid(100), add 25 mL of acetic anhydride, and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 30.936 mg of $C_{15}H_{17}NaO_3S \cdot 1/2H_2O$

Packaging and storage Preserve in light-resistant, tight containers.

Bacampicillin Hydrochloride
바캄피실린염산염



$C_{21}H_{27}N_3O_7S \cdot HCl$: 501.98

1-Ethoxycarbonyloxyethyl(2*S*,5*R*,6*R*)-6-[[(2*R*)-2-amino-2-phenylacetyl]amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylate hydrochloride [*37661-08-8*]

Bacampicillin Hydrochloride contains NLT 626 μg (potency) of ampicillin ($C_{16}H_{19}N_3O_4S$: 349.40) per mg, calculated on the anhydrous basis.

Description Bacampicillin Hydrochloride occurs as a white to pale yellow crystalline powder with a characteristic odor.

It is freely soluble in methanol or ethanol(99.5) and is soluble in water.

Identification (1) Determine the absorption spectra of solutions of Bacampicillin Hydrochloride and bacampicillin hydrochloride RS in methanol (1 in 1000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Bacampicillin Hydrochloride and bacampicillin hydrochloride RS as directed in the potassium chloride disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) An aqueous solution of Bacampicillin Hydrochloride (1 in 50) responds to the Qualitative Analysis for chloride.

Optical rotation $[\alpha]_D^{20}$: Between +140° and +170° (0.1 g, calculated on the anhydrous basis, ethanol(99.5), 25 mL, 100 mm).

pH Dissolve 0.2 g of Bacampicillin Hydrochloride in 10 mL of water; the pH of this solution is between 3.0 and 5.0.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Bacampicillin Hydrochloride according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Arsenic***—Proceed with 1.0 g of Bacampicillin Hydrochloride according to Method 3 and perform the test (NMT 2 ppm).

(3) ***Free ampicillin*—**Weigh accurately about 0.1 g of Bacampicillin Hydrochloride, transfer to a separatory funnel, and dissolve in exactly 15 mL of water cooled with ice. Add 10 mL of 0.05 mol/L phosphate buffer solution, pH 7.0, cooled with ice, shake, add 25 mL of chloroform cooled with ice, shake, and discard the chloroform layer. Proceed with two 25 mL portions of chloroform in the same manner. Centrifuge the water layer, filter the clear supernatant, and use the filtrate as the test solution. Separately, weigh accurately about 20 mg of ampicillin RS, dissolve in water, and make exactly 100 mL. Pipet 5 mL of this solution, add 10 mL of 0.05 mol/L phosphate buffer solution, pH 7.0, and water to make exactly 25 mL. Pipet 10 mL each of the test solution and the standard solution, add exactly 2 mL of sodium hydroxide TS, allow to stand for exactly 15 minutes, and add exactly 2 mL of 1 mol/L hydrochloric acid TS, 10 mL of 0.3 mol/L potassium hydrogen phthalate buffer solution, pH 4.6, and 10 mL of 0.005 mol/L iodine solution. Allow to stand for 20 minutes while protected from light, and titrate each solution with 0.01 mol/L sodium thiosulfate VS. The endpoint of the titration is when

the solution becomes colorless. Separately, pipet 10 mL each of the test solution and the standard solution, add exactly 10 mL of 0.3 mol/L potassium hydrogen phthalate buffer solution, pH 4.6, and 10 mL of 0.005 mol/L iodine solution, and perform a blank test in the same manner and make any necessary correction. When consumptions (mL) of 0.005 mol/L iodine for the test solution and the standard solution are V_T and V_S, respectively, the amount of ampicillin is NMT 1.0%.

$$\text{Content (\%) of liberated ampicillin} = \frac{V_T}{V_S} \times \frac{Potency\ (mg)\ in\ \text{ampicillin RS taken}}{Amount\ (mg) of\ Bacampicillin\ Hydrochloride} \times 20 \times 100$$

0.3 mol/L potassium hydrogen phthalate buffer solution, pH 4.6—Weigh 61.26 g of potassium hydrogen phthalate, dissolve in about 800 mL of water, adjust the pH to 4.6 with sodium hydroxide TS, and add water to make 1000 mL.

(4) ***Dimethylaniline***—Weigh accurately about 1.0 g of Bacampicillin Hydrochloride, add 5 mL of 1 mol/L sodium hydroxide TS and 1 mL of the internal standard solution, centrifuge if necessary, and use the clear supernatant as the test solution. Separately, weigh accurately about 50 mg of dimethylaniline, add 2.0 mL of hydrochloric acid, and add water to make 50 mL. Pipet 5.0 mL of this solution and add water to make exactly 250 mL. Pipet 1.0 mL of this solution, add 5.0 mL of 1 mol/L sodium hydroxide TS and 1.0 mL of the internal standard solution, centrifuge if necessary, and use the clear supernatant as the standard solution. Perform the test with 1 μL each of the test solution and the standard solution as directed under the Gas Chromatography according to the following conditions, and calculate the ratios, QT and QS, of the peak area of dimethylaniline to that of the internal standard in the test solution and the standard solution, respectively (NMT 20 ppm).

$$\text{Content (ppm) of dimethylaniline} = \text{Amount (mg) of dimethylaniline taken} \times \frac{Q_T}{Q_S} \times \frac{Purity\ (\%) of\ dimethylaniline}{Amount\ (mg) of\ Bacampicillin\ Hydrochloride\ taken} \times 4$$

Internal standard solution—Dissolve 50.0 mg of naphthalene in cyclohexane to make 50 mL. Pipet 5.0 mL of this solution, add cyclohexane to make 100 mL, and use this solution as the internal standard solution.

Operating conditions

Detector: A flame ionization detector

Column: A column about 2 mm in internal diameter and about 2 m in length, packed with diatomaceous earth for gas chromatography coated with 50% phenyl-50% methtyl polysiloxane for gas chromatography equivalent to 3% of the mass.

Column temperature: 120 °C

Sample injection port, detector temperature: 150 °C

Carrier gas: Nitrogen

Flow rate: 30 mL/min

Water NMT 1.0% (0.5 g, volumetric titration, direct titration).

Residue on ignition NMT 1.5% (1 g).

Assay Weigh accurately about 40 mg (potency) each of Bacampicillin Hydrochloride and bacampicillin hydrochloride RS, dissolve in water to make exactly 100 mL each, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions, and determine the peak areas, A_T and A_S, of bacampicillin.

$$\text{Potency (μg) of ampicillin } (C_{16}H_{19}N_3O_4S) = \text{Potency (μg) of bacampicillin hydrochloride RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 ℃.

Sample injection port temperature: Constant temperature of about 4 ℃.

Mobile phase: To 500 mL of 0.02 mol/L sodium dihydrogen phosphate, add 0.02 mol/L sodium hydrogen phosphate to adjust the pH to 6.8. To 500 mL of this solution, add 500 mL of acetonitrile.

Flow rate: 1 mL/min

System suitability

System performance: Proceed with 20 μL of the standard solution according to the above conditions; the number of theoretical plates of bacampicillin peak is NLT 2000.

System repeatability: Repeat the test 6 times with 20 μL each of the standard solutions according to the above conditions; the relative standard deviation of peak areas of bacampicillin is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Bacampicillin Hydrochloride Granules
바캄피실린염산염 과립

Bacampicillin Hydrochloride Granules contain NLT 90.0% and NMT 120.0% of labeled amount of ampicillin ($C_{16}H_{19}N_3O_4S$: 349.41).

Method of preparation Prepare as directed under Granules, with Bacampicillin Hydrochloride.

Identification Weigh an appropriate amount of Bacampicillin Hydrochloride Granules according to the labeled potency, add ethanol to dilute to a concentration of 2 mg (potency) per mL, and use this solution as the test solution. Separately, weigh an appropriate amount of bacampicillin hydrochloride RS, add ethanol to make a solution containing 2 mg (potency) per mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate using a mixture of dichloromethane, ethanol and chloroform (10 : 1 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Spray evenly ninhydrin-ethanol solution on the plate; the R_f values of the spots obtained from the test solution and the standard solution are the same.

Particle size distribution estimation by analytical sieving Meets the requirements.

Disintegration Meets the requirements.

Uniformity of dosage units (distribution) Meets the requirements.

Water NMT 2.0% (0.5 g, volumetric titration, direct titration).

Assay Weigh accurately about 40 mg (potency) of pulverized Bacampicillin Hydrochloride Granules according to the labeled potency, dissolve in water to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 40 mg (potency) of bacampicillin hydrochloride RS, dissolve in water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak area of bacampicillin, A_T and A_S, in each solution.

Amount [mg (potency)] of ampicillin ($C_{16}H_{19}N_3O_4S$)
= Amount [mg (potency)] of bacampicillin hydrochloride RS
$\times (A_T / A_S)$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Sample injection port temperature: A constant temperature of about 4 °C.

Mobile phase: To 500 mL of 0.02 mol/L sodium dihydrogen phosphate, add 0.02 mol/L sodium hydrogen phosphate to adjust the pH to 6.8. To 500 mL of this solution, add 500 mL of acetonitrile.

Flow rate: 1 mL/min.

System suitability

System performance: Proceed with 20 μL of the standard solution according to the above conditions; the number of theoretical plates for bacampicillin peak is NLT 3000 plates.

System repeatability: Repeat the test 6 times with 20 μL of the standard solution according to the above conditions; the relative standard deviation of the peak area for bacampicillin is NMT 2.0%.

Packaging and storage Preserve in tight containers.

Bacampicillin Hydrochloride Tablets
바캄피실린염산염 정

Bacampicillin Hydrochloride Tablets contain NLT 90.0% and NMT 120.0% of the labeled amount of ampicillin ($C_{16}H_{19}N_3O_4$: 349.41).

Method of preparation Prepare as directed under Tablets, with Bacampicillin Hydrochloride.

Identification Weigh an appropriate amount of bacampicillin hydrochloride and an appropriate amount of bacammycin hydrochloride RS according to the labeled amount of Bacampicillin Hydrochloride Tablets, dissolve in ethanol(95) to contain 2 mg per mL; and use these solutions as the test solution and the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of these solutions on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate using a mixture of methylene chloride, chloroform and ethanol (10 : 1 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Spray 0.3% ninhydrin methanol solution evenly onto the plate; the spots from the test solution and the standard solution have the same R_f values.

Water NMT 2.0% (0.5 g, volumetric titration, direct titration).

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 tablets of Bacampicillin Hydrochloride Tablets, and powder. Weigh accurately an amount of this powder, equivalent to about 56 mg of ampicillin ($C_{16}H_{19}N_3O_4S$), dissolve in water to make exactly 100 mL, and use this solution as the test solution. Weigh accurately about 80 mg (potency) of bacampicillin hydrochloride RS, dissolve in water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions, and determine the peak areas, A_T and A_S, of bacampicillin.

$$\text{Potency (μg) of ampicillin } (C_{16}H_{19}N_3O_4S) = \text{Potency (μg) of bacampicillin hydrochloride RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 3.9 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: To 500 mL of 0.02 mol/L sodium dihydrogen phosphate, add 0.02 mol/L sodium hydrogen phosphate to adjust the pH to 6.8. To 500 mL of this solution, add 500 mL of acetonitrile.

Bacitracin
바시트라신

	R_1	R_2	R_3
Bacitracin A:	CH_3	CH_3	CH_3
Bacitracin B_1:	CH_3	CH_3	H
Bacitracin B_2:	H	CH_3	CH_3
Bacitracin B_3:	CH_3	H	CH_3

[*1405-87-4*]

Bacitracin is a mixture of peptide-based compounds in which the main component is bacitracin A, having anti-bacterial activity, obtained from the culture of *Bacillus subtilis* or *Bacillus licheniformis*.

Bacitracin contains NLT 60 units (potency) of bacitracin A ($C_{66}H_{103}N_{17}O_{16}S$: 1422.69) per mg, calculated on the dried basis.

Description Bacitracin occurs as a white to pale brown powder.
It is freely soluble in water and slightly soluble in ethanol(99.5).

Identification (1) To 3 mL of Bacitracin aqueous solution (1 in 100), add 3 mL of 4-dimethylaminobenzaldehyde TS, and shake until a deep red to purple color appears. Then, add some drops of sodium nitrite solution (1 in 100) and shake; the resulting solution exhibits a green to dark green color.

(2) Dissolve 60 mg each of Bacitracin and bacitracin RS in 10 mL of water and use these solutions as the test solution and the standard solution, respectively. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 1 μL each of the test solutions and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of 1-butanol, acetic acid(100), water, pyridine and ethanol(99.5) (30 : 15 : 10 : 6 : 5) (as the developing solvent) to a distance of about 10 cm, and air-dry the plate. Spray evenly a ninhydrin TS on the plate and heat at 110 ℃ for 5 minutes; the R_f values of spots obtained from the test solution and the standard solution are the same.

pH Dissolve 1 g of Bacitracin in 10 mL of water; the pH of this solution is between 5.5 and 7.5.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Bacitracin as directed under Method 2 and perform the test. Prepare the control solution with 2.0 mL of the lead standard solution (NMT 20 ppm).

(2) ***Related substances***—Dissolve 0.15 g of Bacitracin in 0.05 mol/L sulfuric acid TS to make 100 mL. To 2 mL of this solution, add 0.05 mol/L sulfuric acid TS to make 10 mL, and use this solution as the test solution. Determine the absorbances A_1 and A_2 of the test solution at the wavelengths 252 nm and 290 nm as directed under the Ultraviolet-visible Spectroscopy; the A_2/A_1 is NMT 0.20.

Loss on drying NMT 5.0% (1.0 g, in vacuum, 60 ℃, 3 hours).

Residue on ignition NMT 1.0% (1 g).

Sterility In case of use for manufacturing of sterile preparations, it meets the requirements. It is excluded if there is a final sterilization process included in the manufacturing process of the sterile preparations.

Bacterial endotoxins In case of use for manufacturing of sterile preparations, less than 0.01 EU per mg (potency) as bacitracin.

Bacitracin content ratio Weigh accurately an appropriate amount of Bacitracin, dissolve in the mobile phase to obtain a solution having known concentration of 2.0 mg per mL, and use this solution as the test solution. Perform the test with 100 μL each of the mobile phase, the test solution and the detection limit solution as directed under the bacitracin content ratio section under Bacitracin Zinc. The amount of bacitracin A is NLT 40.0%, and the amount of active bacitracin (bacitracin A, B_1, B_2 and B_3) is NLT 70.0%. Also, the amount of all peaks flown out before the bacitracin B_1 peak (initial efflux peptide) is NMT 20.0%, and the amount of bacitracin F is NMT 6.0%. The peak in the test solution that is smaller than the bacitracin A obtained from the detection limit solution and the peak appearing in the mobile phase are excluded.

Assay ***Cylinder plate method*** (1) ***Medium*—**Agar media for seed and base layer Use the culture media under the Microbial Assays for Antibiotics A)(2)(A)⑥ⓐ.

(2) ***Test organism*—**Use *Micrococcus luteus* ATCC 10240 as the test organism.

(3) Weigh accurately about 400 units (potency) of Bacitracin, dilute with 1% phosphate buffer (pH 6.0) to obtain solutions having known concentrations of 2.0 and 0.5 units (potency) per mL, respectively, and use these solutions as the high-concentration test solution and the low-concentration test solution, respectively. Separately, weigh accurately about 400 units (potency) of bacitracin RS, dilute with 1% phosphate buffer (pH 6.0) to obtain a solution containing 5 units (potency) per mL, and use this solution as the standard stock solution. Keep the standard stock solution at NMT 10 ℃ and use it within 2 days. Pipet an appropriate amount of the standard stock solution, dilute with 1% phosphate buffer (pH 6.0) to obtain solutions having known concentrations of 2.0 and 0.5 units (potency) per mL, respectively, and use these solutions as the high-concentration standard solution and the low-concentration standard solution. With these solutions, perform the test as directed under the Microbial Assays for Antibiotics, A) (8).

Packaging and storage Preserve in tight containers (in a cold place).

Bacitracin Ointment
바시트라신 연고

Bacitracin Ointment contains NLT 90.0% and NMT 120.0% of the labeled amount of bacitracin A ($C_{66}H_{103}N_{17}O_{16}S$: 1421.77).

Method of preparation Prepare as directed under Ointments, with Bacitracin.

Identification Weigh about 5 g of Bacitracin Ointment, place in a beaker, wash 2 to 3 times with 20 mL of chloroform each, and discard the washings. Dissolve in a small amount of ethanol(95), evaporate to dryness, and perform the test with the residue as directed under the Identification for Bacitracin.

Water NMT 1.0% (1.0 g, volumetric titration, direct titration).

Assay ***Cylinder plate method***—Perform the test according to the Assay under Bacitracin. Weigh accurately an amount of Bacitracin Ointment, equivalent to 500 to 2000 units (potency) according to the labeled potency, place in a separatory funnel, add 50 mL of ether, and shake to mix until it is homogeneous. Extract 3 times with 25 mL each of 1% phosphate buffer solution, pH 6.0, combine the extracts, and add 1% phosphate buffer solution, pH 6.0, to make 100 mL. Pipet an appropriate amount of this solution, dilute with 1% phosphate buffer solution, pH 6.0, to the concentration of (3), and use this solution as the test solution.

Packaging and storage Preserve in tight containers.

Bacitracin·Neomycin Sulfate·Polymyxin B Sulfate Ointment
바시트라신·네오마이신황산염·폴리믹신B황산염 연고

Bacitracin·Neomycin Sulfate·Polymyxin B Sulfate Ointment contains NLT 90.0% and NMT 120.0% of the labeled amounts of bacitracin, neomycin ($C_{23}H_{46}N_6O_{13}$: 614.65) and polymyxin B.

Method of preparation Prepare as directed under Ointments, with Bacitracin, Neomycin Sulfate and Ploymixin B Sulfate.

Identification Weigh appropriate amounts of Bacitracin·Neomycin Sulfate·Polymyxin B Sulfate Ointment and reference standards of each component, dissolve in 0.1 mol/L phosphate buffer solution, pH 8.0, to make solutions containing 1 mg (potency) or 200 units (potency) per mL, and use these solutions as the test solution

and the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot the test solution and the standard solution onto a thin-layer chromatographic plate made of silica gel for thin-layer chromatography, and develop the plate with a mixture of 1-butanol, acetic acid(100) and water (60 : 20 : 20) as the developing solvent. Air-dry the plate and evenly spray a solution of 1% ninhydrin butanol solution mixed with a small amount of pyridine; the spots obtained from the test solution and the standard solution have the same R_f values.

Water NMT 1.0% (1 g, volumetric titration, direct titration).

Assay (1) ***Cylinder plate method for bacitracin—*** Perform the test as directed under the Assay for Bacitracin Ointment.

(2) ***Cylinder plate method for neomycin sulfate—*** Perform the test as directed under the Assay for Neomycin Sulfate. Weigh accurately an amount of Bacitracin·Neomycin Sulfate·Polymyxin B Sulfate Ointment, equivalent to about 10 mg (potency) of neomycin according to the labeled potency, place in a separatory funnel, add 100 mL of ether, and shake well to mix. Extract with 50 mL of 0.1 mol/L phosphate buffer solution, pH 8.0, while mixing well, and collect the buffer solution layer. Repeat this procedure 2 times using 20 mL each of 0.1 mol/L phosphate buffer solution, pH 8.0, combine all of the buffer solution layers, add 50 mL of butanol to this combined buffer solution layer, shake to mix, and discard the butanol layer. Repeat the procedure 2 more times using 25 mL each of butanol, discard the butanol layers, and collect the buffer solution layers. Add 0.1 mol/L phosphate buffer solution, pH 8.0, to make exactly 100 mL, pipet an appropriate amount of the resulting solution, dilute with 0.1 mol/L phosphate buffer solution, pH 8.0, to the concentration of ③, and use this solution as the test solution.

(3) ***Cylinder plate method for polymyxin B sulfate—*** ① Medium

(A) Agar medium for seed layer

Pancreatin digest of casein	17.0g
Glucose	2.5 g
Papain digest of soybean	3.0 g
Agar	13.0 to 20.0 g

Weigh the above amount of substances, add purified water to make 1000 mL, and adjust the pH after sterilizing to between 7.2 and 7.3 with sodium hydroxide TS

(B) Agar media for base layer

Pancreatin digest of casein	17.0 g
Papain digest of soybean	3.0 g
Sodium chloride	5.0g
Glucose	2.5g

Weigh the above amount of substances, add purified water to make 1000 mL, and adjust the pH after sterilizing to between 7.2 and 7.3 with sodium hydroxide TS

(C) Agar medium for transferring test organism

Peptone	6.0g
Glucose	1.0g

Weigh the above amount of substances, add purified water to make 1000 mL, and adjust the pH after sterilizing between 6.5 and 6.6 with sodium hydroxide TS

② Test organism—Use *Bordetella bronchiseptica* ATCC 4617 as the test organism.

③ Suspension of test organism—Culture the test organism in the agar medium for transferring test organism for 16 to 24 hours at 32 to 37 ℃, subculture NLT 3 times, then inoculate the test organism in a slanted agar medium and culture for 16 to 24 hours at 32 to 37 ℃, suspend in an appropriate amount of sterile purified water to produce a suspension whose transmittance is 60% at a wavelength of 660 nm when measured using a photoelectric photometer. Store the suspension at below 15 ℃ and use within 3 days. For the Assay, dissolve 0.13 mL of this adjusted suspension beforehand, place it in 100 mL of agar medium for the seed layer cooled to 48 ℃, and use this solution as the suspension of the test organism.

④ Weigh accurately an amount of Bacitracin·Neomycin Sulfate·Polymyxin B Sulfate Ointment, equivalent to about 8000 to 20000 units (potency) of polymyxin B sulfate according to the labeled potency, place in a separatory funnel, add 20 mL of ether, shake to mix, then extract with 20 mL of 10% phosphate buffer solution, pH 6.0. Then extract 2 times with 10 mL each of 10% phosphate buffer solution, pH 6.0, combine all of the buffer solution layers, then add 10% phosphate buffer solution, pH 6.0, to make exactly 50 mL. Pipet an appropriate amount of this solution, dilute with 10% phosphate buffer solution, pH 6.0, to contain 100.0 and 25.0 units (potency) per mL, and use these solutions as the high-concentration test solution and the low-concentration test solution. Separately, weigh accurately about 20000 to 30000 units (potency) of polymyxin B sulfate RS and dissolve in 10% phosphate buffer solution, pH 6.0, to prepare a standard stock solution containing 1000 units (potency) per mL. For the Assay, pipet an appropriate amount of the standard stock solution, dilute with 10% phosphate buffer solution, pH 6.0, to contain 100.0 and 25.0 units (potency) per mL, respectively, and use these solutions as the high-concentration standard solution and the low-concentration standard solution. With these solutions, perform the test according to (A) ⑧ under the Microbial Assays for Antibiotics.

Packaging and storage Preserve in tight containers.

Bacitracin Zinc
바시트라신아연

	R_1	R_2	R_3
Bacitracin A:	CH_3	CH_3	CH_3
Bacitracin B_1:	CH_3	CH_3	H
Bacitracin B_2:	H	CH_3	CH_3
Bacitracin B_3:	CH_3	H	CH_3

[*1405-89-6*]

Bacitracin Zinc contains NLT 65 units (potency) of bacitracin A ($C_{66}H_{103}N_{17}O_{16}S$: 1422.69) per mg, calculated on the dried basis. Also, Bacitracin Zinc contains NLT 4.0% and NMT 6.0% of zinc (Zn: 65.41), calculated on the dried basis.

Description Bacitracin Zinc occurs as a white to pale yellow powder. It has no or slight odor and a bitter taste. It is slightly soluble in water or alcohol, very slightly soluble in ether, and practically insoluble in chloroform. It is hygroscopic.

Identification Dissolve an appropriate amount of Bacitracin Zinc in 0.1 mol/L hydrochloric acid TS to obtain a solution having a known concentration of 500 units per mL, and use this solution as the test solution. Separately, weigh an appropriate amount of bacitracin zinc RS to obtain a solution having a known concentration of 500 units per mL and use this solution as the standard solution. Perform the test with 10 μL each of the test solutions and the standard solutions as directed under the Thin Layer Chromatography. Spot the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of methanol, 2-propanol, dichloromethane, ammonium hydroxide and water (4 : 2 : 2 : 1 : 5) to a distance of about 15 cm, and dry the plate at 105 ℃ for 10 minutes. Spray evenly a 0.2% ninhydrin-butanol solution on the plate and heat at 105 ℃ for 5 minutes; the spots obtained from the test solution and the standard solution exhibit a dark purple color and have the same R_f value.

pH The pH of the saturated solution of Bacitracin Zinc is between 6.0 and 7.5.

Loss on drying NMT 5.0% (0.1 g, in vacuum, 60 ℃, 3 hours).

Sterility In case of use for manufacturing of sterile preparations, it meets the requirements. It is excluded if there is a final sterilization process included in the manufacturing process of the sterile preparations.

Bacitracin zinc content ratio Weigh accurately an appropriate amount of Bacitracin Zinc, dissolve in the diluent to obtain a solution having a known concentration of 2.0 mg per mL, and use this solution as the test solution. Perform the test with 100 μL each of the diluents, the test solution and the detection limit solution as directed under the Liquid Chromatography according to the following conditions and determine the peak area of the respective solutions according to the automatic integration method. Obtain the amount of bacitracin A according to the following equation (1); it is NLT 40.0%. Obtain the amount of active bacitracin (bacitracin A, B_1, B_2 and B_3) according to the following equation (2); it is NLT 70.0%. Obtain the amount of all peaks flown out before the bacitracin B_1 peak (initial efflux peptide) according to the following equation (3); it is NMT 20.0%. Obtain the amount of bacitracin F according to the following equation (4); it is NMT 6.0%. The peak in the test solution that is smaller than the bacitracin A obtained from the detection limit solution and the peak appearing in the diluent are excluded.

$$\text{Amount of bacitracin A} = \frac{A_\text{A}}{A_\text{T}} \times 100 \quad (1)$$

A_A: Peak area of bacitracin A obtained from the test solution

A_T: Sum of areas of all peaks obtained from the test solution

$$\text{Content (\%) of active bacitracin} = \frac{A_\text{A}}{A_\text{T}} \times \frac{A_\text{A} + A_\text{B1} + A_\text{B2} + A_\text{B3}}{A_\text{T}} \times 100 \quad (2)$$

A_A, A_B1, A_B2, A_B3: Peak areas of bacitracin A, B_1, B_2, and B_3, respectively

A_T: Sum of areas of all peaks obtained from the test solution

$$\text{Content (\%) of initial efflux peptide} = \frac{A_\text{i}}{A_\text{T}} \times 100 \quad (3)$$

A_i: Sum of areas of all peaks flown out before the bacitracin B_1 peak

A_T: Sum of areas of all peaks obtained from the test solution

$$\text{Content (\%) of bacitracin F} = \frac{A_\text{F}}{A_\text{A}} \times 100 \quad (4)$$

A_F: Peak area of bacitracin F

A_A: Peak area of bacitracin A

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silical gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of methanol, water, phosphate buffer (pH 6.0) and acetonitrile (26 : 15 : 5 : 2).

Flow rate: 1.0 mL/min

System suitability

System performance: Proceed with 100 μL of the peak verification solution according to the above conditions at the wavelength 300 nm and verify the location of the bacitracin F peak having a relative retention time of about 2.4. Change the wavelength to 254 nm, and proceed with 100 μL of the system suitability solution according to the above conditions to verify the active portions of bacitracin (bacitracin A, B_1, B_2 and B_3), initial efflux peptide flown out before the bacitracin B_1, and bacitracin F, based on the relative retention time. The relative retention times for bacitracin C_1, C_2, C_3, B_1, B_2, B_3 and F are about 0.5, 0.6, 0.6, 0.7, 0.7, 0.8 and 2.4. Also, the ratio of peak versus valley (*H*v/*H*p) is NMT 1.2, where *H*v is the height of the valley, at which the bacitracin B_1 peak is separated from the bacitracin B_2 peak from the baseline and *H*p is the height of the bacitracin B_1 peak from the baseline.

Time span of measurement: About 3 times the retention time of bacitracin A

Diluent—Dissolve 40 mg of ethylenediaminetetraacetic acid disodium salt dihydrate in 1000 mL of water and adjust pH to 7.0 with dilute sodium hydroxide TS.

System suitability solution—Weigh accurately an appropriate amount of bacitracin zinc RS and dissolve in the diluent to a known concentration of about 2.0 mg/mL.

Detection limit solution—Dilute the system suitability solution with water to known concentration of about 0.01 mg/mL.

Peak verification solution—Heat the system suitability solution on a steam bath for about 30 minutes and cool to room temperature.

Phosphate buffer (pH 6.0)—Dissolve 34.8 g of dibasic potassium phosphate in 1000 mL of water, and adjust pH to 6.0 with a solution made by dissolving 27.2 g of potassium dihydrogen phosphate in 1000 mL of water.

Assay (1) ***Bacitracin***—Standard curve method 1) Medium Agar media for seed and base layer Use the culture media under the Microbial Assays for Antibiotics A)(2)(A)⑥ⓐ.

2) ***Test organism***—Use *Micrococcus luteus* ATCC 10240 as the test organism.

3) Weigh accurately an appropriate amount of Bacitracin Zinc and dilute with 0.01 mol/L hydrochloric acid TS to obtain a solution having a known concentration of 100 units (potency) per mL. Pipet an appropriate amount of this solution, dilute with 1% phosphate buffer (pH 6.0) to obtain a solution having a known concentration of 1.00 unit (potency) per mL, and use this solution as the test solution. Separately, weigh accurately an appropriate amount of bacitracin RS, dilute with 0.01 mol/L hydrochloric acid TS to obtain a solution having a known concentration of 100 units (potency) per mL, and use this solution as the standard stock solution. Pipet an appropriate amount of this standard stock solution, dilute with 1% phosphate buffer (pH 6.0) to obtain solutions having known concentrations of 0.64, 0.80, 1.00, 1.25 and 1.56 units (potency) per mL, and use them as the standard solutions. Use the solution having known concentration of 1.00 unit (potency) per mL as the standard intermediate diluent. Perform the test with the test solution, the standard solution and the standard intermediate diluent as directed under the Microbial Assays for Antibiotics, B)(4).

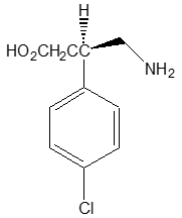
(2) ***Zinc***—Weigh accurately about 0.2 g (potency) of Bacitracin Zinc and dissolve in 0.01 mol/L hydrochloric acid TS to make 100 mL. Pipet 2 mL of this solution, add 0.001 mol/L hydrochloric acid TS to make exactly 200 mL, and use this solution as the test solution. Separately, weigh accurately about 3.11 g of zinc oxide, add 80 mL of 1 mol/L hydrochloric acid TS, warm to dissolve, and cool to room temperature. Then, add water to make exactly 250 mL. Pipet an appropriate amount of this solution, dilute with 0.001 mol/L hydrochloric acid TS to obtain solutions having known concentrations of 0.5, 1.5 and 2.5 μg of zinc per mL, and use these solutions as the standard solutions. Perform the test with the test solution and the standard solutions as directed under the Atomic Absorption Spectroscopy. Determine the absorbances of the test solution and the standard solutions at the wavelength 213.8 nm, using the 0.001 mol/L hydrochloric acid TS as the blank test solution, to obtain the concentration of zinc according to the calibration curve.

$$\text{Content (\%) of zinc} = \frac{C \times 100000}{W \times (100 - m)}$$

C: Concentration (μg/mL) of zinc in the test solution
W: Amount (mg) of Bacitracin Zinc taken
m: Loss on drying (%) of the sample

Packaging and storage Preserve in tight containers.

Baclofen
바클로펜



and enantiomer

$C_{10}H_{12}ClNO_2$: 213.66

(*RS*)-4-Amino-3-(4-chlorophenyl)butanoic acid [*1134-47-0*]

Baclofen contains NLT 98.5% and NMT 101.0% of baclofen ($C_{10}H_{12}$ $ClNO_2$), calculated on the anhydrous basis.

Description Baclofen occurs as a white to pale yellowish white crystalline powder.
It is freely soluble in acetic acid(100), slightly soluble in water, very slightly soluble in methanol and ethanol(95), and practically insoluble in ether.
It is soluble in dilute hydrochloric acid.

Identification (1) To 5 mL of an aqueous solution of Baclofen (1 in 1000), add 1 mL of ninhydrin TS, and heat on a steam bath for 3 minutes; the resulting solution turns a bluish purple color.

(2) Determine the absorption spectra of solutions of Baclofen and baclofen RS in 0.1 mol/L hydrochloric acid TS (1 in 2000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Perform the test with Baclofen as directed under the Flame Coloration (2); it exhibits a green color.

Purity (1) ***Chloride***—Dissolve 0.5 g of Baclofen in 50 mL of acetic acid(100) and add water to make 100 mL. To 10 mL of this solution, add 6 mL of dilute nitric acid and water to make 50 mL. Use this solution as the test solution and perform the test. To 0.30 mL of 0.01 mol/L hydrochloric acid, add 5 mL of acetic acid(100), 6 mL of dilute nitric acid and water to make 50 mL (NMT 0.21%). Use this solution as the control solution.

(2) ***Heavy metals*—**Proceed with 2.0 g of Baclofen according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Arsenic***—Proceed with 1.0 g of Baclofen according to Method 3 and perform the test (NMT 2 ppm).

(4) ***Related substances***—Dissolve 50 mg of Baclofen in 50 mL of the mobile phase and use this solution as the test solution. Pipet 1.0 mL and 1.5 mL of this solution, add the mobile phase to each to make exactly 100 mL, and use these solutions as the standard solution (1) and (2). Perform the test with 25 μL each of the test solution, the standard solution (1) and (2) as directed under the Liquid Chromatography according to the following conditions. Determine the peak height of each solution; each peak height of peaks other than baclofen obtained from the test solution is not higher than peak height of baclofen from the standard solution (1) and the sum of these peak heights is not higher than the peak height of baclofen from the standard solution (2).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 268 nm).

Column: A stainless steel column about 4 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 μm in particle diameter).

Mobile phase: A mixture of methanol and diluted acetic acid(100) (1 in 900) (3 : 2).

Flow rate: Adjust the flow rate so that the retention time of baclofen is about 4 minutes.

System suitability

Test for required detectability: Adjust so the peak height of baclofen obtained from 25 μL of the standard solution (1) is between 5 mm to 10 mm.

System performance: Dissolve 0.40 g of Baclofen and 5 mg of methyl *p*-hydroxybenzoate in 200 mL of the mobile phase. To 10 mL of this solution, add the mobile phase to make 100 mL. Proceed with 25 μL of this solution according to the above conditions; baclofen and methyl *p*-hydroxybenzoate are eluted in this order with the resolution between these peaks being NLT 5.

System repeatability: Repeat the test 6 times with 25 μL each of the standard solution (1) according to the above conditions; the relative standard deviation of the baclofen peak height is NMT 3.0%.

Time span of measurement: About 3 times the retention time of baclofen after the solvent peak.

Water NMT 1.0% (1 g, volumetric titration, direct titration).

Residue on ignition NMT 0.3% (1 g).

Assay Weigh accurately about 0.5 g of Baclofen, dissolve in 80 mL of acetic acid(100), and titrate with 0.1 mol/L perchloric acid VS (indicator: 2 drops of methylrosaniline chloride TS). The endpoint of titration is when the violet color changes to blue and then to greenish blue. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 21.366 mg of $C_{10}H_{12}ClNO_2$

Packaging and storage Preserve in well-closed containers.

Baclofen Tablets
바클로펜 정

Baclofen Tablets contain NLT 93.0% and NMT 107.0% of baclofen ($C_{10}H_{12}ClNO_2$: 213.66).

Method of preparation Prepare as directed under Tablets, with Baclofen.

Identification (1) Take a portion of powdered Baclofen Tablets, equivalent to 10 mg of baclofen according to the labeled amount, add 10 mL of water, shake well to mix, and filter. To 5 mL of the filtrate, add 1 mL of ninhydrin TS, and perform the test as directed under the Identification (1) of Baclofen.

(2) Take a portion of powdered Baclofen Tablets, equivalent to 25 mg of baclofen according to the labeled amount, add 50 mL of 0.1 mol/L hychloric acid TS, shake for 15 minutes to mix, and filter. Determine the absorption spectrum of the filtrate as directed under the Ultraviolet-visible Spectroscopy; it exhibits maxima 257 nm to 261 nm, 264 nm to 268 nm and 272 nm to 276 nm.

(3) Weigh a portion of powdered Baclofen Tablets, equivalent to 10 mg of baclofen according to the labeled amount, and add 2 mL of a mixture of methanol and acetic acid(100) (4 : 1). After shaking well to mix, centrifuge, and use the clear supernatant as the test solution. Separately, dissolve 10 mg of baclofen RS in 2 mL of a mixture of methanol and acetic acid(100) (4 : 1), and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 20 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography (with a fluorescent indicator). Next, develop the plate with a mixture of 1-butanol, water and acetic acid(100) (4 : 1 : 1) (as the developing solvent) to a distance of about 10 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the R_f values of the spots obtained from the test solution and the standard solution are the same.

Dissolution Perform the test with 1 tablet of Baclofen Tablets at 50 revolutions per minute according to Method 2 under the Dissolution, using 500 mL of water as the dissolution medium. Take NLT 20 mL of the dissolved solution 45 minutes after starting the dissolution test, filter through a membrane filter with a pore size of not exceeding 0.8 μm, and discard the first 10 mL of the filtrate. Take exactly V mL of the subsequent filtrate, add water to make exactly V' mL of a solution containing about 10 μg of baclofen ($C_{10}H_{12}ClNO_2$) per mL, and use this solution as the test solution. Separately, weigh accurately about 10 mg of baclofen RS (previously measured the water content), and dissolve in water to make exactly 100 mL. Pipet 10 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at the wavelength of 220 nm as directed under the Ultraviolet-visible Spectroscopy. Meets the requirements if the dissolution rate of Baclofen Tablets for 45 minutes is NLT 70%.

Dissolution rate (%) for the labeled amount of baclofen ($C_{10}H_{12}ClNO_2$)

$$= W_S \times \frac{A_T}{A_S} \times \frac{V'}{V} \times \frac{1}{C} \times 50$$

W_S: Amount (mg) of baclofen RS, calculated on the anhydrous basis

C: Labeled amount of baclofen ($C_{10}H_{12}ClNO_2$) in 1 tablet

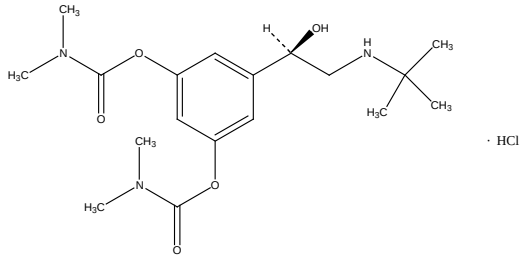
Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass NLT 20 tablets of Baclofen Tablets, and powder. Weigh accurately a portion of this powder, equivalent to about 50 mg of baclofen ($C_{10}H_{12}ClNO_2$), add 130 mL of 0.1 mol/L hydrochloric acid TS, shake to mix for 10 minutes, add 0.1 mol/L hydrochloric acid TS to make exactly 200 mL, and centrifuge. Take exactly 10 mL of the clear supernatant, add 2 drops of phenolphthalein TS, neutralize it with dilute sodium hydroxide TS, add water to make exactly 50 mL, and use this solution as the test solution. Separately, weigh accurately about 0.25 g of the baclofen TS (previously measured the water content), and dissolve in 0.1 mol/L hydrochloric acid TS to make exactly 100 mL. Take exactly 10 mL of this solution and add 0.1 mol/L hydrochloric acid TS to make exactly 100 mL. Take accurately 10 mL of this solution, add 2 drops of phenolphthalein TS, neutralize with dilute sodium hydroxide TS, add water to make exactly 50 mL, and use this solution as the standard solution. Take accurately 2 mL of the test solution and the standard solution, add 4 mL of ninhydrin-tin(II) chloride TS to each, and shake to mix. Heat on a steam bath for 20 minutes, and immediately shake vigorously for 2 minutes to mix. After cooling, add a mixture of water and 1-propanol (1 : 1) to each to make exactly 25 mL. With these solutions, perform the test as directed under the Ultraviolet-visible Spectroscopy, and determine the absorbances, A_T and A_S, of each solution obtained from the test solution and the standard solution at the wavelength of 570 nm, using a solution, prepared with 2 mL of water in the same procedure, as a control solution.

Amount (mg) of baclofen ($C_{10}H_{12}ClNO_2$)
= Amount (mg) of baclofen RS,
as calculated on the anhydrous basis $\times \frac{A_T}{A_S} \times \frac{1}{5}$

Packaging and storage Preserve in well-closed containers.

Bambuterol Hydrochloride
밤부테롤염산염



and enantiomer

$C_{18}H_{29}N_3O_5 \cdot HCl$: 403.90

(*RS*)-[3-[2-(*tert*-Butylamino)-1-hydroxyethyl]-5-(dimethylcarbamoyloxy)phenyl] *N,N*-dimethyl-carbamate hydrochloride [*81732-46-9*]

Bambuterol Hydrochloride contains NLT 98.5% and NMT 101.5% of bambuterol hydrochloride ($C_{18}H_{29}N_3O_5 \cdot HCl$), calculated on the dried basis.

Description Bambuterol Hydrochloride occurs as a white crystalline powder.
It is freely soluble in water and soluble in ethanol(95).
It shows polymorphism.

Identification (1) Determine the infrared spectra of Bambuterol Hydrochloride and bambuterol hydrochloride RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers. If any difference appears between the spectra, perform the following: dissolve Bambuterol Hydrochloride and bambuterol hydrochloride RS in a mixture of acetone and water (6:1) by shaking, allow the mixture to stand in an ice bath, dry the resulting precipitate in vacuum at 50 ℃, and re-determine the spectra.

(2) An aqueous solution of Bambuterol Hydrochloride (1 in 50) responds to the Qualitative Analysis (2) for chloride.

Optical rotation $[\alpha]_D^{20}$: Between -0.10° and +0.01° (0.4 g calculated on the anhydrous basis, water, 20 mL, 100 mm).

Purity (1) ***Acidity or alkalinity***—Dissolve 4.0 g of Bambuterol Hydrochloride in water to make exactly 20 mL. Add 0.2 mL of methyl red TS and 0.2 mL of 0.01 mol/L hydrochloric acid to 10 mL of this solution; the solution exhibits a red color. Then, add 0.4 mL of 0.01 mol/L sodium hydroxide; the solution exhibits a yellow color.

(2) ***Related substances***—Weigh 5.0 mg of Bambuterol Hydrochloride, dissolve in the mobile phase to make exactly 10 mL. Use this solution as the test solution. Separately, dissolve 1.0 mg of formoterol fumarate hydrate RS in the mobile phase to make exactly 10 mL. Mix 0.8 mL of this solution and 0.4 mL of the test solution and add the mobile phase to make 100 mL. Use this solution as the standard solution (1). Add the mobile phase to 1.0 mL of the test solution to make exactly 50 mL, and add the mobile phase to 2.0 mL of this solution to make exactly 20 mL. Use this solution as the standard solution (2). Use the mobile phase as the blank test solution. Perform the test with 20 μL each of the blank test solution, test solution, and standard solution as directed under the Liquid Chromatography according to the following conditions. The area of each peak other than the major peak obtained from the test solution is not greater than the area of the major peak obtained from the standard solution (2) (NMT 0.2%), and the total area of all peaks other than the major peaks is not greater than 3 times the area of the major peak obtained from the solution (NMT 0.6%). Exclude any peaks from the blank test solution and any peaks with an area not greater than 0.25 times the area of the major peak from the standard solution (2).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 214 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with base-deactivated octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: Dissolve 1.3 g of sodium octanesulfonate in 430 mL of a mixture of methanol and acetonitrile (75 : 25). Mix this solution and 570 mL of phosphate buffer solution.

Flow rate: 1.5 mL/min

System suitability

System performance: Proceed with 20 μL of the standard solution (2) according to the above conditions to adjust the height of the major peak to about 50% of full scale. Proceed with 20 μL of the standard solution (1) according to the above conditions; the retention times of formoterol and bambuterol are about 7 minutes and about 9 minutes respectively, with the resolution being NLT 5.0.

Time span of measurement: 1.5 times the retention time of bambuterol.

Phosphate buffer solution—Dissolve 6.90 g of sodium dihydrogen phosphate monohydrate in water to make 1000 mL, and adjust the pH to 3.0 with 5 w/v% phosphoric acid.

Water NMT 0.5% (0.5 g, volumetric titration, direct titration).

Residue on ignition NMT 0.1% (1 g).

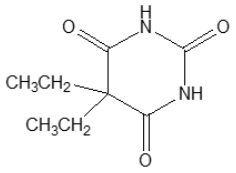
Assay Weigh accurately about 0.32 g of Bambuterol Hydrochloride, dissolve in 50 mL of ethanol(95), add 5 mL of 0.01 mol/L hydrochloric acid, mix, and titrate with 0.1 mol/L sodium hydroxide VS (potentiometric titration

under the Titrimetry). Determine the endpoint between the two inflection points. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS
= 40.39 mg of $C_{18}H_{29}N_3O_5 \cdot HCl$

Packaging and storage Preserve in well-closed containers.

Barbital
바르비탈



$C_8H_{12}N_2O_3$: 184.19
5,5-Diethyl-1,3-diazinane-2,4,6-trione [*57-44-3*]

Barbital, when dried, contains NLT 99.0% and NMT 101.0% of barbital (C8H12N2O3).

Description Barbital occurs as colorless to white crystals or a crystalline powder.
It is freely soluble in acetone or pyridine, soluble in ethanol(95), sparingly soluble in ether, and slightly soluble in water or chloroform.
It is soluble in sodium hydroxide TS or ammonia TS.
The pH of the saturated solution of Barbital is between 5.0 and 6.0.

Identification (1) Add 10 mL of sodium hydroxide TS to 0.2 g of Barbital and boil; the gas produced changes a moistened litmus paper to blue.

(2) Dissolve 50 mg of Barbital in 5 mL of diluted pyridine (1 in 10), add 0.3 mL of copper(II) sulfate TS, shake to mix, and allow to stand for 5 minutes; a purple precipitate is formed. To this, add 5 mL of chloroform and mix; the chloroform layer exhibits a purple color. Separately, weigh 50 mg of Barbital, dissolve in 2 to 3 drops of ammonia-ammonium chloride buffer solution, pH 10.7 and 5 mL of diluted pyridine (1 in 10), and add 5 mL of chloroform and 0.3 mL of copper(II) sulfate TS; a purple precipitate is formed in the water layer, and this precipitate is insoluble in chloroform when shaken to mix.

(3) Add 0.1 g of anhydrous sodium carbonate and 4 mL of water to 0.4 g of Barbital, and shake to mix. To this solution, add 0.3 g of 4-nitrobenzyl chloride in 7 mL of ethanol(95), heat on a water bath with a reflux condenser for 30 minutes, and allow to stand for 1 hour. Filter the precipitated crystals. Wash the crystals with 7 mL of sodium hydroxide TS and a small volume of water, recrystallize with a mixture of ethanol(95) and chloroform (1 : 1), and dry at 105 ℃ for 30 minutes; the melting point is between 192 and 196 ℃

Melting point Between 189 and 192 ℃.

Purity (1) ***Clarity and color of solution—*** Dissolve 0.5 g of Barbital in 5 mL of sodium hydroxide TS; the solution is colorless and clear.

(2) ***Chloride—***Dissolve 0.30 g of Barbital in 20 mL of acetone, add 6 mL of dilute nitric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution as follows; to 0.30 mL of 0.01 mol/L hydrochloric acid , add 20 mL of acetone, 6 mL of dilute nitric acid, and water to make 50 mL (NMT 0.035%).

(3) ***Sulfate—***Dissolve 0.40 g of Barbital in 20 mL of acetone, add 1 mL of dilute hydrochloric acid and add water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution as follows; to 0.40 mL of 0.005 mol/L sulfuric acid, add 20 mL of acetone, 1 mL of dilute hydrochloric acid, and water to make 50 mL (NMT 0.048%).

(4) ***Heavy metals—***Proceed with 1.0 g of Barbital as directed under Method 2 and perform the test. Prepare the control solution with 2.0 mL of the standard lead solution (NMT 20 ppm).

(5) ***Readily carbonizable substances—*** Weigh 0.5 g of Barbital and perform the test. The color of the solution is not more intense than that of Matching fluids for color A.

Loss on drying NMT 1.0% (0.5 g, 105 ℃, 2 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.4 g of Barbital, previously dried, dissolve in 5 mL of ethanol(95) and 50 mL of chloroform, and titrate with 0.1 mol/L potassium hydroxide-ethanol VS (indicator: 1 mL of alizarin yellow GG-thymolphthalein TS). The endpoint of titration is when the yellow color of the solution changes from pale blue through to violet. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L potassium hydroxide-ethanol VS
= 18.419 mg of $C_8H_{12}N_2O_3$

Packaging and storage Preserve in well-closed containers.

Barium Sulfate
황산바륨

Barium Sulfate $BaSO_4$: 233.39
Barium(2+) sulfate [*7727-43-7*]

Description Barium Sulfate occurs as a white powder. It

is odorless and tasteless.
It is practically insoluble in water, ethanol(95), or ether and insoluble in hydrochloric acid, nitric acid, or sodium hydroxide TS.

Identification (1) Transfer 0.5 g of Barium Sulfate into a crucible, add 2 g each of anhydrous sodium carbonate and anhydrous potassium carbonate, mix well, and fuse by heating. After cooling, transfer into hot water, filter while stirring to mix, and add hydrochloric acid to the filtrate. The resulting solution responds to the Qualitative Analysis for sulfate.

(2) Wash hot water insoluble residue (1) with water, dissolve in 2 mL of acetic acid(31), and filter if necessary. Magnesium Glycerophosphate responds to the Qualitative Analysis for barium salt.

Purity (1) ***Acidity or alkalinity***—To 1.0 g of Barium Sulfate, add 20 mL of water, and shake well to mix for 5 minutes; the resulting solution is neutral.

(2) ***Phosphate***—To 1.0 g of Barium Sulfate, add 3 mL of nitric acid and 5 mL of water, and boil for 5 minutes. After cooling, add water to make the initial volume, filter with the filter paper washed with dilute nitric acid, add the same volume of ammonium molybdate TS, and allow to stand at 50 to 60 ℃ for 1 hour; a yellow precipitate does not form.

(3) ***Sulfide***—Transfer 10 g of Barium Sulfate into a 250-mL Erlenmeyer flask, add 10 mL of dilute hydrochloric acid and water to make 100 mL, and boil for 10 minutes; the produced gas does not change moistened lead acetate paper to black.

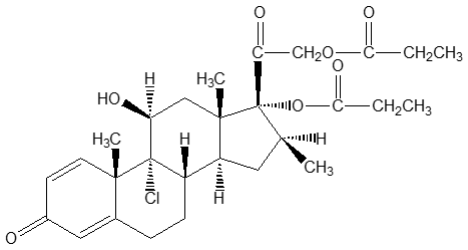
(4) ***Heavy metals***—To 5.0 g of Barium Sulfate, add 2.5 mL of acetic acid(100) and 50 mL of water, and boil for 10 minutes. After cooling, add 0.5 mL of ammonia TS and water to make 100 mL, and filter. Perform the test with 50 mL of the filtrate as the test solution. Prepare the control solution by adding 2.5 mL of lead standard solution, acetic acid(100), 0.25 mL of dilute Ammonia TS acid, and water to make 50 mL (NMT 10 ppm).

(5) ***Arsenic***—Prepare the test solution with 2.0 g of Barium Sulfate according to Method 1 and perform the test (NMT 1 ppm).

(6) ***Hydrochloric acid solubles and soluble barium salt—***Cool the solution from (3), add water to make 100 mL, and filter. Evaporate 50 mL of the filtrate to dryness on a steam bath. To the residue, add 2 drops of hydrochloric acid and 10 mL of warm water, filter with filter paper for quantitative analysis, wash with 10 mL of warm water, and combine the filtrate and the washings. Again, evaporate to dryness, and dry the residue at 105 ℃ for 1 hour; the amount of the residue is NMT 15 mg. If there is residue, add 10 mL of water, shake to mix, filter, and add 0.5 mL of dilute sulfuric acid to the filtrate. Allow to stand for 30 minutes; the resulting solution is not turbid.

Packaging and storage Preserve in well-closed containers.

Beclomethasone Dipropionate
베클로메타손디프로피오네이트



$C_{28}H_{37}ClO_7$: 521.04
(8*S*,9*R*,10*S*,11*S*,13*S*,14*S*,16*S*,17*R*)-9-Chloro-11-hydroxy-10,13,16-trimethyl-3-oxo-17-[2-(propanoyloxy)ethanoyl]-6,7,8,9,10,11,12,13,14,15,16,17-dodecahydro-3*H*-cyclopenta[a]phenanthren-17-yl propanoate [*5534-09-8*]

Beclomethasone Dipropionate, when dried, contains NLT 97.0% and NMT 103.0% of beclomethasone dipropionate ($C_{28}H_{37}ClO_7$).

Description Beclomethasone Dipropionate occurs as a white to pale yellow powder. It is odorless.
It is freely soluble in chloroform, soluble in methanol, sparingly soluble in ethanol(95) or 1,4-dioxane, slightly soluble in ether, and practically insoluble in water.

Melting point—About 208 °C (with decomposition).

Identification (1) Dissolve 2 mg of Beclomethasone Dipropionate in 2 mL of sulfuric acid; the solution exhibits a yellowish color initially, and it gradually turns orange to dark reddish brown. To this solution, carefully add 10 mL of water; the color of the solution turns bluish green, and a flocculent precipitate is formed.

(2) Dissolve 10 mg of Beclomethasone Dipropionate in 1 mL of methanol, add 1 mL of Fehling's TS, and heat; a red to reddish brown precipitate is formed.

(3) Weigh 20 mg of Beclomethasone Dipropionate and use a mixture of 1 mL of sodium hydroxide TS and 20 mL of water as the absorbent. Prepare the test solution, as directed under the Oxygen Flask Combustion; the test solution responds to the Qualitative Analysis for chloride.

(4) Determine the infrared spectra of Beclomethasone Dipropionate and beclomethasone dipropionate RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers. If there is any difference between the spectra, perform the following: dissolve each of Beclomethasone Dipropionate and beclomethasone dipropionate RS in ethanol(95), evaporate ethanol(95), and perform the test with the residue in the same manner.

Optical rotation $[\alpha]_D^{20}$: Between + 108° and + 115° (0.1

g, previously dried, ethanol(95), 10 mL, 100 mm).

Purity (1) ***Heavy metals***—Proceed with 0.5 g of Beclomethasone Dipropionate according to Method 2 and perform the test. Prepare the control solution with 1.5 mL of lead standard solution (NMT 30 ppm).

(2) ***Related substances***—Dissolve 20 mg of Beclomethasone Dipropionate in 5 mL of methanol, and use this solution as the test solution. Pipet 1 mL of this solution, add methanol to make exactly 50 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin-layer chromatography. Spot 5 μL each of the test solution and the standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of toluene, methanol, and water (100 : 25 : 1) (as the developing solvent) to a distance of about 15 cm, and allow to air-dry the plate. Spray evenly alkaline blue tetrazolium TS on the plate; the spots other than the principal spot from the test solution are not more intense than the spot from the standard solution.

Loss on drying NMT 0.5% (0.5 g, 105 ℃, 3 hours).

Residue on ignition NMT 0.1% (0.5 g).

Assay Weigh accurately, about 20 mg each of Beclomethasone Dipropionate and Beclomethasone Dipropionate RS, previously dried, and dissolve each in methanol to make exactly 50 mL. Pipet 10 mL each of the test solution and the standard solution, add exactly 10 mL of the internal standard solution to each, and then add methanol to make 50 mL. Use these solutions as the test solution and the standard solution, respectively. Perform the test with 20 μL each of the test solution and the standard solution, as directed under the Liquid Chromatography to the following conditions, and calculate the peak area ratios of beclomethasone dipropionate to the internal standard for the test solution and the standard solution, Q_T and Q_S, respectively.

Amount (mg) of beclomethasone dipropionate ($C_{28}H_{37}ClO_7$)
= Amount (mg) of beclomethasone dipropionate RS × $\frac{Q_T}{Q_S}$

Internal standard solution—A solution of testosterone dipropionate in the methanol (1 in 4000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 20 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μ*m* in particle diameter).

Column temperature: A constant temperature of about 25 ℃.

Mobile phase: A mixture of acetonitrile and water (3:2).

Flow rate: Adjust the flow rate so that the retention time of beclomethasone dipropionate is about 6 minutes.

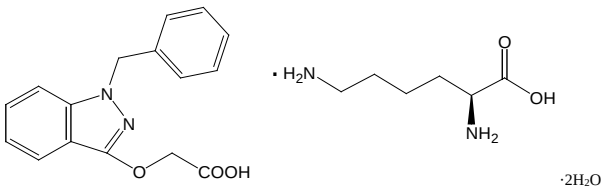
System suitability

System performance: Proceed with 20 μL of the standard solution according to the above conditions; beclomethasone dipropionate and the internal standard are eluted in this order with the resolution between these peaks being NLT 8.

System repeatability: Perform the test 6 times with 20 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area ratio of beclomethasone dipropionate to the internal standard is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Bendazac Lysine Hydrate
벤다작리신수화물



$C_{22}H_{28}N_4O_5 \cdot 2H_2O$: 464.52

L-Lysine 2-[[1-(phenylmethyl)-1*H*-indazol-3-yl] oxy]acetate (1:1) dihydrate, [*81919-14-4*]

Bendazac Lysine Hydrate, when dried, contains NLT 98.0% and NMT 102.0% of bendazac lysine ($C_{22}H_{28}N_4O_5$: 428.49).

Description Bendazac Lysine Hydrate occurs as a white to pale brown crystalline powder. It has a slight, characteristic odor.

It is soluble in water, sparingly soluble in methanol, slightly soluble in ethanol, and practically insoluble in chloroform and ether.

Identification (1) Dissolve 5 g of Bendazac Lysine Hydrate in 100 mL of water, heat to 80 ℃, and add 15 mL of 1 mol/L hydrochloric acid while shaking to mix. Shake well to mix and allow the precipitate to stand at 80 ℃ for 15 minutes. Filter immediately without cooling and wash the residue several times with distilled water. Dry the filtered precipitate under reduced pressure of 2.67 kPa at 105 ℃ and transfer 10 mg of the precipitate to a test tube. Add 2 - 3 drops of thionyl chloride and evaporate to dryness. Add 2 drops of a saturated ethanolic solution of hydroxylamine hydrochloride and 2 drops of 0.5 mol/L potassium hydroxide ethanolic solution to alkalify. Heat on a steam bath for 2 minutes and add 0.5 mol/L hydrochloric acid to acidify. To this solution, add an aqueous solution of 1% iron(III) chloride; the resulting solution exhibits a reddish brown color.

(2) Transfer 2 mL of a 1.5 mg/mL aqueous solution of Bendazac Lysine Hydrate to a test tube, add 0.5 mL of pyridine and 1 mL of a mixture of an aqueous solution of 0.5% pyridine-2-aldehyde and 0.1 mol/L cobalt nitrate (2 : 1), prepared before use, heat on a steam bath for 3 minutes, and cool; the resulting solution exhibits a violet color.

(3) Determine the absorption spectrum of the test solution in the Assay as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum at the wavelength of about 306 nm.

(4) Determine the infrared spectra of Bendazac Lysine Hydrate and bendazac lysine hydrate RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

pH Dissolve 3.5 g of Bendazac Lysine Hydrate in 100 mL of water; the pH of this solution is between 5.5 and 7.5.

Melting point Between 179 and 184 °C.

Optical rotation $[\alpha]_D^{20}$: Between +4.2° and +4.6° (drying, 3.5 g, water, 100 mL, 100 mm).

Purity (1) ***Clarity and color of solution***—A 3.2% aqueous solution of Bendazac Lysine Hydrate is clear.

(2) ***Chloride***—Transfer 1.8 g of Bendazac Lysine Hydrate to a 100-mL volumetric flask, dissolve in 75 mL of water, add 18 mL of 10% nitric acid, dilute with water to volume, mix, and filter. Take 33.3 mL of the filtrate and perform the test as directed under the Chloride. Prepare the control solution with 0.25 mL of 0.01 mol/L hydrochloric acid (NMT 0.015%).

(3) ***Sulfate***—Transfer 1.8 g of Bendazac Lysine Hydrate to a 100-mL volumetric flask, dissolve in 75 mL of water, add 18 mL of 10% nitric acid, dilute with water to volume, mix, and filter. Take 33.3 mL of the filtrate and perform the test as directed under the Sulfate. Prepare the control solution with 0.5 mL of 0.005 mol/L sulfuric acid (NMT 0.040%).

Loss on drying NMT 8.20% (1 g, 105 ℃).

Residue on ignition NMT 0.2% (1 g).

Assay Weigh accurately about 0.5 g of Bendazac Lysine Hydrate, previously dried, dissolve in 20 mL of 0.1 mol/L sodium hydroxide solution with shaking, and add water to make 200 mL. Pipet 2.0 mL of this solution, add water to make 200 mL, and use this solution as the test solution. Separately, weigh accurately about 0.5 g of bendazac lysine hydrate RS, previously dried, proceed in the same manner as the test solution, and use this solution as the standard solution. Perform the test with the test solution and the standard solution as directed under the Ultraviolet-visible Spectroscopy, and determine the absorbances, A_T and A_S, at the wavelength of 306 nm, respectively.

Amount (mg) of bendazac lysine ($C_{22}H_{28}N_4O_5$)
= Amount (mg) of bendazac lysine hydrate RS× $\frac{A_T}{A_S}$

Packaging and storage Preserve in tight containers.

Bendazac Lysine Tablets
벤다작리신 정

Bendazac Lysine Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of bendazac lysine hydrate ($C_{22}H_{28}N_4O_5 \cdot 2H_2O$: 464.52).

Method of preparation Prepare as directed under Tablets, with Bendazac Lysine Hydrate.

Identification Weigh an amount of Bendazac Lysine Tablets, equivalent to 20 mg of bendazac lysine hydrate according to the labeled amount, add 20 mL of methanol, shake to dissolve, and use the filtrate as the test solution. Separately, weigh 10 mg of bendazac lysine hydrate RS, dissolve in 10 mL of methanol, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography (with a fluorescent indicator). Next, develop the plate with a mixture of toluene, methyl ethyl ketone, and acetic acid(100) (45 : 45 : 4) as the developing solvent to a distance of about 15 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the color and R_f values of the spots obtained from the test solution and the standard solution are the same.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

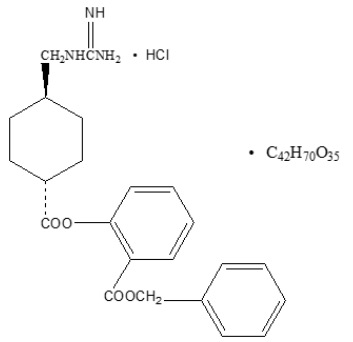
Assay Weigh accurately the mass of NLT 20 tablets of Bendazac Lysine Tablets, and powder. Weigh accurately an amount, equivalent to 0.5 g of bendazac lysine hydrate ($C_{22}H_{28}N_4O_5 \cdot 2H_2O$), add 20 mL of 0.1 mol/L sodium hydroxide solution, shake to dissolve, add water to make 200 mL, and filter. Pipet 2.0 mL of the filtrate, add water to make 200 mL, and use this solution as the test solution. Separately, weigh accurately about 0.5 g of bendazac lysine hydrate RS, proceed in the same manner as in the preparation of the test solution, and use this solution as the standard solution. Perform the test using the test solution and the standard solution as directed under the Ultraviolet-visible Spectroscopy, measure the absorbance A_T and A_S at a wavelength of 306 nm.

Amount (mg) of bendazac lysine hydrate
($C_{22}H_{28}N_4O_5 \cdot 2H_2O$)

= Amount (mg) of bendazac lysine hydrate RS× $\frac{A_T}{A_S}$

Packaging and storage Preserve in tight containers.

Benexate Hydrochloride Betadex
베넥세이트염산염베타덱스



$C_{23}H_{27}N_3O_4 \cdot HCl \cdot C_{42}H_{70}O_{35}$: 1580.94

β-Cyclodextrin trans-phenylmethyl 2-[[[4-[[(aminoiminomethyl)amino]methyl]cyclohexyl]carbonyl]oxy]benzoate hydrochloride (1:1:1), [*91574-91-3*]

Benexate Hydrochloride Betadex contains NLT 97.5% and NMT 101.5% of benexate hydrochloride betadex ($C_{23}H_{27}N_3O_4 \cdot C_{42}H_{70}O_{35}$: 1580.94), calculated on the anhydrous basis.

Description Benexate Hydrochloride Betadex occurs as a white crystalline powder. It is odorless and has a bitter taste.

It is soluble in water, slightly soluble in acetic acid(100), very slightly soluble in methanol or ethanol, and practically insoluble in acetonitrile, ether or chloroform.

Melting point—About 221℃ (with decomposition).

Identification (1) To 4 mL of an aqueous solution of Benexate Hydrochloride Betadex (1 in 500), add 0.5 mL of a solution of α-naphthol in ethanol (1 in 50), 1 mL of diacetyl TS, and 5 mL of water to, then add 1 mL of sodium hydroxide TS, shake to mix, and allow to stand for 30 minutes; the solution exhibits a red color.

(2) Weigh 0.2 g of Benexate Hydrochloride Betadex, add 20 mL of methanol, shake to mix. Filter the residue to collect, wash 3 times with 2 mL each of methanol, dry the residue at 105 ℃ for 1 hour, then dissolve in 5 mL of water, by heating if necessary. After cooling, add 2 mL of iodine TS, heat the resulting precipitate on a steam bath to dissolve, and then allow to stand at room temperature, 1 ~ 30 ℃; yellowish brown precipitates are formed.

(3) Determine the absorption spectrum of Benexate Hydrochloride Betadex as directed in the potassium bromide disk method under the Mid-infrared spectroscopy; it exhibits absorption at the wavenumbers of about 2930 cm^{-1}, 1725 cm^{-1}, 1664 cm^{-1}, 1153 cm^{-1}, 1077 cm^{-1} and 1026 cm^{-1}.

(4) An aqueous solution of Benexate Hydrochloride Betadex (1 in 50) responds to the Qualitative Analysis 1) for chloride.

Optical rotation $[\alpha]_D^{20}$: Between +107 and +114° (0.5 g calculated on the anhydrous basis, water, 50 mL, 100 mm).

Purity (1) ***Clarity and color of solution***—Dissolve 0.10 g of Benexate Hydrochloride Betadex in 10 mL of water; the solution is colorless.

(2) ***Heavy metals***—Proceed with 2.0 g of Benexate Hydrochloride Betadex as directed under Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Benexate hydrochloride***—Weigh accurately 0.5 g of Benexate Hydrochloride Betadex, transfer it into a 50-mL volumetric flask, add 30 mL of acetonitrile, and allow to stand for 5 minutes with occasional shaking. Add 5.0 mL of internal standard solution, add acetonitrile again to make 50 mL and filter. Pipet 10.0 mL of this solution and add water to make 20 mL. Use this solution as the test solution. Separately, weigh accurately about 0.1 g of benexate hydrochloride betadex RS and dissolve in acetonitrile to make 50 mL. Pipet 5.0 mL of this solution, add 5.0 mL of internal standard solution, add 50 mL of acetonitrile again to make 50 mL, and then filter. Pipet 10.0 mL of this solution and add water to make 20 mL. Use this solution as the standard solution. Perform the test with 20 μL each of the test solution and standard solution as directed under the Liquid Chromatography under Assay. Determine the ratio of the peak area, Q_T and Q_S, of benexate hydrochloride to the peak area of the internal standard for each solution; the percentage of the amount of benexate hydrochloride is NMT 1.0%.

$$\text{Content (\%) of benexate hydrochloride } (C_{23}H_{27}N_3O_4 \cdot HCl) = \frac{\text{Amount (mg) of benexate hydrochloride RS, calculated on the anhydrous basis}}{\text{Amount (mg) of sample, calculated on the anhydrous basis}} \times \frac{Q_T}{Q_S} \times 10$$

Internal standard solution—A solution of phenyl benzoate in acetonitrile (1 in 1000).

(4) ***Benzyl salicylate***—Use the solution obtained from Assay as the test solution. Separately, weigh accurately about 20 mg of benzyl salicylate RS and dissolve in a mixture of water and acetonitrile (1 : 1) to make 100 mL. Pipet 5.0 mL of this solution, and add a mixture of water and acetonitrile (1 : 1) to make 50 mL. Weigh 10.0 mL of the resulting solution, add 10.0 mL of the internal standard solution, and then add a mixture of water and acetonitrile (1 : 1) to make 50 mL. Use this solution as the standard solution. Perform the test with 10 μL each of

the test solution and standard solution as directed under the Liquid Chromatography under Assay, and determine the ratio of the peak areas, Q_T and Q_S, of benzyl salicylate to that of the internal standard in each solution; the amount of benzyl salicylate is NMT 0.2%.

$$\text{Content (\%) of benzyl salicylate } (C_{14}H_{12}O_3 : 228.25) = \frac{\text{Amount (mg) of benzyl salicylate RS, calculated on the anhydrous basis}}{\text{Amount (mg) of sample, calculated on the anhydrous basis}} \times \frac{Q_T}{Q_S}$$

Internal standard—A solution of phenyl benzoate in a mixture of water and acetonitrile (1:1) (1 in 400).

(5) **R*elated substances***—Weigh 0.2 g of Benexate Hydrochloride Betadex, dissolve it in 10 mL of a mixture of water and acetonitrile (3 : 1). Use this solution as the test solution. Separately, weigh 4.0 mg of trans-4-guanidinomethylcyclohexanecarboxylic acid hydrochloride RS, and dissolve in a mixture of water and acetonitrile (3 : 1) to make 100 mL. Use this solution as the standard solution. Spot 5 μL each of the test solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, water, and acetic acid (3 : 1 : 1) as the developing solvent to a distance of about 10 cm and air-dry the plate. Evenly spray a solution of 8-oxyquinoline in acetone (1 in 1000) on the plate, air-dry it again, and then evenly spray bromine-sodium hydroxide TS to the plate; the spots other than the principal spot from the test solution are not more intense than those from the standard solution.

Water NMT 5.0% (0.2 g, volumetric titration, back titration).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.15 g of Benexate Hydrochloride Betadex, dissolve in 30 mL of a mixture of water and acetonitrile (1 : 1), add 10.0 mL of internal standard solution, and then add a mixture of water and acetonitrile (1 : 1) to make 50 mL. Use this solution as the test solution. Separately, weigh accurately about 90 mg of benexate hydrochloride betadex RS, dissolve in a mixture of water and acetonitrile (1 : 1), add 20.0 mL of internal standard solution, and then add a mixture of water and acetonitrile (1 : 1) again to make 100 mL. Use this solution as the standard solution. Perform the test with 10 μL each of the test solution and standard solution as directed under the Liquid Chromatography, determine the peak areas of benexate hydrochloride and internal standard in each solution by as directed in the automatic integration method, and then determine the ratio of the peak areas, Q_T and Q_S, of the benexate hydrochloride to that of the internal standard.

$$\text{Amount (mg) of benexate hydrochloride betadex } (C_{23}H_{27}N_3O_4\cdot HCl\cdot C_{42}H_{70}O_{35}) = \text{Amount (mg) of benexate hydrochloride RS, calculated on the anhydrous basis} \times \frac{Q_T}{Q_S} \times \frac{1580.94}{445.95} \times \frac{1}{2}$$

1580.94: Molecular weight of benexate hydrochloride betadex

445.95: Molecular weight of benexate hydrochloride

Internal standard solution—A solution of phenyl benzoate in a mixture of water and acetonitrile (1 : 1) (1 in 400).

Operating conditions

Detector: An ultraviolet-visible spectrometer (wavelength: 290 nm).

Column: A stainless-steel column about 4 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

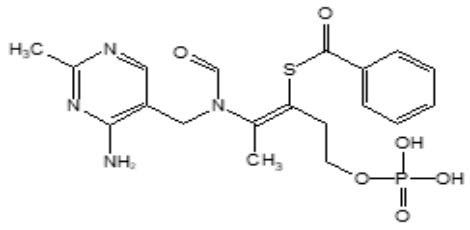
Mobile phase: A mixture of acetonitrile, acetic acid (pH 4.3) and sodium acetate buffer solution (11 : 9).

Flow rate: Adjust the flow rate so that the retention time of the internal standard is about 8 minutes.

Selection of column: Proceed with 10 μL of the standard solution under the above conditions and select the column in which benexate hydrochloride and the internal standard are eluted in this order with the resolution being NLT 3.

Packaging and storage Preserve in tight containers.

Benfotiamine
벤포티아민



$C_{19}H_{23}N_4O_6PS$: 466.45

S-[2-[[(4-Amino-2-methyl-5-pyrimidinyl)methyl]formylamino]-1-[2-(phosphonooxy)ethyl]-1-propen-1-yl] benzenecarbothioic acid ester, [*22457-89-2*]

Benfotiamine, when dried, contains NLT 98.0% and

NMT 102.0% of benfotiamine ($C_{19}H_{23}N_4O_6PS$).

Description Benfotiamine occurs as white crystals or a crystalline powder and is odorless.
It is freely soluble in water or in methanol, slightly soluble in ethanol and practically insoluble in ether or in chloroform.

Melting point—About 200 ℃ (with decomposition).

Identification (1) Dissolve 5 mg of Benfotiamine in 100 mL of acetic acid-sodium acetate buffer solution, pH 4.5. To 1 mL of this solution, add 2 mL of cysteine hydrochloride TS and 1 mL of enzyme TS and warm it at 50 ℃ for 40 minutes. After cooling, add 6 mL of cyanogen bromide TS for thiamine assay, shake to mix for about 30 seconds, add 4 mL of sodium hydroxide solution (3 in 10) and 10 mL of 1-butanol, and shake vigorously to mix. After centrifugation, examine the resulting solution under ultraviolet light; the 1-butanol layer exhibits purplish blue fluorescence. Add more cysteine hydrochloride TS and enzyme TS; the fluorescence disappears.

Cysteine hydrochloride TS—Dissolve 0.7 g of L-cysteine hydrochloride in10 mL of acetic acid-sodium acetate buffer solution, pH 5.0, adjust pH to 5.0, and add acetic acid-sodium acetate buffer solution, pH 5.0 to make 20 mL.

Enzyme TS—Add acetic acid-sodium acetate buffer solution (pH 5.0) to 1 g of the enzyme obtained from *Aspergillus*, which has strong starch saccharifying activity and strong phosphate ester dissociation activity, to make 100 mL. Prepare before use.

(2) To 10 mg of Benfotiamine, add 2 drops of the saturated methanolic solution of hydroxylamine hydrochloride, heat on a steam bath for 3 minutes, allow to stand for 1 minute, add 1 drop of the saturated methanolic solution of potassium hydroxide, and heat the solution until boils. After cooling, add hydrochloric acid (1 in 10) to acidify and add 1 drop of iron(III) chloride TS; the resulting solution exhibits a reddish purple color.

(3) To 50 mg of Benfotiamine, add 1 mL of nitric acid, heat for 1 to 2 minutes, add 5 mL of water and 1 mL of ammonium molybdate TS, and warm again; a yellow precipitate is formed. This precipitate is soluble in ammonia TS.

Purity (1) ***Clarity and color of solution***—Dissolve 0.5 g of Benfotiamine in 10 mL of dilute hydrochloric acid; the resulting solution is colorless and clear.

(2) ***Chloride***—Proceed with 0.2 g of Benfotiamine and perform the test. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid (NMT 0.053%).

(3) ***Sulfate***—Dissolve 1.5 g of Benfotiamine in 3 mL of dilute hydrochloric acid by warming. After cooling, add water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with of 0.35 mL of 0.005 mol/L sulfuric acid, 3 mL of dilute hydrochloric acid and water to make 50 mL (NMT 0.011%).

(4) ***Heavy metals***—Dissolve 1.0 g of Benfotiamine in 5 mL of dilute hydrochloric acid, add 25 mL of water, neutralize with about 3 mL of ammonia TS, and add 2 mL of dilute acetic acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution as follows: dissolve 0.5 g of Benfotiamine in 2.5 mL of dilute hydrochloric acid, add 25 mL of water and about 1.5 mL of ammonia TS to neutralize, and add 2 mL of dilute acetic acid, 1.0 mL of lead standard solution and water to make 50 mL (NMT 20 ppm).

(5) ***Benzoic acid***—Dissolve 1.0 g of Benfotiamine in 15 mL of ether, shake to mix, and filter. Rinse the filter paper with 15 mL of ether, combine the filtrate and the washings, and evaporate it to dryness on a steam bath. To the resulting residue, dissolve in 5 mL of water by warming, and immediately add 3 drops of hydrogen peroxide water (2 in 175), and heat on a steam bath for 5 minutes. After cooling, add 2 drops of iron(III) chloride TS and allow it to stand for 20 minutes; the resulting solution does not exhibit a red color.

(6) ***Thiamine***—Dissolve 50 mg of Benfotiamine in 10 mL of 0.1 mol/L hydrochloric acid by warming and cool it down. To 1 mL of this solution, add 3 mL of cyanogen bromide TS for thiamine assay, shake to mix, add 1 mL of sodium hydroxide solution (3 in 10) and 10 mL of 1-butanol, shake vigorously to mix, and allow it to stand still. Then, filter the 1-butanol layer and examine the filtrate under ultraviolet light (main wavelength: 365 nm); the fluorescence that appears is not more intense than that appears in the solution prepared in the same manner with an aqueous solution containing 5 μg of thiamine hydrochloride per mL (thiamine hydrochloride: NMT 0.1%).

Loss on drying NMT 1.5% (1 g, 105 ℃, 2 hours).

Assay Weigh accurately about 35 mg of Benfotiamine, previously dried, and perform the test as directed under the Analysis for Vitamins.

Packaging and storage Preserve in well-closed containers.

Benfotiamine, Pyridoxine Hydrochloride and Cyanocobalamin capsules
벤포티아민·피리독신염산염·시아노코발라민 캡슐

Benfotiamine, Pyridoxine Hydrochloride and Cyanocobalamin Capsules contain NLT 90.0% and NMT 130.0% of the labeled amount of benfotiamine ($C_{19}H_{23}N_4O_6PS$: 466.45), NLT 90.0% and NMT 150.0% of the labeled amount of pyridoxine hydrochloride

($C_8H_{11}NO_3 \cdot HCl$: 205.64) and cyanocobalamin ($C_{63}H_{88}CoN_{14}O_{14}P$: 1355.38).

Method of preparation Prepare as directed under Capsules, with Benfotiamine, Pyridoxine Hydrochloride and Cyanocobalamin.

Identification ***Benfotiamine, pyridoxine hydrochloride and cyanocobalamin***—Perform the test as directed under the Analysis for Vitamins with the contents of Benfotiamine, Pyridoxine Hydrochloride and Cyanocobalamin Capsules.

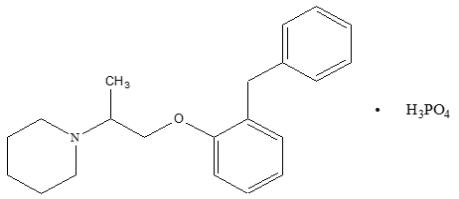
Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Benfotiamine, pyridoxine hydrochloride and cyanocobalamin—Weigh accurately the mass of contents of NLT 20 capsules of Benfotiamine, Pyridoxine Hydrochloride and Cyanocobalamin Capsules and perform the test as directed under the Analysis for Vitamins.

Packaging and storage Preserve in well-closed containers.

Benproperine Phosphate
벤프로페린인산염



$C_{21}H_{27}NO \cdot H_3PO_4$: 407.44

1-[1-Methyl-2-[2-(phenylmethyl) phenoxy]ethyl]piperidine trihydrogen phosphate, [*19428-14-9*]

Benproperine Phosphate contains NLT 98.0% and NMT 101.0% of benproperine phosphate ($C_{21}H_{27}NO \cdot H_3PO_4$), calculated on the anhydrous basis.

Description Benproperine Phosphate occurs as a white crystalline powder and has a characteristic odor.
It is freely soluble in methanol or in acetic acid(100), soluble in water, and insoluble in ethanol(95) or in dichloromethane.
The pH of the aqueous solution of Benproperine Phosphate (1 in 20) is between 4.0 and 6.0.

Identification (1) To 5 mL of the aqueous solution of Benproperine Phosphate (1 in 200), add 1 mL of dilute hydrochloric acid and 5 drops of Reinecke salt TS; a pale red precipitation is formed.

(2) To 25 mL of the aqueous solution of Benproperine Phosphate (1 in 50), add 5 mL of sodium hydroxide TS, and extract three times with 5 mL each of dichloromethane. To the water layer, add 5 mL of dilute nitric acid and 1 mL of ammonium molybdate TS; the resulting solution exhibits a pale yellow color. Heat this solution; a yellow precipitate is formed.

(3) Determine the absorption spectrum of the aqueous solution of Benproperine Phosphate (1 in 10000) as directed under the Ultraviolet-visible Spectroscopy; it exhibits maxima between 268 nm and 272 nm and between 274 nm and 278 nm.

Melting point Between 149 and 153 ℃.

Purity (1) ***Clarity and color of solution***—Dissolve 0.10 g of Benproperine Phosphate in 10 mL of water; the resulting solution is colorless and clear.

(2) ***Heavy metals***—Proceed with 1.0 g of Benproperine Phosphate according to Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Arsenic***—Proceed with 1.0 g of Benproperine Phosphate according to Method 3 and perform the test (NMT 2 ppm).

(4) ***Related substances***—Weigh 0.10 g of Benproperine Phosphate, dissolve in methanol to make 10 mL, and use this solution as the test solution. Pipet 1.0 mL of this solution, add methanol to make exactly 100 mL, and use this solution as the standard solution. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Develop the plate with a mixture of isobutanol and ammonia water(28) (3 : 1) to a distance of about 10 cm, and air-dry the plate. Allow the plate to stand in a container filled with iodine vapor; the spots other than the principal spot obtained from the test solution are not more intense than the spots obtained with the standard solution.

Water NMT 1.5% (0.3 g, volumetric titration, direct titration).

Assay Weigh accurately about 0.8 g of Benproperine Phosphate, dissolve in 40 mL of acetic acid(100) for nonaqueous titration, and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 40.74 mg of $C_{21}H_{27}NO \cdot H_3PO_4$

Packaging and storage Preserve in tight containers.

Benproperine Phosphate Tablets
벤프로페린인산염 정

Benproperine Phosphate Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of benproperine phosphate ($C_{21}H_{27}NO \cdot H_3PO_4$: 407.44).

Method of preparation Prepare Benproperine Phosphate Tablets as directed under Tablets, with Benproperine Phosphate.

Identification (1) Weigh an amount of Benproperine Phosphate Tablets, equivalent to 40 mg of benproperine, according to the labeled amount, add 20 mL of water, shake to mix, and filter. Add 2 drops of dilute hydrochloric acid to 10 mL of the filtrate, and add 5 drops of ammonium reinecke salt TS; a pink precipitate is formed.

(2) Add dilute nitric acid to a portion of the filtrate in (1) to make it acidic, add ammonium molybdate TS, and warm; Yellow precipitates are formed. These precipitates dissolve when sodium hydroxide solution or ammonia TS is added.

Dissolution Perform the test with 1 tablet of Benproperine Phosphate Tablets at 50 revolutions per minute according to Method 2 under the Dissolution, using 900 mL of Solution 2 as the dissolution medium. Take the dissolved solution 45 minutes after starting the Dissolution and filter it. Discard the first 10 mL of the filtrate, pipet *V* mL of the subsequent filtrate, add the dissolution medium to make exactly *V'* mL so that it contains about 100 μg of benproperine phosphate per mL according to the labeled amount, and use this solution as the test solution. Separately, weigh accurately about 20 mg of benproperine phosphate RS, and add the dissolution medium to make exactly 200 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of benproperine phosphate ($C_{21}H_{27}NO \cdot H_3PO_4$) from each solution. Meets the requirements if the dissolution rate of Benproperine Phosphate Tablets in 45 minutes is NLT 75%.

Dissolution rate (%) according to the labeled amount of benproperine phosphate ($C_{21}H_{27}NO \cdot H_3PO_4$)

$$= W_S \times (V' / V) \times (A_T / A_S) \times (1 / C) \times 90$$

W_S: Amount (mg) of benproperine phosphate RS

C: Labeled amount (mg) of benproperine phosphate ($C_{21}H_{27}NO \cdot H_3PO_4$) in 1 tablet

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 270 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: A mixture of methanol and 0.1 mol/L ammonium acetate solution (pH 3.3) (3 : 1).

Flow rate: 1.0 mL/min

0.1 mol/L ammonium acetate solution (pH 3.3)— Dissolve 7.7 g of ammonium acetate in 800 mL of water, add acetic acid(100) to adjust pH to 3.3, and add water to make 1000 mL.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 tablets of Benproperine Phosphate Tablets, and powder. Weigh accurately an amount, equivalent to 5 mg of benproperine phosphate ($C_{21}H_{27}NO \cdot H_3PO_4$), add the mobile phase to make exactly 100 mL, filter, and use the filtrate as the test solution. Separately, weigh accurately about 50 mg of benproperine phosphate RS, and add the mobile phase to make exactly 100 mL. Pipet 10 mL of this solution, add the mobile phase to it make exactly 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography, and determine the peak area, A_T and A_S, of benproperine phosphate in each solution.

Amount (mg) of benproperine phosphate ($C_{21}H_{27}NO \cdot H_3PO_4$)

$$= \text{Amount (mg) of benproperine phosphate RS} \times (A_T / A_S) \times 0.1$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 270 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: A mixture of methanol and 0.1 mol/L ammonium acetate solution (pH 3.3) (3 : 1).

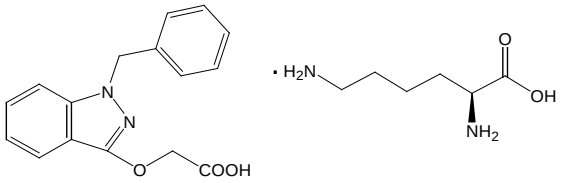
Flow rate: 1.0 mL/min

System suitability

System repeatability: Repeat the test 6 times with 10 μL of the standard solution under the above operating conditions; the relative standard deviation of the peak area of benproperine phosphate is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Benserazide Hydrochloride
벤세라지드염산염



and enantiomer

$C_{10}H_{15}N_3O_5 \cdot HCl$: 293.70

2-Amino-3-hydroxy-*N′*-[(2,3,4-trihydroxyphenyl)methyl]propanehydrazidehydrochloride [*14919-77-8*]

Benserazide Hydrochloride contains NLT 98.0% and NMT 101.0% of benserazide hydrochloride ($C_{10}H_{15}N_3O_5 \cdot HCl$), calculated on the anhydrous basis.

Description Benserazide Hydrochloride occurs as a white to grayish white crystalline powder.
It is freely soluble in water or formic acid, sparingly soluble in methanol, very slightly soluble in ethanol(95), and practically insoluble in ether.
It is hygroscopic.
It is gradually colored by light.
An aqueous solution of Benserazide Hydrochloride (1 in 100) shows no optical rotation.
Dissolve 1.0 g of Benserazide Hydrochloride in 100 mL of water; the pH of this solution is between 4.0 and 5.0.

Identification (1) Determine the absorption spectra of the solutions of Benserazide Hydrochloride and benserazide hydrochloride RS in 0.1 mol/L hydrochloric acid TS (1 in 10000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Benserazide Hydrochloride and benserazide hydrochloride RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both exhibit similar intensities of absorption at the same wavenumbers.

(3) To 10 mL of an aqueous solution of Benserazide Hydrochloride (1 in 30), add silver nitrate TS; a white precipitate is formed. To a portion of the precipitate, add dilute nitric acid; the precipitate does not dissolve.

Purity (1) ***Clarity and color of solution***—Dissolve 0.5 g of Benserazide Hydrochloride in 10 mL of water and perform the test as directed under the Ultraviolet-visible Spectroscopy; the absorbance at the wavelength of 430 nm is NMT 0.10.

(2) ***Heavy metals***—Proceed with 1.0 g of Benserazide Hydrochloride according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Related substances***—Perform the test using light-resistant containers. Dissolve 0.25 g of Benserazide Hydrochloride in 10 mL of methanol and use this solution as the test solution. Pipet 1 mL and 3 mL each of this solution, add methanol to make exactly 200 mL, and use these solutions as the standard solution (1) and the standard solution (2). With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 2 μL each of the test solution, the standard solution (1) and the standard solution (2) on the thin-layer chromatographic plate made of cellulose for thin-layer chromatography. Next, develop the plate with a solution of formic acid in sodium chloride TS (1 in 1000) (as the developing solvent) to a distance of about 10 cm, and air-dry the plate. Spray evenly sodium carbonate TS on the plate, air-dry, and spray evenly Folin's TS; the spots other than the principal spot obtained from the test solution are not more intense than the spot obtained from the standard solution (2), and the number of spots which are more intense than the spot obtained from the standard solution (1) is NMT 2.

Water NMT 2.5% (0.5 g, volumetric titration, direct titration). But use a solution of salicylic acid in methanol for water determination (3 in 20) instead of methanol for water determination.

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.3 g of Benserazide Hydrochloride, dissolve in 5 mL of formic acid, add 50 mL of acetic acid(100), and titrate immediately with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 29.370 mg of $C_{10}H_{15}N_3O_5 \cdot HCl$

Packaging and storage Preserve in light-resistant, tight containers.

Benzalkonium Chloride
벤잘코늄염화물

Benzalkonium Chloride is presented as $[C_6H_5CH_2N(CH_3)_2R]Cl$, where R ranges from C_8H_{17} to $C_{18}H_{37}$ and mainly consists of $C_{12}H_{25}$ and $C_{14}H_{29}$.

Benzalkonium Chloride contains NLT 95.0% and NMT 105.0% of benzalkonium chloride ($C_{22}H_{40}ClN$: 354.01), calculated on the anhydrous basis.

Description Benzalkonium Chloride occurs as a white to yellowish white power, a colorless to pale yellow gelatin-shaped small piece, jelly-like fluid or a mass.
It has a characteristic odor.
It is very soluble in water or ethanol(95), and practically insoluble in ether.
An aqueous solution of Benzalkonium Chloride foams

heavily when shaken.

Identification (1) Dissolve 0.2 g of Benzalkonium Chloride in 1 mL of sulfuric acid, add 0.1 g of sodium nitrate, and heat on a steam bath for 5 minutes. After cooling, add 10 mL of water and 0.5 g of zinc powder, heat for 5 minutes, cool it down, and filter. The filtrate responds to the Qualitative Analysis for primary aromatic amine. The resulting solution exhibits a red color.

(2) To 2 mL of an aqueous solution of Benzalkonium Chloride (1 in 1000), add a mixture of 0.2 mL of bromophenol blue solution (1 in 2000) and 0.5 mL of sodium hydroxide TS; the resulting solution exhibits a blue color. To the resulting solution, add 4 mL of chloroform and shake well to mix; the blue color is moved to the chloroform layer. Separately, take the chloroform layer, and add dropwise a solution of sodium lauryl sulfate (1 in 1000) while shaking to mix; the chloroform layer becomes colorless.

(3) Determine the absorption spectra of Benzalkonium Chloride and benzalkonium chloride RS in 0.1 mol/L hydrochloric acid TS (1 in 2000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(4) To 1 mL of an aqueous solution of Benzalkonium Chloride (1 in 100), add 2 mL of ethanol(95) and 0.5 mL of dilute nitric acid and 1 mL of silver nitrate TS; a white precipitate is formed. The precipitate does not dissolve on the addition of dilute nitric acid, but dissolves on the addition of ammonia TS.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Benzalkonium Chloride in 10 mL of water; the resulting solution is clear and colorless to pale yellow.

(2) ***Petroleum ether-soluble substances***—To 3.0 g of Benzalkonium Chloride, add water to make 50 mL, and then add 50 mL of ethanol(99.5). Add 5 mL of 0.5 mol/L sodium hydroxide TS and extract three times with 50-mL portions of petroleum ether. Combine the petroleum ether extracts, wash three times with 50-mL portions of dilute ethanol, add 10 g of anhydrous sodium sulfate, and shake well to mix. Filter through a dried filter paper, wash the paper two times with 10-mL portions of petroleum ether, evaporate petroleum ether on a water bath by heating, and dry the residue at 105 ℃ for 1 hour; the residue is NMT 1.0%.

Water NMT 15.0% (0.2 g, volumetric titration, direct titration).

Residue on ignition NMT 0.2% (1 g).

Assay Weigh accurately about 0.15 g of Benzalkonium Chloride, dissolve in 75 mL of water, add dropwise diluted dilute hydrochloric acid (1 in 2) to adjust the pH between 2.6 and 3.4. Add 1 drop of methyl orange TS and titrate with 0.02 mol/L sodium tetraphenylborate VS until the solution exhibits a red color.

Each mL of 0.02 mol/L sodium tetraphenylborate VS
= 7.080 mg of $C_{22}H_{40}ClN$

Packaging and storage Preserve in tight containers.

Benzalkonium Chloride Solution
벤잘코늄염화물 액

Benzalkonium Chloride Solution is an aqueous solution containing NMT 50.0 w/v% of benzalkonium chloride.
Benzalkonium Chloride Solution contains NLT 93.0% and NMT 107.0% of benzalkonium chloride ($C_{22}H_{40}ClN$: 354.01), according to the labeled amount.

Method of preparation Prepare with Benzalkonium Chloride dissolved in Tap Water or Purified Water. Prepare with Benzalkonium Chloride Concentrated Solution 50 diluted in Tap Water or Purified Water.

Description Benzalkonium Chloride Solution occurs as a clear and colorless to pale yellow liquid and has a characteristic odor.
It foams heavily on shaking.

Identification (1) Weigh an amount of Benzalkonium Chloride Solution, equivalent to 0.2 g of Benzalkonium Chloride, according to the labeled amount, evaporate to dryness on a steam bath, and perform the test as directed under the Identification (1) of Benzalkonium Chloride.

(2) Weigh an amount of Benzalkonium Chloride Solution, equivalent to 0.01 g of Benzalkonium Chloride, according to the labeled amount, and add water to make 10 mL. With 2 mL of this solution, perform the test as directed under the Identification (2) of Benzalkonium Chloride.

(3) Weigh an amount of Benzalkonium Chloride Solution, equivalent to 1g of benzalkonium chloride, according to the labeled amount, and if necessary, add water or concentrate on a steam bath to make 10 mL. To 1 mL of this solution, add 0.1 mol/L hydrochloric acid TS to make 200 mL, and perform the test with the resulting solution as directed under the Identification (3) of Benzalkonium Chloride.

(4) Weigh an amount of Benzalkonium Chloride Solution, equivalent to 0.1 g of Benzalkonium Chloride, according to the labeled amount, and if necessary, add water or concentrate on a steam bath to make 10 mL. With 1 mL of this solution, perform the test as directed under the Identification (4) of Benzalkonium Chloride.

Assay Weigh an amount of Benzalkonium Chloride Solution, equivalent to about 0.15 g of benzalkonium chloride ($C_{22}H_{40}ClN$), add water to make 75 mL if necessary, and perform the test as directed under the Assay of Benzalkonium Chloride.

Each mL of 0.02 mol/L sodium tetraphenylborate VS
= 7.080 mg of $C_{22}H_{40}ClN$

Packaging and storage Preserve in tight containers.

Benzalkonium Chloride Concentrated Solution 50
벤잘코늄염화물농축액 50

Benzalkonium Chloride Concentrated Solution 50 is an aqueous solution, presented as $[C_6H_5CH_2N(CH_3)_2R]Cl$, where R ranges from C_8H_{17} to $C_{18}H_{37}$ and mainly consists of $C_{12}H_{25}$ and $C_{14}H_{29}$.

Benzalkonium Chloride Concentrated Solution 50 contains NLT 50.0% and NMT 55.0% of benzalkonium chloride ($C_{22}H_{40}ClN$: 354.01).

Description Benzalkonium Chloride Concentrated Solution 50 occurs as a colorless to pale yellow liquid or jelly-like fluid, and has a characteristic odor.
It is very soluble in water or ethanol(95) and practically insoluble in ether.
A solution prepared by adding water to Benzalkonium Chloride Concentrated Solution 50 foams heavily when shaken.

Identification (1) Dissolve 0.4 g of Benzalkonium Chloride Concentrated Solution 50 in 1 mL of sulfuric acid, add 0.1 g of sodium nitrate, and heat on a steam bath for 5 minutes. After cooling, add 10 mL of water and 0.5 g of zinc powder, heat for 5 minutes, allow to cool, and filter. The filtrate responds to the Qualitative Analysis for primary aromatic amine. The resulting solution exhibits a red color.

(2) To 2 mL of an aqueous solution of Benzalkonium Chloride Concentrated Solution 50 (1 in 500), add a mixture of 0.2 mL of bromophenol blue solution (1 in 2000) and 0.5 mL of sodium hydroxide TS; the resulting solution exhibits a blue color. To this solution, add 4 mL of chloroform and shake well to mix; the blue color is moved to the chloroform layer. Separately, take the chloroform layer, and add dropwise a solution of sodium lauryl sulfate (1 in 1000) while shaking to mix; the chloroform layer becomes colorless.

(3) Determine the absorption spectra of Benzalkonium Chloride Concentrated Solution 50 and benzalkonium chloride RS in 0.1 mol/L hydrochloric acid TS (1 in 1000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(4) To 1 mL of an aqueous solution of Benzalkonium Chloride Concentrated Solution 50 (1 in 50), add 2 mL of ethanol(95), 0.5 mL of dilute nitric acid and 1 mL of silver nitrate TS; a white precipitate is formed. The precipitate does not dissolve on the addition of dilute nitric acid, but dissolves on the addition of ammonia TS.

Purity (1) ***Clarity and color of solution***—Dissolve 2.0 g of Benzalkonium Chloride Concentrated Solution 50 in 10 mL of water; the resulting solution is clear and colorless to pale yellow.

(2) ***Petroleum ether-soluble substances***—Weigh 6.0 g of Benzalkonium Chloride Concentrated Solution 50, add water to make 50 mL, and add 50 mL of ethanol(99.5). Add 5 mL of 0.5 mol/L sodium hydroxide TS and extract with three 50-mL portions of petroleum ether. Combine the petroleum ether extracts, wash with three 50-mL portions of dilute ethanol, add 10 g of anhydrous sodium sulfate, and shake well to mix. Filter through a dried filter paper, wash the paper with two 10-mL portions of petroleum ether, evaporate petroleum ether by heating on a steam bath, and dry the residue at 105 ℃ for 1 hour; the residue is NMT 1.0%.

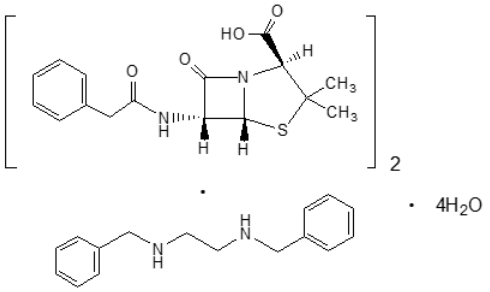
Residue on ignition NMT 0.2% (1 g).

Assay Weigh accurately about 0.30 g of Benzalkonium Chloride Concentrated Solution 50, dissolve in 75 mL of water, add dropwise diluted dilute hydrochloric acid (1 in 2) to adjust the pH between 2.6 and 3.4. Add 1 drop of methyl orange TS and titrate with 0.02 mol/L sodium tetraphenylborate VS until the solution exhibits a red color.

Each mL of 0.02 mol/L sodium tetraphenylborate VS
= 7.080 mg of $C_{22}H_{40}ClN$

Packaging and storage Preserve in tight containers.

Benzathine Penicillin G Hydrate
벤자틴페니실린G수화물



Benzathine Penicillin G
$(C_{16}H_{18}N_2O_4S)_2 \cdot C_{16}H_{20}N_2 \cdot 4H_2O$: 981.19
(2*S*,5*R*,6*R*)-3,3-Dimethyl-7-oxo-6-(2-phenyl-acetamido)-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid compound with *N*,*N*-dibenzylethylenediamine (2 : 1), tetrahydrate [*41372-02-5*]

Benzathine Penicillin G Hydrate is the *N*,*N*-dibenzylethylenediamine salt of a penicillin compound with antibacterial activity produced by the growth of the *Penicillium* genus.

Benzathine Penicillin G Hydrate contains NLT 1213

units (potency) and NMT 1333 unit (potency) of penicillin G sodium ($C_{16}H_{17}N_2O_4S$: 356.37) per mg, calculated on the anhydrous basis. 1 unit is equivalent to 0.6 μg of penicillin G sodium. Benzathine Penicillin G Hydrate contains NLT 24.0% and NMT 27.0% of *N*,*N*-dibenzylethylenediamine ($C_{16}H_{20}N_2$: 240.34), calculated on the anhydrous basis.

Description Benzathine Penicillin G Hydrate occurs as a white crystalline powder.
It is slightly soluble in methanol or ethanol(99.5) and practically insoluble in water.

Identification (1) Determine the absorption spectra of the solutions of Benzathine Penicillin G Hydrate and benzathine penicillin G RS in methanol (1 in 2000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Benzathine Penicillin G Hydrate and benzathine penicillin G RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both exhibit similar intensities of absorption at the same wavenumbers.

Crystallinity Meets the requirements.

Benzathine penicillin G Weigh accurately about 50 mg of Benzathine Penicillin G Hydrate, dissolve in methanol, and make exactly 100 mL. With this solution, determine the absorbance at the wavelength of 263 nm using methanol as the control solution and calculate $E_{1cm}^{1\%}$.

$$\text{Content (\%) of benzathine penicillin G} = E_{1cm}^{1\%} \times \frac{100}{7}$$

Optical rotation $[\alpha]_D^{20}$: Between +217° and +233° (0.1 g, calculated on the anhydrous basis, methanol, 20 mL, 100 mm).

pH The pH of a saturated solution of Benzathine Penicillin G Hydrate is between pH 5.0 and 7.5.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Benzathine Penicillin G Hydrate according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Arsenic***—Proceed with 1.0 g of Benzathine Penicillin G Hydrate according to Method 3 and perform the test (NMT 2 ppm).

(3) ***Related substances***—Dissolve 70 mg of Benzathine Penicillin G Hydrate in 25 mL of methanol, add a solution, prepared by dissolving 1.02 g of anhydrous sodium dihydrogen phosphate and 6.80 g of potassium dihydrogen phosphate in water to make 1000 mL, to make 50 mL, and use this solution as the test solution. Pipet 1.0 mL of the test solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL each of the test solution and the standard solution according to the following conditions as directed under the Liquid Chromatography. Determine the peak area of each of the solutions; the area of the peak with the relative retention time of 2.4 for penicillin G from the test solution is not greater than 2 times the total area of peaks of penicillin G and *N*,*N*-dibenzylethylenediamine from the standard solution. The individual peak area other than the peak with the relative retention time of about 2.4 for penicillin G, *N*,*N*-dibenzylethylenediamine and benzylpenicillin from the test solution is not greater than the total area of peaks of penicillin G and *N*,*N*-dibenzylethylenediamine from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

Column: A stainless steel column about 4.0 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: Control the gradient elution by changing the mixing ratio of the mobile phases A and B as directed under the following table.

Mobile phase A: A mixture of water, methanol and 0.25 mol/L potassium dihydrogen phosphate TS (pH 3.5) (6 : 3 : 1).

Mobile phase B: A mixture of methanol, water and 0.25 mol/L potassium dihydrogen phosphate TS (pH 3.5) (6 : 3 : 1).

Time (min)	Mobile Phase A (vol%)	Mobile Phase B (vol%)
0 - 10	75	25
10 - 20	75 → 0	25 → 100
20 - 55	0	100

Flow rate: 1.0 mL/min

System suitability

Test for required detectability: Pipet 1 mL of the standard solution and add the mobile phase A to make exactly 20 mL. Verify that the peak area of penicillin G obtained from 20 μL of this solution is 3.5% - 6.5% of the peak area of penicillin G obtained from the standard solution.

System performance: Proceed with 20 μL of the standard solution according to the above conditions; *N*,*N*-dibenzylethylenediamine and penicillin G are eluted in this order with the resolution being NLT 25.

System repeatability: Repeat the test 3 times with 20 μL each of the standard solutions according to the above conditions; the relative standard deviation of the peak area of penicillin G is NMT 2.0%.

Time span of measurement: About 3 times the retention time of penicillin G after the solvent peak.

Water Between 5.0% and 8.0% (1 g, volumetric titration, direct titration).

Sterility It meets the requirements when Benzathine Penicillin G Hydrate is used in the manufacturing of sterile preparations. However, it is exempt from the requirements when there is a final sterilization process in the manufacturing process of sterile preparations.

Bacterial endotoxins Less than 0.01 EU per 100 units (potency) of penicillin G when used in the manufacturing of sterile preparations.

Assay (1) ***Penicillin G***—Weigh accurately an amount of Benzathine Penicillin G Hydrate, equivalent to about 85000 units, and dissolve in 25 mL of methanol. Add a portion of a 1000 mL solution, dissolving 1.02 g of anhydrous sodium dihydrogen phosphate and 6.80 g of potassium dihydrogen phosphate in water, to make exactly 50 mL. Pipet 5mL of this solution, add a mixture of the solution, prepared by dissolving 1.02 g of anhydrous sodium dihydrogen phosphate and 6.80 g of potassium dihydrogen phosphate in water to make 1000 mL, and methanol (1 : 1) to make exactly 20 mL, and use this solution as the test solution. Separately, weigh accurately an amount of penicillin G potassium RS, equivalent to about 85000 units, and about 25 mg of *N,N*-dibenzylethylenediamine diacetate, dissolve in 25 mL of methanol. Add the solution, prepared by dissolving 1.02 g of anhydrous sodium dihydrogen phosphate and 6.80 g of potassium dihydrogen phosphate in water to make 1000 mL, to make exactly 50 mL. Pipet 5mL of this solution, add 50 mL of the solution, prepared by dissolving 1.02 g of anhydrous sodium dihydrogen phosphate and 6.80 g of potassium dihydrogen phosphate in water to make 1000 mL, and 50 mL of methanol to make exactly 20 mL, and use this solution as the standard solution. Pipet 20 μL each of the test solution and the standard solution, perform the test as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S of penicillin G, respectively.

$$\text{Amount (unit) of penicillin G sodium} = \text{Potency (unit) of penicillin G potassium RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: Water, methanol and 0.25 mol/L potassium dihydrogen phosphate TS (pH 3.5) (11 : 17 : 2)

Flow rate: Adjust the flow rate so that the retention time of penicillin G is about 18 minutes.

System suitability

System performance: Proceed with 20 μL of the standard solution according to the above conditions; *N,N*-dibenzylethylenediamine and penicillin G are eluted in this order with the resolution being NLT 20.

System repeatability: Repeat the test 6 times with 20 μL each of the standard solutions according to the above conditions; the relative standard deviations of the peak areas of *N,N*-dibenzylethylenediamine and penicillin G are NMT 2.0%, respectively.

(2) ***N,N-Dibenzylethylenediamine***—From the chromatograms of the test solution and the standard solution obtained from (1), calculate the peak areas, A_T and A_S, respectively, equivalent to *N,N*-dibenzylethylenediamine.

$$\text{Content (\%) of } N,N\text{-dibenzylethylenediamine } (C_{16}H_{20}N_2) = \frac{\text{Amount (mg) of } N,N\text{-Dibenzylethylenediamine diacetate taken}}{\text{Amount (mg) of Benzathine Penicillin G Hydrate taken}} \times \frac{A_T}{A_S} \times 100 \times 0.667$$

0.667: Conversion factor from *N,N*-dibenzylethylenediamine diacetate ($C_{16}H_{20}N_2 \cdot 2CH_3COOH$) to *N,N*-dibenzylethylenediamine (benzathine, C_{16202})

Packaging and storage Preserve in light-resistant, tight containers.

Benzathine Penicillin G for Injectable Suspension
현탁주사용 벤자틴페니실린G

Benzathine Penicillin G for Injectable Suspension is an injectable suspension, suspended before use, and contains NLT 90.0% and NMT 120.0% of the labeled amount of benzathine penicillin G hydrate [$(C_{16}H_{18}N_2O_4S)_2 \cdot C_{16}H_{20}N_2 \cdot 4H_2O$: 981.19].

Method of preparation Prepare as directed under Injections, with Benzathine Penicillin G Hydrate.

Description Benzathine Penicillin G for Injectable Suspension occurs as a white to pale yellowish white crystalline powder.

Identification Determine the infrared spectra of Benzathine Penicillin G for Injectable Suspension and benzathine penicillin G hydrate RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

pH The pH of a saturated solution of Benzathine Penicillin G for Injectable Suspension is between pH 5.0 and 7.5.

Sterility Meets the requirements.

Bacterial endotoxins Less than 0.01 EU per 100 units (potency) of penicillin G.

Uniformity of dosage units Meets the requirements.

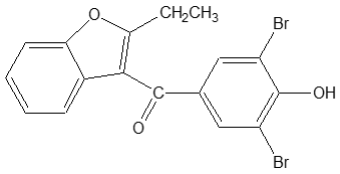
Water NMT 8.0% (0.1 g, volumetric titration, direct titration).

Assay Weigh accurately an appropriate amount of Benzathine Penicillin G for Injectable Suspension, dissolve with 1 mol/L sodium hydroxide TS to obtain a solution with a concentration of 2000 units (potency) per mL, and use this solution as the test solution. Pipet 2 mL of the test solution, place in a flask with a glass stopper, allow to stand for 15 minutes, add exactly 2.0 mL of diluted hydrochloric acid (1 in 10) and 10 mL of 0.01 mol/L iodine solution, and allow to stand for 15 minutes. Add 5 mL of carbon tetrachloride and shake if necessary, and titrate with 0.01 mol/L sodium thiosulfate VS using a micro burette until the solution in the flask turns colorless. In case of adding carbon tetrachloride, titrate until the carbon tetrachloride layer turns colorless. Use between 0.2 mL and 0.5 mL of starch TS as the indicator, if necessary. Separately, weigh accurately an amount of penicillin G sodium hydrate RS, equivalent to the amount of the sample taken, dissolve in 1% phosphate buffer solution, pH 6.0, to prepare a solution containing 2000 units (potency) per mL, and use this solution as the standard solution. Pipet 2 mL of the standard solution, place in a flask with a glass stopper, add 2.0 mL of 1 mol/L sodium hydroxide TS, allow to stand for 15 minutes, and proceed as above. Separately, weigh accurately Benzathine Penicillin G for Injectable Suspension and make a suspension containing 2000 units (potency) per mL by adding 1% phosphate buffer solution, pH 6.0. Place 2.0 mL each of this solution and the standard solution in a flask with a glass stopper, respectively, add exactly 10 mL each of 0.01 mol/L iodine solution, add about 5 mL of carbon tetrachloride and shake, if necessary, titrate with 0.01 mol/L sodium thiosulfate VS using a micro burette, and perform a blank test to make any necessary correction. Denote the volumes (mL) of 0.01 mol/L of iodine solution consumed in the titrations of the test solution and the standard solution as V_T and V_S, respectively.

$$\text{Potency (μg) of penicillin G sodium } (C_{16}H_{17}N_2NaO_4S) = \text{Potency (μg) of penicillin G sodium RS} \times \frac{V_T}{V_S}$$

Packaging and storage Preserve in hermetic containers, in a refrigerator.

Benzbromarone
벤즈브로마론



$C_{17}H_{12}Br_2O_3$: 424.08
(3,5-Dibromo-4-hydroxyphenyl)-(2-ethyl-1-benzofuran-3-yl)methanone [*3562-84-3*]

Benzbromarone, when dried, contains NLT 98.5% and NMT 101.0% of benzbromarone ($C_{17}H_{12}Br_2O_3$).

Description Benzbromarone occurs as a white to pale yellow powder, and is odorless and tasteless.
It is very soluble in *N*,*N*-dimethylformamide, freely soluble in acetone or in chloroform, soluble in ether, sparingly soluble in ethanol(95) and practically insoluble in water.
It is soluble in dilute sodium hydroxide TS.

Identification (1) Determine the absorption spectra of the solutions of Benzbromarone and benzbromarone RS in 0.01 mol/L sodium hydroxide TS (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Benzbromarone and benzbromarone RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Melting point Between 149 and 153 ℃.

Purity (1) ***Sulfate***—Dissolve 1.0 g of Benzbromarone in 40 mL of acetone and add 1 mL of dilute hydrochloric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 0.40 mL of 0.005 mol/L sulfuric acid, 40 mL of acetone, 1 mL of dilute hydrochloric acid and water to make 50 mL (NMT 0.019%).

(2) ***Soluble halide***—Dissolve 0.5 g of Benzbromarone in 40 mL of acetone and add 6 mL of dilute nitric acid and water to make 50 mL. Use this solution as the test solution and perform the test as directed under the Chloride. Prepare the control solution with 0.25 mL of 0.01 mol/L hydrochloric acid, 40 mL of acetone, 6 mL of dilute nitric acid and water to make 50 mL.

(3) ***Heavy metals***—Proceed with 2.0 g of Benzbromarone according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(4) ***Iron***—Prepare the test solution with 1.0 g of Benzbromarone according to Method 3 and perform the test according to Method A. Prepare the control solution with 2.0 mL of iron standard solution (NMT 20 ppm).

(5) ***Related substances***—Dissolve 0.10 g of Benzbromarone in 10 mL of acetone, and use this solution as the test solution. Pipet 1 mL of this solution, add acetone to make exactly 100 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography (fluorescent indicator added). Next, develop the plate with a mixture of cyclohexane, 4-methyl-2-pentanol, ethanol(99.5) and acetic acid(100) (100 : 20 : 2 : 1) (as the developing solvent) to a distance of about 15 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot obtained from the test solution are not more intense than the spots obtained from the standard solution.

Loss on drying NMT 0.5% (1 g, NMT 0.67 kPa, phosphorus pentoxide, 50 ℃, 4 hours).

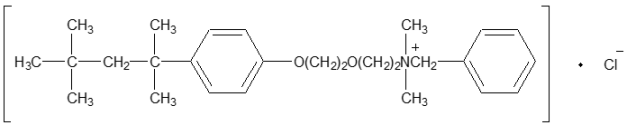
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.6 g of Benzbromarone, previously dried, dissolve in 30 mL of *N,N*-dimethylformamide, and titrate with 0.1 mol/L tetramethylammonium hydroxide VS (indicator: 5 drops of thymol blue-dimethylformamide TS). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L tetramethylammonium hydroxide VS
= 42.41 mg of $C_{17}H_{12}Br_2O_3$

Packaging and storage Preserve in light-resistant, tight containers.

Benzethonium Chloride
벤제토늄염화물



$C_{27}H_{42}ClNO_2$: 448.08

Benzyl-dimethyl-[2-[2-[4-(2,4,4-trimethylpentan-2-yl)phenoxy]ethoxy]ethyl]azanium chloride [*121-54-0*]

Benzethonium Chloride, when dried, contains NLT 97.0% and NMT 101.0% of benzethonium chloride ($C_{27}H_{42}ClNO_2$).

Description Benzethonium Chloride occurs as clear and colorless crystals and is odorless.
It is very soluble in ethanol(95), freely soluble in water, and practically insoluble in ether.
An aqueous solution of Benzethonium Chloride foams heavily when shaken.

Identification (1) Dissolve 0.2 g of Benzethonium Chloride in 1 mL of sulfuric acid, add 0.1 g of sodium nitrate, and heat on a steam bath for 5 minutes. After cooling, add 10 mL of water and 0.5 g of zinc powder, heat for 5 minutes, cool it down, and filter. The filtrate responds to the Qualitative Analysis for primary aromatic amine. The resulting solution exhibits a red color.

(2) To 2 mL of an aqueous solution of Benzethonium Chloride (1 in 1000), add a mixture of 0.2 mL of bromophenol blue solution (1 in 2000) and 0.5 mL of sodium hydroxide TS; the resulting solution exhibits a blue color. To this solution, add 4 mL of chloroform and shake well to mix; the blue color is moved to the chloroform layer. Separately, take the chloroform layer, and add dropwise sodium lauryl sulfate (1 in 1000) while shaking to mix; the chloroform layer becomes colorless.

(3) Determine the absorption spectra of Benzethonium Chloride and benzethonium chloride RS in 0.1 mol/L hydrochloric acid TS (1 in 5000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(4) To 1 mL of an aqueous solution of Benzethonium Chloride (1 in 100), add 2 mL of ethanol(95) and 0.5 mL of dilute nitric acid and 1 mL of silver nitrate TS; a white precipitate is formed. The precipitate does not dissolve on the addition of dilute nitric acid, but it dissolves on the addition of ammonia TS.

Melting point Between 158 and 164 ℃ (after drying).

Purity ***Ammonium***—Dissolve 0.1 g of Benzethonium Chloride in 5 mL of water, add 3 mL of sodium hydroxide TS, and boil; the resulting gas does not change wet red litmus paper into a blue color.

Loss on drying NMT 5.0% (1 g, 105 °C, 4 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.2 g of Benzethonium Chloride, previously dried, dissolve in 75 mL of water, add dropwise diluted dilute hydrochloric acid (1 in 2) to adjust the pH between 2.6 and 3.4. Add 1 drop of methyl orange TS and titrate with 0.02 mol/L sodium tetraphenylborate VS until the solution exhibits a red color.

Each mL of 0.02 mol/L sodium tetraphenylborate VS
= 8.962 mg of $C_{27}H_{42}ClNO_2$

Packaging and storage Preserve in light-resistant, tight containers.

Benzethonium Chloride Solution
벤제토늄염화물 액

Benzethonium Chloride Solution contains NLT 93.0% and NMT 107.0% of benzethonium chloride ($C_{27}H_{42}ClNO_2$: 448.08).

Method of preparation Prepare with Benzethonium Chloride dissolved in Tap Water or Purified Water.

Description Benzethonium Chloride Solution occurs as a clear and colorless liquid and is odorless.
It foams heavily when shaken.

Identification (1) Weigh an amount of Benzethonium Chloride Solution, equivalent to 0.2 g of Benzethonium Chloride, according to the labeled amount, and evaporate to dryness on a steam bath. With the residue, perform the test as directed under the Identification (1) of Benzethonium Chloride.

(2) Weigh an amount of Benzethonium Chloride Solution, equivalent to 10 mg of Benzethonium Chloride, according to the labeled amount, and add water to make 10 mL. With 2 mL of this solution, perform the test as directed under the Identification (2) of Benzethonium Chloride.

(3) Weigh an amount of Benzethonium Chloride Solution, equivalent to 1g of Benzethonium Chloride, according to the labeled amount, and if necessary, add water or concentrate on a steam bath to make 10 mL. To 1 mL of this solution, add 0.1 mol/L hydrochloric acid TS to make 500 mL, and determine the absorption spectrum of the resulting solution as directed under the Ultraviolet-visible Spectroscopy; it exhibits maxima between 262 nm and 264 nm, 268 nm and 270 nm, and 274 nm and 276 nm.

(4) Weigh an amount of Benzethonium Chloride Solution, equivalent to 0.1 g of Benzethonium Chloride, according to the labeled amount, and if necessary, add water or concentrate on a steam bath to make 10 mL. With 1 mL of this solution, perform the test as directed under the Identification (4) of Benzethonium Chloride.

Purity (1) ***Nitrite***—Add 1.0 mL of Benzethonium Chloride Solution in a mixture of 1 mL of glycine solution (1 in 10) and 0.5 mL of acetic anhydride; no gas is generated.

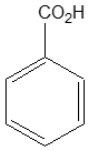
(2) ***Oxidizing material*—**To 5 mL of Benzethonium Chloride Solution, add 0.5 mL of potassium iodide TS and 2 to 3 drops of dilute hydrochloric acid; the resulting solution does not exhibit a yellow color.

Assay Weigh accurately an amount of Benzethonium Chloride Solution, equivalent to about 0.2 g of benzethonium chloride ($C_{27}H_{42}ClNO_2$), add water to make 75 mL if necessary, and perform the test as directed under the Assay of Benzethonium Chloride.

Each mL of 0.02 mol/L sodium tetraphenylborate VS
= 8.962 mg of $C_{27}H_{42}ClNO_2$

Packaging and storage Preserve in light-resistant, tight containers.

Benzoic Acid
벤조산



$C_7H_6O_2$: 122.12

Benzoic acid [*65-85-0*]

Benzoic Acid, when dried, contains NLT 99.5% and NMT 101.0% of benzoic acid ($C_7H_6O_2$).

Description Benzoic Acid occurs as white crystals or a crystalline powder.
It is odorless or has a slightly benzaldehyde-like odor.
It is freely soluble in ethanol(95), acetone, or ether, soluble in hot water, and slightly soluble in water.

Identification Dissolve 1 g of Benzoic Acid in 8 mL of sodium hydroxide TS and add water to make 100 mL; the resulting solution responds to the Qualitative Analysis (2) for benzoate.

Melting point Between 121 and 124 ℃.

Purity (1) ***Heavy metals***—Dissolve 1.0 g of Benzoic Acid in 25 mL of acetone and add 2 mL of dilute acetic acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution by adding 2 mL of dilute acetic acid, 25 mL of acetone and water to 1.0 mL of the lead standard solution to make 50 mL (NMT 10 ppm).

(2) ***Chlorine compound***—Transfer 0.5 g of Benzoic Acid and 0.7 g of calcium carbonate to a crucible, add a small amount of water, mix, and dry. Ignite it at about 600 ℃, dissolve in 20 mL of dilute nitric acid, and filter. Wash the residue with 15 mL of water, combine the washing and the filtrate, and add water to make 50 mL. To this solution, add 0.5 mL of silver nitrate TS; the turbidity of this solution is not more intense than the control solution.

Control solution—Dissolve 0.7 g of calcium carbonate in 20 mL of dilute nitric acid and filter. Wash the residue with 15 mL of water, combine the washing and the filtrate, add 1.2 mL of 0.01 mol/L hydrochloric acid and water to make 50 mL, and add 0.5 mL of silver nitrate TS.

(3) ***Potassium permanganate reducing substances***—Add 1.5 mL of sulfuric acid in 100 mL of water while boiling, add dropwise 0.02 mol/L potassium permanganate solution until the red color of the solution persists for 30 seconds, dissolve 1.0 g of Benzoic Acid in this hot solution, and add 0.50 mL of 0.02 mol/L potassium permanganate solution; the red color of the solution does not disappear within 15 seconds.

(4) ***Phthalic acid***—Weigh accurately about 100 mg of Benzoic Acid, dissolve in 1 mL of water, add 1 mL of resorcinol-sulfuric acid TS, evaporate the water by heating in an oil bath at between 120 and 125 ℃, and heat again for 90 minutes. After cooling, dissolve the resulting residue in 5 mL of water. Take 1 mL of this solution, add 10 mL of sodium hydroxide (43 in 500), and use this solution as the test solution. Separately, take exactly 61 mg of potassium hydrogen phthalate and dissolve in 1000 mL of water. Take 1 mL of this solution and proceed in the same manner as in the preparation of the test solution, and use this solution as the standard solution. Perform the test with the test solution and the standard solution as directed under the Ultraviolet-visible Spectroscopy, and determine the absorbances of these solutions at the wavelength of 495 nm; the absorbance of the test solution is NMT that of the standard solution.

(5) ***Readily carbonizable substances***—Perform the test with 0.5 g of Benzoic Acid. The color of the solution is not more intense than matching fluids for color Q.

Loss on drying NMT 0.5% (1 g, silica gel, 3 hours).

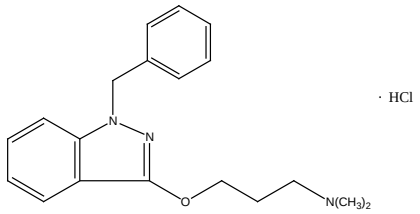
Residue on ignition NMT 0.05% (1 g).

Assay Weigh accurately about 0.5 g of Benzoic Acid, previously dried, dissolve in 25 mL of neutralized ethanol and 25 mL of water, and titrate with 0.1 mol/L sodium hydroxide VS (Indicator: 3 drops of phenolphthalein TS).

Each mL of 0.1 mol/L sodium hydroxide VS
= 12.212 mg of $C_7H_6O_2$

Packaging and storage Preserve in well-closed containers.

Benzydamine Hydrochloride
벤지다민염산염



$C_{19}H_{23}N_3O \cdot HCl$: 345.87
3-(1-Benzylindazol-3-yl)oxy-*N*,*N*-dimethylpropan-1-amine hydrochloride [*132-69-4*]

Benzydamine Hydrochloride contains NLT 99.0% and NMT 101.0% of benzydamine hydrochloride ($C_{19}H_{23}N_3O \cdot HCl$), calculated on the dried basis.

Description Benzydamine Hydrochloride occurs as a white crystalline powder.
It is very soluble in water, freely soluble in ethanol(95) or in chloroform and practically insoluble in ether.

Identification (1) Determine the infrared spectra of Benzydamine Hydrochloride and benzydamine hydrochloride RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) An aqueous solution of Benzydamine Hydrochloride (1 in 50) responds to the Qualitative Analysis for chloride.

pH Dissolve 1.0 g of Benzydamine Hydrochloride in 10 mL of water; the pH of this solution is between 4.0 and 5.5.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Benzydamine Hydrochloride in 10 mL of water; the resulting solution is clear.

(2) ***Heavy metals***—Proceed with 1.0 g of Benzydamine Hydrochloride according to Method 1 and perform the test. Prepare the control solution with 1.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Primary amines***—Dissolve 50 mg of Benzydamine Hydrochloride in 10 mL of ethanol(95) and add 0.1 mL of hydrochloric acid and 2 mL of the solution of 4-dimethylaminobenzaldehyde in ethanol(95) (1 in 20); the resulting yellow color obtained is not more intense than that obtained with 10 mL of the solution of 2-aminobenzoic acid in ethanol(95) (0.5 μg/mL) prepared in the same manner as in the preparation of the test solution.

(4) ***Related substances***—Dissolve 25 mg of Benzydamine Hydrochloride in a mixture of methanol and water (1 : 1) to make exactly 10 mL, and use this solution as the test solution. Dissolve 5 mg of benzydamine hydrochloride related substance I RS (3-dimethylaminopropyl

2-benzylaminobenzoate hydrochloride) and 12.5 mg of benzydamine hydrochloride related substance II RS [3-(1,5-dibenzyl-1*H*-indazol-3-yl)oxypropyldimethylamine hydrochloride] in a mixture of methanol and water (1 : 1) to make exactly 100 mL. To 1.0 mL of this solution, add a mixture of methanol and water (1 : 1) to make exactly 10 mL and use this solution as the standard solution (1). Dissolve 2.5 mg of benzydamine hydrochloride related substance III RS (1-benzyl-1*H*-indazol-3-ol) in a mixture of methanol and water (1 : 1) to make exactly 100 mL. To 1.0 mL of this solution, add a mixture of methanol and water (1 : 1) to make exactly 10 mL and use this solution as the standard solution (2). To 1.0 mL of the test solution, add a mixture of methanol and water (1 : 1) to make exactly 100 mL and use this solution as the standard solution (3). Mix exactly 1.0 mL each of the test solution and the standard solutions (1) and (2) and use the resulting solution as the standard solution (4). Perform the test with 20 μL each of the test solution and the standard solutions as directed under the Liquid Chromatography and determine the area of each peak obtained from each solution by the automatic integration method. The area of any peak of the related substance I or the related substance II obtained from the test solution is not greater than the area of the corresponding peak obtained from the standard solution (1) (NMT 0.2% for the related substance I and NMT 0.5% for the related substance II); the area of any peak of the related substance III is not greater than the area of the corresponding peak obtained from the standard solution (2) (0.1%); the area of any other secondary peak is not greater than the area of the corresponding peak obtained from the standard solution (3) (0.1%), and the sum of the areas of any such peaks is not greater than 1%.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 320 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 ℃.

Mobile phase: Use the mobile phases A and B to control stepwise or based on the gradient elution as follows.

Mobile phase A: Add phosphoric acid to a solution containing 0.01 mol/L potassium dihydrogen phosphate and 0.005 mol/L sodium octyl sulphate to adjust pH to 3.0 ± 0.1.

Mobile phase B: Methanol

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0	50	50
0 - 20	50 → 30	50 → 70
20 - 22	30 → 50	70 → 50
22 - 30	50	50

Flow rate: 1.5 mL/min

System suitability

System performance: Proceed with 20 μL of the standard solution (4) according to the above conditions and adjust to make the retention time of benzydamine to about 10 minutes; the resolution between the two peaks adjacent to benzydamine is NLT 2.5.

Loss on drying NMT 0.5% (1 g, 0.67 kPa, 105 ℃, 3 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.3 g of Benzydamine Hydrochloride, dissolve in 100 mL of acetic acid(100), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 34.59 mg of $C_{19}H_{23}N_3O \cdot HCl$

Containers and storage Preserve in well-closed containers.

Benzydamine Hydrochloride Tablets
벤지다민염산염 정

Benzydamine Hydrochloride Tablets contain NMT 95.0% and NLT 105.0% of the labeled amount of benzydamine hydrochloride ($C_{19}H_{23}N_3O \cdot HCl$: 345.87).

Method of preparation Prepare Benzydamine Hydrochloride Tablets as directed under Tablets, with Benzydamine Hydrochloride.

Identification (1) Weigh an amount of Benzydamine Hydrochloride Tablets, equivalent to 70 mg of benzydamine hydrochloride, according to the labeled amount, extract with 20 mL of chloroform, filter, and concentrate the filtrate by evaporation on a steam bath. Dissolve in 1 mL of sulfuric acid; the solution exhibits pale yellow. Add 3 drops of formaldehyde solution, allow to stand for a long time (heat, if necessary); the solution exhibits reddish brown.

(2) Weigh an amount of Benzydamine Hydrochloride Tablets, equivalent to 50 mg of benzydamine hydrochloride, according to the labeled amount. Extract with 20 mL of water, filter, pipet 1 mL of the filtrate into a test tube, and add 0.5 mL of nitric acid and 1 mL of silver nitrate TS; white precipitates are formed. The precipitates do not dissolve in dilute nitric acid, but dissolve in an excessive amount of ammonia TS.

(3) Weigh an amount of Benzydamine Hydrochlo-

ride Tablets, equivalent to 50 mg of benzydamine hydrochloride, according to the labeled amount, and dissolve in water to make 100 mL. Filter this solution, and use the filtrate as the test solution. Separately, dissolve 50 mg of benzydamine hydrochloride RS in water to make 100 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot the test solution and the standard solution on the thin-layer chromatographic plate of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of ammonia water(28) and methanol (1.5 : 1) as the developing solvent, and air-dry the plate. Spray evenly hexachloroplatinic(IV) acid-potassium iodide TS on the plate; the R_f value and the color of the spots obtained from the test solution and the standard solution are the same.

Disintegration Meets the requirements.

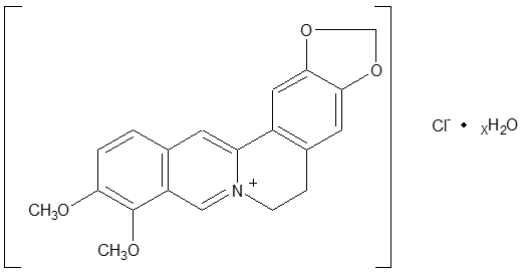
Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 tablets of Benzydamine Hydrochloride Tablets, and power. Then, weigh accurately an amount, equivalent to 25 mg of benzydamine hydrochloride ($C_{19}H_{23}N_3O \cdot HCl$). Dissolve in 20 mL of 1 mol/L hydrochloric acid TS, add water to make exactly 500 mL, filter, and use the filtrate as the test solution. Separately, weigh accurately about 25 mg of benzydamine hydrochloride RS, add water to make exactly 500 mL, and use this solution as the standard solution. Pipet 2 mL each of the test solution and the standard solution, add acetate buffer solution, pH 5.0 to make exactly 100 mL, and perform the test as directed under the Fluorescence Spectroscopy. Determine the fluorescence intensity, F_T and F_S, at the excitation wavelength of 311 nm and the emission wavelength of 375 nm.

Amount (mg) of benzydamine hydrochloride ($C_{19}H_{23}N_3O \cdot HCl$)
= Amount (mg) of benzydamine hydrochloride RS × (F_T / F_S)

Packaging and storage Preserve in tight containers.

Berberine Chloride Hydrate
베르베린염화물수화물



Berberine Chloride $C_{20}H_{18}ClNO_4 \cdot \chi H_2O$
9,10-Dimethoxy-5,6-dihydro-[1,3]dioxolo[4,5-g]isoquinolino[3,2-a]isoquinolin-7-ium chloride hydrate [*141433-60-5*]

Berberine Chloride Hydrate contains NLT 97.0% and NMT 102.0% of berberine chloride ($C_{20}H_{18}ClNO_4$: 371.81), calculated on the anhydrous basis.

Description Berberine Chloride Hydrate occurs as yellow crystals or a crystalline powder and has a slight and characteristic odor and a very bitter taste.
It is sparingly soluble in methanol, slightly soluble in ethanol(95), and very slightly soluble in water.

Identification (1) Determine the absorption spectra as directed under the Ultraviolet-visible Spectroscopy with the solutions of Berberine Chloride Hydrate and berberine chloride hydrate RS (1 in 100000); both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Berberine Chloride Hydrate and berberine chloride hydrate RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) Add 20 mL of water to 0.1 g of Berberine Chloride Hydrate, dissolve by warming, and add 0.5 mL of nitric acid. After cooling, allow the solution to stand for 10 minutes and filter. Add 1 mL of silver nitrate TS to 3 mL of the filtrate and filter the resulting precipitate to collect; the precipitate does not dissolve in dilute nitric acid, but it dissolves in an excess amount of ammonia TS.

Purity (1) ***Acid***—Add 30 mL of water to 0.1 g of Berberine Chloride Hydrate, shake well to mix, and filter. To the filtrate, add 2 drops of phenolphthalein TS and 0.10 mL of 0.1 mol/L sodium hydroxide; the yellow solution turns orange and red.

(2) ***Sulfate***—Add 48 mL of water and 2 mL of dilute hydrochloric acid to 1.0 g of Berberine Chloride Hydrate, shake to mix for 1 minute, and filter. Discard the first 5 mL of the filtrate, take 25 mL of the subsequent filtrate, and add water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution by adding 1 mL of dilute hydrochloric acid,

5 to 10 drops of bromophenol blue TS and water to 0.50 mL of 0.005 mol/L sulfuric acid to make 50 mL (NMT 0.048%).

(3) ***Heavy metals***—Proceed with 1.0 g of Berberine Chloride Hydrate as directed under Method 2 and perform the test. Prepare the control solution with 3.0 mL of lead standard solution (NMT 30 ppm).

(4) ***Related substances***—Dissolve 10 mg of Berberine Chloride Hydrate in 100 mL of the mobile phase and use this solution as the test solution. Pipet 4 mL of the test solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak areas in each solution as directed in the automatic integration method; the sum of peak areas other than the major peak from the test solution is not greater than the major peak area from the standard solution.

Operating conditions

For detector, column, column temperature, mobile phase, flow rate, and system performance, proceed as directed in the operating conditions under the Assay.

Detection sensitivity: Adjust the detection sensitivity so that the peak height of berberine obtained from 10 μL of the standard solution is about 10% of the full scale.

Time span of measurement: About 2 times the retention time of berberine after the solvent peak.

Water Between 8% and 12% (0.1 g, volumetric titration, direct titration).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 10 mg of Berberine Chloride Hydrate, dissolve in the mobile phase to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 10 mg of berberine chloride hydrate RS (previously measure the water content), dissolve in the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 10 mL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak areas, A_T and A_S, of berberine in each solution.

Amount (mg) of berberine chloride ($C_{20}H_{18}ClNO_4$)
= Amount (mg) of berberine chloride RS, calculated on the anhydrous basis $\times \frac{A_T}{A_S}$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 345nm).

Column: A stainless steel column about 4 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: Dissolve 3.4 g of potassium dihydrogen phosphate and 1.7 g of sodium lauryl sulfate in 1000 mL of a mixture of water and acetonitrile (1 : 1).

Flow rate: Adjust the flow rate so that the retention time of berberine is about 10 minutes.

System suitability

System performance: Dissolve 1 mg each of berberine chloride and palmatine chloride in the mobile phase to make 10 mL. Proceed with 10 μL of this solution according to the above conditions; palmatine and berberine are eluted in this order with the resolution being NLT 1.5.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution under the above conditions; the relative standard deviation of the peak areas of berberine is NMT 1.5%.

Packaging and storage Preserve in light-resistant, tight containers.

Berberine Tannate
베르베린탄닌산염

Berberine Tannate is a compound of berberine and tannic acid. It contains NLT 27.0% and NMT 33.0% of berberine ($C_{20}H_{19}NO_5$: 353.37), calculated on the anhydrous basis.

Description Berberine Tannate occurs as a yellow to pale yellowish brown powder.
It is odorless or has a slightly characteristic odor, and is tasteless.
It is practically insoluble in water, methanol, ethanol(95) or acetonitrile.

Identification (1) Add 10 mL of ethanol(95) to 0.1 g of Berberine Tannate, and heat on a steam bath for 3 minutes with shaking. After cooling, filter the solution and add 1 drop of iron(III) chloride TS to 5 mL of the filtrate; the solution exhibits a bluish green color, and a bluish black precipitate is formed when allowed to stand.

(2) Dissolve 10 mg each of Berberine Tannate and berberine tannate RS in 10 mL of methanol and 0.4 mL of 1 mol/L hydrochloric acid TS and add water to make 200 mL. To 8 mL each of these solutions, add water to make 25 mL. Determine the absorption spectra of the solutions as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared spectra of Berberine Tannate and berberine tannate RS, previously dried, as directly in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Purity (1) ***Acid***—Add 30 mL of water to 0.10 g of Berberine Tannate, shake well to mix, and filter. Add 2 drops of phenolphthalein TS and 0.10 mL of 0.1 mol/L sodium hydroxide to the filtrate; the yellow color of the solution turns orange to red.

(2) ***Chloride***—Add 38 mL of water and 12 mL of dilute nitric acid to 1.0 g of Berberine Tannate, shake to mix for 5 minutes, and filter. Discard the first 5 mL of the filtrate, take 25 mL of the subsequent filtrate, and add water to make 50 mL. Use this solution as the test solution. Prepare the control solution as follow; to 0.50 mL of 0.01 mol/L hydrochloric acid, add 6 mL of dilute nitric acid, 10 to 15 drops of bromophenol blue TS and water to make 50 mL (NMT 0.035%).

(3) ***Sulfate***—Add 48 mL of water and 2 mL of dilute hydrochloric acid to 1.0 g of Berberine Tannate, shake to mix for 1 minute, and filter. Discard the first 5 mL of the filtrate, take 25 mL of the subsequent filtrate, add water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution as follow; to 0.50 mL of 0.005 mol/L sulfuric acid, add 1 mL of dilute hydrochloric acid, 5 to 10 drops of bromophenol blue TS and water to make 50 mL (NMT 0.048%).

(4) ***Heavy metals***—Proceed with 1.0 g of Berberine Tannate as directed under Method 2 and perform the test. Prepare the control solution with 3.0 mL of lead standard solution (NMT 30 ppm).

(5) ***Related substances***—Dissolve 10 mg of Berberine Tannate in 100 mL of the mobile phase and use this solution as the test solution. Pipet 4 mL of the test solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak areas of each solution as directed in the automatic integration method; the sum of peak areas other than the major peak from the test solution is not greater than the major peak area from the standard solution.

Operating conditions

For detector, column, column temperature, mobile phase, flow rate and system performance, proceed as directed in the operating conditions under the Assay.

Test for required detectability: Pipet 2 mL of the standard solution and add the mobile phase to make exactly 20 mL. Confirm that the peak area of berberine from 10 μL of this solution is equivalent to 7% to 13% of the peak area of berberine from the standard solution.

Detection sensitivity: Adjust the detection sensitivity so that the peak height of berberine obtained from 10 μL of the standard solution is about 10% of the full scale.

Time span of measurement: About 2 times the retention time of berberine after the solvent peak.

Water NMT 6.0% (0.7 g, volumetric titration, direct titration).

Residue on ignition NMT 1.0% (1 g).

Assay Weigh accurately about 30 mg of Berberine Tannate, dissolve in the mobile phase to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 10 mg of berberine chloride RS (previously measure the water content), dissolve in the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of berberine in each solution.

Amount (mg) of berberine chloride ($C_{20}H_{19}NO_5$)
= Amount (mg) of berberine chloride RS, calculated on the anhydrous basis $\times \frac{A_T}{A_S} \times 0.9504$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 345 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 ℃.

Mobile phase: Dissolve 3.4 g of potassium dihydrogen phosphate and 1.7 g of sodium lauryl sulfate in 1000 mL of a mixture of water and acetonitrile (1 : 1).

Flow rate: Adjust the flow rate so that the retention time of berberine is about 10 minutes.

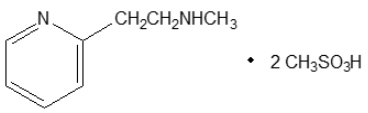
System suitability

System performance: Dissolve 1 mg each of berberine chloride and palmatine chloride in the mobile phase to make 10 mL. Proceed with 10 μL of this solution according to the above conditions; palmatine and berberine are eluted in this order with the resolution being NLT 1.5.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution under the above conditions; the relative standard deviation of the peak areas of berberine is NMT 1.5%.

Packaging and storage Preserve in light-resistant, tight containers.

Betahistine Mesilate
베타히스틴메실산염



$C_8H_{12}N_2 \cdot 2CH_4O_3S$: 328.41

Methanesulfonic acid; *N*-methyl-2-pyridin-2-yl-ethanamine [*5638-76-6*]

Betahistine Mesilate, when dried, contains NLT 98.0% and NMT 101.0% of betahistine mesilate ($C_8H_{12}N_2 \cdot 2CH_4O_3S$).

Method of preparation If there is any possibility of alkyl (methyl, ethyl, isopropyl, etc.) methanesulfonate esters to be inserted as the potential impurities by the manufacturing process of Betahistine Mesilate, take caution with starting material, manufacturing process, and intermediate material control to minimize the residue of impurities in consideration of risk assessment results. If needed, the manufacturing process can be justified by the test data proving that there is no quality risk in the final drug substances.

Description Betahistine Mesilate occurs as white crystals or a crystalline powder.
It is very soluble in water, freely soluble in acetic acid(100), and sparingly soluble in ethanol(99.5).
It is soluble in dilute hydrochloric acid.
It is hygroscopic.

Identification (1) Determine the absorption spectra of the solutions of Betahistine Mesilate and betahistine mesilate RS in 0.1 mol/L hydrochloric acid TS (1 in 50000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Betahistine Mesilate and betahistine mesilate RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) Betahistine Mesilate responds to the Qualitative Analysis (2) for mesylate.

Melting point Between 110 and 114 ℃ (after drying).

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Betahistine Mesilate according to Method 4 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Related substances***—Dissolve 50 mg of Betahistine Mesilate in 10 mL of a mixture of water and acetonitrile (63 : 37), and use this solution as the test solution. Pipet 1 mL of this solution, add a mixture of water and acetonitrile (63 : 37) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak area of each solution by the automatic integration method; the peak area other than betahistine obtained from the test solution is not greater than 1/10 the peak area of betahistine from the standard solution. The total area of the peaks other than betahistine from the test solution is not greater than 1/ 2 the peak area of betahistine from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 261 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 35 °C.

Mobile phase: Add water to 5 mL of diethylamine and 20 mL of acetic acid(100) to make 1000 mL. In 630 mL of this solution, dissolve 2.3 g of sodium lauryl sulfate, and add 370 mL of acetonitrile.

Flow rate: Adjust the flow rate so that the retention time of betahistine is about 5 minutes.

System suitability

Test for required detectability: Pipet 5 mL of the standard solution, and add a mixture of water and acetonitrile (63 : 37) to make exactly 50 mL. Verify that the peak area of betahistine obtained from 20 μL of this solution corresponds to 7% to 13% of the peak area of betahistine obtained from the standard solution.

System performance: Dissolve 10 mg of betahistine mesilate and 10 mg of 2-vinylpyridine in 50 mL of a mixture of water and acetonitrile (63 : 37). Pipet 2 mL of this solution and add a mixture of water and acetonitrile (63 : 37) to make 50 mL. Proceed with 20 μL of this solution according to the above conditions; 2-vinylpyridine and betahistine are eluted in this order with the resolution between these peaks being NLT 5.

System repeatability: Repeat the test 6 times with 20 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area of betahistine is NMT 1.0%.

Time span of measurement: About 3 times the retention time of betahistine after the solvent peak.

Loss on drying NMT 1.0% (1 g, phosphorus pentoxide, in vacuum, 70 ℃, 24 hours).

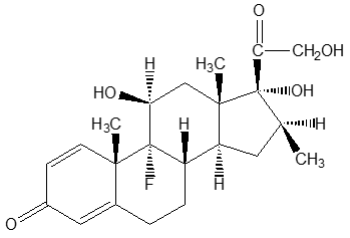
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.2 g of Betahistine Mesilate, previously dried, and dissolve in 1 mL of acetic acid(100), add 50 mL of acetic anhydride, and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 16.420 mg of $C_8H_{12}N_2 \cdot 2CH_4O_3S$

Packaging and storage Preserve in tight containers.

Betamethasone
베타메타손



$C_{22}H_{29}FO_5$: 392.46

(8*S*,9*R*,10*S*,11*S*,13*S*,14*S*,16*S*,17*R*)-9-Fluoro-11,17-dihydroxy-17-(2-hydroxyacetyl)-10,13,16-trimethyl-6,7,8,11,12,14,15,16-octahydrocyclopenta[a]phenanthren-3-one [*378-44-9*]

Betamethasone, when dried, contains NLT 96.0% and NMT 103.0% of betamethasone ($C_{22}H_{29}FO_5$).

Description Betamethasone occurs as a white to pale yellowish white crystalline powder and is odorless.
It is sparingly soluble in methanol, ethanol(95), acetone or 1,4-dioxane, very slightly soluble in chloroform or ether, and practically insoluble in water.

Melting point—About 240 °C (with decomposition).

Identification (1) Weigh 10 mg of Betamethasone and use a mixture of 0.5 mL of 0.01 mol/L sodium hydroxide TS and 20 mL of water as the absorbent. Prepare the test solution, as directed under the Oxygen Flask Combustion; the test solution responds to the Qualitative Analysis for fluoride.

(2) Dissolve 1.0 mg each of Betamethasone and betamethasone RS in 10 mL of ethanol(95). Add 10 mL of phenylhydrazinium hydrochloride TS to 2.0 mL of this solution, shake to mix, and heat on a steam bath at 60 °C for 20 minutes. After cooling, determine the absorption spectra of these solutions as directed under the Ultraviolet-visible Spectroscopy, using a solution prepared with 2.0 mL of ethanol(95) in the same manner, as a control solution; both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the absorption spectra of Betamethasone and betamethasone RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers. If any difference appears between the spectra, dissolve Betamethasone and betamethasone RS in acetone, respectively, evaporate to dryness and repeat the test on the residues.

Optical rotation $[\alpha]_D^{20}$: Between + 118° and + 126° (0.1 g, previously dried, methanol, 20 mL, 100 mm).

Purity (1) ***Heavy metals***—Proceed with 0.5 g of Betamethasone according to Method 2 and perform the test. Prepare the control solution with 1.5 mL of lead standard solution (NMT 30 ppm).

(2) ***Related substances***—Dissolve 10 mg of Betamethasone in 5 mL of a mixture of chloroform and methanol (9:1) and use this solution as the test solution. Pipet 1 mL of this solution, add a mixture of chloroform and methanol (9:1) to make exactly 100 mL and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of dichloromethane, ether, methanol and water (385:75:40:6) (as the developing solvent) to a distance of about 12 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 0.5% (0.5 g, in vacuum, phosphorous(V) oxide, 4 hours).

Residue on ignition NMT 0.5% (0.1 g, platinum crucible).

Assay Weigh accurately about 20 mg of Betamethasone and betamethasone RS, previously dried, and dissolve each in methanol to make exactly 50 mL. Pipet 5 mL each of these solutions, add 5 mL each of the internal standard solution, and add methanol to make exactly 50 mL, and then use this solution as the test solution and the standard solution. Perform the test with 10 μL each of these solutions as directed under the Liquid Chromatography according to the following conditions, and calculate the peak area ratios of betamethasone to the internal standard for the test solution and the standard solution, Q_T and Q_S, respectively.

$$\text{Amount (mg) of betamethasone } (C_{22}H_{29}FO_5) = \text{Amount (mg) of betamethasone RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of butyl *p*-hydroxybenzoate in methanol (1 in 1750).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 240 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 15 cm to 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of water and acetonitrile (3:2).

Flow rate: Adjust the flow rate so that the retention time of Betamethasone is about 4 minutes.

System suitability

System performance: Proceed with 10 μL of the standard solution according to the above conditions; be-

tamethasone and the internal standard are eluted in this order with the resolution between these peaks being NLT 10.

System repeatability: Perform the test 6 times with 10 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area ratios of Betamethasone to the internal standard is NMT 2.0%.

Packaging and storage Preserve in light-resistant, tight containers.

Betamethasone Tablets
베타메타손 정

Betamethasone Tablets contain NLT 90.0% and NMT 107.0% of the labeled amount of betamethasone ($C_{22}H_{29}FO_5$: 392.46).

Method of preparation Prepare Betamethasone Tablets as directed under Tablets, with Betamethasone.

Identification Pulverize Betamethasone Tablets, weigh an amount, equivalent to 2 mg of betamethasone according to the labeled amount, add 20 mL of methanol, shake to mix for 5 minutes, and then filter. Evaporate the filtrate to dryness on a steam bath, and cool. Dissolve the residue in 2 mL of methanol and filter if necessary, use this solution as the test solution Separately, dissolve 2 mg of betamethasone RS in 2 mL of methanol, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography (with a fluorescent indicator). Next, develop the plate with a mixture of 1-butanol, water and acetic acid(100) (3 : 1 : 1) (as the developing solvent) to a distance of about 10 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the R_f value of the principal spot obtained from the test solution is the same as that obtained from the standard solution.

Dissolution Perform the test with 1 tablet of Betamethasone Tablets at 50 revolutions per minute according to Method 2 under the Dissolution using a solution prepared by adding 1.0 mL of internal standard solution to 900 mL of water as the dissolution medium. Take NLT 20 mL of the dissolved solution 30 minutes after starting the Dissolution, and filter according to the membrane filtration method. Discard the first 10 mL of the filtrate, take exactly V mL of the subsequent filtrate, add water according to the labeled amount to contain about 0.56 μg of betamethasone per mL to make exactly V' mL, and use this solution as the test solution. Separately, weigh accurately about 28 mg of betamethasone RS, previously dried in a desiccator (in vacuum, phosphorus pentoxide) for 4 hours, and dissolve in methanol to make exactly 100 mL. Pipet 5 mL of this solution and add water to make exactly 100 mL. Pipet 4 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 100 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions. Determine the peak areas, A_T and A_S, of betamethasone for the test solution and the standard solution, respectively.
Meets the requirements if the dissolution rate of Betamethasone Tablets in 30 minutes is NLT 85%.

Dissolution rate (%) of the labeled amount of betamethasone ($C_{22}H_{29}FO_5$)

$$= W_S \times \frac{A_T}{A_S} \times \frac{V'}{V} \times \frac{1}{C} \times \frac{9}{5}$$

W_S: Amount (mg) of betamethasone RS

C: Labeled amount (mg) of betamethasone ($C_{22}H_{29}FO_5$) per tablet

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 241 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: A mixture of methanol and water (3 : 2).

Flow rate: Adjust the flow rate so that the retention time of betamethasone is about 7 minutes.

System suitability

System performance: Proceed with 100 μL of the standard solution under the above conditions; the number of theoretical plates of betamethasone is NLT 3000 plates and the symmetry factor is NMT 2.0.

System repeatability: Repeat the test 6 times with 30 μL each of the standard solution under the above operating conditions; the relative standard deviation of the peak area ration of betamethasone to that of the internal standard is NMT 1.0%.

Uniformity of dosage units Meets the requirements. Take 1 tablet of Betamethasone Tablets, and add V mL of water to contain about 50 μg of betamethasone per mL according to the labeled amount. Add exactly 2 mL of internal standard solution per 50 μg of betamethasone in this solution, shake to mix for 10 minutes, centrifuge, and use the clear supernatant as the test solution. Separately, weigh accurately about 20 mg of betamethasone RS, previously dried in a desiccator (in vacuum, phosphorus pentoxide) for 4 hours, and dissolve in acetonitrile to make exactly 200 mL. Pipet 5 mL of this solution, add exactly 5 mL of water and 20 mL of internal standard solution, and use this solution as the standard solution.

Perform the test with 50 μL each of the test solution and the standard solution as directed under the Liquid Chromatography, and determine the peak area ratio, Q_T and Q_S, of betamethasone to that of the internal standard for each solution, respectively.

$$\text{Amount (mg) of betamethasone } (C_{22}H_{29}FO_5) = \text{Amount (mg) of betamethasone RS} \times \frac{Q_T}{Q_S} \times \frac{V}{400}$$

Internal standard solution—A solution of butyl p-hydroxybenzoate in acetonitrile (1 in 40000).

Operating conditions

For the detector, column, column temperature, mobile phase and flow rate, proceed as directed in the operating conditions under the Assay.

System suitability

System performance: Proceed with 50 μL of the standard solution under the above operating conditions; betamethasone and the internal standard solution are eluted in this order with the resolution being NLT 10.

System repeatability: Repeat the test 6 times with 50 μL each of the standard solution under the above operating conditions; the relative standard deviation of the peak area ratio of betamethasone to that of the internal standard is NMT 1.0%.

Assay Weigh accurately the mass of NLT 20 tables of Betamethasone Tablets, and powder. Weigh accurately an amount, equivalent to about 5 mg of betamethasone ($C_{22}H_{29}FO_5$), add 25 mL of water, add exactly 50 mL of the internal standard solution, and shake vigorously for 10 minutes to mix. Filter the solution through a membrane filter with a pore size of NMT 0.5 μm, discard the first 5 mL of the filtrate, and use the subsequent filtrate as the test solution. Separately, weigh accurately about 20 mg of betamethasone RS, previously dried in a desiccator (in vacuum, phosphorus pentoxide) for 4 hours, and dissolve in acetonitrile to make exactly 50 mL. Pipet 5 mL of this solution, add exactly 20 mL of the internal standard solution, add 5 mL of water, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and measure the peak area ratio, Q_T and Q_S, of betamethasone to that of the internal standard for each solution, respectively.

$$\text{Amount (mg) of betamethasone } (C_{22}H_{29}FO_5) = \text{Amount (mg) of betamethasone RS} \times \frac{Q_T}{Q_S} \times \frac{1}{4}$$

Internal standard solution—A solution of butyl p-hydroxybenzoate in acetonitrile (1 in 10000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 240 nm).

Column: A stainless steel column about 4 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: A mixture of water and acetonitrile (3 : 2).

Flow rate: Adjust the flow rate so that the retention time of betamethasone is about 4 minutes.

System suitability

System performance: Proceed with 20 μL of the standard solution under the above operating conditions; betamethasone and the internal standard solution are eluted in this order with the resolution being NLT 10.

System repeatability: Repeat the test 6 times with 20 μL each of the standard solution under the above operating conditions; the relative standard deviation of the peak area ratio of betamethasone to that of the internal standard is NMT 1.0%.

Packaging and storage Preserve in light-resistant, tight containers.

Betamethasone and d-Chlorpheniramine Maleate Tablets
베타메타손·d-클로르페니라민말레산염 정

Betamethasone and *d*-Chlorpheniramine Maleate Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of betamethasone ($C_{22}H_{29}FO_5$: 392.47) and *d*-chlorpheniramine maleate ($C_{16}H_{19}ClN_2C_4H_4O_4$: 390.87).

Method of preparation Prepare Betamethasone and *d*-Chlorpheniramine Maleate Tablets as directed under Tablets, with Betamethasone and *d*-Chlorpheniramine Maleate.

Identification (1) ***Betamethasone***—The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay. (2) *d-Chlorpheniramine Maleate*—Powder 5 tablets of Betamethasone and *d*-Chlorpheniramine Maleate Tablets, add ethanol to contain 2 mg per mL, and filter. Use the filtrate as the test solution. Separately, dissolve 10 mg of *d*-chlorpheniramine maleate RS in 5 mL of ethanol, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography (with a fluorescent indicator). Next, develop the plate with a mixture of methanol and ammonia water(28) (100 : 1.5) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Examine the plate under ultraviolet rays (major wavelength: 254 nm) or spray evenly hexachloroplatinic(IV) acid-potassium io-

dide TS on the plate; the spot of the test solution exhibits color and an Rf value corresponding to that of the standard solution.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 tablets of Betamethasone and *d*-Chlorpheniramine Maleate Tablets, and powder. Weigh accurately an amount equivalent to about 0.75 mg of betamethasone ($C_{22}H_{29}FO_5$) and 6 mg of *d*-chlorpheniramine maleate ($C_{16}H_{19}ClN_2C_4H_4O_4$), add the mobile phase to make exactly 50 mL, and filter. Use this solution as the test solution. Separately, dissolve betamethasone RS and *d*-chlorpheniramine maleate RS in the methanol to obtain a concentration of 0.0375 mg/mL and 0.3 mg/mL, respectively. Pipet 20 mL of this solution, add the mobile phase to make exactly 50 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions. Determine the peak areas, A_{T1}, A_{T2}, A_{S1} and A_{S2}, of betamethasone and *d*-chlorpheniramine maleate for each solution.

Amount (mg) of betamethasone ($C_{22}H_{29}FO_5$)
$= 0.0375\ (mg/mL) \times (A_{T1} / A_{S2}) \times 20$

Amount (mg) of *d*-chlorpheniramine maleate ($C_{16}H_{19}ClN_2C_4H_4O_4$)
$= 0.3\ (mg/mL) \times (A_{T1} / A_{S2}) \times 20$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

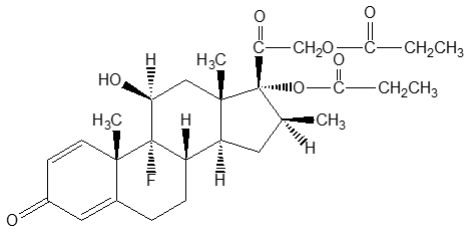
Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: Dissolve 1.01 g of sodium 1-heptanesulfonate in 1000 mL of dilute phosphoric acid (1 in 100). To 700 mL of this solution, add 300 mL of acetonitrile.

Flow rate: 1.0 mL/min

Packaging and storage Preserve in tight containers.

Betamethasone Dipropionate
베타메타손디프로피오네이트



$C_{28}H_{37}FO_7$: 504.59

[2-[(8*S*,9*R*,10*S*,11*S*,13*S*,14*S*,16*S*,17*R*)-9-Fluoro-11-hydroxy-10,13,16-trimethyl-3-oxo-17-propanoyloxy-6,7,8,11,12,14,15,16-octahydrocyclopenta[a]phenanthren-17-yl]-2-oxoethyl] propanoate [*5593-20-4*]

Betamethasone Dipropionate, when dried, contains NLT 97.0% and NMT 103.0% of betamethasone dipropionate ($C_{28}H_{37}FO_7$) and it contains NLT 3.4% and NMT 4.1% of fluorine (F: 19.00).

Description Betamethasone Dipropionate occurs as a white to pale yellowish white crystalline powder and is odorless.

It is freely soluble in acetone, 1,4-dioxane or chloroform, soluble in methanol, sparingly soluble in ethanol(95), slightly soluble in ether, and practically insoluble in water or hexane.

It is gradually colored by light.

Identification (1) Add 4 mL of isoniazid TS to 1 mL of Betamethasone Dipropionate in methanol (1 in 10000), and heat on a steam bath for 2 minutes; the solution exhibits a yellow color.

(2) Weigh 10 mg of Betamethasone Dipropionate and use a mixture of 0.5 mL of 0.01 mol/L sodium hydroxide TS and 20 mL of water as the absorbent. Prepare the test solution, as directed under the Oxygen Flask Combustion; the test solution responds to the Qualitative Analysis for fluoride.

(3) Determine the absorption spectra of solutions of Betamethasone Dipropionate and betamethasone dipropionate RS in methanol (3 in 200000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(4) Determine the infrared spectra of Betamethasone Dipropionate and betamethasone dipropionate RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Optical rotation $[\alpha]_D^{20}$: Between + 77° and + 84° (50 mg, previously dried, acetone, 10 mL, 100 mm).

Melting point Between 176 and 180 ℃.

Purity (1) ***Fluoride***—Prepare 0.10 g of betamethasone dipropionate, add 10.0 mL of diluted 0.01 mol/L sodium hydroxide TS (1 in 20), shake for 10 minutes, and filter through a membrane filter with a pore size of 0.4 μm.

Transfer 5.0 mL of the filtrate into a 20-mL volumetric flask, add 10 mL of a mixture of alizarin complexone TS, acetic acid-potassium acetate buffer solution, pH 4.3 and cerium(III) nitrate TS (1:1:1), add water again to make 20 mL, and allow it to stand for 1 hour. Use it as the test solution. Separately, transfer 1.0 mL of standard fluorine solution into a 20-mL volumetric flask, add 5.0 mL of diluted 0.01 mol/L of sodium hydroxide TS (1 in 20) and 10 mL of a mixture of alizarin complexone TS, acetic acid-potassium acetate buffer solution, pH 4.3 and cerium(III) nitrate TS (1 : 1 : 1), and use this solution as the standard solution. Use 5.0 mL of diluted 0.01 mol/L sodium hydroxide TS (1 in 20) with these solutions and use it as the control solution. Determine the absorbance as directed under the Ultraviolet-visible Spectroscopy; the absorbance of the test solution at 600 nm is not greater than that of the standard solution (NMT 0.012%).

(2) ***Heavy metals***—Proceed with 1.0 g of Betamethasone Dipropionate as directed under Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Related substances***—Perform the test without exposure to daylight, using light-resistant vessels. Dissolve 10 mg of Betamethasone Dipropionate in 10 mL of chloroform, and use this solution as the test solution. Pipet 3 mL of this solution, add chloroform to make exactly 100 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin-layer chromatography. Spot 20 μL each of the test solution and the standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Then, develop the plate with a mixture of chloroform and acetone (7 : 1) (as the developing solvent) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 1.0% (0.5 g, 105 °C, 3 hours).

Residue on ignition NMT 0.2% (0.5 g, platinum crucible).

Assay (1) ***Betamethasone Dipropionate***—Weigh accurately about 15 mg of Betamethasone Dipropionate, previously dried, and dissolve in methanol to make exactly 100 mL. Pipet 5 mL of Betamethasone Dipropionate and add methanol to make exactly 50 mL. Perform the test with this solution as directed under the Ultraviolet-visible Spectroscopy, and determine the absorbance A, at the absorbance maximum wavelength at about 239 nm.

$$\text{Amount (mg) of betamethasone dipropionate } (C_{28}H_{37}FO_7) = \frac{A}{312} \times 10000$$

(2) ***Fluorine***—Weigh accurately about 10 mg of Betamethasone Dipropionate, previously dried, and perform the test as directed under the Assay of fluorine under the Oxygen Flask Combustion, using a mixture of 0.5 mL of 0.01 mol/L sodium hydroxide TS and 20 mL of water as an absorbent.

Packaging and storage Preserve in light-resistant, tight containers.

Betamethasone Dipropionate and Gentamicin Sulfate Cream
베타메타손디프로피오네이트·겐타마이신황산염 크림

Betamethasone Dipropionate and Gentamicin Sulfate Cream contains NLT 90.0% and NMT 110.0% of the labeled mount of betametasone dipropionate ($C_{28}H_{37}FO_7$: 504.59) and NLT 90.0% and NMT 120.0% of the labeled amount of gentamicin sulfate.

Method of preparation Prepare as directed under Creams, with Betametasone Dipropionate and Gentamicin Sulfate.

Identification (1) ***Betametasone dipropionate***—The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

(2) ***Gentamicin sulfate***—Extract an amount equivalent to 7.5 mg of Betamethasone Dipropionate and Gentamicin Sulfate Cream with 20 mL of ethyl acetate and 10 mL of water, and use the water layer as the test solution. Separately, dissolve gentamicin RS in water to make 0.075%(w/v), and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 50 μL each of the test solution and the standard solution onto a thin-layer chromatographic plate made of silica gel for thin-layer chromatography, develop the plate with a mixture of 13.5 M ammonia water, ethyl acetate and methanol (1 : 2 : 1) as the developing solvent, and air-dry the plate. Place the plate in a suitable container containing between 2 g and 4 g of iodine crystal, cover with a lid, and allow to stand for 3 to 5 minutes; the test solution and the standard solution show the same color spots at the same R_f value.

Assay (1) ***Betametasone dipropionate***—Weigh an amount of Betamethasone Dipropionate and Gentamicin Sulfate Cream, equivalent to 1.0 mg of betametasone dipropionate ($C_{28}H_{37}FO_7$), add 30 mL of methanol, shake to mix, add methanol to make 50 mL, filter, and use the filtrate as the test solution. Separately, weigh accurately about 20 mg of betametasone dipropionate RS and dissolve in methanol to make 100 mL. Take 10.0 mL of this solution, add methanol to make 50 mL, and use this solu-

tion as the standard solution. Perform the test with 15 μL each of the test solution and the standard solution according to the following conditions as directed under the Liquid Chromatography, and determine the peak areas, A_T and A_S of each solution.

Amount (mg) of betamethasone dipropionate ($C_{28}H_{37}FO_7$)
= Amount (mg) of betametasone dipropionate RS $\times \frac{A_T}{A_S} \times \frac{1}{20}$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 240 nm).

Column: A stainless steel column about 3.9 mm in internal diameter and about 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm to 10 μm in particle diameter).

Mobile phase: A mixture of acetonitrile and water (45 : 55).

Flow rate: 1.5 mL/min

(2) ***Gentamicin sulfate***—Cylinder plate method Perform test according to (1) and (2) of the Assay for Gentamicin sulfate. However, prepare the test solution as the following method.

Method 1 Weigh accurately an amount of Betamethasone Dipropionate and Gentamicin Sulfate Cream, equivalent to about 1.0 mg (potency) according to the labeled potency, place in a blender, add 80 mL of 0.1 mol/L phosphate buffer solution (pH 8.0), warmed previously to 70 to 85 ℃, grind at high speed for 3 to 5 minutes, cool, then add the above buffer solution to make 100.0 mL of solution.

Method 2 Weigh accurately an amount of Betamethasone Dipropionate and Gentamicin Sulfate Cream, equivalent to 1.0 mg (potency) according to the labeled potency, place in a separatory funnel, add 50 mL of ether, shake to mix until uniform, extract three times with 25 mL of 0.1 mol/L phosphate buffer solution, pH 8.0, combine the extracts, and add the above buffer solution to make 100 mL of solution.

Pipet appropriate amounts of the solutions from Method 1 or Method 2, dilute with 0.1 mol/L phosphate buffer solution, pH 8.0, to the concentrations of (1) ③ and (2) ③, respectively, and use these as the test solutions.

Packaging and storage Preserve in tight containers.

Betamethasone Dipropionate, Clotrimazole and Gentamicin Sulfate Cream
베타메타손디프로피오네이트·클로트리마졸·겐타마이신황산염 크림

Betamethasone Dipropionate, Clotrimazole and Gentamicin Sulfate Cream contains NLT 90.0% and NMT 110.0% of the labeled amounts of betametasone diproprionate ($C_{28}H_{37}FO_7$: 504.59) and clotrimazole ($C_{22}H_{17}ClN_2$: 344.84), and NLT 90.0% and NMT 120.0% of the labeled amount of gentamicin sulfate.

Method of preparation Prepare as directed under Creams, with Betametasone Dipropionate, Clotrimazole and Gentamicin Sulfate.

Identification (1) ***Betametasone proprionate and clotrimazole***—The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

(2) ***Gentamicin sulfate***—Extract an amount equivalent to 7.5 mg of Betamethasone Dipropionate, Clotrimazole and Gentamicin Sulfate Cream with 20 mL of ethyl acetate and 10 mL of water, and use the water layer as the test solution. Separately, dissolve gentamicin RS in water to make 0.075%(w/v), and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 50 μL each of the test solution and the standard solution onto a thin-layer chromatographic plate made of silica gel for thin-layer chromatography, develop the plate with a mixture of 13.5M ammonia water, ethyl acetate and methanol (1 :2 : 1) as the developing solvent, and air-dry the plate. Place the plate in a suitable container containing between 2 g and 4 g of iodine crystal, cover with a lid, and allow to stand for 3 to 5 minutes; the test solution and the standard solution show the same color spots at the same R_f value.

Assay (1) ***Betametasone propionate and clotrimazole***—Weigh accurately about 1 g of Betamethasone Dipropionate, Clotrimazole and Gentamicin Sulfate Cream, add 2.0 mL of the internal standard solution and 4.0 mL of ethanol, warm for about 10 minutes on a steam bath at 60 ℃, and shake to mix for 3 minutes. Repeat this procedure 3 times, cool for about 20 minutes in iced water, centrifuge, and use the clear supernatant as the test solution. Separately, weigh about 32.0 mg of betametasone dipropionate RS, previously dried, and add ethanol to make 100 mL. Weigh about 50.0 mg of clotrimazole RS, previously dried, and add ethanol to make 10.0 mL. Take 2.0 mL each of these solutions, evaporate to dryness, proceed in the same manner as the test solution, and use the resulting solutions as the standard solutions. Perform the test with 10 μL each of the test solution and the standard solutions as directed under the Liquid Chromatography according to the following conditions and de-

termine the peak area ratios of betametasone dipropionate and clotrimazole with respect to the peak area of the internal standard, Q_{T1}, Q_{T2}, Q_{S1} and Q_{S2}, for each solution.

$$\text{Amount (mg) of betamethasone dipropionate } (C_{28}H_{37}FO_7) = \text{Amount (mg) of betametasone dipropionate RS} \times \frac{Q_T}{Q_S} \times \frac{1}{10}$$

$$\text{Amount (mg) of clotrimazole } (C_{22}H_{17}ClN_2) = \text{Amount (mg) of clotrimazole RS} \times \frac{Q_{T2}}{Q_{S2}} \times \frac{1}{5}$$

Internal standard solution—Weigh about 15 mg of progesterone RS and add ethanol to make 100 mL.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column, about 3.9 mm in internal diameter and about 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography.

Mobile phase: A mixture of acetonitrile and 0.05 mol/L dibasic ammonium phosphate (65 : 35).

Flow rate: 0.65 mL/min

(2) ***Gentamicin sulfate***—Cylinder plate method Perform test according to (1) and (2) of the Assay for gentamicin sulfate. However, prepare the test solution as following methods.

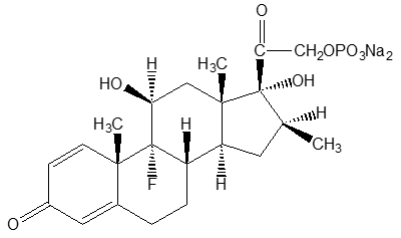
Method 1 Weigh accurately an amount of Betamethasone Dipropionate, Clotrimazole and Gentamicin Sulfate Cream, equivalent to about 1.0 mg (potency) according to the labeled potency, place in a blender, add 80 mL of 0.1 mol/L phosphate buffer solution (pH 8.0), warmed previously to 70 ℃ to 85 ℃, mix at high speed for 3 to 5 minutes, cool, then add the above buffer solution to make 100.0 mL of solution.

Method 2 Weigh accurately an amount of Betamethasone Dipropionate, Clotrimazole and Gentamicin Sulfate Cream, equivalent to about 1.0 mg (potency) according to the labeled potency, place in a separatory funnel, add 50 mL of ether, and shake to mix until homogeneous. Extract 3 times with 25 mL each of 0.1 mol/L phosphate buffer solution, pH 8.0, combine the extracts, and add the above buffer solution to make 100 mL of solution.

Pipet appropriate amounts of the solutions from Method 1 and Method 2 and dilute with 0.1 mol/L phosphate buffer solution, pH 8.0, to the concentrations of (1) ④ and (2) ③, and use these solutions as the test solutions.

Packaging and storage Preserve in tight containers.

Betamethasone Sodium Phosphate
베타메타손포스페이트나트륨



$C_{22}H_{28}FNa_2O_8P$: 516.41

Disodium [2-[(8*S*,9*R*,10*S*,11*S*,13*S*,14*S*,16*S*,17*R*)-9-fluoro-11,17-dihydroxy-10,13,16-trimethyl-3-oxo-6,7,8,11,12,14,15,16-octahydrocyclopenta[a]phenanthren-17-yl]-2-oxoethyl] phosphate [*151-73-5*]

Betamethasone Sodium Phosphate contains NLT 97.0% and NMT 103.0% of betamethasone sodium phosphate ($C_{22}H_{28}FNa_2O_8P$), calculated on the anhydrous basis.

Description Betamethasone Sodium Phosphate occurs as a white to pale yellowish white crystalline powder or a mass and is odorless.

It is freely soluble in water, sparingly soluble in methanol, slightly soluble in ethanol(95), and practically insoluble in ether.

It is hygroscopic.

Melting point—About 213 °C (with decomposition).

Identification (1) Dissolve 2 mg of Betamethasone Sodium Phosphate in 2 mL of sulfuric acid; the resulting solution exhibits a brown color, changing slowly to blackish brown.

(2) Weigh 10 mg of Betamethasone Sodium Phosphate and use a mixture of 0.5 mL of 0.01 mol/L sodium hydroxide TS and 20 mL of water as the absorbent. Prepared the test solution, as directed under the Oxygen Flask Combustion; the test solution responds to the Qualitative Analysis (2) for fluoride.

(3) Transfer 40 mg of Betamethasone Sodium Phosphate to a platinum crucible and carbonize by heating. After cooling, add 5 drops of nitric acid and incinerate by ignition. To the residue, add 10 mL of diluted nitric acid (1 in 50), and boil for several minutes. After cooling, the solution responds to the Qualitative Analysis (2) for phosphate. Neutralize the test solution by adding ammonia TS; the resulting solution responds to the Qualitative Analysis for sodium salt and Qualitative Analysis (1) or (3) for phosphate.

(4) Determine the infrared spectra of Betamethasone Sodium Phosphate and betamethasone sodium phosphate RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both exhibit similar intensities of absorption at the same wavenumbers.

Optical rotation $[\alpha]_D^{20}$: Between + 99° and + 105° (0.1 g, calculated on the anhydrous basis, water, 10 mL, 100 mm).

pH Dissolve 0.10 g of Betamethasone Sodium Phosphate in 20 mL of water; the pH of the solution is between 7.5 and 9.0.

Purity (1) ***Clarity and color of solution***—Dissolve 0.25 g of Betamethasone Sodium Phosphate in 10 mL of water; the resulting solution is clear and colorless.

(2) ***Free phosphoric acid***—Weigh accurately about 20 mg of Betamethasone Sodium Phosphate, dissolve in 20 mL of water, and use this solution as the test solution. Separately, pipet 4 mL of phosphoric acid RS, add 20 mL of water, and use this solution as the standard solution. To the test solution and the standard solution, add exactly 7 mL of dilute sulfuric acid, 2 mL of ammonium molybdate-sulfuric acid TS and 2 mL of *p*-aminophenol sulfate TS, shake well to mix, allow to stand at 20 ± 1 ℃ for 15 minutes, and add water to make exactly 50 mL, respectively. Allow to stand at 20 ± 1 ℃ for 15 minutes. Prepare the control solution as using the solution prepared in the same manner with 20 mL of water. Perform the test with these solutions as directed under the Ultraviolet-visible Spectroscopy, and determine the absorbances, A_T and A_S, at the wavelength of 730 nm; the amount of free phosphoric acid is NMT 0.5%.

$$\text{Content (\%) of free phosphoric acid } (H_3PO_4) = \frac{A_T}{A_S} \times \frac{1}{W} \times 10.32$$

W: Amount (mg) of Betamethasone Sodium Phosphate, calculated on the anhydrous basis.

(3) ***Betamethasone***—Dissolve 20 mg of Betamethasone Sodium Phosphate in exactly 2 mL of methanol, and use this solution as the test solution. Separately, weigh 20 mg of betamethasone RS, and dissolve in exactly 10 mL of methanol. Pipet 1 mL of this solution, add methanol to make exactly 20 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a freshly prepared mixture of *1*-butanol, water and acetic anhydride (3 : 1 : 1) (as the developing solvent) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm); the spot from the test solution corresponding to the spot from the standard solution is not more intense than the spot from the standard solution.

Water NMT 10.0% (0.2 g, volumetric titration, back titration).

Assay Weigh accurately 20 mg each of Betamethasone Sodium Phosphate and betamethasone sodium phosphate RS (water previously determined), and dissolve each in methanol to make exactly 20 mL. Pipet 5 mL each of these solutions, add exactly 5 mL of the internal standard solution, add methanol to make 50 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 10 μL each of these solutions as directed under the Liquid Chromatography according to the following conditions, and calculate the peak area ratios of betamethasone phosphate to that of the internal standard, Q_T and Q_S, respectively.

$$\text{Amount (mg) of betamethasone sodium phosphate } (C_{22}H_{28}FNa_2O_8P) = \text{Amount (mg) of betamethasone sodium phosphate RS, calculated on the anhydrous basis} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of butyl *p*-hydroxybenzoate in methanol (1 in 5000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (7 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: Dissolve 1.6 g of tetra *n*-butylammonium bromide, 3.2 g of sodium monohydrogen phosphate and 6.9 g of potassium dihydrogen phosphate in 1000 mL of water, and add 1500 mL of methanol.

Flow rate: Adjust the flow rate so that the retention time of betamethasone phosphate is about 5 minutes.

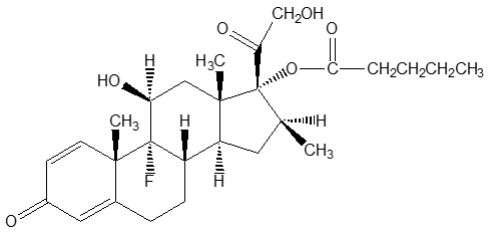
System suitability

System performance: Proceed with 10 μL of the standard solution according to the above conditions; betamethasone phosphate and the internal standard are eluted in this order with the resolution between these peaks being NLT 10.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area ratios of betamethasone phosphate to the internal standard is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Betamethasone Valerate
베타메타손발레레이트



$C_{27}H_{37}FO_6$: 476.58

[(8*S*,9*R*,10*S*,11*S*,13*S*,14*S*,16*S*,17*R*)-9-Fluoro-11-hydroxy-17-(2-hydroxyacetyl)-10,13,16-trimethyl-3-oxo-6,7,8,11,12,14,15,16-octahydrocyclopenta[a]phenanthren-17-yl] pentanoate [*2152-44-5*]

Betamethasone Valerate, when dried, contains NLT 97.0% and NMT 103.0% of betamethasone valerate ($C_{27}H_{37}FO_6$).

Description Betamethasone Valerate occurs as a white crystalline powder and it is odorless.
It is freely soluble in chloroform, soluble in ethanol(95), sparingly soluble in methanol, slightly soluble in ether, and practically insoluble in water.

Melting point—About 190 °C (with decomposition).

Identification (1) Weigh 10 mg of Betamethasone Valerate and use a mixture of 0.5 mL of 0.01 mol/L sodium hydroxide TS and 20 mL of water as the absorbent. Prepare the test solution, as directed under the Oxygen Flask Combustion,; the test solution responds to the Qualitative Analysis for fluoride.

(2) Determine the infrared spectra of Betamethasone Valerate and betamethasone valerate RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Optical rotation $[\alpha]_D^{20}$: Between + 77° and + 83° (0.10 g, previously dried, methanol, 20 mL, 100 mm).

Purity (1) ***Related substances***—Perform the test without exposure to light. Dissolve 20 mg of Betamethasone Valerate in 5 mL of a mixture of chloroform and methanol (9 : 1) and use this solution as the test solution. Pipet 1.0 mL of the test solution, add a mixture of chloroform and methanol (9 : 1) to make exactly 50 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Develop the plate with a mixture of chloroform and methanol (9 : 1) (as the developing solvent) to a distance of about 12 cm, and air-dry the plate. Spray evenly alkaline blue tetrazolium TS on the plate; the spots other than the principal spot obtained from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 0.5% (1 g, 105 °C, 3 hours).

Residue on ignition NMT 0.2% (0.5 g, platinum crucible).

Assay Weigh accurately about 10 mg each of Betamethasone Valerate and betamethasone valerate RS, previously dried, and dissolve each in methanol to make exactly 100 mL. Pipet 10.0 mL each of these solutions, add exactly 10 mL each of the internal standard solution, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 10 μL each of these solutions as directed under the Liquid Chromatography according to the following conditions, and calculate the peak area ratios of betamethasone valerate to the internal standard for the test solution and the standard solution, Q_T and Q_S, respectively.

$$\text{Amount (mg) of betamethasone valerate } (C_{27}H_{37}FO_6) = \text{Amount (mg) of betamethasone valerate RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of isoamyl benzoate in methanol (1 in 1000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and 20 cm to 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (7 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

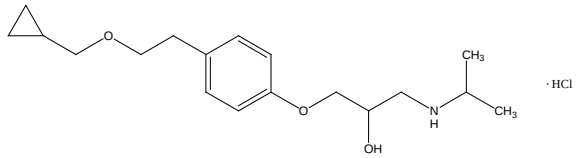
Mobile phase: A mixture of methanol and water (7 : 3).

Flow Rate: Adjust the flow rate so that the retention time of betamethasone valerate is about 10 minutes.

Selection of column: Proceed with 10 μL of the standard solution according to the above conditions; betamethasone valerate and the internal standard are eluted in this order with the resolution between these peaks being NLT 5.

Packaging and storage Preserve in light-resistant, tight containers.

Betaxolol Hydrochloride
베탁솔롤염산염



$C_{18}H_{29}NO_3 \cdot HCl$: 343.89
1-[4-[2-(Cyclopropylmethoxy)ethyl]phenoxy]-3-(propan-2-ylamino)propan-2-ol hydrochloride [*63659-19-8*]

Betaxolol Hydrochloride contains NLT 99.0% and NMT 101.0% of betaxolol hydrochloride ($C_{18}H_{29}NO_3 \cdot HCl$), calculated on the dried basis.

Description Betaxolol Hydrochloride occurs as a white crystalline powder.
It is very soluble in water, and freely soluble in methanol, ethanol(95), or acetic acid(100).
An aqueous solution of Betaxolol Hydrochloride (1 in 100) shows no optical rotation.

Identification (1) Determine the absorption spectra of solutions of Betaxolol Hydrochloride and betaxolol hydrochloride RS in ethanol(95) (1 in 10000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Betaxolol Hydrochloride and betaxolol hydrochloride RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) An aqueous solution of Betaxolol Hydrochloride (1 in 10) responds to the Qualitative Analysis for chloride.

Melting point Between 114 and 117 ℃.

pH Dissolve 1 g of Betaxolol Hydrochloride in 50 mL of water; the pH of this solution is between 4.5 and 6.5.

Purity (1) ***Clarity and color of solution*—**Dissolve 1.0 g of Betaxolol Hydrochloride in 10 mL of water; the resulting solution is clear and colorless.

(2) ***Heavy metals*—**Proceed with 2.0 g of Betaxolol Hydrochloride according to Method 4 under the Heavy Metals and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Arsenic***—Prepare the test solution with 2.0 g of Betaxolol Hydrochloride according to Method 3 and perform the test (NMT 1 ppm).

(4) ***Related substance I*—**Dissolve 0.10 g of Betaxolol Hydrochloride in 10 mL of methanol and use this solution as the test solution. Pipet 3 mL of this solution and add methanol to make exactly 50 mL. Pipet 1 mL of this solution, add methanol to make exactly 20 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under the Thin-layer chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography, develop the plate with a mixture of ethyl acetate, water and acetic acid(100) (10 : 3 : 3) (as the developing solvent) to a distance of about 10 cm, and air-dry the plate. Allow the plate to stand in iodine vapor for 1 hour; the spots other than the principal spot obtained from the test solution are NMT 3 and not more intense than the spots obtained from the standard solution.

(5) ***Related substance II*—**Dissolve 0.10 g of Betaxolol Hydrochloride in 50 mL of the mobile phase, and use this solution as the test solution. Pipet 1 mL of this solution, add the mobile phase to it make exactly 200 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine peak area in each solution by the automatic integration method; individual peak area other than betaxolol from the test solution is not greater than the peak area of betaxolol from the standard solution. The total peak area other than betaxolol from the test solution is not greater than 2 times the peak area of betaxolol from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 273 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: A mixture of diluted 0.05 mol/L potassium dihydrogen phosphate (1 in 2) adjusted to pH 3.0 by adding 1 mol/L hydrochloric acid TS, acetonitrile and methanol (26 : 7 : 7).

Flow rate: Adjust the flow rate so that the retention time of betaxolol is about 9 minutes.

System suitability

Test for required detectability: Pipet 4 mL of the standard solution and add the mobile phase to make exactly 20 mL. Verify that the peak area of betaxolol obtained from 10 μL of this solution corresponds to 14% to 26% of the peak area of betaxolol obtained from the standard solution.

System performance: Dissolve 50 mg of Betaxolol Hydrochloride and 5 mg of 2-naphtol in 200 mL of the mobile phase. Proceed with 10 μL of this solution according to the above conditions; betaxolol and 2-naphtol are eluted in this order with the resolution being NLT 10.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution according to the

above conditions; the relative standard deviation of the peak area of betaxolol is NMT 2.0%.

Time span of measurement: About 2 times the retention time of betaxolol after the solvent peak.

Loss on drying NMT 0.5% (1 g, 105 °C, 4 hours).

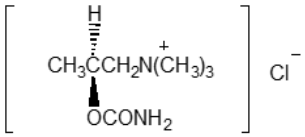
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.3 g of Betaxolol Hydrochloride, dissolve in 50 mL of acetic acid(100), add 7 mL of mercury acetate TS, and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 34.39 mg of $C_{18}H_{29}NO_3 \cdot HCl$

Packaging and storage Preserve in tight containers.

Bethanechol Chloride
베타네콜염화물



and enantiomer

$C_7H_{17}ClN_2O_2$: 196.68
2-Carbamoyloxypropyl(trimethyl)azanium chloride [*590-63-6*]

Bethanechol Chloride, when dried, contains NLT 98.0% and NMT 101.0% of bethanechol chloride ($C_7H_{17}ClN_2O_2$).

Description Bethanechol Chloride occurs as colorless or white crystals or a crystalline powder.
It is very soluble in water, freely soluble in acetic acid(100), and sparingly soluble in ethanol(99.5).
It is hygroscopic.
An aqueous solution of Bethanechol Chloride (1 in 10) shows no optical rotation.

Identification (1) To 2 mL of an aqueous solution of Bethanechol Chloride (1 in 40), add 0.1 mL of cobalt(II) chloride hexahydrate solution (1 in 100), and add 0.1 mL of potassium hexacyanoferrate(II) TS; the solution exhibits a green color, and the color almost entirely fades within 10 minutes.

(2) Add 0.1 mL of iodine TS to 1 mL of an aqueous solution of bethanechol chloride (1 in 100); the solution exhibits a greenish brown color.

(3) Determine the infrared spectra of Bethanechol Chloride and bethanechol chloride RS as directed in the paste method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(4) An aqueous solution of Bethanechol Chloride (1 in 100) responds to the Qualitative Analysis for chloride.

Melting point Between 217 and 221 °C (after drying).

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Bethanechol Chloride according to Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Related substances***—Dissolve 0.1 g of Bethanechol Chloride in 2.5 mL of water, and use this solution as the test solution. Pipet 1 mL of the test solution, add water to make exactly 100 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 1 μL each of the test solution and the standard solution on a plate of cellulose for thin-layer chromatography. Develop the plate with a mixture of a solution of ammonium chloride acetate (1 in 100), acetone, *1*-butanol and formic acid (20 : 20 : 20 : 1) (as the developing solvent) to a distance of about 10 cm, and dry the plate at 105 °C for 15 minutes. Spray evenly hexachloroplatinic(IV) acid-potassium iodide TS on the plate, and allow to stand for 30 minutes; the spots other than the principal spot from the test solution are not more intense than those from the standard solution.

Loss on drying NMT 1.0% (1 g, 105 °C, 2 hours).

Residue on ignition NMT 0.1% (1 g).

Chloride content Weigh accurately 0.4 g of Bethanechol Chloride, previously dried, and dissolve in 30 mL of water. Add 40.0 mL of 0.1 mol/L silver nitrate TS, then add 3 mL of nitric acid and 5 mL of nitrobenzene, and shake to mix for a few minutes. Add 2 mL of ammonium iron(III) sulfate TS and titrate the excess silver nitrate with 0.1 mol/L ammonium thiocyanate VS. The content of chloride is between 17.7% and 18.3%.

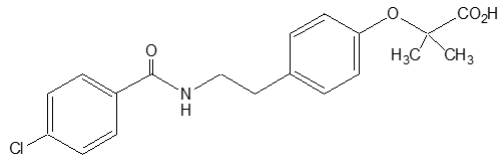
Each mL of 0.1 mol/L silver nitrate TS
= 3.545 mg of Cl

Assay Weigh accurately 0.4 g of Bethanechol Chloride, previously dried, dissolve in 2 mL of acetic acid(100), add 40 mL of acetic anhydride, and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 19.668 mg of $C_7H_{17}ClN_2O_2$

Packaging and storage Preserve in tight containers.

Bezafibrate
베자피브레이트



$C_{19}H_{20}ClNO_4$: 361.82
2-[4-[2-[(4-Chlorobenzoyl)amino]ethyl]phenoxy]-2-methylpropanoic acid [*41859-67-0*]

Bezafibrate, when dried, contains NLT 98.5% and NMT 101.0% of bezafibrate ($C_{19}H_{20}ClNO_4$).

Description Bezafibrate occurs as a white crystalline powder.
It is freely soluble in *N*,*N*-dimethylformamide, soluble in methanol, slightly soluble in ethanol(99.5), and practically insoluble in water.

Identification (1) Determine the absorption spectra of the solutions of Bezafibrate and bezafibrate RS in methanol (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Bezafibrate and bezafibrate RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) Perform the test as directed under the Flame Coloration (2) with Bezafibrate; it exhibits a green color.

Melting point Between 181 and 186 ℃.

Purity (1) ***Chloride*—**Weigh 3.0 g of Bezafibrate, dissolve in 15 mL of *N*,*N*-dimethylformamide, add water to make 60 mL, and shake well. Allow the solution to stand for at least 12 hours and filter. To 40 mL of the filtrate, add 6 mL of dilute nitric acid and water to make 50 mL, and use this solution as the test solution. Prepare the control solution by adding 0.70 mL of 0.01 mol/L hydrochloric acid, 10 mL of *N*,*N*-dimethylformamide, 6 mL of dilute nitric acid and water to make 50 mL (NMT 0.012%).

(2) ***Heavy metals***—Proceed with 2.0 g of Bezafibrate as directed under Method 4 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Related substances***—Dissolve 0.10 g of Bezafibrate in 35 mL of methanol, add diluted 0.5 mol/L ammonium acetate TS (1 in 50) again to make 50 mL, and use this solution as the test solution. Pipet 1.0 mL of the test solution, add 70 mL of methanol and diluted 0.5 mol/L ammonium acetate TS (1 in 50) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 5 μL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak areas by the automatic integration method; the peak areas of with the relative retention time of about 0.65 and 1.86 of bezafibrate from the test solution are not greater than 0.5 times that the peak area of bezafibrate from each standard solution. the peak areas of other than the bezafibrate from the test solution are not greater than 0.2 times the peak area of bezafibrate from the standard solution. Also, the sum of peak area other than the bezafibrate from the test solution is not greater than 0.75 times the peak area of bezafibrate from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 230 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 ℃.

Mobile phase: A mixture of methanol and diluted acetic acid(100) (1 in 100) (9 : 4).

Flow rate: Adjust the flow rate so that the retention time of bezafibrate is about 6 minutes.

System suitability

Test for required detectability: Pipet 5 mL of the standard solution and add a mixture of methanol and diluted 0.5 mol/L ammonium acetate TS (1 in 50) (7 : 3) to make exactly 50 mL. Confirm that the peak area of bezafibrate from 5 μL of this solution is equivalent to 7% to 13% of the peak area of bezafibrate from the standard solution.

System performance: Dissolve 20 mg of Bezafibrate and 10 mg of 4-chlorobenzoate in 70 mL of methanol and add diluted 0.5 mol/L ammonium acetate TS (1 in 50) to make 100 mL. Proceed with 5 μL of this solution under the above operating conditions; 4-chlorobenzoate and bezafibrate are eluted in this order with the resolution between these peaks being NLT 3.

System repeatability: Repeat the test 6 times with 5 μL each of the standard solution under the above operating conditions; the relative standard deviation of the peak area of bezafibrate is NMT 2.0%.

Time span of measurement: About 2.5 times the retention time of bezafibrate after the solvent peak.

Loss on drying NMT 0.5% (1 g, 105 ℃, 3 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.7 g of Bezafibrate, previously dried, dissolve it in 50 mL of ethanol(99.5), and titrate with 0.1 mol/L sodium hydroxide VS (indicator: 3 drops of phenolphthalein TS). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS
= 36.183 mg of $C_{19}H_{20}ClNO_4$

Packaging and storage Preserve in tight containers.

Bezafibrate Tablets
베자피브레이트 정

Bezafibrate Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of bezafibrate ($C_{19}H_{20}ClNO_4$: 361.82).

Method of preparation Prepare as directed under Tablets, with Bezafibrate.

Identification Weigh accurately an amount of Bezafibrate Tablets, equivalent to 0.4 g of bezafibrate according to the labeled amount, add 40 mL of methanol, shake well to mix, centrifuge, and use the clear supernatant as the test solution. Separately, weigh 25 mg of bezafibrate RS, dissolve with 2.5 mL of methanol, and use this solution as the standard solution A. Separately, weigh 10 mg of *N*-(4-chlorobenzoyl)-tyramine RS, dissolve in 5 mL of methanol. Take 1 mL of this solution, add methanol to make 100 mL, and use this solution as the standard solution B. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solutions on a thin-layer chromatographic plate made of silica gel for thin-layer chromatography (with a fluorescent indicator). Next, develop the plate with a mixture of xylene, methyl ethyl ketone, and acetic acid(100) (60 : 30 : 2.7) (as the developing solvent) to a distance of about 10 cm, and dry at about 105 °C. Examine under ultraviolet light (main wavelength: 254 nm);. the spot of the test solution exhibits its color and an R_f value corresponding to that of the standard solution A.

Purity Proceed as directed under the Identification; the spot corresponding to *N*-(4-chlorobenzoyl)-tyramine from the test solution is not more intense than that from the standard solution B.

Disintegration Meets the requirements.

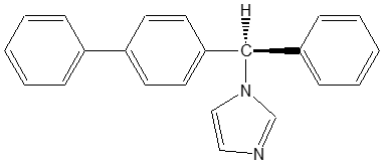
Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 tablets of Bezafibrate Tablets, and powder. Weigh accurately amount, equivalent to about 0.1 g of bezafibrate ($C_{19}H_{20}ClNO_4$), add 100 mL of ammonia-methanol TS, mix, and allow it to stand on a steam bath for 10 minutes. Add ammonia-methanol TS to make exactly 200 mL, filter, pipet 2 mL of the filtrate, add ammonia-methanol TS to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 0.1 g of bezafibrate RS, add ammonia -methanol TS to make exactly 200 mL. Pipet 2.0 mL of this solution, add the ammonia-methanol TS to make exactly 100 mL, and use this solution as the standard solution. Perform the test with each of the test solution and the standard solution as directed under the Ultraviolet-visible Spectroscopy, determine the absorbances (wavelength: 232 nm), A_T and A_S, of the test solution and the standard solution, respectively.

Amount (mg) of bezafibrate ($C_{19}H_{20}ClNO_4$)
= Amount (mg) of bezafibrate RS× (A_T / A_S)

Packaging and storage Preserve in well-closed containers.

Bifonazole
비포나졸



and enantiomer

$C_{22}H_{18}N_2$: 310.39
1-[[(1,1'-Biphenyl)-4-yl]phenylmethyl]imidazole [*60628-96-8*]

Bifonazole, when dried, contains NLT 98.5% and NMT 101.0% of bifonazole ($C_{22}H_{18}N_2$).

Description Bifonazole occurs as a white to pale yellow powder.
It is odorless and tasteless.
It is freely soluble in dichloromethane, soluble in methanol, sparingly soluble in ethanol(95), slightly soluble in ether and practically insoluble in water.
A solution of Bifonazole in methanol (1 in 100) shows no optical rotation.

Identification (1) Determine the absorption spectra of solutions of Bifonazole and bifonazole RS in methanol (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Bifonazole and bifonazole RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Melting point Between 147 and 151 ℃.

Purity (1) ***Chloride***—Add 40 mL of water to 2.0 g of Bifonazole, warm for 5 minutes, cool it down, and filter. Take 10 mL of the filtrate and add 6 mL of dilute nitric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control

solution with 0.30 mL of 0.01 mol/L hydrochloric acid (NMT 0.021%).

(2) ***Sulfate*—**Take 10 mL of the filtrate obtained from (1) and add 1 mL of dilute hydrochloric acid and water to make 50 mL. Use this as the test solution and perform the test. Prepare the control solution with 0.50 mL of 0.005 mol/L sulfuric acid (NMT 0.048%).

(3) ***Heavy metals*—**Proceed with 2.0 g of Bifonazole according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(4) ***Related substances*—**Perform the test using light-resistant containers, protected from direct sunlight. Dissolve 0.10 g of Bifonazole in 10 mL of methanol and use this solution as the test solution. Pipet 3 mL of the test solution and add methanol to make exactly 100 mL. Pipet 25 mL and 5 mL each of this solution, add methanol to make exactly 50 mL, and use these solutions as the standard solution (1) and the standard (2), respectively. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution, the standard solution (1) and the standard solution (2) on a silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate and ammonia water(28) (49 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Examine the plate under ultraviolet rays (main wavelength: 254 nm); the spots with an R_f value of about 0.20 obtained from the test solution are not more intense than the spots from the standard solution (1). The principal spot and the spots other than the above spots obtained from the test solution are not more intense than the spots from the standard solution (2).

Loss on drying NMT 0.5% (0.5 g, in vacuum, phosphorus pentoxide, 2 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.15 g of Bifonazole, previously dried, and dissolve in dichloromethane to make exactly 50 mL. Take exactly 5 mL of this solution, transfer to an Erlenmeyer flask with a stopper, add 10 mL of water, 5 mL of dilute sulfuric acid and 25 mL of dichloromethane, and add again 2 to 3 drops of a solution of methyl yellow in dichloromethane (1 in 500) as an indicator. Shake well to mix and titrate with 0.01 mol/L sodium lauryl sulfate VS using a burette with a minimum calibration of 0.02 mL. Add 1 drop each of 0.01 mol/L sodium lauryl sulfate, shake well to mix, and allow it to stand for some time; the endpoint titration is when the dichloromethane layer turns orange from yellow.

Each mL of 0.01 mol/L sodium lauryl sulfate VS
= 3.1039 mg of $C_{22}H_{18}N_2$

Packaging and storage Preserve in light-resistant, tight containers.

Bifonazole Solution
비포나졸 액

Bifonazole Solution contains NLT 90.0% and NMT 110.0% of the labeled amount of bifonazole ($C_{22}H_{18}N_2$: 310.39).

Method of preparation Prepare as directed under the Liquids, with Bifonazole.

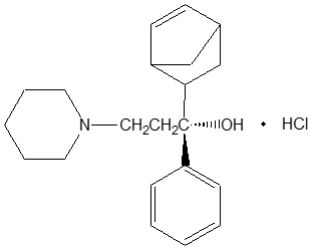
Identification To 1 mL of Bifonazole Solution, add a mixture of methanol and dichloromethane (1 : 1) to make 25 mL and use this solution as the test solution. Separately, weigh 25 mg of bifonazole RS, dissolve in a mixture of methanol and dichloromethane (1 : 1) to make 25 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of toluene, ethyl acetate and diethylamine (6 : 3 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Spray evenly Dragendorff's TS or examine the plate under ultraviolet rays (main wavelength: 254 nm); the R_f value and the color of the spots obtained from the test solution and the standard solutions are the same.

Assay Weigh accurately an amount of Bifonazole Solution, equivalent to 150 mg of bifonazole ($C_{22}H_{18}N_2$), according to the labeled amount, and dissolve in 50 mL of chloroform. Transfer this solution in a 150-mL beaker, add 35 mL of water, 5 mL of 10% sulfuric acid, and 1 mL of N,N′-dimethyl-*ρ*-(m-torylazo)-aniline indicator, and titrate with 0.004 mol/L sodium lauryl sulfate VS. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.004 mol/L sodium lauryl sulfate VS
= 1.2416 mg of $C_{22}H_{18}N_2$

Packaging and storage Preserve in well-closed containers.

Biperiden Hydrochloride
비페리덴염산염



and enantiomer

$C_{21}H_{29}NO \cdot HCl$: 347.92

1-(Bicyclo[2.2.1]hept-2-en-5-yl)-1-phenyl-3-(piperidin-1-yl)propan-1-ol hydrochloride [*1235-82-1*]

Biperiden Hydrochloride, when dried, contains NLT 99.0% and NMT 101.0% of biperiden hydrochloride ($C_{21}H_{29}NO \cdot HCl$).

Description Biperiden Hydrochloride occurs as a white to yellowish white crystalline powder.
It is freely soluble in formic acid, slightly soluble in water, methanol or ethanol(95), and practically insoluble in ether.

Melting point—About 270 °C (with decomposition).

Identification (1) Dissolve 20 mg of Biperiden Hydrochloride in 5 mL of phosphoric acid; the resulting solution is green.

(2) To 10 mg of Biperiden Hydrochloride, add 4 mL of water, heat, dissolve, and cool it down. Add between 5 and 6 drops of bromine TS; a yellow precipitate is formed.

(3) Determine the absorption spectra of solutions of Biperiden Hydrochloride and biperiden hydrochloride RS (1 in 2000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(4) Determine the infrared spectra of Biperiden Hydrochloride and biperiden hydrochloride RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(5) To 20 mg of Biperiden Hydrochloride, add 10 mL of water, heat, dissolve, and cool; it responds to the Qualitative Analysis for chloride.

Purity (1) ***Acidity or alkalinity***—To 1.0 g of Biperiden Hydrochloride, add 50 mL of water, shake strongly to mix, filter, and add 1 drop of methyl red TS to 20 mL of the filtrate; the solution does not exhibit a red or yellow color.

(2) ***Heavy metals***—Proceed with 1.0 g of Valsartan according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Arsenic***—Prepare the test solution with 1.0 g of Biperiden Hydrochloride according to Method 3 and perform the test (NMT 2 ppm).

(4) ***Related substances***—Dissolve 0.10 g of Biperiden Hydrochloride in 20 mL of methanol and use this solution as the test solution. Pipet 1 mL of this solution, add methanol to make exactly 200 mL, and use it as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 50 μL each of the test solution and the standard solution on a plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of chloroform, methanol and ammonia water(28) (80 : 15 : 2) (as the developing solvent) to about 15 cm, and air-dry the plate. Spray evenly Dragendorff's TS on the plate; the spots other than the principal spot from the test solution are not more intense than the spot from the standard solution.

Loss on drying NMT 0.5% (1 g, 105 °C, 3 hours).

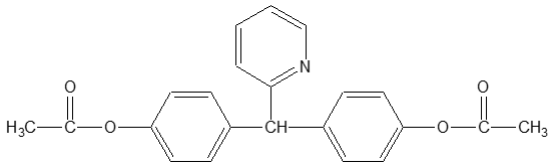
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.4 g of Biperiden Hydrochloride, previously dried, and dissolve in 5 mL of formic acid, add 60 mL of acetic anhydride and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 34.792 mg of $C_{21}H_{29}NO \cdot HCl$

Packaging and storage Preserve in light-resistant, well-closed containers.

Bisacodyl
비사코딜



$C_{22}H_{19}NO_4$: 361.39

4,4'-(2-Pyridinylmethylene)bisphenol-1,1'-diacetate [*603-50-9*]

Bisacodyl, when dried, contains NLT 98.5% and NMT 101.0% of bisacodyl ($C_{22}H_{19}NO_4$).

Description Bisacodyl occurs as a white, crystalline powder.
It is freely soluble in acetic acid(100), soluble in acetone, slightly soluble in ethanol(95) or ether, and practically insoluble in water.
It dissolves in dilute hydrochloric acid.

Identification (1) Determine the absorption spectra of solutions of Bisacodyl and bisacodyl RS in ethanol(95) (3 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Bisacodyl and bisacodyl RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Melting point Between 132 and 136 ℃.

Purity (1) ***Chloride***—Dissolve 1.0 g of Bisacodyl in 30 mL of acetone and add 6 mL of dilute nitric acid and water to make 50 mL. Use this as the test solution and perform the test. Prepare the control solution by putting 30 mL of acetone, 6 mL of dilute nitric acid and water into 0.35 mL of 0.01 mol/L hydrochloric acid to make 50 mL (NMT 0.012%).

(2) ***Sulfate***—Dissolve 1.0 g of Bisacodyl in 2 mL of dilute hydrochloric acid and add water to make 50 mL. Use this as the test solution and perform the test. Prepare the control solution with 0.35 mL of 0.005 mol/L sulfuric acid VS and 2 mL of dilute hydrochloric acid, and add water to make 50 mL (NMT 0.017%).

(3) ***Heavy metals***—Proceed with 2.0 g of Bisacodyl as directed under Method 4 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(4) ***Related substances***—Dissolve 0.20 g of Bisacodyl in 10 mL of acetone and use this solution as the test solution. Pipet 1 mL of the test, add acetone to make exactly 200 mL and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and standard solution on a plate of silica gel with a fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of 2-butanone, chloroform and xylene (1 : 1 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); any spot other than the principal spot obtained from the test solution is not more intense than that from the standard solution.

Loss on drying NMT 0.5% (1 g, 105 ℃, 2 h.).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.3 g of Bisacodyl, previously dried, dissolve it in 50 mL of acetic acid(100) and titrate with 0.1 mol/L perchloric acid VS (Indicator: 0.5 mL of 1-naphtholbenzein TS). The endpoint of the titration is determined to be the point where the color of the solution changes from orange-yellow to green. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 36.139 mg of $C_{22}H_{19}NO_4$

Packaging and storage Preserve in well-closed containers.

Bisacodyl Suppositories
비사코딜 좌제

Bisacodyl Suppositories contain NLT 90.0% and NMT 110.0% of the labeled amount of bisacodyl ($C_{22}H_{19}NO_4$: 361.39).

Method of preparation Prepare as directed under Suppositories, with Bisacodyl.

Identification (1) Weigh an amount of Bisacodyl Suppositories, equivalent to 6 mg of bisacodyl, according to the labeled amount, add 20 mL of ethanol(95), and warm on a steam bath for 10 minutes. Shake vigorously for 10 minutes, and allow to stand in iced water for 1 hour. Next, centrifuge to filter the clear supernatant, and add ethanol(95) to 2 mL of the filtrate to make 20 mL. Determine the absorption spectrum of this solution as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum at the wavelengths between 261 nm and 265 nm.

(2) Use the filtrate in (1) as the test solution. Separately, dissolve 6 mg of bisacodyl RS in ethanol(95), and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 20 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of 2-butanone, chloroform and xylene (1 : 1 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the R_f values of the spots from the test solution and the standard solution are the same.

Disintegration Meets the requirements.

Uniformity of dosage units It meets the requirements when the Content uniformity test is performed according to the following procedure. Take 1 Bisacodyl Suppositories, add tetrahydrofuran to make a solution containing about 0.2 mg of bisacodyl ($C_{22}H_{19}NO_4$) per mL, warm at 40 °C, and shake well to dissolve. After cooling, add tetrahydrofuran again so that the solution contains about 10 μg of bisacodyl ($C_{22}H_{19}NO_4$) per mL to make exactly *V* mL. Pipet 5 mL of this solution, and perform the test under the Assay.

Amount (mg) of bisacodyl ($C_{22}H_{19}NO_4$)

= Amount (mg) of bisacodyl RS× $\frac{Q_T}{Q_S} \times \frac{V}{50}$

Internal standard solution—A solution of ethylparaben in acetonitrile (3 in 100000).

Assay Weigh accurately the mass of NLT 20 Bisacodyl Suppositories, break carefully into small pieces, and mix evenly. Weigh accurately an amount equivalent to about 10 mg of bisacodyl ($C_{22}H_{19}NO_4$), add 40 mL of tetrahydrofuran, warm at 40 °C, and shake to dissolve. After cooling, add tetrahydrofuran again to make exactly 50 mL. Pipet 5 mL of this solution, and add exactly 5 mL of the internal standard solution and then the mobile phase again to make exactly 100 mL. Cool this solution with ice for 30 minutes, centrifuge, and filter the clear supernatant through a membrane filter with a pore size of 0.5 μm. Discard the first 10 mL of the filtrate and use the subsequent filtrate as the test solution. Separately, weigh accurately about 10 mg of bisacodyl RS (previously dried at 105 °C for 2 hours), and dissolve in tetrahydrofuran to make exactly 50 mL. Pipet 5 mL of this solution, proceed in the same manner as the test solution, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the ratio of the peak area of bisacodyl to that of the internal standard, Q_T and Q_S.

Amount (mg) of bisacodyl ($C_{22}H_{19}NO_4$)
= Amount (mg) of bisacodyl RS× $\frac{Q_T}{Q_S}$

Internal standard solution—A solution of ethylparaben in acetonitrile (3 in 100000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 3.9 mm in internal diameter and 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 μm to 10 μm in particle diameter).

Mobile phase: A mixture of 0.01 mol/L citric acid TS, acetonitrile and methanol (2 : 1 : 1).

Flow rate: Adjust the flow rate so that the retention time of bisacodyl is about 8 minutes.

System suitability

System performance: Proceed with 20 μL of the standard solution according to the above conditions; the internal standard and bisacodyl are eluted in this order with the resolution being NLT 2.0.

System repeatability: Repeat the test 6 times with 20 μL each of the standard solution according to the above conditions; the relative standard deviation of the ratios of the peak area of bisacodyl to that of the internal standard is NMT 2.0%.

Packaging and storage Preserve in tight containers.

Bisacodyl Tablets
비사코딜 정

Bisacodyl Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of bisacodyl ($C_{22}H_{19}NO_4$: 361.39).

Bisacodyl Tablets are delayed-release preparations.

Method of preparation Prepare as directed under Tablets, with Bisacodyl.

Identification Weigh an amount of Bisacodyl Tablets, previously powdered, equivalent to about 0.3 g of bisacodyl, add 100 mL of acetone, and shake to mix. Heat on a steam bath to boiling, filter and evaporate to about 20 mL. To this solution, add 200 mL of water, and evaporate acetone by warming on a steam bath, through the nitrogen gas. Cool, filter with a glass filter (G4) after 30 minutes and discard the filtrate. Dissolve the residue on the filter in 50 mL of acetone and evaporate to about 15 mL. Add about 75 mL of water, heat on a steam bath for 15 minutes and cool. Crystallize by scratching the wall of the beaker, filter, dry at 105 ℃ for about 15 minutes and perform the test with the residue as directed under the Identification (2) under Bisacodyl.

Disintegration Meets the requirements. However, the tablets are disintegrated within 60 minutes by Solution 1, and within 45 minutes by Solution 2.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 Bisacodyl Tablets, and powder. Weigh accurately an amount of the powder, equivalent to about 25 mg of bisacodyl ($C_{22}H_{19}NO_4$), add 10 mL of water, shake to mix for 15 minutes, and shake vigorously again to mix for another 15 minutes. To this solution, add 30 mL of acetonitrile and shake to mix for 15 minutes. Shake vigorously again to mix for another 15 minutes, add acetonitrile to make exactly 50 mL, mix and filter. Discard the first 10 mL of the filtrate, take 5 mL of the subsequent filtrate, add 5.0 mL of the internal standard solution, and use this solution as the test solution. Separately, weigh accurately about 25 mg of bisacodyl RS, previously dried at 105 ℃ for 2 hours, and dissolve in acetonitrile to make exactly 50 mL. Take exactly 5 mL of this solution, proceed in the same manner as the solution, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the peak area ratios, Q_T and Q_S, of bisacodyl to the peak area of the internal standard.

Amount (mg) of bisacodyl ($C_{22}H_{19}NO_4$)

$$= \text{Amount (mg) of bisacodyl RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of ethylparaben in acetonitrile (3 in 100000).

Operating conditions

Proceed as directed under the Operating conditions in the Assay under Bisacodyl Suppositories.

System suitability

System performance: Proceed with 20 μL of the standard solution according to the above conditions; the internal standard and bisacodyl are eluted in this order with the resolution being NLT 2.0.

System repeatability: Repeat the test 6 times with 20 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area ratio of bisacodyl to the peak area of the internal standard is NMT 2.0%.

Packaging and storage Preserve in well-closed containers and store at below 30 ℃.

Bisacodyl and Docusate Sodium Tablets
비사코딜·도큐세이트나트륨 정

Bisacodyl and Docusate Sodium Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of bisacodyl ($C_{22}H_{19}NO_4$: 361.39) and docusate sodium ($C_{20}H_{37}NaO_7S$: 444.56).

Bisacodyl and Docusate Sodium Tablets are delayed-release preparations.

Method of preparation Prepare as directed under Tablets, with Bisacodyl and Docusate Sodium.

Identification (1) ***Bisacodyl***—Weigh an amount of Bisacodyl and Docusate Sodium Tablets, previously powdered, equivalent to about 5 mg of bisacodyl, add 5 mL of acetone, and shake to mix. Filter and use the filtrate as the test solution. Weigh 5 mg of bisacodyl RS, add 5 mL of acetone, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of methanol and strong ammonia water (100 : 1.5) as the developing solvent and air-dry the plate. Spray hexachloroplatinic(IV) acid-potassium iodide TS evenly onto the plate; the R_f values and the color of the spots obtained from the test solution and the standard solution are the same.

(2) ***Docusate sodium***—Weigh an amount of Bisacodyl and Docusate Sodium Tablets, previously powdered, equivalent to about 50 mg of docusate sodium, add 10 mL of ethanol, and shake to mix. Filter and use the filtrate as the test solution. Weigh 50 mg of docusate sodium RS, add 10 mL of ethanol, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot the test solution and the standard solution on the thin-layer chromatographic plate made of cellulose. Next, develop the plate with a mixture of water and methanol (5 : 5) as the developing solvent, and air-dry the plate. Spray evenly a solution prepared by dissolving 50 mg of Rhodamine B in a mixture of an equal amount of ethanol and water and making 100 mL; the R_f values and the color of the spots obtained from the test solution and the standard solution are the same.

Dissolution (1) ***Test in an acidic solution***—Perform the test with 1 tablet of Bisacodyl and Docusate Sodium Tablets at 100 revolutions per minute according to Method 1, using 500 mL of 0.1 mol/L hydrochloric acid TS as the dissolution medium. Filter the dissolved solution, 2 hours after the start of the test, with a membrane filter with a pore size of 0.45 μm, and use the filtrate as the test solution. Separately, weigh accurately about 50 mg of bisacodyl RS, add 50 mL of methanol with 1 drop of dilute phosphoric acid, and use this solution as the standard bisacodyl stock solution. Separately, weigh accurately about 47 mg of docusate sodium RS, transfer to a 100-mL volumetric flask, and add 20 mL of ethanol. Add methanol with 1 drop of dilute phosphoric acid to make 100 mL, and use this solution as the standard docusate sodium stock solution. Take 1.0 mL of the solution prepared by diluting 5.0 mL of the standard bisacodyl stock solution with the dissolution medium to make 100 mL and 10.0 mL of the solution prepared by diluting 5.0 mL of the standard docusate sodium stock solution with the dissolution medium to make 100 mL, add dissolution medium to make 100 mL, and use this solution as the standard solution. Perform the test with 100 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas of bisacodyl and docusate sodium in each solution. Determine according to Table 3 of Delayed-release preparations determination method 1.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 210 nm).

Column: A stainless steel column about 3.0 mm in internal diameter and about 12.5 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 ℃.

Mobile phase: Dissolve 8.9 g of sodium dihydrogen phosphate dihydrate and 10 g of sodium lauryl sulfate in 800 mL of water, adjust the pH to 7.5 with 1 mol/L hydrochloric acid solution, and add water to make 1000 mL. To 600 mL of this solution, add 400 mL of acetonitrile.

Flow rate: 1.1 mL/min

System suitability

System performance: Proceed with 100 μL of the standard solution according to the above conditions; the number of theoretical plate and the symmetry factor of bisacodyl are NLT 3000 and NMT 1.3, respectively.

System repeatability: Repeat the test 5 times with 100 μL of the standard solution according to the above conditions; the relative standard deviation of peak areas of bisacodyl and docusate sodium is NMT 2.0%.

(2) ***Test in a buffer solution***—After completing the test in (1), dip a basket with the samples in 100-mL beaker containing 80 mL of water and remove from the beaker. When the water is drained, take 1 tablet each of the sample taken out from the basket, and perform the test at 100 revolutions per minute according to Method 2, using 900 mL of pH 7.5 phosphate buffer solution as the dissolution medium. Filter the dissolved solution, 60 minutes after the start of the test, through a membrane filter with pore diameter of 0.45 μm, and use the filtrate as the test solution. Add 8.0 mL of the solution prepared by adding the dissolution medium to 7.0 mL of the standard bisacodyl stock solution in (1) to make 100 mL and 4.0 mL of the standard docusate sodium stock solution in (1) to make 100 mL, and use this solution as the standard solution. Perform the test with 100 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the conditions in (1), and determine peak areas of bisacodyl and docusate sodium in each solution. Determine according to Table 4 of Delayed-release preparations determination method 1.
The acceptable dissolution criterion is NLT 75% (Q) of the labeled amount of Bisacodyl and Docusate Sodium Tablets dissolved in 60 minutes.

pH 7.5 phosphate buffer solution—Dissolve 8.9 g of sodium dihydrogen phosphate dihydrate and 10 g of sodium lauryl sulfate in 800 mL of water, adjust pH to 7.5 with 1 mol/L hydrochloric acid solution, and add water to make 1 L.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 Bisacodyl and Docusate Sodium Tablets, and powder. Weigh accurately an amount equivalent to 10 mg of bisacodyl ($C_{22}H_{19}NO_4$) and 32.5 mg of docusate sodium ($C_{20}H_{37}NaO_7S$), dissolve in the mobile phase to make 50 mL, filter, and use the filtrate as the test solution. Separately, weigh accurately about 10 mg of bisacodyl RS, and about 32.5 mg of docusate sodium RS, add the mobile phase to make 50 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions and determine the peak areas, A_{T1}, A_{T2}, A_{S1} and A_{S2}, of bisacodyl and docusate sodium in each solution.

$$\text{Amount (mg) of bisacodyl } (C_{22}H_{19}NO_4) = \text{Amount (mg) of bisacodyl RS} \times \frac{A_{T1}}{A_{S1}}$$

$$\text{Amount (mg) of docusate sodium } (C_{20}H_{37}NaO_7S) = \text{Amount (mg) of docusate sodium RS} \times \frac{A_{T2}}{A_{S2}}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 214 nm).

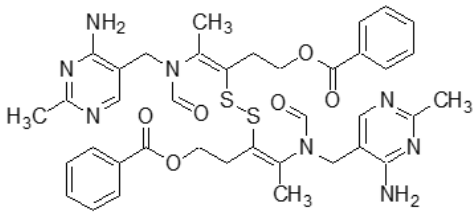
Column: A stainless steel column about 3.9 nm in internal diameter and about 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 μm to 10 μm in particle diameter).

Mobile phase: A mixture of 0.005 mol/L tetrabutylammonium phosphate, acetonitrile and methanol (26 : 23 : 1).

Flow rate: 1.0 mL/min

Packaging and storage Preserve in well-closed containers.

Bisbentiamine
비스벤티아민



$C_{38}H_{42}N_8O_6S_2$: 770.92

N-[(4-Amino-2-methyl-5-pyrimidinyl)methyl]-*N*-[2-[[2-[[(4-amino-2-methyl-5-pyrimidinyl)methyl]formylamino]-1-[2-(benzoyloxy)ethyl]-1-propen-1-yl]dithio]-4-(benzoyloxy)-1-methyl-1-buten-1-yl]-formamide, [*2667-89-2*]

Bisbentiamine, when dried, contains NLT 98.0% and NMT 102.0% of bisbentiamine ($C_{38}H_{42}N_8O_6S_2$).

Description Bisbentiamine occurs as white crystals or a crystalline powder.
It is odorless.
It is freely soluble in chloroform, sparingly soluble in methanol, slightly soluble in ethanol(95), practically insoluble in water, and soluble in dilute hydrochloric acid.

Melting point—Between 140 and 144 °C (with decomposition).

Identification (1) Weigh 5 mg of Bisbentiamine, dissolve in 1 mL of methanol, add 2 mL of water, 2 mL of L-Cysteine hydrochloride (1 in 100) and 1 mL of 0.5 mol/L sodium hydroxide, shake vigorously to mix, and

allow to stand for 5 minutes. Add 1 mL of potassium ferricyanide TS, 5 mL of 0.5 mol/L sodium hydroxide and 5 mL of isobutanol, shake vigorously to mix for 2 minutes, and allow to stand. Next, expose the solution under ultraviolet light and examine the upper portion of the upper liquid layer in the direction perpendicular to the direction of exposure; the isobutanol layer exhibits a violet fluorescence.

(2) Weigh 50 mg of Bisbentiamine, dissolve in 5 mL of methanol by warming, and add 2 mL of a mixture of hydroxylamine hydrochloride (3 in 20) and sodium hydroxide (3 in 20) in equal amounts. Warm at 50 °C to 60 °C on a steam bath for 2 minutes, add 0.8 mL of hydrochloric acid and 0.5 mL of Iron(III) chloride TS, and add 8 mL of water; the solution exhibits a reddish purple color.

Purity (1) ***Clarity and color of solution***—Weigh 1.0 g of Bisbentiamine, dissolve in 20 mL of methanol on a steam bath by warming at 50°C; the solution is clear and colorless.

(2) ***Heavy metals***—Proceed with 1.0 g of Bisbentiamine according to Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Thiochrome-positive substances***—Weigh accurately about 0.1 g of Bisbentiamine, previously dried, dissolve in 10 mL of hydrochloric acid TS, add acidic potassium chloride TS to make 200 mL, and use this solution as the test solution. Separately, weigh accurately about 0.1 g of thiamine hydrochloride RS (calculated on the anhydrous basis), and add 0.001 mol/L hydrochloric acid TS to make 1000 mL. Pipet 2.0 mL of this solution, add acidic potassium chloride TS to make 100 mL, and use this solution as the standard solution. Transfer 5.0 mL each of the test solution and the standard solution to stoppered centrifugal separation tubes T, T', S and S', proceed with them in the same manner as in the Assay, and determine fluorescences, F_T, $F_{T'}$, F_S and $F_{S'}$ of each isobutanol layer. Calculate with the following equation; the amount of thiochrome-positive substances is NMT 0.2%.

Amount (mg) of thiochrome-positive substances
= Amount (mg) of thiochrome-positive substances (calculated on the anhydrous basis)$\times \frac{F_T - F_{T'}}{F_S - F_{S'}} \times \frac{1}{250}$

Loss on drying NMT 0.5% (1 g, in Vacuum, phosphorus pentoxide, 24 hours).

Residue on ignition NMT 0.2% (1 g).

Assay Weigh accurately about 50 mg of Bisbentiamine and bisbentiamine RS, previously dried, dissolve in 25 mL of 1 mol/L hydrochloric acid TS, and add the mobile phase to make exactly 100 mL. Pipet 2 mL each of these solutions, and add the mobile phase to make exactly 50 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S of bisbentiamine.

Amount (mg) of bisbentiamine ($C_{38}H_{42}N_8O_6S_2$)
= Amount (mg) of bisbentiamine RS × A_T / A_S

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless-steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter), or an equivalent column.

Column temperature: A constant temperature of about 40 °C.

Mobile phase: Dissolve 1 g of sodium 1-pentanesulfonate in 600 mL of dilute acetic acid(100) (1 in 100), and add 400 mL of acetonitrile.

Flow rate: 1.0 mL/min

System suitability

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak areas of bisbentiamine is NMT 2.0%.

Packaging and storage Preserve in tight containers.

Bismuth Subgallate
비스무트차갈르산염

Bismuth Subgallate, when dried, contains NLT 47.0% and NMT 51.0% of bismuth (Bi : 208.98).

Description Bismuth Subgallate occurs as a yellow powder, and is odorless and tasteless.
It is practically insoluble in water, ethanol(95) or ether.
It dissolves in warmed dilute hydrochloric acid, dilute nitric acid or dilute sulfuric acid, and also dissolves in sodium hydroxide TS to form a clear, yellow solution, which immediately turns red.
It is affected by light.

Identification (1) Ignite 0.5 g of Bismuth Subgallate; it chars at first and leaves finally a yellow residue. The residue responds to the Qualitative Analysis for bismuth salt.

(2) To 0.5 g of Bismuth Subgallate, add 25 mL of water and 20 mL of hydrogen sulfide TS, shake well to mix, discard the resulting blackish brown precipitate by filtering, and add 1 drop of iron(III) chloride TS to the filtrate; the solution exhibits a bluish black color.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Bismuth Subgallate in 40 mL of diluted sodium hydroxide TS (1 in 8); the solution is clear.

(2) ***Nitrate***—To 0.5 g of Bismuth Subgallate, add 5 mL of dilute sulfuric acid and 25 mL of iron(II) sulfate TS, shake well to mix, filter, and superimpose 5 mL of the filtrate on the sulfuric acid; the boundary layer does not exhibit a reddish brown color.

(3) ***Sulfate***—Ignite 3.0 g of Bismuth Subgallate in a crucible, dissolve cautiously the residue in 2.5 mL of nitric acid by warming. Add the resulting solution in 100 mL of water, shake to mix, and filter. Evaporate 50 mL of the filtrate on a steam bath to make 15 mL, add water to make 20 mL, filter again, and use the filtrate as the test solution. To 5 mL of the test solution, add 2 to 3 drops of barium nitrate TS; no turbidity is produced.

(4) ***Ammonium***—Dissolve 1.0 g of Bismuth Subgallate in 5 mL of sodium hydroxide TS and heat; the gas evolved does not change the color of a moistened red litmus paper to blue.

(5) ***Copper***—To 5 mL of the test solution obtained in (2), add 1 mL of ammonia TS and filter; the filtrate does not exhibit a blue color.

(6) ***Lead***—Ignite 1.0 g of Bismuth Subgallate at about 500 ºC in a crucible, dissolve the residue in the smallest possible amount of nitric acid added dropwise, evaporate over a low flame to dryness, and allow to cool. Add 5 mL of a solution of potassium hydroxide (1 in 6) to the residue, boil carefully for 2 minutes, allow to cool, and centrifuge. Take the clear supernatant in a test tube, add 10 drops of potassium chromate TS, and acidify the solution by adding acetic acid(100) dropwise; neither turbidity nor a yellow precipitate is produced.

(7) ***Silver***—To 5 mL of the test solution obtained in (2), add 0.5 mL of nitric acid and 2 to 3 drops of dilute hydrochloric acid; no turbidity is produced.

(8) ***Alkaline earth metals and alkali metals***—Boil 1.0 g of Bismuth Subgallate with 40 mL of diluted acetic acid (1 in 2) for 2 minutes, allow to cool, add water to make 40 mL, and filter. To 20 mL of the filtrate, add 2 mL of dilute hydrochloric acid, boil, immediately pass hydrogen sulfide thoroughly through the solution, filter the precipitate produced, and wash with water. Combine the filtrate and the washings, add 5 drops of sulfuric acid, evaporate to dryness, and ignite as directed under the Residue on ignition; the weight of the residue is NMT 5.0 mg.

(9) ***Arsenic*—**Mix 0.20 g of Bismuth Subgallate well with 0.20 g of calcium hydroxide and ignite the mixture. Dissolve the residue in 5 mL of dilute hydrochloric acid, use this solution as the test solution, and perform the test (NMT 10 ppm).

(10) ***Gallic acid*—**To 1.0 g of Bismuth Subgallate, add 20 mL of ethanol(95), shake to mix for 1 minute, and filter. Evaporate the filtrate on a steam bath to dryness; the weight of the residue is NMT 5.0 mg.

Loss on drying NMT 6.0% (1 g, 105 ℃, 3 hours).

Assay Weigh accurately 0.5 g of Bismuth Subgallate, previously dried, heat at about 500 ºC for 30 minutes, and allow to cool. Dissolve the residue in 5 mL of diluted nitric acid (2 in 5) by warming and add water to make exactly 100 mL. Pipet 30 mL of this solution, add 200 mL of water, and titrate with 0.02 mol/L ethylenediaminetetraacetic acid disodium salt VS (indicator: 2 to 3 drops of xylenol orange TS). The endpoint of the titration is when the color of the solution changes from purple to yellow.

Each mL of 0.02 mol/L ethylenediaminetetraacetic acid disodium salt VS
= 4.180 mg of Bi

Packaging and storage Preserve in light-resistant, well-closed containers.

Bismuth Subnitrate
비스무트차질산염

Bismuth Subnitrate, when dried, contains NLT 71.5% and NMT 74.5% of bismuth (Bi : 208.98).

Description Bismuth Subnitrateoccurs as a white powder.
It is practically insoluble in water, ethanol(95) or ether.
It readily dissolves in hydrochloric acid or nitric acid without effervescence.
It is slightly hygroscopic and changes moistened blue litmus paper to red.

Identification Bismuth Subnitrate responds to the Qualitative Analysis for bismuth salt and nitrate.

Purity (1) ***Chloride***—Dissolve 0.7 g of Bismuth Subnitrate in 2 mL of water and 2 mL of nitric acid and add 6 mL of dilute nitric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution by evaporating 2 mL of nitric acid on a steam bath to dryness and then adding 0.70 mL of 0.01 mol/L hydrochloric acid, 6 mL of dilute nitric acid and water to make 50 mL (NMT 0.035%).

(2) ***Sulfate***—Dissolve 3.0 g of Bismuth Subnitrate in 3.0 mL of warmed nitric acid, pour this solution into 100 mL of water, shake to mix, and filter. Evaporate the filtrate on a steam bath to 30 mL, filter again, and use the filtrate as the test solution. To 5 mL of the test solution, add 2 to 3 drops of barium nitrate TS; no turbidity is produced.

(3) ***Ammonium***—Boil 0.10 g of Bismuth Subnitrate with 5 mL of sodium hydroxide TS; the gas evolved does not change moistened red litmus paper to blue.

(4) ***Copper***—To 5 mL of the test solution in (2), add 2 mL of ammonia TS and filter; the filtrate does not exhibit a blue color.

(5) ***Lead***—To 1.0 g of Bismuth Subnitrate, add 5 mL of a solution of potassium hydroxide (1 in 6), boil carefully for 2 minutes, allow to cool, and then centrifuge. Transfer the clear supernatant to a test tube, add 10

drops of potassium chromate TS, and acidify by adding acetic acid(100) dropwise; no turbidity or yellow precipitate is produced.

(6) ***Silver***—To 5 mL of the test solution obtained in (2), add 0.5 mL of nitric acid and 2 to 3 drops of dilute hydrochloric acid; no turbidity is produced.

(7) ***Alkaline earth metals and alkali metals***—Boil 2.0 g of Bismuth Subnitrate with 40 mL of diluted acetic acid (1 in 2) for 2 minutes, allow to cool, add water to make 40 mL, and filter. To 20 mL of the filtrate, add 2 mL of dilute hydrochloric acid, boil, immediately pass hydrogen sulfide thoroughly through the solution, filter, and wash the residue with water. Combine the filtrate and the washings, add 5 drops of sulfuric acid, evaporate to dryness, and ignite as directed under the Residue on ignition; the weight of the residue is NMT 5.0 mg.

(8) ***Arsenic***—To 0.20 g of Bismuth Subnitrate, add 2 mL of sulfuric acid, heat until white fumes evolve, and dilute cautiously with water to make 5 mL. Use this solution as the test solution and perform the test (NMT 10 ppm).

(9) ***Carbonate***—To 3 g of Bismuth Subnitrate, add 3 mL of warmed nitric acid; almost no bubbles are produced. Add this solution in 100 mL of water; a white precipitate is produced.

Loss on drying NMT 3.0% (2 g, 105 ℃, 2 hours).

Assay Weigh accurately 0.4 g of Bismuth Subnitrate, previously dried, dissolve in 5 mL of diluted nitric acid (2 in 5) by warming, and add water to make exactly 100 mL. Pipet 25 mL of this solution, add 200 mL of water, and titrate with 0.02 mol/L ethylenediaminetetraacetic acid disodium salt VS (indicator: 5 drops of xylenol orange TS). The endpoint of the titration when the color of the solution changes from purple to yellow.

Each mL of 0.02 mol/L ethylenediaminetetraacetic acid disodium salt VS
= 4.180 mg of Bi

Packaging and storage Preserve in well-closed containers.

Bismuth Subnitrate Tabets
비스무트차질산염 정

Bismuth Subnitrate Tablets contain bismuth (Bi: 208.95) equivalent to NLT 66.0% and NMT 77.2% of the labeled amount of bismuth subnitrate.

Method of preparation Prepare as directed under Tablets, with Bismuth Subnitrate.

Identification Bismuth Subnitrate Tablets respond to the Qualitative Analysis for bismuth salt and nitrate.

Disintegration Meets the requirements.

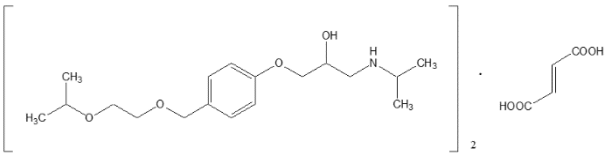
Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 Bismuth Subnitrate Tablets, and powder the tablets. Weigh accurately an amount equivalent to about 0.4 g of bismuth subnitrate, add 5 mL of nitric acid solution (2 in 5), warm the solution to dissolve, and add water to make exactly 100 mL. Take 25.0 mL of this solution, add 200 mL of water and titrate with 0.02 mol/L ethylenediaminetetraacetic acid disodium salt VS (indicator: 5 drops of xylenol orange TS) The endpoint of the titration is when the color of the solution changes from reddish purple to yellow. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.02 mol/L ethylenediaminetetraacetic acid disodium salt VS
= 4.180 mg of Bi

Packaging and storage Preserve in well-closed containers.

Bisoprolol Fumarate
비소프롤롤푸마르산염



$(C_{18}H_{31}NO_4)_2 \cdot C_4H_4O_4$: 766.96

2-Hydroxy-3-[4-[[2-(1-methylethoxy)ethoxy]methyl]phenoxy]-*N*-[(1-methylethyl)propanamine (2*E*)-2-butenedioate [*104344-23-2*]

Bisoprolol Fumarate contains NLT 97.5% and NMT 102.0% of bisoprolol fumarate $[(C_{18}H_{31}NO_4)_2 \cdot C_4H_4O_4]$, calculated on the anhydrous basis.

Description Bisoprolol Fumarate occurs as a white, crystalline powder.
It is very soluble in water or methanol, and freely soluble in ethanol(99.5) or acetic acid(100).
A aqueous solution of Bisoprolol Fumarate (1 in 10) shows no optical rotation.

Identification (1) Determine the infrared spectra of Bisoprolol Fumarate and bisoprolol fumarate RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) The retention times of the major peaks obtained from the test solution and standard solution in the Assay are the same.

Melting point Between 101 and 105 ℃.

Optical rotation $[\alpha]_D^{20}$: Between -0.2° and +0.2° (0.2 g, 20 mL of methanol, 100 mm).

Purity (1) ***Heavy metals***—Proceed with 2.0 g of Bisoprolol Fumarate according to Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Fumaric acid***—Weigh accurately about 0.5 g of Bisoprolol Fumarate, dissolve in 70 mL of ethanol(99.5), add accurately 8.0 mL of 0.1 mol/L tetrabutylammonium hydroxide, shake for 2 minutes, and titrate with 0.1 mol/L tetrabutylammonium hydroxide VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction (14.8% - 15.4%).

Each mL of 0.1 mol/L tetrabutylammonium hydroxide VS
= 5.804 mg of $C_4H_4O_4$

(3) ***Related substance***—Prepare solutions as directed under the preparation of the test solution under the Related substances of the Assay and use each of these solutions as the test solutions. Perform the test with 10 μL of the test solutions as directed under the Liquid Chromatography according to the conditions under the Assay, determine the areas of each peak, and calculate the total amount of related substances; it is NMT 0.5%.

$$\text{Total content (\%) of related substances} = 100 \times \frac{A_i}{A_S}$$

A_i: All peak areas other than peak areas of fumaric acid and bisoprolol.

A_S: The total areas of all peaks in the chromatogram.

Loss on drying NMT 0.5% (1 g, in vacuum, phosphorus oxide, 80 ℃, 5hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 50 mg of Bisoprolol Fumarate, dissolve in 35 vol% acetonitrile solution to make exactly 50 mL, and use this solution as the test solution. Separately, weigh accurately about 50 mg of bisoprolol fumarate RS, dissolve in 35 vol% acetonitrile solution to make exactly 50 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of bisoprolol fumarate from each solution.

$$\text{Amount (mg) of bisoprolol fumarate } [(C_{18}H_{31}NO_4)_2 \cdot C_4H_4O_4] = 50 \times C \times \frac{A_T}{A_S}$$

C: Concentration (mg/mL) of bisoprolol fumarate RS in the standard solution

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 273 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 125 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 μm - 10 μm in particle diameter).

Mobile phase: To 1000 mL of 35 vol% acetonitrile solution, add 5 mL of heptafluorobutyric acid and 5 mL of formic acid, mix, and filter.

Flow rate: 1.0 mL/min

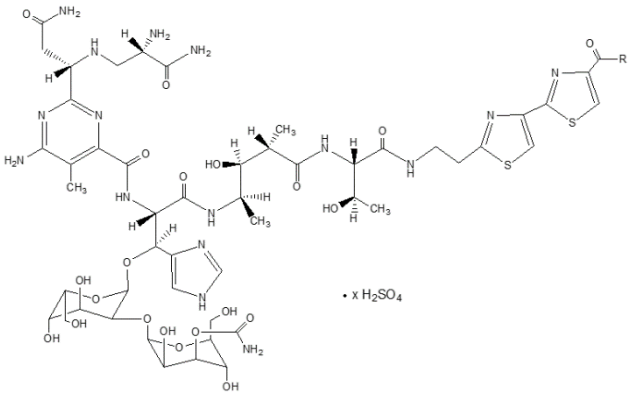
System suitability

System performance: Weigh accurately 25.0 mg of propranolol hydrochloride and 50.0 mg of bisoprolol fumarate and dissolve in 35 vol% acetonitrile solution to make exactly 50 mL. Proceed with 10 μL of this solution according to the above conditions; the resolution between the peaks of bisoprolol and propranolol is NLT 7.0. Additionally, proceed with 10 μL of the standard solution according to the above conditions; the symmetry factor is NMT 2.0.

System repeatability: Repeat the test 5 times with 10 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak areas is NMT 2.0%.

Packaging and storage Preserve in light-resistant, tight containers.

Bleomycin Sulfate
블레오마이신황산염



Bleomycin acid : R = OH

Bleomycin A_1 : R = $NHCH_2CH_2CH_2SOCH_3$

Bleomycin dimethyl A_2 : R = $NHCH_2CH_2CH_2SCH_3$

Bleomycin A_2 : R = $NHCH_2CH_2CH_2S^+(CH_3)_2 \cdot X^-$

Bleomycin $A_{2'\text{-}a}$: R = $NHCH_2CH_2CH_2CH_2NH_2$
Bleomycin $A_{2'\text{-}b}$: R = $NHCH_2CH_2CH_2NH_2$
Bleomycin A_5 : R = $NH(CH_2)_3NH(CH_2)_4NH_2$
Bleomycin B_1 : R = NH_2
Bleomycin B_2 : R = $NH(CH_2)_4NHC(NH)NH_2$
Bleomycin B_4 : R=
$NH(CH_2)_4NHC(NH)NH(CH_2)_4NHC(NH)NH_2$
Bleomycin Sulfate
Bleomycin acid : 1-Bleomycinoic acid sulfate
Bleomycin A_1 : N^1-[3-(Methylsulfinyl)propyl] bleomycinamide sulfate
Bleomycin dimethyl A_2 : N^1-[3-(Methylsulfanyl)propyl]bleomycinamide sulfate
Bleomycin A_2 N^1-[3-(Dimethylsulfonio)propyl] Bleomycinamide sulfate
Bleomycin $A_{2'\text{-}a}$: N^1-(4-Aminobutyl)bleomycinamide sulfate
Bleomycin $A_{2'\text{-}b}$: N^1-(3-Aminopropyl)bleomycinamide sulfate
Bleomycin A_5 : N^1-{3-[(4-Aminobutyl)amino] propyl}bleomycinamide sulfate
Bleomycin $B_{1'}$: Bleomycinamide sulfate
Bleomycin B_2 : N^1-(4-Guanidinobutyl)bleomycinamide sulfate
Bleomycin B_4: N^1-{4-[3-(4-Guanidinobutyl)guanidino]butyl}-bleomycinamide sulfate [*9041-93-4*]

Bleomycin Sulfate is a sulfate of a mixture of substances having antitumor activity produced by the growth of *Streptomyces verticillus*.

Bleomycin Sulfate contains NLT 1400 μg (potency) and NMT 2000 μg (potency) of bleomycin A_2 ($C_{55}H_{84}ClN_{17}O_{21}S_3$: 1451.01) per mg, calculated on the dried basis.

Description Bleomycin Sulfate occurs as a white to yellowish white powder.
It is freely soluble in water and slightly soluble in ethanol(95).
It is hygroscopic.

Identification (1) Dissolve 4 mg of Bleomycin Sulfate and bleomycin sulfate RS in 5 μL of copper(II) sulfate TS and water to make 100 mL. Determine the absorption spectra of this solution as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the absorption spectra of Bleomycin Sulfate and bleomycin sulfate RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both exhibit similar intensities of absorption at the same wavenumbers.

(3) An aqueous solution of Bleomycin Sulfate (1 in 200) responds to the Qualitative Analysis (1) and (2) for sulfate.

pH Dissolve 10 g of Bleomycin Sulfate in 20 mL of water; the pH of this solution is between 4.5 and 6.0.

Purity (1) ***Clarity and color of solution***—Dissolve 80 mg of Bleomycin Sulfate in 4 mL of water; the resulting solution is clear and colorless.

(2) ***Copper***—Weigh accurately 75 mg of Bleomycin Sulfate, dissolve in 10 mL of diluted nitric acid (1 in 100), and use this solution as the test solution. Separately, take exactly 15 mL of the copper standard solution, add diluted nitric acid (1 in 100) to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances of the test solution and the standard solution according to the following conditions as directed under the Atomic Absorption Spectroscopy; the absorbance of the test solution is not greater than the absorbance of the standard solution (NMT 200 ppm).

Gas: Air–acetylene
Lamp: Copper hollow cathode lamp
Wavelength: 324.8 nm

Loss on drying NMT 3.0% (60 mg, in vacuum, phosphorus pentoxide, 60 °C, 3 hours).

Sterility It meets the requirements when used in the manufacturing of sterile preparations.

Bacterial endotoxins Less than 10 EU per mg (potency) of bleomycin when used in the manufacturing of sterile preparations.

Histamine It meets the requirements when used in the manufacturing of sterile preparations. Weigh an appropriate amount of Minocycline Hydrochloride to prepare a solution containing 300 (potency) per mL, and use this solution as the test solution.

Bleomycin content ratio of the active principle Weigh accurately about 10 mg (potency) of Bleomycin Sulfate, dissolve in 20 mL of water, and use this solution as the test solution. Take 20 μL of the test solution and perform the test as directed under the Liquid Chromatography according to the following conditions, and calculate each of the peak areas. Calculate their amount according to the percentage of area; bleomycin A_2 (initial major peak constituent) is between 55% and 70%, bleomycin B_2 (second major peak constituent) is between 25% and 32%, the sum of bleomycin A_2 and bleomycin B_2 is NLT 85%, dimethyl bleomycin A_2 (the relative retention time of bleomycin A_2 is between 1.5 and 2.5) is NMT 5.5%, and the total amount of other peaks is NMT 9.5%.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (7 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: Use mobile phases A and B to control a step or gradient elution as follows.

Mobile phase A: A mixture of mobile phase stock solution and methanol (9 : 1).

Mobile phase B: A mixture of mobile phase stock solution and methanol (3 : 2).

Time (min)	Mobile Phase A (vol%)	Mobile Phase B (vol%)
0 - 60	100 → 0	0 → 100
60 - 75	0	100

Flow rate: About 1.2 mL/min.

System suitability

System performance: Proceed with 20 μL of the test solution according to the above conditions; bleomycin A_2 and bleomycin B_2 are eluted in this order with the resolution being NLT 5.

System repeatability: Repeat the test 6 times with 20 μL each of the test solutions according to the above conditions; the relative standard deviation of the peak area of bleomycin A_2 is NMT 2.0%.

Time span of measurement: About 20 minutes after the efflux of dimethyl bleomycin A_2 after the melting peak.

Mobile phase stock solution—Dissolve 0.96 g of sodium 1-pentanesulfonate and 1.86 g of ethylenediamine acetic acid disodium dihydrogen dihydrate in 1000 mL of water and 5 mL of acetic acid(100) and adjust the pH to 4.3 by adding ammonia TS.

Assay ***Cylinder-plate method***—(1) Medium

(A) Agar medium for seed layer, base layer and test organism transplantation

Peptone	10.0 g
Glycerin	10.0 g
Meat extract	10.0 g
Agar	15.0 g
Sodium chloride	3.0 g

Weigh the above amount of substances, add purified water to make 1000 mL, and adjust the pH with sodium chloride TS to between 6.9 and 7.1 after sterilizing.

(B) Liquid medium for suspension of test organism

Peptone	10.0 g
Sodium chloride	3.0 g
Meat extract	10.0 g
Glycerin	10.0 g

Weigh the above amount of substances, add purified water to make 1000 mL, and adjust the pH with sodium chloride TS to between 6.9 and 7.1 after sterilizing.

(2) Test organism Use *Mycobacterium smegmatis* ATCC 607 as the test organism.

(3) Test microbial suspension Transplant the above test organism in the medium from (A), incubate at 27 ℃ for between 40 and 48 hours, transplant the organism that grew in this medium to 100 mL of the medium from (B), incubate by shaking for 5 days, and use this as the test microbial suspension. Store the test microbial suspension below 5 ℃ and use it within 14 days. Add 0.5 mL of the test microbial suspension to 100 mL of medium from (A), previously melted and cooled at 48 ℃, shake well to mix, and use this as an agar medium for seed.

(4) Agar plate Follow the Microbial Assays for Antibiotics (A) (5). But the amount of agar medium is 5.0 mL for base and 8.0 mL for seed.

(5) Weigh accurately about 5 mg (potency) of Bleomycin Sulfate, add 0.1 mol/L phosphate buffer solution, pH 6.8, to make solutions that contain 4 μg (potency) and 1 μg (potency) per mL, and use these solutions as the high concentration test solution and low concentration test solution, respectively. Separately, take an appropriate amount of bleomycin hydrochloride A_2 RS dry, weigh accurately about 5 mg (potency), and dissolve in 0.1 mol/L phosphate buffer solution, pH 6.8, to make a standard stock solution containing 150 μg (potency) per mL. Preserve this standard stock solution below 5 ℃ and use it within 30 days. Take accurately an appropriate amount of this standard stock solution, dilute it with 0.1 mol/L phosphate buffer solution, pH 6.8, to make solutions containing 30.0 μg and 15.0 μg (potency) per mL, and use these solutions as the high concentration standard solution and low concentration standard solution, respectively. With these solutions, perform the test as directed under the Microbial Assays for Antibiotics (A) (8).

Packaging and storage Preserve in tight containers.

Boric Acid
붕산

H_3BO_3 : 61.83

Boric acid [*10043-35-3*]

Boric Acid, when dried, contains NLT 99.5% and NMT 101.0% of boric acid (H_3BO_3).

Description Boric Acid occurs as colorless or white crystals or a crystalline powder. It is odorless and has a slight, distinctive taste.

It is freely soluble in warm water, hot ethanol or glycerin, soluble in water or ethanol(95), and practically insoluble in ether.

pH Dissolve 1.0 g of Boric Acid in 20 mL of water; the pH of the solution is between 3.5 to 4.1.

Identification An aqueous solution of Boric Acid (1 in 20) responds to the Qualitative Analysis for borate.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Boric Acid in 25 mL of water or 10 mL of hot ethanol; both solutions is clear and colorless.

(2) ***Heavy metals***—Proceed with 2.0 g of Boric Acid according to Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Arsenic***—Proceed with 0.40 g of Boric Acid according to Method 1 and perform the test (NMT 5 ppm).

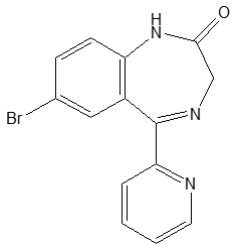
Loss on drying NMT 0.5% (2 g, silica gel, 5 hours).

Assay Weigh accurately about 1.5 g of Boric Acid, previously dried, dissolve it in 15 g of sorbitol and 50 mL of water, and titrate with 1 mol/L sodium hydroxide VS (Indicator: 2 drops of phenolphthalein TS).

Each mL of 1 mol/L sodium hydroxide VS
= 61.83 mg of H_3BO_3

Packaging and storage Preserve in well-closed containers.

Bromazepam
브로마제팜



$C_{14}H_{10}BrN_3O$: 316.15
7-Bromo-5-(pyridin-2-yl)-1,3-dihydro-1,4-benzodiazepin-2-one [*1812-30-2*]

Bromazepam, when dried, contains NLT 99.0% and NMT 101.0% of bromazepam ($C_{14}H_{10}BrN_3O$).

Description Bromazepam occurs as white to pale yellowish white crystals or a crystalline powder.
It is odorless.
It is freely soluble in *N*,*N*-dimethylformamide or acetic acid(100), sparingly soluble in chloroform, slightly soluble in methanol or ethanol(99.5), very slightly soluble in ether, and practically insoluble in water.
It dissolves in dilute hydrochloric acid.

Melting point—About 245 °C (with decomposition).

Identification (1) Determine the absorption spectra of solutions of Bromazepam and bromazepam RS in ethanol(99.5) (1 in 200000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Bromazepam and bromazepam RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Bromazepam in a platinum crucible according to Method 4 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Related substances***—Dissolve 50 mg of Bromazepam in 5 mL of a mixture of acetone and methanol (3 : 2) and use this solution as the test solution. Pipet 1 mL of the test solution and add a mixture of acetone and methanol (3 : 2) to make exactly 50 mL. Pipet 5 mL of this solution, add a mixture of acetone and methanol (3 : 2) to make exactly 50 mL and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 20 μL each of the test solutions and standard solutions on a plate of silica gel with a fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of ethyl acetate, ethanol(99.5) and ammonia water(28) (38 : 1 : 1) to a distance of about 12 cm, and air-dry the plate. The number of spots obtained from the test solution, other than the principal spot and the spot of the origin point, is NMT 2, and they are not more intense than the spots obtained from the standard solution.

Loss on drying NMT 0.2% (1 g, 105 ℃, 4 h.).

Residue on Ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.4 g of Bromazepam, previously dried, and dissolve in 80 mL of acetic acid(100). Titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 31.615 mg of $C_{14}H_{10}BrN_3O$

Packaging and storage Preserve in well-closed containers.

Bromazepam Tablets
브로마제팜 정

Bromazepam Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of bromazepam ($C_{14}H_{10}BrN_3O$: 316.15).

Method of preparation Prepare as directed under Tablets, with Bromazepam.

Identification Weigh an amount of Bromazepam Tablets equivalent to 10 mg of bromazepam according to the labeled amount, add 5 mL of chloroform, shake for 3 minutes to mix, and filter. Use this solution as the test solution. Separately, dissolve 60 mg of bromazepam RS in chloroform to make 25 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot

10 μL each of the test solution and the standard solution on a thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of ethyl acetate and ammonia water(28) (100 : 1) as the developing solvent, and air-dry the plate. Examine the plate under ultraviolet light, spray 1% ferrous sulfate TS (prepare before use), dry, and spray evenly 10% ammonia TS; the R_f values of the violet spots obtained from the test solution and the standard solution are the same.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately 20 tablets of Bromazepam Tablets and powder them. Weigh accurately an amount equivalent to about 15 mg of bromazepam ($C_{14}H_{10}BrN_3O$), add 80 mL of 0.1 mol/L methanolic sulfuric acid and shake to mix for 15 minutes. Add 0.1 mol/L methanolic sulfuric acid to make exactly 100 mL and filter. Pipet 10 mL of the filtrate, add 0.05 mol/L methanolic sulfuric acid to make exactly 50 mL, and use this solution as the test solution. Separately, weigh accurately about 15 mg of bromazepam RS, proceed in the same manner as in the test solution, and use this solution as the standard solution. Perform the test with the test solution and the standard solution as directed under the Ultraviolet-visible Spectroscopy and determine the absorbances, A_T and A_S, at the wavelength of 285 nm.

Amount (mg) of bromazepam ($C_{14}H_{10}BrN_3O$)
= Amount (mg) of bromazepam RS × (A_T / A_S)

Packaging and storage Preserve in well-closed containers.

Bromelain
브로멜라인

Bromelain is a proteolytic enzyme preparation, derived from the juice or leaves and stems of pineapples obtained by pressing. Bromelain, when dried, contains NLT 500 bromelain units per mg.

Description Bromelain occurs as a pale yellow to pale grayish brown powder.
It has a sight, distinctive odor.

Identification Add 10 mg of Bromelain to 10 mL of 20% skim-milk powder solution with pH adjusted to 5.5 using diluted acetic acid and warm the mixture at 37 ℃; the solution coagulates.

Purity (1) ***Lead***—Put about 1.6 g of Bromelain in a crucible and heat gently to carbonize. After cooling, add 2mL of nitric acid and 5 drops of sulfuric acid, heat until white fumes are evolved, and incinerate by ignition at between 500 and 600 °C. After cooling, add 2 mL of hydrochloric acid and 5 mL of water, dissolve by warming, and filter if necessary. Wash the residue with water, combine the washings with the filtrate, and add ammonium citrate solution (9 in 20) and water to make exactly 50 mL. Pipette exactly 25 mL of this solution, transfer it to a separatory funnel, add 10 mL of ammonium sulfate solution (2 in 5) and 5 drops of thymol blue TS. Neutralize with ammonia TS, and then add 2.5 mL of ammonia TS again. Add 20.0 mL of dithizone in n-butyl acetate solution (1:500) to this solution, shake to mix for 10 minutes, and use the obtained n-butyl acetate layer as the test solution. Pipet 10 mL of this solution, and add diluted hydrochloric acid (1 in 100) to make exactly 50 mL. Perform the test with the test solution and the standard solutions as directed under the Atomic Absorption Spectroscopy according to the following conditions; the absorbance of the test solution is NMT that of the standard solution (NMT 10 ppm).

Gas: Air–acetylen or hydrogen
Lamp: Lead hollow-cathode lamp
Wavelength: 283.3 nm

(2) ***Arsenic***—Put 1.0 g of Bromelain into a crucible, add 10 mL of a solution of magnesium nitrate in ethanol(95) (1:10), ignite with ethanol(95) to combust, and then gradually heat to incinerate. After cooling, add 3 mL of hydrochloric acid to the residue, dissolve by warming on a steam bath, and use this solution as the test solution. Proceed with the test solution and perform the test according to Method 4 (NMT 2 ppm).

(3) ***Cyanide***—Put 5.0 g of Bromelain in a distillation flask, add 2 g of tartaric acid, 50 mL of water, and if necessary, 1 drop of silicon resin, and connect the flask to a distillation apparatus. Add 2 mL of sodium hydroxide TS and 10 mL of water, immerse the bottom of a cooler in this solution, then cool with water, and distill until 25 mL of distillate is obtained. Next, add water to make 50 mL. To 25 mL of this solution, add 0.5 mL of iron(II) sulfate TS, 0.5 mL of dilute iron(III) chloride TS, and 1 mL of dilute sulfuric acid; the solution does not exhibit a blue color.

Loss on drying NMT 5.0% (1 g, in vacuum, phosphorus oxide (V) 5 hours).

Residue on Ignition NMT 25.0% (1 g).

Assay Weigh accurately 0.1 g of Bromelain, transfer it into a mortar, add an appropriate amount of enzyme dilute solution, mix by stirring, and then transfer the mixture to a 100-mL volumetric flask. Wash thoroughly the mortar with about 50 mL of enzyme diluent solution, combine the washings in a volumetric flask, and then add enzyme diluent solution to make exactly 100 mL. Centrifuge this solution, and dilute the clear supernatant obtained from the centrifugation, dilute with the enzyme

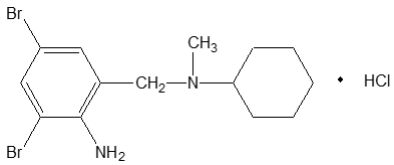
diluent solution to prepare a solution containing 30 to 50 bromelain units per mL. Use this solution as the test solution. Pipet 1.0 mL of the test solution and transfer it into a test tube, and then keep the temperature at 37 ± 0.5 ℃ for 5 minutes. Add 5 mL of substrate solution, previously warmed at 37 ± 0.5 ℃, quickly into the test tube containing the test solution, and initiate the enzyme reaction. After exactly 10 minutes, add 5 mL of the precipitating reagent, shake well to mix, allow to stand at 37 ± 1 ℃ for 40 minutes, and then filter using a filter paper for Assay. Discard 3 mL of the first filtrate and determine the absorbance A of this solution at the wavelength of 660 nm within 2 hours, using water as a control solution. Pipet 1.0 mL of the test solution separately, add 5 mL of the precipitating reagent, shake well to mix, and then add 5 mL of the substrate solution. Proceed with this solution in the same manner for as described above and determine the absorbance A_0. Dissolve tyrosine RS, weighed accurately, in 0.1 mol/L hydrochloric acid TS, and prepare a solution containing 50.0 μg of tyrosine in 1 mL of the solution. With this solution, determine the absorbance AS at a wavelength of 275 nm using water as a control solution.

The number of units in each mg of Bromelain
= [(A - A_0) / A_S] × 55 × [1 / amount (mg) of sample in Each mL of test solution]

Unit of activity—1 bromelain unit is defined as the amount of enzyme that generates a reactant equivalent to 1 μg of tyrosine for 1 minute under the above reaction conditions.

Packaging and storage Preserve in tight containers.

Bromhexine Hydrochloride
브롬헥신염산염



$C_{14}H_{20}Br_2N_2 \cdot HCl$: 412.59

2,4-Dibromo-6-{[cyclohexyl(methyl)amino] methyl}aniline hydrochloride [*611-75-6*]

Bromhexine Hydrochloride, when dried, contains NLT 98.5% and NMT 101.0% of bromhexine hydrochloride ($C_{14}H_{20}Br_2N_2 \cdot HCl$).

Description Bromhexine Hydrochloride occurs as white crystals or a crystalline powder. It is odorless and tasteless.

It is freely soluble in formic acid, sparingly soluble in methanol and slightly soluble in water or ethanol(95).

The pH of a saturated solution of Bromhexine Hydrochloride is between 3.0 and 5.0.

Melting point—About 239 °C (with decomposition).

Identification (1) Dissolve 3 mg of Bromhexine Hydrochloride and bromhexine hydrochloride RS in 0.01 mol/L hydrochloric acid TS to make 100 mL, and determine the absorption spectra of these solutions as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Bromhexine Hydrochloride and bromhexine hydrochloride RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) Dissolve 1 g of Bromhexine Hydrochloride in 20 mL of water, shake well to mix, add 3 mL of sodium hydroxide TS, and extract with four 20 mL portions of ether. Take the water layer and neutralize with dilute nitric acid; the resulting solution responds to the Chemical identification reaction (2) for chloride.

Purity (1) ***Heavy metals*—**Proceed with 2.0 g of Bromhexine Hydrochloride as directed under Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Related substances***—Perform the test without exposure to light, using light-resistant containers. Dissolve 50 mg of Bromhexine Hydrochloride in 10 mL of methanol, and use this solution as the test solution. Pipet 1 mL of this solution and add the mobile phase to make exactly 20 mL. Pipet 1 mL of this solution, add the mobile phase to make exactly 25 mL, and use this solution as the standard solution. Perform the test with 5 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak area of each solution by the automatic integration method; the peak areas other than the major peak from the test solution are not larger than the major peak area from each of the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 245 nm).

Column: A stainless steel column about 5 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: Dissolve 1.0 g of potassium dihydrogen phosphate in 900 mL of water, adjust the pH to 7.0 with 0.5 mol/L sodium hydroxide TS, and add water to make 1000 mL. To 200 mL of this solution, add 800 mL of acetonitile.

Flow rate: Adjust the flow rate so that the retention time of bromhexine is about 6 minutes.

System suitability

Detection sensitivity: Adjust the sensitivity so that the peak height of bromhexine obtained from 5 μL of the standard solution is between 5 mm and 15 mm.

System performance: To 50 mg of bamethan sulfate, add 0.5 mL of the test solution, and dissolve in the mobile phase to make 10 mL. Proceed with 5 μL of this solution according to the above conditions; bamethan and bromhexine are eluted in this order with the resolution being NLT 7.

Time span of measurement: About twice the retention time of bromhexine after the solvent peak.

Loss on drying NMT 0.5% (1 g, 105 °C, 4 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.5 g of Bromhexine Hydrochloride, previously dried, dissolve in 2 mL of formic acid, add 60 mL of acetic anhydride, and heat on a steam bath at 50 ℃ for 15 minutes. Cool it down and titrate with 0.1 mol/L perchloric acid (indicator: 2 drops of methylrosaniline chloride TS). The endpoint of the titration is when the violet color of this solution turns to bluish green and finally to yellowish green. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 41.26 mg of $C_{14}H_{20}Br_2N_2 \cdot HCl$

Packaging and storage Preserve in light-resistant, well-closed containers.

Bromhexine Hydrochloride Tablets
브롬헥신염산염 정

Bromhexine Hydrochloride Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of bromhexine hydrochloride ($C_{14}H_{20}Br_2N_2 \cdot HCl$: 412.59).

Method of preparation Prepare as directed under Tablets, with Bromhexine Hydrochloride.

Identification The retention time of the major peak and the ultraviolet absorption spectra at 200 to 400 nm obtained from the test solution and the standard solution from the Assay are the same.

Dissolution Perform the test with 1 tablet of Bromhexine Hydrochloride Tablets at 50 revolutions per minute according to Method 2, using 900 mL of Solution 1 in the Dissolution as the dissolution medium. Filter the medium 30 minutes after starting the test. Discard the first 10 mL of the filtrate and Take *V* mL of the subsequent filtrate. Add water to make exactly *V* ' mL so that the solution contains about 8.9 μg of bromhexine hydrochloride per mL according to the labeled amount, and use this solution as the test solution. Separately, weigh accurately about 16 mg of bromhexine hydrochloride RS and dissolve in 80% methanol to make 100 mL. Pipet 5 mL of this solution, add the dissolved solution to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and measure the peak areas A_T and A_S of bromhexine hydrochloride ($C_{14}H_{20}Br_2N_2 \cdot HCl$) in each solution. The dissolution rate in 30 minutes of Bromhexine Hydrochloride Tablets is NLT 75%.

Dissolution rate (%) of the labeled amount of bromhexine hydrochloride ($C_{14}H_{20}Br_2N_2 \cdot HCl$)

$$= W_S \times \frac{V'}{V} \times \frac{A_T}{A_S} \times \frac{1}{C} \times 45$$

W_S: Amount (mg) of bromhexine hydrochloride RS

C: Labeled amount (mg) of bromhexine hydrochloride ($C_{14}H_{20}Br_2N_2 \cdot HCl$) in 1 tablet

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 ℃.

Mobile phase: A mixture of 0.02 mol/L potassium dihydrogen phosphate solution(pH 3.5) and methanol (1 : 1).

Flow rate: 1.0 mL/min

System suitability

System repeatability: Repeat the test 6 times with 20 μL of the standard solution according to the above conditions; the relative standard deviation of the peak area for bromhexine hydrochloride is NMT 2.0%.

0.02 mol/L potassium dihydrogen phosphate solution (pH 3.5)—Dissolve 2.72 g of potassium dihydrogen phosphate in about 900 mL of water, adjust the pH to 3.5 with phosphoric acid, and add water to make 1000 mL.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 Bromhexine Hydrochloride Tablets, and powder the tablets. Weigh accurately an amount equivalent to about 8 mg of bromhexine hydrochloride ($C_{14}H_{20}Br_2N_2 \cdot HCl$), add 40 mL of 80% methanol, shake vigorously for 20 minutes to mix, and add 80% methanol to make exactly 100 mL. Filter through a membrane filter with a pore NMT 0.45 μm and use this solution as the test solution. Separately, weigh accurately about 32 mg of bromhexine hydrochloride RS and add 80% methanol to make exactly 100 mL. Take 25 mL of this solution, add 80% methanol to make exactly

100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of bromhexine hydrochloride in each solution.

$$\text{Amount (mg) of bromhexine hydrochloride } (C_{14}H_{20}Br_2N_2\cdot HCl) = \text{Amount (mg) of bromhexine hydrochloride RS} \times \frac{A_T}{A_S} \times \frac{1}{4}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 205 nm). However, a photo-diode array detector (200 nm to 400 nm) is used when the Identification is performed.

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: 40 ℃

Mobile phase: A mixture of 0.02 mol/L potassium dihydrogen phosphate TS (pH 3.5) and methanol (1 : 1).

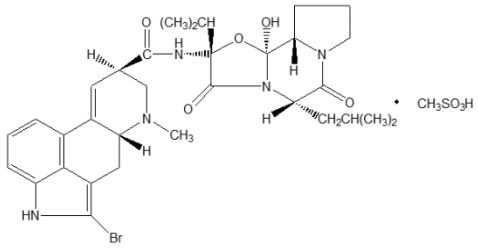
Flow rate: 1.0 mL/min

System suitability

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area of bromhexine hydrochloride is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Bromocriptine Mesilate
브로모크립틴메실산염



$C_{32}H_{40}BrN_5O_5\cdot CH_4O_3S$: 750.70

(5'*S*)-2-Bromo-12'-hydroxy-2'-(1-methylethyl)-5'-(2-methylpropyl)ergotaman-3',6',18-trione; monomethanesulfonic acid [*22260-51-1*]

Bromocriptine Mesilate contains NLT 98.0% and NMT 101.0% of bromocriptine mesilate ($C_{32}H_{40}BrN_5O_5\cdot CH_4O_3S$), calculated on the dried basis.

Method of preparation If there is any possibility of alkyl methanesulfonate esters (methyl, ethyl, isopropyl, etc.) to be formed as the potential impurities by the manufacturing process of Bromocriptine Mesilate, take caution with starting material, manufacturing process, and intermediate material control to minimize the residue of impurities in consideration of risk assessment results. If needed, the manufacturing process can be verified by the test data proving that there is no quality risk in final drug substances.

Description Bromocriptine Mesilate occurs as a white to pale yellowish white or pale brownish white crystalline powder.
It is odorless or has a slight characteristic odor.
It is very soluble in acetic acid(100), freely soluble in methanol, sparingly soluble in ethanol(95), very slightly soluble in acetic anhydride, dichloromethane, or chloroform, and practically insoluble in water or ether.
It is gradually colored by light.

Identification (1) Dissolve 2 mg of Bromocriptine Mesilate in 1 mL of methanol, add 2 mL of p-Dimethylaminobenzaldehyde-iron(III) chloride TS, and shake well to mix; the resulting solution exhibits a violetish blue color.

(2) Determine the absorption spectra of the solutions of Bromocriptine Mesilate and bromocriptine mesilate RS in methanol (3 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths

(3) Determine the infrared spectra of Bromocriptine Mesilate and bromocriptine mesilate RS, previously dried, as directed in the paste method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(4) Perform the test with Bromocriptine Mesilate as directed under the Flame Coloration (2); it exhibits a green color.

Optical rotation $[\alpha]_D^{20}$: Between +95° and +105° [0.1 g, calculated on the dried basis, a mixture of methanol and dichloromethane (1 : 1), 10 mL, 100 mm].

Purity (1) ***Clarity and color of solution***—Dissolve 0.10 g of Bromocriptine Mesilate in 10 mL of methanol; the resulting solution is clear and it's color is not more intense than the following control solution.

Control solution—To 2.5 mL of the colorimetric stock solution of cobalt(II) chloride hexahydrate, 6.0 mL of the colorimetric stock solution of iron(III) chloride hexahydrate and 1.0 mL of the colorimetric stock solution of copper(II) sulfate pentahydrate, add diluted hydrochloric acid (1 in 40) to make exactly 100 mL.

(2) ***Heavy metals*—**Proceed with 1.0 g of Bromocriptine Mesilate according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Related substances***—Perform the test without

exposure to daylight, using light-resistant containers. Dissolve 0.10 g of Bromocriptine Mesilate in 10 mL of methanol, and use this solution as the test solution. Pipet 1 mL of this solution, add methanol to make exactly 200 mL, and use this solution as the standard solution (1). Pipet 1.0 mL of this solution, add water to make exactly 20 mL, and use this solution as the standard solution (2). With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution, the standard solution (1) and the standard solution (2), as a band with 1 cm in width, on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Develop the plate with a mixture of toluene, acetone and ammonia water(28) (500 : 150 : 50 : 1) (as the developing solvent) to a distance of about 10 cm, and air-dry the plate in vacuum for 30 minutes. Spray evenly Dragendorff's TS for spraying on the plate, spray evenly hydrogen peroxide TS, cover the plate with a glass plate, and observe; the spots other than the principal spot obtained from the test solution are not more intense than the spots obtained from the standard solution (1), and the number of the spots other than the principal spot that are more intense than the spots obtained from the standard solution (2) are NMT 1.

Loss on drying NMT 3.0% (1 g, NMT 0.67 kPA, 80 °C, 5 hours).

Residue on ignition NMT 0.1% (1 g).

Content of mesylate Weigh accurately 0.4 g of Bromocriptine Mesilate, dissolve in 70 mL of methanol, and titrate with 0.1 mol/L potassium hydroxide-methanol TS with the aid of a current of nitrogen (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction. The content of mesylate, calculated on the dried basis, is between 12.5% and 13.4%.

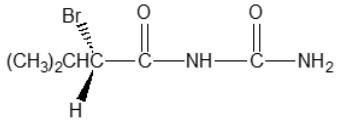
Each mL of 0.1 mol/L potassium hydroxide-methanol TS
= 9.61 mg of CH_3SO_3H

Assay Weigh accurately 0.6 g of Bromocriptine Mesilate, dissolve in 80 mL of a mixture of acetic acid(100) and acetic anhydride (7 : 1) and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 75.07 mg of $C_{32}H_{40}BrN_5O_5 \cdot CH_4O_3S$

Packaging and storage Preserve in light-resistant, tight containers at below -18 ℃.

Bromovalerylurea
브로모발레릴우레아



and enantiomer

$C_6H_{11}BrN_2O_2$: 223.07
2-Bromo-*N*-carbamoyl-3-methylbutanamide [*496-67-3*]

Bromovalerylurea, when dried, contains NLT 98.0% and NMT 101.0% of bromovalerylurea ($C_6H_{11}BrN_2O_2$).

Description Bromovalerylurea occurs as colorless to white crystals or a crystalline powder. It is odorless and has a slightly bitter taste.
It is soluble in ethanol(95), sparingly soluble in ether, and very slightly soluble in water.
It dissolves in sulfuric acid, nitric acid or hydrochloric acid, but precipitates are formed when adding water to the resulting solutions.
It dissolves in sodium hydroxide TS.

Identification (1) To 0.2 g of Bromovalerylurea, add 5 mL of sodium hydroxide (1 in 10), and boil; the resulting gas changes the moistened red litmus paper to blue. To this solution, add an excess of dilute sulfuric acid and boil; the odor of valeric acid is perceptible.

(2) To 0.1 g of Bromovalerylurea, add 0.5 g of anhydrous sodium carbonate, decompose completely by heating slowly, and dissolve the residue in 5 mL of hot water. Cool it down, acidify with acetic acid, and filter. The filtrate responds to the Qualitative Analysis (2) for bromide.

Melting point Between 151 and 155 ℃.

Purity (1) ***Acidity or alkalinity*—**To 1.5 g of Bromovalerylurea, add 30 mL of water, shake well to mix for 5 minutes, and filter; the resulting solution is neutral.

(2) ***Chloride*—**Take 10 mL of the filtrate from (1) and perform the test. Prepare the control solution with 0.40 mL of 0.01 mol/L hydrochloric acid (NMT 0.028%).

(3) ***Sulfate*—**Take 10 mL of the filtrate from (1) and perform the test. Prepare the control solution with 0.40 mL of 0.005 mol/L sulfuric acid (NMT 0.038%).

(4) ***Heavy metals*—**Proceed with 2.0 g of Bromovalerylurea according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(5) ***Arsenic*—**Dissolve 0.5 g of Bromovalerylurea in 5 mL of sodium hydroxide TS, use this solution as the test solution, and perform the test (NMT 4 ppm).

(6) ***Readily carbonizable substances***—Perform the test with 0.5 g of Bromovalerylurea. The color of the solution is not more intense than matching fluid A for

color.

Loss on drying NMT 0.5% (1 g, 80 °C, 2 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.4 g of Bromovalerylurea, previously dried, transfer to a 300-mL Erlenmeyer flask, add 40 mL of sodium hydroxide TS, and boil gently under a reflux condenser for 20 minutes. After cooling, wash the bottom of the reflux condenser and the top of the Erlenmeyer flask with 30 mL of water, add the washings in the Erlenmeyer flask, add 5 mL of nitric acid and exactly 30 mL of 0.1 mol/L silver nitrate solution, and titrate the excess silver nitrate with 0.1 mol/L ammonium thiocyanate VS (indicator: ammonium iron(III) sulfate TS). Perform a blank test in the same manner.

Each mL of 0.1 mol/L silver nitrate solution
= 22.307 mg of $C_6H_{11}BrN_2O_2$

Packaging and storage Preserve in well-closed containers.

Bromperidol Tablets
브롬페리돌 정

Bromperidol Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of bromperidol ($C_{21}H_{23}BrFNO_2$: 420.32).

Method of preparation Prepare as directed under Tablets, with Bromperidol.

Identification (1) Weigh an amount equivalent to about 1 mg of bromperidol according to the labeled amount of Bromperidol Tablets, add 10 mL of chloroform, filter, and use the filtrate as the test solution. Separately, weigh about 10 mg of bromperidol RS, dissolve in 10 mL of chloroform, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of chloroform, formic acid and methanol (17 : 2 : 1) and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm) or spray evenly iodine vapor; the R_f values and the color of the spots obtained from the test solution and the standard solution are the same.

(2) Determine the absorption spectra of the test solution and the standard solution under the Assay as directed under the Ultraviolet-visible Spectroscopy with 0.25 mol/L sulfuric acid as a control solution; both spectra exhibit similar intensities of absorption at the same wavelengths.

Disintegration Meets the requirements.

Uniformity of dosage units It meets the requirement when the Content uniformity test is performed according to the following procedure.

Take 1 tablet of Bromperidol Tablets, put into a 50-mL volumetric flask, add 10 mL of 0.25 mol/L sulfuric acid, and shake to mix until complete disintegration. Then, add methanol to fill up to the gauge line of the flask and filter. Discard the first 10 mL of the filtrate and use the subsequent filtrate as the test solution. Separately, weigh accurately about 50 mg of bromperidol RS, and add methanol to make exactly 100 mL. Take 10.0 mL of this solution, add 10 mL of 0.25 mol/L sulfuric acid, and methanol to make exactly 50 mL, and use this solution as the standard solution. Perform the test with the test solution and the standard solution as directed under the Ultraviolet-visible Spectroscopy and determine the absorbances, A_T and A_S, at the wavelength of 245 nm.

Amount (mg) of bromperidol ($C_{21}H_{23}BrFNO_2$)
= Amount (mg) of bromperidol RS × (A_T / A_S) × 0.1

Assay Weigh accurately the mass of NLT 20 Bromperidol Tablets, and powder. Weigh accurately an amount equivalent to about 1.5 mg of bromperidol ($C_{21}H_{23}BrFNO_2$), put into a separatory funnel, add 20 mL of 0.05 mol/L sulfuric acid, and shake to mix for 5 minutes. To this solution, add 20 mL of ether, shake to extract and take the water layer. To the ether layer, add 10 mL of 0.05 mol/L sulfuric acid to extract, take the water layer and combine the two layers. To the extracted water solution, add 1 mol/L sodium hydroxide solution to alkalize, extract twice with 50 mL each of ether, combine with the ether layer, and wash with 20 mL of water. Next, extract twice with 20 mL and 5 mL of 0.25 mol/L sulfuric acid, respectively, collect the water layer, add 0.25 mol/L sulfuric acid to make exactly 100 mL in total, and use this solution as the test solution. Separately, weigh accurately about 30 mg of bromperidol RS, and add 0.25 mol/L sulfuric acid to make exactly 100 mL. Take 5.0 mL of this solution, add 0.25 mol/L sulfuric acid to make exactly 100 mL, and use this solution as the standard solution. Perform the test with the test solution and the standard solution as directed under the Ultraviolet-visible Spectroscopy and determine the absorbances, A_T and A_S, at the wavelength of 245 nm.

Amount (mg) of bromperidol ($C_{21}H_{23}BrFNO_2$)
= Amount (mg) of bromperidol RS × (A_T / A_S) × 0.05

Packaging and storage Preserve in well-closed containers.

Buflomedil Hydrochloride Injection
부플로메딜염산염 주사액

Buflomedil Hydrochloride Injection contains NLT 95.0% and NMT 105.0% of the labeled amount of buflomedil hydrochloride ($C_{17}H_{25}NO_4 \cdot HCl$: 343.85).

Method of preparation Prepare as directed under Injections, with Buflomedil Hydrochloride.

Identification (1) Take 1 mL of Buflomedil Hydrochloride Injection, add 250 mL of methanol, and determine the absorption spectrum as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum between 273 nm and 277 nm.

(2) Weigh 1 mL of Buflomedil Hydrochloride Injection and about 10 mg of buflomedil hydrochloride RS, dissolve them in 100 mL of methanol, and use these solutions as the test solution and the standard solution, respectively. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on a thin-layer chromatographic plate made of silica gel for thin-layer chromatography (with a fluorescent indicator). Develop the plate with a mixture of methanol, chloroform and ammonia water (6 : 6 : 0.1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Exposure the plate under ultraviolet rays (major wavelength: 254 nm) or spray Dragendorff's TS onto the plate; the R_f values and the colors of the spots obtained from the test solution and the standard solution are identical.

pH Between 3.3 and 5.3.

Pyrogen It meets the requirements when tested as directed under the Pyrogen. In this case, the administered dose is 1 mL (10 mg as buflomedil hydrochloride) per kg.

Sterility Meets the requirements.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Extractable volume of injections Meets the requirements.

Assay Take exactly a volume of Buflomedil Hydrochloride Injection, equivalent to 50 mg of buflomedil hydrochloride ($C_{17}H_{25}NO_4 \cdot HCl$), and dissolve with methanol to make exactly 50 mL. Pipet 5 mL of this solution, add 0.1 mol/L hydrochloric acid to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 50 mg of buflomedil hydrochloride RS, dissolve in methanol to make exactly 50 mL, pipet 5 mL of this solution, add 0.1 mol/L hydrochloric acid to make exactly 100 mL, and use this solution as the standard solution. With the test solution and the standard solution, perform the test as directed under the Ultraviolet-visible Spectroscopy using 0.1 mol/L hydrochloric acid TS as a control solution, and determine the absorbances, A_T and A_S, at 280 nm.

$$\text{Amount (mg) of buflomedil hydrochloride } (C_{17}H_{25}NO_4 \cdot HCl) = \text{Amount (mg) of buflomedil hydrochloride RS} \times (A_T / A_S)$$

Packaging and storage Preserve in hermetic containers.

Buflomedil Hydrochloride Tablets
부플로메딜염산염 정

Buflomedil Hydrochloride Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of buflomedil hydrochloride ($C_{17}H_{25}NO_4 \cdot HCl$: 343.85).

Method of preparation Prepare as directed under Tablets, with Buflomedil Hydrochloride.

Identification (1) Weigh an amount of Buflomedil Hydrochloride Tablets, equivalent to 10 mg of buflomedil hydrochloride, according to the labeled amount, dissolve in methanol to make 100 mL, filter, and use the filtrate as the test solution. Separately, dissolve about 10 mg of buflomedil hydrochloride RS in methanol to make 100 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of methanol, chloroform and ammonia water (6 : 6 : 0.1) and air-dry the plate. Examine the plate under ultraviolet light or spray Dragendorff's TS on the plate; the R_f values and the color of the spots obtained from the test solution and the standard solution are the same.

(2) Weigh an amount of Buflomedil Hydrochloride Tablets, equivalent to 10 mg of buflomedil hydrochloride according to the labeled amount, dissolve in methanol to make 250 mL, and filter. Determine the absorption spectrum of the filtrate as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum at around 280 nm.

Dissolution Perform the test with 1 tablet of Buflomedil Hydrochloride Tablets at 75 revolutions per minute according to Method 2, using 900 mL of Solution 1 in the Dissolution as the dissolution medium. Filter the medium 45 minutes after starting the test. Discard the first 10 mL of the filtrate, Take V mL of the subsequent filtrate, add Solution 1 in the Dissolution so that 1 mL contains about

120 μg of buflomedil hydrochloride according to the labeled amount to make exactly V' mL, and use this solution as the test solution. Separately, weigh accurately about 24 mg of buflomedil hydrochloride RS, dissolve in Solution 1 in the Dissolution to make exactly 200 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and measure the peak areas, A_T and A_S, of buflomedil hydrochloride ($C_{17}H_{25}NO_4 \cdot HCl$) in each solution. The dissolution rate in 45 minutes of Buflomedil Hydrochloride Tablets is NLT 80%.

Dissolution rate (%) of the labeled amount of buflomedil hydrochloride ($C_{17}H_{25}NO_4 \cdot HCl$)
$= W_S \times (V' / V) \times (A_T / A_S) \times (1 / C) \times 450$

W_S: Amount (mg) of buflomedil hydrochloride RS
C: Labeled amount (mg) of buflomedil hydrochloride ($C_{17}H_{25}NO_4 \cdot HCl$) in 1 tablet

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 280 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 μm in particle diameter).

Column temperature: A constant temperature of about 40 ℃.

Mobile phase: A mixture of 0.01 mol/L potassium dihydrogen phosphate TS and acetonitrile (3 : 2).

Flow rate: 0.7 mL/min

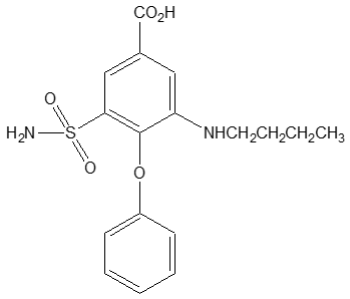
Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 Buflomedil Hydrochloride Tablets, and powder the tablets. Weigh accurately an amount equivalent to about 50 mg of buflomedil hydrochloride ($C_{17}H_{25}NO_4 \cdot HCl$), and dissolve in methanol to make exactly 50 mL. Take 5.0 mL of this solution, add 0.1 mol/L hydrochloric acid to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 50 mg of buflomedil hydrochloride RS, dissolve in methanol to make 50 mL, Take 5.0 mL of this solution, add 0.1 mol/L hydrochloric acid to make exactly 100 mL, and use this solution as the standard solution. Perform the test with the test solution and the standard solution as directed under the Ultraviolet-visible Spectroscopy using 0.1 mol/L hydrochloric acid TS as a control solution, and determine the absorbances, A_T and A_S, at the wavelength of 280 nm.

Amount (mg) of buflomedil hydrochloride ($C_{17}H_{25}NO_4 \cdot HCl$)
= Amount (mg) of buflomedil hydrochloride RS
$\times (A_T / A_S)$

Packaging and storage Preserve in tight containers.

Bumetanide
부메타니드



$C_{17}H_{20}N_2O_5S$: 364.42
3-(Butylamino)-4-phenoxy-5-sulfamoylbenzoic acid [*28395-03-1*]

Bumetanide, when dried, contains NLT 98.5% and NMT 101.0% of bumetanide ($C_{17}H_{20}N_2O_5S$).

Description Bumetanide occurs as white crystals or a crystalline powder.
It is freely soluble in pyridine, soluble in methanol or in ethanol(95), slightly soluble in ether and practically insoluble in water.
It dissolves in potassium hydroxide TS.
It is gradually colored by light.

Identification (1) Dissolve 10 mg of Bumetanide in 1 mL of pyridine, add 2 drops of copper(II) sulfate TS, and shake to mix. Add 3 mL of water and 5 mL of chloroform, shake to mix, and allow to stand; the chloroform layer exhibits a pale blue color.

(2) Dissolve 40 mg each of Bumetanide and bumetanide RS in 100 mL of phosphate buffer solution, pH 7.0. To 10 mL each of these solutions, add water to make 100 mL. Determine the absorption spectra of the resulting solutions as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared spectra of Bumetanide and bumetanide RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Melting point Between 232 and 237 ℃.

Purity (1) ***Clarity and color of solution*—**Dissolve 50 mg of Bumetanide in 2 mL of a solution of potassium hydroxide (1 in 30) and 8 mL of water; the resulting solution is clear and the color of this solution is not more intense than that of the following control solution.

Control solutions—Pipet 0.5 mL each of co-

baltous(II) chloride hexahydrate colorimetric stock solution, iron(III) chloride CS and copper(II) sulfate pentahydrate colorimetric stock solution, mix them, and add diluted hydrochloric acid (1 in 40) to make exactly 100 mL.

(2) ***Chloride***—Thoroughly mix 0.5 g of Bumetanide with 0.7 g of potassium nitrate and 1.2 g of anhydrous sodium carbonate, transfer the mixture in small portions into a red hot platinum crucible, and heat until the reaction is complete. After cooling, add 14 mL of dilute sulfuric acid and 6 mL of water to the residue, boil for 5 minutes, filter, and wash the residue with 10 mL of water. Then, combine the filtrate and the washings and add 6 mL of dilute nitric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid (NMT 0.021%).

(3) ***Heavy metals***—Proceed with 2.0 g of Bumetanide as directed under Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(4) ***Arsenic***—Proceed with 1.0 g of Bumetanide as directed under Method 3 and perform the test (NMT 2 ppm).

(5) ***Related substances***—Perform the test without exposure to direct sunlight using light-resistant containers. Dissolve 0.10 g of Bumetanide in 10 mL of methanol, and use this solution as the test solution. Pipet 1 mL of the test solution and add methanol to make exactly 100 mL. Pipet 2 mL of this solution, add methanol to make exactly 10 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of chloroform, acetic acid(100), cyclohexane and methanol (32 : 4 : 4 : 1) as the developing solvent to a distance of about 12 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot obtained from the test solution are not more intense than the spots from the standard solutions.

Loss on drying NMT 0.5% (1 g, 105 ℃, 2 hours).

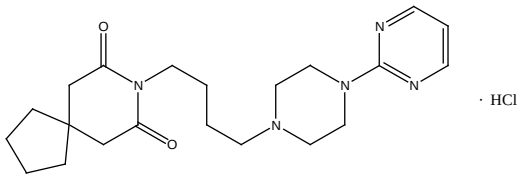
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.5 g of Bumetanide, previously dried, dissolve in 50 mL of ethanol(95), and titrate with 0.1 mol/L sodium hydroxide VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS
= 36.442 mg of $C_{17}H_{20}N_2O_5S$

Packaging and storage Preserve in light-resistant, tight containers.

Buspirone Hydrochloride
부스피론염산염



$C_{21}H_{31}N_5O_2 \cdot HCl$: 421.96
8-[4-(4-Pyrimidin-2-ylpiperazin-1-yl)butyl]-8-azaspiro[4.5]decane-7,9-dione hydrochloride[*33386-08-2*]

Buspirone Hydrochloride contains NLT 97.5% and NMT 102.5% of buspirone hydrochloride ($C_{21}H_{31}N_5O_2 \cdot HCl$), calculated on the anhydrous basis.

Description Buspirone Hydrochloride occurs as a white, crystalline powder.
It is very soluble in water, freely soluble in methanol or dichlormethane, sparingly soluble in ethanol(95) or acetonitrile, very slightly soluble in ethyl acetate, and practically insoluble in hexane.

Identification (1) Determine the infrared spectra of Buspirone Hydrochloride and buspirone hydrochloride RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) The retention times of the major peaks obtained from the test solution and standard solution in the Assay are the same.

(3) An aqueous solution of Buspirone Hydrochloride (1 in 100) responds to the Qualitative Analysis (2) for chloride.

Purity ***Heavy metals*—**Proceed with 1.0 g of Buspirone Hydrochloride according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

Water NMT 0.5% (1 g, volumetric titration, direct titration).

Residue on ignition NMT 0.5% (1 g).

Assay Dissolve about 50 mg each of Buspirone Hydrochloride and buspirone hydrochloride RS, accurately weighed, in 25 mL of 1 mol/L hydrochloric acid TS, and add water to make exactly 100 mL, respectively. To 10 mL of each of these solutions, add 10 mL of the internal standard and add water to make exactly 50 mL, respectively. Use these solutions as the test solution and the standard solution, respectively. Perform the test with 25

μL each of the test solution and the standard solution, under the following conditions under the Liquid Chromatography, and calculate the ratios, Q_T and Q_S, of the peak area of buspirone hydrochloride to that of the internal standard for the test solution and the standard solution, respectively.

$$\text{Amount (mg) of buspirone hydrochloride } (C_{21}H_{31}N_5O_2\cdot HCl) = \text{Amount of (mg) buspirone hydrochloride RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—Dissolve 0.25 g of propyl p-hydroxybenzoate in methanol to make 100 mL. Add water to 25.0 mL of this solution to make 500 mL.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 3.0 mm in internal diameter and 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of phosphate buffer solution and acetonitrile (60 : 40).

Flow rate: 2 mL/min

System suitability

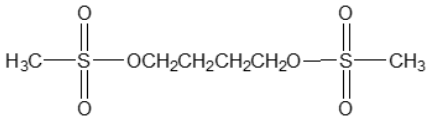
System performance: Proceed with 25 μL of the standard solution according to the above conditions; the resolution between the peaks of buspirone hydrochloride and the internal standard is NLT 4.

System repeatability: Repeat the test 5 times with 25 μL each of the standard solution under the above conditions; the relative standard deviation of the ratios of the peak area of buspirone hydrochloride to that of the internal standard is NMT 2.0%.

Phosphate buffer solution—Dissolve 1.36 g of potassium dihydrogen phosphate in water to make 1000 mL, and adjust the pH to 7.5 with 10 w/v% sodium hydroxide solution.

Packaging and storage Preserve in light-resistant, tight containers.

Busulfan
부설판



$C_6H_{14}O_6S_2$: 246.30

4-Methylsulfonyloxybutyl methanesulfonate [*55-98-1*]

Busulfan contains NLT 98.5% and NMT 101.0% of busulfan ($C_6H_{14}O_6S_2$), calculated on the dried basis.

Description Busulfan occurs as a white, crystalline powder.

It is slightly soluble in ether, very slightly soluble in ethanol(95), and practically insoluble in water.

Identification (1) Add 10 mL of water and 5 mL of sodium hydroxide TS to 0.1 g of Busulfan, dissolve by heating, and use this solution as the test solution.

(i) Add 1 drop of potassium permanganate TS to 7 mL of the test solution; the purple color of potassium permanganate TS turns bluish purple through blue to green.

(ii) Acidify 7 mL of the test solution with dilute sulfuric acid, and then add 1 drop of potassium permanganate TS; the color of potassium permanganate TS remains unchanged.

(2) Determine the infrared spectra of Busulfan and busulfan RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Melting point Between 115 and 118 ℃.

Purity (1) ***Sulfate***—Add 40 mL of water to 1.0 g of Busulfan and dissolve by heating. Cool in ice for 15 minutes and filter. Wash the residue with 5 mL of water, combine the washings and the filtrate, and add 1 mL of dilute hydrochloric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 0.40 mL of 0.005 mol/L sulfuric acid VS (NMT 0.019%).

(2) ***Heavy metals*—**Proceed with 1.0 g of Busulfan according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

Loss on drying NMT 2.0% (1, in vacuum, phosphorus oxide, 60 ℃, 4 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.2 g of Busulfan, add 40 mL of water and boil gently under a reflux condenser for 30 minutes. After cooling, titrate with 0.1 mol/L sodium hydroxide VS (indicator: 3 drops of phenolphthalein TS).

$$\text{Each mL of 0.1 mol/L sodium hydroxide VS} = 12.315 \text{ mg of } C_6H_{14}O_6S_2$$

Packaging and storage Preserve in light-resistant, well-closed containers.

Busulfan Tablets
부설판 정

Busulfan Tablets contain NLT 93.0% and NMT 107.0% of the labeled amount of busulfan ($C_6H_{14}O_6S_2$: 246.30).

Method of preparation Prepare as directed under Tablets, with Busulfan.

Identification Powder Busulfan Tablets and extract the powder several times with acetone. Collect and combine these extracts and evaporate to dryness on a steam bath, with the aid of a current of air. Perform the test with the residue as directed under the Identification (1) and (2) of Busulfan. The melting point of the residue is about 115 ℃.

Disintegration Meets the requirements.

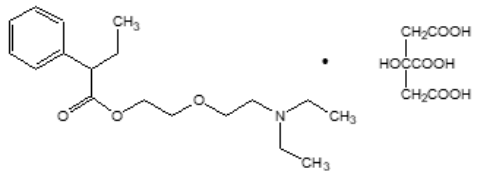
Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 40 tablets of Busulfan Tablets and powder (caution: guard against accidental inhalation of fine powder). Weigh accurately an amount of the powder equivalent to about 80 mg of busulfan ($C_6H_{14}O_6S_2$) and transfer to a beaker. Extract four times with 20 mL each of acetone. At each time of extraction, stir the mixture well, then allow the insoluble matter to settle, decant the clear supernatant, and filter through a glass filter (G4). Collect all of the acetone extracts, evaporate to about 10 mL, add phenolphthalein TS, and neutralize with 0.1 mol/L sodium hydroxide solution. Evaporate to dryness, add about 30 mL of water and perform the test under a reflux condenser as directed under the Assay of Busulfan according to the following (indicator: 3 drops of phenolphthalein TS).

Each mL of 0.1 mol/L sodium hydroxide VS
= 12.315 mg of $C_6H_{14}O_6S_2$

Packaging and storage Preserve in light-resistant, well-closed containers.

Butamirate Citrate
부타미레이트시트르산염



$C_{18}H_8NO_3 \cdot C_6H_8O_7$: 499.55
2-(2-Diethylaminoethyloxy)ethyl 2-phenylbutanoate 2-hydroxypropane 1,2,3-tricarboxylic acid, [*18109-81-4*]

Butamirate Citrate, when dried, contains NLT 98.0% and NMT 101.0% of butamirate citrate ($C_{18}H_{29}NO_3 \cdot C_6H_8O_7$).

Description Butamirate Citrate occurs as a yellowish white lump with a faint amine odor.
It is soluble in water.

Melting point—Between 75 and 77 ℃.

Identification (1) ***Citric acid***—Heat the test solution (1 mL) from Purity on a steam bath along with 1 mL of 0.1 mol/L potassium permanganate and 1 mL of 2 mol/L acetic acid(100) without boiling until it is decolorized. Add 1 mL of bromine water to the clear solution; a white precipitate is formed.

(2) ***Diethylaminoethoxyethanol***—Add 1 mL of the test solution in Purity to a test tube containing 3 mL of 2 mol/L sodium hydroxide TS, and direct the vapor produced onto a piece of red litmus paper soaked with water; the paper turns blue.

(3) Perform the test as directed under the Thin Layer Chromatography under Purity; the Rf value and the color of the spots obtained from the test solution and the standard solution are the same.

(4) Weigh 0.2 g of Butamirate Citrate, transfer it into a 100-mL volumetric flask, dissolve it with 70% ethanol, and dilute with 70% ethanol to 100 mL. Then, determine the absorption spectrum as directed under the Ultraviolet-visible Spectroscopy using 70% ethanol as the control solution; it exhibits an absorption maximum at a wavelength of 249 nm.

Purity Weigh about 2.5 g of Butamirate Citrate and dissolve in warm water to make 50 mL. After cooling, use this solution as the test solution.

(1) ***Chloride***—Pipet 5 mL of the test solution, transfer it into a Nessler tube and perform the test as directed under Chloride. Prepare the control solution with 0.35 mL of 0.01 mol/L hydrochloric acid (NMT 0.05%).

(2) ***Sulfate***—Pipet 5 mL of the test solution, transfer it into a Nessler tube, and then perform the test as directed under Sulfate; no turbidity is produced.

(3) ***Heavy metals***—Proceed with 1 g of Butamirate Citrate according to Method 1 and perform the test. Prepare the control solution with 1.0 mL of lead standard solution (NMT 10 ppm).

(4) ***Related substances***—Weigh about 0.1 g of Butamirate Citrate, place in a separatory funnel, dissolve in 20 mL of water and 10 mL of 2 mol/L ammonia water, and extract 3 times with 20 mL each of n-hexane. After passing the extract through an anhydrous sodium sulfate layer, transfer it into a 300 mL round-bottom flask, dry in vacuum at 50 ℃, and dissolve the residue in 5 mL of methanol. Use this solution as the test solution. Separately, use a 2% methanol solution of butamirate citrate and a 0.05% methanol solution of diethylaminoethoxyethanol as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture

of ethyl acetate, methyl ethyl ketone, water and concentrated formic acid (5 : 3 : 1 : 1) as the developing solvent to a distance of about 10 cm and air-dry the plate. After drying the plate at 100 ℃ for 15 minutes, place it in a developing chamber saturated with iodine, for 30 minutes; Butamirate citrate appears as a brown spot with an Rf value of around 0.56, and diethylaminoethoxyethanol or other related substances are not observed. However, free citric acid appears as a spot elongated from the starting point of butamirate citrate.

pH Between 3.5 and 3.9 (1% aqueous solution).

Loss on drying NMT 1.0% (1 g, 40 ℃, phosphorus pentoxide, vacuum desiccator, 3 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.6 g of Butamirate Citrate, previously dried, transfer it to a 250-mL Erlenmeyer flask, dissolve in 50 mL of acetic acid(100), and add 5 mL of acetic anhydride. Next, titrate with 0.1 mol/L perchloric acid VS until a pure blue color appears. Use 3 to 4 drops of 0.1% methylrosaniline chloride in acetic acid as the indicator. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 49.95 mg of $C_{18}H_{29}NO_3 \cdot C_6H_8O_7$

Packaging and storage Preserve in tight containers.

Butamirate Citrate Syrup
부타미레이트시트르산염 시럽

Butamirate Citrate Syrup contains NLT 95.0% and NMT 105.0% of the labeled amount of butamirate citrate ($C_{18}H_{29}NO_3 \cdot C_6H_8O_7$: 499.52).

Method of preparation Prepare as directed under Syrups, with Butamirate Citrate.

Identification Weigh about 6.0 mL of Butamirate Citrate Syrup, transfer to a 100 mL separatory funnel, add 10 mL of 2 mol/L ammonia water, mix, and extract 4 times with each 20 mL of chloroform. Combine all extracts, pass through a layer of anhydrous sodium sulfate, and filter to a 300 mL round bottom flask. Wash the anhydrous sodium sulfate layer with 10 mL of chloroform, combine the washing with the extracts obtained in the previous step, evaporate at 50 ℃ in vacuum, and dissolve the residue in 1 mL of methanol. Use the resulting solution as the test solution. Use 2% butamirate citrate in methanol as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of ethyl acetate, methyl ethyl ketone, water and concentrated formic acid (5 : 3 : 1 : 1) as the developing solvent to a distance of about 10 cm and air-dry the plate. After drying, allow to stand in a developing chamber saturated with Iodine for 30 minutes; the R_f values and the colors of the spots from the test solution and the standard solution are the same.

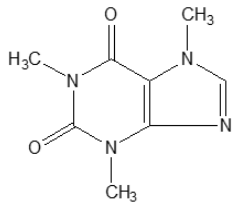
Uniformity of dosage units Meets the requirements.

Assay Weigh accurately an amount of Butamirate Citrate Syrup, equivalent to 75 mg of butamirate citrate ($C_{18}H_{29}NO_3 \cdot C_6H_8O_7$), transfer to a 100 mL separatory funnel, add phosphate buffer (pH 7.0), and mix. Extract 4 times with each 20 mL of chloroform, combine the extracts, pass through a layer of anhydrous sodium sulfate, and filter to a 300-mL round bottom flask. Wash the anhydrous sodium sulfate layer with 10 mL of chloroform, combine the washing with the extracts obtained in the previous step, and evaporate to dryness at 50 ℃ in vacuum. Dissolve the residue in 20 mL of acetic acid(100), add 10 mL of acetic anhydride, mix well, and titrate with 0.01 mol/L perchloric acid VS as directed in the potentiometric titration under the Titrimetry. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.01 mol/L perchloric acid VS
= 4.995 mg of $C_{18}H_{29}NO_3 \cdot C_6H_8O_7$

Packaging and storage Preserve in tight containers.

Anhydrous Caffeine
카페인무수물



$C_8H_{10}N_4O_2$: 194.19
1,3,7-Trimethylpurine-2,6-dione [*58-08-2*]

Anhydrous Caffeine, when dried, contains NLT 98.5% and NMT 101.0% of anhydrous caffeine ($C_8H_{10}N_4O_2$).

Description Anhydrous Caffeine occurs as white crystals or a powder.
It is odorless and has a bitter taste.
It is freely soluble in chloroform, sparingly soluble in water, acetic acid(100), or acetic anhydride, and slightly soluble in ethanol(95) or ether.

Dissolve 1.0 g of Anhydrous Caffeine in 100 mL of water; the pH of this solution is between 5.5 and 6.5.

Identification (1) To 2 mL of an aqueous solution of Anhydrous Caffeine (1 in 500), add dropwise of tannic acid TS; a white precipitate forms and this precipitate dissolves when adding dropwise tannic acid TS again.

(2) To 10 mg of Anhydrous Caffeine, add 10 drops of hydrogen peroxide TS and 1 drop of hydrochloric acid, and evaporate to dryness on a steam bath; the residue exhibits a yellowish red color. Also, transfer this residue into a container containing 2 to 3 drops of ammonia TS; the resulting residue changes to a purple color, which disappears upon the addition of 2 to 3 drops of sodium hydroxide TS.

(3) Dissolve 10 mg of Anhydrous Caffeine in water to make 50 mL. To 5 mL of this solution, add 3 mL of diluted acetic acid (3 in 100) and 5 mL of diluted pyridine (1 in 10) to mix, add 2 mL of diluted sodium hypochlorite TS (1 in 5), and allow to stand for 1 minute. To this solution, add 2 mL of sodium thiosulfate TS and 5 mL of sodium hydroxide TS; the resulting solution exhibits a yellow color.

Melting point Between 235 and 238 ℃.

Purity (1) ***Chloride***—Dissolve 2.0 g of Anhydrous Caffeine in 80 mL of hot water, cool quickly to 20 ℃, add water to make 100 mL, and use this solution as the sample stock solution. To 40 mL of the sample stock solution, add 6 mL of dilute nitric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 0.25 mL of 0.01 mol/L hydrochloric acid (NMT 0.011%).

(2) ***Chloride***—To 40 mL of the sample stock solution (1), add 1 mL of dilute hydrochloric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 0.40 mL of 0.005 mol/L sulfuric acid (NMT 0.024%).

(3) ***Heavy metals***—Proceed with 2.0 g of Anhydrous Caffeine according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(4) ***Related substances***—Dissolve 0.10 g of Anhydrous Caffeine in 10 mL of chloroform, and use this solution as the test solution. Pipet 1 mL of this solution and add chloroform to make exactly 100 mL. Pipet 1 mL of this solution, add chloroform to make exactly 10 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of chloroform and ethanol(95) (9 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot obtained from the test solution are not more intense than the spots obtained from the standard solution.

(5) ***Readily carbonizable substances***—Proceed with 0.5 g of Anhydrous Caffeine and perform the test. The color of the solution is not more intense than that of the Matching Fluid for Color D.

Loss on drying NMT 0.5% (1 g, 80 ℃, 4 hours).

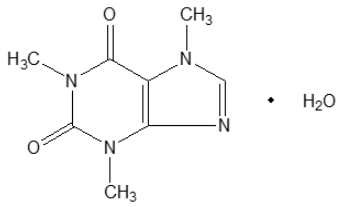
Residue on ignition NMT 0.1% (0.5 g).

Assay Weigh exactly about 0.4 g of Anhydrous Caffeine, previously dried, dissolve in 70 mL of a mixture of acetic anhydride and acetic acid(100) (6 : 1), and titrate with 0.1 mol/L perchloric acid VS (indicator: 3 drops of methylrosaniline chloride TS). However, the endpoint of the titration is when the purple color of this solution changes to green and then finally to yellow. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 19.419 mg of $C_8H_{10}N_4O_2$

Packaging and storage Preserve in tight containers.

Caffeine Hydrate
카페인수화물



Caffeine $C_8H10N_4O_2 \cdot H_2O$: 212.21
1,3,7-Trimethyl-2,3,6,7-tetrahydro-1H-purine-2,6-dione hydrate [*5743-12-4*]

Caffeine Hydrate, when dried, contains NLT 98.5% and NMT 101.0% of caffeine hydrate ($C_8H10N_4O_2$: 194.19).

Description Caffeine Hydrate occurs as soft white crystals or a powder.
It is odorless and has a slightly bitter taste.
It is freely soluble in chloroform, sparingly soluble in water, acetic (100), or acetic anhydride, slightly soluble in ethanol(95), and very slightly soluble in ether.
Dissolve 1.0 g of Caffeine Hydrate in 100 mL of water; the pH of this solution is between 5.5 and 6.5.
It effloresces in dry air.

Identification (1) To 2 mL of an aqueous solution of Caffeine Hydrate (1 in 500), add tannic acid TS dropwise; a white precipitate forms and this precipitate dissolves when adding tannic acid TS dropwise again.

(2) To 10 mg of Caffeine Hydrate, add 10 drops of hydrogen peroxide TS and 1 drop of hydrochloric acid, and evaporate to dryness on a steam bath; the residue exhibits a yellowish red color. Also, transfer this residue into a container containing 2 to 3 drops of ammonia TS; the resulting residue changes to a purple color, which disappears upon the addition of 2 to 3 drops of sodium hydroxide TS.

(3) Dissolve 10 mg of Caffeine Hydrate in water to make 50 mL. To 5 mL of this solution, add 3 mL of diluted acetic acid (3 in 100) and 5 mL of diluted pyridine (1 in 10) to mix, add 2 mL of diluted sodium hypochlorite TS (1 in 5), and allow to stand for 1 minute. To this solution, add 2 mL of sodium thiosulfate TS and 5 mL of sodium hydroxide TS; the resulting solution exhibits a yellow color.

Melting point Between 235 and 238 ℃ (after drying).

Purity (1) ***Chloride***—Dissolve 2.0 g of Caffeine Hydrate in 80 mL of hot water, cool quickly to 20 ℃, add water to make 100 mL, and use this solution as the sample stock solution. To 40 mL of the sample stock solution, add 6 mL of dilute nitric acid and water to make 50 mL, and use this solution as the test solution. Prepare the control solution with 0.25 mL of 0.01 mol/L hydrochloric acid (NMT 0.011%).

(2) ***Sulfate***—To 40 mL of the sample stock solution (1), add 1 mL of dilute hydrochloric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 0.40 mL of 0.005 mol/L sulfuric acid (NMT 0.024%).

(3) ***Heavy metals***—Proceed with 2.0 g of Caffeine Hydrate according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(4) ***Related substances***—Dissolve 0.10 g of Caffeine Hydrate in 10 mL of chloroform, and use this solution as the test solution. Pipet 1 mL of this solution, and add chloroform to make exactly 100 mL. Pipet 1 mL of this solution, add chloroform to make exactly 10 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of chloroform and ethanol(95) (9 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot from the test solution are not more intense than the spots from the standard solution.

(5) ***Readily carbonizable substances***—Proceed with 0.5 g of Caffeine Hydrate and perform the test. The color of the solution is not more intense than that of the Matching Fluid for Color D.

Loss on drying Between 0.5% and 8.5% (1 g, 80 °C, 4 hours).

Residue on ignition NMT 0.1% (0.5 g).

Assay Weigh exactly about 0.4 g of Caffeine Hydrate, previously dried, dissolve in 70 mL of a mixture of acetic anhydride and acetic acid(100) (6 : 1), and titrate with 0.1 mol/L perchloric acid VS (indicator: 3 drops of methylrosaniline chloride TS). The endpoint of the titration is when the purple color of this solution changes to green and then finally to yellow. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 19.419 mg of $C_8H_{10}N_4O_2$

Packaging and storage Preserve in tight containers.

Caffeine And Sodium Benzoate
벤조산나트륨카페인

Caffeine and Sodium Benzoate, when dried, contains NLT 48.0% and NMT 50.0% of caffeine ($C_8H_{10}N_4O_2$: 194.19) and contains NLT 50.0% and NMT 52.0% of sodium benzoate ($C_7H_5NaO_2$: 144.10).

Description Caffeine and Sodium Benzoate occurs as a white powder, is odorless, and has a slightly bitter taste.
It is freely soluble in water, soluble in acetic acid(100) or acetic anhydride, sparingly soluble in ethanol(95) and practically insoluble in ether.

Identification (1) Dissolve 1 g of Caffeine and Sodium Benzoate in 10 mL of water in a separatory funnel, add 1 drop of phenolphthalein TS, and add carefully dropwise 0.01 mol/L sodium hydroxide TS until a pale red color appears. Extract three times each time with 20 mL of chloroform by shaking well to mix and separate from the water layer (use the water layer for Test (2) below). Combine the chloroform extracts, filter it and evaporate the filtrate to dryness on a steam bath. Perform the test with the residue as directed below.

(i) To 2 mL of the aqueous solution of the residue (1 in 500), add tannic acid TS; a white precipitate is formed, which dissolves upon further addition of tannic acid TS.

(ii) To 10 mg of the residue, add 10 drops of hydrogen peroxide TS and 1 drop of hydrochloric acid and evaporate to dryness on a steam bath; the resulting residue exhibits a yellowish red color. Transfer this residue into a container containing 2 to 3 drops of ammonia TS; the resulting residue changes to a purple color, which disappears upon the addition of 2 to 3 drops of sodium hydroxide TS.

(iii) Dissolve 10 mg of the residue in water to make 50 mL. To 5 mL of this solution, add 3 mL of diluted acetic acid (3 in 100) and 5 mL of pyridine solution (1 in 10), mix, then add 2 mL of diluted sodium hypochlorite

TS (1 in 5), and allow to stand for 1 minute. To this solution, add 2 mL of sodium thiosulfate TS and 5 mL of sodium hydroxide TS; the resulting solution exhibits a yellow color.

(2) To 5 mL of the water layer obtained in (1), add 5 mL of water; the resulting solution responds to the Qualitative Analysis (2) for benzoate.

(3) Heat Caffeine and Sodium Benzoate; white fumes are produced. Ignite it further and add hydrochloric acid to the resulting residue; bubbles are formed and the resulting solution responds to the Qualitative Analysis (1) for sodium salt.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Caffeine and Sodium Benzoate in 5 mL of water; the resulting solution is colorless and clear.

(2) ***Akali***—Dissolve 1.0 g of Caffeine and Sodium Benzoate in 20 mL of water and add 1 to 2 drops of phenolphthalein TS; the resulting solution does not exhibit a red color.

(3) ***Chloride***—Dissolve 0.5 g of Caffeine and Sodium Benzoate in 10 mL of water and add 30 mL of ethanol(95), 6 mL of dilute nitric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution by adding 30 mL of ethanol(95) and water to 0.70 mL of 0.01 mol/L hydrochloric acid to make 50 mL (NMT 0.050%).

(4) ***Chlorinated compounds***—Dissolve 1.0 g of Caffeine and Sodium Benzoate in 40 mL of water, add 10 mL of dilute sulfuric acid, and extract twice each time with 20 mL of ether. Allow the combined ether extracts to evaporate at room temperature to dryness. Place the resulting residue and 0.7 g of calcium carbonate in a crucible, mix with a small amount of water, and allow to dry. Next, ignite the resulting residue at about 600 ℃, dissolve in 20 mL of dilute nitric acid, and filter. Wash the residue with 15 mL of water, combine the filtrate and the washings, and add water to make 50 mL. To this solution, add 0.5 mL of silver nitrate TS; the resulting solution is not more turbid than the following control solution.

Control solution—Dissolve 0.7 g of calcium carbonate in 20 mL of dilute nitric acid and filter. Wash the residue with 15 mL of water, combine the filtrate and the washings, and add 1.2 mL of 0.01 mol/L hydrochloric acid and water to make 50 mL, and add 0.5 mL of silver nitrate TS.

(5) ***Heavy metals***—Dissolve 2.0 g of Caffeine and Sodium Benzoate in 47 mL of water, add 3 mL of dilute hydrochloric acid slowly while stirring thoroughly to mix, and filter. Discard the first 5 mL of the filtrate, take the subsequent 25 mL of the filtrate, neutralize with ammonia TS, and add 2 mL of dilute acetic acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution by adding 2 mL of dilute acetic acid and water to 2.0 mL of lead standard solution to make 50 mL (NMT 20 ppm).

(6) ***Arsenic***—Proceed with 1.0 g of Caffeine and Sodium Benzoate according to Method 1 and perform the test (NMT 2 ppm).

(7) ***Phthalic acid***—Weigh accurately about 100 mg of Caffeine and Sodium Benzoate, dissolve it in 1 mL of water, add 1 mL of resorcinol-sulfuric acid TS, and evaporate the water by heating in an oil bath at between 120 and 125 ℃, and heat again for 90 minutes. After cooling, dissolve the resulting residue in 5 mL of water. To 1 mL of this solution, add 10 mL of a solution of sodium hydroxide (43 in 500) and use this solution as the test solution. Separately, take exactly 61 mg of potassium hydrogen phthalate and dissolve it in 1000 mL of water. Take 1 mL of this solution and proceed in the same manner as in the preparation of the test solution, and use this solution as the standard solution. Perform the test with the test solution and the standard solution as directed under the Ultraviolet-visible Spectroscopy, and determine the absorbances of these solutions at the wavelength of 495 nm; the absorbance of the test solution is NMT that of the standard solution.

(8) ***Readily carbonizable substances***—Proceed with 0.5 g of Caffeine and Sodium Benzoate and perform the test; the color of the solution is not more intense than that of the matching fluids for color A.

Loss on drying NMT 3.0% (2 g, 80 ℃, 4 hours).

Assay (1) ***Sodium Benzoate***—Weigh accurately about 0.25 g of Caffeine and Sodium Benzoate, previously dried, and dissolve in 20 mL of acetic acid(100) by warming to 50 ℃, if necessary. After cooling, titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). The endpoint of the titration is the first equivalence point. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 14.411 mg of $C_7H_5NaO_2$

(2) ***Caffeine***—Continue with the titration in (1) with 0.1 mol/L perchloric acid VS from the first equivalence point to the second equivalence point (potentiometric titration under the Titrimetry).

Each mL of 0.1 mol/L perchloric acid VS
= 19.419 mg of $C_8H_{10}N_4O_2$

Packaging and storage Preserve in well-closed containers.

Calamine
칼라민

zinc; iron(3+); oxygen(2-) [*8011-96-9*]

Calamine is zinc oxide which contains a small amount of iron(III) oxide. Calamine, when ignited, contains NLT 98.0% and NMT 100.5% of zinc oxide (ZnO :

81.37).

Description Calamine occurs as a pale red, fine powder, which is odorless and has a faint taste.
It is practically insoluble in water.
It dissolves in hydrochloric acid.

Identification (1) Dissolve 1 g of Calamine in 10 mL of hydrochloric acid, and filter; the filtrate responds to the Qualitative Analysis for zinc salt.

(2) Add 10 mL of 3 mol/L hydrochloric acid to 1 g of Calamine, boil, filter, and add 1 to 2 drops of ammonium thiocyanate to the filtrate; the resulting solution exhibits a red color.

Purity (1) ***Acid insoluble matter***—Dissolve 2.0 g of Calamine in 50 mL of 3 mol/L hydrochloric acid and filter. Rinse the residue with water, and dry at 105 ℃ for 1 hour; the amount is NMT 40 mg (NMT 2.0%).

(2) ***Alkalinity***—Add 20 mL of water to 1.0 g of Calamine, heat on a steam bath for 15 minutes, filter, and add 2 drops of phenolphthalein TS and 0.20 mL of 0.05 mol/L sulfuric acid to the filtrate; the resulting solution is colorless.

(3) ***Lead***—Add 15 mL of water to 1 g of Calamine, add 3 mL of acetic acid(100) while stirring to mix, dissolve by heating on a steam bath, and cool. Filter it, and add 5 drops of potassium chromate TS to the filtrate; the resulting solution does not become turbid.

(4) ***Calcium***—Add 25 mL of 3 mol/L hydrochloric acid to 1 g of Calamine, heat for 30 minutes to dissolve, and filter it. add ammonia TS to the filtrate until the first precipitation is dissolved again, and put another 5 mL of ammonia TS. To 10 mL of this solution, add 2 mL of ammonium oxalate TS; the solution has no turbidity or has a slight turbidity.

(5) ***Calcium or magnesium***—Add 2 mL of sodium phosphate TS to 10 mL of the solution from (5); the solution has no turbidity or has a slight turbidity.

(6) ***Arsenic***—Dissolve 0.25 g of Calamine in 35 mL of water, use this solution as the test solution, and perform the test (NMT 8 ppm).

Loss on ignition NMT 2.0% (2 g).

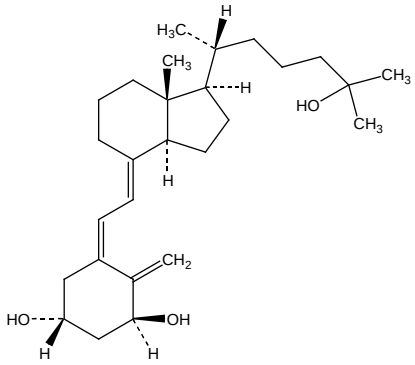
Microbiological examination of non-sterile products The total aerobic microbial count is NMT 1000 CFU, and the total combined yeasts/molds count is NMT 100 CFU per g of Calamine. Also, *Escherichia coli*, *Salmonella*, *Pseudomonas aeruginosa* and *Staphylococcus aureus* are not detected.

Assay Ignite Calamine, weigh accurately about 1.5 g, add accurately 50 mL of 0.5 mol/L sulfuric acid, heat gently to dissolve, and filter. Rince the residue with hot water until the washings become neutral, combine the filtrate with the washings, add 2.5 g of ammonium chloride to cool, and titrate with 1 mol/L sodium hydroxide VS (indicator: 3 drops of methyl orange TS). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.5 mol/L sulfuric acid VS
= 40.69 mg of ZnO

Packaging and storage Preserve in well-closed containers.

Calcitriol
칼시트리올



$C_{27}H_{44}O_3$: 416.64
(1*R*,3*S*,5*Z*)-5-[(2*E*)-2-[(1*R*,3a*S*,7a*R*)-1-[(2*R*)-6-Hydroxy-6-methylheptan-2-yl]-7a-methyl-2,3,3a,5,6,7-hexahydro-1*H*-inden-4-ylidene]ethylidene]-4-methylidenecyclohexane-1,3-diol [*32222-06-3*]

Calcitriol contains NLT 97.0% and NMT 103.0% of calcitriol ($C_{27}H_{44}O_3$).

Description Calcitriol occurs as white crystals.
It is freely soluble in ethanol(95), soluble in oils and practically insoluble in water.
It is sensitive to air, heat and light,
In solution, it shows a reversible isomerization reaction to pre-calcitriol depending on the temperature and time.

Identification (1) Determine the infrared spectra of Calcitriol and Calcitriol RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) The retention times of the major peaks obtained from the test solution and the standard solution under the Assay are the same.

Purity ***Related substances***—Weigh accurately 10 mg of Calcitriol, dissolve in acetonitrile without heating, put acetonitrile to make 55 mL, and add 2-Amino-2-hydroxymethyl-1,3-propanediol buffer solution to make 100 mL. Use this solution as the test solution. Separately, weigh accurately 10 mg of calcitriol RS, dissolve in acetonitrile without heating, put acetonitrile to make 55 mL, and add 2-Amino-2-hydroxymethyl-1,3-propanediol

buffer solution to make 100 mL. Use this solution as the standard solution. Take 50 μL of the test solution and perform the test as directed under the Liquid Chromatography according to the following conditions. Determine the peak area of each solution according to the automatic integration method and determine the peaks other than calcitriol and pre-calcitriol obtained from the test solution according to the percentage peak area method; NMT 0.1% for triazoline adduct of pre-calcitriol with the relative retention time of 0.43; NMT 0.25% for trans-calcitriol {(5*E*,7*E*)-9,10-Secocholesta-5,7,10(19)-trien-1α,3β,25-triol} with the relative retention time of 0.96; NMT 0.1% for 1β-calcitriol {(5*Z*,7*E*)-9,10-Secocholesta-5,7,10(19)-trien-1β,3β,25-triol} with the relative retention time of 1.15; NMT 0.25% for Methylene Calcitriol {(5*Z*,7*E*)-1α,3β-dihydroxy-17-((*R*)-7-hydroxy-7-methyl-octan-2-yl)-9,10-secoandrosta-5,7,10(19)-triene} with the relative retention time of 1.5; NMT 0.1% for each of other unidentified related substances; and the sum of total peak areas of the related substances is NMT 1.0%. However, exclude any peaks smaller than 0.1%.

2-Amino-2-hydroxymethyl-1,3-propanediol buffer solution—Dissolve 1.0 g of 2-Amino-2-hydroxymethyl-1,3-propanediol in 900 mL of water, add phosphoric acid to adjust the pH to 7.0 to 7.5, and add water to make 1000 mL.

Operating conditions

Proceed as directed under the Assay under Calcitriol.

System suitability

System performance: Proceed with 50 μL of the system suitability solution under the above operating conditions; the relative retention time of pre-calcitriol with respect to calcitriol is 0.9 with the resolution being NLT 3.5. Also, proceed with 50 μL of the standard solution under the above operating conditions; the number of theoretical plates is NLT 10000 plates.

System repeatability: Repeat the test 5 times according to the above conditions with 50 μL of the standard solution each time; the relative standard deviation is NMT 1.0%

Time span of measurement: About 2 times the retention time of Calcitriol.

System suitability solution—A solution prepared by taking 2 mL of the standard solution and warming at 80 ℃ for 30 minutes.

Assay Perform the test quickly while protected from light and air. Weigh accurately 1 mg of Calcitriol, dissolve in the mobile phase to make exactly 10 mL, and use this solution as the test solution. Weigh accurately 1 mg of calcitriol RS, dissolve in the mobile phase to make exactly 10 mL, and use this solution as the standard solution (1). Pipet 1.0 mL of this solution, dilute with the mobile phase to make exactly 100 mL, and use this solution as the standard solution (2). Pipet 2 mL of the standard solution (1), allow to stand at 80 ℃ for 30 minutes, and use this solution as the standard solution (3). Perform the test with 50 μL each of the test solution and the standard solution (1) as directed under the Liquid Chromatography, and determine the peak areas A_T and A_S of calcitriol for each solution.

$$\text{Amount (mg) calcitriol } (C_{27}H_{44}O_3) = 10 \times C \times \frac{A_T}{A_S}$$

C: Concentration (mg/mL) of calcitriol in standard solution (1)

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 230 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: A mixture of acetonitrile and 2-Amino-2-hydroxymethyl-1,3-propanediol buffer solution (550 : 450).

Flow rate: 1.0 mL/min

System suitability

System performance: Proceed with 50 μL of the standard solution (3) under the above conditions; the relative retention times of the pre-calcitriol peak to the retention time of calcitriol peak is about 0.9, and the resolution between these peaks are NLT 3.5. Proceed with 50 μL of the standard solution (1) under the above operating conditions; the number of theoretical plates is NLT 10000.

System repeatability: Repeat the test 6 times with 50 μL each of standard solution (1) under the above operating conditions; the relative standard deviation of the peak area of calcitriol is NMT 1%.

2-Amino-2-hydroxymethyl-1,3-propanediol buffer solution—Dissolve 1.0 g of 2-Amino-2-hydroxymethyl-1,3-propanediol in 1000 mL of water, and add phosphoric acid to adjust the pH to 7.0 to 7.5.

Packaging and storage Preserve in light-resistant, tight containers under nitrogen atmosphere at 2 ℃ to 8 ℃. Use immediately the contents after opening the container.

Precipitated Calcium Carbonate
침강탄산칼슘

$CaCO_3$: 100.09

[*471-34-1*]

Precipitated Calcium Carbonate, when dried, contains NLT 98.5% and NMT 101.0% of calcium carbonate ($CaCO_3$).

Description Precipitated Calcium Carbonate occurs as a white, fine crystalline powder, and is odorless and tasteless.
It is practically insoluble in water, but its solubility increases when carbon dioxide is present.
It is practically insoluble in ethanol(95) or ether.
It dissolves with effervescence in dilute acetic acid, dilute hydrochloric acid or dilute nitric acid.

Identification (1) Dissolve 0.5 g of Precipitated Calcium Carbonate in 10 mL of dilute hydrochloric acid, boil, then cool, and add ammonia TS to neutralize; the solution responds to the Qualitative Analysis for calcium salt.

(2) Precipitated Calcium Carbonate responds to the Qualitative Analysis (1) for carbonate.

Purity (1) ***Acid-insoluble substances***—To 5.0 g of Precipitated Calcium Carbonate, add 50 mL of water, then add 20 mL of hydrochloric acid dropwise with stirring, boil for 5 minutes, cool, add water to make 200 mL and filter using filter paper. Wash the residue until the washings show no turbidity when silver nitrate TS is added and ignite the residue with the filter paper to incinerate; the amount of the residue is NMT 10.0 mg.

(2) ***Heavy metals***—Mix 2.0 g of Precipitated Calcium Carbonate with 5 mL of water, add slowly 6 mL of dilute hydrochloric acid, and evaporate on a steam bath to dryness. Dissolve the residue in 50 mL of water and filter. To 25 mL of the filtrate, add 2 mL of dilute acetic acid, 1 drop of ammonia TS and water to make 50 mL, and perform the test using this solution as the test solution. For the control solution, evaporate 3 mL of hydrochloric acid on a steam bath to dryness, and add 2 mL of dilute acetic acid, 2.0 mL of lead standard solution and water to make 50 mL (NMT 20 ppm).

(3) ***Lead***—Weigh accurately 1.0 g of Precipitated Calcium Carbonate, mix with 5 mL of water, and slowly add 8 mL of 3 mol/L hydrochloric acid TS. Evaporate to dryness on a steam bath, dissolve the residue in 5 mL of water, and use this solution as the test solution. Transfer the test solution to a separatory funnel, wash with 10 mL of water, add 6 mL of a diammonium hydrogen citrate solution, 2 mL of hydroxylamine hydrochloride TS and 2 drops of phenol red TS, and add ammonia water(28) until the solution is alkalified. Cool the solution if necessary, add 2 mL of a potassium cyanide solution, extract with 5 mL each of extracting dithizone solution until the extract exhibits a green color, and combine the extracts in another separatory funnel. To the combined extracts, add 20 mL of diluted nitric acid (1 in 1000), shake for 30 seconds, and discard the chloroform layer. To the nitric acid layer, add 5.0 mL of standard dithizone solution and 4 mL of ammonia-cyanide TS, and shake for 30 seconds; the purple color of the chloroform layer is not more intense than the color obtained with 3 mL of diluted lead standard solution (1 in 10) in the same manner as the test solution (NMT 3 ppm).

(4) ***Magnesium and alkali metals***—Dissolve 1.0 g of Precipitated Calcium Carbonate in a mixture of 20 mL of water and 10 mL of dilute hydrochloric acid, boil, neutralize with ammonia TS, and add ammonium oxalate TS dropwise until precipitation of calcium oxalate is completed. Heat the mixture on a steam bath for 1 hour, cool, add water to make 100 mL, shake well and filter. To 50 mL of the filtrate, add 0.5 mL of sulfuric acid, evaporate to dryness and ignite the residue on evaporation at 600 °C to a constant mass; the amount of the residue is NMT 5.0 mg.

(5) ***Barium***—Mix 1.0 g of Precipitated Calcium Carbonate with 10 mL of water, add 4 mL of hydrochloric acid in small portions with stirring, boil for 5 minutes, cool, add water to make 40 mL and filter. With the filtrate, perform the test as directed under the Flame Coloration (1); it does not exhibit a green color.

(6) ***Iron***—Weigh accurately about 40 mg of Precipitated Calcium Carbonate, dissolve in 5 mL of 2 mol/L hydrochloric acid TS, transfer to a beaker, add water to make 10 mL, and use this solution as the test solution. Separately, put 4.0 mL of iron standard solution into a beaker, add water to make 10 mL, and use this solution as the standard solution. To each beaker, add 2 mL of a solution of citric acid (1 in 5) and 2 drops of thioglycolic acid, adjust the pH to 9.5 ± 0.1 with ammonia TS, add water to make 20 mL, mix, and allow to stand for 5 minutes. Again, add water to make 50 mL, and mix well. Immediately, with the test solution and standard solution, determine the absorbances at the absorbance maximum wavelength at about 530 nm as directed under the Ultraviolet-visible Spectroscopy using water as the blank test solution; the absorbance of the test solution is NMT that of the standard solution (NMT 0.1%).

(7) ***Arsenic***—Moisten 0.67 g of Precipitated Calcium Carbonate with 1 mL of water, then dissolve in 4 mL of dilute hydrochloric acid, use this solution as the test solution and perform the test (NMT 3 ppm).

Loss on drying NMT 1.0% (1 g, 180 °C, 4 hours).

Assay Weigh accurately about 0.12 g of Precipitated Calcium Carbonate, previously dried, and dissolve in 20 mL of water and 3 mL of dilute hydrochloric acid. Add 80 mL of water, 15 mL of a solution of potassium hydroxide (1 in 10) and 50 mg of NN indicator, and titrate immediately with 0.05 mol/L disodium ethylenediaminetetraacetate VS. The endpoint of titration is when the color of the solution changes from purple to blue.

Each mL of 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS
= 5.004 mg of $CaCO_3$

Packaging and storage Preserve in tight containers.

Calcium Chloride Hydrate
염화칼슘수화물

$CaCl_2 \cdot 2H_2O$: 147.02

Calcium Chloride Hydrate contains NLT 96.7% and NMT 103.3% of calcium chloride ($CaCl_2 \cdot 2H_2O$).

Description Calcium Chloride Hydrate occurs as a white grain or a mass, which is odorless.
It is very soluble in water, soluble in ethanol(95) and practically insoluble in ether.
It is deliquescent.

Identification An aqueous solution of Calcium Chloride Hydrate (1 in 10) responds to the Qualitative Analysis for calcium salt and chloride.

pH Dissolve 1.0 g of Calcium Chloride Hydrate in 20 mL of freshly boiled and cooled water; the pH of this solution is between 4.5 and 9.2.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Calcium Chloride Hydrate in 20 mL of water; the solution is clear and colorless.

(2) ***hypochlorous acid***—Dissolve 0.5 g of Calcium Chloride Hydrate in 5 mL of water, add 2 to 3 drops of dilute hydrochloric acid and 2 to 3 drops of zinc iodide-starch TS; the resulting solution does not exhibit a blue color immediately.

(3) ***Sulfate***—Perform the test with 1.0 g of Calcium Chloride Hydrate. Prepare the control solution with 0.50 mL of 0.005 mol/L sulfuric acid (NMT 0.024%).

(4) ***Heavy metals***—Proceed with 2.0 g of Calcium Chloride Hydrate according to Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(5) ***Magnesium and alkali metals***—Dissolve 1 g of Calcium Chloride Hydrate in 50 mL of water, add 0.5 g of ammonium chloride, and heat for 1 minute. Add immediately 40 mL of oxalic acid TS to this solution, stir until its precipitation is formed, and add 2 drops of methyl red TS before it is cooled. Add ammonia TS drop by drop until it turns alkaline, cool to room temperature, add water to make 100 mL, mix well, and allow to stand for 4 hours to overnight. Filter this solution, place 50 mL of the clear filtrate into the platinum plate, and add 0.5 mL of sulfuric acid. Evaporate to dryness on a steam bath, and heat gently and ignite until the ammonium is volatilized and the residue reaches a constant weight; the amount is NMT 5 mg (NMT 1.0%).

(6) ***Valium***—Dissolve 0.5 g of Calcium Chloride Hydrate in 5 mL of water, add 2 drops of dilute hydrochloric acid and 2 mL of potassium sulfate TS, and allow to stand for 10 minutes; the solution does not become turbid.

(7) ***Iron, aluminum and phosphate***—Put 1.0 g of Calcium Chloride Hydrate into a Nestler tube and dissolve in 20 mL of water and 1 drop of dilute hydrochloric acid, and heat. After cooling, add 3 drops of ammonia TS, and heat to boiling; the solution does not become turbid or produces no precipitation.

(8) ***Arsenic***—Proceed with 1.0 g of Calcium Chloride Hydrate according to Method 1 and perform the test (NMT 2 ppm).

Assay Weigh accurately about 0.4 g of Calcium Chloride Hydrate and dissolve in water to make 200 mL exactly. Pipet 20 mL of this solution, add 40 mL of water, 2 mL of 8 mol/L potassium hydroxide TS and 0.1 g of NN indicator, and immediately titrate with 0.02 mol/L ethylenediaminetetraacetic acid disodium salt VS. The endpoint of titration is when the color of the solution changes from purple to blue.

Each mL of 0.02 mol/L ethylenediaminetetraacetic acid disodium salt VS
= 2.9402 mg of $CaCl_2 \cdot 2H_2O$

Packaging and storage Preserve in tight containers.

Calcium Chloride Injection
염화칼슘 주사액

Calcium Chloride Injection is an aqueous solution for injection and contains NLT 95.0% and NMT 105.0% of the labeled amount of calcium chloride (CaCl2: 110.98).
The concentration of Calcium Chloride Injection is expressed as the amount of calcium chloride ($CaCl_2$).

Method of preparation Prepare as directed under Injections, with Calcium Chloride.

Description Calcium Chloride Injection occurs as a clear, colorless liquid.

Identification Calcium Chloride Injection responds to the Qualitative Analysis for calcium salt and chloride.

pH Between 4.5 and 7.5.

Sterility Meets the requirements.

Bacterial endotoxins Less than 0.30 EU per mg of Calcium Chloride Injection.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

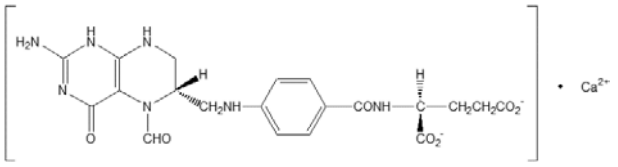
Extractable volume of injections Meets the requirements.

Assay Pipet an amount of Calcium Chloride Injection equivalent to about 0.4 g of calcium chloride ($CaCl_2$), and perform the test as directed under the Assay of Calcium Chloride.

Each mL of 0.02 mol/L ethylenediaminetetraacetic acid disodium salt VS
= 2.2197 mg of $CaCl_2$

Packaging and storage Preserve in hermetic containers.

Calcium Folinate
폴리네이트칼슘



Leucovorin Calcium $C_{20}H_{21}CaN_7O_7$: 511.50
Calcium(2*S*)-2-{[4-[(*R*)-2-amino-5-formyl-4-oxo-5,6,7,8-tetrahydro-1*H*-pteridin-6-yl)methyl-amino]benzoyl]amino}pentanedioate [*1492-18-8*]

Calcium Folinate contains NLT 95.0% and NMT 102.0% of calcium folinate ($C_{20}H_{21}CaN_7O_7$), calculated on the anhydrous basis.

Description Calcium Folinate occurs as a white to pale yellow powder.
It is odorless and tasteless.
It is very soluble in water, freely soluble in acetic acid(100), and practically insoluble in ethanol(95) or ether.
It is gradually affected by light.

Identification (1) Determine the absorption spectra of aqueous solutions of Calcium Folinate and calcium folinate RS (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Calcium Folinate and calcium folinate RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) An aqueous solution of Calcium Folinate (1 in 100) responds to the Qualitative Analysis (2) and (3) for calcium salt.

Optical rotation $[\alpha]_D^{20}$: Between +14° and +19° (0.1 g calculated on the anhydrous basis, water, 10 mL, 100 mm).

pH To 1.25 g of Calcium Folinate, add 50 mL of freshly boiled and cooled water, and dissolve by warming at 40 ℃, if necessary; the pH of this solution is between 6.8 and 8.0.

Purity (1) ***Clarity and color of solution***—To 1.25 g of Calcium Folinate, add 50 mL of freshly boiled and cooled water, and dissolve by warming at 40 ℃, if necessary; the resulting solution is clear. Determine the absorbance of this solution as directed under the Ultraviolet-visible Spectroscopy; the absorbance at a wavelength of 420 nm is NMT 0.25.

(2) ***Heavy metals***—Proceed with 0.40 g of Calcium Folinate according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 50 ppm).

(3) ***Related substances***—Weigh accurately 10 mg of Calcium Folinate, dissolve exactly in 25 mL of water, and use this solution as the test solution. Pipet 2 mL of the test solution, dissolve in water to make exactly 200 mL, and use this solution as the standard solution. With 20 μL each of the test solution and the standard solution, perform the test as directed under the Liquid Chromatography according to the following conditions and determine the peak areas of each solution by the automatic integration method; the peak areas other than the folinate from the test solution are not greater than the peak area of the folinate from the standard solution. Also, the sum of peak areas other than folinate from the test solution is not greater than 5 times the peak area of folinate from the standard solution.

Operating conditions

For the detector, column, column temperature, mobile phase and flow rate, proceed as directed under the conditions under the Assay.

System suitability

System performance: Proceed as directed under the system suitability under the Assay.

Test for required detectability: Pipet 5 mL of the standard solution and add water to exactly 50 mL. Confirm that the peak area of folinate obtained from 20 μL of this solution is equivalent within the range between 7% and 13% of the peak area of folinate obtained from the standard solution.

System repeatability: Repeat the test 6 times with 20 μL each of the standard solutions according to the above operating conditions; the relative standard deviation of the peak areas of folinate is NMT 2.0%.

Time span of measurement: About 2.5 times the retention time of folinate after the solvent peak.

Water Between 7.0% and 17.0% (0.2 g, volumetric titration, direct titration).

Assay Weigh accurately 10 mg of Calcium Folinate and calcium folinate RS (previously determine water content), dissolve each in the water to make exactly 25 mL, pipet 5 mL of these solutions, add the mobile phase to make exactly 25 mL, and use these solutions as the test solution and the standard solution. Perform the test with 20 μL each of the test solution and the standard solution

as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of folinate from each of the solutions.

$$\text{Amount (mg) of calcium folinate } (C_{20}H_{21}CaN_7O_7) = \text{Amount (mg) of calcium folinate RS, calculated on the anhydrous basis} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 45 °C.

Mobile phase: To a mixture of sodium hydrogen phosphate docahydrate (287 in 100000), methanol and tetrabutylammonium hydroxide TS (385 : 110 : 4), add phosphoric acid to adjust the pH to 7.5.

Flow rate: Adjust the flow rate so that the retention time of calcium folinate is about 10 minutes.

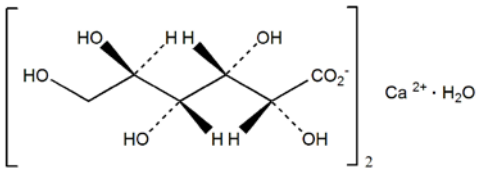
System suitability

System performance: Dissolve 10 mg each of Calcium Folinate and folic acid in 100 mL of the mobile phase. Proceed with 20 μL of this solution under the above operating conditions; calcium folinate and folic acid are eluted in this order with the resolution being NLT 10.

System repeatability: Repeat the test 6 times with 20 μL each of the standard solutions according to the above operating conditions; the relative standard deviation of the peak areas of calcium folinate is NMT 2.0%.

Packaging and storage Preserve in light-resistant, tight containers.

Calcium Gluconate Hydrate
글루콘산칼슘수화물



Calcium Gluconate $C_{12}H_{22}CaO_{14}\cdot H_2O$: 448.39
Calcium(2*R*,3*S*,4*R*,5*R*)-2,3,4,5,6-pentahydroxyhexanoate, hydrate [*299-28-5*]

Calcium Gluconate Hydrate, when dried, contains NLT 99.0% and NMT 104.0% of calcium gluconate hydrate ($C_{12}H_{22}CaO_{14}\cdot H_2O$).

Description Calcium Gluconate Hydrate occurs as a white crystalline powder or granule.
It is soluble in water and practically insoluble in ethanol(99.5).

Identification (1) Weigh 10 mg of Calcium Gluconate Hydrate and calcium gluconate hydrate RS respectively in 1 mL of water, and dissolve by warming, and use these solutions as the test solution and the standard solution, respectively. With the solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on a plate of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of ethanol(95), water, ammonia water and ethyl acetate (5 : 3 : 1 : 1) to a distance of about 10 cm, air-dry the plate, and heat it at 110 °C for 20 minutes. After cooling, spray a mixture of ammonium molybdate TS and cerium sulfate TS evenly onto the plate, air-dry, and heat it at 110 °C for 20 minutes; the spots from the test solution and the standard solution are the same in the R_f value and color tone.

(2) The aqueous solution of Calcium Gluconate Hydrate (1 in 40) responds to the Qualitative Analysis for calcium salt.

Optical rotation $[\alpha]_D^{20}$: Between +6° and +11° (after drying, 0.5 g, 25 mL of water, cooling after warming, 100 mm).

pH Dissolve 1.0 g of Calcium Gluconate Hydrate in 20 mL of water by warming. The pH of the solution is between 6.0 and 8.0.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Calcium Gluconate Hydrate in 50 mL of water by warming; the resulting solution is clear.

(2) ***Chloride***—Weigh 0.40 g of Calcium Gluconate Hydrate and perform the test. Prepare the control solution with 0.80 mL of 0.01 mol/L hydrochloric acid VS (NMT 0.071%).

(3) ***Sulfate***—Weigh 1.0 g of this drug and perform the test. Prepare the control solution with 1.0 mL of 0.005 mol/L sulfuric acid VS (NMT 0.048%).

(4) ***Phosphate***—Weigh 10.0 g of Calcium Gluconate Hydrate to 90 mL of water at between about 70 and 80 ℃ and boil for 10 seconds until the solution becomes clear. Pipet 1 mL of this solution, add water to make 100 mL and use this solution as the test solution. Separately, weigh accurately a suitable amount of potassium dihydrogen phosphate and dissolve in water to make a solution having a concentration of 0.716 mg/mL in 1 mL. Pipet 1.0 mL of this solution and add water to make 100 mL. Pipet 2.0 mL of this solution, add water to make 100 mL and use this solution as the standard solution. Add 4 mL of sulfomolybdic acid TS and 0.1 mL of a mixture containing 3 mol/L hydrochloric acid TS and acidic tin(II) chloride TS (10 : 1) to the test solution and the standard solution respectively to mix, and allow to stand for 10 minutes. The color observed from the test

solution is not darker than that from the standard solution (NMT 0.01%).

(5) ***Heavy metals***—Weigh 1.0 g of Calcium Gluconate Hydrate to 30 mL of water and 2 mL of dilute acetic acid, and dissolve it by heating. After cooling it down, add water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution by adding 2 mL of dilute acetic acid and water to 2.0 mL of lead standard solution to make 50 mL (NMT 20 ppm).

(6) ***Iron***—Weigh 1.0 g of Calcium Gluconate Hydrate, put it in a 100 mL quartz glass flask, add 20 mL of 12 mol/L nitric acid TS, and heat until smoke appears. Add 0.5 mL of 30% hydrogen peroxide to this and heat again until smoke appears. Repeat this procedure until the volume decreases to about 5 mL. Then, cool it down, add 1.0 mL of perchloric acid, and boil. Avoid heating at NLT 190 ℃ or evaporating to dryness as it may cause explosion. Add 2 mol/L hydrochloric acid TS to this solution to make 25 mL and use this solution as the test solution. Separately, pipet 2.0 mL, 4.0 mL and 10.0 mL of iron standard solution, respectively, put each of them in a 100-mL volumetric flask, add 1.37 g of calcium chloride dihydrate to the flask, and dilute with 2 mol/L hydrochloric acid TS to make 100 mL. Use these solutions as the standard solution (1), (2) and (3). Separately, repeat the process of preparing the test solution by using 0.34 g of calcium chloride dihydrate instead and use the resulting solution as the blank test solution. Perform the test with the test solution and the standard solutions (1), (2) and (3) as directed under Atomic Absorption Spectroscopy according to the following conditions and obtain the content of iron in the test solution using the calibration curve derived from the standard solution absorbance; the result is NMT 5 ppm.

Gas: Air–acetylene
Lamp: Iron hollow cathode lamp
Wavelength: 248.3 nm

(7) ***Magnesium and alkali metals***—Completely dissolve 1.0 g of Calcium Gluconate Hydrate in 100 mL of boiling water, and add 10 mL of ammonium chloride TS, 1 mL of ammonia water(28), and 50 mL of ammonium oxalate TS of the temperature between about 70 and 80 ℃. Allow it to stand for 4 hours, add water to make 200 mL, and filter it. Evaporate 100 mL of the filtrate to dryness and ignite to a constant mass: the residue is NMT 2 mg (NMT 0.4%).

(8) ***Arsenic***—Dissolve 0.6 g of Calcium Gluconate Hydrate in 5 mL of water by warming, add 5 mL of dilute sulfuric acid and 1 mL of bromine TS and heat to concentration on a steam bath to 5 mL. Use this solution as the test solution (NMT 3.3 ppm).

(9) ***Sucrose and reducing sugars***—Weigh 0.5 g of Calcium Gluconate Hydrate, put it to 10 mL of water and 2 mL of hydrochloric acid, and boil the solution for 2 minutes. After cooling, add 5 mL of sodium carbonate TS, allow to stand for 5 minutes, add water to make 20 mL and filter. Add 2 mL of Fehling's TS to 5 mL of the filtrate and boil for 1 minute; no orange to red precipitate is formed immediately.

Loss on drying NMT 1.0% (1 g, 80 ℃, 2 hours).

Assay Weigh accurately about 0.4 g of Calcium Gluconate Hydrate, previously dried, dissolve in 100 mL of water, add 2 mL of 8 mol/L potassium hydroxide TS and 0.1 g of NN indicator and titrate immediately with 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS The endpoint is reached when the color of the solution changes from purple to blue.

Each mL of 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS
= 22.420 mg of $C_{12}H_{22}CaO_{14}\cdot H_2O$

Packaging and storage Preserve in well-closed containers.

Calcium Gluconate Injection
글루콘산칼슘 주사액

An aqueous solution for injection, Calcium Gluconate Injection contains NLT 95.0% and NMT 105.0% of the labeled amount of calcium in total (Ca: 40.08).
A small amount of calcium saccharate or other suitable calcium salts may be added to Calcium Gluconate Injection as a stabilizer.

Method of preparation Prepare Calcium Gluconate Injection as directed under Injections, with Calcium Gluconate Hydrate. However, when adding a stabilizer, state the total amount of calcium.

Description Calcium Gluconate Injection occurs as a clear, colorless liquid.

Identification (1) Pipet 5 mL of Calcium Gluconate Injection, heat, add 0.7 mL of acetic acid(100) and 1 mL of freshly distilled phenylhydrazine, and heat on a steam bath for 30 minutes. After cooling, proceed as directed under the Identification (1) for Calcium Gluconate Hydrate hereinafter.

(2) An aqueous solution of Calcium Gluconate Injection (1 in 5) responds to the Qualitative Analysis for calcium salt.

pH Between 6.0 and 8.2.

Sterility Meets the requirements.

Bacterial endotoxins Bacterial endotoxins in Calcium Gluconate Injection is less than 0.17 EU per mg of calcium gluconate hydrate.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

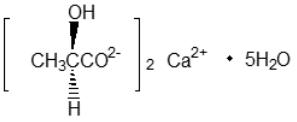
Extractable volume of injections Meets the requirements.

Assay Take an exact amount of Calcium Gluconate Injection equivalent to about 0.4 g of calcium gluconate ($C_{12}H_{22}CaO_{14}$), add 100 mL of water, 2 mL of 8 mol/L potassium hydroxide TS, and 0.1 g of NN indicator, and immediately titrate with 0.05 mol/L ethylenediamine tetraacetate disodium VS. The endpoint of titration is reached when the color of the solution changes from purple to blue.

Each mL of 0.05 mol/L disodium ethylenediaminetetraacetate VS
= 2.0040 mg of Ca

Packaging and storage Preserve in hermetic containers.

Calcium Lactate Hydrate
락트산칼슘수화물



and enantiomer

Calcium Lactate $C_6H_{10}CaO_6 \cdot 5H_2O$: 308.29
Calcium (*RS*)-2-hydroxypropanoate pentahydrate [*5743-47-5*]

Calcium Lactate Hydrate, when dried, contains NLT 97.0% and NMT 101.0% of calcium lactate ($C_6H_{10}CaO_6$: 218.22).

Description Calcium Lactate Hydrate occurs as a white powder or grain.
It is odorless and has a slight sour taste.
1 g of Calcium Lactate Hydrate is slowly soluble in 20 mL of water, slightly soluble in ethanol(95) and practically insoluble in ether.
It is efflorescent at room temperature and becomes an anhydrous matter at 120 ℃.

Identification An aqueous solution of Calcium Lactate Hydrate (1 in 20) responds to the Qualitative Analysis for calcium salt and lactate.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Calcium Lactate Hydrate in 20 mL of water by heating; the resulting solution is clear.

(2) ***Acidity or alkalinity***—Add 2 drops of phenolphthalein TS in the solution in (1); the resulting solution does not exhibit a red color. Add 0.50 mL of 0.1 mol/L sodium hydroxide VS; the resulting solution does not exhibit a red color.

(3) ***Heavy metals***—Add 30 mL of water and 5 mL of dilute acetic acid to 1.0 g of Calcium Lactate Hydrate and dissolve by heating. After cooling, add water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution by adding 2 mL of dilute acetic acid and water to make 50 mL (NMT 20 ppm).

(4) ***Magnesium or alkaline metals***—Dissolve about 1.0 g of Calcium Lactate Hydrate in 40 mL of water, add 0.5 g of ammonium chloride, boil, and add 20 mL of ammonium oxalate TS. Heat on a steam bath for 1 hour, cool it down, add water to make 100 mL, and filter. Add 0.5 mL of sulfuric acid to 50 mL of the filtrate, evaporate to dryness to a constant mass, ignite at a temperature between 450 and 550 ℃; the residue is NMT 5 mg.

(5) ***Arsenic***—Dissolve about 0.5 g of Calcium Lactate Hydrate in 2 mL of water and 3 mL of hydrochloric acid. Use this solution as the test solution and perform the test (NMT 4 ppm).

(6) ***Volatile fatty acid***—Add 2 mL of sulfuric acid to about 1.0 g of Calcium Lactate Hydrate, and heat; the solution does not have the same odor as the acetic acid or butyric acid.

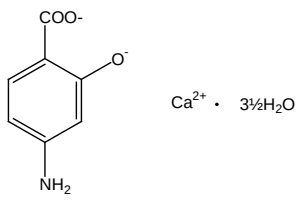
Loss on drying Between 25.0% and 30.0% (1 g, 1 hour from the start at 80 ℃, nest 4 hours at 120 ℃).

Assay Weigh accurately about 0.5 g of Calcium Lactate Hydrate, previously dried, dissolve in water by heating, cool it down, and add water to make exactly 100 mL. Pipet 20 mL of this solution, add 80 mL of water and 1.5 mL of 8 mol/L potassium hydroxide TS, allow it to stand for 3 to 5 minutes, and add 0.1 g of NN indicator. Titrate immediately with 0.02 mol/L ethylenediaminetetraacetic acid disodium salt VS. However, the endpoint of the titration is when the red color of this solution turns blue.

Each mL of 0.02 mol/L disodium ethylenediaminetetraacetate VS
= 4.3644 mg of $C_6H_{10}CaO_6$

Packaging and storage Preserve in tight containers.

Calcium *p*-Aminosalicylate Hydrate
파라아미노살리실산칼슘수화물



PAS-calcium
Calcium p-Aminosalicylate

$C_7H_5CaNO_3 \cdot 3½H_2O$: 254.25

Calcium 4-amino-2-hydroxybenzoate hydrate [*133-15-3*, anhydrous]

Calcium p-Aminosalicylate Hydrate contains NLT 97.0% and NMT 103.0% of calcium p-aminosalicylate ($C_7H_5CaNO_3$: 191.20), calculated on the anhydrous basis.

Description Calcium p-Aminosalicylate Hydrate occurs as a white or slightly colored powder and has a slightly bitter taste.
It is very slightly soluble in water and practically insoluble in ethanol(95) or methanol.
It is gradually changed to brown by light.

Identification (1) To 50 mg of Calcium p-Aminosalicylate Hydrate, add 100 mL of water, shake well to mix, and filter. Add 1 mL of 1 mol/L hydrochloric acid TS to 10 mL of the filtrate, shake to mix, and then add 1 drop of iron(III) chloride TS; the resulting solution exhibits a purple color.

(2) Determine the infrared spectra of Calcium p-Aminosalicylate Hydrate and calcium p-aminosalicylate hydrate RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers

(3) To 3 g of Calcium p-Aminosalicylate Hydrate, add 15 mL of ammonium chloride TS and 15 mL of water, heat on a steam bath for 10 minutes, cool, and then filter; the filtrate responds to the Qualitative Analysis (1), (2), and (3) for calcium salt.

Purity (1) ***Chloride*—**Dissolve 1.0 g of Calcium p-Aminosalicylate Hydrate in 15 mL of dilute nitric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 0.70 mL of 0.01 mol/L hydrochloric acid (NMT 0.025%).

(2) ***Heavy metal***—Proceed with 1.0 g of Calcium p-Aminosalicylate Hydrate according to Method 3 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Arsenic*—**Dissolve 0.40 g of Calcium p-Aminosalicylate Hydrate in 20 mL of 0.1 mol/L hydrochloric acid TS by warming in on a steam bath, and perform the test using this solution as the test solution (NMT 5 ppm).

(4) ***3-aminophenol***—To 0.10 g of Calcium p-Aminosalicylate Hydrate, add 5 mL of 0.1 mol/L ethylenediaminetetraacetic acid disodium salt TS, previously cooled in iced water, and shake vigorously to dissolve. Immediately add 3 mL of ammonia-ammonium chloride buffer solution, pH 11.0, previously cooled in iced water, and shake to mix. Next, add 2 mL of 4-amino-*N*,*N*-diethylaniline sulfate TS, shake to mix, and add 10.0 mL of cyclohexane and 4 mL of diluted potassium hexacyanoferrate(III) TS (1 in 10). Then immediately shake for 20 seconds to mix. Centrifuge this solution, take the cyclohexane layer separately, wash it twice with 5 mL of diluted ammonia TS (1 in 14) each time, add 1 g of anhydrous sodium sulfate, shake to mix, and allow to stand for 5 minutes; the color of the clear cyclohexane layer is not more intense than the following control solution.

Control solution—Dissolve 50 mg of 3-aminophenol in water to make exactly 500 mL. Pipet 20 mL of this solution and add water to make exactly 100 mL. Take 5.0 mL of this solution, add 3 mL of ammonia-ammonium chloride buffer solution (pH 11.0), previously cooled in iced water, shake to mix, and proceed in the same manner.

Water Between 23.3% and 26.3% (0.1 g, volumetric titration, direct titration).

Assay Weigh accurately about 0.2 g of Calcium p-Aminosalicylate Hydrate, add 60 mL of water and 0.75 mL of dilute hydrochloric acid, and heat on a steam bath to dissolve. After cooling, add water to make exactly 100 mL, and use this solution as the test solution. Take exactly 30 mL of the test solution, put it in an iodine bottle, and then add exactly 25 mL of 0.05 mol/L bromine solution. Next, add 20 mL of potassium bromide solution (1 in 4), then quickly add 14 mL of a mixture of acetic acid(100) and hydrochloric acid (5 : 2), and immediately stopper the bottle. Allow to stand for 10 minutes, shaking occasionally to mix. Then add cautiously 6 mL of potassium iodide TS, immediately stopper the bottle, and shake gently to mix. Allow to stand for 5 minutes and titrate the released iodine with 0.1 mol/L sodium thiosulfate VS (indicator: 1 mL of starch TS). Perform a blank test in the same manner.

Each mL of 0.05 mol/L bromine solution VS
= 3.187 mg of $C_7H_5CaNO_3$

Packaging and storage Preserve in light-resistant, tight containers.

Calcium *p*-Aminosalicylate Granules
파라아미노살리실산칼슘 과립

PAS-calcium Granules

Calcium p-aminosalicylate Granules contain NLT 95.0% and NMT 105.0% of the labeled amount of calcium p-aminosalicylate hydrate ($C_7H_5CaNO_3 \cdot 3½H_2O$: 254.25).

Method of preparation Prepare as directed under Granules with Calcium *p*-Aminosalicylate Hydrate.

Identification Powder Calcium *p*-Aminosalicylate Granules, weigh an appropriate amount, equivalent to 50

mg of Calcium *p*-aminosalicylate, according to the labeled amount, add 100 mL of water, shake vigorously to mix, and filter. To 10 mL of the filtrate, add 1 mL of 1 mol/L hydrochloric acid TS, shake to mix, and add 1 drop of iron(III) chloride TS; the solution exhibits a purple color.

Dissolution Weigh accurately an amount of calcium *p*-aminosalicylate hydrate ($C_7H_5CaNO_3 \cdot 3½H_2O$) equivalent to about 250 mg according to the labeled amount, perform the test at 75 revolutions per minute according to Method 2, using 900 mL of water as the dissolution medium. Take NLT 20 mL of the dissolved solution after 60 minutes from the start of the dissolution test, and filter through a membrane filter with a pore size of NMT 0.5 μm. Discard the first 10 mL of the filtrate, pipet 5 mL of the subsequent filtrate, add water to make exactly make 100 mL, and use this solution as the test solution. Separately, weigh accurately an amount of calcium *p*-aminosalicylate hydrate RS, previously determined for Water content, equivalent to about 28 mg, and dissolve in water to make exactly 100 mL. Pipet 5 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances, AT and AS, of the test solution and the standard solution at the absorbance maximum wavelength near 300 nm as directed under Ultraviolet-visible Spectrophotometry. It meets the requirements if the dissolution rate of Calcium *p*-Aminosalicylate Granules in 60 minutes is NLT 75%.

Dissolution rate (%) with respect to the labeled amount of calcium *p*-aminosalicylate hydrate ($C_7H_5CaNO_3 \cdot 3½H_2O$)

$$= \frac{W_S}{W_T} \times \frac{A_T}{A_S} \times \frac{1}{C} \times 900 \times 1.330$$

W_S: Taken amount (g) of *p*-aminosalicylic acid ($C_7H_5CaNO_3$), as calculated on the anhydrous basis, in calcium *p*-aminosalicylate hydrate RS

W_T: Taken amount (g) of Calcium *p*-Aminosalicylate Granules

C: Labeled amount (mg) of calcium *p*-aminosalicylate hydrate $C_7H_5CaNO_3 \cdot 3½H_2O$) in 1 g

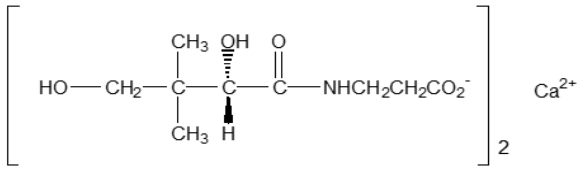
Particle size distribution estimation by analytical sieving Meets the requirements.

Assay Powder Calcium *p*-Aminosalicylate Granules, weigh accurately an amount of calcium p-aminosalicylate hydrate ($C_7H_5CaNO_3 \cdot 3½H_2O$: 254.25) equivalent to about 0.2 g, add 60 mL of water and 0.75 mL of dilute hydrochloric acid, heat on a steam bath to dissolve, cool, add water to make exactly 100 mL, and filter. Pipet 30 mL of the filtrate, place in an iodine bottle, and perform the test as directed under the Assay of Calcium *p*-Aminosalicylate Hydrate.

Each mL of 0.05 mol/L bromine solution VS
= 4.238 mg of $C_7H_5CaNO_3 \cdot 3½H_2O$

Packaging and storage Preserve in light-resistant, tight containers.

Calcium Pantothenate
판토텐산칼슘



$C_{18}H_{32}CaN_2O_{10}$: 476.53

Calcium *bis*(3-{[(2*R*)-2,4-dihydroxy-3,3-dimethylbutanoyl]amino}propanoate) [*137-08-6*]

Calcium Pantothenate, when dried, contains NLT 5.7% and NMT 6.0% of nitrogen (N: 14.01), and NLT 8.2% and NMT 8.6% of calcium (Ca: 40.08).

Description Calcium Pantothenate occurs as a white powder.
It is odorless and has a bitter taste.
It is freely soluble in water, very slightly soluble in ethanol(95), and practically insoluble in ether.
The pH of an aqueous solution of Calcium Pantothenate (1 in 20) is between 7.0 and 9.0.
It is hygroscopic.

Identification (1) Dissolve 50 mg of Calcium Pantothenate in 5 mL of sodium hydroxide TS, and filter. To the filtrate, add 1 drop of copper(II) sulfate TS; the resulting solution exhibits an deep blue color.

(2) To 50 mg of Calcium Pantothenate, add 5 mL of sodium hydroxide TS, and boil for 1 minute. After cooling, add diluted hydrochloric acid (1 in 10) to adjust pH to between 3 and 4, and add 2 drops of iron(III) chloride TS; the resulting solution exhibits a yellow color.

(3) An aqueous solution of Calcium Pantothenate (1 in 10) responds to the Qualitative Analysis for calcium salt.

Optical rotation $[\alpha]_D^{20}$: Between +25.0° and +28.5° (1 g after drying, water, 20 mL, 100 mm).

Purity (1) ***Clarity and color of solution*—**Dissolve 1.0 g of Calcium Pantothenate in 20 mL of water; the resulting solution is clear and colorless.

(2) ***Heavy metals*—**Proceed with 1.0 g of Calcium Pantothenate according to Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Alkaloid*—** Dissolve 50 mg of Calcium Pantothenate in 5 mL of water, and add 0.5 mL of ammonium molybdate TS and 0.5 mL of phosphoric acid solution

(1 in 10); the solution has no white turbidity.

(4) ***Related substances***—Weigh 100 mg of Calcium Pantothenate, add water to make exactly 10 mL, and use this solution as the test solution. Separately, weigh 10 mg of β-alanine RS, dissolve in methanol to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under the Thin Layer Chromatography. Spot 20 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography, develop the plate with a mixture of ethanol(95) and water (65 : 35) as the developing solvent to a distance of about 15 cm, spray evenly a solution of ninhydrin in ethanol(95) (0.2 in 100) on the plate, and air-dry the plate. Heat this thin-layer chromatographic plate at 120 ℃ for 20 minutes; the spots other than the principal spot obtained from the test solution are not more intense than the spots from the standard solution (NMT 1.0%).

Loss on drying NMT 5.0% (1 g, 105 ℃, 4 hours).

Assay (1) ***Nitrogen***—Weigh accurately about 50 mg of Calcium Pantothenate, previously dried, and perform the test as directed under the Nitrogen Determination.

(2) ***Calcium***—Weigh accurately 0.4 g of Calcium Pantothenate, previously dried, and dissolve in 30 mL of water by heating. After cooling, add exactly 25 mL of 0.05 mol/L ethylenediaminetetraacetic acid disodium salt, add 10 mL of pH 10.7 ammonia-ammonium chloride buffer solution, and titrate excess ethylenediaminetetraacetic acid disodium salt with 0.05 mol/L magnesium chloride VS (indicator: 40 mg of eryochrome black T in sodium chloride) However, the endpoint of the titration is when the bluish purple color of the solution turns to purple. Perform a blank test in the same manner.

Each mL of 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS
= 2.0039 mg of Ca

Packaging and storage Preserve in tight containers.

Calcium Polystyrene Sulfonate
폴리스티렌설폰산칼슘

Calcium 2-ethenylbenzenesulfonate [*37286-92-3*]

Calcium Polystyrene Sulfonate is a calcium-type cation exchange resin produced by combining a sulfonic acid group with a styrene-divinylbenzene copolymer.

Calcium Polystyrene Sulfonate, when dried, contains NLT 7.0% and NMT 9.0% of calcium (Ca : 40.08).

Each g of Calcium Polystyrene Sulfonate exchanges with 53 to 71 mg of potassium (K: 39.10), calculated on the dried basis.

Description Calcium Polystyrene Sulfonate occurs as a pale yellowish white to pale yellow powder.
It is odorless and tasteless.
It is practically insoluble in water, ethanol(95) or ether.

Identification (1) Determine the infrared spectra of Calcium Polystyrene Sulfonate and calcium polystyrene sulfonate RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) Mix 0.5 g of Calcium Polystyrene Sulfonate with 10 mL of dilute hydrochloric acid, filter and neutralize the filtrate with ammonia TS; the solution responds to the Qualitative Analysis for calcium salt.

Purity (1) ***Ammonium***—Weigh about 1.0 g of Calcium Polystyrene Sulfonate in a flask, add 5 mL of sodium hydroxide TS, cover the bottom with a watch glass with a wet red litmus test paper attached, and heat for 15 minutes; the gas produced does not change the red litmus test paper to blue. (NMT 5 ppm).

(2) ***Heavy metals***—Proceed with 2.0 g of Calcium Polystyrene Sulfonate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Arsenic***—Proceed with 1.0 g of Calcium Polystyrene Sulfonate according to Method 3, and perform the test (NMT 2 ppm).

(4) ***Styrene***—Weigh 10.0 g of Calcium Polystyrene Sulfonate, add 10 mL of acetone, shake to mix for 30 minutes, and centrifuge. Use the clear supernatant as the test solution. Separately, weigh 10 mg of styrene and add acetone to make exactly 100 mL. Pipet 1 mL of this solution, add acetone to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak area of styrene of each solution; A_T and A_S; A_T is not greater than A_S.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: A mixture of water and acetonitrile (1 : 1).

Flow rate: 2.0 mL/min

System performance: Dissolve 20 mg each of styrene and butyl p-hydroxybenzoate in 100 mL of acetone. To 5 mL of this solution, add acetone to make 100 mL. Proceed with 20 μL of this solution according to the above operating conditions; butyl p-hydroxybenzoate and styrene are eluted in this order with the resolution being NLT 5.

System repeatability: Repeat the test 6 times with 20 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area of styrene is NMT 2.0%.

(5) ***Sodium*—**Pipet 20 mL from the 50 mL of solution obtained from Assay (1), and add water to make exactly 500 mL, and use this solution as the test solution. Separately, weigh accurately 0.2542 g of sodium chloride, previously dried at 130 °C for 2 hours, and dissolve in 0.02 mol/L hydrochloric acid TS to make exactly 1000 mL. Take an appropriate amount of this solution, add 0.02 mol/L hydrochloric acid TS, dilute accurately to contain 1 to 3 μg of sodium (Na: 22.99) per mL, and use this solution as the standard solution. With the test and standard solutions, perform the test as directed under the Atomic Absorption Spectroscopy according to the following conditions, and determine the sodium content in the test solution using the calibration curve obtained from the standard solution (NMT 1%).

Gas: Air–acetylene
Lamp: Potassium hollow cathode lamp
Wavelength: 589.0 nm

Loss on drying NMT 10.0% (1 g, in vacuum, 80 °C, 5 hours).

Fine particles (1) ***Apparatus*—**Use the apparatus shown in the figure.

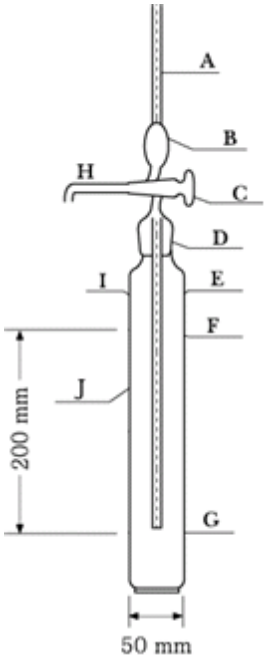
Volume up to the 20 cm mark when inserting the capillary pipet: 550 mL

Volume per inhalation: 10 mL

(2) ***Procedure*—**Weigh accurately about 5.5 g of Calcium Polystyrene Sulfonate, previously dried, add 300 mL of water at 25 °C, and stir to mix for 5 minutes. Transfer this to the sedimentation tube (J) stored at 25 °C, fill water at 25 °C to 2 mm to below the 20 cm mark F of the sedimentation tube (J), and then insert the pipet. Open the three-way cock (C) to release the air, add water from the vent hole (D) to the 20-cm mark (F) exactly, and close the three-way cock (C). Shake the apparatus sufficiently in both vertical and horizontal directions to disperse the content, then open the three-way stopper (C) and allow to stand at 25 ± 1°C for 5 hours and 15 minutes. Next, suck up the suspension in the sedimentation tube (J) exactly up to the pipet port scale (A), and open the three-way cock (C) in the direction of the pipet discharge tube (H) to take it. Repeat the same procedure to combine the result, and take exactly 20 mL of the suspension. Evaporate this solution to dryness on a steam bath, dry it at 105 °C to a constant mass, and then determine the mass W_S (g). Also, pipet 20 mL of the used water, and proceed in the same manner to obtain its mass W_B (g). Determine the amount of fine particles (S) according to the following formula; it is NMT 0.1%.

$$\text{S (\%)} = \frac{|W_S - W_B|(g) \times V(mL)}{20(mL) \times Amount\ of\ sample\ (g)} \times 100$$

V: Internal volume up to the 20 cm mark when inserting the capillary pipet (mL)



Andreasen pipet

A: Mark of pipet bulb	B: Pipet bulb for suction
C: Three-way stopcock	D: Vent-hole
E: Suction tube of pipet	F: Mark of 20 cm
G: Baseline of 0 cm	H: Outlet of pipet
I: Capillary tube of pipet	J: Sedimentation tube

Assay (1) ***Calcium*—**Weigh accurately about 1.0 g of Calcium Polystyrene Sulfonate, previously dried, and add 5 mL of 3 mol/L hydrochloric acid TS, disperse, and place the flask with volume of 50 mL as a receiver at the bottom of a chromatographic tube with an internal diameter of about 12 mm and a height of about 70 mm with glass wool at the bottom. Wash the tube thoroughly using a small amount of 3 mol/L hydrochloric acid TS, and combine the washings with the solution. Again, use 3 mol/L hydrochloric acid TS to elute until the volume reaches about 45 mL. Then, add water to make exactly 50 mL. Pipet 20 mL of this solution, add ammonia TS to exactly adjust the pH to 10, and immediately titrate with 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS. (indicator: 40 mg of eriochrome black T-sodium chloride indicator). The endpoint of titration is when the color of the solution changes from purple to blue. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS
= 2.0039 mg of Ca

(2) ***Potassium exchange capacity*—**Weigh accu-

rately about 1.0 g of Calcium Polystyrene Sulfonate, previously dried, in a glass container with a stopper, add 50 mL of potassium standard stock solution, stir for 120 minutes, and then filter. Discard the first 20 mL of the filtrate, take accurately 5 mL of the subsequent filtrate, and add 0.02 mol/L hydrochloric acid TS to make exactly 100 mL. Pipet 10 mL of this solution, add 0.02 mol/L hydrochloric acid TS to make exactly 1000 mL, and use this solution as the test solution. Separately, pipet an appropriate amount of potassium standard stock solution, add 0.02 mol/L hydrochloric acid TS, dilute accurately to contain 0.5 to 2.5 μg of potassium (K: 39.10) per mL, and use this solution as the standard solution. With the test and standard solutions, perform the test as directed under the Atomic Absorption Spectroscopy according to the following conditions, and determine the potassium content *Y* (mg) in 1000 mL of the test solution using the calibration curve obtained from the standard solution. Determine the potassium exchange capacity per gram of Calcium Polystyrene Sulfonate, calculated on the dried basis, using the following formula.

Potassium exchange capacity (K) (mg) per gram of Calcium Polystyrene Sulfonate, calculated on the dried basis

$$= \frac{X - 100Y}{W}$$

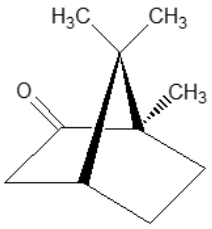
X: Amount (mg) of potassium in 50 mL of potassium standard stock solution before exchange

W: The amount (g) of Calcium Polystyrene Sulfonate taken, calculated on the dried basis

Gas: Air–acetylene
Lamp: Potassium hollow cathode lamp
Wavelength: 766.5 nm

Packaging and storage Preserve in tight containers.

d-Camphor
d-캄파



$C_{10}H_{16}O$: 152.23

(1*R*,4*R*)-4,7,7-Trimethylbicyclo[2.2.1]heptan-3-one [*464-49-3*]

d-Camphor contains NLT 96.0% and NMT 101.0% of *d*-camphor ($C_{10}H_{16}O$).

Description *d*-Camphor occurs as colorless or white translucent crystals or a crystalline powder or a mass, with a characteristic aroma, and a slightly bitter and refreshing taste.
It is freely soluble in ethanol(95), ether or carbon disulfide, and slightly soluble in water.
It slowly volatilizes at room temperature.

Identification Dissolve 0.1 g of *d*-Camphor in 2 mL of methanol, add 1 mL of 2,4-dinitrophenylhydrazine TS, then heat for 5 minutes on a steam bath; orange-red precipitates are formed.

Optical rotation $[\alpha]_D^{20}$: Between +41.0 and +43.0° (5 g, ethanol(95), 50 mL, 100 mm).

Melting point Between 177 and 182 ºC.

Purity (1) ***Water*—**Add 10 mL of carbon disulfide to 1.0 g of *d*-Camphor and shake to mix; the solution exhibits no turbidity.

(2) ***Chlorine compound*—**Weigh about 0.20 g of *d*-Camphor in powder form, transfer to a dried porcelain crucible, add 0.4 g of sodium peroxide and comply decompose by slowly heating over a burner. Dissolve the residue in 20 mL of hot water, acidify by adding 12 mL of dilute nitric acid, filter in a Nessler tube, wash 3 times with 5 mL of hot water each time, combine the filtrate and washings, cool and add water to make 50 mL, add 1 mL of nitric acid TS, shake well to mix, and allow to stand for 5 minutes; the turbidity of the solution is not more intense than that of the following control solution.

Control solution—Proceed in the same manner as for the test solution using 0.20 mL of 0.01 mol/L hydrochloric acid.

(3) ***Non-volatile residue*—**Sublimate 2.0 g of *d*-Camphor by heating on a steam bath, then dry for 3 hours at 105 ℃; the amount of residue is NMT 1.0 mg.

Assay Weigh accurately about 0.1 g each of *d*-Camphor and *d*-camphor RS, add exactly 5 mL of internal standard solution to each, and dissolve in ethanol(99.5) to make 100 mL. Use these solutions as the test solution and the standard solution, respectively. Perform the test with 2 μL each of the test solution and the standard solution as directed under the Gas Chromatography according to the following conditions, and determine the ratios of the peak area of *d*-camphor to that of the internal standard, Q_T and Q_S.

Amount (mg) of *d*-camphor ($C_{10}H_{16}O$)
$= \text{Amount (mg) of } d\text{-camphor RS} \times \frac{Q_T}{Q_S}$

Internal standard solution—A solution of methyl salicylate in ethanol(99.5) (1 in 25).

Operating conditions

Detector: A hydrogen flame ionization detector
Column: A column about 3 mm in internal diameter

and about 3 m in length, packed with diatomaceous earth for gas chromatography, 180 to 250 μm in particle diameter, coated with 20 M polyethylene glycol for gas chromatography at the ratio of 10%.

Column temperature: A constant temperature of about 160 °C.

Carrier gas: Nitrogen

Flow rate: Adjust the flow rate so that the retention time of *d*-camphor is about 6 minutes.

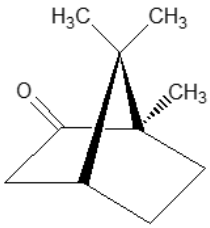
System suitability

System performance: Proceed with 2 μL of the standard solution under the above operating conditions; *d*-camphor and the internal standard are eluted in this order with the resolution being NLT 7.

System repeatability: Repeat the test 6 times with 2 μL of the standard solution under the above operating conditions; the relative standard deviation of the peak area of *d*-camphor to that of the internal standard is NMT 1.0%.

Packaging and storage Preserve in tight containers.

dl-Camphor
dl-캄파



and enantiomer

Synthetic Camphor $C_{10}H_{16}O_3$: 152.24

4,7,7-Trimethylbicyclo[2.2.1]heptan-3-one [*76-22-2*]

dl-Camphor contains NLT 96.0% and NMT 101.0% of *dl*-camphor ($C_{10}H_{16}O$).

Description *dl*-Camphor occurs as colorless or white translucent crystals or a crystalline powder or a mass, with a characteristic aroma, and a slightly bitter and refreshing taste.

It is freely soluble in ethanol(95), ether or carbon disulfide, and slightly soluble in water.

It slowly volatilizes at room temperature.

Identification (1) Dissolve 0.1 g of *dl*-Camphor in 2 mL of methanol, add 1 mL of 2,4-dinitrophenylhydrazine TS, and heat for 5 minutes on a steam bath; orange-red precipitates are formed.

Optical rotation $[\alpha]_D^{20}$: Between -1.5° and +1.5° (5 g, ethanol(95) 50 mL, 100 mm).

Melting point Between 175 and 180 °C.

Purity (1) ***Water***—Add 10 mL of carbon disulfide to 1.0 g of *dl*-Camphor and shake to mix; the solution exhibits no turbidity.

(2) ***Chlorine compound***—Weigh about 0.20 g of *dl*-camphor in powder form, transfer to a dried porcelain crucible, add 0.4 g of sodium peroxide and comply decompose by slowly heating over a burner. Dissolve the residue in 20 mL of hot water, acidify by adding 12 mL of dilute nitric acid, filter in a Nessler tube, wash 3 times with 5 mL of hot water each time, combine the filtrate and washings, cool and add water to make 50 mL, add 1 mL of nitric acid TS, shake well to mix, and allow to stand for 5 minutes; the turbidity of the solution is not more intense than that of the following control solution.

Control solution—Proceed in the same manner as for the test solution using 0.20 mL of 0.01 mol/L hydrochloric acid.

(3) ***Non-volatile residue***—Sublimate 2.0 g of *dl*-Camphor by heating on a steam bath, and dry for 3 hours at 105 °C; the amount of residue is NMT 1.0 mg.

Assay Weigh accurately 0.1 g each of *dl*-Camphor and *dl*-camphor RS, add exactly 5 mL of internal standard solution to each, and dissolve in ethanol(99.5) to make 100 mL. Use these solutions as the test solution and the standard solution, respectively. Proceed with 2 μL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the ratio of the peak area of *dl*-camphor to that of the internal standard Q_T and Q_S.

$$\text{Amount (mg) of } dl\text{-camphor } (C_{10}H_{16}O) = \text{Amount (mg) of } dl\text{-camphor RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of methyl salicylate in ethanol(99.5) (1 in 25).

Operating conditions

Detector: A hydrogen flame ionization detector

Column: A column about 3 mm in internal diameter and about 3 m in length, packed with diatomaceous earth for gas chromatography, 180 to 250 μm in particle diameter, coated with 20 M polyethylene glycol for gas chromatography at the ratio of 10%.

Column temperature: A constant temperature of about 160 °C.

Carrier gas: Nitrogen

Flow rate: Adjust the flow rate so that the retention time of *dl*-camphor is about 6 minutes.

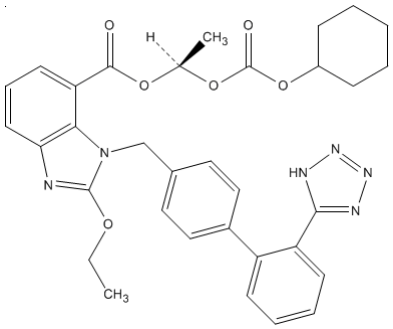
System suitability

System performance: Proceed with 2 μL of the standard solution under the above operating conditions; *dl*-camphor and the internal standard are eluted in this order with the resolution being NLT 7.

System repeatability: Repeat the test 6 times with 2 μL of the standard solution under the above operating conditions; the relative standard deviation of the peak area of *dl*-camphor to that of the internal standard is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Candesartan Cilexetil
칸데사르탄실렉세틸



and enantiomer

$C_{33}H_{34}N_6O_6$: 610.66

1-Cyclohexyloxycarbonyloxyethyl 2-ethoxy-3-[[4-[2-(2*H*-tetrazol-5-yl)phenyl]phenyl]methyl] enzimidazole-4-carboxylate [*145040-37-5*]

Candesartan Cilexetil contains NLT 99.0% and NMT 101.0% of candesartan cilexetil ($C_{33}H_{34}N_6O_6$), calculated on the anhydrous basis.

Description Candesartan Cilexetil occurs as white crystals or a crystalline powder.
It is soluble in acetic acid(100), sparingly soluble in methanol, slightly soluble in ethanol(99.5), and practically insoluble in water.
A solution of Candesartan Cilexetil in methanol (1 in 100) shows no optical rotation.
It shows polymorphism.

Identification (1) Determine the absorption spectra of solutions of Candesartan Cilexetil and Candesartan Cilexetil RS in methanol (1 in 50000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the absorption spectra of Candesartan Cilexetil and Candesartan Cilexetil RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Candesartan Cilexetil according to Method 4 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Related substances***—Dissolve 20 mg of Candesartan Cilexetil in 50 mL of a mixture of acetonitrile and water (3 : 2), and use this solution as the test solution. Take exactly 1 mL of this solution, add a mixture of acetonitrile and water (3 : 2) to make 100 mL, and use this solution as the standard solution. Take exactly 10 μL each of the test solution and the standard solution, and perform the test as directed under the Liquid Chromatography according to the following conditions. Measure the peak area of each solution according to the automatic integration method, and calculate the amount of related substances; the peak area with the relative retention time of about 0.4 and about 2.0 to the candesartan cilexetil in the test solution is not greater than 1/5 times the peak area of candesartan cilexetil in the standard solution, the peak area with the relative retention time of about 0.5 to the candesartan cilexetil in the test solution is not greater than 3/10 times the peak area of candesartan cilexetil in the standard solution, and the peak areas other than the peak of candesartan cilexetil and the peak mentioned above in the test solution are less than 1/10 times the peak area of candesartan cilexetil in the standard solution. In addition, the sum of peak areas other than candesartan cilexetil in the test solution is not greater than 3/5 times the peak area of candesartan cilexetil in the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (4 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: Control the mixing ratio of mobile phase A and mobile phase B stepwise or via the gradient elution as follows.

Mobile phase A: A mixture of acetonitrile, water and acetic acid(100) (57 : 43 : 1).

Mobile phase B: A mixture of acetonitrile, water and acetic acid(100) (90 : 10 : 1).

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 - 30	100 → 0	0 → 100

Flow rate: 0.8 mL/min

System suitability

Test for required detectability: Pipet 2 mL of the standard solution, and add a mixture of acetonitrile and water (3 : 2) to make exactly 20 mL. Confirm that the peak area of candesartan cilexetil obtained from 10 μL of this solution is equivalent to between 7% and 13% of the peak area of candesartan cilexetil obtained from the standard solution.

System performance: Proceed with 10 μL of the

standard solution under the above operating conditions; the number of theoretical plates and the symmetry factor of the peak of candesartan cilexetil are NLT 12000 and NMT 1.5, respectively.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area of candesartan cilexetil is NMT 2.0%.

Time span of measurement: During 30 minutes after injection, which is started after the solvent peak.

Water NMT 0.3% (0.5 g, coulometric titration).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.5 g of Candesartan Cilexetil, dissolve in 60 mL of acetic acid(100), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 61.07 mg of $C_{33}H_{34}N_6O_6$

Packaging and storage Preserve in well-closed containers.

Candesartan Cilexetil Tablets
칸데사르탄실렉세틸 정

Candesartan Cilexetil Tablets contain NMT 95.0% and NLT 105.0% of the labeled amount of candesartan cilexetil ($C_{33}H_{34}N_6O_6$: 610.66).

Method of preparation Prepare as directed under Tablets, with Candesartan Cilexetil.

Identification Weigh a portion of powdered Candesartan Cilexetil Tablets, equivalent to 1 mg of candesartan cilexetil according to the labeled amount, add 50 mL of methanol, shake vigorously to mix for 10 minutes, and then filter. Determine the absorption spectrum of this filtrate as directed under the Ultraviolet-visible Spectroscopy; it exhibits maxima at the wavelength of 252 nm to 256 nm and 302 nm to 307 nm.

Purity ***Related Substances***—Take NLT 10 tablets of Candesartan Cilexetil Tablets, grind them into powder, weigh accurately an amount of this powder, equivalent to 6 mg of candesartan cilexetil according to the labeled amount, add 15 mL of a mixture of acetonitrile and water (3 : 2), shake vigorously to mix for 10 minutes, and centrifuge. Filter the clear supernatant through a membrane filter with a pore diameter of NMT 0.45 μm. Discard the first 3 mL of the filtrate and use the subsequent filtrate as the test solution. Take 1 mL of this solution, add a mixture of acetonitrile and water (3 : 2) to make 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak areas of each solution according to the automatic integration method and calculate the amounts of related substances; the peak area having the relative retention time of about 0.5 to candesartan cilexetil from the test solution is not greater than 1.5 times the peak area of candesartan cilexetil from the standard solution, the peak areas having the relative retention times of about 0.8, about 1.1 and about 1.5 to candesartan cilexetil from the test solution are not greater than 1/2 of the peak area of candesartan cilexetil from the standard solution, respectively, the peak area having the relative retention time of about 2.0 to candesartan cilexetil from the test solution is not larger than the peak area of candesartan cilexetil from the standard solution, the peak areas other than candesartan cilexetil peak, the peak with a relative retention time of about 0.4 to candesartan cilexetil and the above peaks are smaller than 1/10 of the peak area of candesartan cilexetil from the standard solution. Also, the total area of the peaks other than the peak of candesartan cilexetil obtained from the test solution is not larger than 4 times the peak area of candesartan cilexetil obtained from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 3.9 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silical gel for liquid chromatography (4 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: Control the mixing ratio of mobile phase A and mobile phase B stepwise or via the gradient elution as follows.

Mobile phase: A mixture of acetonitrile, water and acetic acid(100) (57 : 43 : 1).

Mobile phase: A mixture of acetonitrile, water and acetic acid(100) (90 : 10 : 1).

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 - 30	100 → 0	0 → 100

Flow rate: 0.8 mL/min

System suitability

Test for required detectability: Pipet 2 mL of the standard solution and add a mixture of acetonitrile and water (3 : 2) to make exactly 20 mL. Confirm that the peak area of candesartan cilexetil obtained from 10 μL of this solution is within the range between 7% and 13% of the peak area of candesartan cilexetil from the standard solution.

System performance: Proceed with 10 μL of the

standard solution under the above conditions; the number of theoretical plates and symmetry factor of the peak of candesartan cilexetil are NLT 12000 and NMT 1.5, respectively.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution under the above operating conditions; the relative standard deviation of the peak areas of candesartan cilexetil is NMT 2.0%.

Time span of measurement: For 30 minutes after injection, beginning after the solvent peak.

Dissolution Perform the test with 1 tablet of Candesartan Cilexetil Tablets at 50 revolutions per minute according to the Method 2 under the Dissolution Test, using 900 mL of polysorbate 20 solution (1 in 100) as the dissolution medium. Take NLT 20 mL of the dissolved solution after 45 minutes from the start of the dissolution test, and filter through a membrane filter with a pore size of NMT 0.45 μm. Discard the first 5 mL of the filtrate, pipet *V mL* of the subsequent filtrate, add water to make *V'* mL so that each mL contains about 2.2 μg of candesartan cilexetil ($C_{33}H_{34}N_6O_6$) according to the labeled amount, and use this solution as the test solution. Separately, weigh accurately about 50 mg of candesartan cilexetil RS (previously determined the water content in the same manner as for Candesartan Cilexetil Tablets), dissolve in acetonitrile to make exactly 50 mL. Take exactly 5 mL of this solution and add acetonitrile to make exactly 50 mL. Take exactly 1 mL of this solution, add the dissolution medium to make exactly 50 mL, and use this solution as the standard solution. Take exactly 50 μL each of the test solution and the standard solution, perform the test as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of candesartan cilexetil for each solution. Meets the requirements if the dissolution rate of Candesartan Cilexetil Tablets in 45 minutes is NLT 75%.

Dissolution rate (%) relative to the labeled amount of candesartan cilexetil ($C_{33}H_{34}N_6O_6$)
= Amount (mg) of candesartan cilexetil RS, calculated on the anhydrous basis

$$\times \frac{A_T}{A_S} \times \frac{V'}{V} \times \frac{1}{C} \times \frac{18}{5}$$

C: Labeled amount (mg) of candesartan cilexetil ($C_{33}H_{34}N_6O_6$) in 1 tablet

Operating conditions

For the detector, column, column temperature, mobile phase and flow rate, proceed as directed in the operating conditions under the Assay.

System suitability

System performance: Proceed with 50 μL of the standard solution under the above operating conditions; the number of theoretical plates and symmetry factor of the peak of candesartan cilexetil are NLT 7000 and NMT 1.5, respectively.

System repeatability: Repeat the test 6 times with 50 μL of the standard solution according to the above operating conditions; the relative standard deviation of the peak areas of candesartan cilexetil is NMT 2.0%.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 tablets of Candesartan Cilexetil Tablets, and powder. Weigh accurately an amount of this powder, equivalent to about 6 mg of candesartan cilexetil ($C_{33}H_{34}N_6O_6$), add exactly 15 mL of internal standard solution, add a mixture of acetonitrile and water (3 : 2) to make 150 mL, shake to mix for 10 minutes, and allow to stand. Filter the clear supernatant through a membrane filter with a pore diameter of not more that 0.45 μm. Discard the first 5 mL of the filtrate and use the subsequent filtrate as the test solution. Separately, weigh accurately about 50 mg of candesartan cilexetil RS (previously determined the water content in the same manner as for candesartan cilexetil), dissolve in acetonitrile to make exactly 50 mL. Take exactly 4 mL of this solution, add exactly 10 mL of the internal standard solution, add a mixture of acetonitrile and water (3 : 2) to make 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions and calculate the ratios, Q_T and Q_S, of the peak area of candesartan cilexetil to that of the internal standard from the test solution and the standard solution, respectively.

Amount (mg) candesartan cilexetil ($C_{33}H_{34}N_6O_6$)
= Amount (mg) of candesartan cilexetil RS, as calculated on the anhydrous basis

$$\times \frac{Q_T}{Q_S} \times \frac{3}{25}$$

Internal standard solution—A solution of acenaphthene in acetonitrile (1 in 800).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless-steel column about 3.9 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (4 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: A mixture of acetonitrile, water and acetic acid(100) (57 : 43 : 1).

Flow rate: Adjust the flow rate so that the retention time of candesartan cilexetil is about 13 minutes.

System suitability

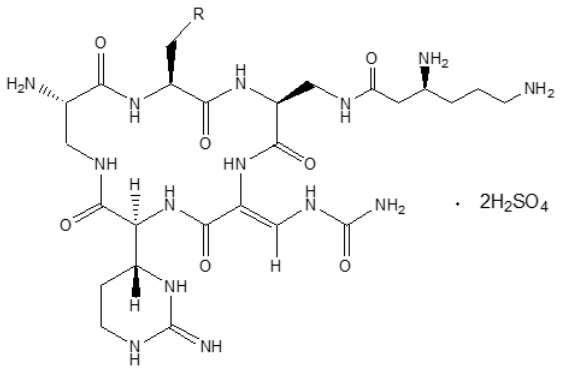
System performance: Proceed with 10 μL of the standard solution under the above conditions; the internal standard and candesartan cilexetil are eluted in this order with the resolution being NLT 5.

System repeatability: Repeat the test 6 times with 10 μL of the standard solution under the above oper-

ating conditions; the relative standard deviation of the peak area ratios of candesartan cilexetil to that of the internal standard is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Capreomycin Sulfate
카프레오마이신황산염



Capreomycin IA R = OH
Capreomycin IB R = H

Capreomycin IA $C_{25}H_{44}N_{44}O_8 \cdot 2H_2SO_4$: 492.87
Capreomycin IB $C_{25}H_{44}N_{44}O_7 \cdot 2H_2SO_4$: 484.87
3,6-Diamino-*N*-({(2*S*,5*S*,11*S*,15*S*,*Z*)-15-amino-2-(hydroxymethyl)-11-[(*R*)-iminohexahydropyrimidin-4-yl]-3,6,9,12,16-pentaoxo-8-(ureidomethylene)-1,4,7,10,13-pentaazacyclohexadecan-5-yl}methyl)hexanamide [*1405-37-4*]

Capreomycin Sulfate contains NLT 700 μg (potency) per mg of capreomycin, calculated on a dried basis.

Description Capreomycin Sulfate occurs as a white to pale yellowish white crystalline powder or a powder.
It is very soluble in water and practically insoluble in ethanol(95), chloroform, or ether.

Identification (1) Weigh an appropriate amount of Capreomycin Sulfate, dissolve in 0.1 mol/L hydrochloric acid TS to make 0.002% solution, and determine the absorption spectra as directed under the Ultraviolet-visible Spectroscopy in the wavelength range of 230 to 350 nm at the layer length of 200 mm; it exhibits a maximum at the wavelength of about 268 nm.

(2) Weigh an appropriate amount of Capreomycin Sulfate, dissolve in 0.1 mol/L sodium hydroxide TS to make 0.002% solution, and determine the absorption spectra as directed under the Ultraviolet-visible Spectroscopy in the wavelength range of 230 to 350 nm; it exhibits a maximum at the wavelength of about 287 nm.

(3) Weigh each of 5 mg (potency) of Capreomycin Sulfate and capreomycin sulfate RS, transfer into the test tube, dissolve in 0.5 mL of hydrochloric acid and 0.5 mL of water, and close the stopper tightly. Warm at 100 ℃ for 16 hours, and evaporate to dryness on a steam bath until there is no smell of hydrogen chloride gas. To each of the residues, dissolve in 1 mL of water, and use these solutions as the test solution and the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot the test solution and the standard solution on the thin-layer chromatographic plate made of cellulose for thin-layer chromatography, and develop the plate with a mixture of 2-propanol, methyl ethyl ketone, and 1 mol/L hydrochloric acid TS (60 : 15 : 25) as the developing solvent. Next, remove the plate, air-dry it in a cold airstream for 15 minutes, warm it at 100 °C for 15 minutes, and cool it. Spray evenly cadmium-ninhydrin TS, and warm at 100 °C for 30 minutes; the R_f values of the spots obtained from the test solution and the standard solution are the same.

(4) An aqueous solution of Capreomycin Sulfate responds to the Qualitative Analysis for sulfate.

Optical rotation $[\alpha]_D^{20}$: Between -26° and -36° (0.3 g, water, 30 mL, 200 mm).

pH Dissolve 3 g (potency) of Capreomycin Sulfate in 100 mL of water; the pH of this solution is between 4.5 and 7.5.

Purity ***Heavy metals***—Proceed with 1.0 g of Capreomycin Sulfate and perform the test according to Method 1. Prepare the control solution with 3.0 mL of lead standard solution (NMT 30 ppm).

Loss on drying NMT 10.0% (0.1 g, 0.7 kPa, 100 ℃, 4 hours).

Residue on ignition NMT 3.0% (1 g, 700 ℃).

Sterility It meets the requirements when used in the manufacturing of sterile preparations. However, it is excluded in cases where there is a terminal sterilization process in the manufacturing of sterile preparations.

Bacterial endotoxins Less than 0.35 EU per mg (potency) of capreomycin when used in the manufacturing of sterile preparations.

Histamine It meets the requirements when used in the manufacturing of sterile preparations under the Histamine. However, weigh an appropriate amount of Capreomycin Sulfate, dissolve in isotonic sodium chloride injection to make a solution containing 3.0 mg (potency) per mL, and use this solution as the test solution.

Capreomycin I Weigh accurately about 0.2 g of Capreomycin Sulfate, transfer it into a 10-mL volumetric flask, and add water exactly to the gauge line. Store the test solution at below 5 °C. Perform the test with the solution as directed under the Paper Chromatography. Use a 300 ×

300 × 600 mm glass vessel for the descending method as the developing chamber. However, fill this glass vessel with a mixture of 1-propanol and water (7 : 3) up to a height of 40 mm from the bottom, and saturate for 2 days. Since the migration rates of capreomycin I and II are influenced by this saturation level, adjust the mixing ratio of the mixture so that the R_f value of capreomycin I is about 0.5, and the R_f value of capreomycin II is about 0.6 after development. Spot 100 μL of the test solution on the 200 × 500 mm or an equivalent Whatman No. 1 filter paper for chromatography, and air-dry with hot air. Separately, develop with the blank test paper using the descending method with a mixture of 1-propanol, water, triethylamine, and acetic acid(100) (75 : 33 : 8 : 8) for 16 hours in the developing chamber, and dry at room temperature for 1 hour. Apply ultraviolet light (wavelength 254 nm) to the dried filter paper; capreomycin I appears at an R_f value of about 0.5, and capreomycin II appears at an R_f value of about 0.6. Mark the region corresponding to the principal spot of the capreomycin, mark the same location in the blank test chromatogram, and then cut out this section. Next, cut each section to be about 1.5 cm^2 in size, transfer it into the 50-mL volumetric flask, and add 0.1 mol/L acetic acid buffer solution (pH 6.2) exactly to the gauge line. Pipet 3.0 mL of this solution, transfer it into the 50-mL volumetric flask, add water exactly to the gauge line, and use this solution as the sample measurement solution. Measure the absorbance of the sample extract and the sample measurement solution at a layer length of 10 mm and a wavelength of 268 nm, respectively, using water as the control solution, and calculate the content of capreomycin I as follows (NLT 90.0% for the total capreomycin). If the content of capreomycin I is NMT 90.0%, perform two more tests, perform the recovery rate test for total capreomycin as follows, and use the average of the results from the three tests as the final result.

$$\text{Content (\%) of capreomycin I} = \frac{A_I - A_b}{A_S} \times 100$$

A_I: Absorbance of the extract from the portion of capreomycin I on the filter paper applied with the sample

A_b: Absorbance of the extract from the portion of capreomycin I on the blank test filter paper applied with the sample

A_S: Absorbance of the sample measurement solution

Recovery rate test of the total capreomycin Spot 100 μL of the test solution on the starting line of the filter paper, dry the filter paper with warm air, cut the spotted area and the area without spotting, again cut each with an area of 1.5 cm^2, and transfer into two 50-mL Erlenmeyer flasks. Perform the test according to the procedure described above, and calculate the total capreomycin recovery rate using the following formula (recovery rate of the total capreomycin 100 ± 2%):

$$\text{Content (\%) of capreomycin I} = \frac{A_T - A_b}{A_S} \times 100$$

A_T: Absorbance of the sample extract solution

A_b: Absorbance of the blank test extract solution

A_S: Absorbance of the sample measurement solution

Assay ***Cylinder plate method*****—**(1) Medium (A) Agar medium for seed and base layer Use the medium in **(A)(2)**(a)②ⓑ under Microbial Assays for Antibiotics.

(2) *Test organism*—Use *Micrococcus luteus* ATCC 9341 as the test organism.

(3) Weigh accurately an appropriate amount of Capreomycin Sulfate, and dissolve in sterile purified water to make a solution containing 8 mg (potency) per mL. Pipet an appropriate amount of this solution, dilute with 0.1 mol/L phosphate buffer solution (pH 8.0) to make solutions containing 800.0 μg and 200.0 μg (potency) per mL, and use these solutions as the high concentration test solution and the low concentration test solution, respectively. Separately, weigh accurately about 80 mg (potency) of capreomycin sulfate RS, and dissolve in sterile purified water to prepare the standard stock solution containing 8 mg (potency) per mL. Store the standard solution at below 5 °C and use it within 7 days. Pipet an appropriate amount of this standard stock solution, dilute with 0.1 mol/L phosphate buffer solution (pH 8.0) to make solutions containing 800.0 μg and 200.0 μg (potency) in 1 mL, and use them as the high concentration standard solution and the low concentration standard solution, respectively. With these solutions, perform the test according to **(A)(8)** under the Microbial Assays for Antibiotics.

Packaging and storage Preserve in tight containers.

Capreomycin Sulfate for Injection
주사용 카프레오마이신황산염

Capreomycin Sulfate for Injection is a preparation for injection, which is dissolved before use. It contains NLT 90.0% and NMT 120.0% of the labeled amount of capreomycin.

Method of preparation Prepare as directed under Injections, with Capreomycin Sulfate.

Description Capreomycin Sulfate for Injection occurs as a white to pale yellowish white powder.

Identification Perform the test according to the Identification (1), (2), and (3) under Capreomycin Sulfate.

pH Dissolve an amount of Capreomycin Sulfate for Injection equivalent to 0.3 mg (potency) of capreomycin in 10 mL of water; the pH of the solution is 4.5 to 7.5.

Purity ***Heavy metals***—Proceed with 1.0 g of Capreomycin Sulfate for Injection according to Method 2 and perform the test. Prepare the control solution with 3.0 mL of lead standard solution (NMT 30 ppm).

Loss on drying NMT 10.0% (0.1 g, 0.7 kPa, 60 ℃, 3 hours).

Residue on ignition NMT 3.0% (1.0 g). Moisten the carbonized residue with 2 mL of nitric acid and 5 drops of sulfuric acid.

Sterility Meets the requirements.

Bacterial endotoxins Less than 0.35 EU per mg (potency) of capreomycin.

Histamine Meets the requirements of the Histamine under Capreomycin Sulfate.

Particulate contamination: Visible particles Meets the requirements.

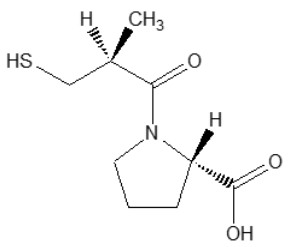
Insoluble particulate matter in injections Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay ***Cylinder plate method***—Perform the test as directed under the Assay under Capreomycin Sulfate. Weigh accurately an appropriate amount of Capreomycin Sulfate for Injection, dissolve it in sterile purified water to prepare a solution containing 8 mg (potency) per mL, pipet an appropriate amount of this solution and add 0.1 mol/L phosphate buffer solution (pH 8.0) to make the concentration of (3). Use this solution as the test solution.

Packaging and storage Preserve in hermetic containers.

Captopril
캅토프릴



$C_9H_{15}NO_3S$: 217.29

(2*S*)-1-[(2*S*)-2-Methyl-3-sulfanylpropanoyl] pyrrolidine-2-carboxylic acid [*62571-86-2*]

Captopril, when dried, contains NLT 97.5% and NMT 102.0% of captopril ($C_9H_{15}NO_3S$).

Description Captopril occurs as white crystals or a crystalline powder.

It is very soluble in methanol, freely soluble in ethanol(99.5) and soluble in water.

Melting point—About 106 °C.

Identification Determine the infrared spectra of Captopril and captopril RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Optical rotation $[\alpha]_D^{20}$: Between -125° and -134° (0.1 g, after drying, ethanol(99.5), 10 mL, 100 mm).

Purity (1) ***Heavy metals***—Proceed with 1.0 g of captopril according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Arsenic***—Prepare the test solution with 1.0 g of Captopril and perform the test according to Method 1 (NMT 2 ppm).

(3) ***Related substances***—Weigh 50.0 mg of captopril, dissolve in methanol to make exactly 25 mL, and use this solution as the test solution (use immediately after preparation). Separately, weigh accurately a suitable amount of captopril disulfide RS, dissolve in methanol so that each mL contains 10 μg, and use this solution as the standard solution. Using 20 μL each of the test solution and the standard solution, perform the test as directed under the Liquid Chromatography according to the following conditions and determine the peak areas A_T and A_S of captopril disulfide for each solution; the amount of captopril disulfide is NMT 1.0%, and the individual peak areas over than those of the solvent, captopril and captopril disulfide are NMT 40% of the major peak area from the standard solution(0.2%), and their total area is not greater than the major peak area of the standard solution (0.5%).

$$\text{Content (\%) of captopril disulfide} = \frac{C_S}{C_U} \times \frac{A_T}{A_S} \times 100$$

C_S: Concentration (μg/mL) of captopril disulfide in the standard solution

C_U: Concentration (μg/mL) of captopril in the test solution

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

Column: A stainless steel column about 3.9 mm in internal diameter and 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (about 5 μm to 10 μm in particle diameter).

Mobile phase: A mixture of methanol solution of tetrahydrofuran (9 in 100) and phosphoric acid solution

(1 in 2000) (33 : 67).

Selection of column: Dissolve captopril RS, captopril disulfide RS and 3-acetylthio-2-methylpropanoic acid RS in methanol so that each solution contains 0.1 mg per mL. Pipet a certain amount of each solution and add methanol so that each solution contains 10 μg per mL. Perform the test using 20 μL of these solutions according to the above conditions; captopril, 3-acetylthio-2-methylpropanoic acid and captopril disulfide are eluted in this order, and the resolution between captopril and 3-acetylthio-2-methylpropanoic acid is NLT 3.0.

Loss on drying NMT 1.0% (1 g, in vacuum, 80 ℃, 3 hours).

Residue on ignition NMT 0.2% (1 g).

Assay Weigh accurately about 0.3 g of Captopril, dissolve in 100 mL of water, add 20 mL of dilute sulfuric acid and 1 g of potassium iodide, shake well to mix, then titrate with 1/60 mol/L potassium iodide VS (indicator: 2 mL of starch TS). Perform a blank test in the same manner and make any necessary correction.

Each mL of 1/60 mol/L potassium iodate VS
= 21.729 mg of $C_9H_{15}NO_3S$

Packaging and storage Preserve in tight containers.

Captopril Tablets
캅토프릴 정

Captopril Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of captopril ($C_9H_{15}NO_3S$: 217.29).

Method of preparation Prepare as directed under Tablets, with Captopril.

Identification Weigh an amount, equivalent to 0.1 g of captopril according to the labeled amount Captopril Tablets, previously powdered, put in an Erlenmeyer flask, add 25 mL of methanol, shake to mix well, and centrifuge. Use the clear supernatant as the test solution. Separately, weigh an appropriate amount of captopril RS, dissolve in methanol to obtain a solution containing 4 mg per mL. Use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 50 μL each of the test solution and the standard solution onto the plate made of silica gel for thin-layer chromatography. Develop the plate with a mixture of toluene, acetic acid(100) methanol (75 : 25 : 1) as the developing solvent to a distance of about 15 cm, and air-dry the plate. Spray a newly prepared mixture of ammonia water(28) and 0.04% of 5,5'-dithio-bis(2-nitrobenzoic acid) methanol solution (1:6) evenly onto the plate; the R_f value of the principal spot obtained from the test solution is the same as that from the standard solution.

Purity ***Captopril Disulfide***—Use the test solution under the Assay. Separately, weigh accurately an appropriate amount of captopril disulfide RS and dissolve in the mobile phase to obtain a solution containing 50 μg per mL. Use this solution as the standard solution. However, Use the test solution and the standard solution within 8 hours of preparation, protected from air. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak area, A_T and A_S, of captopril disulfide in each solution; the amount of captopril disulfide is NMT 3.0%.

$$\text{Content (\%) of captopril disulfide} = \frac{2500C}{W} \times \frac{A_T}{A_S}$$

C: Concentration (mg/mL) of the standard solution
W: Amount (mg) of sample taken

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel (containing 15% CH groups) for liquid chromatography (3 μm to 10 μm in particle diameter).

Mobile phase: A mixture of methanol, water and phosphoric acid (450 : 550 : 0.5).

Flow rate: 1.0 mL/min

System suitability

System performance: Weigh an appropriate amount of captopril RS and captopril disulfide RS and dissolve in the mobile phase to obtain a solution containing 50 μg each per mL. Proceed with 20 μL of this solution as directed under the above operating conditions; captopril and captopril disulfide are eluted in this order with the resolution being NLT 2.0.

System repeatability: Repeat the test 6 times according to the above conditions with 20 μL each of the standard solution; the relative standard deviation of the peak area is NMT 2.0%

Dissolution Perform the test with 1 tablet of Captopril Tablets at 50 revolutions per minute according to Method 1 under the Dissolution, using 900 mL of 0.01 mol/L hydrochloric acid TS as the dissolution medium. Filter the dissolved solution 20 minutes after starting the test. Use the filtrate as the test solution. Separately, weigh accurately an appropriate amount of captopril RS, dissolve in the dissolution medium to make it the same concentration as the test solution. Use this solution as the standard solution. Determine the absorbances of the test solution and the standard solution, respectively, at wavelength of 212 nm as directed under the Ultraviolet-visible

Spectroscopy, using the dissolution medium as the control solution.
Meets the requirements if the dissolution rate of Glimepiride Tablets in 20 minutes is NLT 80%.

Uniformity of dosage units Meets the requirements.

Assay Take NLT 20 tablets of Captopril Tablets, put in an appropriate volumetric flask, add the mobile phase to fill the flask to about half its capacity, and sonicate for 15 minutes. Fill the mobile phase up to the gauge line, shake well with a shaker for 15 minutes, extract, and filter. Take an appropriate amount of the filtrate and add the mobile phase to obtain a solution containing about 1 mg of captopril per mL. Use this solution as the test solution. Separately, weigh an appropriate amount of captopril RS and captopril disulfide RS, dissolve in the mobile phase to obtain a solution containing 1 mg and 50 μ*g* per mL. Use this solution as the standard solution. However, use the test solution and the standard solution within 8 hours of preparation, protected from air. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions, and determine the peak areas, A_T and A_S, of captopril in each solution.

$$\text{Content of captopril } (C_9H_{15}NO_3S) \text{ in 1 mL of test solution (\%)} = C \times \frac{A_T}{A_S}$$

C: Concentration (mg/mL) of the standard solution

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel (containing 15% CH groups) for liquid chromatography (5 μm to 10 μm in particle diameter).

Mobile phase: A mixture of methanol, water and phosphoric acid (450 : 550 : 0.5).

Flow rate: 1.0 mL/min

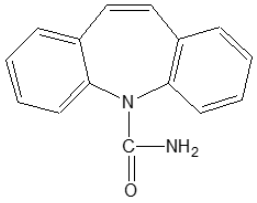
System suitability

System performance: Proceed with 20 μL of the standard solution according to the above operating conditions; captopril and captopril disulfide are eluted in this order with resolution being NLT 2.0.

System repeatability: Repeat the test 6 times according to the above conditions with 20 μL each of the standard solution; the relative standard deviation of the peak area is NMT 2.0%

Packaging and storage Preserve in well-closed containers.

Carbamazepine
카르바마제핀



$C_{15}H_{12}N_2O$: 236.27

2-Azatricyclo[9.4.0.0^{3,8}]pentadeca-1(11),3(8),4,6,9,12,14-heptaene-2-carboxamide [*298-46-4*]

Carbamazepine, when dried, contains NLT 97.0% and NMT 103.0% of carbamazepine ($C_{15}H_{12}N_2O$).

Description Carbamazepine occurs as a white to pale yellow yellowish white powder. It is odorless, and at first, it is tasteless but becomes slightly bitter.
It is freely soluble in chloroform, sparingly soluble in ethanol(95) or acetone, and very slightly soluble in water or ether.

Identification (1) To 0.1 g of Carbamazepine, add 2 mL of nitric acid, and heat on a steam bath for 3 minutes; the resulting solution exhibits a reddish orange color.

(2) To 0.1 g of Carbamazepine, add 2 mL of sulfuric acid, and heat on a steam bath for 3 minutes; the resulting solution exhibits a yellow color and a green fluorescence.

(3) Examine Carbamazepine under ultraviolet light; it exhibits strong blue fluorescence.

(4) Determine the absorption spectra of the solutions of Carbamazepine and Carbamazepine RS in ethanol(95) (1 in 10000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

Melting point Between 189 and 193 ℃.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Carbamazepine in 10 mL of chloroform; the solution is colorless to pale yellow and clear.

(2) ***Acid***—To 2.0 g of Carbamazepine, add exactly 40 mL of water, shake well for 15 minutes to mix, and filter with a glass filter. Pipet 10 mL of the filtrate, and add 1 drop of phenolphthalein TS and 0.50 mL of 0.01 mol/L sodium hydroxide TS; the resulting solution exhibits a red color.

(3) ***Alkali***—Take exactly 10 mL of the filtrate from (2), and add 1 drop of methyl red TS and 0.50 mL of 0.01 mol/L hydrochloric acid VS; the resulting solution exhibits a red color.

(4) ***Chloride***—Dissolve 0.25 g of Carbamazepine in 30 mL of acetone, add 6 mL of dilute nitric acid and water to make 50 mL, use this solution as the test solution,

and perform the test. Prepare the control solution by adding 30 mL of acetone, 6 mL of dilute nitric acid, and water to 0.20 mL of 0.01 mol/L hydrochloric acid to make 50 mL (NMT 0.028%).

(5) ***Heavy metals***—Proceed with 2.0 g of Carbamazepine according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(6) ***Related substances***—Dissolve 0.25 g of Carbamazepine in exactly 10 mL of chloroform and use this solution as the test solution. Separately, dissolve 5.0 mg of iminodibenzyl in chloroform to make exactly 100 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin-layer chromatography. Spot 10 μL each of the test solution and the standard solution on the plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of toluene and methanol (19 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Spray evenly potassium dichromate-sulfuric acid TS on the plate; spots other than the principal spot obtained from the test solution are not more intense than the spot from the standard solution.

Loss on drying NMT 0.5% (1 g, 105 ℃, 2 hours).

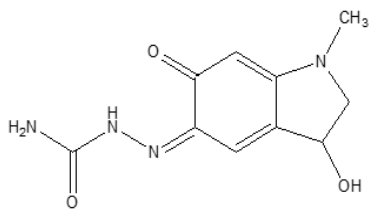
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 50 mg of Carbamazepine, previously dried, and dissolve in ethanol(95) to make exactly 250 mL. Pipet 5 mL of the test solution, and add ethanol(95) to make exactly 100 mL. Perform the test with this solution as directed under the Ultraviolet-visible Spectroscopy, and determine the absorbance, *A* at the absorbance maximum wavelength of about 285 nm.

$$\text{Amount (g) of carbamazepine } (C_{15}H_{12}N_2O) = \frac{A}{490} \times 50000$$

Packaging and storage Preserve in tight containers.

Carbazochrome
카르바조크롬



$C_{10}H_{12}N_4O_3$: 236.23

2-(1,2,3,6-Tetrahydro-3-hydroxy-1-methyl-6-oxo-5*H*-indol-5-ylidene)-hydrazinecarboxamide, [*69-81-8*]

Carbazochrome, when dried, contains NLT 98.0% and NMT 101.0% of carbazochrome ($C_{10}H_{12}N_4O_3$).

Description Carbazochrome occurs as yellowish red to red crystals or a crystalline powder.
It is odorless and has a slightly bitter taste.
It is slightly soluble in acetic acid(100), very slightly soluble in water or ethanol, and practically insoluble in acetic anhydride or ether.

Melting point—About 222 °C (with decomposition).

Identification (1) Dissolve 5 mg of Carbazochrome in 2 mL of sulfuric acid; the resulting solution exhibits an intense green color.

(2) Dissolve 10 mg of Carbazochrome in 2 mL of dilute sulfuric acid (1 in 3); the resulting solution exhibits a yellow color. To this solution, add 0.5 mL of sodium nitrite TS, and shake to mix well; the resulting solution slowly exhibits a reddish brown color.

(3) To 10 mg of Carbazochrome, add 1 mL of aniline, and boil carefully by heating; the gas produced turns moistened red litmus paper blue.

(4) Weigh 2 mg of Carbazochrome, previously dried at 105 ℃ for 5 hours, and determine the infrared absorption spectrum as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; it exhibits absorption at the wavenumbers of about 3350, 1690, 1560, and 1050 cm^{-1}.

Absorbance $E_{1cm}^{1\%}$ (354 nm): Between 1054 and 1130 (after drying, 5 mg, water, 1000 mL).

Purity (1) ***Chloride***—To 1.2 g of Carbazochrome, add 80 mL of water, dissolve by shaking for 5 minutes, and filter. Take 20 mL of the filtrate, add 6 mL of dilute nitric acid, 1 mL of silver nitrate TS and water to make 50 mL, and use this solution as the test solution. Separately, to 20 mL of the filtrate, add 6 mL of dilute nitric acid and 1 mL of silver nitrate TS, allow to stand for 10 minutes, and repeat the filtration process until the solution becomes clear. Wash the residue with 5 mL of water 4 times, combine the filtrate and the washings, add 0.35 mL of 0.01 mol/L hydrochloric acid and water to make 50 mL, and use this solution as the control solution. With the test solution and the control solution, allow to stand for 5 minutes, avoiding direct sunlight, and compare the colors against a black background; the turbidity of the test solution is not more intense than that of the control solution (NMT 0.041%).

(2) ***Heavy metals***—Proceed with 1.0 g of Carbazochrome according to Method 2 and perform the test. Prepare the control solution with 3.0 mL of lead standard solution (NMT 30 ppm).

(3) ***Iron***—Weigh 0.5 g of Carbazochrome, ignite, and prepare the test solution with this residue according to Method 1 under the Iron. Separately, take 3.0 mL of iron standard solution, proceed in the same manner to prepare the control solution, and perform the test according to Method A under the Iron.

(4) ***Arsenic***—Prepare the test solution with 1.0 g of

Carbazochrome according to Method 3 and perform the test (NMT 2 ppm).

Loss on drying NMT 1.0% (1 g, 105 ℃, 5 hours).

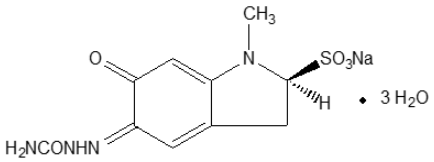
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.3 g of Carbazochrome, previously dried, dissolve in 30 mL of acetic acid(100) for non-aqueous titration by warming, and add 120 mL of acetic anhydride. After cooling, titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 23.623 mg of $C_{10}H_{12}N_4O_3$

Packaging and storage Preserve in tight containers.

Carbazochrome Sodium Sulfonate Hydrate
카르바조크롬설폰산나트륨수화물



and enantiomer

Carbazochrome Sodium Sulfonate
$C_{10}H_{11}N_4NaO_5S \cdot 3H_2O$: 376.32
Sodium (5*Z*)-5-(carbamoylhydrazono)-1-methyl-6-oxo-2,3,5,6-tetrahydro-1H-indole-2-sulfonate hydrate

Carbazochrome Sodium Sulfonate Hydrate contains NLT 98.0% and NMT 102.0% of carbazochrome sodium sulfonate ($C_{10}H_{11}N_4NaO_5S$: 322.27), calculated on the anhydrous basis.

Description Carbazochrome Sodium Sulfonate Hydrate occurs as orange yellow crystals or a crystalline powder.
It is sparingly soluble in water, very slightly soluble in ethanol(95), and practically insoluble in ether.
An aqueous solution of Carbazochrome Sodium Sulfonate Hydrate (1 in 100) shows no optical rotation.

Melting point—About 210 °C (with decomposition).

Identification (1) Determine the absorption spectra of aqueous solutions of Carbazochrome Sodium Sulfonate Hydrate and carbazochrome sodium sulfonate hydrate RS (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelength.

(2) Determine the infrared spectra of Carbazochrome Sodium Sulfonate Hydrate and carbazochrome sodium sulfonate hydrate RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) An aqueous solution of Carbazochrome Sodium Sulfonate Hydrate (1 in 100) responds to the Qualitative Analysis (1) for sodium salt.

pH Dissolve 0.8 g of Carbazochrome Sodium Sulfonate Hydrate in 50 mL of water by warming, and cool; the pH of the solution is between 5.0 and 6.0.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Carbazochrome Sodium Sulfonate Hydrate in 50 mL of water by warming, and allow to stand for cooling; the solution is clear. Perform the test with this solution as directed under the Ultraviolet-visible Spectroscopy; the absorbance at 590 nm is NMT 0.070.

(2) ***Heavy metals***—Proceed with 1.0 g of Carbazochrome Sodium Sulfonate Hydrate according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Related substances***—Dissolve 50 mg of Carbazochrome Sodium Sulfonate Hydrate in 100 mL of water, and use this solution as the test solution. Pipet 2 mL of this solution, add water to make exactly 200 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak area obtained from each solution according to the automatic integration method; the sum of peak areas other than the major peak for the test solution is not larger than the peak area of the major peak for the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 360 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 to 10 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: Dissolve 1.2 g of ammonium dihydrogen phosphate in 1000 mL of water, take 925 mL of this solution, add 75 mL of ethanol(95), and shake to mix. Add phosphoric acid to adjust the pH to 3.

Flow rate: Adjust the flow rate so that the retention time of carbazochrome sulfonate is 6 to 8 minutes.

System suitability

Detection sensitivity: Adjust the sensitivity so that the peak height of carbazochrome sulfonate from 10 μL of the standard solution is about 5% of the full scale.

Test for required detectability: Pipet 2 mL of the standard solution and add the mobile phase to make exactly 20 mL. Confirm that the peak area of carbazochrome sulfonate obtained from 10 μL of this solution is equivalent to NLT 7% and NMT 13% of the peak area of carbazochrome sulfonate obtained from the standard solution.

System performance: Dissolve 10 mg each of Carbazochrome Sodium Sulfonate Hydrate and carbazochrome in 100 mL of water. Proceed with 10 μL of this solution according to the above conditions; carbazochrome sulfonate and carbazochrome are eluted in this order with the resolution being NLT 3.

Time span of measurement: About 3 times the retention time of carbazochrome sulfonate after the solvent peak.

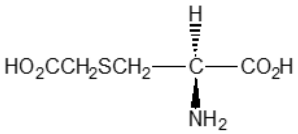
Water Between 13.0% and 16.0% (0.3 g, volumetric titration, direct titration).

Assay Weigh accurately about 0.25 g of Carbazochrome Sodium Sulfonate Hydrate, dissolve in 50 mL of water, transfer into a chromatography column 10 mm in diameter, previously made with 20 mL of strongly acidic ion exchange resin for column chromatography (H type), and elute at the flow rate of about 4 mL per minute. Next, wash the chromatography column with 150 mL of water, combine with the previous eluate, and titrate it with 0.05 mol/L sodium hydroxide VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.05 mol/L sodium hydroxide VS
= 16.114 mg of $C_{10}H_{11}N_4NaO_5S \cdot 3H_2O$

Packaging and storage Preserve in well-closed containers.

Carbocisteine
카르보시스테인



S-Carboxymethyl-L-cysteine

$C_5H_9NO_4S$: 179.19

(2*R*)-2-Amino-3-carboxymethyl sulfanylpropanoic acid *[638-23-3]*

Carbocisteine, when dried, contains NLT 98.5% and NMT 101.0% of carbocisteine ($C_5H_9NO_4S$).

Description Carbocisteine occurs as a white crystalline powder.
It is odorless and has a slightly sour taste.
It is very slightly soluble in water and practically insoluble in ethanol(95).
It dissolves in dilute hydrochloric acid or sodium hydroxide TS.

Melting point—About 186 °C (with decomposition).

Identification (1) To 0.2 g of Carbocisteine, add 1 mL of lead acetate TS and 3 mL of water, shake to mix, add 0.2 g of sodium hydroxide, and heat in direct fire for 1 minute; a dark brown to black precipitate forms.

(2) Determine the infrared spectra of Carbocisteine and carbocisteine RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Optical rotation $[\alpha]_D^{20}$: Between -33.5° and -36.5°. Weigh accurately 5 g of Carbocisteine, previously dried, dissolve in 20 mL of water and sodium hydroxide solution (13 in 100), add 1 mol/L hydrochloric acid TS and 0.1 mol/L hydrochloric acid TS to adjust pH to 6.0, and add water to make exactly 50 mL. Use this solution for measurement at the layer length of 100 mm.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Carbocisteine in 10 mL of sodium hydroxide TS; the resulting solution is colorless and clear.

(2) ***Chloride***—Dissolve 0.20 g of Carbocisteine in 10 mL of water and 20 mL of nitric acid, and add water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution by adding 0.40 mL of 0.01 mol/L hydrochloric acid VS, 20 mL of nitric acid, and water to make 50 mL (NMT 0.071%).

(3) ***Ammonium***—Perform the test with 0.25 g of Carbocisteine. Prepare the control solution with 5.0 mL of ammonium standard solution (NMT 0.02%). However, perform the test as directed under the vacuum distillation.

(4) ***Heavy metals***—Mix 2.0 g of Carbocisteine and 0.5 g of magnesium oxide, and carbonize. After cooling, ignite at NMT 800 °C for 1 hour to incinerate. After cooling, dissolve the residue in 5 mL of a mixture of hydrochloric acid and water (1 : 1). Add 0.1 mL of phenolphthalein TS, and add an ammonia water(28) dropwise until the color of the solution turns pale red. After cooling, add acetic acid(100) until the color disappears, and add another 0.5 mL. Filter and wash, if necessary. Add water to make 20 mL, and use this solution as the test solution. Separately, proceed in the same manner as the preparation of the test solution using 2.0 mL of lead standard solution instead of Carbocisteine. To 10 mL of this solution, add 2 mL of the test solution, and use this solution as the control solution. Separately, add 2 mL of the test solution to 10 mL of water, and use this solution as the blank test solution. To 12 mL each of the test solution, the control solution, and the blank test solution, add 2 mL of pH 3.5 acetate buffer solution, mix, add 1.2 mL of thioacetamide TS, and mix immediately. Allow to stand for 2 minutes; the color of the test solution is not more intense than that of the control solution (NMT 10 ppm).

System suitability—The control solution shows a faint brown color compared to the blank test solution. Also, to the test solution, add 2.0 mL of lead standard solution. To 10 mL of this solution, add 2 mL of the test solution, and use this solution as the system suitability

solution. The system suitability solution is more intense than or has the same intensity as the control solution.

(5) ***Arsenic***—Prepare the test solution with 1.0 g of Carbocisteine, according to Method 3, and perform the test (NMT 2 ppm).

(6) ***Related substances***—Dissolve 0.30 g of Carbocisteine in 10 mL of 0.2 mol/L sodium hydroxide TS, and use this solution as the test solution. Pipet 2 mL of this solution, and add 0.2 mol/L sodium hydroxide TS to make exactly 100 mL. Pipet 1 mL of this solution, add 0.2 mol/L sodium hydroxide TS to make exactly 10 mL, and use it as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography in the starting line with a length of 15 mm. Next, develop the plate with a mixture of 1-butanol, water, and acetic acid(100) (3 : 1 : 1) as the developing solvent to a distance of about 10 cm, and dry the plate at 80 °C for 30 minutes. Spray evenly a solution of ninhydrin in acetone (1 in 50) on the plate and heat at 80 °C for 5 minutes; the spots other than the principal spot obtained from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 0.3% (1 g, 105 °C, 2 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.25 g of Carbocisteine, previously dried, dissolve in exactly 20 mL of 0.1 mol/L perchloric acid, and add 50 mL of acetic acid(100), and titrate the excess perchloric acid with 0.1 mol/L sodium acetate VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 17.919 mg of $C_5H_9NO_4S$

Packaging and storage Preserve in tight containers.

Carbocisteine Capsules
카르보시스테인 캡슐

Carbocisteine Capsules contain NLT 95.0% and NMT 105.0% of the labeled amount of carbocisteine ($C_5H_9NO_4S$: 179.20).

Method of preparation Prepared as directed under Capsules, with Carbocisteine.

Identification (1) Suspend an amount of Carbocisteine Capsules equivalent to 0.1 g of carbocisteine according to the labeled amount in 2 mL of water, add 1% ninhydrin solution, and heat; it exhibits a purple color.

(2) Dissolve 30 mg of carbocisteine in Carbocisteine Capsules in 10 mL of water while shaking, filter this solution, and use the filtrate as the test solution. Weigh 30 mg of carbocisteine RS, dissolve in water, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot the test solution and the standard solution on a thin-layer chromatographic plate made using silica gel for thin-layer chromatography. Develop the plate with a mixture of n-butanol, water and acetic acid(100) (3 : 1 : 1) as the developing solvent, and air-dry the plate. Spray Ninhydrin TS on the plate; the colors and the Rf values obtained from the test solution and the standard solution are the same.

Dissolution Perform the test with 1 capsule of Carbocisteine Capsules at 100 revolutions per minutes using a sinker according to Method 2 under the Dissolution, using 900 mL of water containing 0.5% sodium lauryl sulfate as the dissolution medium. Take the dissolved solution 60 minutes after starting the test, and filter. Use this solution as the test solution. Separately, weigh accurately about 20 mg of carbocisteine RS, dissolve in the dissolution solution to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of carbocisteine ($C_5H_9NO_4S$) in each solution. Meets the requirements if the amount dissolved of Carbocisteine Capsules in 60 minutes is NLT 80%.

Dissolution rate (%) of the labeled amount of Carbocisteine Capsules ($C_5H_9NO_4S$)
$$= \text{Amount (mg) of carbocisteine RS} \times \frac{A_T}{A_S} \times \frac{1}{C} \times 900$$

C: Labeled amount (mg) of carbocisteine ($C_{15}H_{15}NO_4$) in 1 tablet

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with 5 μm octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: phosphate buffer solution: acetonitrile (9 : 1).

Flow rate: 1.0 mL/min

System suitability

System repeatability: Repeat the test 6 times with 20 μL of the standard solution according to the above operating conditions; the relative standard deviation of the peak area for carbocisteine is NMT 2.0%.

Phosphate buffer solution—Dissolve 23 g of phosphoric acid and 1.5 g of heptanesulfonate in water to make 1000 mL.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the contents of NLT 20 capsules of Carbocisteine Capsules, and weigh accurately an amount equivalent to about 0.4 g of carbocisteine ($C_5H_9NO_4S$). Add a small amount of ammonia water to make it alkaline, dissolve it with the mobile phase to make 100 mL, and use this solution as the test solution. Separately, weigh accurately about 200 mg of carbocisteine RS, dissolve it with the mobile phase to make exactly 50.0 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of carbocisteine in each solution.

Amount (mg) of carbocisteine ($C_5H_9NO_4S$)
= Amount (mg) of carbocisteine RS × (A_T /A_S) × 2

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.0 mm in internal diameter and about 30 cm in length, packed with aminosilyl silica gel for liquid chromatography (5 to 10 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: A mixture of acetonitrile and 0.05 mol/L potassium phosphate buffer solution (pH 4.5) (65 : 35).

Flow rate: 2 mL/min

Packaging and storage Preserve in tight containers.

Carbocisteine Syrup
카르보시스테인 시럽

Carbocisteine Syrup contains NLT 95.0% and NMT 105.0% of the labeled amount of carbocisteine ($C_5H_9NO_4S$: 179.20).

Method of preparation Prepare as directed under Syrups, with Carbocisteine.

Identification Take 5 mL of Carbocisteine Syrup, place in a test tube, and add 1% ninhydrin solution; the solution exhibits a violet color.

pH Between 5.0 and 7.0.

Uniformity of dosage units (distribution) Meets the requirements.

Assay Pipet an amount of Carbocisteine Syrup equivalent to 0.4 g of carbocisteine ($C_5H_9NO_4S$: 179.20) according to the labeled amount, alkalify by adding a small amount of ammonia water, and dissolve in the mobile phase to make exactly 100.0 mL. Use this solution as the test solution. Separately, weigh accurately about 200 mg of carbocisteine RS, dissolve in the mobile phase to make exactly 50.0 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of carbocisteine from each solution.

Amount (mg) of carbocisteine ($C_5H_9NO_4S$)
= Amount (mg) of carbocisteine RS × A_T /A_S × 2

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.0 mm in internal diameter and about 30 cm in length, packed with aminosilanized silica gel for liquid chromatography (5 μm to 10 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: A mixture of acetonitrile and 0.05 mol/L phosphate buffer solution (pH 4.5) (65 : 35).

Flow rate: 2 mL/min

Packaging and storage Preserve in tight containers.

Carbon Dioxide
이산화탄소

Carbonic Acid Gas CO_2 : 44.01
Carbon dioxide [*124-38-9*]

Carbon Dioxide contains NLT 99.5 vol% and NMT 101.0 vol% carbon dioxide (CO_2).

Description Carbon Dioxide occurs as a colorless and odorless gas at room temperature and under atmospheric pressure.
1 mL of Carbon Dioxide is soluble in 1 mL of water and is weakly acidic.
1000 mL of Carbon Dioxide is about 1.978 g at 0 °C and 101.3 kPa.

Identification (1) Put a flaming wood splinter into Carbon Dioxide; the flame is extinguished immediately.

(2) Pass Carbon Dioxide through potassium hydroxide TS; white precipitates are formed. Separately take the precipitates and add acetic acid to the precipitates; the precipitates are dissolved as bubbles are formed.

Purity The amount of Carbon Dioxide is taken after maintaining the container at between 18 and 22 ℃ 6 hours before performing the test, and converted to the volume at the pressure of 101.3 kPa at 20 ℃.

(1) ***Acid*—**Transfer 50 mL of freshly boiled and cooled water to a Nessler tube, position the top end of the gas injection tube with a diameter of about 1 mm at 2 mm from the bottom of the tube, pass 1000 mL of Carbon Dioxide over 15 minutes, and add 0.10 mL methyl orange TS; the red color of the resulting solution is not more intense than that of the following control solution.

Control solution—Transfer 50 mL of freshly boiled and cooled water to a Nessler tube and add 0.10 mL of methyl orange TS and 1.0 mL of 0.01 mol/L hydrochloric acid.

(2) ***Hydrogen phosphide, hydrogen sulfide and organic reducing substances*—**To 2 Nessler tubes A and B, add 25 mL of silver nitrate and ammonia TS and 3 mL of ammonia TS, respectively, and use these solutions as solution A and solution B. Pass 1000 mL of Carbon Dioxide through the solution A using the method of (1); the turbidity or staining of the solution A is the same as that of the solution B.

(3) ***Carbon monoxide*—**Take 5.0 mL of Carbon Dioxide directly from a pressure-resistant metal hermetic container with a pressure-reducing plug using a polyvinyl chloride injection tube in a gas measuring tube for gas chromatography or syringe, and perform the test with this solution as directed under the Gas Chromatography according to the following conditions; no peaks appear at the elution position of carbon monoxide.

Operating conditions

Detector: Thermal conductivity detector

Column: A column about 3 mm in internal diameter and about 3 m in length, packed with zeolite for gas chromatography (300 μm to 500 μm in particle diameter, pore diameter 0.5 nm).

Column temperature: A constant temperature of about 50 °C.

Carrier gas: Hydrogen or helium

Flow rate: Adjust the flow rate so that the retention time of carbon monoxide is about 20 minutes.

System suitability

Detection sensitivity: Adjust the sensitivity so that the peak height of carbon monoxide obtained from 5.0 mL of the mixed gas used in system performance is about 10 cm.

System performance: To a gas mixer, add 0.1 mL of carbon monoxide and 0.1 mL of air, add the carrier gas to make 100 mL, and shake to mix well. Proceed with 5.0 mL of the mixed gas according to the above conditions; oxygen, nitrogen and carbon monoxide are eluted in this order, and the individual peaks are completely separated.

(4) ***Oxygen and nitrogen*—**Take 1.0 mL of Carbon Dioxide directly from a pressure-resistant metal hermetic container with a pressure-reducing plug using a polyvinyl chloride collection tube into a gas measuring tube for gas chromatography or syringe and perform the test with this solution as directed under the Gas Chromatography according to the following conditions to determine the peak area A_T of air. Separately, take 0.50 mL of nitrogen in a gas mixer, add the carrier gas to make the total volume to exactly 100 mL, mix well, and use the mixed gas as the standard gas mixture. Proceed with 1.0 mL of the gas in the same manner as for Carbon Dioxide and determine the peak area A_S of nitrogen; A_T is not larger than A_S. Also, additional peaks do not appear.

Operating conditions

Detector: Thermal conductivity detector

Column: A column about 3 mm in internal diameter and about 3 m in length, packed with silica gel for gas chromatography (300 μm to 500 μm in particle diameter).

Column temperature: A constant temperature of about 50 °C.

Carrier gas: Hydrogen or helium

Flow rate: Adjust the flow rate so that the retention time of nitrogen is about 2 minutes.

System suitability

Detection sensitivity: Adjust the sensitivity so that the peak height of nitrogen obtained from 1.0 mL of the standard gas mixture is about 50% of full scale.

System performance: Take 0.5 mL of nitrogen in a gas mixer, add Carbon Dioxide to make 100 mL, and mix well. Proceed with 1.0 mL of the mixed gas according to the above conditions; nitrogen and carbon dioxide are eluted in this order, and the individual peaks are completely separated.

(5) ***Nitrogen monoxide*—**Proceed in the same manner as for (6) Nitrogen dioxide, passing 550 ± 50 mL of Carbon Dioxide in the form of vapor through a nitrogen monoxide-nitrogen dioxide detector tube at a constant rate, and determine the amount of nitrogen monoxide; it is NMT 2.5 ppm.

(6) ***Nitrogen dioxide*—**Connect a tube with a sufficient length to a container so that all liquid-phase contents are vaporized passing through the tube when opening the valve of the container, and prevent the inlet tube connected to the detector tube from frosting. Through the tube (previously replace the air in the apparatus with Carbon Dioxide) pass 550 ± 50 mL of Carbon Dioxide in the form of vapor through a nitrogen monoxide-nitrogen dioxide detector tube at an appropriate constant rate, and determine the amount of nitrogen dioxide; it is NMT 2.5 ppm. However, to prevent contamination, connect the gas volumetric apparatus to the bottom end of the detector tube for measurement.

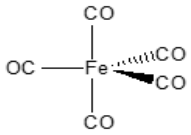
(7) ***Sulfur dioxide*—**Proceed in the same manner as for (6) Nitrogen dioxide, pass 1050 ± 50 mL of Carbon Dioxide in the form of vapor through a sulfur dioxide detector tube at an constant rate, and determine the amount of sulfur dioxide; it is NMT 5 ppm.

Assay Take a sample of Carbon Dioxide as directed under the Purity. Add 125 mL of potassium hydroxide solution (1 in 2) to a gas pipet of appropriate capacity. Next, take accurately about 100 mL of Carbon Dioxide in an about 100 mL of gas buret filled with water, transfer to a gas pipet, and mix by shaking for 5 minutes. Repeat this procedure, occasionally transferring the unabsorbed remaining gas to the gas buret and measuring the volume. When the volume of unabsorbed remaining gas becomes a constant mass, measure the volume, and use this volume as *V* (mL). Convert the amount collected of *V* to the volume at the pressure of 101.3 kPa at 20 ℃.

Amount (mL) of carbon dioxide (CO_2)
= Converted amount (mL) of amount of sample taken
− converted value (mL) of *V*

Packaging and storage Preserve in pressure-resistant metal hermetic containers at NMT 40 ℃.

Carbonyliron
카르보닐철



C_5FeO_5: 195.90

Pentacarbonyliron, [*73479-38-6*]

Carbonyliron is produced by thermally decomposing pentacarbonyliron, which is manufactured by carbonylating iron, to make fine iron.

Carbonyliron contains NLT 98.0% and NMT 101.0% of iron (Fe: 55.85).

Description Carbonyliron occurs as a light gray powder with micro-particles.
It is odorless and tasteless.
It is insoluble in water, acetone, chloroform and ether.
It is soluble in hot dilute hydrochloric acid or dilute nitric acid.
Average particle diameter: NMT 7 μm.

Identification (1) Transfer 0.5 g of Carbonyliron into a beaker, add 20 mL of dilute hydrochloric acid, dissolve on a steam bath until the solution becomes clear, and mix 50 mL of water. To this solution, add 1 mol/L sodium hydroxide TS; a grayish green gel-like precipitate forms, and when sodium sulfide solution is added, the color of the precipitate turns black.

(2) Transfer 0.5 g of Carbonyliron into a beaker, add 20 mL of dilute hydrochloric acid, dissolve on a steam bath until the solution becomes clear, and mix 50 mL of water. To this solution, add dropwise a solution of 1,10-phenanthroline in ethanol (1 in 50); the resulting solution exhibits an intense red color.

(3) To 50 mg of Carbonyliron, add 25 mL of 6 mol/L hydrochloric acid, warm on a steam bath to dissolve, and add water to make 100 mL. Take 5 mL of this solution, add water to make 100 mL, take 10 mL of this solution, and add 3 mL of 1,10-phenanthroline solution. Add 100 mL of water to make 100 mL. After allowing this solution to stand for 10 minutes, determine the absorption spectrum of this solution as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum between 507 nm and 511 nm.

Density Between 2 g/cm^3 and 3 g/cm^3.

Particle size distribution Pass 10 g of Carbonyliron through a sieve; it passes entirely through a No. 200 sieve and remains on a No. 330 sieve in an amount of NMT 5% of the total quantity.

Acid insolubles To 1 g of Carbonyliron, add 25 mL of dilute sulfuric acid, and dissolve by boiling for 5 minutes while shaking. Filter the insolubles using filter paper for quantitative analysis, wash the residue with water until it is not turbid when nitric acid solution is added, and dry the residue with the filter paper at 105 ℃ for 1 hour; the amount of residue is NMT 12.5 mg (NMT 1.25%).

Purity (1) ***Lead***—Proceed with 1.0 g of Carbonyliron and perform the test according to the Lead under the General tests of the United States Pharmacopeia (USP) (NMT 5 ppm).

(2) ***Mercury***—Proceed with 1.0 g of Carbonyliron and perform the test according to Method 2 under the Mercury of General tests of the United States Pharmacopeia (USP) (NMT 2 ppm).

(3) ***Arsenic***—Proceed with 0.75 g of Carbonyliron and perform the test according to Method 2 under the Arsenic of General tests of the United States Pharmacopeia (USP). (NMT 4 ppm).

Assay Weigh accurately about 0.5 g of Carbonyliron, add 50 mL of dilute sulfuric acid, heat on a steam bath to make a clear solution, and cool. Take 10.0 mL of this solution, add 20 mL of water, and titrate with 0.1 mol/L cerium(IV) tetraammonium sulfate VS (indicator: 2 drops of 1,10-phenanthroline TS). The endpoint of the titration is when the reddish orange color of the solution turns to yellowish green. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L cerium (IV) tetraammonium sulfate VS
= 5.585 mg of Fe

Packaging and storage Preserve in tight containers.

Carbonyliron Tablets
카르보닐철 정

Carbonyliron Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of iron (Fe: 55.85)

Method of preparation Prepare as directed under Tablets, with Carbonyliron.

Identification (1) Weigh an amount of Carbonyliron Tablets, equivalent to 0.1 g of iron (Fe), add 20 mL of dilute hydrochloric acid, mix, boil for several minutes, cool and filter. With the filtrate, perform the test according to the Identification (1) for Carbonyliron (in the case of coated preparations, remove the coating and perform the test).

(2) Weigh an amount of Carbonyliron Tablets, equivalent to 0.1 g of iron (Fe), add 20 mL of dilute hydrochloric acid, mix, boil for several minutes, cool and filter. With the filtrate, perform the test according to the Identification (2) for Carbonyliron (in the case of coated preparations, remove the coating and perform the test).

(3) Weigh an amount of Carbonyliron Tablets, equivalent to 50 mg of carbonyliron, and perform the test according to the Identification (3) for Carbonyliron (in the case of coated preparations, remove the coating and then perform the test).

Disintegration Meets the requirements.

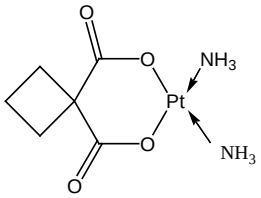
Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 tablets of Carbonyliron Tablets, and powder. Weigh accurately an amount of this powder, equivalent to about 0.1 g of iron (Fe), put it in a 200-mL beaker, add 50 mL of dilute sulfuric acid, heat on a steam bath to make a clear solution, add 20 mL of water, and titrate 0.1 mol/L cerium(IV) tetraammonium sulfate VS (indicator: 3 drops of 1,10-phenanthroline TS). The endpoint of the titration is when the color of the solution changes from reddish orange color to yellowish green. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L cerium(IV) tetraammonium sulfate VS
= 5.585 mg of Fe

Packaging and storage Preserve in tight containers.

Carboplatin
카르보플라틴



$C_6H_{12}N_2O_4Pt$: 371.25

cis-Diammine(cyclobutane-1,1-dicarboxylate-*O*,*O*')platinum(II) [*41575-94-4*]

Carboplatin contains NLT 98.0% and NMT 102.0% of carboplatin ($C_6H_{12}N_2O_4Pt$), calculated on the anhydrous basis.

Description Carboplatin occurs as a white crystalline powder.
It is sparingly soluble in water and very slightly soluble in acetone or ethanol(95).

Melting point—About 200 °C (with decomposition).

Identification Determine the absorption spectra of Carboplatin and carboplatin RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Crystallinity Meets the requirements.

pH Dissolve 0.25 g of Carboplatin in 25 mL of water; the pH of this solution is between 5.0 and 7.0.

Purity (1) ***Clarity and color of solution***—Dissolve 0.1 g of Carboplatin in water to make exactly 10 mL, perform the test with this solution as directed under the Ultraviolet-visible Spectroscopy, and determine the absorbance of the solution at the wavelength of 440 nm, using water as a control solution; it is NLT 97%.

(2) ***Platinum***—Weigh accurately about 0.25 g of Carboplatin, add 400 mL of water, shake occasionally, and dissolve by heating until boiling. After completely dissolving, boil for about 10 minutes, cool as it is for 1 minute, and filter with filter paper. Transfer the filtrate into a 600-mL beaker, wash the filter paper for quantitative analysis with hot water, and combine with the filtrate. Heat this solution to evaporate to about 300 mL, insert a stirring rod, heat to boiling, and slowly drop 10.0 mL of hydrazine monohydrate to the center of the beaker. Add 2 drops of 10 mol/L sodium hydroxide TS, boil for 10 minutes, cool, and coagulate the precipitate. Filter the solution using filter paper for quantitative analysis. Wash the beaker with hot water, filter the washings, and use a small piece of filter paper for quantitative analysis to wipe the beaker and stirring rod. Place all the filter papers in a porcelain crucible, cover it, carbonize by heating

slowly, and ignite at 800 ℃ for 1 hour. After cooling in a silica gel desiccator, weigh, and determine the amount of residue; Carboplatin contains NLT 52.0% and NMT 53.0% of dehydrated carboplatin, calculated on the anhydrous basis.

(3) ***Water-insoluble substances***—Weigh accurately about 1 g of Carboplatin, transfer into a beaker, add 100 mL of water, and dissolve for 30 minutes by stirring. Filter the solution using a glass filter, previously weighed, wash the beaker with water, and filter the washings. Dry the glass filter at 130 ± 10 ℃ to a constant mass; the amount of residue is NMT 0.5%.

(4) ***1,1-Cyclobutanedicarboxylic acid***—Weigh accurately about 50 mg of Carboplatin, dissolve in the mobile phase to make exactly 50 mL, and use this solution as the test solution. Separately, weigh accurately about 50 mg of 1,1-cyclobutanedicarboxylic acid, and dissolve in the mobile phase to make exactly 100 mL. Take 2.0 mL of this solution, add the mobile phase to make exactly 200 mL, and use this solution as the standard solution. Perform the test with 100 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak area of 1,1-cyclobutanedicarboxylic acid, A_T and A_S, according to the automatic integration method; the amount of 1,1-cyclobutanedicarboxylic acid is NMT 0.5%.

$$\text{Content (\%) of 1,1-cyclobutanedicarboxylic acid} = 5\times\frac{C}{W}\times\frac{A_T}{A_S}$$

C: Concentration (μg/mL) of 1,1-cyclobutanedicarboxylic acid in the standard solution

W: Amount (mg) of Carboplatin taken in the test solution

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

Column: A stainless steel column, about 4.0 mm in internal diameter and 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 μm to 10 μm in particle diameter).

Mobile phase: Dissolve 8.5 g of tetrabutylammonium hydrogen sulfate in 80 mL of water, add 3.4 mL of phosphoric acid, and add 10 mol/L sodium hydroxide TS to adjust the pH to 7.55. Transfer 20 mL of this solution into a mixture of 880 mL of water and 100 mL of acetonitrile, and mix.

Flow rate: 2 mL/min

System suitability

System performance: Mix 1.0 mL of the standard solution with 1.0 mL of the standard solution in Assay, and use this solution as the system suitability solution. Proceed with 100 μL of this solution under the above operating conditions; the relative retention times of the carboplatin peak and the 1,1-cyclobutanedicarboxylic acid peak are 0.65 and 1.0, respectively, the resolution between these peaks is NLT 2.5, and the number of theoretical plates obtained from the 1,1-cyclobutanedicarboxylic acid peak is NLT 1500.

System reproducibility: Repeat the test 6 times with each 20 μL of the system suitability solution under the above conditions; the relative standard deviation of the peak area of 1,1-cyclobutanedicarboxylic acid is NMT 10%.

(5) ***Related substances***—Dissolve 0.50 g of Carboplatin in water to make exactly 50 mL, and use this solution as the test solution. Separately, dissolve 25 mg of carboplatin RS in water to make exactly 100 mL, take 1.0 mL of this solution, add 1.0 mL of water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions, and determine the sum of peak areas other than carboplatin and 1,1-cyclobutanedicarboxylic acid from the test solution according to the automatic integration method; it is NMT 2 times the peak area of the carboplatin obtained from the standard solution (0.5%), and each peak area is not larger than the peak area of the carboplatin obtained from the standard solution (0.25%).

Operating conditions

For detector, column, mobile phase, and system suitability, proceed as directed under the operating conditions as directed under the Assay.

Water NMT 0.5% (1 g, anhydrous formamide, volumetric titration, direct titration).

Assay Weigh accurately about 50 mg each of Carboplatin and carboplatin RS, dissolve in water to make exactly 50 mL each, and use these solutions as the test solution and the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions and determine the peak areas A_T and A_S of carboplatin according to the automatic integration method.

$$\text{Amount (mg) of carboplatin } (C_6H_{12}N_2O_4Pt) = \text{Amount (mg) of carboplatin RS}\times\frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 230 nm).

Column: A stainless steel column about 4.0 mm in internal diameter and about 30 cm in length, packed with aminopropylsilyl silica gel for liquid chromatography (3 to 10 μm in particle diameter).

Mobile phase: A mixture of acetonitrile and water (87 : 13).

Flow rate: 2 mL/min

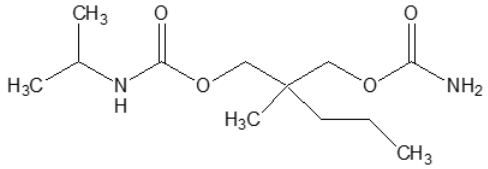
System suitability

System performance: Proceed with 10 μL of the standard solution under the above conditions; the mass distribution ratio for carboplatin is NLT 3.0, the number of theoretical plate for carboplatin is NLT 2500, and the symmetry factor for carboplatin peak is NMT 2.5.

System repeatability: Repeat the test 5 times with 10 μL of the standard solution according to the above conditions; the relative standard deviation of the peak area of carboplatin is NMT 1.2%.

Packaging and storage Preserve in light-resistant, tight containers.

Carisoprodol
카리소프로돌



$C_{12}H_{24}N_2O_4$: 260.33

2-Methyl-2-({[(propan-2-yl)carbamoyl]oxy} methyl)pentyl carbamate [*78-44-4*]

Carisoprodol contains NLT 98.0% and NMT 102.0% of carisoprodol ($C_{12}H_{24}N_2O_4$), calculated on the dried basis.

Description Carisoprodol occurs as a white crystalline powder.
It has a characteristic odor and a bitter taste.
It is freely soluble in ethanol(95), acetone, or chloroform and very slightly soluble in water.

Identification (1) Determine the infrared spectra of Carisoprodol and Carisoprodol RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) Dissolve 0.1 g each of Carisoprodol and Carisoprodol RS in 1.0 mL of chloroform, and use these solutions as the test solution and the standard solution. Perform the test with these solutions according to the Purity under Meprobamate; the R_f values of the principal spots obtained from the test solution and the standard solution are the same.

Melting point Between 91 and 94 ℃.

Purity (1) ***Heavy metals***—Proceed with 2.0 g of Carisoprodol according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Meprobamate***—Weigh 0.1 g of Carisoprodol, dissolve in 1.0 mL of chloroform, and use this solution as the test solution. Separately, weigh 10 mg of meprobamate RS, dissolve in 10 mL of chloroform, and use this solution as the standard solution. Spot 10 μL of the test solution and 5 μL of the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of chloroform and acetone (4 : 1) as the developing solvent to a distance of about 15 cm, and air-dry the plate. Spray evenly antimony(III) chloride TS and a solution of 3% furfural in chloroform alternately on the plate until the black spot appears, and heat at 110 ℃ for 15 minutes; the meprobamate spot obtained from the test solution is not more intense than the spot obtained from the standard solution (NMT 0.5%).

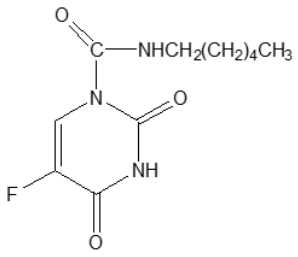
Loss on drying NMT 0.5% (1 g, in vacuum, 60 ℃, 3 hours).

Assay Weigh accurately about 0.4 g of Carisoprodol, add 10 mL of pyridine and 1 drop of phenolphthalein TS, and titrate with 0.1 mol/L sodium methoxide VS until the solution exhibits a pink color. To this solution, add 25.0 mL of 0.1 mol/L sodium methoxide VS, heat under a reflux condenser for 30 minutes, and cool. To this solution, add 40 mL of ethanol(95), and titrate with 0.1 mol/L hydrochloric acid VS (indicator: 7 drops of phenolphthalein TS). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L sodium methoxide VS
= 26.033 mg of $C_{12}H_{24}N_2O_4$

Packaging and storage Preserve in tight containers.

Carmofur
카르모푸르



$C_{11}H_{16}FN_3O_3$: 257.26

5-Fluoro-N-hexyl-2,4-dioxopyrimidine-1-carboxamide [*61422-45-5*]

Carmofur, when dried, contains NLT 98.0% and NMT 101.0% of carmofur ($C_{11}H_{16}FN_3O_3$).

Description Carmofur occurs as a white crystalline powder.
It is very soluble in *N*,*N*-dimethylformamide, freely soluble in acetic acid(100), soluble in ether, sparingly soluble in ethanol(99.5), and practically insoluble in water.

Melting point—About 111 °C (with decomposition).

Identification (1) Proceed with 5 mg of Carmofur as directed under the Oxygen Flask Combustion, using a mixture of 0.5 mL of 0.01 mol/L sodium hydroxide TS and 20 mL of water as an absorbent; the test solution responds to the Qualitative Analysis (2) for fluoride.

(2) Determine the absorption spectra of the solutions of Carmofur and Carmofur RS in a mixture of methanol, and phosphoric acid-acetic acid-boric acid buffer solution (pH 2.0) (9 : 1) (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared spectra of Carmofur and Carmofur RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Purity (1) ***Heavy metals***—Proceed with 2.0 g of Carmofur according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Related substances***—Dissolve 0.20 g of Carmofur in 10 mL of a mixture of methanol and acetic acid(100) (99 : 1), and use this solution as the test solution. Pipet 1 mL of this solution, add a mixture of methanol and acetic acid(100) (99 : 1) to make exactly 500 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin-layer chromatography. Spot 15 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography (fluorescent indicator). Next, develop the plate with a mixture of toluene and acetone (5 : 3) as the developing solvent to a distance of about 12 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot from the test solution are not more intense than the spots from the standard solution. Spray bromine vapor on the plate for 30 seconds, and spray evenly a solution of fluorescein in ethanol(95) (1 in 2500); the spots other than the principal spot obtained from the test solution are not more intense than the spot from the standard solution.

Loss on drying NMT 0.5% (1 g, in vacuum, 50 °C, 3 hours).

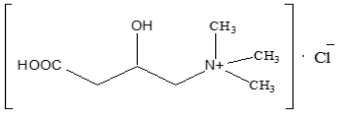
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.5 g of Carmofur, previously dried, dissolve in 20 mL of *N*,*N*-dimethylformamide, and titrate the solution with 0.1 mol/L tetramethylammonium hydroxide-methanol VS (Indicator: 3 drops of thymol blue-dimethylformamide TS). However, the endpoint of the titration is when the yellow of this solution turns bluish green to blue.

Each mL of 0.1 mol/L tetramethylammonium hydroxide-methanol VS
= 25.726 mg of $C_{11}H_{16}FN_3O_3$

Packaging and storage Preserve in tight containers.

DL-Carnitine Hydrochloride
DL-카르니틴염산염



$C_7H_{16}ClNO_3$: 197.66
3-Carboxy-2-hydroxy-*N*,*N*,*N*-trimethyl-1-propanaminium chloride (1:1), [*461-05-2*]

DL-Carnitine Hydrochloride, when dried, contains NLT 98.5% and NMT 101.0% of DL-carnitine hydrochloride ($C_7H_{16}ClNO_3$).

Description DL-Carnitine Hydrochloride occurs as white crystals or a crystalline powder.
It is odorless and has a sour taste.
It is very soluble in water, and practically insoluble in ethanol, acetic acid(100) or ether. DL-Carnitine Hydrochloride is deliquescent.
The pH of an aqueous solution of DL-Carnitine Hydrochloride (1 in 50) is between 2.3 and 2.6.
It has no optical rotation.

Melting point—About 198 °C (with decomposition).

Identification (1) To 3 mL of an aqueous solution of DL-Carnitine Hydrochloride, add 1 mL of Reinecke salt TS; a pale red precipitate forms.

(2) Determine the infrared absorption spectrum of DL-Carnitine Hydrochloride, previously dried, according to the potassium bromide disk method under the Mid-infrared Spectroscopy; it exhibits absorptions at the wavenumber of about 1733, 1486, 1407, 1177 and 1095 cm^{-1}.

(3) An aqueous solution of DL-Carnitine Hydrochloride responds to the Qualitative Analysis for chloride.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of DL-Carnitine Hydrochloride in 10 mL of water; the solution is clear and colorless.

(2) ***Ammonium***—Proceed with 0.3 g of DL-Carnitine Hydrochloride according to the Ammonium and perform the test. Prepare the control solution with 3.0 mL of ammonium standard solution (NMT 0.01%).

(3) ***Heavy metals***—Proceed with 1.0 g of DL-Carnitine Hydrochloride according to Method 4 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(4) ***Arsenic***—Proceed with 2.0 g of DL-Carnitine Hydrochloride according to Method 1 under the Arsenic

(NMT 1 ppm).

(5) ***Related substances***—Dissolve 1.0 g of DL-Carnitine Hydrochloride in 50 mL of mobile phase, and use this solution as the test solution. Pipet 15.0 mL of this solution, add the mobile phase to make 100 mL, and use this solution as the standard solution. Perform the test with 1 μL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak area of each solution as directed in the automatic integration method and calculate the amount of related substances; for the amount of related substances, the total area of peaks other than carnitine is not larger than the area of the carnitine peak in the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 210 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm to 10 μm in particle diameter).

Mobile phase: Dissolve 4.9 g of phosphoric acid and 2.45 g of sodium 1-pentanesulfonate in 1000 mL of water. To this solution, add sodium hydroxide TS to adjust the pH to 2.6.

Flow rate: Adjust the flow rate so that the retention time of carnitine is about 8 minutes.

Selection of column: Dissolve 0.50 g of DL-Carnitine Hydrochloride and 5 mg of L-histidine hydrochloride in 25 mL of the mobile phase. Proceed with 1 μL of this solution according to the operating conditions above; use a column with the resolution being NLT 2.5 between the two peaks.

Detection limit: Adjust the detection limit so that the peak height of DL-carnitine hydrochloride obtained from 1 μL of the standard solution is 6 to 15 mm.

Time span of measurement: About 2 times the retention time of DL-carnitine hydrochloride after the solvent peak.

Loss on drying NMT 1.0% (1 g, 105 °C, 5 hours).

Residue on ignition NMT 0.2% (1 g).

Assay Weigh accurately about 0.3 g of DL-Carnitine Hydrochloride, previously dried, add 20 mL of acetic acid(100), dissolve by warming, and add 140 mL of acetic anhydride. Titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 19.766 mg of $C_7H_{16}ClNO_3$

Packaging and storage Preserve in tight containers.

β-Carotene Suspension 30%
β-카로틴 현탁액30%

β-Carotene Suspension 30% is oil where the microcrystalline β-carotene is dispersed in vegetable oil containing DL-α-tocopherol.

β-Carotene Suspension 30% contains NLT 30.0% of β-carotene ($C_{40}H_{56}$: 536.87).

Composition Each g of β-Carotene Suspension 30% contains 0.3 g of β-carotene, 7 mg of DL-α-tocopherol and 0.693 g of corn oil.

Description β-Carotene Suspension 30% occurs as viscous, reddish brown oil.

Identification Perform the test with β-Carotene Suspension 30% as directed under the Identification under β-Carotene in the US Pharmacopeia.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of β-Carotene Suspension 30% according to Method 2 and perform the test. Prepare the control solution with 1.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Peroxide value***—Perform the test with β-Carotene Suspension 30% as directed under the Peroxide value under General tests in the British Pharmacopoeia; the result is NMT 10 meq/g.

Assay Weigh accurately about 0.167 g of β-Carotene Suspension 30% and perform the test as directed under the Assay under β-Carotene in the US Pharmacopeia.

Packaging and storage Preserve in tight containers, in a cold and dark place.

Caroverine Hydrochloride Injection
카로베린염산염 주사액

Caroverine Hydrochloride Injection contains NLT 95.0% and NMT 105.0% of the labeled amount of caroverine hydrochloride hydrate ($C_{22}H_{27}N_3O_2 \cdot HCl \cdot H_2O$: 419.95).

Method of preparation Prepare as directed under Injections, with Caroverine Hydrochloride Hydrate.

Identification (1) Weigh an amount of Caroverine Hydrochloride Injection, equivalent to 0.1 g of caroverine hydrochloride hydrate, according to the labeled amount, dissolve in 5 mL of 95% ethanol and use this solution as the test solution. Separately, weigh accurately about 0.1 g of caroverine hydrochloride hydrate RS, dissolve in 5 mL of 95% ethanol, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot each of the

test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Then, develop the plate with a mixture of 95% ethanol and 25% ammonia water (95 : 5) as the developing solvent and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm) or spray evenly Dragendorff's TS; the colors and R_f values of the spots obtained from the test solution and the standard solution are the same.

(2) Take 1.0 mL of Caroverine Hydrochloride Injection, add 0.1 mol/L hydrochloric acid, and use this solution as the test solution. Separately, take an appropriate amount of caroverine hydrochloride hydrate RS, add 0.1 mol/L hydrochloric acid to make it the same concentration as the test solution, and use this solution as the standard solution. Determine the absorption spectra of the test solution and the standard solution as directed under the Ultraviolet-visible Spectroscopy using 0.1 mol/L hydrochloric acid as a control solution; both spectra exhibit similar intensities of absorption at the same wavelengths.

Sterility Meets the requirements.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

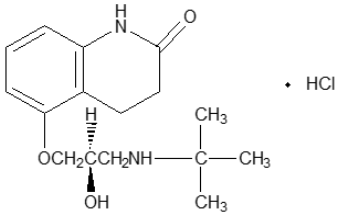
Extractable volume of injections Meets the requirements.

Assay Pipet an amount of Caroverine Hydrochloride Injection, equivalent to 10 mg of caroverine hydrochloride hydrate ($C_{22}H_{27}N_3O_2 \cdot HCl \cdot H_2O$) according to the labeled amount, put into a 100-mL volumetric flask, and add 0.1 mol/L hydrochloric acid TS to make exactly 100 mL. Take 5 mL of this solution, add 0.1 mol/L hydrochloric acid TS to make exactly 50 mL, and use this solution as the test solution. Separately, weigh accurately about 10 mg of caroverine hydrochloride hydrate RS, proceed in the same manner as the test solution, and use this solution as the standard solution. With the test solution and the standard solution, perform the test as directed under the Ultraviolet-visible Spectroscopy using 0.1 mol/L hydrochloric acid TS as a control solution and determine absorbances, A_T and A_S, of caroverine hydrochloride hydrate at 335 nm.

$$\text{Amount (mg) of caroverine hydrochloride hydrate } (C_{22}H_{27}N_3O_2 \cdot HCl \cdot H_2O) = \text{Amount (mg) of caroverine hydrochloride hydrate RS} \times \frac{A_T}{A_S}$$

Packaging and storage Preserve in hermetic containers.

Carteolol Hydrochloride
카르테올롤염산염



and enantiomer

$C_{16}H_{24}N_2O_3 \cdot HCl$: 328.83

5-[3-(*tert*-Butylamino)-2-hydroxypropoxy]-1,2,3,4-tetrahydroquinolin-2-one hydrochloride [*51781-21-6*]

Carteolol Hydrochloride, when dried, contains NLT 99.0% and NMT 101.0% of carteolol hydrochloride ($C_{16}H_{24}N_2O_3 \cdot HCl$).

Description Carteolol Hydrochloride occurs as white crystals or a crystalline powder.

It is soluble in water, sparingly soluble in methanol, very slightly soluble in ethanol(95) or acetic acid(100), and practically insoluble in ether.

An aqueous solution of Carteolol Hydrochloride (1 in 20) exhibits no optical rotation.

Dissolve 1.0 g of Carteolol Hydrochloride in 100 mL of water; the pH of this solution is between 5.0 and 6.0.

Melting point—About 277 °C (with decomposition).

Identification (1) Dissolve 0.1 g of Carteolol Hydrochloride in 5 mL of water, and add 5 drops of Reinecke salt TS; a pale red precipitate forms.

(2) Determine the absorption spectra of aqueous solutions of Carteolol Hydrochloride and carteolol hydrochloride RS solution (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared spectra of Carteolol Hydrochloride and carteolol hydrochloride RS as directed in the potassium chloride disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(4) An aqueous solution of Carteolol Hydrochloride (1 in 50) responds to the Qualitative Analysis for chloride.

pH The pH of an aqueous solution of Carteolol Hydrochloride (1 in 100) is between 5.0 and 6.0.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Carteolol Hydrochloride in 30 mL of water; the solution is colorless and clear.

(2) ***Heavy metals***—Proceed with 2.0 g of Carteolol Hydrochloride according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Arsenic***—Proceed with 1.0 g of Carteolol Hydrochloride according to Method 3 and perform the test (NMT 2 ppm).

(4) ***Related substances***—Dissolve 0.20 g of Carteolol Hydrochloride in 10 mL of methanol, and use this solution as the test solution. Pipet 2 mL of this solution and add methanol to make exactly 100 mL. Pipet 1 mL of this solution, add methanol to make exactly 10 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of chloroform, methanol, and ammonia water(28) (50 : 20 : 1) to a distance of about 12 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot obtained from the test solution are not more intense than the spots obtained from the standard solution.

Loss on drying NMT 0.5% (1 g, 105 °C, 3 hours).

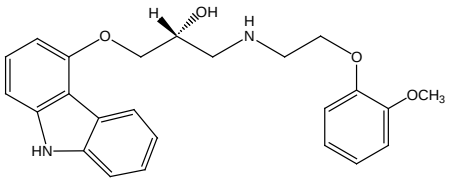
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.5 g of Carteolol Hydrochloride, previously dried, and dissolve in 30 mL of acetic acid(100) by warming on a steam bath. After cooling, add 70 mL of acetic anhydride, and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 32.883 mg of $C_{16}H_{24}N_2O_3 \cdot HCl$

Packaging and storage Preserve in well-closed containers.

Carvedilol
카르베딜롤



and enantiomer

$C_{24}H_{26}N_2O_4$: 406.47

1-(9*H*-Carbazol-4-yloxy)-3-[2-(2-methoxyphenoxy)ethylamino]propan-2-ol [*72956-09-3*]

Carvedilol, when dried, contains NLT 99.0% and NMT 101.0% of carvedilol ($C_{24}H_{26}N_2O_4$).

Description Carvedilol occurs as a white crystalline powder.
It is slightly soluble in ethanol(95), soluble in dichloromethane, and practically insoluble in water.
It shows crystalline polymorphism.

Identification Determine the infrared spectra of Carvedilol and Carvedilol RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers. If there is any difference between the spectra, dissolve Carvedilol and Carvedilol RS each in 2-propanol, evaporate to dryness, and repeat the test with the residue.

Purity (1) ***Heavy metals***—Proceed with 2.0 g of Carvedilol according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Related substances***—Dissolve 25 mg of Carvedilol in the mobile phase to make exactly 25.0 mL, and use this solution as the test solution. To 1.0 mL of the test solution, add the mobile phase to make exactly 100 mL. To 1.0 mL of this solution, add the mobile phase to make exactly 10 mL, and use this solution as the standard solution (1). Separately, dissolve 5 mg of carvedilol related substance I RS {(2*RS*)-1-[Benzyl[2-(2-methoxyphenoxy)ethyl]amino]-3-(9*H*-carbazol-4-yloxy)propan-2-ol} in 5.0 mL of mobile phase, add the mobile phase to make exactly 100 mL, and use this solution as the standard stock solution. Take 4.0 mL of this solution, add the mobile phase to make exactly 100 mL, take 1.0 mL of this solution, and add the mobile phase to make exactly 10 mL. Use this solution as the standard solution (2). Perform the test with 20 μL each of the test solution, the standard solution (1), and the standard solution (2) as directed under the Liquid Chromatography according to the following conditions. To calculate the amount of related substance II, multiply the peak area by 2 as a correction factor. Related substance II obtained from the test solution is not larger than 0.2 times the major peak area obtained from standard solution (1) (0.2%), related substance III obtained from the test solution is not larger than 1.5 times the major peak area obtained from standard solution (1) (0.15%), related substance I is not larger than the peak area of related substance I obtained from standard solution (2) (0.02%), and peak areas of other related substances are not larger than the major peak area obtained from standard solution (1) (0.1%). The sum of the peak areas of related substances other than related substance I obtained from the test solution is not larger than 5 times the major peak area obtained from standard solution (1) (NMT 0.5%). However, exclude any peak having an area smaller than 0.5 times the area of the major peak obtained from the standard solution (1) (NMT 0.05%).

Operating conditions

Detector: An ultraviolet absorption photometer

(wavelength: 240 nm).

Column: A stainless steel column 4.6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 55 °C.

Mobile phase: Dissolve 1.77 g of potassium dihydrogen phosphate in water to make 650 mL, add phosphoric acid to adjust the pH to 2.0, and add 350 mL of acetonitrile to mix.

Flow rate: 1.0 mL/min

Relative retention time: The relative retention time of related substances II, I, and III to the retention time of carvedilol (about 4 minutes) is about 0.5, 2.9, and 3.8, respectively.

System suitability

System performance: Dissolve 5.0 mg of carvedilol related substance I RS {(2*RS*)-1-[Benzyl[2-(2-methoxyphenoxy)ethyl]amino]-3-(9*H*-carbazol-4-yloxy)propan-2-ol} in 5.0 mL of the test solution, add the mobile phase to make exactly 100.0 mL, and proceed with 20 μL of this resulting solution according to the above conditions; the resolution between the carvedilol peak and related substance I peak is NLT 17. Proceed with 20 μL of standard solution (2) according to the above conditions; the signal-to-noise ratio of the related substance I peak is NLT 10.

Time span of measurement: 6 times the retention time of carvedilol.

Loss on drying NMT 0.5% (1 g, 105 ℃, constant mass).

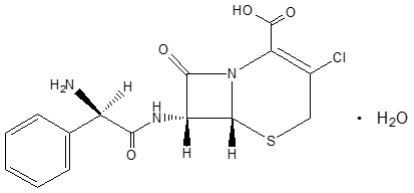
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.35 g of Carvedilol, previously dried, dissolve in 60 mL of acetic acid(100), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Separately, perform a blank test, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 40.649 mg of $C_{24}H_{26}N_2O_4$

Packaging and storage Preserve in light-resistant, well-closed containers.

Cefaclor Hydrate
세파클러수화물



$C_{15}H_{14}ClN_3O_4S \cdot H_2O$: 385.82

(6*R*,7*R*)-7-[[(2*R*)-2-Amino-2-phenylacet]amido]-3-chloro-3,4-didehydrocepham-4-carboxylic acid monohydrate [*70356-03-5*]

Cefaclor Hydrate contains NLT 950 μg (potency) and NMT 1020 μg (potency) of cefaclor ($C_{15}H_{14}ClN_3O_4S$: 367.81) per mg, calculated on the anhydrous basis.

Description Cefaclor Hydrate occurs as a white to yellowish white crystalline powder.
It is odorless or has a slight characteristic odor, and has a slightly bitter taste.
It is soluble in water, sparingly soluble in methanol, very slightly soluble in ethanol(95) and practically insoluble in ether.

Identification (1) Determine the infrared spectra of Cefaclor Hydrate and cefaclor hydrate RS as directed in the paste method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

Crystallinity Meets the requirements.

Optical rotation $[\alpha]_D^{20}$: Between +105° and +120° (0.1 g, calculated on the anhydrous basis, water, 25 mL, 100 mm).

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Cefaclor Hydrate according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Arsenic***—Prepare the test solution by suspending 1.0 g of Cefaclor Hydrate in 10 mL of *N*,*N*-dimethylformamide and perform the test (NMT 2 ppm).

(3) ***Related substances***—Weigh accurately about 50 mg of Cefaclor Hydrate, dissolve in sodium dihydrogen phosphate solution (pH 2.5) to make exactly 10 mL, and use this solution as the test solution. Weigh accurately a suitable amount of cefaclor RS, dissolve in sodium dihydrogen phosphate solution (pH 2.5) to a constant concentration of about 0.05 mg/mL, and use this solution as the standard solution. Perform the test with 20 μL each of the

test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions, determine each peak area from each solution by the automatic integration method, and calculate the amount of each related substance; the amount of each related substance is NMT 0.5% and the total amount of related substances is NMT 2.0%. If necessary, proceed with 20 μL of sodium dihydrogen phosphate solution (pH 2.5) in the same manner as directed above to make a necessary correction.

$$\text{Content (\%) of each related substance} = \frac{C}{W} \times \frac{A_T}{A_S}$$

C: Concentration [μg (potency)/mL] of cefaclor in the standard solution

W: Weight [mg (potency)] of Cefaclor Hydrate taken

A_i: Peak area of each related substance obtained from the test solution

A_S: Peak area of cefaclor obtained from the standard solution

Sodium dihydrogen phosphate solution (pH 2.5)— Dissolve 2.4 g of sodium dihydrogen phosphate monohydrate in 1000 mL of water and adjust the pH to 2.5 with phosphoric acid.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: Control the mixing ratio of mobile phase A and mobile phase B stepwise or via the gradient elution as follows.

Mobile phase A: Dissolve 6.9 g of sodium dihydrogen phosphate monohydrate in 1000 mL of water and adjust the pH to 4.0 with phosphoric acid.

Mobile phase B: A mixture of the mobile phase A and acetonitrile (550 : 450).

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0	95	5
0 - 30	95 → 75	5 → 25
30 - 45	75 → 0	25 → 100
45 - 55	0	100
55 - 60	0 → 95	100 → 5
60 - 70	95	5

Flow rate: 1.0 mL/minute

System suitability

Dissolve a suitable amount of cefaclor delta-3 isomer RS in the standard solution to obtain a solution having a known concentration of about 0.05 mg per mL, and use this solution as the system suitability solution. Proceed with the system suitability solution according to the above conditions; the peak of cefaclor is eluted between 23 minutes and 29 minutes, the resolution between the peaks of cefaclor delta-3 isomer and cefaclor is NLT 2.0, and the symmetry factor of the peak of cefaclor is NMT 1.2.

pH Dissolve 0.25 g of Cefaclor Hydrate in 10 mL of water; the pH of this solution is between 3.0 and 4.5.

Water Between 3.0% and 8.0% (0.2 g, volumetric titration, direct titration).

Assay Weigh accurately 15 mg (potency) each of Cefaclor Hydrate and cefaclor RS, dissolve each in the mobile phase to make exactly 50 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography and determine the peak areas, A_T and A_S, of cefaclor from each solution.

$$\text{Potency (μg) of cefaclor } (C_{15}H_{14}ClN_3O_4S) = \text{Potency (μg) of cefaclor RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 265 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: Dissolve 1.0 g of sodium 1-pentanesulfonate in 780 mL of water, add 10 mL of triethylamine, mix, adjust the pH to 2.5 ± 1 with phosphoric acid, and add 220 mL of methanol.

Flow rate: 1.5 mL/min

System suitability

System performance: Proceed with the system suitability solution according to the above conditions; the relative retention times of cefaclor and cefaclor delta-3 isomer are about 0.8 and about 1.0, respectively, and the resolution between the peaks of cefaclor and cefaclor delta-3 isomer is NLT 2.5, and the symmetry factor of the peak of cefaclor is NMT 1.5.

System repeatability: Repeat the test 5 times with the system suitability solution according to the above conditions; the relative standard deviation of the peak area of cefaclor is NMT 2%.

System suitability solution—Weigh accurately a suitable amount of Cefaclor Hydrate and cefaclor delta-3 isomer RS, and dissolve in the mobile phase to obtain a solution having a known concentration of 0.3 mg per mL.

Packaging and storage Preserve in tight containers.

Cefaclor Capsules
세파클러 캡슐

Cefaclor Capsules contain NLT 90.0% and NMT 120.0% of the labeled amount of cefaclor ($C_{15}H_{14}ClN_3O_4S$: 367.81).

Method of preparation Prepare as directed under Capsules, with Cefaclor Hydrate.

Identification The retention times of the major peaks obtained from the test solution and the standard solution under the Assay are the same.

Water NMT 8.0% (0.2 g, volume titration, direct titration).

Purity ***Related substances***—Weigh accurately the mass of the contents of NLT 20 capsules of Cefaclor Capsules, weigh accurately an amount of the contents, equivalent to about 50 mg (potency) of cefaclor according to the labeled potency, dissolve in sodium dihydrogen phosphate, pH 2.5, and sonicate if necessary. Dilute with sodium dihydrogen phosphate, pH 2.5, to make exactly 10 mL, and use the filtrate as the test solution. Separately, prepare the standard solution as directed under the preparation of the standard solution for related substances under the Purity of cefaclor hydrate, and use this solution as the standard solution. Proceed with 20 μL each of the test solution and the standard solution as directed under the Related substances under the Purity of cefaclor hydrate, and calculate the content (%) of each related substance in each solution (each related substance content: NMT 0.5%, amount of total related substances: NMT 2.0%).

Dissolution Perform the test with 1 capsule of Cefaclor Capsules at 50 revolutions per minute according to Method 2 under the Dissolution, using 900 mL of water as the dissolution medium. Take the dissolved solution 30 minutes after starting the dissolution test, and filter. Discard the first 10 mL of the filtrate and use the subsequent filtrate as the test solution. Separately, weigh accurately about 28 mg (potency) of cefaclor RS, dissolve in water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Assay of Cefaclor Hydrate, and determine the peak areas, A_T and A_S, of cefaclor in each solution. It meets the requirements when the dissolution rate in 30 minutes is NLT 80% (Q).

Dissolution rate (%) of the labeled amount of cefaclor ($C_{15}H_{14}ClN_3O_4S$)

$$= \text{Potency (mg) of cefaclor RS} \times \frac{A_T}{A_S} \times \frac{1}{C} \times 900$$

C: Labeled amount (mg) of cefaclor ($C_{15}H_{14}ClN_3O_4S$) in 1 capsule

Uniformity of dosage units Meets the requirements of the mass variation test.

Assay Weigh accurately the mass of the contents of NLT 20 capsules of Cefaclor Capsules, weigh accurately about 75 mg (potency) of cefaclor according to the labeled potency, add the mobile phase to make exactly 250 mL, and shake well to mix. Then, filter, use the filtrate as the test solution, and perform the test as directed under the Assay of Cefaclor Hydrate.

$$\text{Potency (μg) of cefaclor } (C_{15}H_{14}ClN_3O_4S) = \text{Potency (μg) of cefaclor RS} \times \frac{A_T}{A_S}$$

Packaging and storage Preserve in tight containers.

Cefaclor for Syrup
시럽용 세파클러

Cefaclor for Syrup is a preparation for syrup, which is dissolved before use, and contains NLT 90.0% and NMT 120.0% of the labeled amount of cefaclor ($C_{15}H_{14}ClN_3O_4S$: 367.81).

Method of preparation Prepare as directed under Syrups, with Cefaclor Hydrate.

Identification The retention times of the major peaks obtained from the test solution and the standard solution are the same.

pH Dissolve Cefaclor for Syrup according to the label; the pH of the resulting solution is between 2.5 and 5.0.

Purity ***Related substances***—Weigh accurately an amount of Cefaclor for Syrup, equivalent to 50 mg (potency) of cefaclor according to the labeled amount, add sodium dihydrogen phosphate (pH 2.5) while shaking gently to avoid foaming to make exactly 50 mL, filter, and use the filtrate as the test solution. Use the test solution within 3 hours if stored at room temperature and use it within 20 hours if stored in a refrigerator. Separately, weigh accurately 10 mg (potency) of cefaclor RS, dissolve in sodium dihydrogen phosphate (pH 2.5) to make 20 mL, pipet 1 mL of this solution, and add sodium dihydrogen phosphate (pH 2.5) to make 10 mL so that each mL contains 0.05 mg. Use this solution as the standard solution. Perform the test with each 20 μL of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions and determine the peak area of each so-

lution according to the automatic integration method. Calculate the amount of each related substance according to the following formula; the amount of each related substance is NMT 1.0%, and the total amount of related substances is NMT 3.0%. Exclude any related substances with an amount less than 0.1%.

$$\text{Content (\%) of related substances} = 100 \times \frac{C_S}{C_T} \times \frac{A_i}{A_S}$$

C_S: Concentration [mg (potency)/mL] of cefaclor in the standard solution

C_T: Concentration [mg (potency)/mL] of cefaclor in the test

A_i: Peak area of each related substance from the test solution

A_s: Peak area of cefaclor from the standard solution

Sodium dihydrogen phosphate (pH 2.5)—Dissolve 2.5 g of sodium dihydrogen phosphate monohydrate in 1000 mL of water and adjust the pH to 2.5 with phosphoric acid.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (1.5 μm to 10 μm in particle diameter).

Mobile phase: Control the mixing ratio of mobile phase A and mobile phase B stepwise or via the gradient elution as follows.

Mobile phase A: Dissolve 6.9 g of sodium dihydrogen phosphate monohydrate in 1000 mL of water and adjust the pH to 4.0 with phosphoric acid.

Mobile phase B: A mixture of mobile phase A and acetonitrile (550 : 450).

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0	95	5
0 - 30	95 → 75	5 → 25
30 - 45	75 → 0	25 → 100
45 - 55	0	100
55 - 60	0 → 95	100 → 5
60 - 70	95	5

Flow rate: 1.0 mL/min

System suitability

System performance: Weigh accurately a suitable amount of cefaclor delta-3-isomer, dissolve in the standard solution so that Each mL of the resulting solution contains 0.05 mg, and use this solution as the system suitability solution. Proceed with the system suitability solution according to the above operating conditions; the retention time of the cefaclor peak is between 23 and 29 minutes, the resolution between the peaks of cefaclor delta-3-isomer and cefaclor is NLT 2.0, and the symmetry factor of the cefaclor is NMT 1.2.

Water 2.0% (0.5 g, volumetric titration, direct titration).

Uniformity of dosage units (distribution) Meets the requirements.

Assay Proceed as directed under the Assay under Cefaclor Hydrate. Weigh accurately an amount of Cefaclor for Syrup, equivalent to about 50 mg (potency) according to the labeled potency, dissolve in the mobile phase to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 50 mg (potency) of cefaclor RS, dissolve in the mobile phase to make exactly 100 mL, and use this solution as the standard solution.

Packaging and storage Preserve in tight containers.

Cefaclor Extended-Release Tablets
세파클러 서방정

Cefaclor Extended-Release Tablets contain NLT 90.0% and NMT 120.0% of the labeled amount of cefaclor ($C_{15}H_{14}ClN_3O_4S$: 367.81).

Method of preparation Prepare as directed under Tablets, with Cefaclor Hydrate.

Identification Perform the test as directed under the Assay; the retention time of the major peak in the chromatogram of the test solution corresponds to that in the chromatogram of the standard solution.

Water NMT 6.5% (0.2 g, volumetric titration, direct titration).

Dissolution Perform the test with 1 tablet of Cefaclor Extended-Release Tablets at 100 revolutions per minute according to Method 1 under the Dissolution, using 900 mL of 0.1 mol/L hydrochloric acid TS as the dissolution medium. Take exactly a volume of the dissolved solution after 30 minutes from the start of the test, and carefully add the same volume of the dissolution medium, previously warmed to 37 ± 0.5 °C. Filter the dissolved solution taken through a membrane filter with a pore size not exceeding 0.5 μm, pipet an amount of the filtrate, dilute it with 0.1 mol/L hydrochloric acid TS so that each mL contains about 20 to 30 μg (potency) of cefaclor, and use this solution as the test solution (30 minutes). Repeat this procedure after 60 minutes and after 240 minutes from the start of the test, and use the solutions thus obtained as the test solutions (60 minutes and 240 minutes, respectively). Separately, weigh accurately about 0.11 g (poten-

cy) of cefaclor RS, dissolve in 0.1 mol/L hydrochloric acid TS, dilute with 0.1 mol/L hydrochloric acid TS so that each mL contains about 20 to 30 μg (potency) of cefaclor, and use this solution as the standard solution. Determine the absorbances of the test solutions and the standard solution at 265 nm as directed under the Ultraviolet-visible Spectroscopy, using 0.1 mol/L hydrochloric acid TS as the blank test solution, and calculate the dissolution rate; the acceptable dissolution criterion is 5% to 30% of Cefaclor Extended-Release Tablets dissolved in 30 minutes, 20% to 50% of Cefaclor Extended-Release Tablets dissolved in 60 minutes and NLT 80% of Cefaclor Extended-Release Tablets dissolved in 240 minutes.

Uniformity of dosage units It meets the requirements when the Content uniformity test is performed according to the following procedure. Take 10 tablets of Cefaclor Extended-Release Tablets, dissolve in a volume of methanol equivalent to 25 mL per each tablet, and add the mobile phase so that each mL contains about 1.5 mg (potency) of cefaclor. Pipet 10 mL of this solution, add the internal standard solution to make exactly 50 mL, and use this solution as the test solution. Separately, weigh accurately about 15 mg (potency) of cefaclor RS, dissolve in the internal standard solution to make exactly 50 mL, and use this solution as the standard solution. Perform the test with the test solution and the standard solution as directed under the Assay.

Assay Weigh accurately the mass of NLT 20 tablets of Cefaclor Extended-Release Tablets, and powder. Weigh accurately a portion of the powder, equivalent to about 75 mg (potency) of the labeled potency, dissolve in 150 mL of the internal standard solution, add the mobile phase to make 250 mL, filter, and use the filtrate as the test solution. Separately, weigh accurately about 15 mg (potency) of cefaclor RS, add 30 mL of the internal standard solution, add the mobile phase to make exactly 50 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the peak area ratios, Q_T and Q_S, of cefaclor to the internal standard, respectively.

$$\text{Potency (μg) of cefaclor } (C_{15}H_{14}N_3O_4S) = \text{Potency (μg) of cefaclor RS} \times \frac{Q_T}{Q_S} \times 5$$

Internal standard solution—Dissolve 0.45 g of sodium 2-naphthalenesulfonate in the mobile phase to make 1000 mL.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 265 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 250 mm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: Dissolve 1.0 g of sodium 1-pentanesulfonate in 780 mL of water, add 10 mL of triethylamine, mix, adjust the pH to 2.5 with phosphoric acid, and add 220 mL of methanol.

Flow rate: 1.5 mL/min

Packaging and storage Preserve in tight containers.

Cefaclor Tablets for Oral Suspension
세파클러 현탁용 정

Cefaclor Tablets for Oral Suspension contain NLT 90.0% and NMT 120.0% of the labeled amount of cefaclor ($C_{15}H_{14}ClN_3O_4S$: 367.81).

Method of preparation Prepare as directed under Tablets, with Cefaclor.

Identification The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

Dissolution Perform the test with 1 tablet of Cefaclor Tablets for Oral Suspension at 50 revolutions per minute according to Method 2 under the Dissolution, using 900 mL of 0.1 mol/L hydrochloric acid TS as the dissolution medium. Take exactly a volume of the dissolved solution after 15 minutes from the start of the test, filter through a membrane filter with a pore size not exceeding 0.5 μm, and use 10 mL of the filtrate as the test solution. Separately, weigh accurately about 70 mg (potency) of cefaclor RS, dissolve in 0.1 mol/L hydrochloric acid TS to make 100 mL. To 10 mL of this solution, add 0.1 mol/L hydrochloric acid TS to make 100 mL. Then, to 4 mL of this solution, add 0.1 mol/L hydrochloric acid TS to make 10 mL and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at 265 nm as directed under the Ultraviolet-visible Spectroscopy, and calculate the dissolution rate according to the following equation; the acceptable dissolution criteria is NLT 80% of the labeled potency of Cefaclor Tablets for Oral Suspension dissolved in 15 minutes.

$$\text{Dissolution rate (\%)} = \frac{\text{Potency (mg) of cefaclor RS}}{\text{Labled amount of 1 tablet of Cefaclor Tablets for Oral Suspension}} \times \frac{A_T}{A_S} \times 36$$

Uniformity of dosage units It meets the requirements when tested according to the Mass variation test.

Water NMT 6.5% (0.2 g, volumetric titration, direct

titration).

Assay Weigh accurately the mass of NLT 20 tablets of Cefaclor Tablets for Oral Suspension, and powder. Weigh accurately a portion of the powder, equivalent to about 65 mg (potency) of the labeled potency, and dissolve in the mobile phase to make exactly 100 mL. Pipet 10 mL of this solution, add the mobile phase to make 25 mL, and use this solution as the test solution. Separately, weigh accurately about 65 mg (potency) of cefaclor RS and dissolve in the mobile phase to make exactly 100 mL. Pipet 10 mL of this solution, add the mobile phase to make 25 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the peak areas, A_T and A_S, of cefaclor from the test solution and the standard solution, respectively.

$$\text{Potency (μg) of cefaclor } (C_{15}H_{14}ClN_3O_4S) = \text{Potency (μg) of cefaclor RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 265 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: Dissolve 1.0 g of sodium 1-pentanesulfonate in 780 mL of water, add 10 mL of triethylamine, mix, adjust the pH to 2.5 with phosphoric acid, and add 220 mL of methanol.

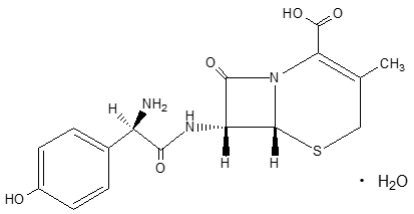
Packaging and storage Preserve in tight containers.

Cefadroxil Hydrate
세파드록실수화물



$C_{16}H_{17}N_3O_5S \cdot H_2O$: 381.40

(6*R*,7*R*)-7-[[(2*R*)-2-amino-2-(4-hydroxyphenyl)acet]amido]-3-methyl-3,4-didehydrocepham-4-carboxylic acid monohydrate [*66592-87-8*]

Cefadroxil Hydrate contains NLT 950 μg and NMT 1020 μg (potency) of cefadroxil ($C_{16}H_{17}N_3O_5S$: 363.39) per mg, calculated on the anhydrous basis.

Description Cefadroxil Hydrate occurs as a white to pale yellowish white powder.

It is sparingly soluble in water, slightly soluble in methanol and very slightly soluble in ethanol(99.5).

Identification (1) Determine the absorption spectra of solutions of Cefadroxil Hydrate and cefadroxil RS (1 in 50000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Cefadroxil Hydrate and cefadroxil RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) Determine the ^1H spectrum of a solution of Cefadroxil Hydrate in a mixture of heavy water for nuclear magnetic resonance spectroscopy and hydrochloric acid for nuclear magnetic resonance spectroscopy (3 : 1) (1 in 10), using sodium 3-(trimethylsilyl)propionic acid-d_4 sodium salt for nuclear magnetic resonance spectroscopy as the internal standard, as directed under the Nuclear Magnetic Resonance Spectroscopy; it exhibits signal A of a single line at about δ 2.1 ppm, signal B of double lines at around δ 7.0 ppm and signal C of double lines at about δ 7.5 ppm, and the integrated intensity ratio of signals A, B and C is 3 : 2 : 2.

Crystallinity Meets the requirements.

Optical rotation $[\alpha]_D^{25}$: Between +164 ° and +182° (0.6 g, calculated on the anhydrous basis, water, 100 mL, 100 mm).

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Cefadroxil Hydrate according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Related substances***—Dissolve 0.1 g of Cefadroxil Hydrate in 4 mL of a mixture of ethanol(99.5), water and diluted hydrochloric acid (1 in 5) (75 : 22: 3) and use this solution as the test solution. Pipet 1 mL of this solution, add a mixture of ethanol(99.5), water and diluted hydrochloric acid (1 in 5) (75 : 22: 3) to make exactly 100 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 2 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel (with a fluorescent indicator) for thin-layer chromatography. Next, develop the plate with a mixture of ethyl acetate, water, ethanol(99.5) and formic acid (14 : 5 : 5 : 1) as the developing solvent to a distance of about 12 cm, and air-dry the plate. Spray evenly ninhydrin-citric acid-acetic acid TS on the plate and heat at 100 °C for 10 minutes; the spots other than the principal spot obtained from the test solution are not more intense than the spots from the standard solution.

(3) ***Dimethylaniline***—Weigh accurately about 1.0 g of Cefadroxil Hydrate, add 5 mL of 1 mol/L sodium hydroxide TS and 1 mL of the internal standard solution, centrifuge, if necessary, and use the clear supernatant as the test solution. Separately, weigh accurately about 50 mg of dimethylaniline, add 2.0 mL of hydrochloric acid, and add water to make 50 mL. Pipet 5.0 mL of this solution and add water to make exactly 250 mL. Pipet 1.0 mL of this solution, add 5.0 mL of 1 mol/L sodium hydroxide TS, add 1.0 mL of the internal standard solution, centrifuge, if necessary, and use the supernatant as the standard solution. Perform the test with 1 μL each of the test solution and the standard solution as directed under the Gas Chromatography according to the following conditions, and calculate the peak area ratio, Q_T and Q_S, of dimethylaniline to the internal standard from the test solution and the standard solution, respectively (NMT 20 ppm).

$$\text{Content (ppm) of dimethylaniline} = \text{Amount (mg) of dimethylaniline taken} \times \frac{Q_T}{Q_S} \times \frac{Purity\ (\%) of\ dimethylaniline}{Amount\ (mg)\ of\ Cefadroxil\ Hydrate\ taken} \times 4$$

Internal standard solution—Dissolve 50.0 mg of naphthalene in cyclohexane to make 50 mL. To 5.0 mL of this solution, add cyclohexane to make 100 mL, and use this solution as the internal standard solution.

Operating conditions

Detector: A flame ionization detector

Column: A column about 2 mm in internal diameter and about 2 m in length, packed with diatomaceous earth for gas chromatography, which is coated with 50% phenyl-50% methylpolysiloxane for gas chromatography, equivalent to 3% of the mass of the diatomaceous earth.

Column temperature: 120 ℃

Temperatures of the sample injection port and the detector: 150 ℃

Carrier gas: Nitrogen

Flow rate: 30 mL/min

pH Dissolve 1.0 g of Cefadroxil Hydrate in 200 mL of water; the pH of this solution is between 4.0 and 6.0.

Water Between 4.2% and 6.0% (0.2 g, volumetric titration, direct titration).

Assay Weigh accurately 50 mg (potency) each of Cefadroxil Hydrate and cefadroxil RS, dissolve each in water to make exactly 500 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with exactly 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculated the peak areas, A_T and A_S, of cefadroxil, respectively, from each solution.

$$\text{Potency (μg) of cefadroxil } (C_{16}H_{17}N3O_5S) = \text{Potency (μg) of cefadroxil RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 262 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 250 mm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: A mixture of a solution of potassium dihydrogen phosphate (17 in 12500) and methanol (17 : 3).

Flow rate: Adjust the flow rate so that the retention time of cefadroxil is about 5 minutes.

System suitability

System performance: Dissolve about 5 mg (potency) of cefadroxil and about 10 mg (potency) of cefatrizine propylene glycol in 50 mL of water. Proceed with 10 μL of this solution according to the above conditions; cefadroxil and cefatrizine propylene glycol are eluted in this order with the resolution between these peaks being NLT 4.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak areas of cefadroxil is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Cefadroxil Capsules
세파드록실 캡슐

Cefadroxil Capsules contain NLT 95.0% and NMT 105.0% of the labeled amount of cefadroxil ($C_{16}H_{17}N_3O_5S$: 363.39).

Method of preparation Prepare as directed under Capsules, with Cefadroxil Hydrate.

Identification Take an amount of Cefadroxil Capsules, equivalent to 10 mg (potency) of cefadroxil according to the labeled amount, add water to make 500 mL, and then filter. Determine the absorption spectrum of the filtrate as directed under the Ultraviolet-visible Spectroscopy; it exhibits maxima between 228 nm and 232 nm and between 261 nm and 265 nm.

Water NMT 7.0% (0.15 g, volumetric titration, direct titration).

Dissolution Perform the test with 1 capsule of Cefadroxil Capsules at 50 revolutions per minute according to Method 2 under the Dissolution, using 900 mL of 0.05 mol/L acetic acid-sodium acetate buffer solution, pH 4.0,

as the dissolution medium. Take 20 mL or more of the dissolved solution 90 minutes after starting the dissolution test, and filter through a membrane filter with a pore size of NMT 0.45 μm. Discard the first 10 mL of the filtrate, pipet *V* mL of the subsequent filtrate, add water to make exactly *V'* mL of a solution containing about 22 μg (potency) of cefadroxil per mL according to the labeled amount, and use this solution as the test solution. Separately, weigh accurately an amount equivalent to about 22 mg (potency) of cefadroxil RS, and dissolve in water to make exactly 100 mL. Pipet 5 mL of this solution, add water to make exactly 50 mL, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution at the wavelength of 263 nm as directed under the Ultraviolet-visible Spectroscopy, using water as a control solution. Meets the requirements if the dissolution rate of Cefadroxil Capsules in 90 minutes is NLT 80%.

Dissolution rate (%) of the labeled amount of cefadroxil ($C_{16}H_{17}N_3O_5S$)

$$= \text{Potency (mg) of cefadroxil RS} \times \frac{A_T}{A_S} \times \frac{V'}{V} \times \frac{1}{C} \times 90$$

C: Labeled amount [mg (potency)] of cefadroxil ($C_{16}H_{17}N_3O_5S$) in 1 capsule

Uniformity of dosage units It meets the requirements when the procedure for content uniformity is performed according to the following procedure. Take 1 capsule of Cefadroxil Capsules, add 300 mL of water, sonicate for 30 minutes to disperse, and then add water to make exactly 500 mL. Pipet 5 mL of this solution, and add water to make a solution containing 0.1 mg (potency) of cefadroxil per mL. Filter, discard the first 10 mL of the filtrate, and use the subsequent filtrate as the test solution. Separately, weigh accurately an amount equivalent to about 20 mg (potency) of cefadroxil RS, add water to make exactly 200 mL, and use this solution as the standard solution. Perform the test as directed under the Assay of Cefadroxil Hydrate.

Assay Weigh accurately the mass of NLT 20 Sodium Chondroitin Sulfate Capsules. Weigh accurately an amount of the contents, equivalent to about 50 mg (potency) of cefadroxil, add 30 mL of water, shake for 30 minutes to mix, and add water to make exactly 500 mL. Then, filter. Discard the first 10 mL of the filtrate and use the subsequent filtrate as the test solution. Separately, weigh accurately about 20 mg (potency) of cefadroxil RS, add water to make exactly 200 mL, and use this solution as the standard solution. Perform the test as directed under the Assay of Cefadroxil Hydrate.

Potency (μg) of cefadroxil ($C_{16}H_{17}N_3O_5S$)

$$= \text{Potency (μg) of cefadroxil RS} \times \frac{A_T}{A_S} \times \frac{5}{2}$$

Packaging and storage Preserve in tight containers.

Cefadroxil for Syrup
시럽용 세파드록실

Cefadroxil for Syrup is a preparation for syrup, which is dissolved before use, and contains NLT 95.0% and NMT 110.0% of the labeled amount of cefadroxil ($C_{16}H_{17}N_3O_5S$: 363.39).

Method of preparation Prepare as directed under Syrups, with Cefadroxil Hydrate.

Identification Weigh an amount of Cefadroxil for Syrup, equivalent to 10 mg (potency) of cefadroxil according to the labeled amount, and dissolve in water to make 500 mL. Determine the absorption spectrum of the solution as directed under the Ultraviolet-visible Spectroscopy; it exhibits maxima between 228 nm and 232 nm and between 261 nm and 265 nm.

pH Dissolve Cefadroxil for Syrup according to the label; the pH of the resulting solution is between 4.5 and 6.0.

Water NMT 2.0% (0.5 g, volumetric titration, direct titration).

Dissolution Weigh accurately an amount of Cefadroxil for Syrup, equivalent to about 0.1 g (potency) of cefadroxil according to the labeled amount, and perform the test at 50 revolutions per minute according to Method 2 under the Dissolution, using 900 mL of water as the dissolution medium (add the sample to be dispersed in the dissolution medium). Take NLT 20 mL of the dissolved solution 15 minutes after starting the test and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard the first 10 mL of the filtrate, take exactly 4 mL of the subsequent filtrate, add water to make exactly 20 mL, and use this solution as the test solution. Separately, weigh accurately 22 mg (potency) of cefadroxil RS and add water to make exactly 100 mL. Pipet 5 mL of this solution, add water to make exactly 50 mL, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution at the wavelength of 263 nm as directed under the Ultraviolet-visible Spectroscopy, using water as a control solution. Meets the requirements if the dissolution rate of Cefadroxil for Syrup in 15 minutes is NLT 85%.

Dissolution rate (%) with respect to the labeled amount of cefadroxil ($C_{16}H_{17}N_3O_5S$)

$$= \frac{Potency\ (mg)\ of\ \text{cefadroxil RS}}{Amount\ (g)\ of\ \text{Cefadroxil for Syrup taken}} \times \frac{A_T}{A_S} \times \frac{1}{C} \times 450$$

C: Labeled amount [mg (potency)]of cefadroxil ($C_{16}H_{17}N_3O_5S$) per g

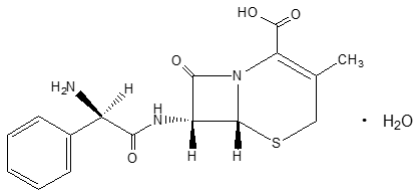
Uniformity of dosage units Meets the requirements.

Assay Weigh accurately an amount of Cefadroxil for Syrup, equivalent to about 50 mg (potency) of cefadroxil according to the labeled amount, dissolve in water to make exactly 500 mL, and use this solution as the test solution. Separately, weigh accurately 20 mg (potency) of cefadroxil RS, add water to make exactly 200 mL, and use the solution as the standard solution. Perform the test with each 10 μL of the test solution and the standard solution as directed under the Assay under Cefadroxil Hydrate.

Potency (μg) of cefadroxil ($C_{16}H_{17}N_3O_5S$)
= Potency (μg) of cefadroxil RS × A_T / A_S × 5 / 2

Packaging and storage Preserve in tight containers.

Cefalexin Hydrate
세팔렉신수화물



$C_{16}H_{17}N_3O_4S \cdot H_2O$: 365.40
(6*R*,7*R*)-7-[(2*R*)-2-Amino-2-phenylacetamido]-3-methyl-3,4-didehydrocepham-4-carboxylic acid monohydrate [*23325-78-2*]

Cefalexin Hydrate contains NLT 950 μg (potency) and NMT 1030 μg (potency) of cefalexin ($C_{16}H_{17}N_3O_4S$: 347.39) per mg, calculated on the anhydrous basis.

Description Cefalexin Hydrate occurs as white to light yellowish white crystals or a crystalline powder.
It is sparingly soluble in water, slightly soluble in methanol and practically insoluble in ethanol(95) or in *N*,*N*-dimethylformamide.
It is hygroscopic.

Identification (1) Determine the absorption spectra of solutions of Cefalexin Hydrate and cefalexin hydrate RS (3 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Cefalexin Hydrate and cefalexin hydrate RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) Determine the ^1H spectrum of a solution of Cefalexin Hydrate in heavy water for nuclear magnetic resonance spectroscopy (1 in 200), using 3-(trimethylsilyl)propanesulfonic acid sodium salt for nuclear magnetic resonance spectroscopy as the internal standard, as directed under the Nuclear Magnetic Resonance Spectroscopy; it exhibits signal A of a single line at around δ 1.8 ppm and signal B of a single line or multiple lines at the tip at around δ 7.5 ppm. The integrated intensity ratio of signals A and B is 3 : 5.

Crystallinity Meets the requirements.

Optical rotation $[\alpha]_D^{20}$: Between +144° and +158° (0.125 g, calculated on the anhydrous basis, water, 25 mL, 100 mm).

pH Dissolve 0.5 g of Cefalexin Hydrate in 10 mL of water; the pH of this solution is between 3.0 and 5.5.

Purity (1) ***Heavy metals***—Proceed with 2.0 g of Cefalexin Hydrate according to Method 4 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Arsenic***—Prepare the test solution by suspending 1.0 g of Cefalexin Hydrate in 10 mL of *N*,*N*-dimethylformamide and perform the test (NMT 2 ppm).

(3) ***Dimethylaniline***—Weigh accurately about 1.0 g of Cefalexin Hydrate, add 5 mL of 1 mol/L sodium hydroxide TS and 1 mL of the internal standard solution, centrifuge, if necessary, and use the clear supernatant as the test solution. Separately, weigh accurately about 50 mg of dimethylaniline, add 2.0 mL of hydrochloric acid, and add water to make 50 mL. Pipet 5.0 mL of this solution and add water to make exactly 250 mL. Pipet 1.0 mL of this solution, add 5.0 mL of 1 mol/L sodium hydroxide TS, add 1.0 mL of the internal standard solution, centrifuge, if necessary, and use the clear supernatant as the standard solution. Perform the test with 1 μL each of the test solution and the standard solution as directed under the Gas Chromatography according to the following conditions, and calculate the peak area ratios, Q_T and Q_S, of dimethylaniline to the peak area of the internal standard from the test solution and the standard solution, respectively (NMT 20 ppm).

$$\text{Content (ppm) of dimethylaniline} = \text{Amount (mg) of dimethylaniline taken} \times \frac{Q_T}{Q_S} \times \frac{Purity\ (\%)\ of\ \text{dimethylaniline}}{Amount\ (\text{mg})\ of\ Cefalexin\ Hydrate\ taken} \times 4$$

Internal standard solution—Dissolve 50.0 mg of naphthalene in cyclohexane to make 50 mL. To 5.0 mL of this solution, add cyclohexane to make 100 mL, and use this solution as the internal standard solution.

Operating conditions

Detector: A flame ionization detector

Column: A column about 2 mm in internal diameter and about 2 m in length, packed with diatomaceous earth

for gas chromatography, which is coated with 50% phenyl-50% methylpolysiloxane for gas chromatography equivalent to 3% of the mass of the diatomaceous earth for gas chromatography.

Column temperature: 120 °C

Temperatures of the sample injection port and the detector: 150 °C

Carrier gas: Nitrogen

Flow rate: 30 mL/min

(4) ***Related substances***—Weigh accurately about 25 mg of Cefalexin Hydrate, dissolve in a solution of potassium dihydrogen phosphate (9 in 500) to make 5 mL, and use this solution as the test solution. Pipet 1 mL of this solution, add a solution of potassium dihydrogen phosphate (9 in 500) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Calculate the peak area from each solution according to the automatic integration method. If necessary, perform the test with 20 μL of the potassium dihydrogen phosphate solution (9 in 500) in the same manner as directed above to correct the variation of the baseline; the area of any peak other than the peak of cefalexin obtained from the test solution is not larger than the peak of cefalexin from the standard solution. Also, the sum of the areas of peaks other than the peak of cefalexin obtained from the test solution that is larger than 1/50 of the peak area of cefalexin obtained from the standard solution is not larger than 5 times the peak area of cefalexin from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: Control the mixing ratio of mobile phase A and mobile phase B stepwise or via the gradient elution as follows.

Mobile phase A: Dissolve 1.0 g of sodium 1-pentanesulfonate in a mixture of 1000 mL of water and 15 mL of triethylamine, and add phosphoric acid to adjust the pH to 2.5.

Mobile phase B: Dissolve 1.0 g of sodium 1-pentanesulfonate in a mixture of 300 mL of water and 15 mL of triethylamine, and add phosphoric acid to adjust the pH to 2.5. To this solution, add 350 mL of acetonitrile and 350 mL of methanol.

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0	100	0
0 - 1	100	0
1 - 34.5	100 → 0	0 → 100
34.5 - 35.5	0	100

Flow rate: 1.0 mL/min

System suitability

Detection sensitivity: Pipet 2 mL of the standard solution and add the potassium dihydrogen phosphate solution (9 in 500) to make exactly 100 mL. Proceed with 20 μL of this solution according to the above conditions; the peak area of cefalexin is equivalent to 1.8% to 2.2% of the peak area of cefalexin obtained from 20 μL of the standard solution.

System performance: Proceed with 20 μL of the standard solution according to the above conditions; the number of theoretical plates and the symmetry factor of the peak of cefalexin are NLT 150000 and between.0.8 and 1.3, respectively.

System repeatability: Repeat the test 3 times with 20 μL each of the standard solutions according to the above conditions; the relative standard deviations of the retention time and the peak area of cefalexin are NMT 2.0%.

Time span of measurement: About 2 times the retention time of cefalexin beginning after the solvent peak.

Water Between 4.0% and 8.0% (0.2 g, volumetric titration, direct titration).

Assay Weigh accurately about 0.1 g (potency) each of Cefalexin Hydrate and cefalexin RS, dissolve each in 0.1 mol/L phosphate buffer solution (pH 4.5), and add water to make exactly 100 mL. Pipet 10 mL each of these solutions, add exactly 5.0 mL each of the internal standard solutions, add 0.1 mol/L phosphate buffer solution (pH 4.5) to make exactly 50 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the peak area ratios, Q_T and Q_S, of cefalexin to that of the internal standard, respectively.

$$\text{Potency (μg) of cefalexin } (C_{16}H_{17}N_3O_4S) = \text{Potency (μg) of cefalexin RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of *m*-hydroxyacetophenone in 0.1 mol/L phosphate buffer solution (pH 4.5) (1 in 1500).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with

octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: Dissolve 6.8 g of potassium dihydrogen phosphate in 1000 mL of water and add diluted phosphoric acid (3 in 500) to adjust the pH to 3.0. To 800 mL of this solution, add 200 mL of methanol.

Flow rate: Adjust the flow rate so that the retention time of cefalexin is about 7 minutes.

System suitability

System performance: Proceed with 10 μL of the standard solution according to the above conditions; cefalexin and the internal standard are eluted in this order with the resolution between these peaks being NLT 6.

System repeatability: Repeat the test 5 times with 10 μL each of the standard solutions according to the above conditions; the relative standard deviation of the peak area ratio of cefalexin to that of the internal standard is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Cefalexin Capsules
세팔렉신 캡슐

Cefalexin Capsules contain NLT 93.0% and NMT 107.0% of the labeled amount of cefalexin ($C_{16}H_{17}N_3O_4S$: 347.39).

Method of preparation Prepare as directed under Capsules, with Cefalexin Hydrate.

Identification Weigh an amount of Cefalexin Capsules, equivalent to 70 mg (potency) of cefalexin, according to the labeled amount, add 25 mL of water, shake vigorously for 5 minutes to mix, and then filter. Pipet 1 mL of the filtrate, and add water to make 100 mL. Determine the absorption spectrum of this solution as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum between 260 nm and 264 nm.

Water NMT 10.0% (0.1 g, volumetric titration, direct titration).

Dissolution Perform the test with 1 capsule of Cefalexin Capsule at 50 revolutions per minute according to Method 2 under the Dissolution, using 900 mL of water as the dissolution medium. Take NLT 20 mL of the dissolved solution 60 minutes after starting the test, and filter through a membrane filter with a pore size of NMT 0.5 μm. Discard the first 10 mL of the filtrate, pipet *V* mL of the subsequent filtrate, add water to make *V'* mL of a solution containing about 22 μg (potency) of cefalexin ($C_{16}H_{17}N_3O_4S$) according to the labeled amount, and use this solution as the test solution. Separately, weigh accurately about 22 mg (potency) of cefalexin RS, and dissolve in water to make exactly 50 mL. Pipet 5 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at the absorbance maximum wavelength at about 262 nm as directed under Ultraviolet-visible Spectrophotometry. It meets the requirements when the dissolution rate of Cefalexin Capsules in 60 minutes is NLT 80%.

Dissolution rate (%) of the labeled amount of cefalexin ($C_{16}H_{17}N_3O_4S$)

$$= \text{Potency (mg) of cefalexin RS} \times \frac{A_T}{A_S} \times \frac{V'}{V} \times \frac{1}{C} \times 90$$

C: Labeled amount (mg) of cefalexin ($C_{16}H_{17}N_3O_4S$) in 1 capsule

Uniformity of dosage units It meets the requirements when the procedure for content uniformity is performed according to the following procedure.

Take 1 capsule of Cefalexin Capsule, add 3*V*/5 mL of 0.1 mol/L phosphate buffer solution (pH 4.5), shake vigorously to mix, then add 0.1 mol/L phosphate buffer solution (pH 4.5) to make exactly *V* mL of a solution containing about 1.25 mg (potency) of cefalexin per mL. Then, centrifuge this solution, pipet 2 mL of the supernatant, add exactly 10 mL of the internal standard solution, and add 0.1 mol/L phosphate buffer solution (pH 4.5) to make exactly 100 mL. Use this solution as the test solution. Separately, weigh accurately about 25 mg (potency) of cefalexin RS, and dissolve in 0.1 mol/L phosphate buffer solution (pH 4.5) to make exactly 100 mL. Pipet 10 mL of this solution, add exactly 10 mL of the internal standard solution, add 0.1 mol/L phosphate buffer solution to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak area ratios, Q_T and Q_S, of cefalexin to the peak area of the internal standard, respectively.

Amount [mg (potency)] of cefalexin ($C_{16}H_{17}N_3O_4S$)

$$= W_S \times \frac{Q_T}{Q_S} \times \frac{V}{20}$$

W_S: Amount [mg (potency)] of cefalexin RS

Assay Weigh accurately the mass of NLT 20 Cefalexin Capsules, weigh accurately an amount equivalent to about 0.1 g of cefalexin, previously powdered, add 60 mL of 0.1 mol/L phosphate buffer solution (pH 4.5), and shake vigorously for 10 minutes. Then, add 0.1 mol/L phosphate buffer solution (pH 4.5) to make exactly 100 mL, and centrifuge. Pipet 2 mL of the supernatant, add exactly 10 mL of the internal standard solution, add 0.1 mol/L phosphate buffer solution (pH 4.5) to make exactly 100 mL, and use this solution as the test solution. Per-

form the test as directed under the Assay of Cefalexin for Syrup.

Packaging and storage Preserve in tight containers.

Cefalexin for Syrup
시럽용 세팔렉신

Cefalexin for Syrup is a preparation for syrup, which is dissolved or suspended before use, and contains NLT 90.0% and NMT 110.0% of the labeled amount of cefalexin ($C_{16}H_{17}N_3O_4S$: 347.39).

Method of preparation Prepare as directed under Syrups, with Cefalexin Hydrate.

Identification Weigh an amount of Cefalexin for Syrup, equivalent to 3 mg (potency) of cefalexin according to the labeled amount, and dissolve in water to make 100 mL. Determine the absorption spectrum of this solution as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum between 260 nm and 264 nm.

pH Dissolve Cefalexin for Syrup according to the label; the pH of the resulting solution is between 3.0 and 6.0.

Water NMT 5.0% (0.4 g, volumetric titration, direct titration).

Uniformity of dosage units (distribution) Perform the procedure for content uniformity according to the following procedure; it meets the requirements. Take the entire content of 1 pack of Cefalexin for Syrup, add 3*V*/5 mL of 0.1 mol/L phosphate buffer solution (pH 4.5), and mix vigorously for 10 minutes. Add 0.1 mol/L phosphate buffer solution (pH 4.5) to make exactly *V* mL of a solution containing about 1 mg (potency) of cefalexin per mL, and centrifuge. Pipet 2 mL of the supernatant, add exactly 10 mL of the internal standard solution, add 0.1 mol/L phosphate buffer solution (pH 4.5) to make 100 mL, and use this solution as the test solution. Proceed as directed under the Assay and perform the test.

Amount [mg (potency)] of cefalexin ($C_{16}H_{17}N_3O_4S$)
$$= W_S \times \frac{Q_T}{Q_S} \times \frac{V}{20}$$

W_S: Amount [mg (potency)] of cefalexin RS

Internal standard solution—A solution of *m*-hydroxyacetophenone in 0.1 mol/L phosphate buffer solution (pH 4.5) (1 in 15000).

Dissolution Weigh accurately an amount of Cefalexin for Syrup, equivalent to about 0.25 g (potency) of cefalexin according to the labeled amount, and perform the test at 50 revolutions per minute according to Method 2, using 900 mL of water as the dissolution medium. Take NLT 20 mL of the dissolved solution 15 minutes after starting the test and filter through a membrane filter with a pore size not exceeding 0.5 μm. Discard the first 10 mL of the filtrate, pipet 2 mL of the subsequent filtrate, add water to make exactly 25 mL, and use this solution as the test solution. Separately, weigh accurately an amount of cefalexin RS, equivalent to about 22 mg (potency), and dissolve in water to make exactly 50 mL. Pipet 5 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution at the absorbance maximum wavelength of around 262 nm, as directed under the Ultraviolet-visible Spectroscopy. It meets the requirements if the dissolution rate of Cefalexin for Syrup in 15 minutes is NLT 80%.

Dissolution rate (%) with respect to the labeled amount cefalexin ($C_{16}H_{17}N_3O_4S$)
$$= \frac{W_S}{W_T} \times \frac{A_T}{A_S} \times \frac{1}{C} \times 1125$$

W_S: Amount [mg (potency)] of cefalexin RS
W_T: Amount (g) of Cefadroxil for Syrup taken
C: Labeled amount [mg (potency)] of cefalexin ($C_{16}H_{17}N_3O_4S$) per g

Assay Powder Cefalexin for Syrup, if necessary, and weigh accurately a portion of the powder, equivalent to about 0.1 g (potency) of cefalexin, add 60 mL of 0.1 mol/L phosphate buffer solution (pH 4.5), and shake vigorously for 10 minutes. Add 0.1 mol/L phosphate buffer solution (pH 4.5) to make exactly 100 mL and centrifuge. Pipet 2 mL of the supernatant, add exactly 10 mL of the internal standard solution, add 0.1 mol/L phosphate buffer solution (pH 4.5) to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 20 mg (potency) of cefalexin RS and add 0.1 mol/L phosphate buffer solution (pH 4.5) to make exactly 100 mL. Take exactly 10 mL of this solution, add exactly 10 mL of the internal standard solution, add 0.1 mol/L of phosphate buffer solution (pH 4.5) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with each 10 μL of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions and determine the ratios, Q_T and Q_S, of the peak area of cefalexin to that of the internal standard.

Potency (μg) of cefalexin ($C_{16}H_{17}N_3O_4S$)
$$= \text{Potency (μg) of cefalexin RS} \times \frac{Q_T}{Q_S} \times 5$$

Internal standard solution—A solution of *m*-hydroxyacetophenone in 0.1 mol/L phosphate buffer solution (pH 4.5) (1 in 15000).

Operating conditions

Detector: An ultraviolet absorption photometer

(wavelength: 254 nm).

Column: A stainless steel column, about 3.0 mm in internal diameter and 75 mm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: Dilution 2.72 g of potassium dihydrogen phosphate in 1000 mL of water and adjust the pH to 3.0 with diluted phosphoric acid (3 in 500). Add 200 mL of methanol to 800 mL of this solution.

Flow rate: Adjust the flow rate so that the retention time of cefalexin is about 6 minutes.

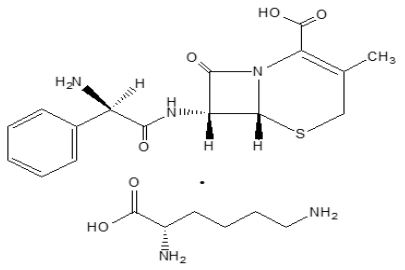
System suitability

System performance: Proceed with 10 μL of the standard solution according to the above operating conditions; cefalexin and the internal standard are eluted in this order, with the resolution being NLT 8.

System repeatability: Repeat the test 6 times with each 10 μL of the standard solution according to the above operating conditions; the relative standard deviation of the ratios of the peaks of cefalexin to that of the internal standard is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Cefalexin Lysinate
세팔렉신리시네이트



$C_{16}H_{17}N_3O_4S \cdot C_6H_{14}N_2O_2$: 493.58

L-Lysine (6*R*,7*R*)-7-[[(2*R*)-2-amino-2-phenylacetyl]amino]-3-methyl-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylate (1:1), [*53950-14-4*]

Cefalexin Lysinate contains NLT 634 μg (potency) and NMT 715 μg (potency) of cefalexin ($C_{16}H_{17}N_3O_4S$: 347.39) per mg.

Description Cefalexin Lysinate occurs as a white to pale yellow crystalline powder.
It is freely soluble in water.

Identification (1) Determine the infrared spectra of Cefalexin Lysinate and cefalexin lysinate RS as directed in the potassium bromide disk method under the Mid-infrared spectroscopy; both spectra exhibit same intensities of absorption at the same wavenumbers.

(2) Weigh a suitable amount each of Cefalexin Lysinate and cefalexin lysinate RS, dissolve each in water to obtain solutions having known concentrations of 20% (potency), and use these solutions as the test solution and the standard solutions, respectively. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of acetonitrile-water (3 : 1) as the developing solvent. Spray evenly ninhydrin TS on the thin-layer chromatographic plate; the R_f values of the spots obtained from the test solution and the standard solution are the same.

Optical rotation $[\alpha]_D^{20}$: Between +98° and +107° (2.5 g, calculated on the anhydrous basis, potassium hydrogen phthalate buffer solution (pH 4.4), 25 mL).

Melting point Between 168 and 174 °C.

pH Dissolve Cefalexin Lysinate in water to obtain a solution having known concentration of 0.1 g/mL. the pH of this solution is between 7.5 and 8.5.

Water NMT 0.8% (1.0 g, volumetric titration, direct titration).

Absorbance $E_{1cm}^{1\%}$ (260 nm): Between 145 and 170 (2 mg, water, 100 mL).

Sterility It meets the requirements when Cefalexin Lysinate is used for manufacturing sterile preparations. However, it is excluded when there is a terminal sterilization process in the manufacturing process of sterile preparations.

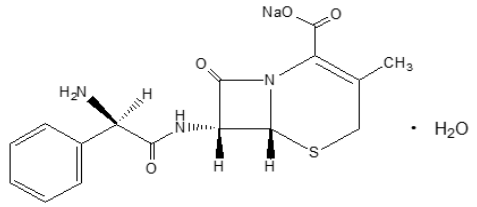
Pyrogen It meets the requirements when Cefalexin Lysinate is used for manufacturing sterile preparations. However, perform the test by injecting 1 mL of a solution prepared by adding physiological saline injection to obtain a solution having known concentration of 7 mg (potency) per mL of Cefalexin Lysinate per kg of the body weight of a rabbit.

Assay Weigh accurately about 0.15 g (potency) of Cefalexin Lysinate, dissolve in water to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 0.15 g (potency) of cefalexin RS, dissolve in water to make exactly 100 mL, and use this solution as the standard solution. Pipet 10 mL each of the test solution and the standard solution, put them into a 100-mL glass-stoppered flask, add 5 mL each of 1 mol/L sodium hydroxide TS, and allow to stand for 20 minutes. Then, add exactly 20 mL of a freshly prepared buffer solution (containing 5.44 w/v%) of sodium acetate and 2.4 w/v% of acetic acid(100)), exactly 5 mL of 1 mol/L hydrochloric acid and exactly 25 mL of 0.01 mol/L io-

dine solution, close the stopper, and allow to stand in the dark for 20 minutes. Titrate the excess iodine with 0.02 mol/L sodium thiosulfate VS (Indicator: 0.2 ~ 0.5 mL of starch solution). Separately, pipet 10 mL each of the test solution and the standard solution, add exactly 20 mL of a freshly prepared buffer solution (containing 5.44 w/v% of sodium acetate and 2.4 w/v% of acetic acid(100)) and exactly 25 mL of 0.01 mol/L iodine solution, and perform a blank test in the same manner as directed above to make any necessary correction.

Packaging and storage Preserve in tight containers.

Cefalexin Sodium Hydrate
세팔렉신나트륨수화물



$C_{16}H_{16}N_3NaO_4S \cdot H_2O$: 387.39

(6*R*,7*R*)-7-[[(2*R*)-2-Amino-2-phenylacetyl]amino]-3-methyl-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid sodium salt (1:1) monohydrate, [*15686-71-2, calculated on the anhydrous basis*]

Cefalexin Sodium Hydrate contains NLT 845 μg (potency) of cefalexin ($C_{16}H_{17}N_3O_4S$: 347.39) per mg, calculated on the anhydrous basis.

Description Cefalexin Sodium Hydrate occurs as a white to almost white crystalline powder and is odorless. It is freely soluble in water.

Identification (1) Determine the infrared spectra of Cefalexin Sodium Hydrate and cefalexin sodium hydrate RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) Cefalexin Sodium Hydrate responds to the Qualitative Analysis 1) for sodium salt.

Crystallinity It meets the requirements as directed under the Crystallinity.

pH Dissolve Cefalexin Sodium Hydrate in water to obtain a solution having known concentration of 10 mg/mL; the pH of this solution is between 7.5 and 10.0.

Water NMT 5.5% (0.2 g, volumetric titration, direct titration).

Sterility It meets the requirements when Cefalexin Sodium Hydrate is used for manufacturing sterile preparations. However, it is excluded when there is a terminal sterilization process in the manufacturing process of sterile preparations.

Pyrogen It meets the requirements when Cefalexin Sodium Hydrate is used for manufacturing sterile preparations. In this case, perform the test by injecting 1 mL of a solution prepared by adding Isotonic Sodium Chloride Injection to obtain a solution having known concentration of 20 mg (potency) per mL of Cefalexin Sodium Hydrate per kg of the body weight of a rabbit.

Assay Weigh accurately about 50 mg (potency) each of Cefalexin Sodium Hydrate and cefalexin sodium hydrate RS and dissolve each in water to make exactly 50 mL. Pipet 5 mL each of these solutions, add 5.0 mL of the internal standard solution and water to make exactly 50 mL and use these solutions as the test solution and the standard solution, respectively. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions and calculate the peak area ratios, Q_T and Q_S, of cefalexin to the peak area of the internal standard, respectively.

$$\text{Potency (μg) of cefalexin } (C_{16}H_{17}N_3O_4S) = \text{Potency (μg) of cefalexin RS} \times (Q_T/Q_S)$$

Internal standard solution—A solution of *m*-hydroxyacetophenone in 0.1 mol/L phosphate buffer solution (pH 4.5) (1 in 1500).

Operating conditions

Detector: An ultraviolet-visible spectrometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 15 to 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 - 10 μm in particle diameter).

Mobile phase: Adjust the pH of 0.05 mol/L potassium dihydrogen phosphate solution to 3.0 with phosphoric acid. To 800 mL of this solution, add 200 mL of methanol.

Packaging and storage Preserve in tight containers.

Cefalexin Sodium for Injection
주사용 세팔렉신나트륨

Cefalexin Sodium for Injection, as an injection that is dissolved upon use, contains NLT 90.0% and NMT 120.0% of the labeled amount of cefalexin ($C_{16}H_{17}N_3O_4S$: 347.39).

Method of preparation Prepare as directed under Injections, with Cefalexin Sodium Hydrate.

Description Cefalexin Sodium for Injection occurs as a white crystalline powder or a powder.

Identification Perform the test as directed under the Identification (1) under Cefalexin Sodium Hydrate.

pH Dissolve Cefalexin Sodium for Injection in water to make 10 mg/mL; the pH of the solution is between 7.5 and 10.0.

Water NMT 5.5% (0.2 g, volumetric titration, direct titration).

Sterility Meets the requirements.

Pyrogen It meets the requirements when performing the test by injecting 1 mL per kg of the body weight of a rabbit as directed under the Pyrogen.

Particulate contamination: Visible particles Meets the requirements.

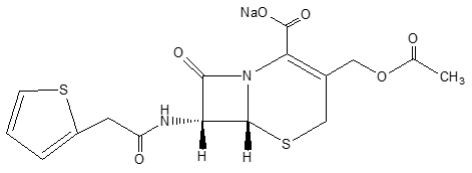
Insoluble particulate matter in injections Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Perform the test as directed under the Assay under Cefalexin Sodium Hydrate. However, weigh accurately about 0.1 g (potency) according to the labeled potency of Cefalexin Sodium for Injection, dissolve in water, add water to make exactly 100 mL, then filter. Pipet 5 mL of the filtrate, add 5 mL of the internal standard solution and water to make exactly 50 mL, and use this solution as the test solution.

Packaging and storage Preserve in hermetic containers.

Cefalotin Sodium
세팔로틴나트륨



$C_{16}H_{15}N_2NaO_6S_2$: 418.42

Sodium (6*R*,7*R*)-7-[2-(thiophen-2yl)acetamido]-3-acetyloxymethyl-3,4-didehydrocepham-4-carboxylate [*58-71-9*]

Cefalotin Sodium contains NLT 920 μg (potency) and NMT 980 μg (potency) of cefalotin ($C_{16}H_{16}N_2O_6S_2$: 396.44) per mg, calculated on the anhydrous basis.

Description Cefalotin Sodium occurs as white to light yellowish white crystals or a crystalline powder.
It is freely soluble in water, slightly soluble in methanol, very slightly soluble in ethanol(95) and practically insoluble in ether.

Identification (1) Determine the absorption spectra of solutions of Cefalotin Sodium and cefalotin sodium RS (1 in 50000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Cefalotin Sodium and cefalotin sodium RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) Determine the ^1H spectrum of a solution of Cefalotin Sodium in heavy water for nuclear magnetic resonance spectroscopy (1 in 10), using 3-(trimethylsilyl)propanesulfonic acid sodium salt for nuclear magnetic resonance spectroscopy as the internal standard, as directed under the Nuclear Magnetic Resonance Spectroscopy; it exhibits signal A of a single line at around δ 2.1 ppm, signal B of a single line or different lines at the tip at around δ 3.9 ppm and signal C of multiple lines at around δ 7.0 ppm. The integrated intensity ratio of signals A, B and C is 3 : 2. : 2.

(4) Cefalotin Sodium responds to the Qualitative Analysis (1) for sodium salt.

Crystallinity Meets the requirements.

Optical rotation $[\alpha]_D^{20}$: Between +124 ° and +134° (5.0 g, calculated on the anhydrous basis, water, 100 mL, 100 mm).

pH Dissolve 1.0 g of Cefalotin Sodium in 10 mL of water; the pH of this solution is between 4.5 and 7.5.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Cefalotin Sodium in 10 mL of water; the resulting solution is clear. Perform the test with this solution as directed under the Ultraviolet-visible Spectroscopy; the absorbance at 450 nm is NMT 0.20.

(2) ***Heavy metals***—Proceed with 1.0 g of Cefalotin Sodium according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Arsenic***—Prepare the test solution with 1.0 g of Cefalotin Sodium according to Method 3 and perform the test (NMT 2 ppm).

(4) ***Related substances***—Pipet 1 mL of the standard solution obtained in the Assay, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate each peak area by the automatic integration method; the area of any peak other than the peak of cefalotin obtained from the test solution is not

larger than the peak area of cefalotin from the standard solution, and the total area of the peaks other than the peak of cefalotin obtained from the test solution is not larger than 3 times the peak area of cefalotin from the standard solution.

Operating conditions

For the detector, column, column temperature, mobile phase and flow rate, proceed as directed in the operating conditions under the Assay.

System suitability

Detection sensitivity: Pipet 1 mL of the standard solution and add the mobile phase to make exactly 10 mL. Proceed with 10 μL of this solution according to the above conditions; the peak area of cefalexin is equivalent to 7% to 13% of the peak area of cefalexin obtained from 10 μL of the standard solution.

System performance: Heat the standard solution at 90 °C for about 10 minutes. After cooling, pipet 2.5 mL of this solution and add the mobile solution to make exactly 100 mL. Proceed with 10 μL of this solution according to the above conditions; the resolution between the peak of cefalotin and the peak of the related substance having a relative retention time of about 0.5 with respect to cefalotin is NLT 9, and the symmetry factor of the peak of cefalotin is NMT 1.8.

System repeatability: Repeat the test 3 times with 10 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak areas of cefalotin is NMT 2.0%.

Time span of measurement: About 4 times the retention time of cefalotin.

Water NMT 1.0% (0.5 g, volumetric titration, direct titration).

Sterility It meets the requirements when Cefalotin Sodium is used for manufacturing sterile preparations. However, it is excluded when there is a terminal sterilization process in the manufacturing process of sterile preparations.

Bacterial endotoxins Less than 0.13 EU/mg (potency) of cefalotin when used for manufacturing sterile preparations.

Assay Weigh accurately 25 mg (potency) each of Cefalotin Sodium and cefalotin sodium RS, dissolve each in the mobile phase to make exactly 25 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography and determine the peak areas, A_T and A_S, of cefalotin.

$$\text{Potency (μg) of cefalotin } (C_{16}H_{16}N_2O_6S_2) = \text{Potency (μg) of cefalotin sodium RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 ℃.

Mobile phase: Dissolve 17 g of sodium acetate trihydrate in 790 mL of water and add 0.6 mL of acetic acid(100). If necessary, adjust the pH to 5.9 with 0.1 mol/L sodium hydroxide TS or acetic acid(100). To this solution, add 150 mL of acetonitrile and 70 mL of ethanol(95).

Flow rate: Adjust the flow rate so that the retention time of cefalotin is about 12 minutes.

System suitability

System performance: Heat the standard solution on a steam bath at 90 ℃ for 10 minutes. After cooling, take 2.5 mL of this solution and add the mobile phase to make exactly 100 mL. Proceed with 10 μL of this solution under the above conditions; the resolution between the peak of cefalotin and the peak having the relative retention time of 0.5 with respect to cefalotin is NLT 9, and the symmetry factor of the peak of cefalotin is NMT 1.8.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solutions according to the above conditions; the relative standard deviation of the peak areas of cefalotin is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Cefalotin Sodium for Injection
주사용 세팔로틴나트륨

Cefalotin Sodium for Injection, as an injection that is dissolved upon use, contains NLT 90.0% and NMT 120.0% of the labeled amount of cefalotin ($C_{16}H_{16}N_2O_6S_2$: 396.44)

Method of preparation Prepare as directed under Injections, with Cefalotin Sodium.

Description Cefalotin Sodium for Injection occurs as a white to pale yellowish white powder.

Identification Determine the absorption spectra of 0.0025% aqueous solutions of Cefalotin Sodium for Injection and cefalotin sodium RS as directed under the Ultraviolet-visible Spectroscopy at the wavelength of between 220 nm and 310 nm; both spectra exhibit maxima and minima at the same wavelengths.

pH Dissolve an amount of Cefalotin Sodium for Injection equivalent to 0.25 g (potency) of cefalotin in 1 mL of

water; the pH of this solution is between 5.0 and 7.5.

Water NMT 1.5% (1.0 g, volumetric titration, direct titration).

Sterility Meets the requirements.

Bacterial endotoxins Less than 0.13 EU per mg (potency) of cefalotin.

Particulate contamination: Visible particles Meets the requirements.

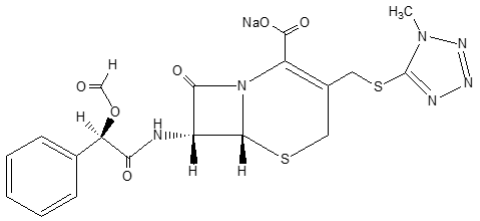
Insoluble particulate matter in injections Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Perform the test as directed under the Assay under Cefalotin Sodium. Weigh accurately an appropriate amount according to the labeled potency of Cefalotin Sodium for Injection, dissolve in the mobile phase to obtain a solution having a known concentration of 1 mg (potency) per mL, and use this solution as the test solution.

Packaging and storage Preserve in hermetic containers.

Cefamandole Nafate
세파만돌나페이트



$C_{19}H_{17}N_6NaO_6S_2$: 512.50

Sodium (6*R*,7*R*)-7-[[(2*R*)-2-formyloxy-2-phenylacet]amido]-3-[(5-methyl-1,3,4-thiadiazol-2-yl)sulfanylmethyl]-3,4-didehydrocepham-4-carboxylate [*42540-40-9*]

Cefamandole Nafate contains NLT 810 μg and NMT 1000 μg (potency) of cefamandole ($C_{18}H_{18}N_6O_5S_2$: 462.51) per mg, calculated on the anhydrous basis.

Description Cefamandole Nafate occurs as a white powder.
It is soluble in water or in ethanol and very slightly soluble in ethyl acetate, in chloroform, in ether or in benzene.

Identification Dissolve 10 mg each of Cefamandole Nafate and cefamandole nafate RS in the developing solution to make 1 mL and use these solutions as the test solution and the standard solution, respectively. Use these solutions promptly after preparation. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solutions and the standard solutions on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of ethyl acetate, acetone, acetic acid(100) and water (5 : 2 : 1 : 1) to a distance of about three-fourths of the length of the plate, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the R_f values of the spots obtained from the test solution and the standard solution are the same.

pH Dissolve 1 g of Cefamandole Nafate in 10 mL of water; the pH of this solution is between 3.5 and 7.0.

Purity ***Heavy metals***—Proceed with 1.0 g of Cefamandole Nafate according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

Water NMT 2.0% (0.5 g, volumetric titration, direct titration).

Sterility It meets the requirements when used in the manufacturing of sterile preparations. However, it is excluded in cases where there is a terminal sterilization process in the manufacturing process of sterile preparations.

Bacterial endotoxins Less than 0.15 EU/mg (potency) of cefamandole, when used in the manufacturing sterile preparations.

Assay Weigh accurately 50 mg each of Cefamandole Nafate and cefamandole nafate RS, dissolve each in the mobile phase to make exactly 100 mL, and use these solutions as the test solution and the standard solution, respectively. Prepare these solutions before use. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the sums of peak areas, S_T and S_S, of cefamandole and cefamandole nafate from the test solution and the standard solution, respectively.

$$\text{Potency (μg) of cefamandole } (C_{18}H_{18}N_6O_5S_2) = \text{Potency (μg) of cefamandole nafate RS} \times \frac{S_T}{S_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 ℃.

Mobile phase: To 350 mL of acetonitrile, add 600

mL of water and 100 μL of triethylamine, adjust the pH to 2.5 with phosphoric acid, and add water to make exactly 1000 mL.

Flow rate: 1.0 mL/min

System suitability

System performance: Proceed with 20 μL of the system suitability solution according to the above conditions; cefamandole and cefamandole nafate are eluted in this order with the resolution between these peaks being NLT 7.0.

System repeatability: Repeat the test 6 times with 20 μL each of the standard solutions according to the above conditions; the relative standard deviation of the peak areas of cefamandole is NMT 1.0%.

System suitability solution—The standard solution heated at 60 ℃ for 30 minutes.

Packaging and storage Preserve in tight containers.

Cefamandole Nafate for Injection
주사용 세파만돌나페이트

Cefamandole Nafate for Injection, as an injection that is dissolved upon use, contains NLT 90.0% and NMT 120.0% of the labeled amount of cefamandole ($C_{18}H_{18}N_6O_5S_2$: 462.51).

Method of preparation Prepare as directed under Injections, with Cefamandole Nafate.

Description Cefamandole Nafate for Injection occurs as a white powder.

Identification Perform the test as directed under the Identification under Cefamandole Nafate.

pH Dissolve an amount of Cefamandole Nafate for Injection equivalent to 0.1 g (potency) of cefomandole in 1 mL of water and allow to stand for 30 minutes; the pH of this solution is between 6.0 and 8.0.

Water NMT 3.0% (0.2 g, volumetric titration, direct titration).

Sterility Meets the requirements.

Bacterial endotoxins Less than 0.15 EU per mg (potency) of cefamandole.

Particulate contamination: Visible particles Meets the requirements.

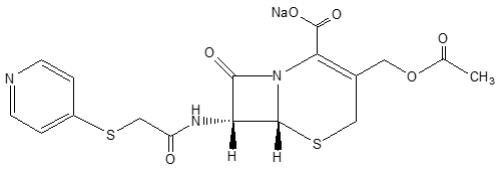
Insoluble particulate matter in injections Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Perform the test according to the Assay under Cefamandole Nafate. However, weigh accurately an amount of Cefamandole Nafate for Injection equivalent to about 50 mg (potency) of cefamandole nafate, dissolve in the mobile phase to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately an amount equivalent to about 50 mg (potency) of cefamandole nafate RS, dissolve in the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Prepare before use.

Packaging and storage Preserve in hermetic containers.

Cefapirin Sodium
세파피린나트륨



$C_{17}H_{16}N_3NaO_6S_2$: 445.45

Sodium (6*R*,7*R*)-7-[2-(pyridin-4-yl)sulfanyl-acetamido]-3-acetyloxymethyl-3,4-didehydro-cepham-4-carboxylate [*24356-60-3*]

Cefapirin Sodium contains NLT 865 μg (potency) of cefapirin ($C_{17}H_{17}N_3O_6S_2$: 423.46) per mg, calculated on the anhydrous basis.

Description Cefapirin Sodium occurs as a white to yellowish white powder.

It is freely soluble in water, sparingly soluble in methanol, slightly soluble in ethanol(95) and practically insoluble in acetone.

Identification (1) Determine the absorption spectra of solutions of Cefapirin Sodium and cefapirin sodium RS (3 in 200000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Cefapirin Sodium and cefapirin sodium RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) Determine the ^1H spectrum of a solution of Cefapirin Sodium in heavy water for nuclear magnetic resonance spectroscopy (1 in 10), using 3-(trimethylsilyl)propionic acid-d_4 sodium salt for nuclear magnetic resonance spectroscopy as the internal standard, as directed under the Nuclear Magnetic Resonance Spectroscopy; it exhibits signal A of a single line at around δ 2.2 ppm and signals B and C of multiple lines at around δ 7.3 ppm and δ 8.3 ppm, respectively. The integrated area

ratio of signals A, B and C is about 3 : 2 : 2.

(4) Cefapirin Sodium responds to the Qualitative Analysis (1) for sodium salt.

Optical rotation $[\alpha]_D^{20}$: Between +157° and +175° (2 g, calculated on the anhydrous basis, water, 100 mL, 100 mm).

pH Dissolve 0.1 of Cefapirin Sodium in 10 mL of water; the pH of this solution is between 6.5 and 8.5.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Cefapirin Sodium according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Arsenic***—Prepare the test solution with 1.0 g of Cefapirin Sodium according to Method 3 and perform the test. Use a solution of magnesium nitrate in ethanol(95) (1 in 25) (NMT 2 ppm).

(3) ***Related substances***—Dissolve 0.1g of Cefapirin Sodium in a mixture of acetone and water (3 : 1) to make exactly 5 mL, and use this solution as the test solution. Pipet 1 mL of this solution, add a mixture of acetone and water (3 : 1) to make exactly 100 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solutions and the standard solutions on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of ethyl acetate, acetone, water and acetic acid(100) (5 : 2 : 1 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot and the spot of the starting point obtained from the test solution are not more intense than the spots from the standard solutions.

Water NMT 2.0% (0.7 g, volumetric titration, direct titration).

Sterility It meets the requirements when Cefapirin Sodium is used for manufacturing sterile preparations. However, it is excluded when there is a terminal sterilization process in the manufacturing process of sterile preparations.

Bacterial endotoxins Less than 0.17 EU/mg (potency) of cefapirin when used for manufacturing sterile preparations.

Assay Weigh accurately about 0.1 g (potency) each of Cefapirin Sodium and cefapirin sodium RS, and dissolve each in 1% phosphate buffer solution (pH 6.0) to make exactly 100 mL. Then, pipet 5 mL of each solution, add exactly 5 mL each of the internal standard solution and 1% phosphate buffer solution (pH 6.0) to make exactly 100 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the peak area ratio, Q_T and Q_S, of cefapirin to the internal standard, respectively.

$$\text{Potency (μg) of cefapirin } (C_{17}H_{17}N_3O_6S_2) = \text{Potency (μg) of cefapirin RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of vanillin (1 in 1000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: A mixture of 0.05 mol/L sodium dihydrogen phosphate TS (pH 2.6) and acetonitrile (93 : 7).

Flow rate: Adjust the flow rate so that the retention time of cefapirin is about 7 minutes.

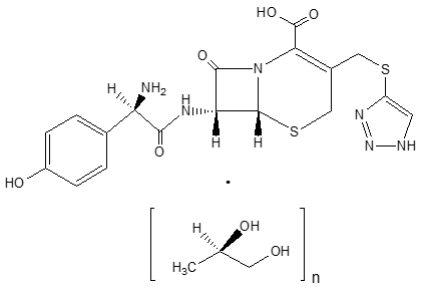
System suitability

System performance: Proceed with 20 μL of the standard solution under the above conditions; cefapirin and the internal standard are eluted in this order with the resolution between these peaks being NLT 10.

System repeatability: Repeat the test 6 times with 20 μL each of the standard solutions according to the above conditions; the relative standard deviation of the peak area ratio of cefapirin to that of the internal standard is NMT 1.0%.

Packaging and storage Preserve in hermetic containers.

Cefatrizine Propylene Glycol
세파트리진프로필렌글리콜



$C_{18}H_{18}N_6O_5S_2 \cdot (C_3H_8O_2)n$

(6*R*,7*R*)-7-[[(2*R*)-2-Amino-2-(4-hydroxyphenyl)acet]amido]-3-[(2H-triazol-4-yl)sulfanylmethyl]-3,4-didehydrocepham-4-carboxylic acid (2*R*)-propane-1,2-diol [*51627-14-6*, cefatrizine]

Cefatrizine Propylene Glycol contains NLT 816 μg (potency) and NMT 876 μg (potency) of cefatrizine ($C_{18}H_{18}N_6O_5S_2$: 462.50) per mg, calculated on the anhydrous basis.

Description Cefatrizine Propylene Glycol occurs as a white to yellowish white powder.
It is sparingly soluble in water and practically insoluble in methanol or ethanol(95).

Identification (1) Determine the absorption spectra of solutions of Cefatrizine Propylene Glycol and cefatrizine propylene glycol RS (1 in 50000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Cefatrizine Propylene Glycol and cefatrizine propylene glycol RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) Determine the ^1H spectrum of a solution of Cefatrzine Propylene Glycol in a mixture of heavy water for nuclear magnetic resonance spectroscopy and deuterated hydrochloric acid for nuclear magnetic resonance spectroscopy (3 : 1) (1 in 10), using 3-(trimethylsilyl)propionic acid-d_4 sodium salt for nuclear magnetic resonance spectroscopy as the internal standard, as directed under the Nuclear Magnetic Resonance Spectroscopy; it exhibits signal A of double lines at about δ 1.2 ppm, signal B of double lines at around δ 7.0 ppm, signal C of double lines at about δ 7.5 ppm and signal D of a single line at δ 8.3 ppm. The integrated intensity ratio of signals A : B : C : D is about 3 : 2 : 2 : 1.

Optical rotation $[\alpha]_D^{20}$: Between +52° and +58° (2.5 g, calculated on the anhydrous basis, 1 mol/L hydrochloric acid TS, 50 mL, 100 mm).

pH Dissolve 1 g of Cefatrzine Propylene Glycol in 10 mL of water; the pH of this solution is between 3.5 and 6.0.

Absorbance $E_{1cm}^{1\%}$ (270 nm): Between 190 and 220 (40 mg, water, 2000 mL).

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Cefatrzine Propylene Glycol according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Arsenic***—Prepare the test solution with 1.0 g of Cefatrzine Propylene Glycol according to Method 3 and perform the test (NMT 2 ppm). Use a solution of magnesium nitrate hexahydrate in ethanol(95) (1 in 25).

(3) ***Related substances***—Dissolve 25 mg of Cefatrzine Propylene Glycol in 5 mL of water and use this solution as the test solution. Pipet 1 mL of this solution, add water to make exactly 20 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solutions and the standard solutions on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate using a mixture of 1-butanol, water and acetic acid(100) (3 : 1 : 1) as the developing solvent to a distance of about 12 cm, and air-dry the plate. Spray evenly ninhydrin-citric acid-acetic acid TS on the plate and heat at 100 °C for 10 minutes; the spots other than the principal spot obtained from the test solution are not more intense than the spots from the standard solution.

Water NMT 2.0% (0.5 g, volumetric titration, direct titration).

Residue on ignition NMT 0.1% (1 g, platinum crucible).

Assay Weigh accurately 20 mg (potency) each of Cefatrizine Propylene Glycol and cefatrizine propylene glycol RS, dissolve each in water to make exactly 100 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the peak areas, A_T and A_S, of cefatrizine from each solution.

$$\text{Potency (μg) of cefatrizine } (C_{18}H_{18}N_6O_5S_2) = \text{Potency (μg) of cefatrizine propylene glycol RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 270 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: A mixture of a solution prepared by dissolving 1.36 g of potassium dihydrogen phosphate in water to make 1000 mL and methanol (17 : 3).

Flow rate: 1.0 mL/min

System suitability

System performance: Weigh accurately about 5 mg (potency) of cefadroxil and about 10 μL (potency) of Cefatrizine Propylene Glycol and dissolve in 50 mL of water. Proceed with 10 μL of this solution under the above conditions; cefadroxil and cefatrizine are eluted in this order with the resolution between these peaks being NLT 4.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solutions according to the above conditions; the relative standard deviation of the peak areas of cefatrizine is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Cefatrizine Propylene Glycol Capsules
세파트리진프로필렌글리콜 캡슐

Cefatrizine Propylene Glycol Capsules contain NLT 90.0% and NMT 120.0% of the labeled amount of cefatrizine ($C_{18}H_{18}N_6O_5S_2$: 462.51).

Method of preparation Prepared as directed under Capsules, with Cefatrizine Propylene Glycol.

Identification Dissolve 3 mg (potency) of Cefatrizine Propylene Glycol Capsules in 2 mL of water, add 2 mL of dilute sodium hydroxide TS, mix, and allow to stand for 30 minutes. Then, add 1 mL of 1 mol/L hydrochloric acid TS; the resulting solution exhibits a yellow color.

Disintegration Meets the requirements.

Water NMT 4.0% (0.2 g, volumetric titration, direct titration).

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of the contents of NLT 20 capsules of Cefatrizine Propylene Glycol Capsules, weigh accurately about 20 mg (potency) according to the labeled potency, dissolve in water to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 20 mg (potency) of cefatrizine propylene glycol RS, dissolve in water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the peak areas, A_T and A_S, of cefatrizine from each solution.

$$\text{Potency (μg) of cefatrizine } (C_{18}H_{18}N_6O_5S_2) = \text{Potency (μg) of cefatrizine propylene glycol RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 270 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: A mixture of a solution prepared by dissolving 1.36 g of potassium dihydrogen phosphate in water to make 1000 mL and methanol (17 : 3).

Flow rate: 1.0 mL/min

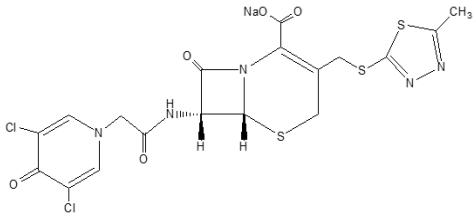
System suitability

System performance: Weigh accurately about 5 mg (potency) of cefadroxil and about 10 mg (potency) of Cefatrizine Propylene Glycol and dissolve in 50 mL of water. Proceed with 10 μL of this solution under the above conditions; cefadroxil and cefatrizine are eluted in this order with the resolution between these peaks being NLT 4.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak areas of cefatrizine is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Cefazedone Sodium
세파제돈나트륨



$C_{18}H_{15}Cl_2N_5NaO_5S_3$: 570.43

(6*R*,7*R*)-7-[[2-(3,5-Dichloro-4-oxo-1(4*H*)-pyridinyl)acetyl]amino]-3-[[(5-methyl-1,3,4-thiadiazol-2-yl)thio]methyl]-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid sodium salt (1:1), [*63521-15-3*]

Cefazedone Sodium contains NLT 865 μg (potency) of cefazedone ($C_{18}H_{15}Cl_2N_5O_5S_3$: 548.45) per mg, calculated on the anhydrous basis.

Description Cefazedone Sodium occurs as a white to yellowish white powder and is odorless.
It is very soluble in water, slightly soluble in ethanol, very slightly soluble in chloroform and practically insoluble in diethyl ether.
It is slightly hygroscopic.
It is easily changed by light.

Identification (1) Determine the infrared spectra of Cefazedone Sodium and cefazedone sodium RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) Cefazedone Sodium responds to the Qualitative Analysis for sodium salt.

Optical rotation $[\alpha]_D^{20}$: Between -3° and +4° (1% aqueous solution, 100 mm).

pH The pH of 1% aqueous solution of Cefazedone Sodium is between 4.5 and 6.5.

Absorption $E_{1cm}^{1\%}$ (278 nm): Between 490 and 570 (2.0 mg, calculated as an anhydrous basis, water, 100 mL).

Purity ***Heavy metals***—Proceed with 1.0 g of

Cefazedone Sodium according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

Sterility It meets the requirements when used in the manufacturing of sterile preparations. However, it is excluded in cases where there is a final sterilization process in the manufacturing process of sterile preparations.

Bacterial endotoxins Less than 0.016 EU/mg (potency) of cefazedone, when used in the manufacturing of sterile preparations.

Water NMT 7.0% (0.1 g, volumetric titration, direct titration).

Residue on ignition Between 12.0% and 12.8% (calculated on the anhydrous basis).

Assay Weigh accurately about 50 mg (potency) each of Cefazedone Sodium and cefazedone sodium RS and dissolve each in the mobile phase to make exactly 50 mL. Pipet 1 mL each of these solutions, add the mobile phase to make exactly 50 mL, and use these solutions as the test solution and the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography, and calculate the peak areas, A_T and A_S, of cefazedone, respectively, from each solution.

Potency (μg) of cefazedone ($C_{18}H_{15}Cl_2N_5O_5S_3$)
= Potency (μg) of cefazedone sodium RS× $\frac{A_T}{A_S}$ ×0.96

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 278 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of 0.02 mol/L ammonium phosphate buffer (pH 5.0) and acetonitrile (17 : 3).

Flow rate: 1.0 mL/min

System suitability

System repeatability: Repeat the test 6 times with 20 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak areas of Cefazedone Sodium is NMT 1.0%.

0.02 mol/L ammonium phosphate buffer (pH 5.0)— Dissolve 2.3 g of ammonium dihydrogen phosphate in 980 mL of water, adjust the pH to 5.0 with 0.1 mol/L sodium hydroxide solution, and add water to make 1000 mL.

Packaging and storage Preserve in light-resistant, tight containers.

Cefazedone Sodium for Injection
주사용 세파제돈나트륨

Cefazedone Sodium for Injection, as an injection that is dissolved upon use, contains NLT 90.0% and NMT 120.0% of the labeled amount of cefazedone ($C_{18}H_{15}Cl_2N_5O_5S_3$: 548.45).

Method of preparation Prepare as directed under Injections, with Cefazedone Sodium.

Description Cefazedone Sodium for Injection occurs as a white to yellowish white powder.

Identification Perform the test as directed under the Identification (2) under Cefazedone Sodium.

Optical rotation $[\alpha]_D^{20}$: Between -3° and +10° (1% aqueous solution, 100 mm).

pH Dissolve Cefazedone Sodium for Injection according to the labeled amount; the pH of this solution is between 4.5 and 6.0.

Sterility Meets the requirements.

Bacterial endotoxins Less than 0.1 EU per mg of cefazedone sodium.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

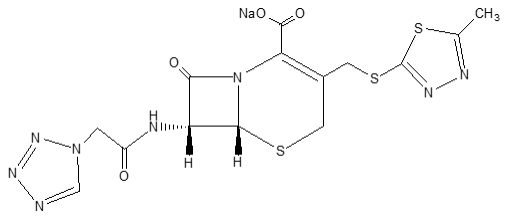
Uniformity of dosage units Meets the requirements.

Water NMT 2.5% (0.5 g, volumetric titration, direct titration)

Assay Perform the test as directed under the Assay under Cefazedone Sodium. However, weigh accurately each 50 mg (potency) of Cefazedone Sodium for Injection and cefazedone sodium RS, and add each the mobile phase to make exactly 100 mL. Take 5 mL each of these solutions, add each the mobile phase to make exactly 100 mL, and use these solution as the test solution and the standard solution.

Packaging and storage Preserve in light-resistant, hermetic containers.

Cefazolin Sodium
세파졸린나트륨



$C_{14}H_{13}N_8NaO_4S_3$: 476.49
Sodium (6*R*,7*R*)-3-[(5-methyl-1,3,4-thiadiazol-2-yl)sulfanylmethyl]-7-[[2-(tetrazol-1-yl)acet] amido]-3,4-didehydrocepham-4-carboxylate [*27164-46-1*]

Cefazolin Sodium contains NLT 900 μg and NMT 975 μg (potency) of cefazolin ($C_{14}H_{14}N_8O_4S_3$: 454.51) per mg, calculated on the anhydrous basis.

Description Cefazolin Sodium occurs as white to light yellowish white crystals or a crystalline powder.
It is freely soluble in water or in formamide, slightly soluble in methanol and practically insoluble in ethanol(95).

Identification (1) Determine the absorption spectra of solutions of Cefazolin Sodium and cefazolin sodium RS (1 in 50000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Cefazolin Sodium and cefazolin sodium RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) Determine the ^1H spectrum of a solution of Cefazolin Sodium in heavy water for nuclear magnetic resonance spectroscopy (1 in 10), using sodium 3-(trimethylsilyl)propionic acid-d_4 sodium salt for nuclear magnetic resonance spectroscopy as the internal standard, as directed under the Nuclear Magnetic Resonance Spectroscopy; it exhibits signals A and B of single lines at around δ 2.7 ppm and around δ 9.3 ppm, respectively. The ratio of integrated intensity of signals A and B is about 3 : 1.

(4) Cefazolin Sodium responds to the Qualitative Analysis for sodium salt.

Optical rotation $[\alpha]_D^{20}$: Between -19° and -23° (2.5 g, calculated on the anhydrous basis, water, 25 mL, 100 mm).

pH Dissolve 1 g of Cefazolin Sodium in 10 mL of water; the pH of this solution is between 4.8 and 6.5.

Absorption $E_{1cm}^{1\%}$ (272 nm): Between 264 and 292 (1.6 mg, water 100 mL).

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Cefazolin Sodium in 10 mL of water; the resulting solution is colorless to pale yellow and clear. Perform the test with this solution as directed under the Ultraviolet-visible Spectroscopy; the absorbance at 420 nm is NMT 0.35. The test should be performed within 10 minutes after preparing the solution.

(2) ***Heavy metals***—Proceed with 2.0 g of Cefazolin Sodium according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Arsenic***—Prepare the test solution with 2.0 g of Cefazolin Sodium according to Method 3 and perform the test. When preparing the test solution, add 10 mL of a solution of magnesium nitrate in ethanol(95) (1 in 50) and then 1.5 mL of strong hydrogen peroxide, and ignite (NMT 1 ppm).

(4) ***Related substances***—Dissolve 0.10 g of Cefazolin Sodium in 20.0 mL of 0.1 mol/L phosphate buffer (pH 7.0) and use this solution as the test solution. Prepare the test solution immediately before use. Take 5 μL of the test solution and perform the test as directed under the Liquid Chromatography according to the following conditions. Determine each peak area of the test solution by the automatic integration method and calculate the amount of related substances by the percentage peak area method; the amount of the related substance having a relative retention time of about 0.2 with respect to cefazolin and of each related substance other than cefazolin is NMT 1.5%, and the total amount of related substances other than cefazolin is NMT 2.5%. For the area of the peak having the relative retention time of about 0.2 with respect to the retention time of cefazolin, multiply the area obtained by the automatic integration method by the correction factor,1.43.

Operating conditions

For the detector, column, column temperature, mobile phase and flow rate, proceed as directed in the operating conditions under the Assay.

System suitability

Detection sensitivity: Dissolve about 80 mg of cefazolin RS in 0.1 mol/L phosphate buffer solution (pH 7.0) to make 100 mL, and use this solution as the system suitability solution. Pipet 1 mL of this solution and add 0.1 mol/L phosphate buffer solution (pH 7.0) to make exactly 20 mL. Confirm that the peak area of cefazolin obtained from 5 μL of this solution is equivalent to 3 to 7% of the peak area of cefazolin obtained from the system suitability solution.

System performance: Proceed as directed under the system suitability under the Assay.

System repeatability: Repeat the test 6 times with 5 μL each of the system suitability solutions according to the above conditions; the relative standard deviation of the peak area of cefazolin is NMT 1.0%.

Time span of measurement: About 3 times the retention time of cefazolin beginning after the solvent peak.

(5) ***Dimethylaniline***—Weigh accurately about 1.0 g

of Cefazolin Sodium, add 5 mL of 1 mol/L sodium hydroxide TS and 1 mL of the internal standard solution, centrifuge, if necessary, and use the supernatant as the test solution. Separately, weigh accurately about 50 mg of dimethylaniline, add 2.0 mL of hydrochloric acid, and add water to make 50 mL. Pipet 5.0 mL of this solution and add water to make exactly 250 mL. Pipet 1.0 mL of this solution, add 5.0 mL of 1 mol/L sodium hydroxide TS, add 1.0 mL of the internal standard solution, centrifuge, if necessary, and use the supernatant as the standard solution. Perform the test with 1 μL each of the test solution and the standard solution as directed under the Gas Chromatography according to the following conditions, and calculate the peak area ratios, Q_T and Q_S, of dimethylaniline to the internal standard, respectively (NMT 20 ppm).

$$\text{Content (ppm) of dimethylaniline} = \text{Amount (mg) of dimethylaniline taken} \times \frac{Q_T}{Q_S} \times \frac{Purity\ (\%) of\ dimethylaniline}{Amount\ (mg)\ of\ Cefazolin\ Sodium\ taken} \times 4$$

Internal standard solution—Dissolve 50.0 mg of naphthalene in cyclohexane to make 50 mL. To 5.0 mL of this solution, add cyclohexane to make 100 mL, and use this solution as the internal standard solution.

Operating conditions

Detector: A hydrogen flame ionization detector

Column: A column about 2 mm in internal diameter and about 2 m in length, packed with diatomaceous earth for gas chromatography, which is coated with 50% phenyl-50% methylpolysiloxane for gas chromatography equivalent to 3% of the mass of the diatomaceous earth.

Column temperature: 120 ℃

Temperatures of the sample injection port and the detector: 150 ℃

Carrier gas: Nitrogen

Flow rate: 30 mL/min

Water NMT 2.5% (1 g, volumetric titration, direct titration). Use a mixture of formamide for water determination and methanol for water determination (2 : 1) instead of methanol for water determination.

Sterility It should meet the requirement when used in the manufacturing of sterile preparations. However, it is excluded when there is a terminal sterilization process in the manufacturing process of sterile preparations.

Bacterial endotoxins Less than 0.10 EU/mg (potency) of cefazolin when used in the manufacturing of sterile preparations.

Assay Weigh accurately about 0.1 g (potency) each of Cefazolin Sodium and cefazolin sodium RS, dissolve each in the internal standard solution to make exactly 100 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 5 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the peak area ratios, Q_T and Q_S, of cefazolin to the internal standard, respectively.

$$\text{Potency (μg) of cefazolin } (C_{14}H_{14}N_8O_4S_3) = \text{Potency (μg) of cefazolin RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of *p*-acetoanisidide in 0.1 mol/L phosphate buffer solution (pH 7.0) (11 in 20000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 μm in particle diameter).

Mobile phase: Dissolve 2.27 g of disodium hydrogen phosphate dodecahydrate and 0.47 g of citric acid monohydrate in water to make 935 mL, and add 65 mL of acetonitrile.

Flow rate: Adjust the flow rate so that the retention time of cefazolin is about 8 minutes.

System suitability

System performance: Proceed with 5 μL of the standard solution according to the above conditions; cefazolin and *p*-acetoanisidide are eluted in this order with the resolution between these peaks being NLT 4.

System repeatability: Repeat the test 6 times with 5 μL each of the standard solutions according to the above conditions; the relative standard deviation of the peak area ratio of cefazolin to the internal standard is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Cefazolin Sodium for Injection
주사용 세파졸린나트륨

Cefazolin Sodium for Injection, as an injection that is dissolved upon use, contains NLT 90.0% and NMT 110.0% of the labeled amount of cefazolin ($C_{14}H_{14}N_8O_4S_3$: 454.51).

Method of preparation Prepare as directed under Injections, with Cefazolin Sodium.

Description Cefazolin Sodium for Injection occurs as white to yellowish white crystals, a crystalline powder or a mass.

Identification (1) Determine the absorption spectrum of

a solution of Cefazolin Sodium for Injection (1 in 50000) as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum at the wavelength of between 270 nm and 274 nm.

(2) Cefazolin Sodium for Injection responds to the Qualitative Analysis (1) for sodium salt.

pH Dissolve an amount of Cefazolin Sodium for Injection equivalent to 1.0 g (potency) of cefazolin in 10 mL of water; the pH of this solution is between 4.5 and 6.5.

Purity (1) ***Clarity and color of solution***—Perform the test within 10 minutes after preparing the solution. Dissolve an amount of Cefazolin Sodium for Injectionequivalent to 1.0 g (potency) of cefazolin sodium according to the labeled amount, in 10 mL of water; the resulting solution is clear. Determine the absorbance of this solution at the wavelength of 400 nm as directed under the Ultraviolet-visible Spectroscopy; it is NMT 0.35.

(2) ***Related substances***—Take an amount of Cefazolin Sodium for Injection, equivalent to 0.10 g (potency) of cefazolin sodium according to the labeled amount, dissolve in 20 mL of 0.1 mol/L phosphate buffer solution, pH 7.0, and use this solution as the test solution. Prepare the test solution before use. Perform the test with 5 μL of the test solution as directed under the Liquid Chromatography according to the following operating conditions, and determine the area percentage of individual peak by the automatic integration method. The peak of individual related substance other than cefazolin is NMT 1.5%, and the sum of the peaks of total related substances other than cefazolin is NMT 2.5%. Determine the peak area of the related substances having a relative retention time of about 0.2 to cefazolin by multiplying the correction factor of 1.43.

Operating conditions

For the detector, column, column temperature, mobile phase and flow rate, proceed according to the operating conditions as directed under the Assay under Cefazolin Sodium.

System suitability

Test for required detectability: Pipet 8 mL of the test solution, add 0.1 mol/L phosphate buffer solution, pH 7.0, to make exactly 50 mL, and use this solution as the system suitability solution. To 1 mL of this solution, add 0.1 mol/L phosphate buffer solution, pH 7.0, to make exactly 20 mL. Confirm that the peak area of cefazolin sodium obtained from 5 μL of this solution is between 3% and 7% of the peak area of cefazolin sodium obtained from 5 μL of the system suitability solution.

System performance: Proceed as directed under the system suitability in the Assay under the Cefazolin Sodium.

System repeatability: Repeat the test 6 times with 5 μL of the system suitability solution according to the above operating conditions; the relative standard deviation of peak areas of cefazolin is NMT 1.0%.

Time span of measurement: About 3 times the retention time of cefazolin after the solvent peak.

Water NMT 3.0% (0.5 g, volumetric titration, direct titration). Use a mixture of formamide for water determination and methanol for water determination (2:1) instead of methanol for water determination.

Sterility Meets the requirements.

Bacterial endotoxin NMT 0.05 EU per mg (potency) of cefazolin sodium.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Uniformity of dosage units Meets the requirements.

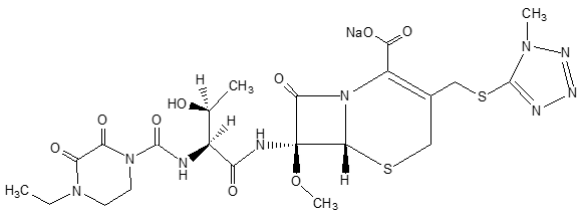
Assay Weigh accurately the mass of the contents of NLT 10 containers of Cefazolin Sodium for Injection. Weigh accurately an amount of Cefazolin Sodium for Injection equivalent to 50 mg (potency), dissolve in the internal standard solution to make exactly 50 mL, and use this solution as the test solution. Separately, weigh accurately about 50 mg (potency) of cefazolin RS, dissolve it in the internal standard solution to make 50 mL, and use this solution as the standard solution. Perform the test as directed under the Assay under Cefazolin Sodium.

$$\text{Potency (μg) of cefazolin } (C_{14}H_{14}N_8O_4S_3) = \text{Potency (μg) of cefazolin RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of *p*-acetanisidide in 0.1 mol/L phosphate buffer solution, pH 7.0, (11 in 20000).

Packaging and storage Preserve in hermetic containers.

Cefbuperazone Sodium
세프부페라존나트륨



$C_{22}H_{28}N_9NaO_9S_2$: 649.63

Sodium (6*R*,7*S*)-7-[[(2*S*,3*R*)-2-[(4-ethyl-2,3-dioxopiperazine-1-carbonyl)amido]-3-hydroxybutanamido]-7-methoxy-3-[(1-methyltetrazol-5-yl)sulfanyl-methyl]-3,4-didehydrocepham-4-carboxylate [*76648-01-6*]

Cefbuperazone Sodium contains NLT 870 μg (potency) of cefbuperazone ($C_{22}H_{29}N_9O_9S_2$: 627.65) per mg, calculated on the anhydrous basis.

Description Cefbuperazone Sodium occurs as a white to pale yellowish white powder or a mass.
It is very soluble in water, freely soluble in methanol or pyridine, sparingly soluble in ethanol(95), and very slightly soluble in acetonitrile.

Identification (1) Determine the absorption spectra of respective aqueous solutions of Cefbuperazone Sodium and cefbuperazone sodium RS (1 in 50000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine ^1H of a solution prepared by adding 0.5 mL of deuterated pyridine for nuclear magnetic resonance spectroscopy and 1 drop of deuterium oxide for nuclear magnetic resonance spectroscopy to 0.1 g of Cefbuperazone Sodium, as directed under the Nuclear Magnetic Resonance Spectroscopy, using tetramethylsilane for nuclear magnetic resonance spectroscopy as the internal standard; it exhibits the triplet signal A at about δ 1.1 ppm and doublet signals B and C at about δ 1.6 ppm and δ 5.1 ppm, respectively, with the ratio of area strength of the signals A : B : C being about 3 : 3 : 1.

(3) Cefbuperazone Sodium responds to the Qualitative Analysis (1) for sodium salt.

Optical rotation $[\alpha]_D^{20}$: Between +48° and +56° (0.4 g, calculated on the anhydrous basis, water, 20 mL, 100 mm).

pH Dissolve 1.0 g of Cefprozil Hydrate in 4 mL of water; the pH of this solution is between 4.0 and 6.0.

Purity (1) ***Clarity and color of solution*—**Dissolve 1.0 g of Cefuroxime Sodium in 4 mL of water; the solution is pale yellow and clear.

(2) ***Heavy metals*—**Proceed with 2.0 g of Cefbuperazone Sodium as directed under Method 4 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Arsenic*—**Prepare the test solution with 1.0 g of Cefbuperazone Sodium, according to Method 4 and perform the test (NMT 2 ppm).

(4) ***Related substances*—**Dissolve 0.10 g of Cefbuperazone Sodium in 100 mL of the mobile phase, and use this solution as the test solution. Pipet 1 mL of this solution, add the mobile phase to it make exactly 50 mL, and use this solution as the standard solution. Perform the test with 25 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions, determine individual peak areas in each of the respective solutions according to the automatic integration method, and obtain the percentage of the peak area of each related substance in the test solution compared to 50 times the peak area of cefbuperazone in the standard solution; the related substance with the relative retention time with respect to cefbuperazone of about 0.2 is NMT 2.0%, the related substance with the relative retention time with respect to cefbuperazone of about 0.6 is NMT 4.5%, the related substance with the relative retention time with respect to cefbuperazone of about 1.6 is NMT 1.0%. Also, the sum of peak areas of related substances is NMT 6.0%. The peak areas of the related substances with relative retention times of about 0.2 and 1.6 are the results of multiplying the correction factors 0.72 and 0.69 by the areas obtained according to the automatic integration method, respectively.

Operating conditions

For the detector, column, column temperature, mobile phase and flow rate, proceed as directed in the operating conditions under the Assay.

System suitability

Test for required detectability: Pipet 1 mL of the standard solution and add the mobile phase to make exactly 10 mL. Confirm that the peak area of cefbuperazone obtained from 25 mL of this solution is within the range between 7% and 13% of the peak area of cefbuperazone obtained from the standard solution.

System performance: Proceed with 25 μL of the standard solution according to the above conditions; the number of theoretical plates of the cefbuperazone peak is NLT 5000, and the symmetry factor is NMT 1.5.

System repeatability: Repeat the test 6 times with 25 μL each of the standard solutions according to the above conditions; the relative standard deviation of the peak area of cefbuperazone is NMT 2.0%.

Time span of measurement: About 2 times the retention time of cefbuperazone.

Water NMT 1.0% (3 g, volumetric titration, direct titration).

Sterility It meets the requirements when Cefbuperazone Sodium is used in a sterile preparation. However, it is exempt from the requirements when there is a final sterilization process in the manufacturing process of sterile preparations.

Bacterial endotoxins It is less than 0.1 EU per mg (potency) of cefbuperazone when used in a sterile preparation.

Assay Weigh accurately about 0.1 g (potency) each of Cefbuperazone Sodium and cefbuperazone RS, and add the mobile phase to each to make exactly 100 mL. Pipet 10 mL each of these solutions, add exactly 10 mL of the internal standard solution to each, add the mobile phase to each to make 50 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 10 μL each of these solutions as directed under the Liquid Chromatography according to the following operating conditions, and calculate the peak area

ratios, Q_T and Q_S, of cefbuperazone to the internal standard, respectively.

$$\text{Potency (μg) of cefbuperazone } (C_{22}H_{29}N_9O_9S_2) = \text{Potency (μg) of cefbuperazone RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of acetanilide in the mobile phase (1 in 4000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: In 1000 mL of a mixture of water, acetonitrile, and acetic acid (pH 5.0)-sodium acetate buffer (83 : 13 : 4), dissolve 2.0 g of tetra n-propylammonium bromide.

Flow rate: 1.4 mL/min

System suitability

System performance: Proceed with 10 μL of the standard solution according to the above conditions; the internal standard and cefbuperazone are eluted in this order with the resolution being NLT 3.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solutions according to the above conditions; the relative standard deviation of the peak area ratio of cefbuperazone to the internal standard is NMT 1.0%.

Packaging and storage Preserve in hermetic containers in a cold place.

Cefbuperazone Sodium for Injection
주사용 세프부페라존나트륨

Cefbuperazone Sodium for Injection, as an injection that is dissolved before use, contains NLT 90.0% and NMT 120.0% of the labeled amount of cefbuperazone ($C_{22}H_{29}N_9O_9S_2$: 627.65).

Method of preparation Prepare as directed under Injections, with Cefbuperazone Sodium.

Description Cefbuperazone Sodium for Injection occurs as a white to pale yellow powder or a mass.

Identification (1) Weigh 20 mg (potency) of Cefbuperazone Sodium for Injection, dissolve in 1 mL of hydroxylamine hydrochloride-ethanol TS, and allow it to stand for 3 minutes. Add 1 mL of acidic ammonium iron(III) sulfate TS, and shake to mix; the resulting solution exhibits a reddish brown color.

(2) Weigh 0.1 g (potency) of Cefbuperazone Sodium for Injection, dissolve in 4 mL of 1 mol/L sodium hydroxide TS, and heat on a steam bath for 20 minutes. After cooling, neutralize with 6 mol/L hydrochloric acid TS. Heat again on a steam bath for 2 to 3 minutes, add 1 mL of calcium chloride TS, and allow it to stand for 30 minutes. Filter the formed precipitate through a glass filter (G4), wash the precipitate 4 times with 5 mL of water, and dissolve in 1 mL of 2 mol/L sulfuric acid TS. Dissolve in about 10 mg of magnesium. Take 3 drops of this solution, add 2 mL of 2,7-dihydroxynaphthalene TS, and heat on a steam bath for 10 minutes; the resulting solution exhibits a violet red color.

(3) Determine the absorption spectrum of a solution of Cefbuperazone Sodium for Injection (1 in 50000) as directed under the Ultraviolet-visible Spectroscopy; it exhibits maxima absorbance at 226 nm to 230 nm and 267 nm to 271 nm.

pH Dissolve 2.5 g of Cefbuperazone Sodium for Injection in 10 mL of water; the pH of this solution is 4.0 to 6.0.

Water NMT 1.0% (1.0 g, volumetric titration, direct titration).

Sterility Meets the requirements.

Bacterial endotoxins Less than 0.1 EU per mg (potency) of cefbuperazone.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately an amount of Cefbuperazone Sodium for Injection, equivalent to about 0.5 g (potency), according to the labeled potency, and dissolve in the mobile phase to make exactly 100 mL. Pipet an appropriate amount of this solution to obtain 1 mg (potency) in 1 mL. Pipet 10 mL of this solution, add 10 mL of the internal standard solution, add the mobile phase to make exactly 50 mL, and use this solution as the test solution. Separately, weigh accurately about 0.1 g (potency) of cefbuperazone RS, and dissolve in the mobile phase to make exactly 100 mL. Pipet 10 mL of this solution, add exactly 10 mL of the internal standard solution, add the mobile phase to make 50 mL, and use this solution as the standard solution. Perform the test with 25 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the ratios, Q_T and Q_S, of the peak area of cefbuperazone to that of the internal standard in each solution.

Potency (μg) of cefbuperazone ($C_{22}H_{29}N_9O_9S_2$)
= Potency (μg) of cefbuperazone RS× $\frac{Q_T}{Q_S}$ × 5

Internal standard solution—Weigh accurately 0.1 g of acetanilide, dissolve in the mobile phase to make 200 mL.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (8 μm to 10 μm in particle diameter).

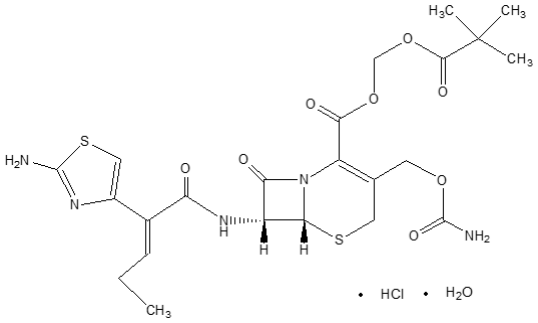
Mobile phase: Weigh 60.1 g of acetic acid(100) and 101.1 g of triethylamine, dissolve in water to make 1000 mL. Add 2 mL of dilute acetic acid and 120 mL of acetonitrile to 4.0 mL of this solution, and add water to make 1000 mL.

Flow rate: Adjust the flow rate so that the retention time of cefbuperazone is about 5 minutes.

Selection of column: Proceed with the standard solution according to the above conditions; cefbuperazone and the internal standard are eluted in this order with the resolution being NLT 10.0.

Packaging and storage Preserve in hermetic containers.

Cefcapene Pivoxil Hydrochloride Hydrate
세프카펜피복실염산염수화물



Cefcapene pivoxil hydrochloride
$C_{23}H_{29}N_5O_8S_2 \cdot HCl \cdot H_2O$: 622.11
2,2-Dimethylpropanoyloxymethyl (6*R*,7*R*)-7-[(2*E*)-2-(2-amino-1,3-thiazol-4-yl)pent-2-enamido]-3-(carbamoyloxymethyl)-3,4-didehydrocepham-4-carboxylate hydrate hydrochloride [*147816-24-8*]

Cefcapene Pivoxil Hydrochloride Hydrate contains NLT 722 μg (potency) and NMT 764 μg (potency) of cefcapene ($C_{17}H_{19}N_5O_6S_2$: 453.49) per mg, calculated on the anhydrous basis.

Description Cefcapene Pivoxil Hydrochloride Hydrate occurs as a white to pale yellowish white crystalline powder or a mass.
It has a slightly characteristic odor.
It is freely soluble in *N,N*-dimethylformamide or methanol, soluble in ethanol(99.5), slightly soluble in water, and practically insoluble in ether.

Identification (1) Determine the infrared spectra of Cefcapene Pivoxil Hydrochloride Hydrate and cefcapene pivoxil hydrochloride RS as directed in the paste method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) Determine ^1H of a solution of Cefcapene Pivoxil Hydrochloride Hydrate in deuterated methanol for nuclear magnetic resonance spectroscopy (1 in 50) as directed under the Nuclear Magnetic Resonance Spectroscopy, using tetramethylsilane for nuclear magnetic resonance spectroscopy as the internal standard; it exhibits the triplet signal A at about δ 6.3 ppm and singlet signal B at about δ 6.7 ppm, with the ratio of area strength of the signals A : B being about 1 : 1.

(3) Dissolve 10 mg of Cefcapene Pivoxil Hydrochloride Hydrate in 2 mL of a mixture of water and methanol (1 in 1) and add 1 drop of silver nitrate TS; a white precipitate is formed.

Optical rotation $[\alpha]_D^{20}$: Between +51° and +54° (0.1 g, calculated on the anhydrous basis, methanol, 10 mL, 100 mm).

Absorbance $E_{1cm}^{1\%}$ (265 nm): Between 255 and 285 (30 mg, calculated on the anhydrous basis, 2000 mL of a mixture of acetate buffer (pH 5.5) and methanol (1 in 1)).

Purity (1) ***Heavy metals***—Proceed with 2.0 g of Carvedilol according to Method 4 and perform the test. Prepare the control solution with 2.0 mL of the lead standard solution (NMT 10 ppm).

(2) ***Related substance I***—Dissolve an amount equivalent to about 10 mg (potency) of Cefcapene Pivoxil Hydrochloride Hydrate in 2 mL of methanol, add a mixture of water and methanol (1 in 1) to make 50 mL, and use this solution as the test solution. Perform the test with 30 μL of the test solution as directed under the Liquid Chromatography according to the following conditions, and determine individual peak areas according to the automatic integration method. If necessary, proceed with 30 μL of a mixture of water and methanol (1 : 1) in the same manner to make corrections for baseline variability. Obtain the amount of peaks other than cefcapene pivoxil according to the percentage peak area method; the peaks with the relative retention times with respect to cefcapene pivoxil of about 1.5 and 1.7 are NMT 0.2%, respectively, each of other peaks is NMT 0.1%, and the sum of peaks is NMT 1.5%.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 265 nm).

Column: A stainless steel column, about 4.6 mm in internal diameter and 15 to 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 20 °C.

Mobile phase: Control the mixing ratio of mobile phase A and mobile phase B stepwise or via the gradient elution as follows.

Mobile phase A: Dissolve 5.99 g of potassium dihydrogen phosphate in water to make 1100 mL. To this solution, add a solution prepared to 1000 mL by dissolving 1.89 g of tetra *n*-pentylammonium bromide in methanol.

Mobile phase B: A mixture of methanol and water (22 : 3).

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 - 20	98	2
20 - 40	98 → 50	2 → 50
40 - 50	50	50

Flow rate: 0.8 mL/min

System suitability

Test for required detectability: Pipet 1 mL of the test solution, add a mixture of water and methanol (1 : 1) to make exactly 100 mL, and use this solution as the system suitability solution. Pipet 1 mL of this solution, and add a mixture of water and methanol (1 : 1) to make exactly 10 mL. Confirm that the peak area of cefcapene pivoxil obtained from 30 μL of this solution is within the range between 7% and 13% of the peak area of cefcapene pivoxil obtained from the system suitability solution.

System performance: Dissolve 10 mg of Cefcapene Pivoxil Hydrochloride Hydrate and 10 mg of propyl p-hydroxybenzoate in 25 mL of methanol, and add water to make 50 mL. To 5 mL of this solution, add a mixture of water and methanol (1 : 1) to make 50 mL. Proceed with 30 μL of this solution according to the above conditions; cefcapene pivoxil and propyl p-hydroxybenzoate are eluted in this order with the resolution being NLT 7.

System repeatability: Repeat the test 3 times with 30 μL each of the system suitability solutions according to the above conditions; the relative standard deviation of the peak area of cefcapene pivoxil is NMT 4.0%.

Time span of measurement: About 2.5 times the retention time of cefcapene pivoxil.

(3) ***Related substance II***—Dissolve an amount equivalent to about 2 mg (potency) of Cefcapene Pivoxil Hydrochloride Hydrate in *N*,*N*-dimethylformamide for liquid chromatography to make 20 mL, and use this solution as the test solution. Perform the test with 20 L of the test solution as directed under the Liquid Chromatography according to the following operating conditions. Determine individual peak areas in the test solution according to the automatic integration method; the sum of areas of peaks eluted before cefcapene pivoxil is NMT 1.7% of the sum of areas of peaks other than the solvent-derived peak.

Operating conditions

Detector: An ultraviolet absorption spectrophotometer (wavelength: 280 nm).

Column: A stainless steel column, about 7.8 mm in internal diameter and about 30 cm in length, packed with styrene-divinylbenzene copolymer for liquid chromatography.

Column temperature: A constant temperature of about 25 °C.

Mobile phase: A solution of lithium bromide in *N*,*N*-dimethylformamide for liquid chromatography (13 in 5000).

Flow rate: Adjust the flow rate so that the retention time of cefcapene pivoxil is about 22 minutes.

System suitability

Test for required detectability: Pipet 1 mL of the test solution, add *N*,*N*-dimethylformamide for liquid chromatography to make exactly 100 mL, and use this solution as the system suitability solution. Pipet 3 mL of this solution, and add *N*,*N*-dimethylformamide for liquid chromatography to make exactly 10 mL. Confirm that the peak area of cefcapene pivoxil obtained from 20 μL of this solution is within the range between 20% and 40% of the peak area of cefcapene pivoxil obtained from the system suitability solution.

System performance: Proceed with 20 μL of the test solution according to the above conditions; the number of theoretical plates of the cefcapene pivoxil peak is NLT 12000.

System repeatability: Repeat the test 6 times with 20 μL each of the system suitability solution according to the above conditions; the relative standard deviation of the peak area of cefcapene pivoxil is NMT 4.0%.

Time span of measurement: About 1.8 times the retention time of cefcapene pivoxil.

Water Between 2.8% and 3.7% (0.5 g, volumetric titration, back titration).

Assay Weigh accurately about 20 mg (potency) each of Cefcapene Pivoxil Hydrochloride Hydrate and cefcapene pivoxil hydrochloride RS, and dissolve each in a respective mixture of water and methanol (1 : 1) to make exactly 50 mL. To 10 mL each of these solutions, add exactly 10 mL of the internal standard solution. Add a mixture of water and methanol (1 : 1) to each to make 50 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 10 μL each of these solutions as directed under the Liquid Chromatography according to the following operating conditions, and calculate the peak area ratios, Q_T and Q_S, of cefcapene pivoxil to the internal standard, respectively.

Potency (μg) of cefcapene ($C_{17}H_{19}N_5O_6S_2$)
= Potency (μg) of cefcapene pivoxil hydrochloride RS
$$\times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of *p*-benzylphenol in a mixture of water and methanol (1 : 1) (7 in 4000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 265 nm).

Column: A stainless steel column about 3.0 mm in internal diameter and 7.5 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: Dissolve 1.56 g of sodium dihydrogen phosphate dihydrate and 1.22 g of sodium 1-decanesulfonate in water to make 1000 mL. To 700 mL of this solution, add 300 mL of acetonitrile and 100 mL of methanol.

Flow rate: Adjust the flow rate so that the retention time of cefcapene pivoxil is about 5 minutes.

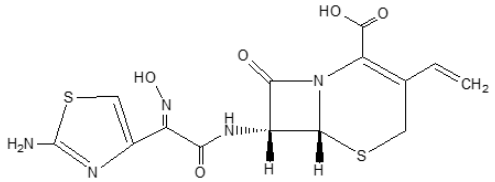
System suitability

System performance: Dissolve 0.2 g of Cefcapene Pivoxil Hydrochloride Hydrate in 10 mL of methanol, and warm in a 60 ℃ water bath for 20 minutes. After cooling, pipet 1 mL of this solution, add exactly 10 mL of the internal standard solution, and add a mixture of water and methanol (1 : 1) to make 50 mL. Proceed with 10 μL of this solution according to the above conditions; cefcapene pivoxil, cefcapene pivoxil substituent, and the internal standard are eluted in this order, the retention time ratios of cefcapene pivoxil substituent and the internal standard to cefcapene pivoxil are about 1.7 and 2.0, respectively, and the resolution between cefcapene pivoxil substituent and the internal standard is NLT 1.5.

System repeatability: Repeat the test 5 times with 10 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area ratio of cefcapene pivoxil to the internal standard is NMT 1.0%.

Packaging and storage Preserve in light-resistant, tight containers at below 5 ℃.

Cefdinir
세프디니르



$C_{14}H_{13}N_5O_5S_2$: 395.41

(6*R*,7*R*)-7-[(2*E*)-2-(2-Amino-1,3-thiazol-4-yl)-2-methoxyiminoacetamido]-3-ethenyl-3,4-didehydrocepham-4-carboxylic acid [*91832-40-5*]

Cefdinir contains NLT 930 μg (potency) and NMT 1020 μg (potency) of cefdinir ($C_{14}H_{13}N_5O_5S_2$: 395.41) per mg.

Description Cefdinir occurs as a white to pale yellow crystalline powder.
It is sparingly soluble in water, ethanol(95) or ether.
It dissolves in 0.1 mol/L phosphate buffer (pH 7.0).

Identification (1) Determine the absorption spectra of respective solutions of Cefdinir and cefdinir RS in 0.1 mol/L phosphate buffer (pH 7.0) (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Cefdinir and cefdinir RS as directed in the paste method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) Determine ^1H of a solution of Cefdinir in a mixture of deuterated dimethylsulfoxide for nuclear magnetic resonance spectroscopy and deuterium oxide for nuclear magnetic resonance spectroscopy (4 : 1) (1 in 10) as directed under the Nuclear Magnetic Resonance Spectroscopy, using tetramethylsilane for nuclear magnetic resonance spectroscopy as the internal standard; it exhibits the multiplet signals A and B at about δ 5.0 to 6.1 ppm and at about δ 6.4 to 7.5 ppm, respectively, with the ratio of area strength of the signals A : B being about 2 : 1.

Optical rotation $[\alpha]_D^{20}$: Between -58° and -66° (0.25 g, 0.1 mol/L phosphate buffer (pH 7.0) 25 mL, 100 mm).

Purity (1) ***Heavy metals***—Proceed with 2.0 g of Cefdinir as directed under Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Related substances***—Dissolve 0.1 g of Cefdinir in 10 mL of 0.1 mol/L phosphate buffer (pH 7.0). Pipet 3 mL of this solution, add tetramethylammonium hydroxide TS (pH 5.5) to make exactly 20 mL, and use this solution as the test solution. With 10 μL of the test solution, perform the test as directed under the Liquid

Chromatography according to the following conditions. Determine each peak area in the test solution according to the automatic integration method; the peak area of *E*-isomer with the relative retention time with respect to the cefdinir peak of 1.5 under the percentage peak area method is NMT 0.8% and the sum of peak areas other than cefdinir is NMT 3.0%.

Operating conditions

Detector: An ultraviolet absorption spectrophotometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature at about 40 °C.

Delivery of mobile phase: Control the mobile phases A and B stepwise or based on the gradient elution as follows.

Mobile phase A: To 1000 mL of tetramethylammonium hydroxide TS (pH 5.5), add 0.4 mL of 0.1 mol/L disodium dihydrogen ethylenediaminetetraacetate TS.

Mobile phase B: To 500 mL of tetramethylammonium hydroxide TS (pH 5.5), add 300 mL of acetonitrile for liquid chromatography and 200 mL of methanol, and add 0.4 mL of 0.1 mol/L disodium dihydrogen ethylenediaminetetraacetate TS.

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 - 2	95	5
2 - 22	95 → 75	5 → 25
22 - 32	75 → 50	25 → 50
32 - 37	50	50
37 - 38	50 → 95	50 → 5
38 - 58	95	5

Flow rate: 1.0 mL/min. Under this condition, the retention time of cefdinir is about 22 minutes.

System suitability

Test for required detectability: Pipet 1 mL of the test solution, add tetramethylammonium hydroxide TS (pH 5.5) to make exactly 100 mL, and use this solution as the system suitability solution. To 1 mL of this solution, add tetramethylammonium hydroxide TS (pH 5.5) to make exactly 10 mL. Confirm that the peak area of cefdinir obtained from 10 μL of this solution is within the range between 7% and 13% of the peak area of cefdinir obtained from the system suitability solution.

System performance: Dissolve 0.03 g of cefdinir RS and 2 mg of cefdinir lactam ring-cleavage lactones in 3 mL of 0.1 mol/L phosphate buffer (pH 7.0), and add tetramethylammonium hydroxide TS (pH 5.5) to make 20 mL. Proceed with 10 μL of this solution according to the above conditions; the peak 1 and peak 2 of the cefdinir lactam ring-cleavage lactones (split into 4), cefdinir, and the peak 3 and peak 4 of the cefdinir lactam ring-cleavage lactones are eluted in this order, the relative retention time of the peak 3 of the cefdinir lactam ring-cleavage lactones with respect to cefdinir is NLT 1.09, the number of theoretical plates of the cefdinir peak is NLT 7000, and the symmetry factor is NMT 3.0.

System repeatability: Repeat the test 3 times with 10 μL each of the system suitability solutions according to the above conditions; the relative standard deviation of the peak area of cefdinir is NMT 2.0%.

Time span of measurement: 40 minutes after injecting the test solution.

Water NMT 2.0% (1 g, volumetric titration, direct titration. Use a mixture of formamide for water determination and methanol for water determination (2 : 1) instead of methanol for water determination.

Assay Weigh accurately about 20 mg (potency) each of Cefdinir and cefdinir RS, dissolve each in respective 0.1 mol/L phosphate buffer (pH 7.0) to make exactly 100 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 5 μL each of these solutions as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of cefdinir, respectively.

$$\text{Potency (μg) of cefdinir } (C_{14}H_{13}N_5O_5S_2) = \text{Potency (μg) of cefdinir RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption spectrophotometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: To 1000 mL of tetramethylammonium hydroxide TS (pH 5.5), add 0.4 mL of 0.1 mol/L disodium dihydrogen ethylenediaminetetraacetate TS. To 900 mL of this solution, add 60 mL of acetonitrile for liquid chromatography and 40 mL of methanol.

Flow rate: Adjust the flow rate so that the retention time of cefdinir is about 8 minutes.

System suitability

System performance: Dissolve 2 mg of cefdinir RS and 5 mg of cefdinir lactam ring-cleavage lactones in 10 mL of 0.1 mol/L phosphate buffer (pH 7.0). Proceed with 5 μL of this solution according to the above conditions; the peak 1 and peak 2 of the cefdinir lactam ring-cleavage lactones (split into 4), cefdinir, and the peak 3 and peak 4 of the cefdinir lactam ring-cleavage lactones are eluted in this order, the resolution between the peak 2 of the cefdinir lactam ring-cleavage lactones and cefdinir

is NLT 1.2, the number of theoretical plates of the cefdinir peak is NLT 2000, and the symmetry factor is NMT 1.5.

System repeatability: Repeat the test 6 times with 5 μL each of the standard solutions according to the above conditions; the relative standard deviation of the peak area of cefdinir is NMT 1.0%.

Packaging and storage Preserve in light-resistant, tight containers.

Cefdinir Capsules
세프디니르 캡슐

Cefdinir Capsules contain NLT 90.0% and NMT 110.0% of the labeled amount of cefdinir ($C_{14}H_{13}N_5O_5S_2$: 395.41).

Method of preparation Prepare as directed under Capsules, with Cefdinir.

Identification Weigh an amount of Cefalexin Capsules, equivalent to 10 mg (potency) of cefdinir according to the labeled amount, add 100 mL of 0.1 mol/L phosphate buffer solution (pH 7.0), sonicate for 1 minute, and then filter. To 2 mL of the filtrate, add 0.1 mol/L phosphate buffer solution (pH 7.0) to make 20 mL. Determine the absorption spectrum of this solution as directed under the Ultraviolet-visible Spectroscopy; it exhibits maxima between 221 and 225 nm and 285 and 289 nm.

Dissolution Perform the test with 1 capsule of Cefdinir Capsules at 50 revolutions per minute according to Method 2 under the Dissolution with a sinker, using 900 mL of Solution 2 in the Dissolution as the dissolution solution. Take NLT 20 mL of the dissolved solution 45 minutes after starting the test, and filter through a membrane filter with a pore size of NMT 0.5 μm. Discard the first 10 mL of the filtrate, take exactly *V* mL of the subsequent filtrate, add Solution 2 in the Dissolution to obtain exactly *V′* mL of a solution containing about 56 μg (potency) of cefdinir per mL according to the labeled amount, and use this solution as the test solution. Separately, weigh accurately an amount equivalent to about 28 mg (potency) of cefdinir RS, and dissolve in Solution 2 in the Dissolution to make exactly 100 mL. Pipet 4 mL of this solution, add Solution 2 in the Dissolution to make exactly 20 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, respectively. The acceptable dissolution criterion is NLT 75% of Cefdinir Capsules dissolved in 45 minutes.

Dissolution rate (%) of the labeled amount of cefdinir ($C_{14}H_{13}N_5O_5S_2$)

$$= \text{Potency (mg) of cefdinir RS} \times \frac{A_T}{A_S} \times \frac{V'}{V} \times \frac{1}{C} \times 180$$

C: Labeled amount (mg) of cefalexin ($C_{14}H_{13}N_5O_5S_2$) in 1 capsule

Operating conditions

Perform the test according to the operating conditions of the Assay under Cefdinir.

System suitability

System performance: Proceed with 20 μL of the standard solution under the above operating conditions; the number of theoretical plates of the cefdinir peak is NLT 2,000 plates with the symmetry factor being NMT 2.0.

System repeatability: Repeat the test 6 times with 20 μL each of the standard solutions according to the above conditions; the relative standard deviation of the peak area of cefdinir is NMT 1.0%.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 Cefdinir Capsules. Weigh accurately an amount of Cefdinir Capsules, equivalent to about 0.1 g (potency) of cefdinir according to the labeled potency, add 70 mL of 0.1 mol/L phosphate buffer solution (pH 7.0), shake for 30 minutes to mix, and then add 0.1 mol/L phosphate buffer solution (pH 7.0) to make exactly 100 mL. Then, centrifuge this solution at 3000 rpm for 10 minutes, pipet 4 mL of the clear supernatant, add 0.1 mol/L phosphate buffer solution (pH 7.0) to make exactly 20 mL, and use this solution as the test solution. Separately, weigh accurately about 20 mg (potency) of cefdinir RS, dissolve in 0.1 mol/L phosphate buffer solution (pH 7.0) to make exactly 100 mL, and use this solution as the standard stock solution. Perform the test as directed under the Assay of Cefdinir.

Potency (mg) of cefdinir ($C_{14}H_{13}N_5O_5S_2$)

$$= \text{Potency (mg) of cefdinir RS} \times \frac{A_T}{A_S} \times 5$$

Packaging and storage Preserve in tight containers.

Cefdinir Fine Granules
세프디니르 세립

Cefdinir Fine Granules contain NLT 93.0% and NMT 107.0% of the labeled amount of cefdinir ($C_{14}H_{13}N_5O_5S_2$: 395.41).

Method of preparation Prepare as directed under Powders, with Cefdinir.

Identification Weigh an amount of Cefdinir Fine Granules equivalent to 10 mg (potency) of cefdinir according

to the labeled amount, add 100 mL 0.1 mol/L phosphate buffer solution (pH 7.0), sonicate for 1 minute, and filter. To 2 mL of the filtrate, add 0.1 mol/L phosphate buffer solution (pH 7.0) to make 20 mL. Determine the absorption spectra of this solution as directed under the Ultraviolet-visible Spectroscopy; it exhibits maxima 221 to 225 nm and 285 to 289 nm.

Particle size distribution estimation by analytical sieving Meets the requirements.

Dissolution Weigh accurately an amount of Cefdinir Fine Granules equivalent to about 0.1 g (potency) according to the labeled potency, and perform the test at 50 revolutions per minute according to Method 2 under the Dissolution, using 900 mL of Solution 2 as the dissolution medium. Take NLT 20 mL of the dissolved solution 30 minutes after starting the test, and filter through a membrane filter with a pore size of NMT 0.5 μm. Discard the first 10 mL of the filtrate and use the subsequent filtrate as the test solution. Separately, weigh accurately an amount equivalent to about 28 mg (potency) of cefdinir RS, and dissolve in Solution 2 in the Dissolution to make exactly 50 mL. Pipet 4 mL of this solution, add Solution 2 in the Dissolution to make exactly 20 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas A_T and A_S of cefdinir. Meets the requirements if the dissolution rate of Cefdinir Fine Granules in 30 minutes is NLT 75%.

Dissolution rate (%) with respect to the labeled amount of cefdinir ($C_{14}H_{13}N_5O_5S_2$)

$$= \frac{Potency\ (mg)\ of\ cefdinir\ RS}{W_T} \times \frac{A_T}{A_S} \times \frac{1}{C} \times 360$$

W_T: Taken amount (g) of Cefdinir Fine Granules

C: Labeled amount [mg (potency)] of cefdinir ($C_{14}H_{13}N_5O_5S_2$) in 1 g

Operating conditions

Perform the test according to the operating conditions as directed under the Assay of Cefdinir.

System suitability

System performance: Proceed with 20 μL of the standard solution under the above operating conditions; the number of theoretical plates of the cefdinir peak is NLT 2,000 plates, and the symmetry factor is NMT 2.0.

System repeatability: Repeat the test 6 times with 20 μL each of the standard solutions according to the above conditions; the relative standard deviation of the peak area of cefdinir is NMT 1.0%.

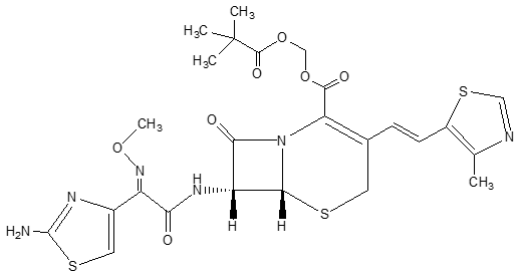
Uniformity of dosage units (distribution) Meets the requirements.

Assay Perform the test as directed under the Assay of Cefdinir. If necessary, weigh accurately an amount of powdered Cefdinir Fine Granules equivalent to 0.1 g (potency) of cefdinir according to the labeled amount, add 70 mL of 0.1 mol/L phosphate buffer solution (pH 7.0), shake for 30 minutes to mix, and add 0.1 mol/L phosphate buffer solution (pH 7.0) to make exactly 100 mL. Centrifuge this solution at 3000 rpm for 10 minutes, pipet 4 mL of the clear supernatant, add 0.1 mol/L phosphate buffer solution (pH 7.0), shake for 30 minutes to mix, and add 0.1 mol/L phosphate buffer solution (pH 7.0) to make exactly 20 mL, and use this solution as the test solution. Separately, weigh accurately about 20 mg (potency) of cefdinir RS, dissolve in 0.1 mol/L phosphate buffer solution (pH 7.0) to make exactly 100 mL, and use this solution as the standard solution.

Potency (mg) of cefdinir ($C_{14}H_{13}N_5O_5S_2$)
= Potency (mg) of cefdinir RS× $\frac{A_T}{A_S}$ ×5

Packaging and storage Preserve in light-resistant, tight containers.

Cefditoren Pivoxil
세프디토렌피복실



$C_{25}H_{28}N_6O_7S_3$: 620.72

2,2-Dimethylpropanoyloxymethyl (6*R*,7*R*)-7-[(2*E*)-2-(2-amino-1,3-thiazol-4-yl)-2-methoxyiminoacetamido]-3-[2-(4-methyl-1,3-thiazol-5-yl)ethen-1-yl]-3,4-didehydrocepham-4-carboxylate [*117467-28-4*]

Cefditoren Pivoxil contains NLT 770 μg (potency) and NMT 820 μg (potency) of cefditoren ($C_{19}H_{18}N_6O_5S_3$: 506.58) per mg, calculated on the anhydrous basis.

Description Cefditoren Pivoxil occurs as a pale yellowish white to pale yellow crystalline powder.
It is sparingly soluble in methanol, slightly soluble in acetonitrile or ethanol(95), very slightly soluble in ether, and practically insoluble in water.
It dissolves in dilute hydrochloric acid.

Identification (1) Dissolve 5 mg of Cefditoren Pivoxil in 3 mL of hydroxyammonium hydrochloride-ethanol TS, allow to stand for 5 minutes, add 1 mL of acidic ammonium iron(III) sulfate TS, and shake to mix; the resulting

solution exhibits a reddish brown color.

(2) Dissolve 1 mg of Cefditoren Pivoxil in 1 mL of dilute hydrochloric acid and 4 mL of water. While cooling, add 3 drops of sodium nitrite TS, shake to mix, and allow to stand for 2 minutes. Add 1 mL of ammonium amidosulfate TS, shake well to mix, and allow to stand for 1 minute. To this, add 1 mL of a solution prepared by dissolving 1.0 g of *N*,*N*-diethyl-*N*′-1-naphthylethylenediamine oxalate in 100 mL of a mixture of acetone and water (1 : 1); the resulting solution exhibits a violet color. Prepare the mixture of acetone and water (1 : 1) just before the use.

(3) Determine the absorption spectra of respective solutions of Cefditoren Pivoxil and cefditoren pivoxil RS in methanol (1 in 50000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(4) Determine ^{1}H of a solution of Cefditoren Pivoxil in deuterated chloroform for nuclear magnetic resonance spectroscopy (1 in 50) as directed under the Nuclear Magnetic Resonance Spectroscopy, using tetramethylsilane for nuclear magnetic resonance spectroscopy as the internal standard; it exhibits the singlet signals A, B and C at about δ 1.1 ppm, δ 2.4 ppm and δ 4.0 ppm, respectively, doublet signals D and E at about δ 6.4 ppm and δ 6.7 ppm, respectively, and singlet signal F at about δ 8.6 ppm, with the ratio of area strength of the signals A : B : C : D : E : F being about 9 : 3 : 3 : 1 : 1 : 1.

Optical rotation $[\alpha]_D^{20}$: Between -45° and -52° (50 mg, methanol, 10 mL, 100 mm).

Absorbance $E_{1cm}^{1\%}$ (231 nm): Between 340 and 360 (50 mg, methanol, 2500 mL).

Purity (1) ***Heavy metals***—Proceed with 2.0 g of Cefditoren Pivoxil as directed under Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Related substances***—Perform this test using a light-resistant container, protected from direct sunlight. Weigh accurately about 20 mg (potency) of Cefditoren Pivoxil, add exactly 5 mL of the internal standard solution, add acetonitrile to make exactly 20 mL, and use this solution as the test solution. Separately, weigh accurately about 20 mg (potency) of cefditoren pivoxil RS and add acetonitrile to make exactly 100 mL. Pipet 1 mL of this solution, add exactly 5 mL of the internal standard solution, add acetonitrile to make exactly 20 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the peak area ratios, Q_{TI}, Q_{TII} and Q_{TIII}, of the related substances I, II and III to that of the internal standard in the test solution, respectively, and the peak area ratio Q_S of cefditoren pivoxil to that of the internal standard. (related substance I NMT 1.5%, related substance II NMT 2.0%, and related substance III NMT 1.0%) The peak areas of related substances I, II and III are the results of multiplying the correction factors 1.25, 0.97 and 1.17 by the areas obtained according to the automatic integration method, respectively.

$$\text{Content (\%) of related substances} = \frac{Q_T}{Q_S} \times \frac{W_S}{W_T}$$

W_S: $\dfrac{\text{Taken amount (mg) of cefditoren pivoxil RS}}{\dfrac{\textit{Potency } (\mu g/mg) \textit{ of } \text{cefditoren pivoxil RS}}{816}}$

W_T: Taken amount (mg) of Cefditoren Pivoxil

Internal standard solution—A solution of acetonitrile in propyl p-hydroxybenzoate (1 in 40000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and 250 mm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: Dissolve 1.58 g of ammonium formate in 900 mL of water, adjust the pH to about 6.0 with diluted formic acid (1 in 250), and add water to make exactly 1000 mL. To 450 mL of this solution, add 275 mL of acetonitrile and 275 mL of methanol.

Flow rate: Adjust the flow rate so that the retention time of cefditoren pivoxil is about 15 minutes. Under this condition, the related substance I is eluted in about 6 minutes, the related substance II is eluted in about 17 minutes, and the related substance III is eluted in about 22 minutes.

Selection of column: Dissolve 20 mg of cefditoren pivoxil RS and 5 mg of propyl p-hydroxybenzoate in 20 mL of acetonitrile, and proceed with 10 μL of this solution according to the above conditions. Use a column with which propyl p-hydroxybenzoate and cefditoren pivoxil are eluted in this order with the resolution being NLT 5.0.

(3) ***Other related substances***—Perform this test using a light-resistant container, protected from direct sunlight. Weigh accurately about 20 mg (potency) of Cefditoren Pivoxil, add acetonitrile to make exactly 20 mL, and use this solution as the test solution. Separately, weigh accurately about 20 mg (potency) of cefditoren pivoxil RS, and dissolve in acetonitrile to make exactly 100 mL. Pipet 1 mL of this solution, add acetonitrile to make exactly 20 mL, and use it as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the conditions of (2); each peak area, other than cefditoren pivoxil and related substances I, II and III, obtained from the test so-

lution is not larger than the peak area of cefditoren pivoxil from the standard solution (NMT 1.0%), and the sum of peak areas obtained from the test solution is not larger than 2 times the peak area of cefditoren pivoxil from the standard solution (NMT 2.0%). For detection sensitivity and time span of measurement, proceed as below.

Detection sensitivity: Adjust the sensitivity so that the peak height of cefditoren pivoxil from 10 μL of the standard solution is between 5% and 10% of the full scale.

Time span of measurement: About 2 times the retention time of cefditoren pivoxil after the solvent peak

Water NMT 1.5% (0.5 g, volumetric titration, direct titration).

Residue on ignition NMT 0.1% (1 g).

Assay Perform this test using a light-resistant container, protected from direct sunlight. Weigh accurately about 40 mg (potency) each of Cefditoren Pivoxil and cefditoren pivoxil RS, dissolve each in respective 40 mL of acetonitrile, add exactly 10 mL of the internal standard solution to each, and add acetonitrile to each to make 100 mL. Use these solutions as the test solution and the standard solution, respectively. Perform the test with 10 μL each of these solutions as directed under the Liquid Chromatography according to the following conditions, and calculate the peak area ratios, Q_T and Q_S, of cefditoren pivoxil to that of the internal standard, respectively.

$$\text{Potency (μg) of cefditoren } (C_{19}H_{18}N_6O_5S_3) = \text{Potency (μg) of cefditoren pivoxil RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of acetonitrile in propyl p-hydroxybenzoate (1 in 200).

Operating conditions

Detector: An ultraviolet absorption spectrophotometer (wavelength: 230 nm).

Column: A stainless steel column about 4.6 mm internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: Dissolve 1.58 g of ammonium formate in 900 mL of water, adjust the pH to 6.0 with diluted formic acid (1 in 250), and add water to make 1000 mL. To 450 mL of this solution, add 275 mL of acetonitrile and 275 mL of methanol.

Flow rate: Adjust the flow rate so that the retention time of cefditoren pivoxil is about 15 minutes.

System suitability

System performance: Proceed with 10 μL of the standard solution according to the above conditions; the internal standard and cefditoren pivoxil are eluted in this order with the resolution being NLT 5.

System repeatability: Repeat the test 5 times with 10 μL each of the standard solutions according to the above conditions; the relative standard deviation of the peak area ratio of cefditoren pivoxil to that of the internal standard is NMT 1.0%.

Packaging and storage Preserve in light-resistant, tight containers

Cefditoren Pivoxil Fine Granules
세프디토렌피복실 세립

Cefditoren Pivoxil Granules

Cefditoren Pivoxil Fine Granules contain NLT 90.0% and NMT 110.0% of labeled amount of cefditoren ($C_{19}H_{18}N_6O_5S_3$: 506.58).

Method of preparation Prepare as directed under Powders, with Cefditoren Pivoxil.

Identification (1) Powder Cefditoren Pivoxil Fine Granules, weigh an appropriate amount of Cefditoren Pivoxil Fine Granules equivalent to 0.1 g (potency) of cefditoren pivoxil, according to the labeled amount, add 10 mL of acetonitrile, shake vigorously to mix, and filter. To 1 mL of the filtrate, add acetonitrile to make 50 mL. To 1 mL of this solution, add acetonitrile to make 20 mL, and determine the absorption spectrum of the resulting solution as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum 230 nm to 234 nm.

(2) Proceed as directed under the Assay; the test solution and the standard solution exhibit peaks at the same retention time.

Purity (1) ***Related substances***—Perform the test as directed under the Purity (2) Cefditoren Pivoxil. Weigh accurately about 16 mg (potency) of pulverized Cefditoren Pivoxil Fine Granules according to the labeled potency, add 10 mL of diluted acetonitrile (3 in 4), shake to mix, add exactly 5 mL of the internal standard solution and diluted acetonitrile (3 in 4) to make exactly 20 mL, and filter. Centrifuge the filtrate, and use this solution as the test solution (NMT 2.0% for related substance I, NMT 3.5% for related substance II, and NMT 1.0% for related substance III).

(2) ***Other related substances***—Perform the test as directed under the Purity (3) of Cefditoren Pivoxil. Weigh accurately about 16 mg (potency) of pulverized Cefditoren Pivoxil Fine Granules according to the labeled potency, add 10 mL of diluted acetonitrile (3 in 4), shake to mix, add diluted acetonitrile (3 in 4) to make exactly 20 mL, filter, centrifuge, and use the solution as the test solution. Each peak area, other than cefditoren pivoxil, related substances I, II and III from the test solution is NMT that of cefditoren pivoxil from the standard solution

(NMT 1.0%), and the sum of peak areas obtained from the test solution is NMT 2 times the peak area of cefditoren pivoxil from the standard solution (NMT 2.0%).

Loss on drying NMT 4.5% (0.5 g, in vacuum at the pressure not exceeding·0.67 kPa, 60 ℃, 3 hours).

Dissolution Perform the test as directed under the Dissolution of Cefditoren Pivoxil Tablets Weigh accurately an amount of Cefditoren Pivoxil Fine Granules equivalent to about 0.1 g (potency) according to the labeled potency, and perform the test at 50 revolutions per minute according to Method 2, using 900 mL of Solution 1 for the Disintegration as the dissolution medium. Take NLT 20 mL of the dissolved solution 20 minutes after starting the test, and filter. Discard the first 10 mL of the filtrate, pipet 2 mL of the subsequent filtrate, add water to make exactly 20 mL, and use this solution as the test solution. Perform the test with the test solution and the standard solution as directed under the Ultraviolet-visible Spectroscopy using the dissolution medium as a control solution; it meets the requirements if the dissolution rate of Cefditoren Pivoxil Fine Granules in 30 minutes is NLT 80%.

Particle size distribution estimation by analytical sieving Meets the requirements.

Uniformity of dosage units (distribution) Meets the requirements.

Assay Perform the test using a light-resistant container protected from direct sunlight. Weigh accurately an amount of powdered Cefditoren Pivoxil Fine Granules, equivalent to about 40 mg (potency) of cefditoren pivoxil according to the labeled amount, add 70 mL of diluted acetonitrile (3 in 4), and shake vigorously to mix. To this solution, add exactly 10 mL of the internal standard solution and acetonitrile to make 100 mL, filter, and use the filtrate as the test solution. Separately, weigh accurately about 20 mg (potency) of cefditoren pivoxil RS, dissolve in 20 mL of acetonitrile, add exactly 5 mL of the internal standard solution, add acetonitrile to make 50 mL, and use this solution as the standard solution. Perform the test as directed under the Assay of Cefditoren Pivoxil.

$$\text{Potency (μg) of cefditoren } (C_{19}H_{18}N_6O_5S_3) = \text{Potency (μg) of cefditoren pivoxil RS} \times \frac{Q_T}{Q_S} \times 2$$

Internal standard solution—An acetonitrile solution of propyl *p*-hydroxybenzoate (1 in 200).

Packaging and storage Preserve in light-resistant, tight containers.

Cefditoren Pivoxil Tablets
세프디토렌피복실 정

Cefditoren Pivoxil Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of cefditoren ($C_{19}H_{18}N_6O_5S_3$: 506.58).

Method of preparation Prepare as directed under Tablets, with Cefditoren Pivoxil.

Identification (1) Powder Cefditoren Pivoxil Tablets, weigh a portion of the powder equivalent to 35 mg (potency) of cefditoren pivoxil according to the labeled amount, add 100 mL of methanol, shake to mix, and filter. To 5 mL of the filtrate, add methanol to make 100 mL, and determine the absorption spectrum of the resulting solution as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum between 229 nm and 233 nm.

(2) Perform the test as directed under the Assay; the test solution and the standard solution exhibit peaks at the same retention time.

Loss on drying NMT 4.0% (0.5 g, in vacuum at the pressure not exceeding·0.67 kPa, 60 ℃, 3 hours).

Dissolution Perform the test with 1 tablet of Cefditoren Pivoxil Tablets at 50 revolutions per minute according to Method 2 under the Dissolution, using 900 mL of Solution 1 for dissolution test as the dissolution medium. Take NLT 20 mL of the dissolved solution after 20 minutes from the beginning of the dissolution test, and filter through a membrane filter with a pore size of NMT 0.45 μm. Discard the first 10 mL of the filtrate, pipet *V* mL of the subsequent filtrate, add water to make exactly *V'* mL of a solution containing about 11 μg (potency) of cefditoren pivoxil per mL according to the labeled amount, and use this solution as the test solution. Separately, weigh accurately about 22 mg (potency) of cefditoren pivoxil RS, dissolve in 20 mL of diluted acetonitrile (3 in 4), and add Solution 1 for dissolution test to make exactly 200 mL. Pipet 2 mL of this solution, add water to make exactly 20 mL, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution at the wavelength of 272 nm as directed under the Ultraviolet-visible Spectroscopy, using water as a control solution. Meets the requirements if the dissolution rate of Cefditoren Pivoxil Tablets in 20 minutes is NLT 85%.

$$\text{Dissolution rate (\%) with respect to the labeled amount of cefditoren pivoxil } (C_{25}H_{28}N_6O_7S_3) = \text{Potency (mg) of cefditoren pivoxil RS} \times \frac{A_T}{A_S} \times \frac{V'}{V} \times \frac{1}{C} \times 45$$

C: Labeled amount [mg (potency)] of cefditoren

pivoxil ($C_{25}H_{28}N_6O_7S_3$) in 1 tablet

Uniformity of dosage units It meets the requirements when the procedure for content uniformity is performed according to the following method. Perform the test using light-resistant containers away from direct sunlight. To 1 tablet of Cefditoren Pivoxil Tablets, add exactly 12.5 mL of Solution 1 for dissolution test, and shake vigorously to mix. Add about 25 mL of acetonitrile, shake to mix again, and add acetonitrile to make exactly 50 mL. Weigh accurately V mL of this solution, equivalent to about 20 mg (potency) of cefditoren pivoxil according to the labeled amount, add exactly 5 mL of the internal standard solution, then add diluted acetonitrile (3 in 4) to make exactly 50 mL, filter, and use the filtrate as the test solution. Separately, weigh accurately about 20 mg (potency) of cefditoren pivoxil RS, add exactly 2.5 mL of Solution 1 for dissolution test, shake vigorously to mix, dissolve in 20 mL of diluted acetonitrile (3 in 4), add 5 mL of internal standard solution, and then add diluted acetonitrile (3 in 4) again to make exactly 50 mL, and use this solution as the standard solution. Perform the test as directed under the Assay of Cefditoren Pivoxil.

Potency (μg) of cefditoren ($C_{19}H_{18}N_6O_5S_3$)
= Potency (μg) of cefditoren pivoxil RS
× Q_T / Q_S × 50 / V

Internal standard solution—A solution of propyl p-hydroxybenzoate in acetonitrile (1 in 200).

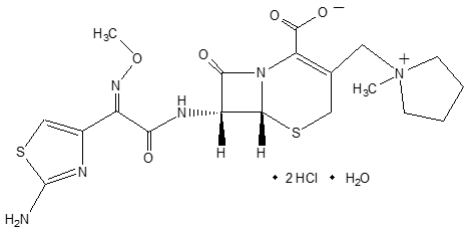
Assay Perform this test using light-resistant containers, protected from direct sunlight. Weigh accurately an amount of Cefditoren Pivoxil Tablets, equivalent to 0.5 g (potency) of cefditoren pivoxil according to the labeled amount, add 63 mL of Solution 1 for dissolution test, shake vigorously to mix, add 125 mL of acetonitrile, shake to mix again, and add acetonitrile to make exactly 250 mL. Pipet 10 mL of this solution, add exactly 5 mL of the internal standard solution, add diluted acetonitrile (3 in 4) to make exactly 50 mL, filter, and use the filtrate as the test solution. Separately, weigh accurately about 20 mg (potency) of cefditoren pivoxil RS, add 2.5 mL of the Solution 1 for dissolution test, shake vigorously to mix, dissolve in 20 mL of diluted acetonitrile (3 in 4), add 5 mL of internal standard solution, then add diluted acetonitrile (3 in 4) to make exactly 50 mL, and use this solution as the standard solution. Perform the test as directed under the Assay of Cefditoren Pivoxil.

Potency (μg) of cefditoren ($C_{19}H_{18}N_6O_5S_3$)
= Amount (μg) of cefditoren pivoxil RS × Q_T / Q_S × 25

Internal standard solution—A solution of propyl p-hydroxybenzoate in acetonitrile (1 in 200).

Packaging and storage Preserve in tight containers.

Cefepime Dihydrochloride Hydrate
세페핌염산염수화물



$C_{19}H_{24}N_6O_5S_2 \cdot 2HCl \cdot H_2O$: 571.50

(6R,7R)-7-{2-[(2Z)-2-(2-Amino-1,3-thiazol-4-yl)-2-methoxyimino]acetamido}-3-(1-methyl-pyrrolidin-1-ium-1-yl)methyl-3,4-didehydrocepham-4-carboxylate hydrate dihydrochloride [*123171-59-5*]

Cefepime Dihydrochloride Hydrate contains NLT 835 μg and NMT 886 μg (potency) of cefepime ($C_{19}H_{24}N_6O_5S_2$: 480.56) per mg, calculated on the anhydrous basis.

Description Cefepime Dihydrochloride Hydrate occurs as white to yellow crystals or a crystalline powder.
It is freely soluble in water or methanol, slightly soluble in ethanol(95) and practically insoluble in ether.

Identification (1) Weigh 20 mg (potency) of Cefepime Dihydrochloride Hydrate, dissolve in 2 mL of water, add 1 mL of hydroxylamine hydrochloride solution (1 in 10) and 2 mL of sodium hydroxide TS, and allow to stand for 5 minutes. Then, add 3 mL of 1 mol/L hydrochloric acid TS, and 3 drops of Iron(III) chloride TS; the solution exhibits a reddish brown color.

(2) Weigh about 15 mg (potency) of Cefepime Dihydrochloride Hydrate, dissolve in 5 mL of water, and add 2 drops of silver nitrate TS; the solution becomes turbid in white.

(3) Determine the absorption spectra of aqueous solutions of Cefepime Dihydrochloride Hydrate and cefepime hydrochloride RS (1 in 20000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(4) Determine the infrared spectra of Cefepime Dihydrochloride Hydrate and cefepime hydrochloride RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(5) Weigh 50 mg (potency) of Cefepime Dihydrochloride Hydrate, dissolve in 5 mL of deuterium water, and determine the nuclear magnetic resonance spectrum as directed under the Nuclear Magnetic Resonance Spectroscopy (^{1}H); it exhibits a single line signal at around 3.1 ppm and around 7.2 ppm, respectively, and the area ratio strength of each signal is 3 : 1.

Crystallinity Meets the requirements.

Optical rotation $[\alpha]_D^{20}$: Between +39° and +47° (60 mg calculated on the anhydrous basis, water, 20 mL, 100 mm).

Absorbance $E_{1cm}^{1\%}$ (259 nm): Between 310 and 340 (60 mg calculated on the anhydrous basis, water, 1 mL).

pH Dissolve 0.1 g (potency) of Cefepime Dihydrochloride Hydratein in 10 mL of water; the pH is between 1.6 and 2.1.

Purity (1) ***Clarity and color of solution***—Dissolve 0.5 g of Cefepime Dihydrochloride Hydrate in 50 mL of an arginine solution; the solution is clear and the color of the solution is not more intense than the Matching Fluid for Color H.

(2) ***Heavy metals***—Proceed with 1.0 g of Cefepime Dihydrochloride Hydrate according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of the lead standard solution (NMT 20 ppm).

(3) ***Related substances***—(i) *N*-Methylpyrrolidone: Weigh accurately about 80 mg (potency) of Cefepime Dihydrochloride Hydrate, dissolve in dilute nitric acid (2 in 3125) to make exactly 10 mL, and use this solution as the test solution. Separately, add 30 mL of water to a 100-mL volumetric flask and weigh accurately the mass. Spot about 0.125 g of *N*-methylpyrrolidone RS into this solution, weigh accurately the mass, and add water to this solution to make 100 mL. Take exactly 4 mL of this solution, add diluted nitric acid (2 in 3125) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 100 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions and determine the peak areas, A_T and A_S, of *N*-Methylpyrrolidone in the test solution and in the standard solution.

$$\text{Content (\%) of } N\text{-methylpyrrolidone} = \frac{Amount\ (mg)\ of\ N\text{-methylpyrrolidone RS} \times f}{Amount\ (mg)\ of\ Cefepime\ Dihydrochloride\ Hydrate\ taken} \times \frac{A_T}{A_S} \times \frac{1}{250}$$

f: Purity (%) of *N*-methylpyrrolidone RS

Operating conditions

Detector: An electrical conductivity detector

Column: A plastic tube about 4.6 mm in internal diameter and about 5 cm in length, packed with 5 μm of hydrophilic silica gel for liquid chromatography, was introduced with sulfonic acid groups with an exchange capacity of about 0.3 meq/g.

Column temperature: A constant temperature of about 35 °C.

Mobile phase: Add 10 mL of acetonitrile to 990 mL of diluted nitric acid (2 in 3125).

Flow rate: 1.0 mL/min

System suitability

System performance: Add about 0.125 g of *N*-methylpyrrolidone RS to 20 mL of a sodium chloride solution (3 in 1000). Take exactly 4 ml of the solution prepared by adding water to make 100 mL, and add diluted nitric acid (2 in 3125) to make 100 mL. Proceed with 100 μL of this solution under the above operating conditions; sodium and *N*-methylpyrrolidone are eluted in this order with the resolution being NLT 2.0.

System repeatability: Repeat the test 5 times with 100 μL of the standard solution under the above operating conditions; the relative standard deviation of the peak area of *N*-methylpyrrolidone is NMT 4.0%.

(ii) Other related substances: Weigh accurately about 0.1 g (potency) of Cefepime Dihydrochloride Hydrate, dissolve in the mobile phase A to make exactly 50 mL, and use this solution as the test solution. Take 5 μL of the test solution and perform the test as directed under the Liquid Chromatography according to the following conditions. Determine the peak area in the test solution and calculate the amount of related substances as directed under the percentage peak area method (NMT 0.5%).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: Mix the mobile phase A with the mobile phase B from 0% to 25% at a rate of 1% per minute.

Mobile phase A: Dissolve 0.57 g of ammonium dihydrogen phosphate in 1000 mL of water.

Mobile phase B: Acetonitrile.

Flow rate: Adjust the flow rate so that the retention time of cefepime is about 9.5 minutes.

System suitability

Test for required detectability: Pipet 1.0 mL of the test solution, add the mobile phase A to make exactly 10 mL, and use this solution as the system suitability solution. Pipet 1 mL of the system suitability solution, add the mobile phase A to make 10 mL, and use this solution as the detection confirmation solution. Pipet 1 mL of the detection confirmation solution and add the mobile phase A to make 10 mL. Confirm that the peak area of cefepime obtained from 5 μL of this solution is 7 to 13% of the peak area of cefepime obtained from 5 μL of the detection confirmation solution.

System performance: Proceed with 5 μL of the system suitability solution under the above operating conditions; the number of theoretical plates of the peak of cefepime is NMT 6000.

System repeatability: Repeat the test 3 times with 5 mL of the system suitability solution under the above operating conditions; the relative standard deviation of the peak area for cefepime is NMT 2.0%.

Time span of measurement: About 2.5 times of the retention time of cefepime.

Water Between 3.0% and 4.5%. However, weigh accurately about 50 mg of Cefepime Dihydrochloride Hydrate, and dissolve in 2 mL of methanol for water determination. Pipet 0.5 mL of this solution and perform the test (volumetric titration, direct titration).

Residue on ignition NMT 0.1% (1 g).

Sterility It meets the requirements when used in sterility preparations. However, it is excluded in cases where there is a terminal sterilization process in the manufacturing of sterile preparations.

Bacterial endotoxins It is less than 0.04 EU per mg of cefepime (potency) when used in the manufacturing of sterile preparations. Weigh accurately about 30 mg (potency) of Cefepime Dihydrochloride Hydrate, dissolve in water for bacterial endotoxins, and adjust the pH to 6.0 to 7.5 using 1 mol/L sodium hydroxide TS for bacterial endotoxins or 1 mol/L hydrochloric acid TS for bacterial endotoxins, and then add water for bacterial endotoxins again to make exactly 5 mL. Pipet a certain amount of this solution, add water for bacterial endotoxins to reach an appropriate concentration, and use this solution as the test solution.

Assay Weigh accurately about 60 mg (potency) each of Cefepime Dihydrochloride Hydrate and cefepime dihydrochloride hydrate RS, dissolve each in the mobile phase to make exactly 50 mL, and use these solutions as the test solution and the standard solution, respectively. Proceed with 10 μL each of the test solution and the standard solution, and perform the test as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of cefepime in the test solution and the standard solution.

$$\text{Potency (μg) of cefepime } (C_{19}H_{24}N_6O_5S_2) = \text{Potency (μg) of cefepime dihydrochloride hydrate RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 3.9 mm in internal diameter and 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: Adjust the pH of sodium 1-pentanesulfonate solution (261 in 100000) to 3.4 using acetic acid(100), and then adjust the pH to 4.0 using potassium hydroxide solution (13 in 20). Add 50 mL of acetonitrile to 950 mL of this solution.

Flow rate: Adjust the flow rate so that the retention time of cefepime is about 8 minutes.

System suitability

System performance: Proceed with 10 μL of the standard solution under the above operating conditions; the number of theoretical plates of the peak of cefepime is NMT 1500.

System repeatability: Repeat the test 5 times with 10 μL of the standard solution according to the above conditions; the relative standard deviation of the peak area of cefepime is NMT 2.0%.

Packaging and storage Preserve in light-resistant, tight containers.

Cefepime Dihydrochloride for injection
주사용 세페핌염산염

Cefepime Dihydrochloride for injection, as an injection that is dissolved upon use, contains NLT 95.0% and NMT 110.0% of the labeled amount of cefepime ($C_{19}H_{24}N_6O_5S_2$: 480.56).

Method of preparation Prepare as directed under Injections, with Cefepime Dihydrochloride Hydrate.

Description Cefepime Dihydrochloride for injection occurs as a white to pale yellow powder.

Identification Perform the test with Cefepime Dihydrochloride for injection as directed under the Identification (1) and (3) under Cefepime Dihydrochloride Hydrate.

pH Dissolve an amount of Cefepime Dihydrochloride for injection equivalent to 0.1 g (potency) of cefepime dihydrochloride in 1 mL of water; the pH of this solution is between 4.0 and 6.0.

Purity (1) ***Clarity and color of solution***—Dissolve an amount of Cefepime Dihydrochloride for injection, equivalent to 0.5 g (potency) of cefotiam hydrochloride hydrate according to the labeled amount, in 5 mL of water; the resulting solution is colorless or pale yellow.

(2) ***N-Methylpyrrolidone***—Perform the test as directed under the Purity (2) under Cefepime Dihydrochloride Hydrate. However, weigh accurately about 0.2 g (potency) according to the labeled potency of Cefepime Dihydrochloride for injection, dissolve in diluted nitric acid (2 in 625) to make exactly 20 mL, and use this solution as the test solution (NMT 1.0%).

Water NMT 4.0%. However, perform the test as directed under the Water test under Cefepime Dihydrochlo-

ride Hydrate (volumetric titration, direct titration).

Sterility Meets the requirements.

Bacterial endotoxins Meets the requirements. Cefepime Dihydrochloride for injection is NLT 0.06 EU per mg (potency) of cefepime. However, dissolve about 0.1 g (potency) according to the labeled potency of Cefepime Dihydrochloride for injection in water for endotoxin assay, adjust the pH, if necessary, to between 6.0 and 7.5 using 0.1 mol/L sodium hydroxide TS for endotoxin assay or 0.1 mol/L hydrochloric acid TS for endotoxin assay, and add water for endotoxin assay to make a solution having a known concentration of about 0.1 g (potency) per mL. Pipet a certain amount of this solution, add water for endotoxin assay to reach an appropriate concentration, and use this solution as the test solution.

Particulate contamination: Visible particles Meets the requirements.

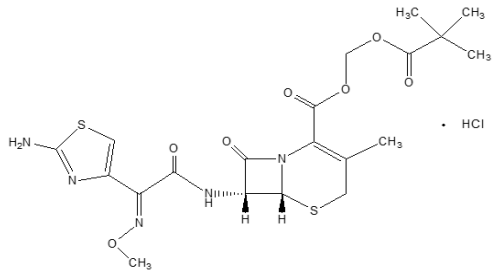
Insoluble particulate matter in injections Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Perform the test as directed under the Assay under Cefepime Dihydrochloride Hydrate. However, weigh accurately about 60 mg (potency) according to the labeled potency of Cefepime Dihydrochloride for injection, dissolve in the mobile phase to make exactly 50 mL, and use this solution as the test solution.

Packaging and storage Preserve in hermetic containers.

Cefetamet Pivoxil Hydrochloride
세페타메트피복실염산염



$C_{20}H_{25}N_5O_7S_2 \cdot HCl$: 548.04

(6*R*,7*R*)-(2,2-Dimethyl-1-oxopropoxy)methyl 7-[[(2*Z*)-2-(2-amino-4-thiazolyl)-2-(methoxyimino)acetyl]amino]-3-methyl-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid hydrochloride (1:1), [*65243-33-6*]

Cefetamet Pivoxil Hydrochloride contains NLT 653 μg (potency) of cefetamet $C_{14}H_{15}N_5O_5S_2$: 397.43) per mg, calculated on the anhydrous basis.

Description Cefetamet Pivoxil Hydrochloride occurs as a white to pale yellow crystalline powder.
It is odorless or has a slight, characteristic odor and a bitter taste.
It is very soluble in methanol or dimethylformamide, freely soluble in ethanol and practically insoluble in water or ether.

Identification (1) Weigh 10 mg (potency) of Cefetamet Pivoxil Hydrochloride, dissolve in 2 mL of diluted methanol (1 → 2), add 3 mL of a hydroxylamine hydrochloride-ethanol solution, and allow it to stand for 5 minutes. Add 1 mL of acidic ammonium iron(III) sulfate TS, and shake well to mix; the solution exhibits a reddish brown color.

(2) Weigh 50 mg (potency) of Cefetamet Pivoxil Hydrochloride, dissolve in 2 mL of methanol, add 3 ml of dilute nitric acid and 1 mL of silver nitrate TS, and shake well to mix; a white precipitate is formed.

(3) Determine the infrared spectra of Cefetamet Pivoxil Hydrochloride and cefetamet pivoxil hydrochloride RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(4) Determine the absorption spectrum as directed under the Ultraviolet-visible Spectroscopy with a solution of Cefetamet Pivoxil Hydrochloride in 0.01mol/L hydrochloric acid TS (1 in 50000); it exhibits a maximum between 261 nm and 265 nm.

(5) Determine 1H as directed under the Nuclear Magnetic Resonance Spectroscopy with a solution (1 in 20) of deuterated dimethylsulfoxide for nuclear magnetic resonance spectrum of Cefetamet Pivoxil Hydrochloride and tetramethylsilane for nuclear magnetic resonance spectrum as internal standard; it exhibits a single line signal at around 1.2 ppm, 2.0 ppm, 3.9 ppm, and 6.9 ppm, and the area ratio strength of each signal is 9 : 3 : 3 : 1.

Optical rotation $[\alpha]_D^{20}$: Between +76° and +84° (0.25 g, calculated on the anhydrous basis, ethanol, 25 mL, 100 mm).

Absorbance $E_{1cm}^{1\%}$ (263 nm): Between 327 and 347 (20 mg, calculated on the anhydrous basis, 0.1 mol/L hydrochloric acid TS, 1000 mL).

Purity ***Heavy metals***—Proceed with 1.0 g of Cefetamet Pivoxil Hydrochloride according to Method 4 under the Heavy Metals and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

Water NMT 1.0% (1.0 g, volumetric titration, direct titration).

Assay Weigh accurately about 20 mg (potency) of each Cefetamet Pivoxil Hydrochloride and cefetamet pivoxil hydrochloride RS, dissolve in diluent I to make exactly

50 mL. Pipet each 5 mL of this solution, add exactly 6 mL of the internal standard solution, add diluent II to make exactly 50 mL, and use this solution as the test solution and the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the ratios, Q_T and Q_S of the peak area of Cefetamet Pivoxil Hydrochloride to that of the internal standard.

$$\text{Potency (μg) of cefetamet } (C_{14}H_{15}N_5O_5S_2) = \text{Potency (μg) of cefetamet pivoxil hydrochloride RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A diluent solution II of diethyl phthalate (1 in 500).

Diluent I—A mixture of water and acetonitrile (11 : 9).

Diluent II—Weigh 3.20 g of tetra *n*-heptylammonium bromide, dissolve in 360 mL of acetonitrile, and add 92 mL of methanol and 548 mL of water.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 263 nm).

Column: A stainless steel column about 6 mm in internal diameter and 150 mm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 20 °C.

Mobile phase: Weigh 5.796 g of anhydrous sodium dihydrogen phosphate and 3.522 g of potassium dihydrogen phosphate, dissolve in water to make exactly 1000 mL, and use this solution as the solution A. Weigh 20.256 g of citric acid and 7.840 g of sodium hydroxide, dissolve in water to make 1000 mL, and use this solution as the solution B. Weigh 3.20 g of tetra *n*-heptylammonium bromide, dissolve in 360 mL of acetonitrile, and add 92 mL of methanol, 500 mL of water, 44 mL of the solution A and 4 mL of the solution B.

Flow rate: Adjust the flow rate so that the retention time of cefetamet pivoxil is about 10 minutes.

Selection of column: Proceed with 10 μL of the standard solution according to the above conditions; cefetamet pivoxil and the internal standard are eluted in this order with the resolution being NLT 6.0.

Packaging and storage Preserve in tight containers.

Cefetamet Pivoxil Hydrochloride Tablets
세페타메트피복실염산염 정

Cefetamet Pivoxil Hydrochloride Tablets contain cefetamet ($C_{14}H_{15}N_5O_5S$: 397.43) equivalent to NLT 90.0% and NMT 120.0% of the labeled amount.

Method of preparation Prepare as directed under Tablets, with Cefetamet Pivoxil Hydrochloride.

Identification (1) Weigh about 20 mg (potency) according to the labeled amount of Cefetamet Pivoxil Hydrochloride Tablets, add 2 mL of methanol, shake to mix, and centrifuge at 2500 revolutions per minute for 10 minutes. To 1 mL of the clear supernatant, add 1 mL of water and 3 mL of hydroxylamine hydrochloride-ethanol TS, allow to stand for 5 minutes, add 1 mL of acidic ammonium iron(III) sulfate TS, and shake to mix; the resulting solution exhibits a reddish brown color.

(2) Weigh about 10 mg (potency) according to the labeled amount of Cefetamet Pivoxil Hydrochloride Tablets, add about 30 mL of 0.1 mol/L hydrochloric acid TS, and sonicate for 2 minutes. Add 0.1 mol/L hydrochloric acid TS to make 50 mL, and filter. To 5 mL of the filtrate, add 0.1 mol/L hydrochloric acid TS to make exactly 50 mL, and use this solution as the test solution. Perform the test with the test solution as directed under the Identification (4) of Cefetamet Pivoxil Hydrochloride.

(3) Weigh accurately about 0.1 g (potency) according to the labeled amount of Cefetamet Pivoxil Hydrochloride Tablets, add 8.8 mL of methanol, and shake to mix for 10 minutes. Then, add 1.0 mL of a solution of calcium chloride in methanol (1 in 8) and 0.2 mL of a mixture of methanol and strong ammonia water (3 : 2), shake to mix, and centrifuge at 3000 revolutions per minute for 10 minutes. Use the clear supernatant as the test solution. Separately, weigh about 20 mg (potency) of cefetamet pivoxil hydrochloride RS, dissolve in 2.0 mL of methanol, and use this solution as the standard solution. Perform the test with these solutions as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the 0.2 mm-thick thin-layer chromatographic plate made using silica gel with fluorescent indicator for thin-layer chromatography prepared by combining 10 μm to 12 μm silica gel with octadecyl group. Develop the plate with a mixture of methanol and hydrochloric acid potassium chloride buffer solution TS (pH 2.0) (8 : 5) as the developing solvent to a distance of about 12 cm, and air-dry the plate, and examine the plate under ultraviolet light (main wavelength: 254 nm); the spots obtained from the test solution and the standard solution exhibit a dark violet color, and the Rf values obtained from the test solution and the standard solution are the same.

Water NMT 2.0% (0.5 g, volumetric titration, direct titration).

Dissolution Perform the test with 1 tablet of Cefetamet Pivoxil Hydrochloride Tablets at 100 revolutions per minute using a sinker according to Method 2 under the Dissolution, using 900 mL of Solution 1 in the Disintegration

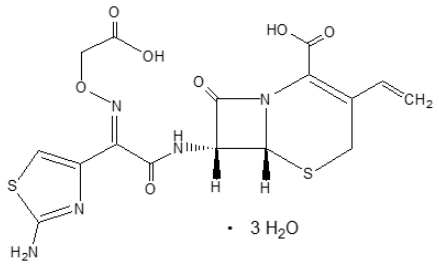
as the dissolution medium. Take 20 mL of the dissolved solution 60 minutes after starting the test, and filter through a membrane filter with a pore size of NMT 0.5 μm. Discard the first 10 mL of this filtrate, pipet a suitable amount of the subsequent filtrate, and add dissolution medium to dilute so that the dissolved solution contains 20 to 30 μg (potency). Use this solution as the test solution. Separately, weigh accurately about 15 mg of cefetamet pivoxil hydrochloride RS, and dissolve in the dissolution medium to make exactly 50 mL. Pipet 5 mL of this solution, add the dissolution medium to make exactly 50 mL, and use this solution as the standard solution. With the test solution and the standard solution, perform the test as directed under the Ultraviolet-visible Spectroscopy using the dissolution medium as a control solution, and determine the absorbances, A_T and A_S, at the wavelength of 263 nm. It meets the requirements when the amount dissolved of Cefetamet Pivoxil Hydrochloride Tablets in 60 minutes is NLT 75.0% of the labeled potency.

Uniformity of dosage units Meets the requirements.

Assay Proceed as directed under the Assay under Cefetamet Pivoxil Hydrochloride. Weigh accurately about 20 mg (potency) according to the labeled amount of Cefetamet Pivoxil Hydrochloride Tablets, dissolve in 40 mL of diluent I, sonicate for 2 minutes, and add diluent I again to make exactly 50 mL. Centrifuge this solution at 3000 revolutions per minute for 10 minutes, pipet 5 mL of the clear supernatant, add exactly 6 mL of the internal standard solution, and add diluent II to make exactly 50 mL. Use this solution as the test solution.

Packaging and storage Preserve in tight containers.

Cefixime
세픽심수화물



Cefixime $C_{16}H_{15}N_5O_7S_2 \cdot 3H_2O$: 507.50
(6*R*,7*R*)-7-[(2*E*)-2-(2-Amino-1,3-thiazol-4-yl)-2-(carboxymethoxyimino)acetamido]-3-ethenyl-3,4-didehydrocepham-4-carboxylic acid trihydrate [*125110-14-7*]

Cefixime Hydrate contains NLT 930 μg (potency) and NMT 1020 μg (potency) of cefixime ($C_{16}H_{15}N_5O_7S_2$: 453.45) per mg, calculated on the anhydrous basis.

Description Cefixime Hydrate occurs as a white to pale yellow crystalline powder.
It is freely soluble in methanol or dimethylsulfoxide, sparingly soluble in ethanol(99.5), and practically insoluble in water.

Identification (1) Determine the absorption spectra of solutions of Cefixime Hydrate and cefixime RS in 0.1 mol/L phosphate buffer solution, pH 7.0 (1 in 62500) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Cefixime Hydrate and cefixime RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) Dissolve 50 mg of Cefixime Hydrate in 0.5 mL of a mixture of deuterated dimethylsulfoxide for nuclear magnetic resonance spectroscopy and deuterium oxide for nuclear magnetic resonance spectroscopy (4:1). With this solution, determine ^1H as directed under the Nuclear Magnetic Resonance Spectroscopy using tetramethylsilane
for nuclear magnetic resonance spectroscopy as the internal standard; the resulting spectrum exhibits the singlet signal A near δ 4.7 ppm, the multiplet signal B near δ 6.5 ppm to δ 7.4 ppm, and the area intensity ratio A : B of each signal is 1 : 1.

Crystallinity Meets the requirements.

Optical rotation $[\alpha]_D^{20}$: Between -75° and -88° (0.45 g, calculated on the anhydrous basis, sodium bicarbonate (1 in 50), 50 mL, 100 mm).

pH The pH of a saturated solution of Cefixime Hydrate is between 2.4 and 4.1.

Absorbance $E_{1cm}^{1\%}$ (288 nm): Between 500 and 550 (70 mg, calculated on the anhydrous basis, 0.1 mol/L phosphate buffer (pH 7.0), 5 L).

Purity ***Related Substances***—Dissolve 0.1 g of Cefixime Hydrate in 100 mL of 0.1 mol/L phosphate buffer solution, pH 7.0, and use this solution as the test solution. With 10 μL of the test solution, perform the test as directed under the Liquid Chromatography according to the following conditions. Determine the peak area of each solution by the automatic integration method and determine their amounts by the percentage peak area method; the amount of each peak other than cefixime is NMT 1.0% and the total amount of peaks other than cefixime is NMT 2.5%.

Operating conditions

Proceed as directed under the operating conditions under the Assay.

System suitability

Test for required detectability: Pipet 1 mL of the test solution and add 0.1 mol/L phosphate buffer solution, pH 7.0, to make exactly 100 mL. Confirm that the height of the cefixime peak obtained from 10 μL of this solution is between 20 and 60 mm.

System performance: Dissolve about 2 mg of the cefixime RS in 200 mL of 0.1 mol/L phosphate buffer solution, pH 7.0, and use this solution as the system suitability solution. With 10 μL of this solution, proceed according to the above conditions; the number of theoretical plate and the symmetry factor of the peak of cefixime are NLT 4000 and NMT 2.0, respectively.

System repeatability: Repeat the test 6 times with 10 μL each of the system suitability solution according to the above conditions; the relative standard deviation of the peak areas of cefixime is NMT 2.0%.

Time span of measurement: About 3 times the retention time of cefixime from the solvent peak.

Water Between 9.0% and 12.0% (0.1 g, volumetric titration, direct titration).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.1 g (potency) each of Cefixime Hydrate and cefixime RS, dissolve in 0.1 mol/L phosphate buffer solution, pH 7.0, to make exactly 100 mL. Pipet 10 mL each of these solutions, add 0.1 mol/L phosphate buffer solution, pH 7.0, to make exactly 50 mL, and use these solutions as the test solution and the standard solution. Perform the test with 10 μL each of these solutions as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas A_T and A_S of cefixime.

$$\text{Potency (μg) of cefixime } (C_{16}H_{15}N_5O_7S_2) = \text{Potency (μg) of cefixime RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and 125 mm in length, packed with octadecylsilanized silica gel for liquid chromatography (4 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: Take 25 mL of a solution of tetrabutylammonium hydroxide TS (10 in 13), add water to make 1000 mL, and adjust the pH to 6.5 with diluted phosphoric acid (1 in 10). To 300 mL of this solution, add 100 mL of acetonitrile.

Flow rate: Adjust the flow rate so that the retention time of cefixime is about 10 minutes.

System suitability

System performance: Proceed with 10 μL of the standard solution according to the above conditions; the number of theoretical plates and the symmetry factor of cefixime are NLT 4000 and NMT 2.0, respectively.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solutions according to the above conditions; the relative standard deviation of the ratios of cefixime peak area is NMT 2.0%.

Packaging and storage Preserve in light-resistant, tight containers.

Cefixime Fine Granules
세픽심 세립

Cefixime Fine Granules contain NLT 90.0% and NMT 120.0% of labeled amount of cefixime ($C_{16}H_{15}N_5O_7S_2$: 453.45).

Method of preparation Prepare microparticles as directed under Powders, with Cefixime Hydrate.

Identification (1) Weigh about 10 mg of Cefixime Fine Granules, dissolve in 0.5 mL of sodium bicarbonate solution (21 in 2500) and 1.5 mL of water, add 3 mL of hydroxylamine hydrochloride TS, and allow to stand for 5 minutes. Add 1 mL of dilute ammonium iron(III) sulfate TS and shake to mix; the resulting solution exhibits a reddish brown color.

(2) Weigh 1 mg of Cefixime Fine Granules, add 1 drop of sodium bicarbonate solution (21 in 2500) and 4 mL of water to dissolve, and add 1 mL of dilute hydrochloric acid while cooling with ice. Add 1 mL of freshly prepared sodium nitrite solution (1 in 100), shake to mix allow to stand in an iced water for 2 minutes, add 1 mL of ammonium sulfamate TS while cooling with ice, shake to mix, and allow to stand for 1 minute. Add 1 mL of *N*-(1-naphthyl)ethylenediamine dihydrochloride (1 in 1000); the resulting solution exhibits a reddish purple color.

(3) Weight about 2 mg (potency) of Cefixime Fine Granules according to the labeled potency, dissolve in 150 mL of 0.1 mol/L phosphate buffer solution (pH 7.0), and determine the absorption spectrum as directed under the Ultraviolet-visible Spectroscopy; it exhibits absorption maximum between 286 nm and 290 nm.

Water NMT 3.0% (1.0 g, volumetric titration, direct titration). For the solvent, use a mixture of formamide for water determination and methanol, instead of methanol for water determination.

Particle size distribution estimation by analytical sieving Meets the requirements.

Uniformity of dosage units (distribution) Meets the requirements.

Assay Weigh accurately 0.1 g (potency) of powdered

Cefixime Fine Granules according to the labeled potency, add 70 mL of 0.1 mol/L phosphate buffer solution (pH 7.0), shake to mix, and add 0.1 mol/L phosphate buffer solution, (pH 7.0) to make exactly 100 mL. Centrifuge this solution at 3000 rpm for 10 minutes, pipet 10 mL of the clear supernatant, add 10.0 mL of the internal standard solution and 0.1 mol/L phosphate buffer solution (pH 7.0) to make exactly 50 mL, and use this solution as the test solution. Separately, weigh accurately about 0.1 g of cefixime RS, and add 0.1 mol/L phosphate buffer solution (pH 7.0) to make exactly 100 mL. Pipet 10 mL of this solution, add 10.0 mL of the internal standard solution and 0.1 mol/L phosphate buffer solution (pH 7.0) to make exactly 50 mL, and use this solution as the standard solution. Perform the test with 5 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the peak area ratios, Q_T and Q_S, of cefixime to the internal standard, respectively.

$$\text{Potency (μg) of cefixime } (C_{16}H_{15}N_5O_7S_2) = \text{Potency (μg) of cefixime RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—Weigh about 0.37 g of 2-naphthalenesulfonic acid, and dissolve in 100 mL of 0.1 mol/L phosphate buffer solution (pH 7.0).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and 25 to 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (7 μm in particle diameter).

Mobile phase: Take 25 mL of 0.4 mol/L tetrabutylammonium hydroxide solution, add water to make 1000 mL, adjust the pH to 7.0 with diluted phosphoric acid (1 in 10). To 290 mL of this solution, add 110 mL of acetonitrile, and use after degassing.

Flow rate: Adjust the flow rate so that the retention time of cefixime is about 9 minutes.

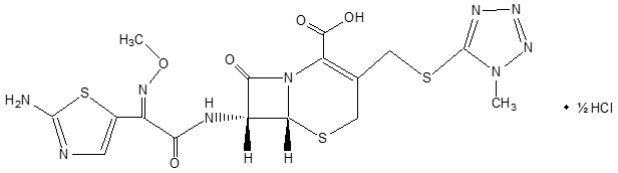
System suitability

System performance: Perform the test with 5 μL of the standard solution under the above operating conditions; cefixime and 2-naphthalenesulfonic acid are eluted in this order with the resolution between these peaks being NLT 4.0.

System repeatability: Repeat the test 6 times with 5 μL each of the standard solution according to the above conditions; the relative standard deviation of the ratios of the peak area of cefixime to that of the internal standard is NMT 2.0%.

Packaging and storage Preserve in tight containers.

Cefmenoxime Hydrochloride
세프메녹심염산염



$C_{16}H_{17}N_9O_5S_3 \cdot ½HCl$: 529.79

(6*R*,7*R*)-7-[(2*E*)-2-(2-Amino-1,3-thiazol-5-yl)-2-methoxyiminoacetamido]-3-[2-(1-methyltetrazol-5-yl)sulfanylmethyl]-3,4-didehydrocepham-4-carboxylic acid hemihydrochloride [*75738-58-8*]

Cefmenoxime Hydrochloride contains NLT 890 μg (potency) and NMT 975 μg (potency) of cefmenoxime ($C_{16}H_{17}N_9O_5S_3$: 511.56) per mg, calculated on the anhydrous basis.

Description Cefmenoxime Hydrochloride occurs as white to pale orange-yellow crystals or a crystalline powder.

It is freely soluble in formamide or dimethylsulfoxide, slightly soluble in methanol, very slightly soluble in water, and practically insoluble in ethanol(95).

Identification (1) Determine the absorption spectrum of a solution of Cefmenoxime Hydrochloride in 0.1 mol/L phosphate buffer (pH 6.8) (3 in 200000) as directed under the Ultraviolet-visible Spectroscopy; it exhibits maxima at the wavelengths between 230 nm and 234 nm and between 255 nm and 259 nm.

(2) Determine the infrared spectra of Cefmenoxime Hydrochloride and cefmenoxime hydrochloride RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) Determine the nuclear magnetic resonance spectrum of a solution prepared by dissolving 50 mg (potency) of Cefmenoxime Hydrochloride in 0.5 mL of deuterated dimethylsulfoxide, as directed under the Nuclear Magnetic Resonance Spectroscopy (^1H); it exhibits 2 singlet signals at about 3.9 ppm and a singlet signal at about 6.8 ppm, with the ratio of area strength of the signals being 3 : 3 : 1.

(4) Dissolve 10 mg (potency) of Cefmenoxime Hydrochloride in 1 mL of diluted sodium carbonate TS (1 in 20), and add 5 mL of acetic acid(100) and 2 drops of silver nitrate TS; a white precipitate is formed.

Crystallinity Meets the requirements.

Optical rotation $[\alpha]_D^{20}$: Between -27° and -35° [1 g, 0.1 mol/L phosphate buffer (pH 6.8), 100 mL, 100 mm].

pH Dissolve 10 g (potency) of Cefmenoxime Hydrochloride in 150 mL of water. The pH of this solution is

between 2.8 and 3.3.

Purity (1) ***Clarity and color of solution*—**Dissolve 1.0 g of Cefmenoxime Hydrochloride in 10 mL of diluted sodium carbonate TS (1 in 4); the solution is clear and colorless to pale yellow.

(2) ***Heavy metals*—**Proceed with 1.0 g of Sodium Sulfamethoxazole as directed under Method 4 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Arsenic*—**Prepare the test solution with 1.0 g of Cefmenoxime Hydrochloride according to Method 4 and perform the test. After cooling, add 10 mL of dilute hydrochloric acid to the residue (NMT 2 ppm).

(4) ***Related substances*—**Weigh accurately about 0.1 g of Cefmenoxime Hydrochloride, dissolve in 20 mL of 0.1 mol/L phosphate buffer (pH 6.8), and add the mobile phase to make exactly 100 mL. Pipet 4 mL of this solution, add the mobile phase to make exactly 50 mL, and use this solution as the test solution. Separately, weigh accurately about 10 mg of 1-methyl-1*H*-tetrazole-5-thiol and dissolve in the mobile phase to make exactly 100 mL. Pipet 4 mL of this solution. add the mobile phase to make exactly 250 mL and use this solution as the standard solution (1). Separately, weigh accurately about 0.1 g of cefmenoxime hydrochloride RS, dissolve in 20 mL of 0.1 mol/L phosphate buffer (pH 6.8), and add the mobile phase to make exactly 100 mL. Pipet 1 mL of this solution, add the mobile phase to make exactly 250 mL, and use this solution as the standard solution (2). Immediately after preparation, pipet 10 μL each of the test solutions, the standard solution (1) and the standard solution (2), perform the test with these solutions as directed under the Liquid Chromatography according to the following operating conditions, and determine individual peak areas in each of the respective solutions. Determine the amounts of 1-methyl-1*H*-tetrazole-5-thiol and total related substances according to the following equation; the amounts are NMT 1.0% and 3.0%, respectively.

$$\text{1-methyl-1}H\text{-tetrazole-5-thiol (\%)} = \frac{W_{Sa}}{W_T} \times \frac{A_{Ta}}{A_{Sa}} \times 20$$

$$\text{Content (\%) of total related substances} = \left\{\frac{W_{Sa}}{W_T} \times \frac{A_{Ta}}{A_{Sa}} \times 20\right\} + \left\{\frac{W_{Sb}}{W_T} \times \frac{A_T}{A_{Sb}} \times 5\right\}$$

W_{Sa}: Amount (g) of 1-methyl-1*H*-tetrazole-5-thiol

W_{Sb}: Amount (g) of cefmenoxime hydrochloride RS

W_T: Amount (g) of Cefotetan

A_{Sa}: Peak area of 1-methyl-1*H*-tetrazole-5-thiol in the standard solution (1)

A_{Sb}: Peak area of cefmenoxime in the standard solution (2)

A_{Ta}: Peak area of 1-methyl-1H-tetrazole-5-thiol in the test solution

S_T: The sum of peak areas, other than 1-methyl-1H-tetrazole-5-thiol and cefmenoxime, in the test solution

Operating conditions

For the detector, column, column temperature, mobile phase and flow rate, proceed as directed in the operating conditions under the Assay.

System suitability

System performance: Proceed as directed under the system suitability under the Assay.

Test for required detectability: Pipet 5 mL of the standard solution (1) and add the mobile phase to make exactly 100 mL. The peak area of 1-methyl-1*H*-tetrazole-5-thiol obtained from 10 μL of this solution is within the range between 4.5% and 5.5% of the peak area of 1-methyl-1*H*-tetrazole-5-thiol from the standard solution (1). Next, pipet 2 mL of the standard solution (2) and add the mobile phase to make exactly 100 mL. Confirm that the peak area of cefmenoxime obtained from 10 μL of this solution is within the range between 1.5% and 2.5% of the peak area of cefmenoxime from the standard solution (2).

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution (1) according to the above conditions; the relative standard deviation of the peak area of 1-methyl-1H-tetrazole-5-thiol is NMT 1.0%.

Time span of measurement: About 2.5 times the retention time of cefmenoxime.

Water NMT 1.5% (1 g, volumetric titration, direct titration). For the solvent, use a mixture of formamide for water determination and methanol (2 : 1) instead of methanol for water determination.

Sterility It meets the requirements when Cefmenoxime Hydrochloride is used in a sterile preparation. However, it is excluded when there is a terminal sterilization process in the manufacturing process of sterile preparations.

Bacterial endotoxins It is less than 0.083 EU per mg (potency) of cefmenoxime when used in a sterile preparation.

Assay Weigh accurately about 50 mg each of Cefmenoxime Hydrochloride and cefmenoxime hydrochloride RS, dissolve in 10 mL of 0.1 mol/L phosphate buffer (pH 6.8), and add the mobile phase to make exactly 50 mL. Pipet 4 mL each of these solutions, add exactly 20 mL of the internal standard solution to each, add the mobile phase to each to make exactly 50 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 10 μL each of these solutions as directed under the Liquid Chromatography according to the following operating conditions, and calculate the peak area ratios, Q_T and Q_S, of cefmenoxime to the internal standard in the test solution and the standard solution, respectively.

$$\text{Potency (μg) of cefmenoxime } (C_{16}H_{17}N_9O_5S_3) = \text{Potency (μg) of cefmenoxime hydrochloride RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of phthalamide in methanol (3 in 2000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μ*m* in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: To 1000 mL of water, add 200 mL of acetonitrile and 20 mL of acetic acid(100).

Flow rate: Adjust the flow rate so that the retention time of cefmenoxime is about 8 minutes.

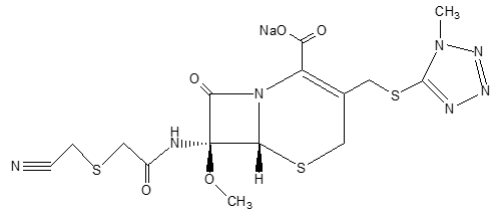
System suitability

System performance: Proceed with 10 μL of the standard solution according to the above conditions; cefmenoxime and the internal standard are eluted in this order with the resolution being NLT 2.3.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solutions according to the above conditions; the relative standard deviation of the peak area ratio of cefmenoxime to the internal standard is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Cefmetazole Sodium
세프메타졸나트륨



$C_{15}H_{16}N_7NaO_5S_3$: 493.52

Sodium (6*R*,7*S*)-7-[2-(cyanomethylsulfanyl)acetamido]-7-methoxy-3-[2-(1-methyltetrazol-5-yl)sulfanylmethyl]-3,4-didehydrocepham-4-carboxylate [*56796-39-5*]

Cefmetazole Sodium contains NLT 860 μg (potency) and NMT 965 μg (potency) of cefmetazole ($C_{15}H_{17}N_7O_5S_3$: 471.53) per mg, calculated on the anhydrous basis.

Description Cefmetazole Sodium occurs as a white to pale yellowish white powder or a mass.

It is very soluble in water, freely soluble in methanol, slightly soluble in ethanol(95), and practically insoluble in tetrahydrofuran.

It is hygroscopic.

Identification (1) Dissolve 25 mg (potency) of Cefmetazole Sodium in water to make 1000 mL. Determine the absorption spectrum of this solution as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum at wavelengths between 270 nm and 274 nm.

(2) Determine the infrared spectra of Cefmetazole Sodium and cefmetazole sodium RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) Determine ^1H of a solution of Cefmetazole Sodium in deuterium oxide for nuclear magnetic resonance spectroscopy (1 in 10) as directed under the Nuclear Magnetic Resonance Spectroscopy; it exhibits singlet signals at about δ 3.6 ppm, δ 4.1 ppm and δ 5.2 ppm, with the ratio of area strength of the signals being 3 : 3 : 1.

(4) Cefmetazole Sodium responds to the Qualitative Analysis (1) for sodium salt.

Optical rotation $[\alpha]_D^{20}$: Between +73° and +85° (0.25 g, water, 25 mL, 100 mm).

pH Dissolve 1 g (potency) of Cefpiramide Sodium in 10 mL of water; the pH of this solution is between 4.2 and 6.2.

Absorbance $E_{1cm}^{1\%}$ (272 nm): Between 200 and 230 (25 mg, calculated on the anhydrous basis, water, 1000 mL).

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Cefmetazole Sodium in 10 mL of water; the solution is clear and colorless to pale yellow.

(2) ***Heavy metals***—Proceed with 1.0 g of Cefmetazole Sodium as directed under Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Arsenic***—Prepare the test solution with 1.0 g of Cefmetazole Sodium according to Method 3 and perform the test (NMT 2 ppm).

(4) ***Related substances***—Dissolve 0.1 g of Cefmetazole Sodium in 2 mL of water, and use this solution as the test solution. Pipet 1 mL of the test solution, add water to make exactly 25 mL, and use this solution as the standard solution (1). Separately, weigh accurately about 0.10 g of 1-methyl-1*H*-tetrazole-5-thiol, dissolve in water to make exactly 100 mL, and use this solution as the standard solution (2). With these solutions, quickly perform the test as directed under the Thin Layer Chromatography. Spot 1 μL each of the test solutions, the standard solution (1) and the standard solution (2) on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of 1-butanol, water and acetic acid(100) (4 : 1 : 1) as the developing solvent to a distance of about 12 cm, and air-dry the plate. Allow it to stand in iodine vapor; the spot obtained from the test solution that corresponds to the spot obtained from the standard solution (2) in terms of location is not more intense than the spot from

the standard solution (2), and the spots, other than the principal spot and the above spot, obtained from the test solution are not more intense than the spots from the standard solution (1).

Water NMT 1.0% (1.0 g, volumetric titration, direct titration).

Sterility It meets the requirements when Cefmetazole Sodium is used in a sterile preparation. But it is exempt from the requirements when there is a final sterilization process in the manufacturing process of sterile preparations.

Bacterial endotoxins It is less than 0.06 EU per mg (potency) of cefmetazole when used in a sterile preparation.

Assay Weigh accurately about 50 mg (potency) each of Cefmetazole Sodium and cefmetazole RS, and add the mobile phase to each to make exactly 25 mL. Pipet 1 mL each of these solutions, add exactly 10 mL of the internal standard solution to each, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 10 μL each of these solutions as directed under the Liquid Chromatography according to the following operating conditions, and calculate the peak area ratios, Q_T and Q_S, of cefmetazole to the internal standard in the test solution and the standard solution, respectively.

$$\text{Potency (μg) of cefmetazole } (C_{15}H_{17}N_7O_5S_3) = \text{Potency (μg) of cefmetazole RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of methyl p-hydroxybenzoate in the mobile phase (1 in 10000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 214 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: Dissolve 5.75 g of ammonium dihydrogen phosphate in 700 mL of water. To this solution, add 280 mL of methanol, 20 mL of tetrahydrofuran and 3.2 mL of 40% tetrabutylammonium hydroxide TS, and adjust the pH to 4.5 with phosphoric acid.

Flow rate: Adjust the flow rate so that the retention time of cefmetazole is about 8 minutes.

System suitability

System performance: Proceed with 10 μL of the standard solution according to the above conditions; cefmetazole and the internal standard are eluted in this order with the resolution being NLT 10.

System repeatability: Repeat the test 5 times with 10 μL each of the standard solutions according to the above conditions; the relative standard deviation of the peak area ratio of cefmetazole to the internal standard is NMT 2.0%.

Packaging and storage Preserve in hermetic containers.

Cefmetazole Sodium for Injection
주사용 세프메타졸나트륨

Cefmetazole Sodium for Injection, as an injection that is dissolved upon use, contains NLT 90.0% and NMT 110.0% of the labeled amount of cefmetazole ($C_{15}H_{17}N_7O_5S_3$: 471.53).

Method of preparation Prepare as directed under Injections, with Cefmetazole Sodium.

Description Cefmetazole Sodium for Injection occurs as a white to light yellow powder or a mass.
It is hygroscopic.

Identification (1) Determine the absorption spectra of Cefmetazole Sodium for Injection and an aqueous solution of cefmetazole sodium for injection (1 in 40000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Cefmetazole Sodium for Injection and cefmetazole sodium RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

pH Dissolve an amount of Cefmetazole Sodium for Injection equivalent to 1.0 g (potency) of cefmetazole sodium in 10 mL of water; the pH of this solution is between 4.2 and 6.2.

Purity (1) ***Clarity and color of solution***—Dissolve an amount equivalent to 1.0 g (potency) of cefmetazole sodium according to the labeled amount of Cefmetazole Sodium for Injection in 10 mL of water; the resulting solution is clear and the color is not more intense than the following control solution.

Control solution—Pipet 5 mL of the colorimetric stock solution of cobalt(II) chloride hexahydrate and 5 mL of the colorimetric stock solution of iron(III) chloride, and add water to make exactly 50 mL. Pipet 15 mL of this solution and add water to make exactly 20 mL.

(2) ***Related substances***—Perform the test as directed under the Purity (4) under Cefmetazole Sodium.

Sterility Meets the requirements.

Bacterial endotoxins Less than 0.06 EU per mg (potency) of cefmetazole.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Uniformity of dosage units Meets the requirements.

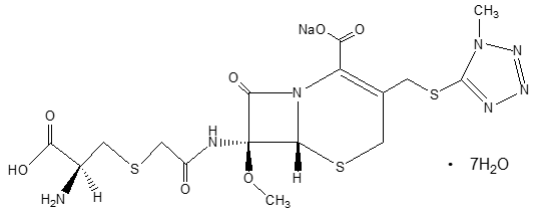
Assay Take 10 containers of Cefmetazole Sodium for Injection, dissolve the contents of each in the mobile phase, combine each solution, and add the mobile phase to make exactly 500 mL. Pipet a volume of this solution equivalent to about 0.2 g (potency) of cefmetazole sodium, and add the mobile phase to make exactly 100 mL. Pipet 1 mL of this solution, add exactly 10 mL of the internal standard solution, and use this solution as the test solution. Separately, weigh accurately an amount equivalent to about 50 mg (potency) of cefmetazole RS and dissolve in the mobile phase to make exactly 25 mL. Pipet 1 mL of this solution, add exactly 10 mL of the internal standard solution, mix, and use this solution as the standard solution. Perform the test as directed under the Assay under Cefmetazole Sodium.

$$\text{Potency (mg) of cefmetazole } (C_{15}H_{17}N_7O_5S_3) = \text{Potency (mg) of cefmetazole RS} \times \frac{Q_T}{Q_S} \times 4$$

Internal standard solution—A solution of methyl *p*-hydroxybenzoate in the mobile phase (1 in 10000).

Packaging and storage Preserve in hermetic containers. Plastic containers for aqueous injections may be used.

Cefminox Sodium Hydrate
세프미녹스나트륨수화물



Cefminox Sodium

$C_{16}H_{20}N_7NaO_7S_3 \cdot 7H_2O$: 667.66

Sodium (6*R*,7*S*)-7-[2-[(2*S*)-2-amino-2-carboxyethyl]sulfanyl]acetamido-7-methoxy-3-[2-(1-methyltetrazol-5-yl)sulfanylmethyl]-3,4-didehydrocepham-4-carboxylate heptahydrate [*88641-36-5*]

Cefminox Sodium Hydrate contains NLT 900 μg (potency) and NMT 970 μg (potency) of cefminox ($C_{16}H_{21}N_7O_7S_3$: 519.58) per mg, calculated on the anhydrous basis.

Description Cefminox Sodium Hydrate occurs as a white to pale yellowish white crystalline powder.
It is freely soluble in water, sparingly soluble in methanol, and practically insoluble in ethanol(95).

Identification (1) Determine the absorption spectra of respective aqueous solutions of Cefminox Sodium Hydrate and cefminox sodium RS (1 in 50000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) Determine the infrared spectra of Cefminox Sodium Hydrate and cefminox sodium RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) Determine ^1H of a solution of Cefminox Sodium Hydrate in deuterium oxide for nuclear magnetic resonance spectroscopy (1 in 30) as directed under the Nuclear Magnetic Resonance Spectroscopy, using sodium 3-thylsilylpropanesulfonate for nuclear magnetic resonance spectroscopy; it exhibits the multiplet signal A at about δ 3.2 ppm, singlet signal B at about δ 3.5 ppm, singlet signal C at about δ 4.0 ppm and singlet signal D at about δ 5.1 ppm, with the ratio of area strength of the signals A : B : C : D being about 2 : 3 : 3 : 1.

(4) A solution of Pravastatin Sodium (1 in 100) corresponds to the Qualitative Tests (1) for sodium salt.

Optical rotation $[\alpha]_D^{20}$: Between +62° and +72° (50 mg, water, 10 mL, 100 mm).

pH Dissolve 0.70 g of Cefpirome Sulfate in 10 mL of water; the pH of this solution is between 4.5 and 6.0.

Purity (1) ***Heavy metals***—Proceed with 2.0 g of Cefminox Sodium Hydrate as directed under Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Arsenic***—Prepare the test solution with 2.0 g of Cefminox Sodium Hydrate according to Method 3 and perform the test (NMT 1 ppm).

Water Between 18.0% and 20.0% (0.1 g, volumetric titration, direct titration).

Sterility It meets the requirements when used in sterile preparations. However, it is excluded in cases where there is a final sterilization process in the manufacturing of a sterile preparation.

Bacterial endotoxins It is less than 0.05 EU per mg (potency) of cefminox when used in a sterile preparation.

Assay Weigh accurately about 70 mg (potency) each of

Cefminox Sodium Hydrate and cefminox sodium RS, add water to each to make exactly 100 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions, and determine the peak areas, A_T and A_S, of cefminox, respectively.

$$\text{Potency (μg) of cefminox } (C_{16}H_{21}N_7O_7S_3) = \text{Potency (μg) of cefminox sodium RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 273 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: A mixture of buffer and methanol (9 : 1).

Flow rate: 1.0 mL/min

System suitability

System repeatability: Repeat the test 6 times with 20 μL each of the standard solutions according to the above conditions; the relative standard deviation of the peak area of cefminox is NMT 1.0%.

Buffer—Dissolve 2.04 g of sodium acetate trihydrate in 750 mL of water, adjust the pH to 4.0 with acetic acid, and add water to make exactly 1000 mL.

Packaging and storage Preserve in hermetic containers.

Cefminox Sodium for Injection
주사용 세프미녹스나트륨

Cefminox Sodium for Injection, as an injection that is dissolved before use, contains NLT 90.0% and NMT 120.0% of the labeled amount of cefminox ($C_{16}H_{21}N_7O_7S_3$: 519.58).

Method of preparation Prepare as directed under Injections, with Cefminox Sodium.

Description Cefminox Sodium for Injection occurs as a white to pale yellowish white crystalline powder.

Identification (1) Weigh 20 mg (potency) of Cefminox Sodium for Injection, dissolve in 2 mL of water, add 3 mL of hydroxylamine hydrochloride TS, and allow it to stand for 5 minutes. Add 1 mL of acidic ammonium iron(III) sulfate TS, and shake to mix; the resulting solution exhibits a reddish brown color.

(2) Weigh 10 mg (potency) of Cefminox Sodium for Injection, and dissolve in 1 mL of water. Spot 1 μL of this solution on a filter paper, spray evenly ninhydrin TS, and heat at 100 ℃ for 5 minutes; the solution exhibits a pale, bluish purple color.

(3) Determine the absorption spectrum of a solution of Cefminox Sodium for Injection (1 in 50000) as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum absorbance at 271 nm to 275 nm.

pH Dissolve 50 mg (potency) of Cefminox Sodium for Injection per mL in water; the pH of the solution is 4.5 to 6.0.

Water Between 18.0% and 20.0% (0.1 g, volumetric titration, direct titration).

Sterility Meets the requirements.

Bacterial endotoxins Less than 0.05 EU per mg (potency) of cefminox.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately an amount of Cefminox Sodium for Injection, equivalent to 70 mg (potency) of cefminox sodium, according to the labeled potency, dissolve in water to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 70 mg (potency) of cefminox sodium RS, dissolve in water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of cefminox in each solution.

$$\text{Potency (μg) of cefminox } (C_{16}H_{21}N_7O_7S_3) = \text{Potency (μg) of cefminox sodium RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 273 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silical gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 ℃.

Mobile phase: A mixture of buffer solution and methanol (9 : 1).

Flow rate: 1.0 mL/min

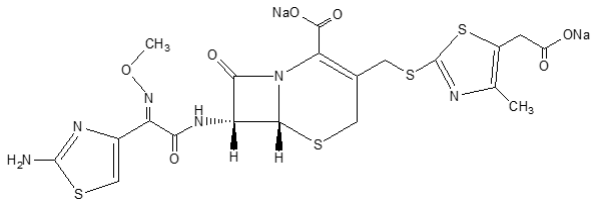
System suitability

System repeatability: Repeat the test 6 times with 20 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area of cefminox is NMT 1.0%.

Buffer solution—Weigh 2.04 g of sodium acetate trihydrate, dissolve in 750 mL of water, adjust the pH to 4.0 with acetic acid, and add water to make exactly 1000 mL.

Packaging and storage Preserve in hermetic containers.

Cefodizime Sodium
세포디짐나트륨



$C_{20}H_{18}N_6Na_2O_7S_4$: 628.63

Disodium (6*R*,7*R*)-7-{2-[(2*E*)-2-(2-amino-1,3-thiazol-4-yl)-2-methoxyimino]acetamido}-3-{[(5-carboxylatomethyl)-4-methyl-1,3-thiazol-2-yl]sufanyl}methyl-3,4-didehydrocepham-4-carboxylate [*86329-79-5*]

Cefodizime Sodium contains NLT 890 μg (potency) of ethanol-free ($C_{20}H_{20}N_60_7S_4$: 584.67) per mg, calculated on the anhydrous basis.

Description Cefodizime Sodium occurs as a white to pale yellowish white crystalline powder.
It is very soluble in water and practically insoluble in acetonitrile or ethanol(99.5).

Identification (1) Determine the absorption spectra of solutions of Cefodizime Sodium and cefodizime sodium RS (1 in 50000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelength.

(2) Determine the infrared spectra of Cefodizime Sodium and cefodizime sodium RS according to the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) Determine ^1H as directed under the nuclear magnetic resonance spectrum using the heavy aqueous solution (1 in10) of Cefodizime Sodium for the nuclear magnetic resonance spectrum and sodium 3-trimethylsilylpropanesulfonate for the nuclear magnetic resonance spectrum as an internal standard; It exhibits single-line signals A, B, and C at around δ 2.3 ppm, δ 4.0 ppm, and δ 7.0 ppm, respectively, and the area intensity ratio A : B : C of each signal is about 3 : 3 : 1.

(4) Cefodizime Sodium responds to the Qualitative Analysis (1) for sodium salt.

Optical rotation $[\alpha]_D^{20}$: Between -56° and -62° (on the anhydrous and ethanol-free basis, 0.2 g, 20 mL of water, 100 mm).

pH Dissolve 1.0 g (potency) of Cefodizime Sodium in 10 mL of water; the pH is between 5.5 and 7.5.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Cefodizime Sodium in 10 mL of water; the solution is clear and exhibits a pale yellow color.

(2) ***Heavy metal***—Weigh about 1.0 g of Cefodizime Sodium in a crucible, loosely cover it with a lid, and heat gently to carbonize. After cooling, add 2mL of sulfuric acid, heat cautiously until white fumes are no longer evolved, and incinerate by ignition at 500 to 600 °C. Perform the test according to Method 2. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Arsenic***—Proceed with 1.0 g of Cefodizime Sodium according to Method 3 and perform the test (NMT 2 ppm).

(4) ***Related substances***—Dissolve 30 mg of Cefodizime Sodium in 10 mL of the mobile phase and use this solution as the test solution. Pipet 1 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Pipet 5 μL of the test solution and the standard solution, perform the test according to the Liquid Chromatography under the following conditions, and determine the peak area of each solution by the automatic integration method; the peak area from each peak other than cefodizime of the test solution is not larger than the peak area of cefodizime from the standard solution. In addition, the sum of peak areas other than cefodizime from the test solution is not greater than 3 times the peak area of cefodizime from the standard solution.

Operating conditions

For the detector, column, column temperature, mobile phase and flow rate, perform the test as directed under the operating conditions under the Assay.

System suitability

For system performance and system repeatability, perform the test as directed under the system suitability under the Assay.

Test for required detectability: Pipet 2 mL of the standard solution and add the mobile phase to make exactly 20 mL. Confirm that the peak area of cefodizime obtained from 5 μL of this solution is within the range of 7 to 13% of the peak area of cefodizime in the standard solution.

Time span of measurement: About 4 times the retention time of cefodizime after the solvent peak.

(5) ***Ethanol***—Weigh accurately about 0.2 g of Cefodizime Sodium, add exactly 5 mL of the internal standard solution, put water to make exactly 25 mL, and use this solution as the test solution. Separately, pipet 2 mL of ethanol(99.5), add water to make exactly 100 mL., and use this solution as the standard stock solution. Pipet 0.25 mL of the standard stock solution, add exactly 5 mL of the internal standard solution, add water to make exactly 25 mL, and use this solution as the standard solution. Perform the test with 1 μL each of the test solution and the standard solution as directed under the Gas Chromatography according to the following conditions, and calculate the peak area ratios, Q_T and Q_S of ethanol to that of the internal standard. Determine the amount of ethanol according to the following formula; it is NMT 2.0%.

$$\text{Content (\%) of ethanol} = 1 / W_T \times Q_T / Q_S \times 0.5 \times 0.79$$

W_T: Amount (g) of Cefodizime Sodium taken
0.79: Density (g/mL) of ethanol at 20 ℃

Internal standard solution—1-propanol solution (1 in 1000).

Operating conditions

Detector: A hydrogen flame ionization detector

Column: A fused silica capillary column, 0.53 mm in internal diameter and 30 m in length, of which the inner surface is coated with 6% cyanopropylphenyl-94% polydimethylsiloxane for gas chromatography to a thickness of 3.0 μm.

Column temperature: Maintain at 50 °C for 5 minutes, then raise to 200 °C by 50 °C per minute, and keep at 200 °C for 5 minutes.

Sample injection port temperature: 210 ℃

Detector temperature: 280 °C.

Carrier gas: Nitrogen

Flow rate: 5 mL/min

Split ratio: 1 : 5

System suitability

System performance: Proceed with 1 μL of the standard solution under the above operating conditions; ethanol and the internal standard are eluted in this order.

System reproducibility: Repeat the test 6 times with 1 μL of the standard solution under the above operating conditions; the relative standard deviation of the peak area of ethanol with respect to that of the internal standard is NMT 2.0%.

Water NMT 4.0% (0.5 g, volumetric titration, direct titration).

Sterility It meets the requirements when used in sterility preparations. However, it is excluded in cases where there is a terminal sterilization process in the manufacturing of sterile preparations.

Bacterial endotoxins It is less than 0.10 EU per mg (potency) of ceftazidime when used in the manufacturing of sterile preparations.

Assay Weigh assay about 50 mg (potency) each of Cefodizime Sodium and cefodizime sodium RS, dissolve in exactly 10 mL of the internal standard solution, and add water to make 100 mL. Use these solutions as the test solution and the standard solution, respectively. Perform the test with 10 μL each of these solutions as directed under the Liquid Chromatography according to the following conditions and calculate the peak area ratios, Q_T and Q_S, of cefodizime to that of the internal standard, respectively.

$$\text{Potency (μg) of ceftazidime } (C_{20}H_{20}N_6 0_7S_4) = \text{Potency (μg) of cefodizime sodium RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of anhydrous caffeine (3 in 400).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: Dissolve 0.80 g of potassium dihydrogen phosphate and 0.20 g of anhydrous sodium dihydrogen phosphate in water, add 80 mL of acetonitrile, and add water again to make 1000 mL.

Flow rate: Adjust the flow rate so that the retention time of cefodizime is about 5 minutes.

System suitability

System performance: Proceed with 10 μL of the standard solution under the above conditions; cefodizime sodium and the internal standard are eluted in this order with the resolution being NLT 6.

System repeatability: Repeat the test 6 times with 10 μL of the standard solution under the above operating conditions; the relative standard deviation of the peak area of cefodizime to that of the internal standard is NMT 2.0%.

Packaging and storage Preserve in tight containers.

Cefodizime Sodium for Injection
주사용 세포디짐나트륨

Cefodizime Sodium for Injection, as an injection that is dissolved upon use, contains NLT 90.0% and NMT 120.0% of the labeled amount of cefodizime ($C_{20}H_{20}N_6O_7S_4$: 584.67).

Method of preparation Prepare as directed under Injections, with Cefodizime Sodium.

Description Cefodizime Sodium for Injection occurs as a white to pale yellowish white crystalline powder and is odorless.

Identification (1) Weigh 10 mg (potency) of Cefodizime Sodium for Injection, dissolve in 2 mL of water, add 3 mL of hydroxylamine hydrochloride-ethanol TS, allow it to stand for 5 minutes, add 1 mL of acidic ammonium iron(III) sulfate TS, and shake to mix; the resulting solution exhibits a reddish brown color.

(2) Weigh 1 mg (potency) of Cefodizime Sodium for Injection, dissolve in 4 mL of water, add 1 mL of dilute hydrochloric acid while cooling with iced water, add 1 mL of freshly prepared sodium nitrite solution (1 in 100), and allow it to stand for 2 minutes. While cooling again with ice, add 1 mL of ammonium sulfamate TS, allow it to stand for 1 minute, and add 1 mL of hydrochloric acid-*N*-1-naphthylethylenediamine hydrochloride solution (1 in 1000); the resulting solution exhibits a violet color.

(3) Weigh about 2 mg (potency) of Cefodizime Sodium for Injection, and dissolve in water to make 100 mL. Determine the absorption spectrum of this solution as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum at the wavelength of between 258 nm and 264 nm.

pH Dissolve Cefodizime Sodium for Injection in water to make 0.1 g/mL; the pH of the solution is between 5.5 and 7.5.

Water NMT 4.0% (0.2 g, volumetric titration, direct titration).

Sterility Meets the requirements.

Bacterial endotoxin Below than 0.10 EU per mg (potency) of cefodizime.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately an amount of Cefodizime Sodium for Injection, equivalent to about 50 mg (potency) of cefodizime according to the labeled potency, add exactly 10 mL of the internal standard solution, dissolve in water to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately each about 50 mg (potency) of cefodizime sodium RS, proceed in the same manner as in the test solution, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the ratios, Q_T and Q_S, of the peak area of cefodizime to that of internal standard in each solution.

$$\text{Potency (μg) of cefodizime } (C_{20}H_{20}N_6O_7S_4) = \textit{Potency} \text{ (μg) of cefodizime sodium RS} \times \frac{Q_T}{Q_S} \times \frac{100}{(100-m)}$$

m: Water (%) of Cefodizime Sodium for Injection

Internal standard solution—A solution of anhydrous caffeine (3 in 400).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 15 cm to 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (8 μm to 10 μm in particle diameter).

Column temperature: Between 20 and 40 °C.

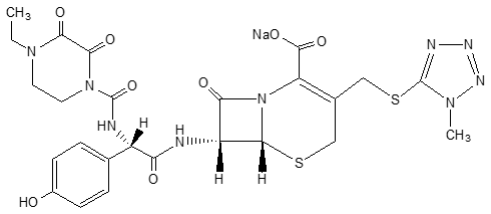
Mobile phase: Dissolve 0.80 g of potassium dihydrogen phosphate and 0.20 g of anhydrous sodium dihydrogen phosphate in water, add 80 mL of acetonitrile, and add water again to make 1000 mL.

Flow rate: Adjust the flow rate so that the retention time of cefodizime is about 5 minutes.

Selection of column: Perform the test with 10 μL of the standard solution according to the above operating conditions; cefodizime and caffeine are eluted in this order with resolution being NLT 6.

Packaging and storage Preserve in hermetic containers.

Cefoperazone Sodium
세포페라존나트륨



$C_{25}H_{26}N_9NaO_8S_2$: 667.65

Sodium (6*R*,7*R*)-7-[[(2*R*)-2-[(4-ethyl-2,3-dioxopiperazine-1-carbonyl)amino]-2-(4-hydroxyphenyl)acet]amido]-3-[(5-methyl-1,3,4-thiadiazol-2-yl)sulfanylmethyl]-3,4-didehydrocepham-4-carboxylate [*62893-20-3*]

Cefoperazone Sodium contains NLT 871 μg (potency) of cefoperazone ($C_{25}H_{27}N_9O_8S$: 645.67) per mg, calculated on the anhydrous basis.

Description Cefoperazone Sodium occurs as a white to yellowish white crystalline powder.
It is freely soluble in water, soluble in methanol and slightly soluble in ethanol(99.5).

Identification (1) Determine the absorption spectra of solutions of Cefoperazone Sodium and cefoperazone sodium RS (1 in 50000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the ^1H spectrum of a solution of Cefoperazone Sodium in deuterium oxide for nuclear magnetic resonance spectroscopy (1 in 10), using 3-(trimethylsilyl)propanesulfonic acid sodium salt for nuclear magnetic resonance spectroscopy as the internal standard, as directed under the Nuclear Magnetic Resonance Spectroscopy; it exhibits a triple signal A at around δ 1.2 ppm, and double signals B and C at around δ 6.8 ppm and at around δ 7.3 ppm, respectively, and the area intensity ratio of signals A : B : C is 3 : 2 : 2.

(3) Cefoperazone Sodium responds to the Qualitative Analysis (1) for sodium salt.

Crystallinity Meets the requirements, except for freeze-dried powder.

Optical rotation $[\alpha]_D^{20}$: Between -15° and -25° (1 g, water, 100 mL, 100 mm).

pH Dissolve 1.0 g of Cefoperazone Sodium in 4 mL of water; the pH of this solution is between 4.5 and 6.5.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Cefoperazone Sodium in 10 mL of water; the resulting solution is pale yellow and clear.

(2) ***Heavy metals***—Proceed with 2.0 g of Cefoperazone Sodium as directed under Method 4 and perform the test. Prepare the control solution with 1.0 mL of lead standard solution (NMT 5 ppm).

(3) ***Arsenic***—Proceed with 1.0 g of Cefoperazone Sodium as directed under Method 4 and perform the test (NMT 2 ppm).

(4) ***Related substances***—Weigh accurately 0.1 g of Cefoperazone Sodium, dissolve in water to make exactly 100 mL, and use this solution as the test solution. Pipet 1 mL of this solution, add water to make exactly 50 mL, and use this solution as the standard solution. Perform the test with 25 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak areas of each solution by the automatic integration method, and calculate the ratio of each related substance from the test solution to 50 times the peak area of cefoperazone from the standard solution; the related substance having the retention time of about 8 minutes is NMT 5.0%, the related substance having the retention time of about 17 minutes is NMT 1.5%, and the sum of all related substances is NMT 7.0%. For the calculation of the peak areas of the related substances having the retention time of about 8 minutes and 17 minutes, multiply the areas obtained by the automatic integration method by the correction factors 0.90 and 0.75, respectively.

Operating conditions

For the detector, column, column temperature, mobile phase and flow rate, proceed as directed in the operating conditions under the Assay.

System suitability

Detection sensitivity: Pipet 1 mL of the standard solution and add the mobile phase to make exactly 20 mL. Proceed with 25 μL of this solution according to the operating conditions; the peak area of cefoperazone is equivalent to 3.5% to 6.5% of the area of each peak obtained from 25 μL of the standard solution.

System performance: Proceed with 25 μL of the standard solution according to the above conditions; the number of theoretical plates of the peak area of cefoperazone is NLT 5000 with the symmetry factor being NMT 1.5.

System repeatability: Repeat the test 6 times with 25 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak areas of cefoperazone is NMT 2.0%.

Time span of measurement: About 3 times the retention time of cefoperazone beginning after the solvent peak.

Water NMT 5.0% for crystalline powder (0.2 g, volumetric titration, direct titration). NMT 2.0% for freeze-dried powder (0.5 g, volumetric titration, direct titration).

Sterility It meets the requirements when used in a sterile preparation. However, it is excluded where there is a final sterilization process in the manufacturing of a sterile preparation.

Bacterial endotoxins Less than 0.20 EU per mg (potency) of cefoperazone, when used for manufacturing sterile preparations.

Assay Weigh accurately about 0.1 g (potency) of Cefoperazone Sodium and dissolve in water to make exactly 100 mL. Pipet 5 mL of this solution, add 5 mL of the internal standard solution, and use this solution as the test solution. Separately, weigh accurately about 0.1 g (potency) of cefoperazone RS, dissolve in 5 mL of 0.1 mol/L phosphate buffer solution (pH 7.0), and add water to make exactly 100 mL. Pipet 5 mL of this solution, add 5 mL of the internal standard solution, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the peak area ratio, Q_T and Q_S, of cefoperazone to the internal standard, respectively.

Potency (μg) of cefoperazone ($C_{25}H_{27}N_9O_8S_2$)

$$= \text{Potency } (\mu g) \text{ of cefoperazone RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of acetanilide in a mixture of water and acetonitrile (43 : 7) (3 in 8000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 35 ℃.

Mobile phase: To 57 mL of acetic acid(100) and 139 mL of triethylamine, add water to make 1000 mL. To 20 mL of this solution, add 835 mL of water, 140 mL of acetonitrile and 5 mL of dilute acetic acid.

Flow rate: Adjust the flow rate so that the retention time of cefoperazone is about 10 minutes.

System suitability

System performance: Proceed with 10 μL of the standard solution according to the above conditions; the internal standard and cefoperazone are eluted in this order with the resolution between these peaks being NLT 5.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area ratio of cefoperazone to the internal standard is NMT 1.0%.

Packaging and storage Preserve in hermetic containers (in a cold place).

Cefoperazone Sodium for Injection
주사용 세포페라존나트륨

Cefoperazone Sodium for Injection, as an injection that is dissolved upon use, contains NLT 90.0% and NMT 120.0% of the labeled amount of cefoperazone ($C_{25}H_{27}N_9O_8S_2$: 645.67).

Method of preparation Prepare as directed under Injections, with Cefoperazone Sodium.

Description Cefoperazone Sodium for Injection occurs as white to yellowish white powder.

Identification (1) Determine the infrared spectra of Cefoperazone Sodium for Injection and cefoperazone as directed in the paste method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) Weigh appropriate amounts of each of Cefoperazone Sodium for Injection and cefoperazone RS, add a mixture of acetone and water (9 : 1) to prepare solutions each having a known concentration of 1.0 mg per mL, and use these solutions as the test solution and the standard solution, respectively. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on a thin-layer chromatographic plate made of silica gel for thin-layer chromatography (with a fluorescent indicator). Develop the plate with a mixture of 2-butanone, acetic acid(100) and water (18 : 3 : 1 :) as the developing solvent, and examine the plate under ultraviolet light (main wavelength: 254 nm); the R_f values of the spots obtained from the test solution and the standard solution are the same.

(3) The retention times of the major peaks obtained from the test solution and the standard solution under the Assay are the same.

pH Dissolve an amount of Cefoperazone Sodium for Injection equivalent to 0.25 g (potency) of cefoperazone in 1 mL of water; the pH of this solution is between 4.5 and 6.5.

Water NMT 5.0% for crystalline powder (0.2 g, volumetric titration, direct titration), and NMT 2.0% for freeze-dried powder (0.5 g, volumetric titration, direct titration).

Sterility Meets the requirements.

Bacterial endotoxins Less than 0.20 EU per mg (potency) of cefoperazone.

Particulate contamination: Visible particles Meets the requirements.

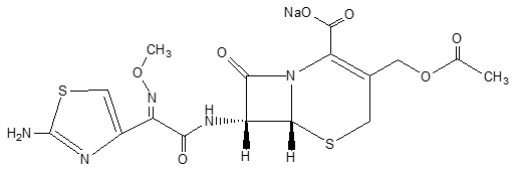
Insoluble particulate matter in injections Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Perform the test as directed under the Assay under Cefoperazone Sodium. However, weigh accurately an amount equivalent to about 0.1 g (potency) according to the labeled potency of Cefoperazone Sodium for Injection, dissolve in water to make exactly 100 L. Pipet 10 mL of this solution, add exactly L of the internal standard solution, add the mobile phase to make exactly 50 mL, and use this solution as the test solution.

Packaging and storage Preserve in hermetic containers.

Cefotaxime Sodium
세포탁심나트륨



$C_{16}H_{16}N_5NaO_7S_2$: 477.45

Sodium (6*R*,7*R*)-7-{2-[(2*E*)-2-(2-amino-1,3-thiazol-4-yl)-2-methoxyimino]acetamido}-3-acetyloxymethyl-3,4-didehydrocepham-4-carboxylate [*64485-93-4*]

Cefotaxime Sodium contains NLT 916 μg (potency) of cefotaxime ($C_{16}H_{17}N_5O_7S_2$: 455.47) per mg, calculated on the anhydrous basis.

Description Cefotaxime Sodium occurs as a white to yellowish white, crystalline powder.
It is very soluble in water and sparingly soluble in ethanol(96) and very slightly soluble in methanol.

Identification (1) Dissolve 2 mg of Cefotaxime Sodium and cefotaxime sodium RS in 0.01 mol/L hydrochloric acid TS to make 100 mL. Determine the absorption spectra of these solutions as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Cefotaxime Sodium and cefotaxime sodium RS according to the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) Determine 1H as directed under the nuclear magnetic resonance spectrum using the heavy aqueous solution (1 in125) of Cefotaxime Sodium for nuclear magnetic resonance spectrum and sodium 3-trimethylsilylpropanesulfonate for the nuclear magnetic resonance spectrum as an internal standard; It exhibits single-line signals A, B, and C at around δ 2.1 ppm, δ 4.0 ppm, and δ 7.0 ppm, respectively, and the area intensity ratio A : B : C of each signal is about 3 : 3 : 1.

(4) Cefodizime Sodium responds to the Qualitative Analysis (1) for sodium salt.

Optical rotation $[\alpha]_D^{20}$: Between +58° and +64° (0.25 g calculated on the dried basis, water, 25 mL, 100 mm).

pH Dissolve 1 g of Cefotaxime Sodium in 10 mL of water; the pH of this solution is between 4.5 and 6.5.

Absorbance $E_{1cm}^{1\%}$ (235 nm): Between 360 and 390 (20 mg calculated on the dried basis, water, 1000 mL).

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Cefotaxime Sodium in 10 mL of water; the resulting solution is clear and bright yellow.

(2) ***Sulfate***—Dissolve 2.0 g of Cefotaxime Sodium in 40 mL of water and add 2 mL of dilute hydrochloric acid and water to make 50 mL, and shake well to mix, and filter. Discard the initial 10 mL of the filtrate, add water to 25 mL of the subsequent filtrate to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution by taking 1.0 mL of 0.005 mol/L sulfuric acid, and adding 1 mL of dilute hydrochloric acid and water to make 50 mL (NMT 0.048%).

(3) ***Heavy metals***—Proceed with 1.0 g of Cefotaxime Sodium according to Method 2 and perform the test. Prepare the control solution with 2 mL of lead standard solution (NMT 20 ppm).

(4) ***Arsenic***—Weigh accurately about 1.0 g of Cefotaxime Sodium, and perform the test according to Method 3 (NMT 2 ppm).

(5) ***related substances***—Perform the test as described under the Assay. However, weigh accurately about 25 mg of Cefotaxime Sodium, dissolve in the mobile phase to make exactly 25 mL, and use this solution as the test solution. However, the time span of measurement of the test solution is about 3.5 times the retention time of cefotaxime (each related substance is NMT 1.0%, total related substances are NMT 3.0%).

System suitability

For the system performance and repeatability, proceed as directed under the system suitability under the Assay.

Test for required detectability: Pipet 2 mL of the standard solution, and add the mobile phase A to make exactly 100 mL. Pipet 2 mL of this solution and add the mobile phase A to make exactly 20 mL. Confirm that the peak area of cefotaxime obtained from 10 μL of this solution is equivalent to 0.15 to 0.25% of the peak area of cefotaxime obtained from the standard solution.

(6) ***Dimethylaniline***—Weigh accurately about 1.0 g of Cefotaxime Sodium, add 5 mL of 1 mol/L sodium hydroxide TS and 1 mL of the internal standard solution, and then centrifuge it, if necessary. Use the clear supernatant as the test solution. Separately, weigh accurately 50 mg of dimethylaniline, and add 2.0 mL of hydrochloric acid and water to make 50 mL. Pipet 5.0 mL of this solution and add water to make exactly 250 mL. Pipet 1.0 mL of this solution, add 5.0 mL of 1 mol/L sodium hydroxide TS and 1 mL of the internal standard solution, and then centrifuge it if necessary. Use the clear supernatant as the standard solution. Perform the test with each 1 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the ratio of the peak area, Q_T and Q_S of dimethylaniline to that of the internal standard (NMT 20 ppm).

$$\text{Content (ppm) of dimethylaniline} = \text{Amount (mg) of dimethylaniline taken} \times \frac{Q_T}{Q_S} \times \frac{Purity\ (\%) of\ dimethylaniline}{Amount\ (mg)\ of\ Cefotaxime\ Sodium\ taken} \times 4$$

Dissolve 50.0 mg of internal standard solution Naphthalene in cyclohexane to make 50 mL. Pipet 5.0

mL of this solution and add cyclohexane to make 100 mL, and use this solution as the internal standard solution.

Operating conditions

Detector: A hydrogen flame ionization detector

Column: A tube about 2 mm in internal diameter and about 2 mm in length, packed with diatomaceous earth for gas chromatography coated with 3% by mass of 50% phenyl-50% methylpolysiloxane for gas chromatography.

Column temperature: 120 ℃

Sample injection port, detector temperature: 150 ℃

Carrier gas: Nitrogen

Flow rate: 30 mL/min

Loss on drying NMT 3.0% (1 g, 105 ℃, 3 hours).

Sterility It meets the requirements when used in sterile preparations. However, it is excluded in cases where there is a terminal sterilization process in the manufacturing of sterile preparations.

Bacterial endotoxins It is less than 0.05 EU per mg (potency) of cefotaxime when used in the manufacturing of sterile preparations.

Assay Weigh about 40 mg (potency) each of Cefotaxime Sodium and cefotaxime sodium RS, dissolve in the mobile phase A to make exactly 50 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 10 μL each of these solutions as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of cefotaxime.

$$\text{Potency (μg) of cefodizime } (C_{16}H_{17}N_5O_7S_2) = \text{Potency (μg) of cefodizime sodium RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 235 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 30 °C.

Mobile phase: Control the gradient elution by modifying the mixing ratio of mobile phases A and B as follows.

Mobile phase A: Add phosphoric acid to 0.05 mol/L dibasic sodium phosphate TS to adjust the pH to 6.25. Add 140 mL of methanol to 860 mL of this solution.

Mobile phase B: Add phosphoric acid to 0.05 mol/L dibasic sodium phosphate TS to adjust the pH to 6.25. Add 400 mL of methanol to 600 mL of this solution.

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 - 7	100	0
7 - 9	100 → 80	0 → 20
9 - 16	80	20
16 - 45	80 → 0	20 → 100
45 - 50	0	100

Flow rate: Adjust the flow rate so that the retention time of cefotaxime is about 14 minutes (about 1.3 mL/min).

System suitability

System performance: Add 7.0 mL of water and 2.0 mL of methanol to 1 mL of the standard solution, and shake to mix. Add 25 mg of sodium carbonate decahydrate to this solution, shake to mix, and allow to stand at room temperature for 10 minutes. Add 3 drops of acetic acid(100) and 1 mL of standard solution, and shake to mix. Proceed with 10 μL of this solution according to the above operating conditions; desacetylcefotaxime with a relative retention time of about 0.3 and cefotaxime are eluted in this order with the resolution being NLT 20. The symmetry coefficient of the cefotaxime peak is NMT 2.

System repeatability: Repeat the test 6 times according to the above conditions with 10 μL of the standard solution each time; the relative standard deviation of the peak area of cefotaxime is NMT 2.0%.

Packaging and storage Preserve in tight containers.

Cefotaxime Sodium for Injection
주사용 세포탁심나트륨

Cefotaxime Sodium for Injection, as an injection that is dissolved upon use, contains NLT 90.0% and NMT 120.0% of the labeled amount of cefotaxime ($C_{16}H_{17}N_5O_7S_2$: 455.47).

Method of preparation Prepare as directed under Injections, with Cefotaxime Sodium.

Description Cefotaxime Sodium for Injection occurs as a white to light yellowish white powder.

Identification (1) Perform the test as directed under the Identification (2) under Cefotaxime Sodium.

(2) Perform the test as directed under the Identification (4) under Cefotaxime Sodium.

(3) The retention times of the major peaks obtained from the test solution and the standard solution under the Assay are the same.

pH Dissolve an amount of Cefotaxime Sodium for Injec-

tion equivalent to 1.0 g (potency) of cefotaxime in 10 mL of water; the pH of this solution is between 4.5 and 6.5.

Purity ***Related substances***—Perform the test as directed under the Purity (5) under Cefotaxime Sodium. However, the time span of measurement is 8 times the peak retention of the principal constituent (NMT 1.0% for individual related substance and NMT 4.0% for total related substances).

Loss on drying NMT 3.0% (1 g, 105 °C, 3 hours).

Sterility Meets the requirements.

Bacterial endotoxins Less than 0.05 EU per mg (potency) of cefotaxime.

Particulate contamination: Visible particles Meets the requirements.

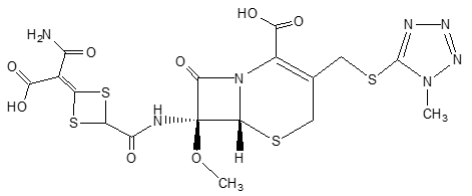
Insoluble particulate matter in injections Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Perform the test as directed under the Assay under Cefotaxime Sodium. Weigh accurately an amount equivalent to about 40 mg (potency) according to the labeled potency of Cefotaxime Sodium for Injection, dissolve in the mobile phase A to make exactly 50 mL, and use this solution as the test solution.

Packaging and storage Preserve in hermetic containers.

Cefotetan
세포테탄



$C_{17}H_{17}N_7O_8S_4$: 575.62

(6*R*,7*S*)-7-[[4-(2-Amino-1-carboxy-2-oxoethylidene)-1,3-dithietane-2-carbonyl]amino]-7-methoxy-3-[(1-methyltetrazol-5-yl)sulfanylmethyl]-3,4-didehydrocepham-4-carboxylic acid [*69712-56-7*]

Cefotetan contains NLT 960 μg (potency) and NMT 1010 μg (potency) of cefotetan ($C_{17}H_{17}N_7O_8S_4$: 575.62) per mg, calculated on the anhydrous basis.

Description Cefotetan occurs as a white to pale yellowish white powder.
It is sparingly soluble in methanol and slightly soluble in water or in ethanol(95).

Identification (1) Determine the absorption spectra of Cefotetan and cefotetan RS in 1% phosphate buffer solution (pH 6.5) (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Cefotetan and cefotetan RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) Dissolve 50 mg of Cefotetan in 0.5 mL of a solution of sodium bicarbonate in heavy water for nuclear magnetic resonance spectroscopy (1 in 25), and determine the ^1H spectrum of this solution as directed under the Nuclear Magnetic Resonance Spectroscopy; it exhibits signals of single lines at around δ 3.6 ppm, at around δ 4.0 ppm, at around δ 5.1 ppm and at around δ 5.2 ppm, and the integrated intensity ratio of these signals is 3 : 3 : 1 : 1.

Optical rotation $[\alpha]_D^{20}$: Between +112° and +124° (0.5 g, calculated on the anhydrous basis, sodium bicarbonate solution (1 in 200), 50 mL, 100 mm).

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Cefotetan in a solution of sodium bicarbonate (1 in 30); the resulting solution is colorless to pale yellow and clear.

(2) ***Heavy metals***—Proceed with 1.0 g of Cefotetan according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Related substances—***Weigh accurately about 0.1 g of Cefotetan, dissolve in methanol, add exactly 2 mL of the internal standard solution, add methanol to make 20 mL, and use this solution as the test solution. Separately, weigh accurately about 3 mg of 1-methyl-1*H*-tetrazole-5-thiol RS for liquid chromatography, previously dried in a desiccator (in vacuum, silica gel) for 2 hours, and about 2 mg of cefotetan RS, calculated on the anhydrous basis, and dissolve in methanol to make exactly 20 mL. Pipet 2 mL of this solution, add exactly 2 mL of the internal standard solution, add methanol to make exactly 20 mL, and use this solution as the standard solution. Perform the test with 5 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the peak area ratios, Q_{Ta}, Q_{Tb}, Q_{Tc}, Q_{Td}, Q_{Te} and Q_{Tf}, of 1-methyl-1*H*-tetrazole-5-thiol, cefotetan lactone, eluted at the relative retention time of about 0.5 with respect to cefotetan, Δ2-cefotetan, eluted at the relative retention time of about 1.2 with respect to cefotetan, isothiazole substance, eluted at the relative retention time of about 1.3 with respect to cefotetan, each of other related substances and the total amount other related substances, respectively, to the internal standard, obtained from the test solution, and the peak area ratios, Q_{Sa} and Q_{Sb}, of 1-methyl-1*H*-tetrazole-5-thiol and cefotetan, respectively,

to the peak area of the internal standard, obtained from the standard solution. Calculate the amount of each related substance using the following equations; the amount of 1-methyl-1*H*-tetrazole-5-thiol is NMT 0.3%, the amount of cefotetan lactone is NMT 0.3%, the amount of Δ2-cefotetan is NMT 0.5%, the amount of isothiazole substance is NMT 0.5%, the amount of each of other related substances is NMT 0.2%, and the total amount of related substances is NMT 0.4%.

$$\text{1-methyl-1}H\text{-tetrazole-5-thiol (\%)} = \frac{W_{Sa}}{W_T} \times \frac{Q_{Ta}}{Q_{Sa}} \times \frac{1}{100}$$

$$\text{Content (\%) of cefotetan lactone} = \frac{W_{Sa}}{W_T} \times \frac{Q_{Tb}}{Q_{Sb}} \times \frac{1}{100}$$

$$\text{Content (\%) of } \Delta\text{2-cefotetan} = \frac{W_{Sb}}{W_T} \times \frac{Q_{Tc}}{Q_{Sb}} \times \frac{1}{100}$$

$$\text{Content (\%) of isothiazole substance} = \frac{W_{Sb}}{W_T} \times \frac{Q_{Td}}{Q_{Sb}} \times \frac{1}{100}$$

$$\text{Content (\%) of each of other related substances} = \frac{W_{Sb}}{W_T} \times \frac{Q_{Te}}{Q_{Sb}} \times \frac{1}{100}$$

$$\text{Total content (\%) of other related substances} = \frac{W_{Sb}}{W_T} \times \frac{Q_{Tf}}{Q_{Sb}} \times \frac{1}{100}$$

W_{Sa}: Amount (mg) of 1-methyl-1*H*-tetrazole-5-thiol
W_{Sb}: Amount (mg) of cefotetan RS, calculated on the anhydrous basis
W_T: Amount (g) of Cefotetan

Internal standard solution—A solution of anhydrous caffeine in methanol (3 in 10000).

Operating conditions

For the detector, column, column temperature, mobile phase and flow rate, proceed as directed in the operating conditions under the Assay.

System suitability

System performance: Proceed as directed under the system suitability under the Assay.

Test for required detectability: Pipet 15 mL of the standard solution and add methanol to make exactly 100 mL. Confirm that the peak area of cefotetan obtained from 5 μL of this solution is equivalent to 12% to 18% of the peak area of cefotetan from the standard solution.

System repeatability: Repeat the test 6 times with 5 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area ratio of cefotetan to the peak area of the internal standard is NMT 2.0%.

Time span of measurement: About 3.5 times the retention time of cefotetan.

Isomer ratio Dissolve 10 mg of Cefotetan in 20 mL of methanol and use this solution as the test solution. Perform the test with 5 μL of the test solution as directed under the Liquid Chromatography according to the following conditions, and calculate the area of the adjacent two peaks that appear at the retention time of around 40 minutes, one having a shorter retention time (*l*-form) and another having a longer retention time (*d*-form). Calculate the amount of *l*-form by the percentage peak area method; it is between 35% and 45%.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: A mixture of 0.1 mol/L phosphate buffer solution (pH 7.0), water and a solution of tetrabutylammonium hydrogen sulfate in acetonitrile (1 in 150) (9 : 9 : 2).

Flow rate: Adjust the flow rate so that the retention time of the *l*-form is about 40 minutes.

System suitability

System performance: Proceed with 5 μL of the test solution according to the above conditions; the *l*-form and the *d*-form are eluted in this order with the resolution between these peaks being NLT 1.5.

System repeatability: Pipet 1 mL of the test solution, and add methanol to make exactly 10 mL. Repeat the test 6 times with 5 μL each of these solutions; the relative standard deviation of the peak area of the *l*-form is NMT 5.0%.

Water NMT 2.5% (1 g, volumetric titration, direct titration).

Residue on ignition NMT 0.1% (1 g).

Sterility It meets the requirements when Cefotetan is used for manufacturing sterile preparations. However, it is excluded when there is a terminal sterilization process in the manufacturing process of sterile preparations.

Bacterial endotoxins Less than 0.17 EU/mg (potency) of cefotetan, when used for manufacturing sterile preparations.

Assay Weigh accurately about 50 mg (potency) each of Cefotetan and cefotetan RS, dissolve each in 0.1 mol/L phosphate buffer solution (pH 6.5), and add water to make exactly 50 mL. Pipet 15 mL each of these solutions, add exactly 10 mL each of the internal standard solutions, add 0.1 mol/L phosphate buffer solution (pH 6.5) to make exactly 50 mL, and use these solutions as the test solution

and the standard solution, respectively. Perform the test with 5 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the peak area ratios, Q_T and Q_S, of cefotetan to that of the internal standard, respectively.

$$\text{Potency (μg) of cefotetan } (C_{17}H_{17}N_7O_8S_4) = \text{Potency (μg) of cefotetan RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of anhydrous caffeine solution (1 in 1000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: Dissolve 11.53 g of phosphoric acid in 1000 mL of water. To 850 mL of this solution, add 50 mL of acetonitrile, 50 mL of acetic acid(100) and 50 mL of methanol.

Flow rate: Adjust the flow rate so that the retention time of cefotetan is about 17 minutes.

System suitability

System performance: Proceed with 5 μL of the standard solution according to the above conditions; caffeine and cefotetan are eluted in this order with the resolution between these peaks being NLT 8.

System repeatability: Repeat the test 6 times with 5 μL each of the standard solutions according to the above conditions; the relative standard deviation of the peak area ratio of cefotetan to that of the internal standard is NMT 1.0%.

Packaging and storage Preserve in light-resistant, tight containers (below 5 °C).

Cefotetan Sodium for Injection
주사용 세포테탄나트륨

Cefotetan Sodium for Injection, as an injection that is dissolved upon use, contains NLT 90.0% and NMT 120.0% of the labeled amount of cefotetan ($C_{17}H_{17}N_7O_8S_4$: 575.62).

Method of preparation Prepare as directed under Injections with Cefotetan by adding sodium bicarbonate to make cefotetan disodium.

Description Cefotetan Sodium for Injection occurs as a white to pale yellowish white powder.

Identification (1) Dissolve an amount of Cefotetan Sodium for Injection equivalent to about 10 mg (potency) of cefotetan in 2 mL of hydroxylamine hydrochloride TS, allow to stand for 3 minutes, add 1 mL of acidic ammonium iron(III) sulfate TS, and agitate; the resulting solution exhibits a reddish brown color.

(2) Dissolve an amount of Cefotetan Sodium for Injection equivalent to about 10 mg (potency) of cefotetan in 1% phosphate buffer solution (pH 6.5) to make 1000 mL. Determine the absorption spectrum of this solution as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum at the wavelength of between 283 nm and 287 nm.

(3) Perform the test with Cefotetan Sodium for Injection as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; it exhibits absorption at the wavenumbers of about 1760 cm^{-1}, 1630 cm^{-1}, 1520 cm^{-1}, 1580 cm^{-1} and 1080 cm^{-1}.

pH Dissolve an amount of Cefotetan Sodium for Injection equivalent to 0.1 g (potency) of cefotetan in 1 mL of water; the pH of this solution is between 4.5 and 6.5.

Water NMT 1.5% (1.0 g, volumetric titration, direct titration).

Sterility Meets the requirements.

Bacterial endotoxins Less than 0.17 EU per mg (potency) of cefotetan.

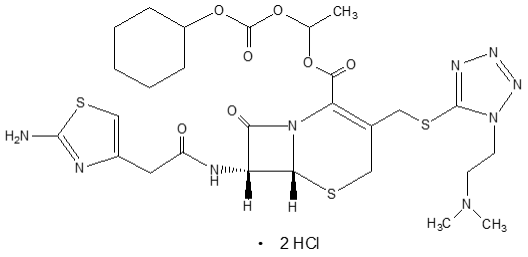
Insoluble particulate matter in injections Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Perform the test as directed under the Assay under Cefotetan. However, weigh an appropriate amount of Cefotetan Sodium for Injection, and dilute with 1% phosphate buffer solution (pH 6.5) to prepare a solution having a known concentration of 1 mg (potency) per mL. Pipet 15 mL of this solution, add exactly 10 mL of the internal standard solution, add 0.1 mol/L phosphate buffer solution (pH 6.5) to make exactly 50 mL, and use this solutions as the test solution.

Packaging and storage Preserve in hermetic containers.

Cefotiam Hexetil Hydrochlorid
세포티암헥세틸염산염



$C_{27}H_{37}N_9O_7S_3 \cdot 2HCl$: 768.76

1-Cyclohexyloxycarbonyloxyethyl (6*R*,7*R*)-7-[[2-(2-amino-1,3-thiazol-4-yl)acet]amido]-3-[[1-[2-(dimethylamino)ethyl]tetrazol-5-yl]sulfanyl-methyl]-3,4-didehydrocepham-4-carboxylate dihydrochloride [*95789-30-3*]

Cefotiam Hexetil Hydrochloride contains NLT 615 μg (potency) and NMT 690 μg (potency) of cefotiam ($C_{18}H_{23}N_9O_4S_3$: 525.63) per mg, calculated on the anhydrous basis.

Description Cefotiam Hexetil Hydrochloride occurs as a white to pale yellowish white powder.
It is very soluble in water, in methanol or in ethanol(95), freely soluble in dimethylsulfoxide and slightly soluble in acetonitrile.
It dissolves in 0.1 mol/L hydrochloric acid TS.
It is hygroscopic.

Identification (1) Determine the absorption spectra of solutions of Cefotiam Hexetil Hydrochloride and cefotiam hexetil hydrochloride RS in 1 mol/L hydrochloric acid TS (3 in 125000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the ^1H spectrum of a solution of Cefotiam Hexetil Hydrochloride in deuterated dimethylsulfoxide for nuclear magnetic resonance spectroscopy (1 in 20) as directed under the Nuclear Magnetic Resonance Spectroscopy, using tetramethylsilane for nuclear magnetic resonance spectroscopy as the internal standard; it exhibits single signals A and B at around δ 2.8 ppm and at around δ 6.6 ppm, respectively, and a multiple signal C at around δ 6.9 ppm, and the area intensity ratio of signals A, B and C is about 6 : 1 : 1.

(3) To an aqueous solution of Cefotiam Hexetil Hydrochloride (1 in 200), add 2 mL of dilute nitric acid and 1 mL of silver nitrate TS and mix; a white precipitate is formed.

O**ptical rotation** $[\alpha]_D^{20}$: Between +52° and +60° (0.1 g, calculated on the anhydrous basis, 0.1 mol/L hydrochloric acid TS, 10 mL, 100 mm).

Purity (1) ***Heavy metals***—Proceed with 2.0 g of Cefotiam Hexetil Hydrochloride as directed under Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Arsenic***—Proceed with 2.0 g of Cefotiam Hexetil Hydrochloride as directed under Method 3 and perform the test. Use a solution of magnesium nitrate hexahydrate in ethanol(95) (1 in 5) (NMT 1 ppm).

(3) ***Related substance I***—Weigh accurately about 50 mg of Cefotiam Hexetil Hydrochloride and dissolve in a mixture of diluted phosphoric acid (1 in 100) and acetonitrile (4 : 1) to make exactly 50 mL. Pipet 10 mL of this solution, add a mixture of diluted phosphoric acid (1 in 100) and acetonitrile (4 : 1) to make exactly 25 mL, and use this solution as the test solution. Separately, weigh accurately about 50 mg of cefotiam hexetil hydrochloride RS and dissolve in a mixture of diluted phosphoric acid (1 in 100) and acetonitrile (4 : 1) to make exactly 50 mL. Pipet 1 mL of this solution, add a mixture of diluted phosphoric acid (1 in 100) and acetonitrile (4 : 1) to make exactly 50 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography, and determine the area of each peak obtained from each solution by the automatic integration method. Calculate the amount of related substances by the following equation; the amount of the related substance having a relative retention time of about 1.2 with respect to one of the two peaks of cefotiam hexetil, which has the longer retention time, is NMT 2.0%, and the amount of each of other related substances is NMT 0.5%. For the calculation of the area of the peak having a relative retention time of about 1.2 with respect to one of the two peaks of cefotiam hexetil, which has the longer retention time, multiply the area obtained by the automatic integration method by the correction factor 0.78.

$$\text{Content (\%) of each related substance} = \frac{Potency\ (g)\ of\ cefotiam\ hexetil\ hydrochloride\ RS}{W_T} \times \frac{A_T}{A_S} \times 5$$

W_T: Amount (g) of Cefotiam Hexetil Hydrochloride taken

A_S: Sum of the two peak areas of cefotiam hexetil obtained from the standard solution

A_T: Peak area of each related substance obtained from the test solution

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 ℃.

Mobile phase: Adjust so that the mixing rate of the mobile phase A and the mobile phase B is changed linearly from 1 : 0 to 0 : 1 for 30 minutes.

Mobile phase A: A mixture of diluted 0.2 mol/L

potassium dihydrogen phosphate TS (1 in 2), acetonitrile and acetic acid(100) (72 : 28 : 1).

Mobile phase B: A mixture of diluted 0.2 mol/L potassium dihydrogen phosphate TS (1 in 2), acetonitrile and acetic acid(100) (60 : 40 : 1).

Flow rate: 0.7 mL/min

System suitability

Test for required detectability: Pipet 1 mL of the standard solution and add a mixture of diluted phosphoric acid (1 in 100) and acetonitrile (4 : 1) to make exactly 50 mL. Confirm that each area of the two peaks of cefotiam hexetil obtained from 10 μL of this solution is equivalent to 1.6% to 2.4% of that from the standard solution.

System performance: Proceed with 10 μL of the standard solution according to the above conditions; the resolution between the two peaks of cefotiam hexetil is NLT 2.0.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solutions according to the above conditions; the relative standard deviation of the sum of the two peak areas of cefotiam hexetil is NMT 2.0%.

Time span of measurement: About 3 times the retention time of one of the two peaks of cefotiam hexetil, which is eluted first, beginning after the solvent peak.

(4) ***Related substance II*—**Weigh accurately about 20 mg of Cefotiam Hexetil Hydrochloride, dissolve in 2 mL of methanol, add a mixture of a solution of dibasic ammonium phosphate (79 in 20000) and acetic acid(100) (200 : 3) to make exactly 50 mL, and use this solution as the test solution. Separately, weigh accurately about 25 mg of cefotiam hydrochloride RS and dissolve in the mobile phase to make exactly 50 mL. Pipet 2 mL of this solution, add the mobile phase to make exactly 50 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography, and determine the area of each peak obtained from each solution by the automatic integration method. Calculate the amount of the related substances by the following equation; the amount of the related substance having the relative retention time of about 0.1 and 0.9 with respect to cefotiam is NMT 1.0%, and the amount of each of the other related substances is NMT 0.5%. For the calculation of the area of the peak having the relative retention time of about 0.9 with respect to cefotiam, multiply the area obtained by the automatic integration method by the correction factor 0.76.

$$\text{Content (\%) of each related substance} = \frac{Potency\ (g)\ of\ cefotiam\ hexetil\ hydrochloride\ RS}{W_T} \times \frac{A_T}{A_S} \times 4$$

W_T: Amount (g) of Cefotiam Hexetil Hydrochloride taken

A_S: Peak area of cefotiam obtained from the standard solution

A_T: Peak area of each related substance obtained from the test solution

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: A mixture of a solution of dibasic ammonium phosphate (79 in 20000), methanol and acetic acid(100) (200 : 10 : 3).

Flow rate: Adjust the flow rate so that the retention time of cefotiam is about 15 minutes.

System suitability

Test for required detectability: Pipet 1 mL of the standard solution and add the mobile phase to make exactly 50 mL. Confirm that the peak area of cefotiam obtained from 10 μL of this solution is equivalent to 1.6% to 2.4% of that from the standard solution.

System performance: To 1 mL of a solution of acetaminophen in the mobile phase (1 in 50000), add 3 mL of the standard solution, and mix well. Proceed with 10 μL of this solution according to the above conditions; acetaminophen and cefotiam are eluted in this order with the resolution between these peaks being NLT 4.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solutions according to the above conditions; the relative standard deviation of the peak areas of cefotiam is NMT 2.0%.

Time span of measurement: About twice the retention time of cefotiam after the solvent peak.

(5) ***Total related substances*—**The total amount of related substances obtained under Related substance I and Related substance II is NMT 6.5%.

Water NMT 3.5% (0.1 g, volumetric titration, direct titration).

Residue on ignition NMT 0.1% (1 g).

Isomer ratio Perform the test with 20 μL of the test solution used in the Assay as directed under the Assay, and determine the areas of the two peaks, A_a for the peak with the shorter retention time, and A_b for the peak with the longer retention time, both of which appear at the retention time of around 10 minutes; $A_a/(A_a+A_b)$ is NLT 0.45 and NMT 0.55.

Assay Weigh accurately about 30 mg (potency) each of Cefotiam Hexetil Hydrochloride and cefotiam hexetil hydrochloride RS, dissolve each in a mixture of diluted phosphoric acid (1 in 100) and acetonitrile (4 : 1) to make 50 mL. Pipet 5 mL each of these solutions, add exactly 5

ml each of the internal standard solutions, add a mixture of diluted phosphoric acid (1 in 100) and acetonitrile (4 : 1) to make 50 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the peak area ratios, Q_T and Q_S, of cefotiam hexetil to that of the internal standard, respectively. For this calculation, use the sum of the two peak areas that appear at the retention time of around 10 minutes as the peak area of cefotiam hexetil.

$$\text{Potency (μg) of cefotiam } (C_{18}H_{23}N_9O_4S_3) = \text{Potency (μg) of cefotiam hexetil hydrochloride RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of benzoic acid in a mixture of diluted phosphoric acid (1 in 100) and acetonitrile (4 : 1) (7 in 10000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 ℃.

Mobile phase A: A mixture of diluted 0.2 mol/L potassium dihydrogen phosphate TS (1 in 2), acetonitrile and acetic acid(100) (72 : 28 : 1).

Flow rate: Adjust the flow rate so that the retention time of the peak of cefotiam hexetil that is eluted first is about 9 minutes.

System suitability

System performance: Proceed with 20 μL of the standard solution according to the above conditions; the internal standard and cefotiam hexetil are eluted in this order with the resolution between these peaks being NLT 2.0.

System repeatability: Repeat the test 6 times with 20 μL each of the standard solutions according to the above conditions; the relative standard deviation of the peak area ratio of cefotiam hexetil to the internal standard is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Cefotiam Hexetil Hydrochloride Tablets
세포티암헥세틸염산염 정

Cefotiam Hexetil Hydrochloride Tablets contain NLT 90.0% and NMT 120.0% of the labeled amount of cefotiam ($C_{18}H_{23}N_9O_4$: 525.63).

Method of preparation Prepare as directed under Tablets, with Cefotiam Hexetil Hydrochloride.

Identification (1) Weigh about 50 mg (potency) according to the labeled potency of Cefotiam Hexetil Hydrochloride Tablets, add 25 mL of water, shake vigorously for 5 minutes to mix, and centrifuge. To 10 mL of the clear supernatant, add 1 mL of hydroxylamine hydrochloride solution (1 in 10) and 2 mL of 1 mol/L sodium hydroxide TS, allow it to stand for 5 minutes, add 3 mL of 1 mol/L hydrochloric acid and 3 drops of iron(III) chloride TS, and shake vigorously to mix; the resulting solution exhibits a deep reddish purple color.

(2) Take 1 mL of the filtrate in (1), and add water to make 100 mL. Determine the absorption spectrum as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum absorbance between 257 nm and 262 nm.

Water NMT 3.0% (0.5 g, volumetric titration, direct titration).

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately an amount, equivalent to about 1 g (potency) of cefotiam, according to the labeled potency of Cefotiam Hexetil Hydrochloride Tablets, and add a mixture of diluted phosphoric acid (1 in 100) and acetonitrile (4 : 1) to obtain a solution containing 1 mg (potency) per mL. Pipet 20 mL of this solution, add exactly 5.0 mL of the internal standard solution, make exactly 300 mL with a mixture of diluted phosphoric acid (1 in 100) and acetonitrile (4 : 1), and filter through a membrane filter. Use the filtrate as the test solution. Separately, weigh accurately about 50 mg (potency) of cefotiam hexetil hydrochloride RS, and dissolve in a mixture of diluted phosphoric acid (1 in 100) and acetonitrile (4 : 1) to make exactly 50 mL. Pipet 20 mL of this solution, add exactly 5.0 mL of the internal standard solution, and then make exactly 300 mL with a mixture of diluted phosphoric acid (1 in 100) and acetonitrile (4 : 1). Use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak area ratios, Q_T and Q_S, of cefotiam hexetil to that of internal standard in each solution. Since cefotiam hexetil is detected with two peaks, use the sum of the two peak areas as the peak area of cefotiam hexetil.

$$\text{Potency (μg) of cefotiam } (C_{18}H_{23}N_9O_4S_3) = \text{Potency (μg) of cefotiam hexetil hydrochloride} \times \frac{Q_T}{Q_S} \times 20$$

Internal standard solution—Pipet 25 mL of a solution of sodium benzoate (21 in 500), add 6 mL of 2 mol/L

hydrochloric acid TS, and add 120 mL of methanol and a mixture of diluted phosphoric acid (1 in 100) and acetonitrile (4 : 1) to make exactly 250 mL.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

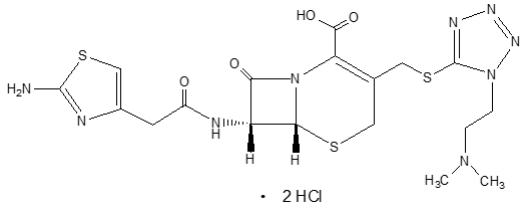
Mobile phase: To 720 mL of the diluted 0.2 mol/L potassium dihydrogen phosphate (1 in 2), add 280 mL of acetonitrile and 10 mL of acetic acid(100).

Flow rate: Adjust the flow rate so that the retention time of the peak eluted first is about 9 minutes.

Selection of column: Perform the test with 20 μL of the standard solution according to the above operating conditions; the resolution of the two peaks of cefotiam hexetil is NLT 2.0.

Packaging and storage Preserve in tight containers.

Cefotiam Hydrochloride
세포티암염산염



· 2 HCl

$C_{18}H_{23}N_9O_4S_3 \cdot 2HCl$: 598.55

(6*R*,7*R*)-7-[[2-(2-Amino-1,3-thiazol-4-yl)acet]amido]-3-[[1-[2-(dimethylamino)ethyl]tetrazol-5-yl]sulfanylmethyl]-3,4-didehydrocepham-4-carboxylic acid dihydrochloride [*66309-69-1*]

Cefotiam Hydrochloride contains NLT 810 μg (potency) and NMT 890 μg (potency) of cefotiam ($C_{18}H_{23}N_9O_4S_3$: 525.63) per mg, calculated on the anhydrous basis.

Description Cefotiam Hydrochloride occurs as white to pale yellowish white crystals or a crystalline powder.
It is freely soluble in water, in methanol or in formamide, slightly soluble in ethanol and practically insoluble in acetonitrile.

Identification (1) Determine the absorption spectra of aqueous solutions of Cefotiam Hydrochloride and cefotiam hydrochloride RS (1 in 50000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Cefotiam Hydrochloride and cefotiam hydrochloride RS as directed in the potassium chloride disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) Determine the ^1H spectrum of a solution of Cefotiam Hydrochloride in deuterium oxide for nuclear magnetic resonance spectroscopy (1 in 10), using 3-(trimethylsilyl)propanesulfonic acid sodium salt for nuclear magnetic resonance spectroscopy as the internal standard, as directed under the Nuclear Magnetic Resonance Spectroscopy; it exhibits single signals A and B at around δ 3.1 ppm and at around δ 6.7 ppm, respectively, and the area intensity ratio of signals A and B is about 6 : 1.

(4) Dissolve 0.1 g of Cefotiam Hydrochloride in 5 mL of dilute nitric acid and immediately add 1 mL of silver nitrate TS; a white precipitate is formed.

Crystallinity Meets the requirements.

Optical rotation $[\alpha]_D^{20}$: Between +60° and +72° (1 g, calculated on the anhydrous basis, water, 100 mL, 100 mm).

pH Dissolve about 1.0 g (potency) of Cefotiam Hydrochloride in 10 mL of water; the pH of this solution is between 1.2 and 1.7.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Cefotiam Hydrochloride in 10 mL of water; the resulting solution is colorless to yellow and clear.

(2) ***Heavy metals***—To about 1.0 g of Cefotiam Hydrochloride, add 1 mL of sulfuric acid and heat gently to carbonize. After cooling, add 10 mL of a solution of magnesium nitrate hexahydrate in ethanol(95) (1 in 10), fire the ethanol to burn, and then heat gradually to incinerate. If a carbonized substance still remains, moisten with a small amount of sulfuric acid, and ignite again to incinerate. After cooling, add 2 mL of hydrochloric acid to the residue, warm on a steam bath to dissolve, and then heat it to evaporate to dryness. To the residue, add 10 mL of water and warm on a steam bath to dissolve. After cooling, adjust the pH to between 3 and 4 with ammonia TS, filter if necessary, and wash the residue with 10 mL of water. Then, transfer the filtrate and the washings into a Nessler tube and add water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 2.0 mL of lead standard solution in the same manner as in the preparation of the test solution (NMT 20 ppm).

(3) ***Arsenic***—Proceed with 1.0 g of Cefotiam Hydrochloride as directed under Method 4 and perform the test. After cooling, add 10 mL of dilute hydrochloric acid to the residue (NMT 2 ppm).

Water NMT 7.0% (0.25 g, volumetric titration, direct titration. Use a mixture of formamide for water determination and methanol for water determination (2 :

1) instead of methanol for water determination.)

Sterility It meets the requirements when Cefotiam Hydrochloride is used in a sterile preparation. However, it is excluded in cases where there is a terminal sterilization process in the manufacturing of a sterile preparation.

Bacterial endotoxins Less than 0.125 EU/mg (potency) of cefotiam, when Cefotiam Hydrochloride is used in a sterile preparation.

Assay Weigh accurately 0.1 g (potency) each of Cefotiam Hydrochloride and cefotiam hydrochloride RS, dissolve each in the mobile phase to make exactly 100 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography, and calculate the peak areas, A_T and A_S, of cefotiam, respectively.

$$\text{Potency (μg) of cefotiam } (C_{18}H_{23}N_9O_4S_3) = \text{Potency (μg) of cefotiam hydrochloride RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.0 mm in internal diameter and about 125 mm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 ℃.

Mobile phase: To 800 mL of 0.05 mol/L dibasic sodium phosphate TS, add 0.05 mol/L potassium dihydrogen phosphate TS to adjust the pH to 7.7. To 440 mL of this solution, add 60 mL of acetonitrile.

Flow rate: Adjust the flow rate so that the retention time of cefotiam is about 14 minutes.

System suitability

System performance: Dissolve 0.04 g of orcin in 10 mL of the standard solution. Proceed with 10 μL of this solution according to the above conditions; orcin and cefotiam are eluted in this order with the resolution between these peaks being NLT 5.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solutions according to the above conditions; the relative standard deviation of the peak areas of cefotiam is NMT 1.0%.

Packaging and storage Preserve in hermetic containers.

Cefotiam Hydrochloride for Injection
주사용 세포티암염산염

Cefotiam Hydrochloride for Injection, as an injection that is dissolved upon use, contains NLT 90.0% and NMT 110.0% of the labeled amount of cefotiam ($C_{18}H_{23}N_9O_4S_3$: 525.63).

Method of preparation Prepare as directed under Injections, with Cefotiam Hydrochloride.

Description Cefotiam Hydrochloride for Injection occurs as a white to pale yellow powder.

Identification (1) Determine the absorption spectrum with Cefotiam Hydrochloride for Injection and an aqueous solution of cefotiam hydrochloride for injection (1 in 50000) as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum at the wavelength of between 257 nm and 261 nm.

(2) Determine the ^1H spectrum of a solution of Cefotiam Hydrochloride for Injection in deuterium oxide for nuclear magnetic resonance spectroscopy (1 in 10), as directed under the Nuclear Magnetic Resonance Spectroscopy; it exhibits single signals A and B between δ 2.7 ppm and 3.0 ppm and at around δ 6.5 ppm, respectively, and the area intensity ratio of signals A and B is about 6 : 1.

pH Dissolve an amount equivalent to 0.5 g (potency) of Cefotiam Hydrochloride for Injection in 5 mL of water; the pH of this solution is between 5.7 and 7.2.

Purity ***Clarity and color of solution***—Dissolve an amount equivalent to 1.0 g (potency) of cefotiam hydrochloride according to the labeled amount of Cefotiam Hydrochloride for Injection in 10 mL of water; the resulting solution is clear. Perform the test 10 minutes after dissolving as directed under the Ultraviolet-visible Spectroscopy; the absorbance of the solution at the wavelength of 450 nm is NMT 0.20.

Loss on drying NMT 6.0% (0.5 g, in vacuum, 60 °C, 3 hours).

Sterility Meets the requirements.

Bacterial endotoxins Less than 0.125 EU per mg (potency) of cefotiam.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Uniformity of dosage units Meets the requirements.

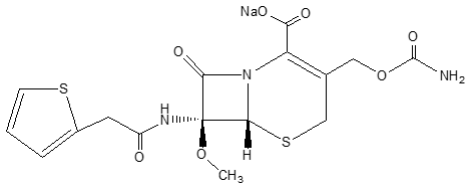
Assay Weigh accurately the mass of the contents of NLT 10 containers of Cefotiam Hydrochloride for Injection. Weigh accurately an amount equivalent to about 50 mg (potency) of cefotiam hydrochloride according to the labeled amount, dissolve in the mobile phase to make exactly 50 mL, and use this solution as the test solution.

Separately, weigh accurately about 50 mg (potency) of cefotiam hydrochloride RS, dissolve in the mobile phase to make exactly 50 mL, and use this solution as the standard solution. Perform the test as directed under the Assay under Cefotiam Hydrochloride.

$$\text{Potency (μg) of cefotiam } (C_{18}H_{23}N_9O_4S_3) = \text{Potency (μg) of cefotiam hydrochloride RS} \times \frac{A_T}{A_S}$$

Packaging and storage Preserve in hermetic containers. Plastic containers for aqueous injections may be used.

Cefoxitin Sodium
세폭시틴나트륨



$C_{16}H_{17}N_3NaO_7S_2$: 449.44

Sodium (6*R*,7*R*)-7-[2-(thiophen-2-yl)acetamido]-3-carbamoyloxymethyl-3,4-didehydrocepham-4-carboxylate [*33564-30-6*]

Cefoxitin Sodium contains NLT 927 μg and NMT 970 μg (potency) of cefoxitin ($C_{16}H_{17}N_3O_7S_2$: 427.46) per mg, calculated on the anhydrous, acetone-free, and methanol-free basis.

Description Cefoxitin Sodium occurs as a white to pale yellowish white particle or a powder.
It is very soluble in water, soluble in methanol, slightly soluble in ethanol(95), and practically insoluble in ether.

Identification (1) The retention time of the major peak obtained from the test solution corresponds to that from the standard solution, as obtained in the Assay.

(2) Dissolve 25 mg of Cefoxitin Sodium in 0.05 mol/L phosphate buffer (pH 7.0) to make 1000 mL, and determine the absorption spectrum of this solution as directed under the Ultraviolet-visible Spectroscopy; it exhibits maxima at the wavelengths of between 234 nm and 238 nm and between 260 nm and 264 nm.

(3) Dissolve 20 mg each of Cefoxitin Sodium and cefoxitin sodium RS in methanol to make 10 mL, and use these solutions as the test solution and the standard solution, respectively. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on a thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of chloroform, acetone and formic acid (10 : 9 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Spray 4-dimethylaminocinnamaldehyde TS on the plate and heat the plate at about 80 ℃ for 5 minutes; the R_f values of the purple spots from the test solution and the standard solution are the same.

(4) Cefoxitin Sodium responds to the Qualitative Analysis (1) for sodium salt.

Optical rotation $[\alpha]_D^{20}$: Between +206° and +214° (0.25 g, calculated on the anhydrous basis, acetone-free, and methanol-free basis, methanol, 25 mL, 100 mm).

pH Dissolve 1 g of Cefoxitin Sodium in 10 mL of water. The pH of this solution is between 4.2 and 7.0.

Absorbance $E_{1cm}^{1\%}$ (262 nm): Between 190 and 210 (2.0 mg, calculated on the anhydrous basis, 0.05 mol/L phosphate buffer (pH 7.0), 100 mL).

Purity (1) ***Heavy metals*—**Proceed with 1.0 g of Cefoxitin Sodium as directed under Method 2 and perform the test. Prepare the control solution with 2.0 mL of the lead standard solution (NMT 20 ppm).

(2) ***Cefoxitin lactone*—**Weigh accurately about 0.1 g of Cefoxitin Sodium, dissolve in methanol to make exactly 10 mL, and use this solution as the test solution. Pipet 1 mL of the test solution, add methanol to make exactly 100 mL, and use this solution as the standard solution. Perform the test with the test solution and the standard solution as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of chloroform, acetone and formic acid (10 : 9 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Spray evenly 4-dimethylaminobenzaldehyde TS on the plate and heat the plate at about 80 ℃ for 5 minutes; the spots other than the principal spot obtained from the test solution are not more intense than the spots from the standard solution (NMT 1.0%).

Water NMT 1.0% (0.5 g, volumetric titration, direct titration). Use a mixture of ethylene glycol and pyridine (3 : 1) instead of methanol.

Sterility It meets the requirements when used in a sterile preparation. However, it is excluded in cases where there is a terminal sterilization process in the manufacturing of a sterile preparation.

Bacterial endotoxins It is less than 0.10 EU per mg of cefoxitin when used in a sterile preparation.

Assay Weigh accurately about 50 mg (potency) of Cefoxitin Sodium, dissolve in the mobile phase to make exactly 100 mL, and use this solution as the test solution. Separately, weigh 10 mg of cefoxitin sodium RS, dissolve in the mobile phase to make exactly 20 mL, and use

this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of cefoxitin, respectively.

Potency (μg) of cefoxitin ($C_{16}H_{17}N_3O_7S_2$)
= Potency (μg) of cefoxitin RS × A_T / A_S

Operating conditions

Detector: An ultraviolet absorption spectrophotometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of water, methanol and acetic acid(100) (50 : 50 : 1).

Flow rate: Adjust the flow rate so that the retention time of cefoxitin is about 6 minutes.

System suitability

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area of cefoxitin is NMT 2.0%.

Packaging and storage Preserve in tight containers.

Cefoxitin Sodium for Injection
주사용 세폭시틴나트륨

Cefoxitin Sodium for Injection, as an injection that is dissolved upon use, contains NLT 90.0% and NMT 120.0% of the labeled amount of cefoxitin ($C_{16}H_{17}N_3O_7S_2$: 427.46).

Method of preparation Prepare as directed under Injections, with Cefoxitin Sodium.

Description Cefoxitin Sodium for Injection occurs as a white to pale yellowish white powder.

Identification Perform the test as directed under the Identification (1), (2) and (3) under Cefoxitin Sodium.

pH Dissolve an amount of Cefoxitin Sodium for Injection equivalent to 1.0 g (potency) of cefoxitin sodium in 10 mL of water; the pH of this solution is between 4.2 and 7.0.

Water NMT 2.0% (0.5 g, volumetric titration, direct titration).

Sterility Meets the requirements.

Bacterial endotoxins Less than 0.10 EU per mg (potency) of cefoxitin.

Particulate contamination: Visible particles Meets the requirements.

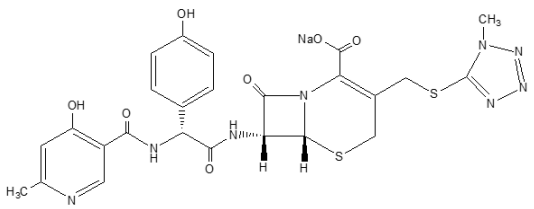
Insoluble particulate matter in injections Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Perform the test as directed under the Assay under Cefoxitin Sodium. However, weigh accurately an amount equivalent to about 50 mg (potency) according to the labeled potency of Cefoxitin Sodium for Injection, dissolve in the mobile phase to make exactly 100 mL, and use this solution as the test solution.

Packaging and storage Preserve in hermetic containers.

Cefpiramide Sodium
세프피라미드나트륨



$C_{25}H_{23}N_8NaO_7S_2$: 634.62

Sodium (6*R*,7*R*)-7-[[(2*R*)-2-(4-hydroxyphenyl)-2-[(4-hydroxy-6-methylpyridin-3-yl)carbonylamino]acetamido]-3-[(1-methyltetrazol-5-yl)sulfanyl methyl]-3,4-didehydrocepham-4-carboxylate [*74849-93-7*]

Cefpiramide Sodium contains NLT 900 μg and NMT 990 μg (potency) of cefpiramide ($C_{25}H_{24}N_8O_7S_2$: 612.64) per mg, calculated on the anhydrous basis.

Description Cefpiramide Sodium occurs as a white to yellowish white powder.
It is very soluble in dimethylsulfoxide, freely soluble in water, sparingly soluble in methanol and slightly soluble in ethanol(95).

Identification (1) Determine the absorption spectrum as directed under the Ultraviolet-visible Spectroscopy with 0.05 mol/L phosphate buffer solution (pH 7.0) (1 → 50000) of Cefpiramide Sodium; it exhibits an absorption maximum between 270 nm and 275 nm.

(2) Determine the nuclear magnetic resonance spectrum as directed under the Nuclear Magnetic Resonance Spectroscopy (^{1}H) with the deuterated dimethylsulfoxide solution (1 in 10) of Cefpiramide Sodium; it exhibits singlet signals at around 2.3 ppm, around 3.9 ppm and around 8.2 ppm, and the area intensity ratio of each signal is 3 : 3 : 1.

(3) Cefpiramide Sodium responds to the Qualitative Analysis (1) for sodium salt.

Optical rotation $[\alpha]_D^{20}$: Between -33° and -40° (0.2 g calculated on the anhydrous basis, 0.05 mol/L phosphate buffer solution (pH 7.0), 10 mL, 100 mm).

pH Dissolve 1 g (potency) of Cefpiramide Sodium in 10 mL of water; the pH of this solution is between 5.5 and 8.0.

Purity (1) ***Dissolution*—**Dissolve 1.0 g of Cefpiramide Sodium in 0.05 mol/L phosphate buffer solution (pH 7.0); the solution is clear and colorless to pale yellow.

(2) ***Heavy metals*—**Weigh 1.0 g of Cefpiramide Sodium and perform the test according to Method 2. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Related substances*—**Weigh accurately about 25 mg of Cefpiramide Sodium and dissolve it in 0.03 mol/L phosphate buffer solution (pH 7.5) to make exactly 50 mL, and use this solution as the test solution. Separately, weigh accurately an amount, equivalent to about 25 mg of 1-methyl-1*H*-tetrazole-5-thiol RS and about 75 mg (potency) of cefpyramide RS, previously dried for 2 hours in a desiccator (in vacuum, silica gel), and dissolve in 0.03 mol/L phosphate buffer solution (pH 7.5) to make exactly 100 mL. Pipet 2 mL of this solution, add 0.03 mol/L phosphate buffer solution (pH 7.5) to make exactly 100 mL, and use this solution as the standard solution. Pipet 5 μL each of the test and standard solutions and perform the test as directed under the Liquid Chromatography according to the following operating conditions, and measure each peak area of each solution. Determine each amount using the following formula; 1-methyl-1*H*-tetrazole-5-thiol is NMT 1.0%, other related substances are NMT 1.5%, and the sum of other related substances is NMT 4.0%.

Content (%) of 1-methyl-1*H*-tetrazole-5-thiol ($C_2H_4N_4S$)

$$= \frac{W_{Sa}}{W_T} \times \frac{A_{Ta}}{A_{Sa}}$$

Content (%) of other individual related substances

$$= \frac{W_{Sb}}{W_T} \times \frac{A_{Tc}}{A_{Sb}}$$

W_{Sa}: Amount (mg) of 1-methyl-1*H*-tetrazole-5-thiol

W_{Sb}: Amount [mg (potency)] of cefpiramide sodium RS

W_T: Amount (mg) of cefpiramide sodium

A_{Sa}: Peak area of 1-ethyl-1*H*-tetrazole-5-thiol in the standard solution

A_{Sb}: peak area of the cefpiramide of the standard solution

*A*Ta: Peak area of 1-methyl-1H-tetrazole-5-thiol in the test solution

A_{Tc}: Each peak area other than 1-methyl-1H-tetrazole-5-thiol and cefpiramide in the test solution

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and 30 cm in length, packed with 10 μm octylsilyl silica gel for liquid chromatography.

Column temperature: A constant temperature of about 25 °C.

Mobile phase: A mixture of 0.03 mol/L phosphate buffer solution (pH 7.5) and methanol (3 : 1).

Flow rate: Adjust so that the retention time of the cefpiramide is about 11 minutes.

System suitability

Test for required detectability: Pipet 5 mL of the standard solution and add 0.03 mol/L phosphate buffer solution (pH 7.5) to make exactly 50 mL. Confirm that the peak area of 1-methyl-1*H*-tetrazole-5-thiol obtained from 5 μL of this solution is 8% to 12% of the peak area of 1-methyl-1*H*-tetrazole-5-thiol from the standard solution.

System performance: Weigh 25 mg of cefpiramide RS and 7 mg of cinnamic acid and dissolve in the mobile phase to make 50 mL. Proceed with 5 μL of this solution according to the above conditions: cinnamic acid and cefpiramide are eluted in this order with the resolution being NLT 3.

System repeatability: Repeat the test 6 times according to the above conditions with 5 μL each of the standard solutions; the relative standard deviation of the peak area of 1-methyl-1H-tetrazole-5-thiol is NMT 2.0%.

Time span of measurement: About 2 times the retention time of cefpiramide.

Water NMT 7.0% (0.35 g, volumetric titration, direct titration).

Sterility It meets the requirements when used in the manufacturing of sterile preparations. However, it is excluded in cases where there is a final sterilization process in the manufacturing of a sterile preparation.

Bacterial endotoxins It is less than 0.06 EU per mg (potency) of cefpiramide when used in the manufacturing of sterile preparations,

Assay Weigh accurately about 50 mg (potency) of Cefpiramide Sodium and cefpiramide RS, add exactly 5 mL of the internal standard solution to each, and dissolve in the mobile phase to make exactly 100 mL. Use these solutions as the test solution and the standard solution, respectively. Perform the test with 5 μL each of these solutions as directed under the Liquid Chromatography according to the following conditions, and measure the peak area ratio, Q_T and Q_S, of cefpiramide to the peak area of the internal standard in the test solution and the standard solution.

Potency (μg) of cefpiramide ($C_{25}H_{24}N_8O_7S_2$)

$$= \text{Potency } (\mu g) \text{ of cefpiramide RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—4-dimethylaminoantipyrine solution (1 in 100).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: A mixture of 0.01 mol/L phosphate buffer solution (pH 6.8), acetonitrile, tetrahydrofuran and methanol (22 : 1 : 1 : 1).

Flow rate: Adjust so that the retention time of cefpiramide is about 7 minutes.

System suitability

System performance: Proceed with 5 μL of the standard solution according to the above conditions; cefpiramide and the internal standard are eluted in this order with the resolution being NLT 7.0.

System repeatability: Repeat the test 6 times according to the above conditions with 5 μL each of the standard solutions; the relative standard deviation of the peak area ratio of cefpiramide to that of the internal standard is NMT 2.0%.

Packaging and storage Preserve in light-resistant, tight containers (NMT 5 °C).

Cefpiramide Sodium for Injection
주사용 세프피라미드나트륨

Cefpiramide Sodium for Injection is a preparation for injections, which is dissolved before use, and contains NLT 90.0% and NMT 120.0% of the labeled amount of cefpiramide ($C_{25}H_{24}N_8O_7S_2$: 612.64).

Method of preparation Prepare as directed under Injections, with Cefpiramide Sodium.

Description Cefpiramide Sodium for Injection occurs as a white to pale yellowish white powder.

Identification (1) Dissolve about 10 mg (potency) of Cefpiramide Sodium for Injection in 2 mL of water, add 2 mL of hydroxylammonium hydrochloride TS and allow to stand for 5 minutes. Add 1 mL of dilute ammonium iron(III) sulfate TS and shake to mix; the resulting solution exhibits a reddish brown color.

(2) Weigh 10 mg (potency) of Cefpiramide Sodium for Injection, dissolve in 2 mL of water, add 2 mL of sodium carbonate solution (1 in 100) and 3 mL of diazobenzenesulfonic acid TS, and shake to mix; the resulting solution exhibits an orange red color.

(3) Weigh 2 mg (potency) of Cefpiramide Sodium for Injection, and dissolve in 0.05 mol/L phosphate buffer solution (pH 7.0) to make 100 mL. Determine the absorption spectrum of this solution as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum between 270 nm and 275 nm.

pH Dissolve 1.0 g of Cefpiramide Sodium for Injection in 10 mL of water; the pH of this solution is between 6.0 and 8.0.

Water NMT 3.0% (0.2 g, volumetric titration, direct titration).

Sterility Meets the requirements.

Bacterial endotoxins Less than 0.06 EU per mg (potency) of cefpiramide.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately about 1.0 g (potency) of Cefpiramide Sodium for Injection according to the labeled potency, and dissolve in water to obtain a solution containing 10 mg (potency) per mL. Pipet 5 mL of this solution, add 5.0 mL of the internal standard solution, then add the mobile phase to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 50 mg (potency) of cefpiramide RS, add exactly 5 mL of the internal standard solution, dissolve in the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 5 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the ratios, Q_T and Q_S, of the peak area of cefpiramide to that of the internal standard, respectively.

$$\text{Potency } (\mu g) \text{ of cefpiramide } (C_{25}H_{24}N_8O_7S_2) = Potency \text{ } (\mu g) \text{ of cefpiramide RS} \times \frac{Q_T}{Q_S} \times 20$$

Internal standard solution—Weigh 1 g of aminopyrine, and dissolve in water to make 100 mL.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography

(10 μm in particle diameter).

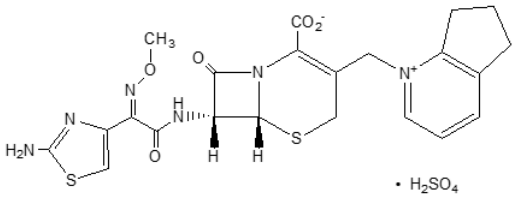
Mobile phase: A mixture of 0.01 mol/L phosphate buffer solution (pH 6.8), methanol, acetonitrile and tetrahydrofuran (880 : 40 : 40 : 40).

Flow rate: Adjust the flow rate so that the retention time of cefpiramide is about 7 minutes.

Selection of column: Perform the test with 5 μL of the standard solution according to the above operating conditions. Use a column giving elution of cefpiramide and aminopyrine in this order with the resolution between these peaks being NLT 7.0.

Packaging and storage Preserve in light-resistant, hermetic containers.

Cefpirome Sulfate
세프피롬황산염



$C_{22}H_{22}N_6O_5S_2 \cdot H_2SO_4$: 612.66

bis[(7*R*)-7-[(2*Z*)-2-(2-Amino-1,3-thiazol-4-yl)-2-methoxyiminoacetamido]-3-[(6,7-dihydro-5*H*-cyclopenta[b]pyridin-1-ium-1-yl)methyl]-3,4-didehydrocepham-4-carboxylate] sulfate [*98753-19-6*]

Cefpirome Sulfate contains NLT 760 μg (potency) of cefpirome ($C_{22}H_{22}N_6O_5S_2$: 514.58) per mg, calculated on the anhydrous basis.

Description Cefpirome Sulfate occurs as a white to pale yellowish white crystalline powder and has a slight characteristic odor.

It is soluble in water and practically insoluble in ethanol(95) or ether.

It is hygroscopic.

Identification (1) Dissolve 10 mg of Cefpirome Sulfate in 2 mL of water, add 3 mL of hydroxylamine hydrochloride-ethanol TS, allow to stand for 5 minutes, add 1 mL of acidic ammonium iron(III) sulfate TS, and shake to mix; the resulting solution exhibits a reddish brown color.

(2) Dissolve 1 mg of Cefpirome Sulfate in 4 mL of water and add 1 mL of dilute hydrochloric acid while cooling in an ice bath. To this solution, add 1 mL of freshly prepared sodium nitrite solution (1 in 100) and allow to stand for 2 minutes. While cooling again in an ice bath, add 1 mL of ammonium sulfate TS, allow to stand for 1 minute, and add 1 mL of *N*-1-naphthylethylenediamine dihydrochloride (1 in 1000); the resulting solution exhibits a violet color.

(3) Weigh 5 mg of Cefpirome Sulfate, dissolve in a mixture of 1 mL of ethanol(95) and 1 mL of water, add 0.1 g of 1-chloro-2,4-dinitrobenzene, and heat on a steam bath for 5 minutes. After cooling, add 2 to 3 drops of sodium hydroxide (1 in 10) and 3 mL of ethanol(95); the resulting solution exhibits a reddish brown color.

(4) Determine the absorption spectra of solutions of Cefpirome Sulfate and cefpirome sulfate RS 0.01 mol/L hydrochloric acid (1 in 50000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(5) With deuterium oxide for nuclear magnetic resonance spectroscopy(1 in 25) of Cefpirome Sulfate, determine ^1H as directed under the Nuclear Magnetic Resonance Spectroscopy using sodium 3-trimethylsilylpropanesulfonate as the internal standard; it exhibits a singlet signal A at around δ 4.1 ppm, a doublet signal B at around δ 5.9 ppm, a singlet signal C at around δ 7.1 ppm a multiplet signal D at around δ 7.8 ppm, and the area intensity ratio of each signal, A : B : C : D is about 3 : 1 : 1 : 1.

(6) An aqueous solution of Cefpirome Sulfate (1 in 250) responds to the Qualitative Analysis (1) for sulfate.

Optical rotation $[\alpha]_D^{20}$: Between -27° and -33° (0.5 g, calculated on the anhydrous basis, 20 mL of a solution prepared by adding water to 25 mL of acetonitrile to make 50 mL, 100 mm).

pH Dissolve 0.1 g of Cefpirome Sulfate in 10 mL of water; the pH of this solution is between 1.6 and 2.6.

Absorbance $E_{1cm}^{1\%}$ (270 nm): Between 405 and 435 (50 mg, calculated on the anhydrous basis, 0.01 mol/L hydrochloric acid TS, 2500 mL).

Purity ***Heavy metals***—Proceed with 1.0 g of Cefpirome Sulfate according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of the lead standard solution (NMT 20 ppm).

Water—NMT 2.5% (0.5 g, volumetric titration, direct titration).

Sterility—It meets the requirements when used in sterile preparations. However, it is exempt from the requirements when there is a final sterilization process in the manufacturing process of sterile preparations.

Bacterial endotoxins—Less than 0.10 EU per mg (potency) of cefpirome when used in sterile preparations.

Assay Weigh accurately about 50 mg (potency) of Cefpirome Sulfate and cefpirome sulfate RS, and dissolve each in water to make exactly 100 mL. To 5 mL each of these solutions, add water to make exactly 20 mL, and use these solutions as the test solution and the standard solution. Perform the test with 20 μL of each of these solutions as directed under the Liquid Chromatography method according to the following conditions, and determine the peak areas A_T and A_S of cefpirome.

Potency (μg) of cefpirome ($C_{22}H_{22}N_6O_5S_2$)

$$= \text{Potency (μg) of cefpirome sulfate RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption spectrophotometer (wavelength: 270 nm).

Column: A stainless steel column about 4.6 mm internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: Dissolve 3.45 g of ammonium dihydrogen phosphate in 1000 mL of water and adjust to pH 3.3 with phosphoric acid. Add 100 mL of acetonitrile to 800 mL of this solution.

Flow rate: Adjust the flow rate so that the retention time of cefpirome is about 7.5 minutes.

System suitability

System performance: Proceed with 20 μL of the standard solution according to the above conditions; the number of theoretical plates of the cefpirome peak is NLT 3600.

System repeatability: Repeat the test 5 times with 20 μL each of the standard solutions according to the above conditions; the relative standard deviation of the peak areas of cefpirome is NMT 1.0%.

Packaging and storage Preserve in hermetic containers (at 2 ℃ to 8 ℃).

Cefpirome Sulfate for Injection
주사용 세프피롬황산염

Cefpirome Sulfate for Injection is a preparation for injections, which is dissolved before use, and contains NLT 90.0% and NMT 120.0% of the labeled amount of cefpirome ($C_{22}H_{22}N_6O_5S_2$: 514.58).

Method of preparation Prepare as directed under Injections, with Cefpirome Sulfate.

Description Cefpirome Sulfate for Injection occurs as a white to pale yellow crystalline powder.

Identification (1) Dissolve about 10 mg (potency) of Cefpirome Sulfate for Injection in 2 mL of water, add 3 mL of hydroxylammonium hydrochloride-ethanol TS, and allow to stand for 5 minutes. Add 1 mL of acidic ammonium iron(III) sulfate TS, and shake to mix; the resulting solution exhibits a reddish brown color.

(2) Weigh 1 mg (potency) of Cefpirome Sulfate for Injection, dissolve in 4 mL of water, cool in iced water, and add 1 mL of dilute hydrochloric acid. Add 1 mL of freshly prepared sodium nitrite solution (1 in 100), and allow to stand for 2 minutes. Cool the solution again in iced water, add 1 mL of ammonium sulfamate TS, allow to stand for 1 minute, and add 1 mL of N-(naphthyl) ethylenediamine hydrochloride solution (1 in 1000); the resulting solution exhibits a violet color.

(3) Weigh 5 mg (potency) of Cefpirome Sulfate for Injection, dissolve in 1 mL of ethanol and 1 mL of water, add 0.1 g of 2,4-dinitrochlorobenzene, and heat on a steam bath for 5 minutes. After cooling, add 2 to 3 drops of sodium hydroxide solution (1 in 10) and 3 mL of ethanol; the resulting solution exhibits a reddish brown color.

pH Dissolve 1 g (potency) of Cefpirome Sulfate for Injection per 10 mL in water, and remove air bubbles; the pH of the solution is 5.5 to 7.5.

Loss on drying NMT 2.5% (0.2 g, NMT 0.7 kPa, phosphorus pentoxide, 3 hours).

Sterility Meets the requirements.

Bacterial endotoxins Less than 0.15 EU per mg of cefpirome sulfate.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately an amount of Cefpirome Sulfate for Injection equivalent to about 50 mg (potency) of cefpirome according to the labeled potency, and dissolve in water to make exactly 100 mL. Pipet 5 mL of this solution, add water to make exactly 20 mL, and use this solution as the test solution. Separately, weigh accurately about 50 mg (potency) of cefpirome sulfate RS, and dissolve in water to make exactly 100 mL. Pipet 5 mL of this solution, add water to make exactly 20 mL and use this solution as the standard solution. Perform the test with 20 μL of these solutions as directed under the Liquid Chromatography according to the following conditions and determine the peak areas of cefpirome, A_T, and A_S, respectively, from each solution.

$$\text{Potency (μg) of cefpirome } (C_{22}H_{22}N_6O_5S_2) = \text{Potency (μg) of cefpirome RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 270 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: Dissolve 3.45 g of ammonium dihydrogen phosphate in water to make 1000 mL, and adjust the pH to 3.3 with phosphoric acid. Mix this solution with

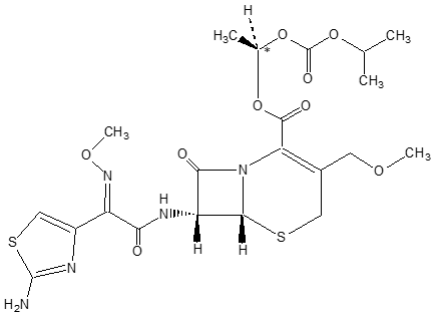
acetonitrile at a ratio of 8 : 1.

Flow rate: Adjust the flow rate so that the retention time of cefpirome is 6 to 9 minutes.

Selection of column: Perform the test with 20 μL of the standard solution according to the above conditions. Use a column giving the number of theoretical plate NLT 3600.

Packaging and storage Preserve in hermetic containers.

Cefpodoxime Proxetil
세프포독심프록세틸



and C* epimer

$C_{21}H_{27}N_5O_9S_2$: 557.60

1-(1-Methylethyloxycarbonyloxy)ethyl (6*R*,7*R*)-7-[(2*E*)-2-(2-aminothiazol-4-yl)-2-methoxyimino-acetamido]-3-methoxymethyl-3,4-didehydrocepham-4-carboxylate [*87239-81-4*]

Cefpodoxime Proxetil contains NLT 706 μg (potency) and NMT 774 μg (potency) of cefpodoxime ($C_{15}H_{17}N_5O_6S_2$: 427.46) per mg, calculated on the anhydrous basis.

Description Cefpodoxime Proxetil occurs as a white or pale brown powder.

It is very soluble in acetonitrile, methanol or chloroform, freely soluble in ethanol(99.5), and very slightly soluble in water.

Identification (1) Determine the absorption spectra of solutions of Cefpodoxime Proxetil and cefpodoxime proxetil RS in acetonitrile (3 in 200000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Cefpodoxime Proxetil and cefpodoxime proxetil RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) With a solution of deuterated chloroform (1 in 10) of Cefpodoxime Proxetil, determine ^1H as directed under the Nuclear Magnetic Resonance Spectroscopy; the resulting spectrum exhibits doublet signals near δ 1.3 ppm and δ 1.6 ppm, and singlet signals near δ 3.3 ppm and δ 4.0, respectively. The area intensity ratio of each signal is 2 : 1 : 1 : 1.

Optical rotation $[\alpha]_D^{20}$: Between +24.0° and +31.4° (0.1 g, calculated on anhydrous basis, acetonitrile, 20 mL, 100 mm).

Absorbance $E_{1cm}^{1\%}$ (234 nm): Between 324 and 360 (0.1 g, calculated on the anhydrous basis, acetonitrile, 1000 mL).

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Cefpodoxime Proxetil according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Related substances***—Dissolve 50 mg of Cefpodoxime Proxetil in 50 mL of a mixture of water, acetonitrile and acetic acid(100) (1 : 1 : 2), and use this solution as the test solution. With 20 μL of the test solution, perform the test as directed under the Liquid Chromatography according to the following conditions, and determine each peak area. If necessary, proceed with 20 μL a mixture of water, acetonitrile and acetic acid(100) (99 : 99 : 2) in the same manner to calibrate the solvent peak and baseline fluctuations. Calculate the amount of related substances by the percentage peak area method; the peak having the relative retention time for isomer B of cefpodoxime proxetil of about 0.8, is NMT 2.0%, the peaks other than cefpodoxime proxetil are NMT 1.0%, and the total area of the peaks other than cefpodoxime proxetil is NMT 6.0%.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless-steel column about 4.6 nm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 22 ℃.

Mobile phase: Use the mobile phases A and B to control the step or the gradient elution as follows.

Mobile phase A: A mixture of water, methanol, and formic acid (11 : 8 : 1).

Mobile phase B: A mixture of methanol and formic acid (1 in 50) (19 : 1).

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 - 65	95	5
65 - 145	95 → 15	5 → 85
145 - 155	15	85

Flow rate: Adjust the flow rate so that the retention time of isomer B of cefpodoxime proxetil is about 60 minutes.

System suitability

Test for required detectability: Pipet 5 mL of the

test solution, add a mixture of water, acetonitrile and acetic acid(100) (99 : 99 : 2) to make exactly 200 mL, and use this solution for the detection confirmation solution. Pipet 2 mL of the detection confirmation solution and add a mixture of water, acetonitrile and acetic acid(100) (99 : 99 : 2) to make exactly 100 mL. Confirm that the peak areas of isomer A and isomer B of cefpodoxime proxetil obtained from 20 μL of this solution are between 1.4% to 2.6% of the peak areas of isomer A and isomer B of cefpodoxime proxetil from the detection confirmation solution.

System performance: Dissolve 1 mg of Cefpodoxime Proxetil in 100 mL of a mixture of water, acetonitrile and acetic acid(100) (99 : 99 : 2). Proceed with 20 μL of this solution according to the above conditions; isomer A and isomer B of cefpodoxime proxetil are eluted in this order with the resolution being NLT 6.0.

System repeatability: Dissolve 1 mg of Cefpodoxime Proxetil in 100 mL of a mixture of water, acetonitrile and acetic acid(100) (99 : 99 : 2) Repeat the test 5 times with 20 μL each of this solution according to the above conditions; the relative standard deviation of ratios of the peak areas isomer A and isomer B of cefpodoxime proxetil is NMT 2.0%, respectively.

Time span of measurement: About 2.5 times the retention time of isomer B of cefpodoxime proxetil after the solvent peak.

Water NMT 2.5% (0.5 g, volumetric titration, direct titration).

Residue on ignition NMT 0.2% (1 g).

Isomer ratio Perform the test with 5 μL of the test solution obtained under the Assay as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas the two isomers of cefpodoxime proxetil, A_a for the isomer with the shorter retention time and A_b for the isomer with the longer retention time; Ab/(Aa+Ab) is between 0.50 and 0.60.

Operating conditions

For the detector, column, column temperature, mobile phase and flow rate, proceed as directed in the operating conditions under the Assay.

System suitability

System performance and system repeatability: Proceed as directed under the system suitability under the Assay.

Assay Weigh accurately about 60 mg (potency) each of Cefpodoxime Proxetil and cefpodoxime proxetil RS, dissolve in 80 mL of acetonitrile, add exactly 4 mL of the internal standard solution to each, and add acetonitrile to make exactly 100 mL. Use these solutions as the test solution and the standard solution. Perform the test with 5 μL each of these solutions as directed under the Liquid Chromatography according to the following conditions, and calculate the ratios, Q_{T1}, Q_{T2}, Q_{S1}, and Q_{S2} of the peak area of cefpodoxime proxetil and its isomers to that of the internal standard from the test solution and the standard solution.

$$\text{Potency (μg) of cefpodoxime proxetil } (C_{15}H_{17}N_5O_6S_2) = \text{Potency (μg) of cefpodoxime proxetil RS} \times \frac{Q_{T1}+Q_{T2}}{Q_{S1}+Q_{S2}}$$

Internal standard solution—Dissolve 0.3 g of propyl p-hydroxybenzoate-ethylin a solution of citric acid monohydrate in acetonitrile (1 in 2000) to make 100 mL.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 240 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: A mixture of methanol and water (9:11).

Flow rate: Adjust the flow rate so that the retention time of the internal standard is about 11 minutes.

System suitability

System performance: Proceed with 5 μL of the standard solution according to the above conditions; propyl p-hydroxybenzoate-ethyl, isomer A of cefpodoxime proxetil, and isomer B of cefpodoxime proxetil are eluted in this order with the resolution between the isomers being NLT 4.0.

System repeatability: Repeat the test 5 times with 5 μL each of the standard solutions according to the above conditions; the relative standard deviation of ratios of the peak area of isomer B of cefpodoxime proxetil to that of the internal standard is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Cefpodoxime Proxetil for Syrup
시럽용 세프포독심프록세틸

Cefpodoxime Proxetil for Syrup is a preparation for syrup, which is dissolved before use, and contains NLT 90.0% and NMT 120.0% of the labeled amount of cefpodoxime ($C_{15}H_{17}N_5O_6S_2$: 427.46).

Method of preparation Prepare as directed under Syrups, with Cefpodoxime Proxetil.

Identification (1) Dissolve an amount of powdered Cefpodoxime Proxetil for Syrup, equivalent to 10 mg (potency) of cefpodoxime, in 2 mL of hydroxylamine hydrochloride TS, allow to stand for 5 minutes, add 1 mL of acidic ammonium iron(III) sulfate TS, and shake to mix; a reddish brown color develops.

(2) Dissolve an amount of powdered Cefpodoxime Proxetil for Syrup, equivalent to 1 mg (potency) of cefpodoxime, in 4 mL of water, and add 1 mL of dilute sulfuric acid while cooling on ice. Add 1 mL of a freshly prepared sodium nitrite solution (1 in 100), shake, and allow to stand for 2 minutes. Add 1 mL of ammonium amidosulfate solution (1 in 100) while cooling on ice, shake well to mix, allow to stand for 1 minute, and add 1 mL of N-(1-Naphthyl)ethylenediamine hydrochloride TS; a purple color develops.

(3) Dissolve an amount of powdered Cefpodoxime Proxetil for Syrup, equivalent to 15 mg (potency) of cefpodoxime, in acetonitrile to make 1000 mL. Determine the absorption spectrum of this solution as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum at the wavelength of between 232 nm and 236 nm.

pH Dissolve Cefpodoxime Proxetil for Syrup according to the label; the pH of the resulting solution is between 4.0 and 5.5.

Water NMT 2.0% (0.5 g, volumetric titration, direct titration).

Uniformity of dosage units (distribution) Meets the requirements.

Assay Proceed as directed under the Assay under Cefpodoxime Proxetil. However, weigh accurately an amount of Cefpodoxime Proxetil for Syrup, equivalent to about 0.1 g (potency) according to the labeled potency, transfer it to a blender, add exactly 30 mL of the internal standard solution, and blend at high speed. Filter, pipet 3 mL of the filtrate, add acetonitrile to make exactly 20 mL, and use this solution as the test solution. Separately, weigh accurately about 50 mg (potency) of cefpodoxime proxetil RS, dissolve in acetonitrile, add 15 mL of the internal standard solution and acetonitrile to make exactly 100 mL, and use this solution as the standard solution.

Internal standard solution—Dissolve 0.2 g of ethylparaben in a solution of citric acid monohydrate in acetonitrile (1 in 2000) to make 300 mL.

Packaging and storage Preserve in tight containers.

Cefpodoxime Proxetil Tablets
세프포독심프록세틸 정

Cefditoren Pivoxil Tablets contain NLT 90.0% and NMT 120.0% of the labeled amount of cefpodoxime ($C_{15}H_{17}N_5O_6S_2$: 427.46).

Method of preparation Prepare as directed under Tablets, with Cefpodoxime Proxetil.

Identification (1) Weigh an amount of Cefpodoxime Proxetil Tablets, previously powdered, equivalent to 10 mg (potency) of cefpodoxime, dissolve in 2 mL of hydroxylamine hydrochloride TS, allow to stand for 5 minutes, add 1 mL of acidic ammonium iron(III) sulfate TS, and shake to mix; the resulting solution exhibits a reddish brown color.

(2) Weigh an amount of Cefpodoxime Proxetil Tablets, previously powdered, equivalent to 1 mg (potency) of cefpodoxime, dissolve in 4 mL of water, cool with ice, and add 1 mL of dilute sulfuric acid. Add 1 mL of freshly prepared sodium nitrite solution (1 in 100), shake to mix, and allow to stand for 2 minutes. Cool with ice again, add 1 mL of ammonium amidosulfate solution (1 in 100), shake well to mix, allow to stand for 1 minute, and add 1 mL of hydrochloric acid *N*-(1-naphthyl)ethylenediamine hydrochloride TS; the resulting solution exhibits a reddish purple color.

(3) Weigh an amount of Cefpodoxime Proxetil Tablets, previously powdered, equivalent to 15 mg (potency) of cefpodoxime, and dissolve in acetonitrile to make 1000 mL. Determine the absorption spectrum of this solution as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum between 232 nm and 236 nm.

Water NMT 5.0% (0.2 g, volumetric titration, direct titration).

Dissolution Perform the test with 1 tablet of Cefpodoxime Proxetil Tablets at 75 revolutions per minute according to the Method 2 under the Dissolution. Put 54.5 g of glycine and 42.6 g of sodium chloride in a 1000-mL flask, previously filled with about 500 mL of water, add carefully 14.2 mL of hydrochloric acid while shaking the flask, cool, and add water to make 1000 mL. Take 50 mL of the resulting solution, add water to make 900 mL, and adjust the pH to 3.0±0.1 with 10 mol/L sodium hydroxide, if needed. Use this solution as the test solution. Take the dissolved solution after 30 minutes from the start of the test, and filter. Discard the first 10 mL of the filtrate and use the subsequent filtrate as the test solution. Separately, weigh accurately an appropriate amount of cefpodoxime proxetil RS, dissolve in a small amount of methanol, add the test solution to make the same concentration as the test solution, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at the absorbance maximum wavelength near 259 nm as directed under the Ultraviolet-visible Spectroscopy, using the dissolution medium as a control solution. It meets the requirements when the dissolution rate in 30 minutes is NLT 70% (Q).

Dissolution rate (%) with respect to the labeled amount of cefpodoxime proxetil ($C_{15}H_{17}N_5O_6S_2$)

$$= C_S \times \frac{A_T}{A_S} \times \frac{1}{C} \times 90000$$

Cs: Concentration [mg (potency)/mL] of the standard solution

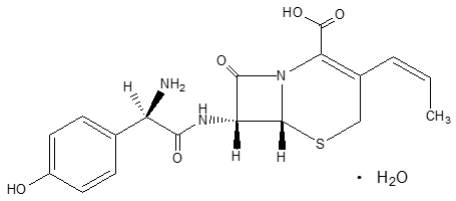
C: Labeled amount [mg (potency)] of cefpodoxime proxetil ($C_{15}H_{17}N_5O_6$) in 1 tablet

Uniformity of dosage units Meets the requirements.

Assay Perform the test as directed under the Assay under Cefpodoxime Proxetil. However, weigh accurately the mass of NLT 20 tablets of Cefpodoxime Proxetil Tablets, and powder. Weigh accurately a portion of the powder, equivalent to about 60 mg (potency) according to the labeled potency of Cefpodoxime Proxetil Tablets, put in a blender, add 40 mL of acetonitrile, mix at high speed, and filtrate. Pipet 20 mL of the filtrate, add exactly 2 mL of the internal standard solution, and add acetonitrile to make exactly 50 mL. Use this solution as the test solution.

Packaging and storage Preserve in tight containers.

Cefprozil Hydrate
세프프로질수화물



Cefprozil $C_{18}H_{19}N_3O_5S \cdot H_2O$: 407.44
(6*R*,7*R*)-7-[(2*R*)-2-Amino-2-(4-hydroxyphenyl)acetamido]-3-[(*Z*)-prop-1-enyl]-3,4-didehydro-cepham-4-carboxylic acid monohydrate [*121123-17-9*]

Cefprozil Hydrate contains NLT 900 μg (potency) and NMT 1050 μg (potency) of cefprozil ($C_{18}H_{19}N_3O_5S$: 389.43) per mg, calculated on the anhydrous basis.

Description Cefprozil Hydrate occurs as a white to pale yellow powder.
It is sparingly soluble in methanol, slightly soluble in water or dimethylsulfoxide, and practically insoluble in ethanol(95) and acetone.

Identification (1) Determine the infrared spectra of Cefprozil Hydrate and cefprozil(*Z*) isomer RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths

(2) The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

Crystalline Meets the requirements.

pH Dissolve 1 g of Cefprozil Hydrate in 200 mL of water; the pH of this solution is between 3.5 and 6.5.

Cefprozil(E) isomer Perform the test under the Assay and calculate according to the following formula (content ratio: between 0.06 and 0.11).

$$\text{Content ratio of cefprozil } (E) \text{ isomer} = \frac{Amount\ (\mu g/mg)\ of\ \text{cefprozil } (E) \text{ isomer}}{Amount\ (\mu g/mg) of\ \text{cefprozil } (Z) \text{isomer} + \text{Amount } (\mu g/mg) \text{ of cefprozil } (E) \text{ isomer}}$$

Water Between 3.5% and 6.5% (0.2 g, volumetric titration, direct titration).

Assay Weigh accurately about 25 mg (potency) of Cefprozil Hydrate, dissolve in water to make 100 mL, and use this solution as the test solution. Separately, weigh accurately about 25 mg (potency) of cefprozil(*Z*) isomer RS, dissolve in water to make exactly 100 mL, and use this solution as the cefprozil(*Z*) isomer standard solution. Separately, weigh accurately about 25 mg (potency) of cefprozil(E) isomer RS, dissolve in water to make exactly 100 mL, pipet 5 mL of this solution, and add water to make exactly 50 mL. Use this solution as the cefprozil(E) isomer standard solution. Perform the test with exactly 10 μL each of the test solution and standard solutions as directed under the Liquid Chromatography according to the following conditions.

Potency (μg) in 1 mg of Cefprozil Hydrate = Amount (μg) of cefprozil(*Z*) isomer in 1 mg of Cefprozil Hydrate + Amount (μg) of cefprozil(E) isomer in 1 mg of Cefprozil Hydrate

$$\text{Amount (μg) of cefprozil(Z) isomer in 1 mg of Cefprozil Hydrate} = \frac{W_1}{W} \times P_1 \times \frac{A_1}{T_1}$$

$$\text{Amount (μg) of cefprozil(E) isomer in 1 mg of Cefprozil Hydrate} = \frac{W_2}{W} \times P_2 \times \frac{A_2}{T_2}$$

W Amount (mg) of Cefprozil Hydrate taken
W_1 Amount (mg) of cefprozil(*Z*) isomer RS taken
A_1 Peak area of cefprozil(*Z*) isomer in the test solution
T_1 Peak area of cefprozil *Z*) isomer in the standard solution
P_1 Potency (μg/mg) of cefprozil(*Z*) isomer RS
W_2: Amount (mg) of cefprozil(*E*) isomer RS taken
A_2 Peak area of cefprozil(*E*) isomer in the test solution
T_2 Peak area of cefprozil(E) isomer in the standard solution
P_2 Potency (μg/mg) of cefprozil(*E*) isomer RS

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 280 nm).

Column: A stainless steel column about 4 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: Dissolve 20.7 g of ammonium dihydrogenphosphate in 1800 mL of water, adjust the pH to 4.4 with phosphoric acid, and add 200 mL of acetonitrile.

Flow rate: 1.0 mL/min

Packaging and storage Preserve in tight containers.

Cefprozil for Syrup
시럽용 세프프로질

Cefprozil for Syrup is a preparation for syrup, which is suspended before use, and contains NLT 90.0% and NMT 120.0% of the labeled amount of cefprozil ($C_{18}H_{19}N_3O_5S$: 389.43).

Method of preparation Prepare as directed under Syrups, with Cefprozil Hydrate.

Identification (1) Dissolve about 50 mg (potency) each of Cefprozil for Syrup and cefprozil (Z) isomer RS in 10 mL of a mixture of acetone and 0.1 mol/L hydrochloric acid TS (4 : 1) and use these solutions as the test solution and the standard solution, respectively. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot the test solution and the standard solution on a plate of silica gel for thin-layer chromatography, and develop the plate with a mixture of 1-butanol, acetic acid and water (60 : 20 : 20). Expose the plate to iodine vapor; the R_f values of the spots obtained from the test solution and the standard solution are the same.

(2) Perform the test as directed in Identification (2) under Cefprozil Hydrate.

pH Dissolve Cefprozil for Syrup according to the label; the pH of the resulting solution is between 4.0 and 6.0.

Water NMT 3.0% (0.2 g, volumetric titration, direct titration).

Uniformity of dosage units (distribution) Meets the requirements.

Assay Proceed as directed under the Assay under Cefprozil Hydrate. Weigh accurately an amount of Cefprozil for Syrup, equivalent to about 25 mg (potency), dissolve in water to make exactly 100 mL, centrifuge, and use the clear supernatant as the test solution.

Packaging and storage Preserve in tight containers.

Cefprozil Tablets
세프프로질 정

Cefprozil Tablets contain NLT 90.0% and NMT 120.0% of the labeled amount of cefprozil ($C_{18}H_{19}N_3O_5S$: 389.43).

Method of preparation Prepare as directed under Tablets, with Cefprozil Hydrate.

Identification Powder Cefprozil Tablets, and perform the test as directed under the Identification of Cefprozil for Syrup.

Water NMT 7.0% (0.1 g, volumetric titration, direct titration).

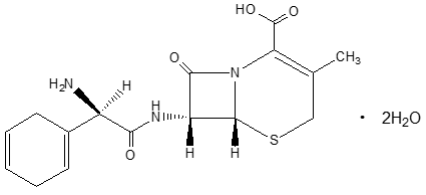
Dissolution Perform the test with 1 tablet of Cefprozil Tablets at 100 revolutions per minute according to Method 1 under the Dissolution, using 900 mL of water as the dissolution medium. Take a certain amount of the dissolved solution 45 minutes after starting the start, filter through a membrane filter with a pore size NMT 0.5 μm, and dilute with water so that it contains 0.3 mg (potency) per mL. Use this solution as the test solution. Perform the test according to the operating conditions under the Assay and calculate the dissolution rate; it meets the requirements if the dissolution rate of Cefprozil Tablets in 45 minutes is NLT 75%.

Uniformity of dosage units Meets the requirements.

Assay Perform the test as directed under the Assay under Cefprozil Hydrate. Weigh accurately the mass of NLT 20 tablets of Cefprozil Tablets and powder. Weigh accurately an amount, equivalent to about 25 mg (potency), add water, shake well to mix to make exactly 100 mL, and centrifuge. Use the clear supernatant as the test solution.

Packaging and storage Preserve in tight containers.

Cefradine Hydrate
세프라딘수화물



Cefradine $C_{16}H_{19}N_3O_4S \cdot 2H_2O$: 385.44

(6*R*,7*R*)-7-[2-Amino-2-(cyclohexa-1,4-dien-1-yl)aceamido]-3-methyl-3,4-didehydrocepham-4-

carboxylic acid monohydrate [*31828-50-9*]

Cefradine Hydrate contains NLT 900 μg (potency) and NMT 1050 μg (potency) of cefradine ($C_{16}H_{19}N_3O_4S$: 349.41) per mg, calculated on the anhydrous basis.

Description Cefradine Hydrate occurs as a white to pale yellowish white crystalline powder.
It is odorless or has a slight characteristic odor and has a bitter taste.
It is sparingly soluble in water, slightly soluble in methanol, very slightly soluble in ethanol(95), and practically insoluble in ether.

Identification Determine the infrared spectra of Cefradine Hydrate and cefradine RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers. If any difference appears between the spectra, dissolve each in methanol, and repeat the test with the respective residues.

Crystallinity Meets the requirements.

pH Dissolve 0.1 g of Cefradine Hydrate in 10 mL of water. The pH of this solution is between 3.5 and 6.0.

Purity (1) ***Heavy metals***—Proceed with 2.0 g of Cefradine Hydrate as directed under Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm). (NMT 10 ppm).

(2) ***Arsenic***—Prepare the test solution with 2.0 g of Cefradine Hydrate according to Method 4 and perform the test (NMT 1 ppm).

(3) ***Cefalexin***—Perform the test as directed under the Assay and determine the amount of cefalexin according to the following equation (NMT 5.0%).

$$\text{Content (\%) of cefalexin } (C_{16}H_{17}N_3O_4S) = \frac{A_T}{A_S} \times 100$$

A_T: Peak area of cefalexin obtained from the test solution

A_S: Sum of peak areas of cefradine and cefalexin obtained from the test solution

Water Between 8.5% and 10.5% (0.2 g, volumetric titration, direct titration).

Sterility It meets the requirements when Cefradine Hydrate is used in a sterile preparation. However, it is excluded in cases where there is a terminal sterilization process in the manufacturing of a sterile preparation.

Bacterial endotoxins It is less than 0.20 EU per mg of cefradine when Cefradine Hydrate is used in a sterile preparation.

Assay Weigh accurately about 50 mg (potency) each of Cefradine Hydrate and cefradine RS, add the mobile phase to each to make exactly 100 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 20 mL each of these solutions as directed under the Liquid Chromatography according to the following conditions, and determine the amount of cefradine according to the following equation.

$$\text{Potency (μg) of cefradine } (C_{16}H_{19}N_3O_4S) = \text{Potency (μg) of cefradine RS} \times \frac{A_T}{A_S}$$

A_T: Sum of peak areas of cefradine and cefalexin obtained from the test solution

A_S: Sum of peak areas of cefradine and cefalexin obtained from the standard solution

Operating conditions

Detector: An ultraviolet absorption spectrophotometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of water, methanol, 0.5 mol/L sodium acetate and 0.7 mol/L acetic acid (782 : 200 : 15 : 3).

Flow rate: 1.0 mL/min

System suitability

System performance: Proceed with 20 μL of the system suitability solution according to the above conditions; the relative retention times of cefalexin and cefradine are 0.8 and 1.0, respectively, with the resolution between the two peaks being NLT 2.0.

System repeatability: Repeat the test 5 times with 20 μL each of the system suitability solutions according to the above conditions; the relative standard deviation of the peak of cefradine is NMT 2.0%.

System suitability solution—Dissolve suitable quantities of cefradine RS and cefalexin RS in the mobile phase, respectively, to make respective solutions having a concentration of 0.5 mg per mL.

Packaging and storage Preserve in light-resistant, tight containers.

Cefradine Capsules
세프라딘 캡슐

Cefradine Capsules contain NLT 90.0% and NMT 120.0% of the labeled amount of cefradine ($C_{16}H_{19}N_3O_4S$: 349.41).

Method of preparation Prepare as directed under Capsules, with Cefradine Hydrate.

Identification Weigh an amount equivalent to about 0.25 g (potency) of Cefradine Capsules, according to the labeled potency, transfer to a stoppered test tube, add 10 mL of water and 5 mL of hydrochloric acid, and boil on a steam bath for 10 minutes. After cooling, and centrifuge; the resulting solution exhibits an orange color.

Loss on drying NMT 7.0% (0.1 g, 0.7 kPa, 60 ℃, 3 hours).

Dissolution Perform the test with 1 capsule of Cefradine Capsule at 100 revolutions per minute according to Method 1 under the Dissolution, using 900 mL of 0.12 mol/L hydrochloric acid TS as the dissolution medium. Take the dissolved solution after 45 minutes from the start of the test and filter. Discard the first 10 mL of the filtrate, pipet V mL of the subsequent filtrate, add the dissolution medium to make exactly V′ mL, and use this solution as the test solution. Separately, weigh accurately an appropriate amount of cefradine RS, dissolve in the dissolution medium to obtain the same concentration as the test solution, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at the absorbance maximum wavelength near 255 nm as directed under the Ultraviolet-visible Spectroscopy, using the dissolution medium as a control solution. It meets the requirements when the dissolution rate of Cefradine Capsules in 45 minutes is NLT 75% (Q).

$$\text{Dissolution rate (\%) of the labeled amount of cefradine } (C_{16}H_{19}N_3O_4S) = C_s \times \frac{A_T}{A_S} \times \frac{V'}{V} \times \frac{1}{C} \times 90000$$

Cs: Concentration [mg (potency)/mL] of the standard solution

C: Labeled amount (mg) of cefradine ($C_{16}H_{19}N_3O_4S$) in 1 capsule

Uniformity of dosage units Meets the requirements.

Assay Perform the test as directed under the Assay of Cefradine Hydrate. However, weigh accurately the mass of NLT 20 Cefradine Capsules, weigh accurately an amount equivalent to about 50 mg (potency), dissolve in the mobile phase to make exactly 100 mL, and use this solution as the test solution.

Packaging and storage Preserve in tight containers.

Cefradine for Injection
주사용 세프라딘

Cefradine for Injection, as an injection that is dissolved upon use, contains NLT 90.0% and NMT 120.0% of the labeled amount of cefradine ($C_{16}H_{19}N_3O_4S$: 349.41).

Method of preparation Prepare as directed under Injections, with Cefradine.

Description Cefradine for Injection occurs as a white to pale yellowish white powder.

Identification Perform the test as directed under the Identification under Cefradine Capsules.

pH Dissolve an amount of Cefradine for Injection equivalent to 1 g (potency) of cefradine in 100 mL of water; the pH of this solution is between 8.0 and 9.6.

Loss on drying NMT 5.0% (0.1 g, 0.7 kPa, 60 ℃, 3 hours).

Sterility Meets the requirements.

Bacterial endotoxins Less than 0.20 EU per mg (potency) of cefradine.

Particulate contamination: Visible particles Meets the requirements.

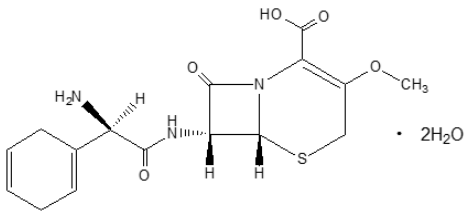
Insoluble particulate matter in injections Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Perform the test as directed under the Assay under Cefradine Hydrate. However, weigh accurately an amount equivalent to about 50 mg (potency) according to the labeled potency of Cefradine for Injection, dissolve in the mobile phase to make exactly 100 mL, and use this solution as the test solution.

Packaging and storage Preserve in hermetic containers.

Cefroxadine Hydrate
세프록사딘수화물



Cefroxadine $C_{16}H_{19}N_3O_5S \cdot 2H_2O$: 401.43

(6*R*,7*R*)-7-[2-Amino-2-(cyclohexa-1,4-dien-1-yl)aceamido]-3-methyloxy-3,4-didehydrocepham-4-carboxylic acid monohydrate [*95615-72-8*]

Cefroxadine Hydrate contains NLT 930 μg (potency) and NMT 1020 μg (potency) of cefroxadine

($C_{16}H_{19}N_3O_5S$: 365.40) per mg, calculated on the anhydrous basis.

Description Cefroxadine Hydrate occurs as a pale yellowish white to pale yellow crystalline grain or a powder.
It is freely soluble in formic acid, slightly soluble in methanol, and very slightly soluble in acetonitrile or ethanol(95).
It dissolves in 0.001 mol/L hydrochloric acid TS or dilute acetic acid.

Identification (1) Determine the absorption spectra of respective solutions of Cefroxadine Hydrate and cefroxadine RS in 0.001 mol/L hydrochloric acid TS (1 in 50000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine ^1H of a solution of Cefroxadine Hydrate in deuterated formic acid for nuclear magnetic resonance spectroscopy (1 in 10) as directed under the Nuclear Magnetic Resonance Spectroscopy, using tetramethylsilane for nuclear magnetic resonance spectroscopy as the internal standard; it exhibits the sharp singlet signals A, B and C at about δ 2.8 ppm, δ 4.1 ppm and δ 6.3 ppm, respectively, with the ratio of area strength of the signals A : B : C being about 4 : 3 : 1.

Optical rotation $[\alpha]_D^{20}$: Between +95° and +108° (0.1 g, calculated on the anhydrous basis, 100 mL of diluted acetic acid(100) (3 in 25), 100 mm).

Purity (1) ***Heavy metals***—Place 1.0 g of Cefroxadine Hydrate in a porcelain crucible, and add 10 mL of a solution of magnesium nitrate hexahydrate in ethanol(95) (1 in 10) to mix. Light the ethanol to burn and lightly heat to carbonize. After cooling, add 2 mL of nitrogen acid, heat carefully, and ignite to 500 to 600 ℃ to ash. If there is a residual carbide, wet it with a small amount of nitric acid and ignite again to ash. After cooling, add 6 mL of hydrochloric acid, and evaporate to dryness on a steam bath. Wet the residue with 3 drops of hydrochloric acid, add 10 mL of hot water, and warm on a steam bath to dissolve. After cooling, add ammonia TS dropwise to adjust the pH to between 3 and 4, add 2 mL of dilute acetic acid, and if necessary, filter. Place the resultant material in a Nessler tube, wash the porcelain crucible with 10 mL of water, and combine the washings with new water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution by proceeding in the same manner as the preparation of the test solution with 2.0 mL of lead standard solution and 10 mL of a solution of magnesium nitrate hexahydrate in ethanol(95) (1 in 10) placed in a porcelain crucible (NMT 20 ppm).

(2) ***Arsenic***—Prepare the test solution with 1.0 g of Cefroxadine Hydrate according to Method 4 and perform the test (NMT 2 ppm).

(3) ***Related substances***—Dissolve 10 mg of Cefroxadine Hydrate in 100 mL of the mobile phase, and use this solution as the test solution. Pipet 1 mL of this solution, add the mobile phase to it make exactly 100 mL, and use this solution as the standard solution. Perform the test with 40 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions, and determine individual peak areas in each of the respective solutions according to the automatic integration method; the peak areas with the relative retention times with respect to cefroxadine of about 0.07, 0.6 and 0.8, respectively, obtained from the test solution are not larger than 2 times the peak area of cefroxadine, 4 times the peak area of cefroxadine, and the peak area of cefroxadine, respectively, from the standard solution, each peak area, other than cefroxadine and the peaks above, obtained from the test solution is not larger than 1/2 of the peak area of cefroxadine from the standard solution, and the sum of peak areas other than cefroxadine obtained from the test solution is not larger than 6 times the peak area of cefroxadine from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 10 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: Dissolve 1.4 g of sodium perchlorate in 1000 mL of a mixture of water and acetonitrile (489 : 11).

Flow rate: Adjust the flow rate so that the retention time of cefroxadine is about 20 minutes.

System suitability

Test for required detectability: Pipet 2 mL of the standard solution and add the mobile phase to make exactly 20 mL. Confirm that the peak area of cefroxadine obtained from 40 μL of this solution is within the range between 7% and 13% of the peak area of cefroxadine obtained from the standard solution.

System performance: Dissolve 3 mg of Cefroxadine Hydrate and 15 mg of orcin in 100 mL of the mobile phase. Proceed with 40 μL of this solution according to the above conditions; orcin and cefroxadine are eluted in this order with the resolution being NLT 3.

System repeatability: Repeat the test 6 times with 40 μL each of the standard solutions according to the above conditions; the relative standard deviation of the peak area of cefroxadine is NMT 2.0%.

Time span of measurement: About 2 times the retention time of cefroxadine.

Water **Between** 8.5% and 12.0% (0.1 g, volumetric titration, direct titration).

Assay Weigh accurately about 50 mg (potency) of Cefroxadine Hydrate and cefroxadine RS, dissolve each in a respective mixture of dilute acetic acid and phosphor-

ic acid (500 : 1), add exactly 5 mL of the internal standard solution to each, and add a mixture of dilute acetic acid and phosphoric acid (500 : 1) to each to make 200 mL. Use these solutions as the test solution and the standard solution, respectively. Perform the test with 10 μL each of these solutions as directed under the Liquid Chromatography according to the following operating conditions, and calculate the peak area ratios, Q_T and Q_S, of cefroxadine to the internal standard, respectively.

$$\text{Potency (μg) of cefroxadine } (C_{16}H_{19}N_3O_5S) = \text{Potency (μg) of cefroxadine RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—Dissolve 1.6 g of vanillin in 5 mL of methanol, and add a mixture of dilute acetic acid and phosphoric acid (500 : 1) to make 100 mL.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 10 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: A mixture of ammonium sulfate solution (1 in 50) and acetonitrile (97 : 3).

Flow rate: Adjust the flow rate so that the retention time of cefroxadine is about 10 minutes.

System suitability

System performance: Proceed with 10 μL of the standard solution according to the above conditions; cefroxadine and the internal standard are eluted in this order with the resolution being NLT 1.5.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solutions according to the above conditions; the relative standard deviation of the peak area ratio of cefroxadine to the internal standard is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Cefroxadine Capsules
세프록사딘 캡슐

Cefroxadine Capsules contain NLT 90.0% and NMT 120.0% of the labeled amount of cefroxadine ($C_{16}H_{19}N_3O_5S$: 365.41).

Method of preparation Prepare as directed under Capsules, with Cefroxadine.

Identification (1) Weigh 5 mg (potency) of Cefroxadine Capsules, dissolve in 2 mL of hydroxylamine hydrochloride-acetate TS, allow it to stand for 3 minutes, and add 1 mL of acidic ammonium iron(III) sulfate TS; the resulting solution exhibits a reddish brown color.

(2) Weigh 5 mg (potency) of Cefroxadine Capsules, transfer into a test tube, add 2 drops of a solution of benzoyl peroxide in acetone (1 in 10), evaporate to dryness on a steam bath, and fix a glass rod coated with concentrated chromotropic acid TS at the bottom, in a test tube with a cork stopper. Heat at 120 to 130 ℃ on a steam bath for several minutes; concentrated chromotropic acid TS exhibits a reddish violet color.

(3) Weigh 2 mg (potency) of Cefroxadine Capsules, dissolve in 0.001 mol/L hydrochloric acid TS to make 100 mL. Determine the absorption spectrum of this solution as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum absorbance between 267 nm and 271 nm.

Water NMT 12.0% (0.1 g, volumetric titration, direct titration).

Dissolution Perform the test with 1 capsule of Cefroxadine Capsule at 100 revolutions per minute according to Method 2 under the Dissolution, using 900 mL of Solution 1 as the dissolution medium. Take the dissolved solution 45 minutes after starting the test, and filter. Discard the first 10 mL of the filtrate, pipet *V* mL of the subsequent filtrate, add the dissolution medium to make *V'* mL of a solution containing about 200 μg of cefroxadine ($C_{16}H_{19}N_3O_5S$) per mL according to the labeled amount, and use this solution as the test solution. Separately, weigh accurately about 20 mg of cefroxadine RS, dissolve in the dissolution medium to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Assay, and determine the peak areas, A_T and A_S, of cefroxadine ($C_{16}H_{19}N_3O_5S$) in each solution. It meets the requirements when the amount dissolved of Cefroxadine Capsules in 45 minutes is NLT 80%.

$$\text{Amount dissolved (\%) of the labeled amount of cefroxadine } (C_{16}H_{19}N_3O_5S) = W_S \times (V'/V) \times (A_T/A_S) \times (1/C) \times 900$$

W_S: Amount (mg) of cefroxadine RS

C: Labeled amount (mg) of cefroxadine ($C_{16}H_{19}N_3O_5S$) in 1 capsule

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the contents of NLT 20 Cefroxadine Capsules. Weigh accurately about Cefroxadine Capsules, equivalent to about 25 mg (potency) of cefroxadine according to the labeled potency, dissolve in the mobile phase to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 25 mg (potency) of cefroxadine RS, add the mobile phase to make exactly 100 mL, and use this solution as

the standard solution. Pipet 10 μL each of the test solution and the standard solution, perform the test as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of cefroxadine in each solution.

Amount [potency (mg)] of cefroxadine ($C_{16}H_{19}N_3O_5S$)
= Amount [potency (mg)] of cefroxadine RS × (A_T / A_S)

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 267 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: A mixture of 0.1 mol/L phosphoric acid solution and acetonitrile (17 : 3).

Flow rate: 1.0 mL/min

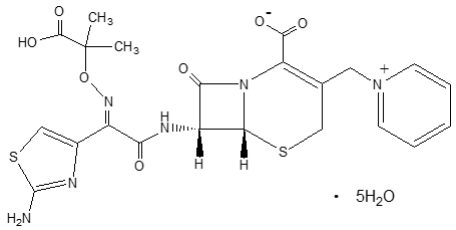
System suitability

System repeatability: Repeat the test 6 times with 10 μL of the standard solution according to the above conditions; the relative standard deviation of the peak area of cefroxadine is NMT 2.0%.

0.1 mol/L phosphoric acid—To 6.8 mL of 85% phosphoric acid, add water to make 1000 mL.

Packaging and storage Preserve in tight containers.

Ceftazidime Hydrate
세프타지딤수화물



Ceftazidime $C_{22}H_{22}N_6O_7S_2 \cdot 5H_2O$: 636.65
(6*R*,7*R*)-7-[(2*E*)-2-(2-Amino-1,3-thiazol-4-yl)-2-(2-carboxypropan-2-yloxyimino)acetamido]-3-(pyridin-1-ium-1-yl)methyl-3,4-didehydrocepham-4-carboxylate pentahydrate [*78439-06-2*]

Ceftazidime Hydrate contains NLT 950 μg and NMT 1020 μg (potency) of netilmicin ($C_{22}H_{22}N_6O_7S_2$: 546.58) per mg, calculated on the dried basis.

Description Ceftazidime Hydrate occurs as a white to pale yellowish white crystalline powder.
It is sparingly soluble in water and very slightly soluble in acetonitrile or ethanol(95).

Identification (1) Determine the absorption spectra of solutions of Ceftazidime Hydrate and ceftazidime RS in phosphate buffer solution, pH 6.0 (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Ceftazidime Hydrate and ceftazidime RS according to the potassium bromide disk method as directed under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) Weigh 50 mg of Ceftazidime Hydrate, add 5 mg of dried sodium carbonate, and dissolve in 0.5 mL of deuterium oxide for nuclear magnetic resonance spectroscopy. With this solution, measure ^1H according to the Nuclear Magnetic Resonance Spectroscopy, using 3-(Trimethylsilyl)propanesulfonic acid sodium salt for nuclear magnetic resonance spectroscopy as the internal standard; it exhibits singlet signals A and B at around δ 1.5 ppm and δ 6.9 ppm, and a multiplet signal C at δ 7.9 to 9.2 ppm. The area intensity ratio of each signal, A : B : C is 6 : 1 : 5.

Crystallinity Meets the requirements.

Optical rotation $[\alpha]_D^{20}$: Between -28° and -34° (0.5 g, calculated on the dried basis, phosphate buffer solution (pH 6.0), 100 mL, 100 mm).

pH Dissolve 0.5 g of Ceftazidime Hydrate in 100 mL of water; the pH of this solution is between 3.0 and 4.0.

Purity (1) ***Clarity and color of solution***—Add 5 g of anhydrous sodium dihydrogen phosphate and 1 g of potassium dihydrogen phosphate to 1.0 g of Ceftazidime Hydrate, dissolve in water to make 100 mL; the resulting solution is clear. Perform the test with this solution as directed under the Ultraviolet-visible Spectroscopy; the absorbance at the wavelength of 420 nm is NMT 0.20.

(2) ***Free pyridine***—Weigh accurately about 50 mg of Ceftazidime Hydrate, dissolve in the mobile phase to make exactly 10 mL, and use this solution as the test solution. Separately, weigh accurately about 0.1 g of pyridine and dissolve in the mobile phase to make exactly 100 mL. Pipet 1 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and standard solution as directed under the Liquid Chromatography under the following conditions. Determine the peak height, H_T and H_S; the amount of free pyridine is NMT 0.3%.

$$\text{Amount (mg) of free pyridine} = \text{Amount (mg) of the pyridine taken} \times \frac{H_T}{H_S} \times \frac{1}{1000}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 20 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: Dissolve 2.88 g of ammonium dihydrogen phosphate in 500 mL of water, add 300 mL of acetonitrile, and add water to make 1 L. Put ammonia water(28) to adjust the pH to 7.0.

Flow rate: Adjust the flow rate so that the retention time of pyridine is about 4 minutes.

System suitability

Test for required detectability: Confirm that the peak height of pyridine obtained from 10 μL of the standard solution reaches about 50% of the full scale of the data collection device.

System performance: Dissolve 5 mg of Ceftazidime Hydrate in 100 mL of the mobile phase solution of pyridine (1 in 20000). Proceed with 10 μL of this solution under the above operating conditions; ceftazidime and pyridine are eluted in this order with the resolution being NLT 9.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution under the above operating conditions; the relative standard deviation (RSD) of the peak height for pyridine is NMT 5.0%.

(3) ***Heavy metals***—Proceed with 1.0 g of Ceftazidime Hydrate according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(4) ***Arsenic***—Prepare the test solution with 1.0 g of Ceftazidime Hydrate according to Method 3 and perform the test (NMT 2 ppm).

(5) ***Related substances (Trityl-t-butyl and t-butyl)***—Dissolve 0.1 g of Ceftazidime Hydrate in 2 mL of diluted dibasic sodium phosphate TS (1 in 3), and use this solution as the test solution. Pipet 1 mL of this solution, add diluted dibasic sodium phosphate TS (1 in 3) to make exactly 100 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 2 μL each of the test solution and the standard solution onto a plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of n-butyl acetate, acetic acid(100), acetic acid buffer solution (pH 4.5) and 1-butanol (16 : 16 : 13 : 3) to a distance of about 12cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots above the principal spot obtained from the test solution are not more intense than the spots from the standard solution.

(6) ***Other related substances***—Dissolve 20 mg of Ceftazidime Hydrate in 10 mL of the mobile phase, and use this solution as the test solution. Pipet 1 mL of this solution, dissolve in the mobile phase to make exactly 200 mL, and use this solution as the standard solution. Perform the test with 5 μL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak area of each solution by automatic integration method; each peak area other than the peak of ceftazidime is not greater than the peak area of ceftazidime from the standard solution. In addition, the sum of peak areas other than ceftazidime in the test solution is not greater than 5 times the peak area of ceftazidime in the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 20 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: Dissolve 5.0 g of ammonium dihydrogen phosphate in 750 mL of water, adjust the pH to 3.5 with phosphoric acid, and add water to make 870 mL. To this solution, add 130 mL of acetonitrile.

Flow rate: Adjust the flow rate so that the retention time of ceftazidime is about 4 minutes.

System suitability

Test for required detectability: Pipet 1 mL of the standard solution and add the mobile phase to make exactly 5 mL. Confirm that the peak area of ceftazidime obtained from 5 μL of this solution is 15% to 25% of the peak area of ceftazidime obtained from 5 μL of the standard solution.

System performance: Dissolve 10 mg each of Ceftazidime Hydrate and acetanilide in 20 mL of the mobile phase. Proceed with 5 μL of this solution under the above operating conditions; ceftazidime and acetanilide are eluted in this order with the resolution being NLT 10.

System repeatability: Repeat the test 6 times with 5 μL of the standard solution according to the above operating conditions; the relative standard deviation of the peak area for ceftazidime is NMT 2.0%.

Time span of measurement: About 3 times the retention time of ceftazidime after the solvent peak.

Loss on drying Between 13.0 and 15.0% (0.1 g, NMT 0.67 kPa, 60 °C, 3 hours).

Sterility It meets the requirements when used in a sterile preparation. However, it is excluded in cases where there is a final sterilization process in the manufacturing of a sterile preparation.

Bacterial endotoxins It is less than 0.10 EU per mg of ceftazidime (potency) when used in the manufacturing of sterile preparations.

Assay Weigh accurately about 0.1 g (potency) each of Ceftazidime Hydrate and ceftazidime RS and dissolve in a 0.05 mol/L phosphate buffer solution (pH 7.0) to make exactly 100 mL. Pipet 10 mL each of this solution, put exactly 5 mL of the internal standard solution, add 0.05 mol/L phosphate buffer solution (pH 7.0) to make 50 mL, and use this solution as the test solution and the standard solution, respectively. Perform the test with 5 μL each of these solutions as directed under the Liquid Chromatography according to the following conditions and calculate the peak area ratios, Q_T and Q_S, of ceftazidime to that of the internal standard.

$$\text{Potency (μg) of ceftazidime } (C_{22}H_{22}N_6O_7S_2) = \text{Potency (μg) of minocycline hydrochloride RS} \times \frac{Q_T}{Q_S}$$

Internal standard—0.05 mol/L phosphate buffer solution (pH 7.0) of dimedon (11 in 10000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 10 cm in length, packed with hexyl silyl silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: Dissolve 4.26 g of anhydrous sodium dihydrogen phosphate and 2.72 g of potassium dihydrogen phosphate in 980 mL of water and add 20 mL of acetonitrile.

Flow rate: Adjust the flow rate so that the retention time of ceftazidime is about 4 minutes.

System suitability

System performance: Proceed with 5 μL of the standard solution according to the above conditions; the internal standard and ceftazidime are eluted in this order with the resolution being NLT 3.

System repeatability: Repeat the test 6 times with 5 μL each of the standard solution as directed under the above conditions, the relative standard deviation of peak area ratios of ceftazidime to the internal standard is NMT 1.0%.

Packaging and storage Preserve in light-resistant, tight containers.

Ceftazidime for Injection
주사용 세프타지딤

Ceftazidime for Injection contains NLT 93.0% and NMT 107.0% of the labeled amount of ceftazidime ($C_{22}H_{22}N_6O_7S_2$: 546.58), calculated as dissolve injections.

Method of preparation Prepare as directed under Injections, with Ceftazidime Hydrate.

Description Ceftazidime for Injection occurs as a white to pale yellowish white powder.

Identification Determine the absorption spectrum of a solution of Ceftazidime for Injection in phosphate buffer solution (pH 6.0) (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum at 255 nm to 259 nm.

pH Dissolve an amount of Ceftazidime for Injection, equivalent to 1.0 g (potency) of ceftazidime, in 10 mL of water; the pH of this solution is 5.8 to 7.8.

Purity ***Clarity and color of solution***—Weigh an amount of Ceftazidime for Injection, equivalent to 1.0 g (potency) of ceftazidime hydrate, according to the labeled amount, dissolve in 10 mL of a solution prepared by dissolving 5 g of anhydrous sodium dihydrogen phosphate and 1 g of potassium dihydrogen phosphate in water to make 100 mL; the resulting solution is clear. Perform the test with this solution as directed under the Ultraviolet-visible Spectroscopy; the absorbance of the solution at 420 nm is NMT 0.3.

Loss on drying NMT 14.0% (0.1 g, in vacuum at a pressure NMT 0.67 kPa, 60 °C, 3 hours).

Sterility Meets the requirements.

Bacterial endotoxins Less than 0.067 EU per mg (potency) of ceftazidime.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Uniformity of dosage units Meets the requirements.

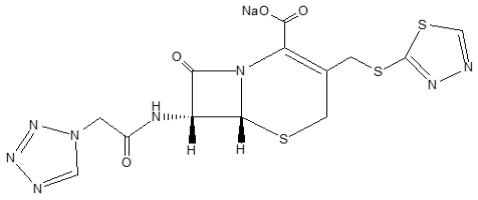
Assay Weigh accurately the mass of NLT 10 samples of Ceftazidime for Injection. Weigh accurately an amount equivalent to about 0.25 g (potency) of ceftazidime hydrate, and dissolve in 0.05 mol/L phosphate buffer solution (pH 7.0) to make exactly 250 mL. Pipet 10 mL of this solution, add exactly 5 mL of the internal standard solution, add again 0.05 mol/L phosphate buffer solution (pH 7.0) to make 50 mL, and use this solution as the test solution. Separately, weigh accurately about 25 mg (potency) of ceftazidime RS, and dissolve in 0.05 mol/L phosphate buffer solution (pH 7.0) to make exactly 25 mL. Pipet 10 mL of this solution, add exactly 5 mL of the internal standard solution, add 0.05 mol/L phosphate buffer solution (pH 7.0) to make 50 mL and use this solution as the standard solution. Perform the test as directed under the Assay of Ceftazidime Hydrate.

Potency (Mg) of ceftazidime ($C_{22}H_{22}N_6O_7S_2$)
= Potency (μg) of ceftazidime RS× $\frac{Q_T}{Q_S}$ ×10

Internal standard solution—A solution of dimedon in 0.05 mol/L phosphate buffer solution (pH 7.0) (11 in 10000)

Packaging and storage Preserve in light-resistant, hermetic containers.

Ceftezole Sodium
세프테졸나트륨



$C_{13}H_{11}N_8NaO_4S_3$: 462.47
(6*R*,7*R*)-8-Oxo-7-[[2-(1*H*-tetrazol-1-yl)acetyl]amino]-3-[(1,3,4-thiadiazol-2-ylthio)methyl]-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid sodium salt (1:1), [*41136-22-5*]

Ceftezole Sodium contains NLT 860 μg (potency) of ceftezole ($C_{13}H_{12}N_8O_4S_3$: 440.48) per mg, calculated on the anhydrous basis.

Description Ceftezole Sodium occurs as white to pale yellowish white crystals or a crystalline powder.
It is freely soluble in water, sparingly soluble in methanol, and practically insoluble in ethanol, acetone, chloroform or ether.

Identification (1) Dissolve about 10 mg (potency) of Ceftezole Sodium in 2 mL of water, add 3 mL of hydroxylamine hydrochloride TS, allow it to stand for 5 minutes, and add 1 mL of acidic ammonium iron(III) sulfate TS and shake to mix; the resulting solution exhibits a reddish brown color.

(2) Dissolve about 50 mg (potency) of Ceftezole Sodium in 50 mL of 0.1 mol/L hydrochloric acid TS, heat on a steam bath for 10 minutes, cool it down, and transfer 20 mL of this solution to a separatory funnel. Add 20 mL of chloroform, shake well to mix, take the chloroform layer, and filter through cotton wool in a funnel where a small amount of anhydrous sodium sulfate is placed on. To 10 mL of the filtrate, add 1 mL of cobalt acetate tetrahydrate TS; the solution exhibits an orange color.

(3) Dissolve 10 mg (potency) of Ceftezole Sodium in water to make 500 mL. Determine the absorption spectrum of this solution as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum between 270 nm and 274 nm.

(4) With deuterium oxide solution for nuclear magnetic resonance spectroscopy (1 in 10) of Ceftezole Sodium, determine 1H as directed under the Nuclear Magnetic Resonance Spectroscopy using sodium 3-trimethylsilylpropanesulfonate for nuclear magnetic resonance spectroscopy as the internal reference compound; the resulting spectrum exhibits singlet signals near 9.3 ppm and 9.4 ppm, respectively, and the area ratio of each signal is 1 : 1.

(5) Ceftezole Sodium responds to the Qualitative Analysis (1) for sodium salt.

Optical rotation $[\alpha]_D^{20}$: Between -5° and -9° (2.5 g, water, 25 mL, 100 mm).

pH Dissolve Ceftezole Sodium in water to make 0.1 g/mL; the pH of the solution is between 4.5 and 6.5.

Absorbance $E_{1cm}^{1\%}$ (272 nm): Between 270 and 300 (1.6 mg, water, 100 mL).

Water NMT 5.0% (0.2 g, volumetric titration, direct titration).

Sterility It meets the requirements when Ceftezole Sodium is used in sterile preparations. But it is exempt from the requirements when there is a final sterilization process in the manufacturing process of sterile preparations.

Bacterial endotoxins Less than 0.062 EU per mg of Ceftezole Sodium.

Assay Weigh accurately about 0.1 g (potency) each of Ceftezole Sodium and ceftezole sodium RS, add 10 mL of the internal standard solution, dissolve in 0.1 mol/L of phosphate buffer solution, pH 7.0, to make exactly 100 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the ratios, Q_T and Q_S, of the peak area of ceftezole to that of internal standard, respectively.

Potency (μg) of ceftezole ($C_{13}H_{12}N_8O_4S_3$)
= Potency (μg) of ceftezole RS× $\frac{Q_T}{Q_S}$

Internal standard solution—Weigh 0.5 g of anhydrous caffeine and dissolve in 0.1 mol/L of phosphate buffer solution, pH 7.0, to make exactly 100 mL.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column, about 4 mm in internal diameter and about 15 cm - 20 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 μm in particle diameter).

Mobile phase: Dissolve 3 g of citric acid in 930 mL of water and add 70 mL of acetonitrile.

Flow rate: Adjust the flow rate so that the retention time of ceftezole is about 9 minutes.

Selection of column: Proceed with 5 μL of the standard solution under the above operating conditions; use a column giving elution of anhydrous caffeine and ceftezole in this order with the resolution between these peaks being NLT 2.5.

Packaging and storage Preserve in tight containers.

Ceftezole Sodium for Injection
주사용 세프테졸나트륨

Ceftezole Sodium for Injection is a preparation for injection, which is dissolved before use, and contains NLT 90.0% and NMT 120.0% of the labeled amount of ceftezole ($C_{13}H_{12}N_8O_4S_3$: 440.48).

Method of preparation Prepare as directed under Injections, with Ceftezole Sodium.

Description Ceftezole Sodium for Injection occurs as a white to pale yellowish white crystalline powder or a powder.

Identification Perform the test as directed under the Identification (1), (2) and (3) of Ceftezole Sodium.

pH Dissolve 0.1 g of Ceftezole Sodium for Injection in 10 mL of water; the pH of this solution is 4.5 to 6.5.

Water NMT 5.0% (0.2 g, volumetric titration, direct titration).

Sterility Meets the requirements.

Bacterial endotoxins Less than 0.075 EU per mg of ceftezole sodium.

Particulate contamination: Visible particles Meets the requirements.

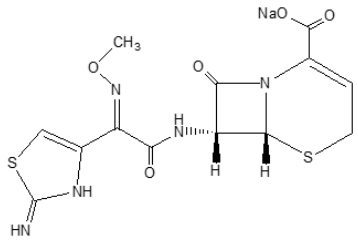
Insoluble particulate matter in injections Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Perform the test as directed under the Assay of Ceftezole Sodium. However, weigh accurately about 0.1 g (potency) of Ceftezole Sodium for Injection according to the labeled potency, add 10.0 mL of the internal standard solution, dissolve in 0.1 mol/L phosphate buffer solution (pH 7.0) to make exactly 100 mL and use this solution as the test solution.

Packaging and storage Preserve in hermetic containers.

Ceftizoxime Sodium
세프티족심나트륨



$C_{13}H_{12}N_5NaO_5S_2$: 405.38

Sodium (6*R*,7*R*)-7-[(2*E*)-2-(2-aminothiazol-4-yl)-2-methoxyiminoacetamido]-3,4-didehydrocepham-4-carboxylate [*68401-82-1*]

Ceftizoxime Sodium contains NLT 925 μg (potency) and NMT 965 μg (potency) of ceftizoxime ($C_{13}H_{13}N_5O_5S_2$: 383.40) per mg, calculated on the anhydrous basis.

Description Diclofenac Sodium occurs as white to pale yellow crystals or a crystalline powder.
It is very soluble in water, slightly soluble in methanol, and practically insoluble in ethanol(95).

Identification (1) Determine the absorption spectrum with an aqueous solution of Ceftizoxime Sodium (1 in 63000) as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum between 233 nm and 237 nm.

(2) Determine the infrared spectra of Ceftizoxime Sodium and ceftizoxime sodium RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) With deuterium oxide for nuclear magnetic resonance spectroscopy (1 in 10) of Ceftriaxone Sodium Hydrate, determine ^1H as directed under the Nuclear Magnetic Resonance Spectroscopy; the resulting spectrum exhibits a singlet signal near δ 4.0 ppm, a multiplet signal near δ 6.3 and a singlet signal near δ 7.0 ppm, and the area intensity ratio of each signal is 3 : 1 : 1.

(4) Ceftizoxime Sodium responds to the Qualitative Analysis (1) for sodium salt.

Crystallinity Meets the requirements.

Optical rotation $[\alpha]_D^{20}$: Between +125° and +145° (0.25 g as anhydrous basis, water, 25 mL, 100 mm).

pH Dissolve 1.0 g (potency) of Ceftizoxime Sodium in 10 mL of water; the pH of this solution is between 6.0 and 8.0.

Absorbance $E_{1cm}^{1\%}$ (235 nm): Between 410 and 450 (1.6 mg calculated on the anhydrous basis, water, 100 mL).

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Ceftizoxime Sodium in 10 mL of water; the solution is clear and colorless to pale yellow.

(2) ***Heavy metals***—Proceed with 2.0 g of Ceftizoxime Sodium according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of the lead standard solution (NMT 10 ppm).

(3) ***Arsenic***—Prepare test solution with 2.0 g of Ceftizoxime Sodium according to Method 3 and perform the test (NMT 1 ppm).

(4) ***Related substances***—Dissolve 0.11 g of Ceftizoxime Sodium in 100 mL of 0.1 mol/L phosphate buffer solution, pH 7.0, and use this solution as the test solution. With 5 μL of the test solution, perform the test as directed under the Liquid Chromatography according to the following conditions. Determine the peak area of each solution by the automatic integration method; the total area of the peaks other than ceftizoxime is NMT 0.5% of the peak area of the ceftizoxime. The total area of the peaks other than ceftizoxime is NMT 1.0% of the peak area of the ceftizoxime.

Operating conditions

For the detector, column and column temperature, comply with the operating conditions under the Assay.

Mobile phase: Dissolve 2.31 g of dibasic sodium phosphate and 1.42 g of citric acid monohydrate in 1000 mL of water and adjust the pH to 3.6 with dilute phosphoric acid (1 in 10) or dilute sodium hydroxide TS. To 200 mL of this solution, add 10 mL of acetonitrile.

Flow rate: Adjust the flow rate so that the retention time of ceftizoxime is about 12 minutes.

System suitability

Test for required detectability: Pipet 1mL of the test solution, add 0.1 mol/L phosphate buffer solution, pH 7.0, to make exactly 100 mL, and use this solution as the detection confirmation solution. Pipet 1 mL of the detection confirmation solution, add 0.1 mol/L phosphate buffer solution, pH 7.0, to make exactly 10 mL, and confirm that the peak area of ceftizoxime obtained from a 5 μL of this solution is 7% to 13% of the peak area of ceftriaxone in the detection confirmation solution.

System performance: Dissolve about 10 mg of the ceftizoxime RS in 100mL of 0.1 mol/L phosphate buffer solution, pH 7.0, and use this solution as the detection confirmation solution. Proceed with 5 μL of this solution according to the above conditions; the number of theoretical plates and symmetry factor of the peak of ceftizoxime is NLT 4000 and NMT 2.0, respectively.

System repeatability: Repeat the test 6 times with 5 μL each of the system suitability solutions according to the above conditions; the relative standard deviation of the peak areas for ceftizoxime is NMT 2.0%.

Time span of measurement: A range of about 5 times the retention time of ceftizoxime after the solvent peak.

Water NMT 8.5% (0.4 g, volumetric titration, direct titration).

Sterility It meets the requirements when Ceftizoxime Sodium is used in sterile preparations. But it is exempt from the requirements when there is a final sterilization process in the manufacturing process of sterile preparations.

Bacterial endotoxins Less than 0.10 EU per mg (potency) of ceftizoxime when used for the manufacturing of sterile preparations.

Assay Weigh accurately about 0.1 g (potency) each of Ceftizoxime Sodium and ceftizoxime RS, dissolve in the phosphate buffer solution, pH 7.0, to make exactly 20 mL, and use these solutions as the test stock solution and the standard stock solution, respectively. Pipet 2 mL each of the test stock solution and the standard stock solution, add 10.0 mL of the internal standard solution to each solution, add 0.1 mol/L phosphate buffer solution, pH 7.0, to make exactly 20 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 5 μL each of these solutions as directed under the Liquid Chromatography according to the following conditions, and calculate the ratios, Q_T and Q_S, of the peak area of ceftizoxime to that of the internal standard in the test solution and the standard solution, respectively.

$$\text{Potency (μg) of ceftizoxime } (C_{13}H_{13}N_5O_5S_2) = \text{Potency (μg) of ceftizoxime RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of 0.1 mol/L phosphate buffer solution, pH 7.0, in m-hydroxybenzoic acid (3 in 500).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 μm in particle diameter).

Column temperature: A constant temperature of about 35 °C.

Mobile phase: Dissolve 2.31 g of dibasic sodium phosphate and 1.42 g of citric acid monohydrate in 1000 mL of water and adjust the pH to 3.6 with dilute phosphoric acid (1 in 10) or dilute sodium hydroxide TS. To 450 mL of this solution, add 50 mL of acetonitrile.

Flow rate: Adjust the flow rate so that the retention time of ceftizoxime is about 4 minutes.

System suitability

System performance: Proceed with 5 μL of the standard solution according to the above conditions; ceftizoxime and the internal standard are eluted in this order with the resolution being NLT 7.0. The symmetry

factor of each peak is NMT 2.0.

System repeatability: Repeat the test 6 times with 5 μL each of the standard solution according to the above conditions; the relative standard deviation of ratios of the peak area of ceftizoxime to that of the internal standard is NMT 1.0%.

Packaging and storage Preserve in light-resistant, tight containers.

Ceftizoxime Sodium for Injection
주사용 세프티족심나트륨

Ceftizoxime Sodium for Injection contains NLT 90.0% and NMT 120.0% of the labeled amount of ceftizoxime ($C_{13}H_{13}N_5O_5S_2$: 383.41), calculated as dissolve injections.

Method of preparation Prepare as directed under Injections, with Ceftizoxime Sodium.

Description Ceftizoxime Sodium for Injection occurs as a white to pale yellow powder.

Identification (1) Weigh an amount of Ceftizoxime Sodium for Injection, equivalent to 10 mg (potency) of ceftizoxime, dissolve in 2 mL of water, add 3 mL of hydroxylamine hydrochloride TS, and allow to stand for 5 minutes. Then add 1 mL of acidic ammonium iron(III) sulfate TS; the resulting solution exhibits a reddish brown color.

(2) Weigh an amount of Ceftizoxime Sodium for Injection, equivalent to 1 mg (potency) of ceftizoxime, dissolve in 4 mL of water, and cool on an ice bath while adding 1 mL of dilute hydrochloric acid. Add 1 mL of freshly prepared sodium nitrite solution (1 in 100), and allow to stand for 2 minutes. While cooling again on an ice bath, add 1 mL of ammonium sulfate TS, allow to stand for 1 minute, and add 1 mL of N-(1-Naphthyl)ethylenediamine hydrochloride solution (1 in 1000); the resulting solution exhibits a violet color.

(3) Perform the test as directed under the Identification (1) of Ceftizoxime Sodium.

pH Dissolve 1.0 g (potency) of ceftizoxime in Ceftizoxime Sodium for Injection in 10 mL of water; the pH of this solution is 6.0 to 8.0.

Water NMT 8.5% (0.1 g, volumetric titration, direct titration).

Sterility Meets the requirements.

Bacterial endotoxins Less than 0.10 EU per mg (potency) of ceftizoxime.

Particulate contamination: Visible particles Meets the requirements.

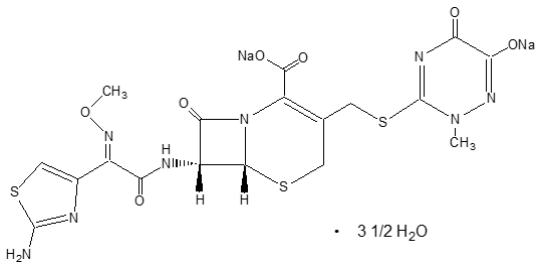
Insoluble particulate matter in injections Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Perform the test as directed under the Assay of Ceftizoxime Sodium. However, weigh accurately an amount of Ceftizoxime Sodium for Injection, equivalent to about 0.5 g (potency), according to the labeled potency, and dissolve in 0.1 mol/L phosphate buffer solution (pH 7.0) to prepare a solution containing about 5 mg (potency) per mg. Pipet 2 mL of this solution, add exactly 10 mL of the internal standard solution, add 0.1 mol/L phosphate buffer solution (pH 7.0) to make exactly 20 mL, and use this solution as the test solution.

Packaging and storage Preserve in hermetic containers.

Ceftriaxone Sodium Hydrate
세프트리악손나트륨수화물



Ceftriaxone Sodium

$C_{18}H_{16}N_8Na_2O_7S_3 \cdot 3½H_2O$: 661.60

Disodium (6*R*,7*R*)-7-[(2*E*)-2-(2-aminothiazol-4-yl)-2-(methoxyimino)acetamido]-3-(2,5-dihydro-2-methyl-6-oxido-5-oxo-1,2,4-triazin-3-ylsulfanylmethyl)-3,4-didehydrocepham-4-carboxylate hemi-heptahydrate [*104376-79-6*]

Ceftriaxone Sodium Hydrate contains NLT 905 μg (potency) and NMT 935 μg (potency) of ceftriaxone ($C_{18}H_{18}N_8O_7S_3$: 554.58) per mg, calculated on the anhydrous basis.

Description Ceftriaxone Sodium Hydrate occurs as a white to yellowish white crystalline powder.
It is freely soluble in water, slightly soluble in methanol, very slightly soluble in ethanol(99.5), and practically insoluble in acetonitrile.

Identification (1) Determine the absorption spectra of solutions of Ceftriaxone Sodium Hydrate and ceftriaxone sodium RS (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) With deuterated dimethylsulfoxide for nucle-

ar magnetic resonance spectroscopy (1 in 10) of Ceftriaxone Sodium Hydrate, determine ^1H as directed under the Nuclear Magnetic Resonance Spectroscopy, using tetramethylsilane for nuclear magnetic resonance spectroscopy as the internal standard; the resulting spectrum exhibits singlet signals A, B, C and D near δ 3.5 ppm, δ 3.8 ppm, δ 6.7 ppm and δ 7.2 ppm, respectively, and the area intensity ratio of each signal A : B : C : D is 3 : 3 : 1 : 2. Furthermore, since the signal near δ 3.5 ppm overlaps with the signal of water, the measurement is conducted while maintaining the probe temperature at about 50 ℃.

(3) Ceftriaxone Sodium Hydrate responds to the Qualitative Analysis (1) for sodium salt.

Crystallinity Meets the requirements.

Optical rotation $[\alpha]_D^{20}$: Between -153° and -170° (50 mg, calculated on the anhydrous basis, water, 2.5 mL, 20 mm).

pH Dissolve 0.6 g of Ceftriaxone Sodium Hydrate in 5 mL of water; the pH of this solution is between 6.0 and 8.0.

Purity (1) ***Clarity and color of solution***—Dissolve 0.6 g of Ceftriaxone Sodium Hydrate in 5 mL of water; the resulting solution is clear and bright yellow.

(2) ***Heavy metals***—Proceed with 1.0 g of Ceftriaxone Sodium Hydrate according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Arsenic***—Proceed with 1.0 g of Ceftriaxone Sodium Hydrate according to Method 3 and perform the test (NMT 2 ppm).

(4) ***Related substances***—(i) Dissolve 20 mg of Ceftriaxone Sodium Hydrate in 10 mL of mobile phase and use this solution as the test solution. Pipet 1 mL of this solution, add a mixture of water and acetonitrile (11 : 9) to make 100 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak area of each solution by the automatic integration method; the peak area of related substances I with a relative retention time of about 0.5, and the peak area of related substances II with a relative retention time of about 1.3 from the test solution is NMT the peak area of the ceftriaxone from the standard solution. However, the peak areas of related substances I and related substances II are determined by multiplying the areas measured using the automatic integration method by their respective correction factors of 0.9 and 1.2.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase A: Dissolve 5.796 g of anhydrous sodium dihydrogen phosphate and 3.522 g of potassium dihydrogen phosphate in water to make exactly 1000 mL and use this solution as solution A. Dissolve 20.256 g of citric acid monohydrate and 7.840 g of sodium hydroxide in water to make exactly 1000 mL and use this solution as solution B. Dissolve 4.0 g of tetra n-heptylammonium bromide in 450 mL of acetonitrile. To this solution, add 490 mL of water, 55 mL of the solution A and 5 mL of the solution B.

Flow Rate: Adjust the flow rate so that the retention time of ceftriaxone is about 7 minutes.

System suitability

Test for required detectability: Pipet 5 mL of the test solution, add a mixture of water and acetonitrile (11 : 9) to make exactly 200 mL, and use this solution as the system suitability solution. Pipet 1 mL of this solution and add a mixture of water and acetonitrile (11 : 9) to make exactly 100 mL. Confirm that the peak area of ceftriaxone obtained from 10 μL of this solution is 0.9% - 1.1% of the peak area of ceftriaxone obtained from 10 μL of the system suitability solution.

System performance: Dissolve 10 mg of Ceftriaxone Sodium Hydrate in a mixture of water and acetonitrile (11 : 9) to make 5 mL. To this solution, add 5 mL of a mixture of water and acetonitrile in diethyl terephthalate (11 : 9) (9 in 5000) and add a mixture of water and acetonitrile (11 : 9) to make 200 mL. Proceed with 10 μL of this solution according to the above conditions; ceftriaxone and diethyl terephthalate are eluted in this order with the resolution being NLT 6.

System repeatability: Repeat the test 6 times with 10 μL each of the system suitability solution according to the above conditions; the relative standard deviation of the peak areas of ceftriaxone is NMT 1.0%.

Time span of measurement: About 2 times the retention time of ceftriaxone.

(ii) Dissolve 0.01 g of Ceftriaxone Sodium Hydrate in 10 mL of the mobile phase and use this solution as the test solution. Pipet 1 mL of this solution, add a mixture of acetonitrile and water (23 : 11) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak area of each solution by the automatic integration method; the peak areas of each related substance that are eluted after the peak of ceftriaxone from the test solution are not greater than the peak area of ceftriaxone from the standard solution. Also, the total area of peaks of related substances is not greater than 2.5 times the peak area of the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer

(wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase A: Dissolve 5.796 g of anhydrous sodium dihydrogen phosphate and 3.522 g of potassium dihydrogen phosphate in water to make exactly 1000 mL and use this solution as solution A. Dissolve 20.256 g of citric acid monohydrate and 7.840 g of sodium hydroxide in water to make exactly 1000 mL and use this solution as solution B. Dissolve 4.0 g of tetra n-heptylammonium bromide in 450 mL of acetonitrile. To this solution, add 490 mL of water, 55 mL of the solution A and 5 mL of the solution B and add 700 mL of acetonitrile again.

Flow Rate: Adjust the flow rate so that the retention time of ceftriaxone is about 3 minutes.

System suitability

Test for required detectability: Pipet 5 mL of the test solution, add a mixture of acetonitrile and water (23 : 11) to make exactly 100 mL, and use this solution as the system suitability solution. Pipet 1 mL of this solution and add a mixture of acetonitrile and water (23 : 11) to make exactly 100 mL. Confirm that the peak area of ceftriaxone obtained from 10 μL of this solution is 0.9% - 1.1% of the peak area of ceftriaxone obtained from 10 μL of the system suitability solution.

System performance: Dissolve 10 mg of Ceftriaxone Sodium Hydrate in a mixture of acetonitrile and water (23 : 11) to make 5 mL. To this solution, add 5 mL of a mixture of water and acetonitrile in diethyl terephthalate (11 : 9) (9 in 5000) and add a mixture of water and acetonitrile (23 : 11) to make exactly 200 mL. Proceed with 10 μL of this solution according to the above conditions; ceftriaxone and diethyl terephthalate are eluted in this order with the resolution being NLT 3.

System repeatability: Repeat the test 6 times with 10 μL each of the system suitability solutions according to the above conditions; the relative standard deviation of the peak areas of ceftriaxone is NMT 1.0%.

Time span of measurement: About 10 times the retention time of ceftriaxone.

Water Between 8.0% and 11.0% (0.15 g, volumetric titration, direct titration).

Sterility It meets the requirements when Ceftriaxone Sodium Hydrate is used in sterile preparations. But it is exempt from the requirements when there is a final sterilization process in the manufacturing process of sterile preparations.

Bacterial endotoxins Less than 0.20 EU per mg of ceftriaxone (potency) when used for the manufacturing of sterile preparations.

Assay Weigh accurately about 0.1 g (potency) each of Ceftriaxone Sodium Hydrate and ceftriaxone sodium RS and dissolve in a mixture of water and acetonitrile (11: 9) to make exactly 50 mL, respectively. Pipet 5 mL each of these solutions, add exactly 5 mL of the internal standard solution to each, add a mixture of water and acetonitrile (11 : 9) to make 200 mL, and use these solutions as the test solution and the standard solution. Perform the test with 10 μL each of these solutions as directed under the Liquid Chromatography according to the following conditions, and calculate the ratios, Q_T and Q_S, of peak areas of ceftriaxone to that of the internal standard, respectively.

$$\text{Potency (μg) of ceftriaxone } (C_{18}H_{18}N_8O_7S_3) = \text{Potency (μg) of minocycline ceftriaxone sodium RS} \times \frac{Q_T}{Q_S}$$

Internal standard—A mixture of water and acetonitrile in diethyl terephthalate (11 : 9) (9 in 5000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase A: Dissolve 5.796 g of anhydrous sodium dihydrogen phosphate and 3.522 g of potassium dihydrogen phosphate in water to make exactly 1000 mL and use this solution as solution A. Dissolve 20.256 g of citric acid monohydrate and 7.840 g of sodium hydroxide in water to make exactly 1000 mL and use this solution as solution B. Dissolve 4.0 g of tetra n-heptylammonium bromide in 450 mL of acetonitrile. To this solution, add 490 mL of water, 55 mL of the solution A and 5 mL of the solution B.

Flow rate: Adjust the flow rate so that the retention time of ceftriaxone is about 7 minutes.

System suitability

System performance: Proceed with 10 μL of the standard solution according to the above conditions; ceftriaxone and internal standard are eluted in this order with the resolution being NLT 6.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solutions according to the above conditions; the relative standard deviation of the ratios of the peak area of ceftriaxone to that of the internal standard is NMT 1.0%.

Packaging and storage Preserve in light-resistant, tight containers.

Ceftriaxone Sodium for Injection
주사용 세프트리악손나트륨

Ceftriaxone Sodium for Injection contains NLT 90.0% and NMT 120.0% of the labeled amount of ceftriaxone ($C_{18}H_{18}N_8O_7S_3$: 554.58), calculated as dissolve injections.

Method of preparation Prepare as directed under Injections, with Ceftriaxone Sodium Hydrate.

Description Ceftriaxone Sodium for Injection occurs as a white to yellowish white powder.

Identification Determine the infrared spectra of Ceftriaxone Sodium for Injection and ceftriaxone sodium RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit the same intensities of absorption at the same wavenumbers.

pH Dissolve an amount of Ceftriaxone Sodium for Injection, equivalent to 1.2 g (potency) of ceftriaxone, in 10 mL of water; the pH of this solution is 6.0 to 8.0.

Water Between 8.0% and 11.0% (0.1 g, volumetric titration, direct titration).

Sterility Meets the requirements.

Bacterial endotoxins Less than 0.20 EU per mg (potency) of ceftriaxone.

Particulate contamination: Visible particles Meets the requirements.

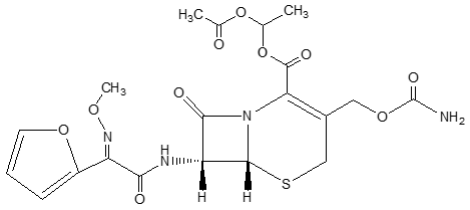
Insoluble particulate matter in injections Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Proceed as directed under the Assay under Ceftriaxone Sodium Hydrate. However, weigh accurately an amount of Ceftriaxone Sodium for Injection, equivalent to about 0.1 g (potency), according to the labeled potency, and dissolve in a mixture of water and acetonitrile (11 : 9) to make exactly 50 mL. Pipet 5 mL of this solution, add exactly 5 mL of the internal standard solution, add a mixture of water and acetonitrile (11 : 9) to make exactly 200 mL, and use this solution as the test solution.

Packaging and storage Preserve in hermetic containers.

Cefuroxime Axetil
세푸록심악세틸



$C_{20}H_{22}N_4O_{10}S$: 510.47

(1RS)-1-Acetoxyethyl (6R,7R)-3-carba moyloxymethyl-7-[(Z)-2-furan-2-yl-2-(methoxyimino)acetylamino]-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylate [*64544-07-6*]

Cefuroxime Axetil contains NLT 800 μg (potency) and NMT 850 μg (potency) of cefuroxime ($C_{16}H_{16}N_4O_8S$: 424.39) per mg, calculated on the anhydrous basis.

Description Cefuroxime Axetil occurs as a white to yellowish white, amorphous powder.
It is freely soluble in dimethylsulfoxide, soluble in methanol, sparingly soluble in ethanol(95), and very slightly soluble in water.

Identification (1) Determine the absorption spectra of respective solutions of Cefuroxime Axetil and cefuroxime axetil RS in methanol (3 in 200000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Cefuroxime Axetil and cefuroxime axetil RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) Determine ^1H of a solution of Cefuroxime Axetil in deuterated dimethylsulfoxide for nuclear magnetic resonance spectroscopy (1 in 20) as directed under the Nuclear Magnetic Resonance Spectroscopy, using tetramethylsilane for nuclear magnetic resonance spectroscopy as the internal standard; it exhibits the doublet signal A at about δ 1.5 ppm, singlet signal B at about δ 2.1 ppm, and singlet signal C at about δ 3.9 ppm, with the ratio of area strength of the signals A : B : C being 1 : 1 : 1.

Crystallinity It shows no crystallinity when tested.

Optical rotation $[\alpha]_D^{20}$: Between +41° and +47° (0.5 g, methanol, 50 mL, 100 mm).

Purity (1) ***Heavy metals***—Proceed with 2.0 g of Cefuroxime Axetil as directed under Method 2 and perform the test. Prepare the control solution with 2.0 mL of the lead standard solution (NMT 10 ppm).

(2) ***Arsenic***—Place 1.0 g of Cefuroxime Axetil in a crucible, add 10 mL of a solution of magnesium nitrate in ethanol(95) (1 in 10), and slowly heat to ash. If there is a residual carbide, wet it with a small amount of nitric acid and ignite to ash. After cooling, to the residuum, add 10

mL of dilute hydrochloric acid, and warm on a steam bath to dissolve. Use this solution as the test solution and perform the test (NMT 2 ppm).

(3) ***Related substances***—Dissolve 25 mg of Cefuroxime Axetil in 4 mL of methanol, add ammonium dihydrogen phosphate solution (23 in 1000) to make 10 mL, and use this solution as the test solution. Pipet 1 mL of this solution, add 40 mL of methanol, add ammonium dihydrogen phosphate solution (23 in 1000) to make exactly 100 mL, and use this solution as the standard solution. Pipet 2 mL each of the test solution and the standard solution, perform the test with these solutions as directed under the Liquid Chromatography according to the following operating conditions, and determine the peak areas from the respective solutions according to the automatic integration method; the peak areas other than cefuroxime axetil obtained from the test solution are not larger than 1.5 times the sum of the 2 peak areas of cefuroxime axetil from the standard solution, and the sum of peak areas other than cefuroxime axetil obtained from the test solution is not larger than 4 times the sum of the 2 peak areas of cefuroxime axetil from the standard solution.

Internal standard solution—A solution of acetanilide in methanol (27 in 5000).

Operating conditions

For the detector, column, column temperature, mobile phase and flow rate, proceed as directed in the operating conditions under the Assay.

System suitability

Detection sensitivity: Pipet 1 mL of the standard solution, add 4 mL of methanol, and add ammonium dihydrogen phosphate solution (23 in 1000) to make exactly 10 mL. Proceed with 2 μL of this solution as directed under the Procedure. The obtained peak area of cefuroxime axetil is within the range between 7% and 13% of each peak obtained from 2 μL of the standard solution.

System performance: Proceed with 10 μL of the standard solution according to the above conditions; the internal standard and cefuroxime axetil are eluted in this order with the resolution of the 2 peaks of cefuroxime axetil being NLT 1.5.

System repeatability: Repeat the test 6 times with 2 μL each of the standard solutions according to the above conditions; the relative standard deviation of the sum of the 2 peaks of cefuroxime axetil is NMT 2.0%.

Time span of measurement: About 3 times the retention time of cefuroxime axetil after the solvent peak

(4) ***Acetone***—Weigh accurately about 1 g of Cefuroxime Axetil, add exactly 0.2 mL of the internal standard solution, dissolve in dimethylsulfoxide to make 10 mL, and use this solution as the test solution. Separately, weigh accurately about 0.5 g of acetone, and add dimethylsulfoxide to make exactly 100 mL. Pipet 0.2 mL of this solution, add exactly 0.2 mL of the internal standard solution, add dimethylsulfoxide to make exactly 10 mL, and use this solution as the standard solution. Perform the test with 1 μL each of the test solution and the standard solution as directed under the Gas Chromatography according to the following conditions, and calculate the peak area ratios, Q_T and Q_S, of acetone to the internal standard, respectively; the amount of acetone is NMT 1.3%.

$$\text{Content (\%) of acetone} = \frac{W_T}{W_S} \times \frac{Q_T}{Q_S} \times 0.2$$

W_S: Taken amount (g) of acetone
W_T: Taken amount (g) of Cefuroxime Axetil

Internal standard solution—A solution of 1-propanol in dimethylsulfoxide (1 in 200).

Operating conditions

Detector: A flame ionization detector

Column: A glass column, about 3 mm in inside diameter and about 2 m in length, packed with diatomaceous earth for gas chromatography (between 125 μm and 150 μm in particle diameter) that is coated at 20% with a mixture of polyethylene glycol 600 for gas chromatography and polyethylene glycol 1500 for gas chromatography in the ratio of 1 : 1.

Column temperature: A constant temperature of about 90 °C.

Sample injection port temperature: A constant temperature of about 115 °C.

Carrier gas: Nitrogen

Flow rate: Adjust the flow rate so that the retention time of the internal standard is about 4 minutes.

System suitability

System performance: Proceed with 1 μL of the standard solution according to the above conditions; acetone and the internal standard are eluted in this order with the resolution being NLT 5.

System repeatability: Repeat the test 6 times with 1 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area of acetone with respect to the peak area of the internal standard is NMT 5.0%.

Water NMT 2.0% (0.4 g, volumetric titration, direct titration).

Residue on ignition NMT 0.2% (0.5 g).

Isomer ratio Perform the test as directed under the Assay and determine the content ratio of isomer A according to the following equation (between 0.48 and 0.55).

$$\text{Content ratio of isomer A in Cefuroxime Axetil} = \frac{Peak\ area\ of\ isomer\ A}{Peak\ area\ of\ isomer\ A + peak\ area\ of\ isomer\ B}$$

Assay Weigh accurately about 50 mg (potency) each of

Cefuroxime Axetil and cefuroxime axetil RS, and add methanol to each to make exactly 50 mL. Pipet 10 mL each of these solutions, add exactly 5 mL of the internal standard solution and 5 mL of methanol to ac, add ammonium dihydrogen phosphate solution (23 in 1000) to each to make exactly 50 mL, and use the resulting solutions as the test solution and the standard solution, respectively. Perform the test with 10 μL each of these solutions as directed under the Liquid Chromatography according to the following conditions, and calculate the ratios, Q_T and Q_S, of the sum of the 2 peak areas of cefuroxime axetil to the peak area of the internal standard, respectively.

$$\text{Potency (μg) of cefuroxime } (C_{16}H_{16}N_4O_8S) = \text{Potency (μg) of cefuroxime axetil RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of acetanilide in methanol (27 in 5000).

Operating conditions

Detector: An ultraviolet absorption spectrophotometer (wavelength: 278 nm).

Column: A stainless steel column, about 4.6 mm in internal diameter and about 20 cm in length, packed with trimethylsilyl silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: A mixture of ammonium dihydrogen phosphate solution (23 in 1000) and methanol (5 : 3).

Flow rate: Adjust the flow rate so that the retention time of the first eluted one of the 2 peaks of cefuroxime axetil is about 8 minutes.

System suitability

System performance: Proceed with 10 μL of the standard solution according to the above conditions; the internal standard and cefuroxime axetil are eluted in this order with the resolution of the two peaks of cefuroxime axetil being NLT 1.5.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solutions according to the above conditions; the relative standard deviation of the ratio of the sum of the 2 peak areas of cefuroxime axetil to the peak area of the internal standard is NMT 1.0%.

Relative retention time: The relative retention time of isomer B and the relative retention time of isomer A with respect to the internal standard are about 2 and about 2.25, respectively.

Packaging and storage Preserve in light-resistant, tight containers.

Cefuroxime Axetil for Syrup
시럽용 세푸록심악세틸

Cefuroxime Axetil for Syrup is a preparation for syrup, which is suspended before use, and contains NLT 90.0% and NMT 120.0% of the labeled amount of cefuroxime ($C_{16}H_{16}N_4O_8S$: 424.39).

Method of preparation Prepare as directed under Syrups, with Cefuroxime Axetil.

Identification (1) Dissolve an amount of each Cefuroxime Axetil for Syrup and cefuroxime axetil RS in methanol so that each solution contains 15.8 μg (potency) per mL and measure the absorption spectra of the solutions in the range from 230 nm to 320 nm as directed under the Ultraviolet-visible Spectroscopy; both solutions exhibit a maximum at around 276 nm.

(2) The retention times of the major peaks obtained from the test solution and the standard solution prepared as directed under the Assay are the same.

pH Dissolve Cefuroxime Axetil for Syrup according to the label; the pH of the resulting solution is between 3.5 and 7.0.

Water NMT 6.0% (0.2 g, volumetric titration, direct titration).

Dissolution Weigh accurately an amount of Cefuroxime Axetil for Syrup, equivalent to about 0.15 g (potency) according to the labeled amount, suspend according to the label, and perform the test with the suspension at 100 revolutions per minute according to Method 2 under the Dissolution, using 900 mL of phosphate buffer solution (pH 7.0) as the dissolution medium. Take NLT 20 mL of the dissolved solution 30 minutes after starting the test and filter through a membrane filter with a pore size not exceeding 0.5 μm. Discard the first 10 mL of the filtrate, pipet *V* mL of the subsequent filtrate, add phosphate buffer solution (pH 7.0) to make exactly *V'* mL so that Each mL of the solution contains about 20 μg (potency) of cefuroxime ($C_{16}H_{16}N_4O_8S$) according to the labeled amount, and use this solution as the test solution. Separately, weigh accurately about 0.15 g (potency) of cefuroxime axetil RS, add 25 mL of methanol, add phosphate buffer solution (pH 7.0) so that each mL contains 20 μg (potency), and use the solution as the standard solution. Determine the absorbances of the test solution and the standard solution at the absorbance maximum wavelength, around 278 nm, as directed under the Ultraviolet-visible Spectroscopy. Meets the requirements if the dissolution rate of Cefuroxime Axetil for Syrup in 30 minutes is NLT 65%.

$$\text{Dissolution rate (\%) with respect to the labeled amount of cefuroxime } (C_{16}H_{16}N_4O_8S) = \frac{C_S}{Amount\ (g)\ of\ \text{Cefuroxime Axetil for Syrup taken}} \times \frac{A_T}{A_S} \times \frac{V'}{V} \times \frac{1}{C} \times 90000$$

C_S: Concentration [mg (potency)/mL] of the standard solution

C: Labeled amount [mg (potency)] of cefuroxime ($C_{16}H_{16}N_4O_8S$) per g

Uniformity of dosage units (distribution) Meets the requirements.

Assay Proceed as directed under the Assay under Cefuroxime Axetil. Weigh accurately an amount of Cefuroxime Axetil for Syrup, equivalent to about 0.15 g (potency) according to the labeled potency, add 2 mL of water, shake the flask vigorously until dispersed, add 10.0 mL of the internal standard solution and methanol to make exactly 200 mL, and filter. Take exactly 20 mL of the filtrate, add water to make exactly 50 mL, and use the solution as the test solution. Separately, weigh accurately about 15 mg (potency) of cefuroxime axetil RS, dissolve in 1.0 mL of the internal standard solution, add water to make exactly 50 mL, and use the solution as the standard solution. Perform the test with each 20 μL of the test solution and the standard solution.

Packaging and storage Preserve in tight containers.

Cefuroxime Axetil Tablets
세푸록심악세틸 정

Cefuroxime Axetil Tablets contain NLT 90.0% and NMT 120.0% of the labeled amount of cefuroxime ($C_{16}H_{16}N_4O_8$ S: 424.39).

Method of preparation Prepare as directed under Tablets, with Cefuroxime Axetil.

Identification The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

Water NMT 6.0% (0.2 g, volumetric titration, direct titration).

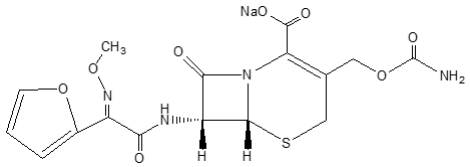
Dissolution Perform the test with 1 tablet of Cefuroxime Axetil Tablets at 55 revolutions per minute according to Method 2 under the Dissolution, using 900 mL of 0.07 mol/L hydrochloric acid solution, appropriately deaerated, as the dissolution medium. Take a certain volume of the dissolved solution after 15 minutes from the start of the dissolution test, and carefully add the same volume of the dissolution medium, previously warmed to 37±0.5 °C. Filter the dissolved solution taken through a membrane filter with a pore size NMT 0.5 μm, pipet a certain amount of the filtrate, dilute it with 0.07 mol/L hydrochloric acid solution so that it contains about 20 μg (potency) of cefuroxime ($C_{16}H_{16}N_4O_8S$) per mL, and use this solution as the test solution for dissolution test (15 minutes). Repeat this procedure after 45 minutes from the start of the dissolution test, and use the resulting solution as the test solution for the dissolution test (45 minutes). Separately, weigh accurately about 60 mg (potency) of cefuroxime axetil RS, dissolve with 5 mL of methanol, add 0.07 mol/L hydrochloric acid solution so that it contains 20 μg (potency) per mL, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at the absorbance maximum wavelength of around 278 nm as directed under the Ultraviolet-visible Spectroscopy, and calculate the dissolution rate; it meets requirements if the dissolution rate of Cefpodoxime Axetil Tablets in 15 minutes is NLT 65%, and the dissolution rate of Cefpodoxime Axetil Tablets in 45 minutes is NLT 80%.

Uniformity of dosage units Meets the requirements.

Assay Perform the test as directed under the Assay of Cefuroxime Axetil. However, weigh accurately the mass of NLT 20 tablets of Cefpodoxime Axetil Tablets, and powder. Weigh accurately a portion of the powder, equivalent to about 50 mg (potency) according to the labeled potency, and dissolve in methanol to make exactly 50 mL. Pipet 10 mL of the resulting solution, add 5 mL of the internal standard solution and 5 mL of methanol, add ammonium dihydrogen phosphate solution (23 in 1000) to make exactly 50 mL, and use this solution as the test solution.

Packaging and storage Preserve in tight containers.

Cefuroxime Sodium
세푸록심나트륨



$C_{16}H_{15}N_4NaO_8S$: 446.37

Sodium (6*R*,7*R*)-7-[(2*E*)-2-(furan-2-yl)-2-methoxyiminoacetamido]-3-carbamoyloxymethyl-3,4-didehydrocepham-4-carboxylate [*56238-63-2*]

Cefuroxime Sodium contains NLT 875 μg (potency) of cefuroxime ($C_{16}H_{16}N_4O_8S$: 424.39) per mg, calculated on the anhydrous basis.

Description Cefuroxime Sodium occurs as white to pale yellowish white crystals or a crystalline powder.
It is freely soluble in water, sparingly soluble in methanol, and very slightly soluble in ethanol(95).

Identification (1) Determine the absorption spectra of

respective aqueous solutions of Cefuroxime Sodium and cefuroxime sodium RS (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Cefuroxime Sodium and cefuroxime sodium RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) Determine ^1H of a solution of Cefuroxime Sodium in deuterium oxide for nuclear magnetic resonance spectroscopy (1 in 10) as directed under the Nuclear Magnetic Resonance Spectroscopy, using sodium 3-trimethylsilylpropanesulfonate for nuclear magnetic resonance spectroscopy as the internal standard; it exhibits the singlet signal A at about δ 4.0 ppm, quartet signal B at about δ 6.6 ppm, and doublet signals C and D at about δ 6.9 ppm and δ 7.7 ppm, respectively, with the ratio of area of the signals A : B : C : D being 3 : 1 : 1 : 1.

(4) Cefuroxime Sodium responds to the Qualitative Analysis (1) for sodium salt.

Optical rotation $[\alpha]_D^{20}$: Between +59° and +66° (0.5 g, calculated on the anhydrous basis, water, 100 mL, 100 mm).

pH Dissolve 1 g of Cefuroxime Sodium in 10 mL of water; the pH of this solution is between 6.0 and 8.5.

Purity (1) ***Clarity and color of solution*—**Dissolve 1.0 g of Cefuroxime Sodium in 10 mL of water; the solution is clear. Determine the absorbance of this solution as directed under the Ultraviolet-visible Spectroscopy; the absorbance at a wavelength of 450 nm is NMT 0.25.

(2) ***Heavy metals*—**Proceed with 1.0 g of Cefuroxime Sodium as directed under Method 2 and perform the test. Prepare the control solution with 3.0 mL of lead standard solution (NMT 30 ppm).

(3) ***Arsenic*—**Proceed with 1.0 g of Ceftriaxone Sodium according to Method 3 and perform the test (NMT 2 ppm).

(4) ***Related substances*—**Dissolve 25 mg of Cefuroxime Sodium in 25 mL of water, and use this solution as the test solution. Pipet 1 mL of the test solution, add water to make exactly 100 mL, and use this solution as the standard solution. Pipet 20 μL each of the test solution and the standard solution, perform the test with these solutions as directed under the Liquid Chromatography according to the following operating conditions, and determine individual peak areas in each solution according to the automatic integration method; each peak area other than cefuroxime obtained from the test solution is not larger than the peak area of cefuroxime from the standard solution. Also, the sum of peak areas other than cefuroxime in the test solution is not larger than 3 times the peak area of cefuroxime in the standard solution.

Operating conditions

For the detector, column, column temperature, mobile phase and flow rate, proceed as directed in the operating conditions under the Assay.

System suitability

System performance: Proceed as directed under the system suitability under the Assay.

Test for required detectability: Pipet 1 mL of the standard solution and add water to make exactly 10 mL. Confirm that the peak area of cefuroxime obtained from 20 μL of this solution is within the range between 7% and 13% of the peak area of cefuroxime obtained from the standard solution.

System repeatability: Repeat the test 6 times with 20 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area of cefuroxime is NMT 2.0%.

Time span of measurement: About 4 times the retention time of cefuroxime after the solvent peak.

(5) ***Dimethylaniline*—**Weigh accurately about 1.0 g of Cefuroxime Sodium, add 5 mL of 1 mol/L sodium hydroxide TS and 1 mL of the internal standard solution, and if necessary, centrifuge. Use the clear supernatant as the test solution. Separately, weigh accurately about 50 mg of dimethylaniline, add 2.0 mL of hydrochloric acid, and add water to make 50 mL. Pipet 5.0 mL of this solution and add water to make exactly 250 mL. Pipet 1.0 mL of this solution, add 5.0 mL of 1 mol/L sodium hydroxide TS and 1.0 mL of the internal standard solution, and if necessary, centrifuge. Use the supernatant as the standard solution. Perform the test with 1 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the peak area ratios, Q_T and Q_S, of dimethylaniline to that of the internal standard, respectively (NMT 20 ppm).

$$\text{Content (ppm) of dimethylaniline} = \text{Amount (mg) of dimethylaniline taken} \times \frac{Q_T}{Q_S} \times \frac{Purity\ (\%)\ of\ dimethylaniline}{Taken\ amount\ (mg)\ of\ Cefuroxime\ Sodium} \times 4$$

Internal standard solution—Dissolve 50.0 mg of naphthalene in cyclohexane to make 50 mL. To 5.0 mL of this solution, add cyclohexane to make 100 mL, and use this solution as the internal standard solution.

Operating conditions

Detector: A flame ionization detector

Column: A column about 2 mm in internal diameter and about 2 m in length, packed with diatomaceous earth for gas chromatography coated with 50% phenyl-50% methylpolysiloxane for gas chromatography in 3% of its mass.

Column temperature: 120 °C

Temperatures of the sample injection port and the detector: 150 °C

Carrier gas: Nitrogen

Flow rate: 30 mL/min

Water NMT 4.0% (0.4 g, volumetric titration, direct titration).

Sterility It meets the requirements when used in a sterile preparation. However, it is excluded in cases where there is a terminal sterilization process in the manufacturing of a sterile preparation.

Bacterial endotoxins It is less than 0.10 EU per mg (potency) of cefuroxime when used in a sterile preparation.

Assay Weigh accurately about 25 mg (potency) each of Cefuroxime Sodium and cefuroxime sodium RS, add water to each to make exactly 25 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 20 μL each of these solutions as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of cefuroxime, respectively.

$$\text{Potency (μg) of cefuroxime } (C_{16}H_{16}N_4O_8S) = \text{Potency (μg) of cefuroxime sodium RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption spectrophotometer (wavelength: 273 nm).

Column: A stainless steel column, about 4.6 mm in internal diameter and about 125 mm in length, packed with hexasilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: Dissolve 0.68 g of sodium acetate trihydrate in 900 mL of water, add acetic acid(100) to adjust the pH to 3.4, and add water to make 1000 mL. To 990 mL of this solution, add 10 mL of acetonitrile.

Flow rate: Adjust the flow rate so that the retention time of cefuroxime is about 8 minutes.

System suitability

System performance: Allow the test solution to stand at 60 ℃ for 10 minutes and cool. Quickly proceed with 20 μL of this solution according to the above conditions; the resolution between the peak of cefuroxime and the peak with the relative retention time with respect to cefuroxime of about 0.7 is NLT 2.0.

System repeatability: Repeat the test 6 times with 20 μL each of the standard solutions according to the above conditions; the relative standard deviation of the peak area of cefuroxime is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Cefuroxime Sodium for Injection
주사용 세푸록심나트륨

Cefuroxime Sodium for Injection, as an injection that is dissolved upon use, contains NLT 90.0% and NMT 120.0% of the labeled amount of cefuroxime ($C_{16}H_{16}N_4O_8S$: 424.39).

Method of preparation Prepare as directed under Injections, with Cefuroxime Sodium.

Description Cefuroxime Sodium for Injection occurs as a white to pale yellowish white powder.

Identification Perform the test as directed under the Identification (1) and (2) under Cefuroxime Sodium.

pH Dissolve an amount of Cefuroxime Sodium for Injection equivalent to 1.0 g (potency) of cefuroxime in 10 mL of water; the pH of this solution is between 6.0 and 8.5.

Water NMT 3.5% (0.2 g, volumetric titration, direct titration).

Sterility Meets the requirements.

Bacterial endotoxins Less than 0.10 EU per mg (potency) of cefuroxime.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately about 50 mg (potency) according to the labeled potency of Cefuroxime Sodium for Injection, and dissolve in water to make exactly 250 mL. Pipet 5 mL of this solution, add water to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 50 mg (potency) of cefuroxime sodium RS, and dissolve in water to make 50 mL. Pipet 5 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the peak areas of cefuroxime sodium, A_T and A_S, in the test solution and the standard solution, respectively.

$$\text{Potency (μg) of cefuroxime } (C_{16}H_{16}N_4O_8S) = \text{Potency (μg) of cefuroxime sodium RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with hexyl silyl silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of a solution obtained by adding 0.1 mol/L acetic acid to 50 mL of 0.1 mol/L sodium acetate solution (acetate buffer solution, pH 3.4) and acetonitrile (10 : 1).

Flow rate: 2.0 mL/min

Packaging and storage Preserve in hermetic containers.

Cellulase
셀룰라제

Cellulase is an enzyme with cellulose digestive activity, from a useful strain of the genus *Aspergillus*, and contains NLT 90.0% of the cellulose digestive unit of the labeled amount.

Description Cellulase occurs as a pale yellow to pale yellowish brown power and has a characteristic odor.

Identification Perform the test as directed under the Assay; it exhibits positive response.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Cellulase according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Arsenic*—**Proceed with 1.0 g of Cellulase according to Method 3 and perform the test (NMT 2 ppm).

Loss on drying NMT 5.0% (1 g, 105℃, 4 hours).

Residue on ignition NMT 8. 0% (1 g).

Assay Weigh accurately about 0.5 g of Cellulase and dissolve in water to make exactly 200 mL. Take 1 mL of Cellulase, add water to make 100 mL, and use this solution as the test solution. Take 4 mL of sodium carboxymethyl cellulose solution, allow to stand at 37 ± 0.5 ℃ for 10 minutes, add 1 mL of the test solution, shake to mix, and allow to react at 37 ± 0.5 ℃ for 30 minutes. Add 2 mL of Fehling's alkaline copper TS, shake to mix, heat on a steam bath for 30 minutes, and cool with running water. Add 2 mL of arsenic molybdate TS, shake well to mix, add 3 mL of 0.5 mol/L sodium hydroxide. Shake again to mix, dissolve the precipitate, allow to stand for 20 minutes, and add acetic acid-sodium acetate buffer solution, pH 4.5, to make 25 mL. Take 1.0 mL of this solution, add 9 mL of acetic acid-sodium acetate buffer solution, pH 4.5, shake well to mix, perform the test as directed under the Ultraviolet-visible Spectroscopy, and determine the absorbance A_T at the wavelength of 750 nm. Take 1 mL of the test solution, add 2 mL of Fehling's alkaline copper TS and then 4 mL of sodium carboxymethyl cellulose solution, and shake to mix. Proceed according to the above conditions to determine absorbance A_B. Calculate the amount (mg) of glucose, G_T and G_B, corresponding to A_T and A_B, respectively, from the calibration curve of the standard glucose solution.

$$\text{Cellulose digestive activity (unit/g)} = (G_T - G_B) / 30 \times 1 / 0.18 \times 1 / W$$

W: Amount (g) of the sample per mL of the test solution.

Definition of potency: Under the conditions specified above, one cellulose saccharifying activity unit is the amount of enzyme that catalyzes the increase of reducing activity equivalent to 1 μmole of glucose per minute.

Glucose calibration curve: Weigh accurately about 50 mg of the glucose RS, previously dried at 105 ℃ for 6 hours, and dissolve in water to make exactly 50 mL. Pipet 1, 2, 3, 4, and 5 mL of this solution, add water to make exactly 10 mL, respectively, and use these solutions as the standard solutions for the calibration curve. Pipet 1 mL each of water and the standard solution for the calibration curve, add 4 mL of sodium carboxymethyl cellulose solution and 2 mL of Fehling's alkaline copper TS, shake to mix, and heat on a steam bath for 30 minutes. After cooling with water, add 2 mL of arsenic molybdate TS, and shake to mix. Add 3 mL of 0.5 mol/L sodium hydroxide, dissolve the precipitate, allow to stand for 20 minutes, and add acetic acid-sodium acetate buffer solution, pH 4.5, to make 25 mL. Take 1 mL each of these solutions, add 9 mL of acetic acid-sodium acetate buffer solution, pH 4.5, shake to mix, and perform the test as directed under the Ultraviolet-visible Spectroscopy to determine the absorbances A_0, A_1, A_2, A_3, A_4 and A_5 at the wavelength of 750 nm. Construct a calibration curve by plotting the absorbances, $A_1 - A_0$, $A_2 - A_0$, $A_3 - A_0$, $A_4 - A_0$ and $A_5 - A_0$, versus the amount (mg) of glucose.

Packaging and storage Preserve in tight containers.

Cellulase II
셀룰라제II

Cellulase II is a cellulose digestive enzyme extracted and purified from the enzyme obtained by culturing filamentous fungi of the genus *Aspergillus*. About 1 g of Cellulase II, when dried, contains NLT 2000 units of cellulose digestive activity.

Description Cellulase II occurs as a pale brown fine powder and has a characteristic odor. It is freely soluble in water.

Identification Perform the test with Cellulase II as direct under the Assay; it exhibits a positive response.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Cellulase II in 100 mL of water; the resulting solution is clear.

(2) ***Heavy metals***—Proceed with 0.1 g of Cellulase II according to Method 2, and perform the test. Prepare the control solution with 0.5 mL of lead standard solution (NMT 50 ppm).

(3) ***Arsenic—***Proceed with 0.1 g of Cellulase II according to Method 3, and perform the test (NMT 2 ppm).

Loss on drying NMT 5% (1 g, 105 ℃, 2 hours).

Residue on ignition NMT 20% (1 g).

Assay ***Cellulose digestive activity***—Weigh accurately about 20.0 mg of Cellulase II, transfer to a 100-mL volumetric flask, add water to make 1000 mL, filter, and use this solution as the test solution. Add 4.0 mL of sodium carboxymethyl cellulose solution in a 50-mL volumetric flask, heat on a steam bath at 40 ℃ for 5 minutes, add 1 mL of the test solution, and heat on a steam bath at 40 ℃ for 30 minutes. Add 2.0 mL of alkaline copper solution of Fehling's TS, heat in a hot water bath for 20 minutes, and cool with running water. Add 1.0 mL of arsenic molybdate TS, shake to mix, allow to stand at room temperature for 20 minutes, and add water to make exactly 50 mL. Determine absorbance at a wavelength of 500 nm using water as the control solution. With the difference in absorbance between the test solution and blank test solution, determine the amount of glucose using the glucose calibration curve, and calculate the cellulose digestive activity.

$$\text{Cellulose digestive activity (unit/g)} = \frac{\text{Amount (mg) of glucose produced}}{30} \times 100$$

Definition of potency: Under the conditions specified above, 100 cellulose digestive activity unit is the amount that creates reducing sugar equivalent to 1 mg of glucose per minute.

Glucose calibration curve: Weigh accurately about 1.0 g of glucose RS, previously dried at 80 ℃ for 5 hours, dissolve in water to make 100 mL, and use this solution as the standard solution for calibration curve. Pipet accurately 5.0 mL of water with 1 mL, 2 mL, 4 mL, 6 mL, 8 mL and 10 mL each of the standard solution for calibration curve, and add water to make 100 mL. Pipet accurately 5.0 mL each of these solutions to a 50-mL volumetric flask, add 2.0 mL each of alkaline copper solution of Fehling's TS, and heat for 20 minutes in a hot water bath. Cool with running water, add 1.0 mL of arsenic molybdate TS, shake well to mix, allow to stand for 20 minutes at room temperature, and add water to make exactly 50 mL. With these solutions, determine the absorbances A_0, A_1, A_2, A_3, A_4, A_5 and A_6 at the wavelength of 500nm as directed under the Ultraviolet-visible Spectroscopy. Construct a calibration curve by plotting the differences in absorbances $A_1 - A_0$, $A_2 - A_0$, $A_3 - A_0$, $A_4 - A_0$, $A_5 - A_0$ and $A_6 - A_0$ versus the amounts (mg) of glucose.

Packaging and storage Preserve in tight containers.

Cellulase AP_3 I
셀룰라제AP_3I

Cellulase AP_3 I is digestive enzyme extracted and purified from the enzyme obtained by culturing filamentous fungi belonging to the genus *Aspergillus*. Cellulase AP_3 I contains between 1200 and 1800 units of cellulose digestive activities per g when tested as directed under the Digestive Power.

Description Cellulase AP_3 I occurs as a pale yellow to pale yellowish brown powder and has a characteristic odor.
It is soluble in water and practically insoluble in ethanol.

Identification Dissolve about 0.5 g of Cellulase AP_3 I in water to make 50 mL, take 1 mL of this solution, add 10 mL of sodium carboxymethyl cellulose solution heated to 37 ± 0.5 ℃, and shake well to mix. Allow this solution to stand at 37 ± 0.5 ℃ for 10 minutes, add 4 mL of Fehling's TS, and heat; a reddish brown precipitate is formed.

Purity (1) ***Heavy metals—***Proceed with 1.0 g of Cellulase AP_3 I according to Method 2 and perform the test. Prepare the control solution with 5.0 mL of lead standard solution (NMT 50 ppm).

(2) ***Arsenic—***Proceed with 1.0 g of Cellulase AP_3 I according to Method 3 and perform the test (NMT 2 ppm).

Loss on drying NMT 10.0% (1 g, 105 °C, 4 hours).

Residue on ignition NMT 15.0% (1 g).

Assay ***Cellulose saccharifying activity***—Weigh accurately about 0.5 g of Cellulase AP_3 I, and add water to make 200 mL. Pipet 1.0 mL of this solution, add 100 mL of water, and use this solution as the test solution. Pipet accurately 1.0 mL of the test solution and 1.0 mL of water, add 2 mL of alkaline copper solution of Fehling's TS, and shake well to mix. Add 4 mL of sodium carboxymethyl cellulose solution, shake to mix, heat on a steam bath for 30 minutes, and cool immediately with running water. Add 2 mL of arsenic molybdate TS, shake to mix, add 3 mL of 0.5 mol/L sodium hydroxide TS, and shake to mix. Dissolve the precipitate, allow to stand at room temperature for 20 minutes, and add acetic acid-sodium acetate buffer solution, pH 4.5 to make 25 mL. Pipet 1.0 mL of

each of these solutions, add 9 mL of acetic acid-sodium acetate buffer solution, pH 4.5, shake to mix, and determine the absorbance, A_T and A_B at the wavelength of 750 nm as directed under the Ultraviolet-visible Spectroscopy. Separately, determine the amount of glucose, G_T and G, corresponding to A_T and A_B using the glucose calibration curve.

$$\text{Cellulose saccharifying activity (unit/g)} = \frac{(G_T - G_B)}{30} \times \frac{1}{0.18} \times n$$

n: Dilution factor of the test solution

Definition of potency: Under the conditions specified above, one cellulose saccharifying activity unit is the amount of enzyme that catalyzes the increases of reducing activity equivalent to 1 μmole of glucose per minute.

Glucose calibration curve: Weigh accurately about 1 g of glucose RS, previously dried at 105 ℃ for 6 hours, and calculate the loss in weight. Weigh accurately 1.0 g of dried weight equivalent to glucose, and dissolve in water to make 1000 mL. Pipet 1.0, 2.0, 3.0, 4.0 and 5.0 mL of this solution separately, and add water to make 10 mL, respectively (0.1, 0.2, 0.3, 0.4, and 0.5 mL of glucose in each 1 mL of the solution). Pipet 1.0 mL of each of the solutions, add 4.0 mL of sodium carboxymethyl cellulose solution and 2.0 mL of alkaline copper TS to a 50-mL Nessler tube, and shake to mix. Insert stopper to the Nessler tube, heat on a steam bath for 30 minutes, and cool with water. Add 2 mL of arsenic molybdate TS, shake to mix, add 3 mL of 0.5 mol/L sodium hydroxide TS into each tube, and shake to dissolve the precipitate. Allow the mixture to stand for 20 minutes, add acetate-sodium acetate buffer solution, pH 4.5 to make 25 mL. Pipet 1.0 mL of this solution and add 9.0 mL of acetate-sodium acetate buffer solution, pH 4.5, and shake to mix. Determine the absorbances A_1, A_2, A_3, A_4, and A_5 at the wavelength of 750 nm. Separately, pipet 1.0 mL of water instead of 1.0 mL of glucose solution, proceed in the same manner, and determine absorbance A_0. Construct a calibration curve by plotting the difference of absorbance (A_1-A_0, A_2-A_0, A_3-A_0, A_4-A_0, and A_5-A_0) versus the amount of glucose (mg).

Packaging and storage Preserve in tight containers.

Centella Titrated Extract, Hydrocortisone Acetate and Neomycin Sulfate Ointment
센텔라정량추출물·히드로코르티손아세테이트·네오마이신황산염 연고

Centella Titrated Extract, Hydrocortisone Acetate and Neomycin Sulfate Ointment contains NLT 36.0% and NMT 44.0% of asioticoside ($C_{48}H_{78}O_{19}$: 959.12), NLT 90.0% and NMT 110.0% of hydrocortisone acetate ($C_{23}H_{32}O_6$: 404.50), and NLT 90.0% and NMT 120.0% of neomycin sulfate ($C_{23}H_{46}N_6O_{13}\cdot 3H_2SO_4$: 908.88) according to the labeled amount of centella titrated extract.

Method of preparation Prepare as directed under Ointments, with Centella Titrated Extract, Hydrocortisone Acetate and Neomycin Sulfate.

Identification (1) ***Centella titrated extract and hydrocortisone acetate—***Take 3 g of Centella Titrated Extract, Hydrocortisone Acetate and Neomycin Sulfate Ointment, add 10 mL of methanol, shake to mix on a steam bath, then cool in a cold place, and filter. Take 5 mL of the filtrate, add methanol to make 10 mL, and use this solution as the test solution. Weigh appropriate amounts of asiaticoside RS, madecassic acid RS and asiatic acid RS and dissolve in methanol to make 0.5%. Separately weigh hydrocortisone acetate RS, dissolve in methanol to make 0.2%, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of 1-butanol, ethanol(95), water and ammonia water (12 : 8 : 2 : 1) as the developing solvent, and air-dry the plate. Spray the plate with a mixture of acetic anhydride and sulfuric acid (9 : 1); the spots from the test solution and the standard solution have the same R_f value and color.

(2) ***Neomycin sulfate—***Weigh an appropriate amount of Centella Titrated Extract, Hydrocortisone Acetate and Neomycin Sulfate Ointment, place in a separatory funnel, add 50 mL of ether, shake vigorously to mix, and extract with an appropriate amount of 0.1 mol/L phosphate buffer solution (pH 8.0). Add 1 mL of ninhydrin TS and 0.5 mL of pyridine to 5 mL of an aqueous solution (1 in 1000) of Centella Titrated Extract, Hydrocortisone Acetate and Neomycin Sulfate Ointment and boil for 10 minutes; the solution exhibits a bluish purple color.

Assay (1) ***Asiaticoside in centella titrated extract—***Weigh a certain amount of centella titrated extract (equivalent to about 12 mg of asiaticoside ($C_{48}H_{78}O_{19}$)) according to the labeled amount of Centella Titrated Extract, Hydrocortisone Acetate and Neomycin Sulfate Ointment, add 20 mL of the mobile phase, dissolve by warming on a steam bath, cool, add the mobile phase to make exactly 50 mL, centrifuge, and use the clear supernatant as the test solution. Separately, weigh accurately about 12 mg of asiaticoside RS, proceed in the same manner with the test solution, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of each solution.

Amount (mg) of asiaticoside ($C_{48}H_{78}O_{19}$)
= Amount (mg) of asiaticoside RS × (A_T / A_S)

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 214 nm).

Column: A stainless steel column about 3.9 mm in internal diameter and about 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of water, methanol and acetonitrile (4 : 3 : 3).

Flow rate: 1.0 mL/min

(2) ***Hydrocortisone acetate***—Weigh accurately an amount of Centella Titrated Extract, Hydrocortisone Acetate and Neomycin Sulfate Ointment, equivalent to about 10 mg of hydrocortisone acetate ($C_{23}H_{32}O_6$) according to the labeled amount, add 30 mL of ethanol(95), shake to mix while warming on a steam bath, then cool and filter. Wash the residue 3 times with 20 mL of ethanol(95), combine the filtrate and washings, and add ethanol to make exactly 100 mL. Pipet 10 mL of this solution, add ethanol(95) to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 25 mg of hydrocortisone acetate RS, dissolve in ethanol(95) to make exactly 50 mL. Pipet 2 mL of this solution, add ethanol(95) to make exactly 100 mL, and use this solution as the standard solution. Pipet 20 mL each of the test solution and the standard solution, add 2 mL of 0.5% blue tetrazolium and 2 mL of tetramethylammonium hydroxide, seal, shake to mix, and let stand for 90 minutes in the dark. Separately, carry out the same procedure with ethanol and use the resulting solution as the blank test solution. Determine the absorbances of the test solution and the standard solution A_T and A_S at the wavelength of 525 nm, using the blank test solution as a control solution.

Amount (mg) of hydrocortisone acetate ($C_{23}H_{32}O_6$)
= Amount (mg) of hydrocortisone acetate RS × (A_T / A_S) × 0.4

(3) ***Neomycin sulfate***

Cylinder plate method and standard curve method (Prepare the test solution as follows.)

Method 1 Weigh accurately an amount of Centella Titrated Extract, Hydrocortisone Acetate and Neomycin Sulfate Ointment, equivalent to about 0.1 g (potency) according to the labeled potency, place in a separatory funnel, add 50 mL of ether and shake sufficiently to mix, extract 3 times with 25 mL each of 0.1 mol/L phosphate buffer solution (pH 8.0), combine the extracts, and prepare a solution of appropriate concentration using 0.1 mol/L phosphate buffer solution (pH 8.0).

Method 2 Weigh accurately an amount of Centella Titrated Extract, Hydrocortisone Acetate and Neomycin Sulfate Ointment, equivalent to about 10 mg (potency) of neomycin sulfate according to the labeled potency, place in a blender, add 60 mL of 0.1 mol/L phosphate buffer solution (pH 8.0) and grind at high speed for 3 minutes, then add 0.1 mol/L phosphate buffer solution (pH 8.0) to make exactly 100 mL of solution.

Method 3 Weigh accurately an amount of Centella Titrated Extract, Hydrocortisone Acetate and Neomycin Sulfate Ointment, equivalent to about 10 mg (potency) of neomycin sulfate according to the labeled potency, place in a glass centrifuge tube with a glass stopper, add exactly 50 mL of diluted hydrochloric acid (1 in 100), and shake thoroughly to mix while warming. Cool, add 50 mL of chloroform, shake well to mix, centrifuge, pipet 25 mL of the clear supernatant, adjust pH to 8.0 using sodium hydroxide solution (1 in 5), then add 0.1 mol/L phosphate buffer solution (pH 8.0) to make exactly 50 mL of solution.

Take appropriate amounts of the solutions from Method 1, Method 2 and Method 3 and dilute with 0.1 mol/L phosphate buffer solution (pH 8.0) to the concentrations of (A) ③ and (B) ③, and use these solutions as the test solutions.

(i) Cylinder plate method

① Medium: Agar medium for strata and base layer

Peptone	6.0 g
Yeast extract	3.0 g
Meat extract	1.5 g
Sodium chloride	2.5 g
Glucose	1.0 g
Agar	15.0 ~ 20.0 g

Weigh the above amount of substances, add purified water to make 1000 mL, and adjust the pH after sterilizing with sodium hydroxide TS to between 7.8 and 8.0.

② Test organism and test organism suspension Use *Staphylococcus aureus* ATCC 6538P as the test organism. However, make a test suspension so that the transmittance of the test suspension is 80% when measured using an absorbance photometer at a wavelength of 650 nm.

③ Weigh accurately an amount of Centella Titrated Extract, Hydrocortisone Acetate and Neomycin Sulfate Ointment equivalent to about 20 mg (potency) according to the labeled potency, dissolve in 0.1 mol/L phosphate buffer solution (pH 8.0) to make a solution containing 1 mg (potency) per mL, and use this solution as the test stock solution. Take appropriate amounts of this test stock solution and dilute with 0.1 mol/L phosphate buffer solution (pH 8.0) to contain 80 μg (potency) and 20 μg (potency) per mL, and use these solutions as the high-concentration and low-concentration test solu-

tions, respectively. Separately, take an appropriate amount of neomycin sulfate RS, dry for 3 hours at 0.7 kPa and 60 ℃, then weigh accurately an amount equivalent to 20 mg (potency), dissolve in 0.1 mol/L phosphate buffer solution (pH 8.0) to prepare a standard stock solution containing 1 mg (potency) per mL. Keep the standard stock solution below 5 ℃ and use it within 30 days. For the Assay, pipet an appropriate amount of the standard stock solution, dilute with 0.1 mol/L phosphate buffer (pH 8.0) to contain 80 μg (potency) and 20 μg (potency) per mL, and use these solutions as the high-concentration standard solution and the low-concentration standard solution, respectively. With these solutions, perform the test according to (A) ⑧ under the Microbial Assays for Antibiotics.

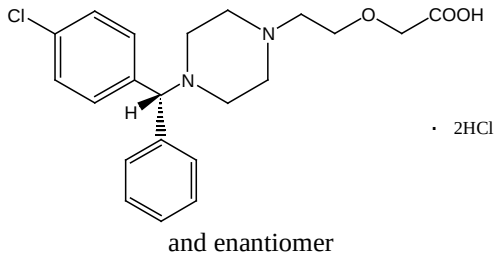
(ii) Standard curve method ① Medium : Follow (A) ① of the Assay.

② Test organism Use *Staphylococcus aureus* ATCC 6538 P as the test organism.

③ **Assay** Pipet an appropriate amount of the test stock solution of (A) ③, dilute with 0.1 mol/L phosphate buffer solution (pH 8.0) to contain 10.0 μg(potency) per mL, and use this solution as the test solution. Separately, pipet an appropriate amount of the standard stock solution of (A) ③ under the Assay, dilute with phosphate buffer solution (pH 8.0) to contain 6.4 μg(potency), 8.0 μg(potency), 10.0 μg(potency), 12.5 μg(potency) and 15.6 μg(potency) per mL, and use these solutions as the standard solutions, and use a solution containing 10.0 μg(potency) as the standard intermediate diluent. Perform the test as directed under the Microbial Assays for Antibiotics (B) ④ with the test solution, the standard solution and the standard intermediate diluent.

Packaging and storage Preserve in tight containers.

Cetirizine Dihydrochloride
세티리진염산염



and enantiomer

$C_{21}H_{25}N_2O_3Cl \cdot 2HCl$: 461.81

2-[2-{4-[(4-Chlorophenyl)phenylmethyl]piperazin-1-yl}ethoxy]acetic acid dihydrochloride [*83881-52-1*]

Cetirizine Dihydrochloride contains NLT 99.0% and NMT 100.5% of cetirizine dihydrochloride ($C_{21}H_{25}N_2O_3Cl \cdot 2HCl$), calculated on an anhydrous basis.

Description Cetirizine Dihydrochloride occurs as a white powder.

It is freely soluble in water and practically insoluble in dichloromethane or in acetone.

Identification (1) Weigh accurately 20.0 mg of Cetirizine Dihydrochloride and dissolve in 0.1 mol/L hydrochloric acid TS to make exactly 100 mL. Dilute 10.0 mL of this solution with 0.1 mol/L hydrochloric acid TS to make exactly 100 mL. Determine the absorption spectrum of this solution as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum at 231 nm and the specific absorbance at this wavelength is between 359 and 381.

(2) Determine the infrared spectra of Cetirizine Dihydrochloride and cetirizine dihydrochloride RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) Dissolve 10 mg of Cetirizine Dihydrochloride in water to make 5 mL and use this solution as the test solution. Separately dissolve 10 mg of cetirizine dihydrochloride RS in water to make 5 mL and use this solution as the standard solution (1). Also, dissolve 10 mg of chlorphenamine maleate RS in water to make 5 mL. To 1 mL of the solution, add 1 mL of the standard solution (1) and use the resulting solution as the standard solution (2). With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solutions (1) and (2) on the thin-layer chromatographic plate made of silica gel (mixed with a fluorescent indicator) for thin-layer chromatography. Next, develop the plate with a mixture of dichloromethane, methanol and ammonia water(28) (90 : 10 : 1) as the developing solvent to a distance of about 15 cm, and dry the plate in cool air. Examine the plate under ultraviolet light (main wavelength: 254 nm); the R_f values of the principal spots obtained from the test solution and the standard solution (1) are the same. However, this test is valid only when the two spots obtained from the standard solution (2) are clearly separated.

(4) An aqueous solution of Cetirizine Dihydrochloride (1 in 100) responds to the Qualitative Analysis for chloride.

pH Dissolve 1.0 g of Cetirizine Dihydrochloride in 20 mL of water; the pH of this solution is between 1.2 and 1.8.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Cetirizine Dihydrochloride in 20 mL of water; the solution is clear.

(2) ***Heavy metals***—Proceed with 2.0 g of Cetirizine Dihydrochloride according to Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Related substances*—**Weigh accurately 20.0 mg of Cetirizine Dihydrochloride, dissolve in the mobile phase to make 100.0 mL, and use this solution as the test solution. Separately, dissolve 5.0 mg of cetirizine dihydrochloride RS and 5.0 mg of cetirizine related substance I RS [(RS)-1-[(4-chlorophenyl)phenylmethyl]piperazine} in the mobile phase to make exactly 25 mL. To 1.0 mL of this solution, add the mobile phase to make exactly 100 mL and use this solution as the standard solution (1). To 2.0 mL of the test solution, add the mobile phase to make exactly 50 mL. To 5.0 mL of this solution, add the mobile phase to make exactly 100 mL and use this solution as the standard solution (2). Perform the test with 20 μL each of the test solution and the standard solutions (1) and (2) as directed under the Liquid Chromatography, and determine the peak area from each solution by the automatic integration method. The area of any peak other than the major peak obtained from the test solution is not larger than that obtained from the standard solution (2) (0.2%), and the sum of the peak areas other than the major peak area obtained from the test solution is not larger than 1.5 times the peak area obtained from the standard solution (2) (0.3%). However, exclude any peak having an area smaller than 0.1 times the peak area obtained from the standard solution (2).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 230 nm).

Column : A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of acetonitrile, water and dilute sulfuric acid (93 : 6.6 : 0.4).

Flow rate: 1.0 mL/min

System suitability

System performance: Proceed with 20 μL of the standard solution (1) according to the above conditions and adjust the sensitivity of the system so that the peak heights are about 50% of the full scale of the data collection device; the resolution between the peak of cetirizine and cetirizine related substance I is NLT 3 and the symmetry factor is NMT 2.0.

Loss on drying NMT 0.5% (1.0 g, 105 ºC, constant mass).

Residue on ignition NMT 0.2% (1.0 g).

Assay Weigh accurately about 0.1 g of Cetirizine Dihydrochloride, dissolve in a mixture of acetone and water (70: 30), and titrate with 0.1 mol/L sodium hydroxide VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS
= 15.394 mg of $C_{21}H_{25}N_2O_3Cl \cdot 2HCl$

Packaging and storage Preserve in light-resistant, well-closed containers.

Cetirizine Dihydrochloride Solution
세티리진염산염 액

Cetirizine Dihydrochloride Solution contains NLT 95.0% and NMT 105.0% of cetirizine dihydrochloride ($C_{21}H_{25}ClN_2O_3 \cdot 2HCl$: 461.81) of the labeled amount.

Method of preparation Prepare as directed under Liquids, with Cetirizine Dihydrochloride.

Identification The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

pH Between 4.0 and 6.5.

Assay Pipet a volume of Cetirizine Dihydrochloride Solution, equivalent to 10 mg of the labeled amount of cetirizine dihydrochloride ($C_{21}H_{25}ClN_2O_3 \cdot 2HCl$) and transfer it into a 100 mL-volumetric flask. Add 15 mL of water, sonicate for 10 minutes to dissolve, add 50% acetonitrile to make 100 mL, filter, and use this solution as the test solution. Separately, weigh accurately about 10 mg of cetirizine dihydrochloride RS, transfer it into a 100 mL-volumetric flask, then proceed in the same way as in the preparation of the test solution, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography, and calculate the peak areas, A_T and A_S, of cetirizine dihydrochloride, respectively, from each solution.

Amount (mg) of cetirizine dihydrochloride ($C_{21}H_{25}ClN_2O_3 \cdot 2HCl$)
= Amount (mg) of cetirizine dihydrochloride RS $\times \frac{A_T}{A_S}$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 230 nm).

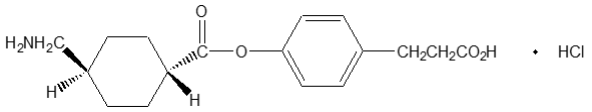
Column: A stainless steel column about 4 mm in internal diameter and about 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 - 10 μm in particle diameter).

Mobile phase: A mixture of phosphate buffer (pH 7.0) and acetonitrile (80 : 60).

Flow rate: 1.0 mL/min

Packaging and storage Preserve in tight containers.

Cetraxate Hydrochloride
세트락세이트염산염



$C_{17}H_{23}NO_4 \cdot HCl$: 341.83
3-[4-[4-(Aminomethyl)cyclohexanecarbonyl]oxyphenyl] propanoic acid hydrochloride [*27724-96-5*]

Cetraxate Hydrochloride, when dried, contains NLT 98.5% and NMT 101.0% of cetraxate hydrochloride ($C_{17}H_{23}NO_4 \cdot HCl$).

Description Cetraxate Hydrochloride occurs as white crystals or a crystalline powder.
It is soluble in methanol, sparingly soluble in water or ethanol(95), and practically insoluble in ether.

Melting point—About 236 ℃ (with decomposition)

Identification (1) Determine the absorption spectra of solutions of Cetraxate Hydrochloride and cetraxate hydrochloride RS in methanol (1 in 2500) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Dissolve 0.5 g of Cetraxate Hydrochloride in 5 mL of a mixture of water and 2-propanol (1 : 1) by warming, cool to NMT 25 ℃, and filter the extracted crystals. Determine the infrared spectra of the crystals, dried in vacuum for 4 hours and then dried again at 105 ℃ for 1 hour, and cetraxate hydrochloride RS, previously dried, as directed in the potassium chloride disk method under the Mid-infrared Spectroscopy; both exhibit similar intensities of absorption at the same wavenumbers.

(3) An aqueous solution of Cetraxate Hydrochloride (1 in 100) responds to the Qualitative Analysis (2) for chloride.

Purity (1) ***Heavy metals***—Proceed with 2.0 g of Cetraxate Hydrochloride as directed under Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Arsenic***—Proceed with 1.0 g of Cetraxate Hydrochloride as directed under Method 3 and perform the test. Use a solution of magnesium nitrate in ethanol(95) (1 in 5) (NMT 2 ppm).

(3) ***Cis isomer***—Dissolve 0.10 g of Cetraxate Hydrochloride in 10 mL of water and use this solution as the test solution. Pipet 5 mL of this solution and add water to make exactly 100 mL. Pipet 2 mL of this solution, add water to make exactly 50 mL, and use this solution as the standard solution. With 10 μL each of the test solution and the standard solution, perform the test as directed under the Liquid Chromatography according to the following conditions and determine the peak areas from the respective solutions according to the automatic integration method; the peak area whose retention time is 1.3 to 1.6 times the retention time of cetraxate in the test solution is not greater than the peak area of cetraxate in the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

Column: A stainless steel column about 6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 ℃.

Mobile phase: To a mixture of water, methanol and 0.5 mol/L ammonium acetate TS (15 : 10 : 4), add acetic acid to adjust the pH to 6.0.

Flow rate: Adjust the flow rate so that the retention time of cetraxate is about 10 minutes.

System suitability

Detection sensitivity: Adjust the sensitivity so that the peak height of cetraxate obtained from 10 μL of the standard solution is NLT 20 mm.

System performance: Dissolve 20 mg of Cetraxate Hydrochloride and 10 mg of phenol in 100 mL of water. Take 2 mL of this solution and add water to make 20 mL. Proceed with 10 μL of this solution according to the above conditions; cetraxate and phenol are eluted in this order with the resolution between these peaks being NLT 5.

(4) ***3-(p-hydroxyphenyl)propionic acid***—To 0.10 g of Cetraxate Hydrochloride, add exactly 2 mL of the internal standard solution, add methanol to make 10 mL, and use this solution as the test solution. Separately, to 25 mg of 3-(*p*-hydroxyphenyl)propionic acid, and dissolve in methanol to make exactly 100 mL. Pipet 2 mL of this solution, add exactly 2 mL of the internal standard solution, add methanol to make exactly 10 mL, and use this solution as the standard solution. Perform the test with 10 μL each of these solutions as directed under the Liquid Chromatography according to the following conditions and calculate the peak area ratios, Q_T and Q_S, of 3-(*p*-hydroxyphenyl)propionic acid to internal standard, respectively; Q_T is not greater than Q_S.

Internal standard solution—A solution of caffeine in methanol (1 in 4000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 230 nm).

Column: A stainless steel column about 6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 ℃.

Mobile phase: To a mixture of water, methanol and 0.5 mol/L ammonium acetate TS (15 : 5 : 2), add acetic acid to adjust the pH to 5.5.

Flow rate: Adjust the flow rate so that the retention time of 3-(*p*-hydroxyphenyl)propionic acid is about 7 minutes.

System suitability

System performance: Proceed with 10 μL of the standard solution according to the above conditions; 3-(*p*-hydroxyphenyl)propionic acid and internal standard are eluted in this order with resolution between these peaks being NLT 5.

Detection sensitivity: Adjust the sensitivity so that the peak height of 3-(*p*-hydroxyphenyl)propionic acid from 10 μL of the standard solution is NLT 30 mm.

(5) ***Related substances*—**Dissolve 0.10 g of Cetraxate Hydrochloride in 10 mL of methanol and use this solution as the test solution. Pipet 1 mL of this solution, add methanol to make exactly 100 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of chloroform, methanol and acetic acid(100) (20 : 4 : 3) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Spray evenly ninhydrin TS on the plate and heat the plate at 90 ℃ for 10 minutes; the spots other than the principal spot obtained from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 0.5% (0.5 g, 105 ℃, 3 hours).

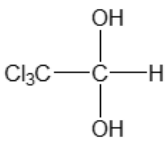
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.5 g of Cetraxate Hydrochloride, previously dried, dissolve in 100 mL of water, and add dilute sodium hydroxide TS to adjust the pH to between 7.0 and 7.5. To this solution, add 10 mL of formaldehyde solution, stir for about 5 minutes to mix, and titrate with 0.1 mol/L sodium hydroxide VS over about 20 minutes (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS
= 34.183 mg of $C_{17}H_{23}NO_4 \cdot HCl$

Packaging and storage Preserve in tight containers.

Chloral Hydrate
포수클로랄



$C_2H_3Cl_3O_2$: 165.40

2,2,2-Trichloroethane-1,1-diol [*25655-41-8*]

Chloral Hydrate contains NLT 99.5% and NMT 101.0% of chloral hydrate ($C_2H_3Cl_3O_2$).

Description Chloral Hydrate occurs as colorless crystals. It has an irritating odor and an irritating and slightly bitter taste.
It is very soluble in water and freely soluble in ethanol(95) or ether.
It slowly evaporates in the air.

Identification (1) Dissolve 0.2 g of Chloral Hydrate in 2 mL of water, and add 2 mL of sodium hydroxide TS; the resulting solution is turbid, and two clear layers form by warming.

(2) To 0.2 g of Chloral Hydrate, add 3 drops of aniline and 3 drops of sodium hydroxide TS, and heat; an unpleasant odor of phenyl isocyanide (toxic) is perceptible.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Chloral Hydrate in 2 mL of water; the resulting solution is clear and colorless.

(2) ***Acid***—Dissolve 0.20 g of Chloral Hydrate in 2 mL of water, and add 1 drop of methyl orange TS; the resulting solution exhibits a yellow color.

(3) ***Chloride*—**Perform the test with 1.0 g of Chloral Hydrate. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid TS (NMT 0.011%).

(4) ***Chloral alcoholate*—**Weigh 1.0 g of Chloral Hydrate, add 10 mL of sodium hydroxide TS, warm, and filter the clear supernatant. Add dropwise iodine TS until the filtrate becomes yellow, and allow to stand for 1 hour; a yellow precipitate does not form.

(5) ***Benzene*—**To the solution of (1), add 3 mL of water, and warm; it has no benzene odor.

(6) ***Heavy metals*—**Dissolve 3.0 g of Chloral Hydrate in freshly boiled and cooled water to make 30 mL. Pipet 10.0 mL of this solution, and add water to make 20 mL. Use this solution as the test solution and perform the test. Separately, proceed with 6.0 mL of the lead standard solution in the same manner as the test solution. To 10 mL of this solution, add 2 mL of the test solution, and use this solution as a control solution. Separately, add 2 mL of the test solution to 10 mL of water, and use this solution as the blank test solution. To 12 mL each of the test solution, the control solution and the blank test solution, add 2 mL of acetate buffer solution, pH 3.5, mix, add 1.2 mL of thioacetamide TS, and immediately mix. Allow to stand for 2 minutes; the color of the test solution is not more intense than that of the control solution (NMT 20 ppm).

Residue on ignition NMT 0.1% (1 g).

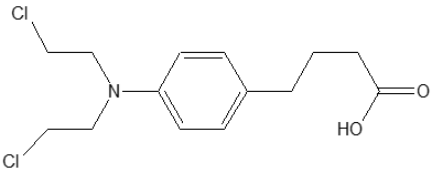
Assay Weigh accurately about 4 g of Chloral Hydrate in a stoppered flask, add 10 mL of water and 40 mL of 1

mol/L sodium hydroxide, allow to stand for exactly 2 minutes, and immediately titrate excess sodium hydroxide solution with 0.5 mol/L sulfuric acid VS (indicator: 2 drops of phenolphthalein TS). Perform a blank test in the same manner.

Each mL of 1 mol/L sodium hydroxide VS
= 165.40 mg of $C_2H_3Cl_3O_2$

Packaging and storage Preserve in tight containers.

Chlorambucil
클로람부실



$C_{14}H_{19}Cl_2NO_2$: 304.21
4-[4-[*bis*(2-Chloroethyl)amino]phenyl]butanoic acid
[*305-03-3*]

Chlorambucil contains NLT 98.0% and NMT 101.0% of chlorambucil ($C_{14}H_{19}NaO_2$: 2), calculated on the anhydrous basis.

Description Chlorambucil occurs as a milk white grain powder.
It is freely soluble in acetone and practically insoluble in water.
It dissolves in dilute sodium hydroxide TS.

Identification (1) Dissolve 50 mg of Chlorambucil in 5 mL of acetone and add water to make 10 mL. Add 1 drop of 1 mol/L sulfuric acid and then add 4 drops of silver nitrate TS; the solution does not become turbid immediately. Warm this solution on a steam bath; the resulting solution forms white turbidity.

(2) Determine the infrared spectra of solutions of Chlorambucil and Chlorambucil RS in carbon disulfide (1 to 125) as directed under the solution method under the Mid-infrared Spectroscopy, using solid cells with 1 mm in thickness; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Melting point Between 65 and 69 ºC.

Water NMT 0.5% (1 g, volumetric titration, direct titration).

Assay Weigh accurately about 0.2 g of Chlorambucil, dissolve in 10 mL of acetone, add 10 mL of water, and titrate with 0.1 mol/L sodium hydroxide VS (indicator: 2 drops of phenolphthalein TS).

Each mL of 0.1 mol/L sodium hydroxide VS
= 30.421 mg of $C_{14}H_{19}Cl_2NO_2$

Packaging and storage Preserve in light-resistant, tight containers.

Chlorambucil Tablets
클로람부실 정

Chlorambucil Tablets contain NLT 85.0% and NMT 110.0% of the labeled amount of chlorambucil ($C_{14}H_{19}Cl_2NO_2$: 304.22).

Method of preparation Prepare as directed under Tablets, with Chlorambucil.

Identification Weigh an amount of Chlorambucil Tablets, previously powdered, equivalent to 16 mg of chlorambucil, add 20 mL of carbon disulfide, and shake to mix. Filter this solution, evaporate the filtrate to dryness, dissolve the residue in 2 mL of carbon disulfide, and perform the test as directed under the Identification (1) of Chlorambucil.

Disintegration Meets the requirements. However, in the case of coated tablets, precipitate it in water at room temperature for 5 minutes in advance, place it in an auxiliary container, and perform the test using Solution 1; disintegrate within 30 minutes. If it does not disintegrate, take out the auxiliary container, and continue the test at 37 ± 2 ℃ using Solution 2 as the test solution; disintegrate within a total of 45 minutes. If 1 or 2 tablets do not completely disintegrate, perform the test with 12 new tablets; NMT 2 tablets do not disintegrate out of a total of 18 tablets.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 Chlorambucil Tablets, and powder. Weigh accurately an amount, equivalent to about 2 mg of chlorambucil ($C_{14}H_{19}Cl_2NO_2$), add 50 mL of ethanol(95), and shake gently. Add 5.0 mL of 0.1 mol/L hydrochloric acid and 2.0 mL of internal standard solution, sonicate for 5 minutes, and shake to mix. Add ethanol(95) to make exactly 100 mL, filter, and use the filtrate as the test solution. Separately, weigh accurately about 20 mg of chlorambucil RS, previously dried in a silica gel desiccator for 24 hours, and dissolve in ethanol(95) to make exactly 20 mL. Pipet 2.0 mL of this solution, add about 50 mL of ethanol(95), shake gently, and add 5.0 mL of 0.1 mol/L hydrochloric acid and 2.0 mL of internal standard solution. Add ethanol(95) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the

peak area ratios, Q_T and Q_S of chlorambucil to the peak area of the internal standard, respectively.

$$\text{Amount (mg) of chlorambucil } (C_{14}H_{19}Cl_2NO_2) = \text{Amount (mg) of chlorambucil RS} \times \frac{Q_T}{Q_S} \times \frac{1}{10}$$

Internal standard solution—A solution ethanol of propyl p-hydroxybenzoate in ethanol (1 in 2500).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 2 mm in internal diameter and 25 cm to 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm to 10 μm in particle diameter).

Mobile phase: Add 1.0 mL of acetic acid(100) to 500 mL of ethanol(95), and add water to make 1000 mL.

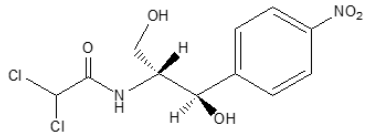
System suitability

System performance: Proceed with 10 μL of the standard solution according to the above conditions; chlorambucil and the internal standard are with the resolution being NLT 2.0.

System reproducibility: Repeat the test 6 times with 10 μL each of the standard solution under the above operating conditions; the relative standard deviation of the ratios of the peak area of chlorambucil to that of the internal standard is NMT 2.0%.

Packaging and storage Preserve in well-closed containers (preserve in light-resistant, well-closed containers for uncoated tablets.).

Chloramphenicol
클로람페니콜



$C_{11}H_{12}Cl_2N_2O_5$: 323.13

2,2-Dichloro-*N*-[(1*R*,2*R*)-1,3-dihydroxy-1-(4-nitrophenyl)propan-2-yl]acetamide [*56-75-7*]

Chloramphenicol contains NLT 980 μg and NMT 1020 μg (potency) of chloramphenicol ($C_{11}H_{12}Cl_2N_2O_5$) per mg, calculated on the dried basis.

Description Chloramphenicol occurs as white to yellowish white crystals or a crystalline powder.
It is freely soluble in methanol or ethanol(99.5) and slightly soluble in water.

Identification (1) Using the test solution and the standard solution obtained from Chloramphenicol and chloramphenicol RS under the Assay, determine the absorption spectrum according to the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Chloramphenicol and chloramphenicol RS according to the potassium bromide disk method as directed under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Crystallinity Meets the requirements.

Optical rotation $[\alpha]_D^{20}$: Between +18.5° and +21.5° (1.25 g, ethanol(99.5), 25 mL, 100 mm).

Melting point Between 150 and 155 ℃.

pH The pH of the saturated solution of Chloramphenicol is between 4.5 and 7.5.

Absorbance $E_{1cm}^{1\%}$ (278 nm): Between 289 and 307 (20 mg, water,1000 mL).

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Chloramphenicol according to Method 2 and perform the test. Prepare the control solution with 2.5 mL of lead standard solution (NMT 25 ppm).

(2) ***Arsenic***—Prepare the test solution with 2.0 g of Chloramphenicol according to Method 4 and perform the test (NMT 1 ppm).

(3) ***Related substances***—Dissolve 0.10 g of Chloramphenicol in 10 mL of methanol, and use this solution as the test solution. Pipet 1 mL of this solution, dissolve in methanol to make exactly 100 mL, and use this solution as the standard solution (1). Pipet 10 mL of the standard solution (1), add methanol to make exactly 20 mL, and use this solution as the standard solution (2). With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 20 μL each of the test solution and standard solutions (1) and (2) on a thin-layer chromatographic plate made of silica gel for thin-layer chromatography (with a fluorescent indicator), develop the plate with a mixture of chloroform, methanol and acetic acid(100) (79 : 14 : 7) to a distance of about 15 cm, and air-dry the plate. Examine the plate under ultraviolet rays (main wavelength: 254 nm); the spots other than the spots of the starting point and the principal spot from the test solution are not more intense than the spots from the standard solution (1). The sum of spots other than the spots of the starting point and the principal spot from the test solution is NMT 2.0%.

Loss on drying NMT 0.5% (1 g, 105 ℃, 3 hours).

Residue on ignition NMT 0.1% (1 g).

Sterility It meets the requirements when used in the manufacturing of sterile preparations. However, it is excluded in cases where there is a terminal sterilization process in the manufacturing of sterile preparations.

Bacterial endotoxins It meets the requirements when used in the manufacturing of sterile preparations. Chloramphenicol is less than 0.2 EU per mg (potency) of chloramphenicol.

Assay Weigh accurately about 50 mg (potency) each of Chloramphenicol and chloramphenicol RS, dissolve in the mobile phase to make exactly 50 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas A_T and A_S of chloramphenicol.

Potency (μg) of chloramphenicol ($C_{11}H_{12}Cl_2N_2O_5$)
= Potency (μg) of chloramphenicol RS × $\frac{A_T}{A_S}$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 280 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 250 mm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of water, methanol and acetic acid(31) (550 : 450 : 1).

Flow rate: 1.5 mL/min.

System suitability

System performance: Proceed with 10 μL of the standard solution under the above operating conditions; the number of theoretical plates and symmetry factor of the peak of chloramphenicol are NLT 1800 and NMT 2.0, respectively.

System repeatability: Repeat the test 6 times according to the above conditions with 10 μL of the standard solution; the relative standard deviation of the peak area of chloramphenicol is NMT 1.0%

Packaging and storage Preserve in tight containers.

Chloramphenicol Ophthalmic Solution
클로람페니콜 점안액

Chloramphenicol Ophthalmic Solution contains NLT 90.0% and NMT 120.0% of the labeled amount of chloramphenicol ($C_{11}H_{12}Cl_2N_2O_5$: 323.13).

Method of preparation Prepare as directed under Ophthalmic Solutions, with Chloramphenicol.

Identification (1) Weigh an amount of Chloramphenicol Ophthalmic Solution, equivalent to 10 mg of chloramphenicol, dissolve in 1 mL of 50% ethanol(95), add 3 mL of calcium chloride solution (1 in 100) and 50 mg of zinc powder, and warm on a steam bath for 10 minutes. Pour the clear supernatant into a test tube, add 0.1 g of anhydrous sodium acetate and 2 drops of benzoyl chloride, shake for 1 minute, and add 10 drops of iron(III) chloride TS (add dilute hydrochloric acid if the liquid is not clear); the solution exhibits a reddish purple to violet color. Perform the test as above without adding zinc powder; the resulting solution is colorless.

(2) The retention times of the major peak obtained from the test solution and the standard solution in the Assay are the same.

pH Between 3.0 and 6.0. However, the pH is 7.0 to 7.5 with the buffer solution.

Sterility Meets the requirements.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in ophthalmic solutions Meets the requirements.

Assay Proceed as directed under the Assay under Chloramphenicol. However, weigh accurately an amount of Chloramphenicol Ophthalmic Solution equivalent to about 40 mg (potency) according to the labeled potency to make exactly 100 mL with methanol. Pipet 5 mL of this solution to make 25 mL with the mobile phase, filter it through a membrane filter with a pore size of NMT 0.5 μm, and use the filtrate as the test solution. Weigh accurately an amount of chloramphenicol RS equivalent to about 40 mg (potency), make exactly 100 mL with methanol, and pipet 5 mL of this solution to make 25 mL with the mobile phase. Filter it through a membrane filter with a pore size of NMT 0.5 μm, and use the filtrate as the standard solution.

Packaging and storage Preserve in tight containers.

Chloramphenicol, Dexamethasone Disodium Phosphate and Tetrahydrozoline Hydrochloride Ophthalmic Solution
클로람페니콜·덱사메타손이나트륨인산염·테트라히드로졸린염산염 점안액

Chloramphenicol, Dexamethasone Disodium Phosphate and Tetrahydrozoline Hydrochloride Ophthalmic Solution contains NLT 90.0% and NMT 120.0% of the labeled amount of chloramphenicol ($C_{11}H_{12}C_{l2}N_2O_5$: 323.13); NLT 90.0% and NMT 110.0% of the labeled amount of dexamethasone disodium phosphate ($C_{22}H_{28}FNa_2O_8P$: 516.41) and tetrahydrozoline hydrochloride ($C_{13}H_{16}N_2 \cdot HCl$: 236.74).

Method of preparation Prepare as directed under Oph-

thalmic Solutions, with Chloramphenicol, Dexamethasone Disodium Phosphate and Tetrahydrozoline Hydrochloride.

Identification (1) ***Chloramphenicol***—The retention time of the peak obtained from the test solution and the standard solution from the Assay and the ultraviolet absorption spectrum between 200 and 400 nm are the same.

(2) ***Dexamethasone disodium phosphate***—The retention time of the peak obtained from the test solution and the standard solution from the Assay and the ultraviolet absorption spectrum between 200 and 400 nm are the same.

(3) ***Tetrahydrozoline hydrochloride***—Take an amount of Chloramphenicol, Dexamethasone Disodium Phosphate and Tetrahydrozoline Hydrochloride Ophthalmic Solution, equivalent to 10 mg of tetrahydrozoline hydrochloride, and add diluted hydrochloric acid (1 in 100) to make 100 mL. Take 1 mL of this solution, add diluted hydrochloric acid (1 in 100) to make 100 mL, and use this solution as the test solution. Take 1 mL of this solution, add diluted hydrochloric acid (1 in 100) to make 100 mL, and use this solution as the test solution. Separately, weigh about 10 mg of tetrahydrozoline hydrochloride RS, proceed in the same manner as in the preparation of the test solution with tetrahydrozoline hydrochloride RS, and use this solution as the standard solution. Determine the absorption spectra of the test solution and the standard solution as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelength.

pH Between 5.5 and 7.5.

Sterility Meets the requirements.

Particulate contamination: Visible particles Meets the requirements.

Particulate matter in Ophthalmic solutions Meets the requirements.

Assay Pipet an amount of Chloramphenicol, Dexamethasone Disodium Phosphate and Tetrahydrozoline Hydrochloride Ophthalmic Solution, equivalent to about 100 mg of chloramphenicol ($C_{11}H_{12}Cl_2N_2O_5$), [about 20 mg of dexamethasone disodium phosphate ($C_{22}H_{28}FNa_2O_8P$) and about 5 mg of tetrahydrozoline hydrochloride ($C_{13}H_{16}N_2 \cdot HCl$)], according to the labeled amount, and add methanol to make 10 mL. Sonicate for about 30 minutes, filter through a membrane filter with a pore size of 0.45 μm, and use the filtrate as the test solution. Separately, weigh accurately about 100 mg of chloramphenicol RS, about 20 mg of dexamethasone disodium phosphate RS and about 5 mg of tetrahydrozoline hydrochloride RS, add 80% methanol to make 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas of chloramphenicol, dexamethasone disodium phosphate and tetrahydrozoline hydrochloride, A_{T1}, A_{T2}, A_{T3}, A_{S1}, A_{S2} and A_{S3}.

$$\text{Amount (mg) of chloramphenicol } (C_{11}H_{12}Cl_2N_2O_5) = \text{Amount (mg) of chloramphenicol RS} \times \frac{A_{T1}}{A_{S1}}$$

$$\text{Amount (mg) of dexamethasone disodium phosphate } (C_{22}H_{28}FNa_2O_8P) = \text{Amount (mg) of dexamethasone disodium phosphate RS} \times \frac{A_{T2}}{A_{S2}}$$

$$\text{Amount (mg) of tetrahydrozoline hydrochloride } (C_{13}H_{16}N_2 \cdot HCl) = \text{Amount (mg) of tetrahydrozoline hydrochloride RS} \times \frac{A_{T3}}{A_{S3}}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 230 nm). However, proceed with a photodiode array detector (200 to 400 nm) for the Identification.

Column: A stainless steel column about 4.6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 30 °C.

Mobile phase: Use mobile phases A and B to control a stepwise or gradient elution-wise as follows.

Mobile phase A: Dissolve 2.72 g of potassium dihydrogen phosphate in water to make 1000 mL, and add phosphoric acid to adjust the pH to 3. Add 100 mL of methanol to 900 mL of this solution.

Mobile phase B: Dissolve 2.72 g of potassium dihydrogen phosphate in water to make 1000 mL, and add phosphoric acid to adjust the pH to 3. Add 900 mL of methanol to 100 mL of this solution.

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 - 2	80	20
2 - 15	80 → 10	20 → 90
15 - 20	10	90
20 - 30	80	20

Flow rate: 1.0 mL/min

System suitability

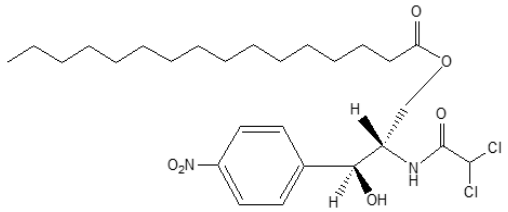
System performance: Proceed with 10 μL of the standard solution according to the above conditions; dexamethasone disodium, chloramphenicol, phosphate and tetrahydrozoline hydrochloride are eluted in this order with the resolution being NLT 11.0.

System repeatability: Repeat the test 6 times with

10 μL of the standard solution according to the above conditions; the relative standard deviation of the peak areas of chloramphenicol, dexamethasone disodium phosphate and tetrahydrozoline hydrochloride is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Chloramphenicol Palmitate
클로람페니콜팔미테이트



$C_{27}H_{42}Cl_2N_2O_6$: 561.54

[(2*R*,3*R*)-2-[(2,2-Dichloroacetyl)amino]-3-hydroxy-3-(4-nitrophenyl)propyl]hexadecanoate [*530-43-8*]

Chloramphenicol Palmitate contains NLT 558 μg and NMT 587 μg (potency) of Chloramphenicol ($C_{11}H_{12}Cl_2N_2O_5$ 323.13) per mg, calculated on the dried basis.

Description Chloramphenicol Palmitate occurs as a white to grayish white crystalline powder.
It is freely soluble in acetone, sparingly soluble in methanol or ethanol(99.5) and practically insoluble in water.

Identification (1) Determine the absorption spectra of solutions of Chloramphenicol Palmitate and chloramphenicol palmitate RS in ethanol(99.5) (1 in 33000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Dissolve 5 mg of Chloramphenicol Palmitate and chloramphenicol palmitate RS in 1 mL of acetone and use these solutions as the test solution and the standard solution, respectively. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography (with a fluorescent indicator). Develop the plate with a mixture of acetone and cyclohexane (1: 1) to a distance of about 10 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the R_f value of the principal spot obtained from the test solution and the spots from the standard solution are the same.

Crystallinity Meets the requirements.

Optical rotation $[\alpha]_D^{25}$: Between +21° and +25° [1 g, calculated on the dried basis, ethanol(99.5), 20 mL, 100 mm].

Melting point Between 91 and 96 ℃.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Chloramphenicol Palmitate according to Method 4 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Arsenic***—Proceed with 1.0 g of Chloramphenicol Palmitate according to Method 3 and perform the test (NMT 2 ppm).

(3) ***Related substances***—Weigh accurately 50 mg of Chloramphenicol Palmitate, dissolve in 50 mL of methanol, and use this solution as the test solution. Pipet 1 mL of this solution, add methanol to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under Liquid Chromatography according to the following conditions, and determine each peak area of the respective solution by the automatic integration method; the sum of peak areas other than the peak of chloramphenicol palmitate from the test solution is not larger than 3.5 times the peak area of chloramphenicol palmitate from the standard solution. The peak areas of chloramphenicol and chloramphenicol palmitate, having a relative retention time of about 0.5 and about 5.0 with respect to chloramphenicol palmitate, are calculated by multiplying the area obtained by the automatic integration method by the sensitivity coefficients of 0.5 and 1.4, respectively.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 270 nm).

Column: A stainless steel column about 6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 20 °C.

Mobile phase: Methanol

Flow rate: Adjust the flow rate so that the retention time of chloramphenicol palmitate is about 5 minutes.

Time span of measurement: About 6 times of the retention time of chloramphenicol palmitate.

System suitability

Test for required detectability: Dissolve 50 mg of Chloramphenicol Palmitate in methanol to make 50 mL. Pipet 1 mL of this solution, add methanol to make exactly 100 mL, and use this solution as the system suitability solution. Pipet 5 mL of the system suitability solution and add methanol to make exactly 50 mL. Confirm that the peak area of chloramphenicol palmitate obtained from 20 μL of this solution is equivalent to 7 to 13% of that from the system suitability solution.

System performance: Proceed with 20 μL of the system suitability solution under the above operating conditions; the number of theoretical plates for the peak of chloramphenicol palmitate is NLT 5000.

System reproducibility: Repeat the test 6 times with 20 μL each of the system suitability solutions under the above conditions; the relative standard deviation of the peak area of chloramphenicol palmitate is NMT 1.0%.

(4) ***Free chloramphenicol***—Weigh accurately about 1.0 g of Chloramphenicol Palmitate, and dissolve in xylene by heating to make exactly 80 mL. After cooling, extract with 15 mL volumes of water three times and discard the xylene. To the extract, add water to make exactly 50 mL. Add exactly 10 mL of toluene to this solution, mix, and extract the water layer. Perform the test with this solution as directed under the Ultraviolet-visible Spectroscopy; the absorbance, *A*, at a wavelength of 278 nm is NMT 0.268. Perform a blank test in the same way and make necessary corrections(NMT 450 ppm).

$$\text{Free chloramphenicol (ppm)} = A \times \frac{10000}{5.96}$$

Loss on drying NMT 1.0% (1 g, NMT 0.67 kPa, 60 ℃, 3 hours).

Assay Weigh accurately about 37 mg (potency) each of Chloramphenicol Palmitate and chloramphenicol palmitate RS, dissolve each in 40 mL of methanol and 1 mL of acetic acid(100), and add methanol to make exactly 50 mL. Pipet 10 mL of this solution, add the mobile phase to make exactly 25 mL, and use them as the test solution and the standard solution, respectively. Take exactly 10 μL each of the test solution and the standard solution, perform the test as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas A_T and A_S of chloramphenicol palmitate for each solution.

$$\text{Potency (μg) of chloramphenicol } (C_{11}H_{12}Cl_2N_2O_5) = \text{Potency (μg) of chloramphenicol RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 280 nm).

Column: A stainless steel column about 3.9 mm in internal diameter and about 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: A mixture of methanol, water and acetic acid(100) (172: 27 : 1).

Flow rate: Adjust the flow rate so that the retention time of chloramphenicol palmitate is about 7 minutes.

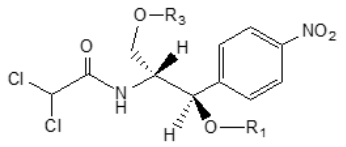
System suitability

System performance: Proceed with 10 μL of the standard solution under the above operating conditions; the number of theoretical plates for the peak of chloramphenicol palmitate is NLT 2400.

System repeatability: Repeat the test 6 times according to the above conditions with 10 μL of the standard solution each time; the relative standard deviation of the peak area of chloramphenicol palmitate is NMT 1.0%

Packaging and storage Preserve in light-resistant, tight containers.

Chloramphenicol Sodium Succinate
클로람페니콜숙시네이트나트륨



$C_{15}H_{15}Cl_2N_2NaO_8$: 445.18

Sodium 4-[(2*R*,3*R*)-2-[(2,2-dichloroacetyl)amino]-3-hydroxy-3-(4-nitrophenyl)propoxy]-4-oxo-butanoate [*982-57-0*]

Chloramphenicol Sodium Succinate contains NLT 711 μg (potency) of chloramphenicol ($C_{11}H_{12}Cl_2N_2O_5$: 323.13) per mg, calculated on the anhydrous basis.

Description Chloramphenicol Sodium Succinate occurs as white to yellowish white crystals or a crystalline powder.

It is very soluble in water and freely soluble in methanol or ethanol(99.5).

It is hygroscopic.

Identification (1) Determine the absorption spectra of aqueous solutions of Chloramphenicol Sodium Succinate and chloramphenicol sodium succinate RS (1 in 50000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelength.

(2) Determine the infrared spectra of Chloramphenicol Sodium Succinate and chloramphenicol sodium succinate RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) This solution responds to the Qualitative Analysis (1) for sodium salt.

Optical rotation $[\alpha]_D^{20}$: Between +5 and +8° (1.25 g calculated on the anhydrous basis, 25 mL of water, 100 mm).

pH Dissolve 1.4 g of Chloramphenicol Sodium Succinate in 5 mL of water; the pH of this solution is between 6.0 and 7.0.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g

of Chloramphenicol Sodium Succinate in 10 mL of water; the resulting solution is clear, and colorless to yellow.

(2) ***Heavy metals***—Proceed with 1.0 g of Chloramphenicol Sodium Succinate according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Arsenic***—Proceed with 1.0 g of Chloramphenicol Sodium Succinate according to Method 1 and perform the test (NMT 2 ppm).

(4) ***Free chloramphenicol***—Weigh accurately about 33 mg of Chloramphenicol Sodium Succinate, dissolve in the mobile phase to make exactly 50 mL, filter through a filter with a pore size of not exceeding 0.5 μm, and use the filtrate as the test solution. Weigh accurately about 0.6 mg of chloramphenicol RS, dissolve in the mobile phase to make exactly 100 mL, filter through a filter with a pore size of not exceeding 0.5 μm, and use the filtrate as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, determine each peak area of the respective solution by the automatic integration method, and determine the peak areas, A_T and A_S, of chloramphenicol in each solution (NMT 2.0%).

$$\text{Content (\%) of free chloramphenicol } (C_{11}H_{12}Cl_2N_2O_5) = 5000 \times \frac{C}{W \times Q} \times \frac{A_T}{A_S}$$

C: Concentration (μg/mL) of chloramphenicol in the standard solution

Q: Amount (μg) of chloramphenicol in each mg of chloramphenicol sodium succinate in the test solution

W: Amount (mg) of sample taken

A_T: Peak area of chloramphenicol obtained from the test solution

As: Peak area of chloramphenicol obtained from the standard solution

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 275 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 10 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of 0.05 mol/L ammonium dihydrogen phosphate TS (pH adjusted to 2.5 ± 0.1 with 10% phosphoric acid) and methanol (60 : 40).

Flow rate: 1 mL/min

System suitability

Column performance: Proceed with the test solution under the above operating conditions; the resolution between the two major peaks, chloramphenicol-1-succinate and chloramphenicol-3-succinate, is NLT 2.0, and the number of theoretical plates and symmetry factor are NLT 1750 and NMT 1.2, respectively.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solutions according to the above operating conditions; the relative standard deviation of the peak areas of the two major peaks, chloramphenicol-1-succinate and chloramphenicol-3-succinate, is NMT 2.0%.

Sterility It meets the requirements when used in the manufacturing of sterile preparations. However, it is excluded in cases where there is a terminal sterilization process in the manufacturing of sterile preparations.

Bacterial endotoxins It is less than 0.2 EU per mg of chloramphenicol when used in the manufacturing of sterile preparations.

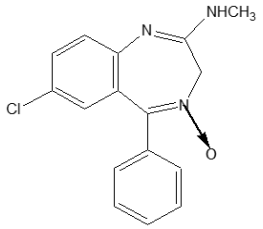
Water NMT 2.0% (1.0 g, volumetric titration, direct titration).

Assay Weigh accurately about 20 mg (potency) of Chloramphenicol Sodium Succinate, dissolve in water to make exactly 1000 mL, and use this solution as the test solution. Separately, weigh accurately about 20 mg (potency) of Chloramphenicol Succinate RS, and add exactly 50 mL of water to suspend. Add slowly 7 mL of 0.01 mol/L sodium hydroxide TS while stirring, and adjust the pH to 7.0. To this solution, add water to make exactly 1000 mL, and use this solution as the standard solution. Measure the absorbances of the test solution (A_T) and the standard solution (A_S) at the wavelength of 276 nm as directed under the Ultraviolet-visible Spectroscopy.

$$\text{Potency (μg) of chloramphenicol } (C_{11}H_{12}Cl_2N_2O_5) = \text{Potency (μg) of Chloramphenicol Sodium Succinate RS} \times \frac{A_T}{A_S}$$

Packaging and storage Preserve in hermetic containers.

Chlordiazepoxide
클로르디아제폭시드



$C_{16}H_{14}ClN_3O$: 299.76

7-Chloro-2-methylamino-5-phenyl-3*H*-1,4-benzodiazepine-4-oxide [*58-25-3*]

Chlordiazepoxide, when dried, contains NLT 98.5% and NMT 101.0% of chlordiazepoxide ($C_{16}H_{14}ClN_3O$).

Description Chlordiazepoxide occurs as white to pale yellow crystals or a crystalline powder.
It is freely soluble in acetic acid(100), sparingly soluble

in ethanol(95), very slightly soluble in ether and practically insoluble in water.
It is soluble in dilute hydrochloric acid.
It is gradually affected by light.

Melting point—About 240 °C (with decomposition).

Identification (1) Determine the absorption spectra of solutions of Chlordiazepoxide and chlordiazepoxide RS in 0.1 mol/L hydrochloric acid TS (1 in 200000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the absorption spectra of Chlordiazepoxide and chlordiazepoxide RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) Perform the test with Chlordiazepoxide as directed under the Flame Coloration (2); a green color is observed.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Chlordiazepoxide according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Related substances***—Perform the test using light-resistant containers. Weigh 0.20 g of Chlordiazepoxide, dissolve in exactly 10 mL of a mixture of ethanol and ammonia TS (97:3), and use this solution as the test solution. Pipet 1 mL of this solution, add a mixture of methanol and ammonia TS (97 : 3) to make exactly 200 mL, and use this solution as the standard solution (1). Separately, weigh 10 mg of 2-amino-5-chlorobenzophenone RS, add methanol to make exactly 200 mL, and use this solution as the standard solution (2). With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 25 μL of the test solution and 5 μL each of the standard solutions (1) and (2) on a plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate and ethanol(99.5) (19: 1) to a distance of about 12 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot from the test solution are not more intense than the spots from the standard solution (1). Spray evenly a solution of sodium nitrite in 1 mol/L hydrochloric acid TS (1 in 100) on the plate, allow to stand for 1 minute, and spray evenly oxalic acid N-(1-naphthyl)-N'-diethylethylenediamine and acetone TS on the plate: the spots from the test solution are not more intense than the spots from the standard solution (2).

Loss on drying NMT 0.5% (1 g, in vacuum, phosphorus pentoxide, 60 ℃, 4 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.6 g of Chlordiazepoxide, previously dried, dissolve in 50 mL of acetic acid, and titrate with 0.1 mol/L perchloric acid VS (indicator: 3 drops of methylosaniline chloride TS). However, the endpoint of the titration is when the color of the clear supernatant changes from purple through bluish purple to blue. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 29.976 mg of $C_{16}H_{14}ClN_3O$

Packaging and storage Preserve in light-resistant, tight containers.

Chlordiazepoxide Powder
클로르디아제폭시드 산

Chlordiazepoxide Powder contains NLT 93.0% and NMT 107.0% of the labeled amount of chlordiazepoxide ($C_{16}H_{14}ClN_3O$: 299.76).

Method of preparation Prepare as directed under Powders, with Chlordiazepoxide.

Identification (1) Weigh a portion of Chlordiazepoxide Powder, equivalent to 10 mg of chlordiazepoxide according to the labeled amount, add 100 mL of 0.1 mol/L hydrochloric acid TS, shake to mix, and filter. Add 0.1 mol/L hydrochloric acid TS to 5 mL of the filtrate to make 100 mL. Determine the absorption spectrum of this solution as directed under the Ultraviolet-visible Spectroscopy; it exhibits maxima between 244 nm and 248 nm and between 306 nm and 310, and a minimum between 288 nm and 292 nm.

(2) Weigh a portion of Chlordiazepoxide Powder, equivalent to 20 mg of chlordiazepoxide according to the labeled amount, add 10 mL of methanol, and shake for 5 minutes to mix. Then, filter by suction through a glass filter, and evaporate the filtrate with the aid of a current of nitrogen to dryness. Dry the residue in vacuum at 60 ºC for 1 hour and determine the absorption spectrum of the residue as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy: it exhibits absorption at the wave numbers of about 1625 cm^{-1}, 1465 cm^{-1} 1265 cm^{-1}, 850 cm^{-1} and 765 cm^{-1}.

Purity ***Related substances***—Perform the test using light-resistant containers. Weigh an amount, equivalent to 50 mg of chlordiazepoxide, according to the labeled amount of Chlordiazepoxide Powder, add exactly 5 mL of a mixture of methanol and ammonia TS (97 : 3), shake to mix, centrifuge, and use the clear supernatant as the test solution Separately, weigh 50.0 mg of chlordiazepoxide RS, dissolve in a mixture of methanol and ammonia TS (97 : 3) to make exactly 50 mL, and use this solution as the standard solution (1). Weigh 5.0 mg of 2-amino-5-chlorobenzophenone RS, dissolve in methanol

to make exactly 200 mL, and use this solution as the standard solution (2). With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 25 μL of the test solution and 10 μL each of the standard solutions (1) and (2) on a plate made of silica gel with fluorescent indicator for thin-layer chromatography. Proceed as directed under the Purity (2) under Chlordiazepoxide.

Particle size distribution estimation by analytical sieving Meets the requirements.

Uniformity of dosage units (divided) Meets the requirements.

Assay Perform the test using light-resistant containers. Weigh accurately an amount of Chlordiazepoxide Powder, equivalent to about 0.1 g of chlordiazepoxide ($C_{16}H_{14}ClN_3O$), transfer into a stoppered flask, and add exactly 10 mL of water to wet. Then add exactly 90 mL of methanol, stopper, shake vigorously for 15 minutes, and centrifuge. Pipet 10 mL of the clear supernatant, add exactly 5 mL of the internal standard solution, add methanol again to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 0.1 g of chlordiazepoxide RS (previously dried in a phosphorus pentoxide desiccator in vacuum at 60 ºC for 4 hours), and dissolve in exactly 10 mL of water and 90 mL of methanol. Pipet 10 mL of this solution, put exactly 5 mL of the internal standard solution, add methanol again to make 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the ratios of the peak area, Q_T and Q_S, of chlordiazepoxide to that of the internal standard for the test solution and the standard solution, respectably.

$$\text{Amount (mg) of chlordiazepoxide } (C_{16}H_{14}ClN_3O) = \text{Amount (mg) of chlordiazepoxide RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of isobutyl salicylate in methanol (1 in 20).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and 25 to 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: A mixture of methanol and 0.02 mol/L ammonium dihydrogenphosphate TS (7:3).

Flow rate: Adjust the flow rate so that the retention time of chlordiazepoxide is about 5 minutes.

System suitability

System performance: Proceed with 10 μL of the standard solution under the above conditions; Chlordiazepoxide and the internal standard are eluted in this order with the resolution being NLT 9.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution under the above operating conditions; the relative standard deviation of the peak area of chlordiazepoxide to that of the internal standard is NMT 1.0%.

Packaging and storage Preserve in light-resistant, tight containers.

Chlordiazepoxide Tablets
클로르디아제폭시드 정

Chlordiazepoxide Tablets contain NLT 93.0% and NMT 107.0% of chlordiazepoxide ($C_{16}H_{14}ClN_3O$: 299.76) of the labeled amount.

Method of preparation Prepare as directed under Tablets, with Chlordiazepoxide.

Identification (1) Weigh the amount, equivalent to 10 mg of chlordiazepoxide according to the labeled amount of Chlordiazepoxide Tablets, previously powdered, add 100 mL of 0.1 mol/L hydrochloric acid TS, shake to mix, and filter. Add 0.1 mol/L hydrochloric acid TS to 5 mL of the filtrate to make 100 mL. Determine the absorption spectrum of the solution as directed under the Ultraviolet-visible Spectroscopy; it exhibits maxima between 244 nm and 248 nm and between 306 nm and 310 nm; it exhibits a minimum between 288 nm and 292 nm.

(2) Weigh the amount, equivalent to 10 mg of chlordiazepoxide according to the labeled amount of Chlordiazepoxide Tablets, previously powdered, add 10 mL of ether to shake vigorously, and centrifuge. Pipet 5 mL of the clear supernatant, and evaporate ether by heating in the water bath.

(3) Determine the infrared spectra of the residues as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; it exhibits absorption at the wavenumbers of about 1625 cm^{-1}, 1465 cm^{-1}, 1265 cm^{-1}, 850 cm^{-1} and 765 cm^{-1}.

Purity ***Related substances***—Perform the test, using light-resistant containers. Weigh the amount, equivalent to 50 mg of chlordiazepoxide according to the labeled amount of Chlordiazepoxide Tablets, previously powdered, add exactly 5 mL of a mixture of methanol and ammonia TS (97 : 3), shake to mix, centrifuge, and use the clear supernatant as the test solution. Separately, weigh 50 mg of chlordiazepoxide RS, and dissolve in a mixture of methanol and ammonia RS (97 : 3) to make exactly 50 mL, and use this solution as the standard solution (1). Again, weigh 5.0 mg of 2-amino-5-

chlorobenzophenone RS, dissolve in methanol to make exactly 200 mL, and use this solution as the standard solution (2). With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 25 μL of the test solution and 10 μL each of the standard solution (1) and (2) on the plate made of silica gel with fluorescent indicator for thin-layer chromatography. Perform the test as directed under the Purity (2) of Chlordiazepoxide.

Dissolution Perform the test with 1 tablet of Chlordiazepoxide Tablets at 100 revolutions per minute according to Method 2 under the Dissolution, using 900 mL of Solution 2 as the dissolution solution. Take NLT 30 mL of the dissolved solution after 60 minutes from the start of the Dissolution, and filter through a membrane filter with a pore size of NMT 0.8 μm. Discard the first 10 mL of the filtrate, pipet V mL of the subsequent filtrate, and add Solution 2 for the Dissolution to obtain exactly V′ mL of a solution containing about 3.7 μg of chlordiazepoxide ($C_{16}H_{14}ClN_3O$) per mL according to the labeled amount, and use the clear supernatant as the test solution. Separately, weigh accurately about 12 mg of chlordiazepoxide for Assay (previously dried in a phosphorus pentoxide desiccator in vacuum at 60 ºC for 4 hours), and dissolve in Solution 2 for the Dissolution to make exactly 200 mL. Pipet 3 mL of this solution, add Solution 2 for the Dissolution to make exactly 50 mL, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at the wavelength of 260 nm as directed under the Ultraviolet-visible Spectroscopy.
Meets the requirements if the dissolution rate of Chlordiazepoxide Tablets in 60 minutes is NLT 70%.

Dissolution rate (%) with respect to the labeled amount of chlordiazepoxide ($C_{16}H_{14}ClN_3O$)

$$= W_S \times \frac{A_T}{A_S} \times \frac{V'}{V} \times \frac{1}{C} \times 10$$

W_S: Amount (mg) of chlordiazepoxide RS
C: Labeled amount (mg) of chlordiazepoxide ($C_{16}H_{14}ClN_3O$) in 1 tablet

Uniformity of dosage units Meets the requirements.

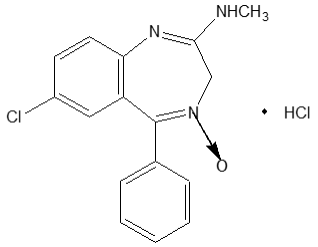
Assay Perform this procedure, using light-resistant containers. Take the number of tablets equivalent to 0.1 g of chlordiazepoxide ($C_{16}H_{14}ClN_3O$) of Chlordiazepoxide Tablets, add 10 mL of water, and shake well to disintegrate. Next, add 60 mL of methanol to shake well, add again methanol to make exactly 100 mL, and centrifuge. Take exactly 10 mL of the clear supernatant, add exactly 5 mL of the internal standard solution, add methanol to make 100 mL, and use this solution as the test solution. Separately, weigh accurately about 10 mg of chlordiazepoxide RS (previously dried in a phosphorus pentoxide desiccator in vacuum at 60 ºC for 4 hours), dissolve in 1 mL of water and methanol, add exactly 5 mL of the internal standard solution, add methanol to make 100 mL, and use this solution as the standard solution. Perform the test as directed under the Assay of Chlordiazepoxide Acid.

Amount (mg) of chlordiazepoxide ($C_{16}H_{14}ClN_3O$)
= Amount (mg) of chlordiazepoxide RS $\times \frac{Q_T}{Q_S} \times 10$

Internal standard solution—A solution of Isobutyl salicylate in methanol (1 in 20).

Packaging and storage Preserve in light-resistant, tight containers.

Chlordiazepoxide Hydrochloride
클로르디아제폭시드염산염



$C_{16}H_{14}ClN_3O \cdot HCl$: 336.22
7-Chloro-2-methylamino-5-phenyl-3*H*-1,4-benzodiazepine-4-oxide monohydrochloride [*438-41-5*]

Chlordiazepoxide Hydrochloride contains NLT 98.0% and NMT 102.0% of chlordiazepoxide hydrochloride ($C_{16}H_{14}ClN_3O \cdot HCl$), calculated on the dried basis.

Description Chlordiazepoxide Hydrochloride occurs as a white, crystalline powder and is odorless.
It is soluble in water or ethanol(95) and practically insoluble in hexane.
It is affected by light.

Identification (1) To about 20 mg of Chlordiazepoxide Hydrochloride, add 5 mL of hydrochloric acid and 10 mL of water, and heat to hydrolyze. After cooling, add 2 mL of sodium nitrite solution (1 in 1000), 1 mL of ammonium sulfamate solution (1 in 200) and 1 mL of N-1-naphthylethylenediamine dihydrochloride solution (1 in 1000); the solution exhibits a purple color.

(2) The retention times of the major peaks obtained from the test solution and the standard solution under the Assay are the same.

(3) Determine the infrared spectra of Chlordiazepoxide Hydrochloride and chlordiazepoxide hydrochloride RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Melting point Between 212 and 218 ℃ (with decompo-

sition).

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Chlordiazepoxide Hydrochloride according to Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Related substances***—Weigh about 50 mg of Chlordiazepoxide Hydrochloride, transfer into an Erlenmeyer flask, and add 2.5 mL of acetone, and shake to mix. Allow to stand until insoluble substances settle and use the clear supernatant as the test solution. Separately, weigh an appropriate amount 7-chloro-1,3-dihydro-5-phenyl-2H-1,4-benzodiazepin-2-one-4-oxide RS, dissolve in acetone to prepare a solution containing 100 μg per mL, and use this solution as the standard solution (1). Weigh an appropriate amount of 2-amino-5-chlorobenzophenone RS, dissolve in acetone to prepare a solution containing 10 μg per mL, and use this solution as the standard solution (2). With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 50 μL of the test solution and 10 μL each of the standard solutions (1) and (2) on a plate made of silica gel for the Thin-layer chromatography. Develop the plate in a developing chamber, previously not equilibrated with the developing solvent, with ethyl acetate to about three-fourths of the plate, and air-dry the plate. Spray evenly 1 mol/L sulfuric acid in the plate, dry the plate at 105 ºC for 15 minutes, and then spray evenly sodium nitrite (1 in 1000), ammonium sulfamate (1 in 200) and N-(1-naphthyl)ethylenediamine hydrochloric acid (1 in 1000) ; the spots from the test solution, equivalent to those from the standard solutions, are not greater or more intense than the spots from the standard solutions (1) and (2).

Loss on drying NMT 0.5% (1 g, in vacuum, phosphorus pentoxide, 60 ℃, 4 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Perform the procedure, protected from direct sunlight. Weigh about 0.1 g of Chlordiazepoxide Hydrochloride, add the mobile phase, sonicate for 5 minutes to dissolve, and make exactly 50 mL. Take exactly 10 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the test solution Separately, weigh accurately an amount of chlordiazepoxide hydrochloride RS, dissolve in the mobile phase to make a solution containing 2 mg per mL. Pipet 10 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 5 μL each of the test solution and the standard solution as directed under Liquid Chromatography according to the following conditions. Measure the peak areas, A_T and A_S, of Chlordiazepoxide Hydrochloride, for the test solution and the standard solution, respectively.

$$\text{Amount (mg) of Chlordiazepoxide Hydrochloride} = 0.5 \times C \times \frac{A_T}{A_S}$$

C: Concentration (μg/mL) of the standard solution

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 3.9 mm in internal diameter and 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (about 5 μm to 10 μm in particle diameter).

Mobile phase: A mixture of methanol and water (60:40).

Flow rate: 1 mL/min

System suitability

System performance: Proceed with 5 μL of the standard solution under the above operating conditions; the number of theoretical plates and symmetry factor are NLT 3600 and NMT 2.0, respectively.

System repeatability: Repeat the test 5 times with 5 μL each of the standard solution according to the above operating conditions; the relative standard deviation of the peak area for chlordiazepoxide hydrochloride is NMT 2.0%.

Packaging and storage Preserve in light-resistant, tight containers.

Chlordiazepoxide Hydrochloride Capsules
클로르디아제폭시드염산염 캡슐

Chlordiazepoxide Hydrochloride Capsules contain NLT 90.0% and NMT 110.0% of the labeled amount of chlordiazepoxide hydrochloride ($C_{16}H_{14}ClN_3$: 336.22).

Method of preparation Chlordiazepoxide Hydrochloride Capsules are prepared as directed under Tablets, with Chlordiazepoxide Hydrochloride.

Identification (1) Determine the absorption spectrum of the test solution obtained from the Assay as directed under the Ultraviolet-visible Spectroscopy; it exhibits maxima at the wavelengths of 245 ± 2 nm and 311 ± 2 nm, and absorbance ratio is 2.90 to 3.45.

(2) Take an appreciate amount of the contents of Chlordiazepoxide Hydrochloride Capsules, and perform the test as directed under the Identification (1) of Chlordiazepoxide Hydrochloride.

Purity ***Related substances***—Weigh an amount of Chlordiazepoxide Hydrochloride Capsules equivalent to 25 mg of Chlordiazepoxide Hydrochloride according to the labeled amount, and perform the test as directed under the Purity (2) of Chlordiazepoxide Hydrochloride. Use 15 μL of 7-chloro-1,3-dihydro-5-phenyl-2H-1,4-benzodiazepin-2-one-4-oxide in acetone (1 in 1000) and 10 μL

of 2-amino-5-chloro-benzophenone in acetone (1 in 20000).

Dissolution Take 1 capsule of Chlordiazepoxide Hydrochloride Capsules, proceed with 900 mL of water as the dissolution medium at 100 revolutions per minute according to Method 1, and perform the test. Take the dissolved solution after 30 minutes from the start of the test, and pass through a membrane filter with a pore size of NMT 0.8 μm. Pipet *V mL* of the filtrate, add water to prepare exactly *V′* mL of a solution having known concentration of about 6 μg of Chlordiazepoxide Hydrochloride per mL, and use this solution as the test solution. Separately, weigh accurately about 30 mg of chlordiazepoxide hydrochloride RS, and dissolve in water acid to make exactly 100 mL. Pipet 2 mL of the resulting solution, and add water to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at the absorbance maximum wavelength of about 245 nm, using water as the blank, as directed under Ultraviolet-visible Spectrophotometry. Remove the contents of 12 Chlordiazepoxide Hydrochloride Capsules as completely as possible with the aid of a current of air, determine the absorbance at the same dilution and in the same manner as for the Capsules and make any necessary modifications.

It meets the requirements if the dissolution rate of Chlordiazepoxide Hydrochloride Capsules for 30 minutes is NLT 85%.

Dissolution rate (%) of the labeled amount of Chlordiazepoxide Hydrochloride Capsules ($C_{16}H_{14}ClN_3O \cdot HCl$)

$$= W_S \times \frac{A_T}{A_S} \times \frac{V'}{V} \times \frac{90}{C} \times \frac{1}{5}$$

W_S: Amount (mg) of chlordiazepoxide hydrochloride RS

C: Labeled amount (mg) of chlordiazepoxide hydrochloride ($C_{16}H_{14}ClN_3O \cdot HCl$) per tablet

Uniformity of dosage units It meets the requirements when the procedure for content uniformity is performed according to following method.

Perform the test using a light-resistant container. Transfer the contents of 1 capsule to a 200-mL volumetric flask, dissolve in and dilute with water to volume, and filter, discarding the first 20 mL of the filtrate. Dilute a portion of the filtrate quantitatively and step-wise with 0.1N hydrochloric acid to obtain a solution having a concentration of about 6 μg of Chlordiazepoxide Hydrochloride per mL. Dissolve a suitable quantity of Chlordiszeposide Hydrocholride RS, accurately weighed, in 0.1 N hydrochloric acid to obtain a standard solution having a known concentration of about 6 μg per mL. Concomitantly determine the absorbances A_T and A_S of the test solution and the standard solution at the absorbance maximum wavelength of about 245nm, with a suitable spectrophotometer, using 0.1 mol/L hydrochloric acid as the blank.

Amount (mg) of chlordiazepoxide hydrochloride ($C_{16}H_{14}ClN_3O \cdot HCl$) in 1 capsule of Chlordiazepoxide Hydrochloride Capsules

$$= \frac{T}{D} \times C \times \frac{A_T}{A_S}$$

T: Labeled amount (mg) of chlordiazepoxide hydrochloride in 1 capsule

D: Concentration (μg/mL) of chlordiazepoxide hydrochloride in the test solution calculated according to the labeled amount

C: Concentration (μg/mL) of the standard solution

Assay Perform the test using light-resistant containers. Weigh accurately the contents of NLT about 20 Chlordiazepoxide Hydrochloride Capsules and determine the average weight per capsule. Mix the combined contents and transfer an accurately weighed portion of the powder, equivalent to about 60 mg of chlordiazepoxide hydrochloride (C16H14ClN3O·HCl), to a volumetric flask. Add methanol to make 100 mL, mix and filter and discard the first 15 mL of the filtrate. Pipet 5 mL of the clear filtrate into a volumetric flask and add sulfuric acid in ethanol (1 in 360) to make 100 mL. Pipet 10 mL of this solution into a volumetric flask and dilute with sulfuric acid in ethanol (1 in 360) to make 50 mL and use this solution as the test solution. Dissolve an accurately a portion of Chlordiazepoxide Hydrochloride in methanol to obtain a solution having a known concentration of about 60 mg per mL. Dilute this solution quantitatively and step-wise with sulfuric acid in ethanol (1 in 360) to obtain a standard solution having a known concentration of about 6 μg per mL. Concomitantly determine the absorbances of the test solution and the standard solution at the absorbance maximum wavelength at about 245 nm, as directed under Ultraviolet-visible Spectrophotometry, using sulfuric acid in ethanol (1 in 360) as the blank. Calculate the absorbances, A_T and A_S, for the test solution and the standard solution, respectively.

Amount (mg) of chlordiazepoxide hydrochloride ($C_{16}H_{14}ClN_3O \cdot HCl$)

$$= 10 \times C \times \frac{A_T}{A_S}$$

C: Concentration (μg/mL) of the standard solution

Packaging and storage Preserve in light-resistant, tight containers.

Chlordiazepoxide Hydrochloride for Injection
주사용 클로르디아제폭시드염산염

Chlordiazepoxide Hydrochloride for Injection is a preparation for injection, which is dissolved before use. It

contains NLT 93.0% and NMT 107.0% of the labeled amount of chlordiazepoxide hydrochloride ($C_{16}H_{14}ClN_3O \cdot HCl$: 336.22).

Method of preparation Prepare as directed under Injections, with Chlordiazepoxide Hydrochloride.

Description Lincomycin Hydrochloride Hydrate occurs as a white crystalline powder and is odorless.
It is soluble in water and ethanol(95) and practically insoluble in hexane.
It is affected by light.

Identification Perform the test as directed under the Identification under Chlordiazepoxide Hydrochloride.

pH Dissolve 1.0 g of Chlordiazepoxide Hydrochloride for Injection in 100 mL of water; the pH of the solution is between 2.5 and 3.5.

Purity ***Heavy metals and related substances***—Perform the tests as directed under the Purity (1) and (2) under Chlordiazepoxide Hydrochloride.

Loss on drying NMT 0.5% (1 g, in vacuum, phosphorus pentoxide, 60 ℃, 4 hours).

Sterility Meets the requirements.

Bacterial endotoxins Less than 3.57 EU per mg of chlordiazepoxide hydrochloride.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Perform the test as directed under the Assay under Chlordiazepoxide Hydrochloride.

Packaging and storage Preserve in light-resistant, hermetic containers.

Chlorhexidine Gluconate Solution
클로르헥시딘글루콘산염 액

Chlorhexidine Gluconate Solution is an aqueous solution of 2-gluconate of chlorhexidine.

Chlorhexidine Gluconate Solution contains NLT 19.0 w/v% and NMT 21.0 w/v% of chlorhexidine gluconate ($C_{22}H_{30}Cl_2N_1 \cdot 2C_6H_{12}O_7$: 897.76).

Description Chlorhexidine Gluconate Solution occurs as a clear, colorless to pale yellow liquid, is odorless, and has a bitter taste.
It is miscible with acetic acid(100) or water.
1 mL of Chlorhexidine Gluconate Solution is miscible with NMT 5 mL of ethanol(99.5) or NMT 3 mL of acetone, but a white turbidity is formed with the addition of these solvents.
It is gradually colored by light.

Specific gravity—d_{20}^{20}: Between 1.06 and 1.07.

Identification (1) To 0.05 mL of Chlorhexidine Gluconate Solution, add 5 mL of methanol, 1 mL of bromine TS and 1 mL of 8 mol/L sodium hydroxide TS; the solution exhibits a deep red color.

(2) To 0.5 mL of Chlorhexidine Gluconate Solution, add 10 mL of water and 0.5 mL of copper(II) sulfate TS; a white precipitate is formed. Heat to boiling; the precipitate changes to pale violet.

(3) To 10 mL of Chlorhexidine Gluconate Solution, add 5 mL of water, cool in iced water, and slowly add 5 mL of sodium hydroxide TS while stirring to mix; a white precipitate is formed. Filter this solution, wash the residue with water, and recrystallize from diluted ethanol (7 in 10), and dry at 105℃ for 30 minutes; the crystals obtained melt between 130 and 134 ℃.

(4) Neutralize the filtrate in (3) using 5 mol/L hydrochloric acid TS. To 5 mL of the resulting solution, add 0.65 mL of acetic acid(100) and 1 mL of freshly distilled phenylhydrazine, heat on a steam bath for 30 minutes and cool, and scratch the inner wall with a glass rod; crystals are formed. Collect the crystals, dissolve in 10 mL of hot water, add a small amount of activated charcoal, and filter. After cooling, scratch the inner wall with a glass rod, collect the formed crystals, and dry; the crystals obtained melt at about 195℃ (with decomposition).

pH Dissolve about 5.0 mL of Chlorhexidine Gluconate Solution in 100 mL of water; the pH of this solution is between 5.5 and 7.0.

Purity (1) **4-*Chloroaniline***—Dissolve 2.0 mL of Chlorhexidine Gluconate Solution in water to make exactly 100 mL. Take exactly 5 mL of this solution, add 20 mL of water, 5 mL of 1 mol/L hydrochloric acid TS and 0.3 mL of sodium nitrite TS, shake to mix, and allow to stand for 2 minutes. Next, add 4 mL of ammonium sulfamate TS, and allow to stand for 1 minute. Next, add 5 mL of oxalic acid *N*-(1-naphthyl)-*N'*-diethylethylenediamine-acetone TS, allow to stand for 10 minutes, and add 1 mL of ethanol(95) and water to make 50 mL; the color of the resulting solution is not more intense than the following control solution.

Control solution—Dissolve 20 mg of 4-chloroaniline in 10 mL of 1 mol/L hydrochloric acid TS, and add water to make exactly 100 mL. Pipet 5 mL of this solution and add water to make exactly 100 mL. To 5 mL of this solution, add 20 mL of water and 5 mL of 1 mol/L hydrochloric acid TS, and proceed in the same manner as the above.

(2) ***Related substances***—Pipet 5.0 mL of Chlorhexidine Gluconate Solution and add water to make 100 mL. Take exactly 5 mL of this solution, transfer to a 25 mL volumetric flask, and add diluent to make a solution containing about 2 mg of chlorhexidine gluconate per mL, use this solution as the test solution. Pipet 3.0 mL of the test solution, add diluent to make 100 mL, and use this solution as the standard solution (1). Pipet 2.0 mL of the standard solution (1), add diluent to make 100 mL, and use this solution as the standard solution (2). Perform the test with 20 μL each of the test solution, the standard solutions (1) and (2) as directed under the Liquid Chromatography according to the following operating conditions. Determine the peak area of each solution by the automatic integration method; the total area of peaks other than chlorhexidine obtained from the test solution is not larger than the peak area of chlorhexidine from the standard solution (1) (3.0%). However, disregard any peak having an area smaller than the peak area of chlorhexidine from the standard solution (2).

Diluent—Dissolve 27.6 g of sodium dihydrogen phosphate dihydrate in 1500 mL of water, adjust the pH to 3.0 with phosphoric acid, and add water to make 2000 mL.

Operating conditions

Proceed as directed under the operating conditions under the Assay.

Residue on ignition NMT 0.1% (0.2 g, after evaporation).

Assay Pipet 5.0 mL of Chlorhexidine Gluconate Solution, and add water to make exactly 250 mL. Pipet 5 mL of this resulting solution, add diluent to make exactly 250 mL, and use this solution as the test solution. Separately, weigh accurately 100 mg of chlorhexidine acetate RS, and dissolve in water to make 100 mL. Pipet 5 mL of this solution, add diluent to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 50 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the peak areas, A_T and A_S, of chlorhexidine from the test solution and the standard solution, respectively.

The amount (w/v%) of chlorhexidine gluconate ($C_{22}H_{30}Cl_2N_1 \cdot 2C_6H_{12}O_7$) in Chlorhexidine Gluconate Solution

$$= \frac{897.76}{625.55} \times 0.25 \times C \times \frac{A_T}{A_S}$$

899.76: Molecular weight of chlorhexidine gluconate

625.55: Molecular weight of chlorhexidine acetate

C: Concentration (μg/mL) of chlorhexidine acetate in standard solution

Diluent—Dissolve 27.6 g of sodium dihydrogen phosphate dihydrate in 1500 mL of water, adjust the pH to 3.0 with phosphoric acid, and add water to make 2000 mL.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 239 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: Control the mixing ratio of mobile phase A and mobile phase B in stages or gradient elution as follows.

Mobile phase A: A mixture of a solution, prepared by dissolving 27.6 g of sodium dihydrogen phosphate dihydrate and 10 mL of triethylamine in 1500 mL of water, adjusting the pH to 3.0 with phosphoric acid, and adding water to make 2000 mL, and acetonitrile (70:30).

Mobile phase B: Acetonitrile

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 - 9	100	0
9 - 10	100 → 45	0 → 55
10 - 15	45	55
15 - 16	45 → 100	55 → 0
16 - 21	100	0

Flow rate: 1.5 mL/min

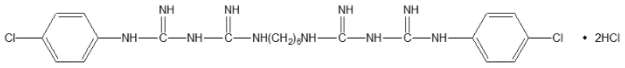
System suitability

System performance: Dissolve 0.1 mg of chlorhexidine acetate RS and 0.1 mg of 4-chloroaniline in 100 mL of diluent, and use this solution as the system suitability solution Proceed with 50 μL of system suitability solution according to the above conditions; the resolution between chlorhexidine and 4-chloroaniline is NLT 3.

System repeatability: Repeat the test 6 times with 50 μL of the system suitability solution according to the above operating conditions; the relative standard deviations of the peak areas of chlorhexidine and 4-chloroaniline are NMT 2.0% and 5.0%, respectively.

Packaging and storage Preserve in light-resistant, tight containers.

Chlorhexidine Hydrochloride
클로르헥시딘염산염



$C_{22}H_{30}Cl_2N_{10}\cdot 2HCl$: 578.37

N-(4-Chlorophenyl)-1-3-(6-{*N*-[3-(4-chlorophenyl)carbamimidamidomethanimidoyl]amino}hexyl)carbamimidamido-methanimidamide hydrochloride [*3697-42-5*]

Chlorhexidine Hydrochloride, when dried, contains NLT 98.0% and NMT 101.0% of chlorhexidine hydrochloride ($C_{22}H_{30}Cl_2N_{10}\cdot 2HCl$).

Description Chlorhexidine Hydrochloride occurs as a white, crystalline powder, which is odorless and has a bitter taste.
It is soluble in formic acid, slightly soluble in methanol or warm methanol, and practically insoluble in water, ethanol(95) or ether.
It is gradually colored by light.

Identification (1) Dissolve 10 mg of Chlorhexidine Hydrochloride in 5 mL of methanol by warming, and add 1 mL of bromine TS and 1 mL of 8 mol/L sodium hydroxide TS; the solution exhibits a deep red color.

(2) Dissolve 0.3 g of Chlorhexidine Hydrochloride in 10 mL of 6 mol/L hydrochloric acid TS, cool in iced water, and slowly add 10 mL of 8 mol/L sodium hydroxide TS while stirring to mix; a white precipitate develops. Filter the precipitate, wash the residue with water, and recrystallize from diluted ethanol (7 in 10), and dry at 105℃ for 30 minutes; the crystals obtained melt between 130 and 134 ℃.

(3) Dissolve 0.1 g of Chlorhexidine Hydrochloride in 50 mL of dilute nitric acid; the resulting solution responds to the Qualitative Analysis for chloride.

Purity (1) ***Heavy metals***—Proceed with 2.0 g of Chlorhexidine Hydrochloride according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Arsenic***—Put 1.0 g of Chlorhexidine Hydrochloride into a crucible, add 10 mL of a solution of magnesium nitrate in ethanol(95) (1 in 10), fire ethanol to combust, and heat gradually to incinerate. If a carbonized substance remains, moisten with a small amount of nitric acid, and ignite again to incinerate. After cooling, add 10 mL of dilute hydrochloric acid to the residue, warm on a steam bath to dissolve, use this solution as the test solution, and perform the test (NMT 2 ppm).

(3) ***Related substances***—Weigh accurately about 0.2 g of Chlorhexidine Hydrochloride, dissolve in the mobile phase A to make 100 mL, and use this solution as the test solution. Separately, pipet 3.0 mL of the test solution, add the mobile phase A to make exactly 100 mL, and use this solution as the standard solution (1). Pipet 2 mL of this solution, add the mobile phase A to make exactly 100 mL, and use this solution as the standard solution (2). Perform the test with 20 μL each of the test solution, the standard solution (1) and the standard solution (2) as directed under the Liquid Chromatography according to the following conditions; the total amount of related substances is NMT 3.0%. However, disregard any peak with an area less than that of the major peak from the standard solution (2).

$$\text{Content (\%) of each related substance} = 100 \times \frac{A_T}{A_S} \times \frac{C_S}{C_T}$$

C_S: Concentration (mg/mL) of chlorhexidine hydrochloride in the standard solution (1)

C_T: Concentration (mg/mL) of chlorhexidine hydrochloride in the test solution

A_T: Peak area of individual related substance in the test solution

A_S: Peak area of chlorhexidine in the standard solution (1)

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 239 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: Control the mixing ratio of mobile phase A and mobile phase B in stages or gradient elution as follows.

Mobile phase A: Dissolve 27.6 g of sodium dihydrogen phosphate dihydrate and 10 mL of triethylamine in 1500 mL of water, adjust the pH to 3.0 with phosphoric acid, and add water to make 2000 mL. Add 300 mL of acetonitrile to 700 mL of this solution.

Mobile phase B: Acetonitrile

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0	100	0
0 - 15	100	0
15 - 16	100 → 45	0 → 55
16 - 21	45	55
21 - 22	45 → 100	55 → 0
22 - 27	100	0

Flow rate: 1.5 mL/min

(4) ***4-Chloroaniline***—Dissolve 0.1 g of Chlorhexidine Hydrochloride in 2 mL of formic acid, immediately add 15 mL of 1 mol/L hydrochloric acid TS and 20 mL of water, add 0.3 mL of sodium nitrite TS, shake to mix, and allow to stand for 2 minutes. Next, add 4 mL of ammonium sulfamate TS, allow to stand for 1 minute, add 5 mL of oxalic acid *N*-(1-naphthyl)-*N'*-diethylethylenediamine-acetone TS, allow to stand for 10 minutes, and add 1 mL

of ethanol(95) and water to make 50 mL; the color of the resulting solution is not more intense than the following control solution.

Control solution—Dissolve 20 mg of 4-chloroaniline in 10 mL of 1 mol/L hydrochloric acid TS, and add water to make exactly 100 mL. Pipet 5 mL of this solution and add water to make exactly 100 mL. To 2.0 mL of this solution, add 2 mL of formic acid, 15 mL of 1 mol/L hydrochloric acid TS and 20 mL of water, and proceed in the same manner as the above.

Loss on drying NMT 2.0% (1 g, 130 ℃, 2 hours).

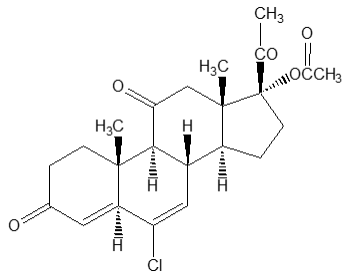
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.2 g of Chlorhexidine Hydrochloride, previously dried, dissolve in 2.0 mL of formic acid, add 60 mL of acetic anhydride, and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 1 mol/L perchloric acid VS
= 14.459 mg of $C_{22}H_{30}Cl_2N_{10}\cdot 2HCl$

Packaging and storage Preserve in light-resistant, tight containers.

Chlormadinone Acetate
클로르마디논아세테이트



$C_{23}H_{29}ClO_4$: 404.93

[(8*R*,9*S*,10*R*,13*S*,14*S*,17*R*)-17-Acetyl-6-chloro-10,13-dimethyl-3-oxo-2,8,9,11,12,14,15,16-octahydro-1*H*-cyclopenta[a]phenanthren-17-yl]acetate [*302-22-7*]

Chlormadinone Acetate, when dried, contains NLT 98.0% and NMT 101.0% of chlormadinone acetate ($C_{23}H_{29}ClO_4$).

Description Chlormadinone Acetate occurs as white to pale yellow crystals or a crystalline powder and is odorless.

It is freely soluble in chloroform, soluble in acetonitrile (95), slightly soluble in ethanol(95) or ether and practically insoluble in water.

Identification (1) Dissolve 2 mg of Chlormadinone Acetate in 1 mL of ethanol(95) and add 1 mL of 1,3-dinitrobenzene TS and 1 mL of potassium hydroxide solution (1 in 5); the resulting solution exhibits a purple color.

(2) Add 2 mL of potassium hydroxide-ethanol TS to 50 mg of Chlormadinone Acetate and boil on a steam bath for 5 minutes. After cooling, add 2 mL of diluted sulfuric acid (2 in 7) and boil gently for 1 minute; the odor of ethyl acetate is perceptible.

(3) Determine the infrared spectra of Chlormadinone Acetate and chlormadinone acetate RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(4) Perform the Flame Coloration (2) with Chlormadinone Acetate; it exhibits a green color.

Optical rotation $[\alpha]_D^{20}$: Between -10.0° and -14.0° (0.2 g after drying, acetonitrile, 10 mL, 100 mm).

Melting point Between 211 and 215 ºC.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Chlormadinone Acetate according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Arsenic***—Prepare the test solution with 1.0 g of Chlormadinone Acetate according to Method 3 and perform the test (NMT 2 ppm).

(3) ***Related substances***—Dissolve 20 mg of Chlormadinone Acetate in 10 mL of acetonitrile and use this solution as the test solution. Pipet 1 mL of this solution, add acetonitrile to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine each peak area of each solution according to the automatic integration method; the total area of peaks other than the peak of Chlormadinone Acetate from the test solution is not larger than the peak area of Chlormadinone Acetate from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 236 nm).

Column: A stainless steel column about 6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 30 °C.

Mobile phase: A mixture of acetonitrile and water (13 : 7).

Flow rate: Adjust the flow rate so that the retention time of Chlormadinone Acetate is about 10 minutes.

System suitability

Test for required detectability: Pipet 5 mL of the standard solution and add acetonitrile to make exactly 50 mL. Confirm that the peak area of Chlormadinone Acetate obtained from 10 mL of this solution is within the range of 7 to 13% of the peak area of Chlormadinone Acetate obtained from the standard solution.

System performance: Dissolve 8 mg of Chlormadinone Acetate and 2 mg of butyl p-hydroxybenzoate in 100 mL of acetonitrile. Proceed with 10 μL of this solution under the above operating conditions; butyl p-hydroxybenzoate and Chlormadinone Acetate are eluted in this order with the resolution being NLT 8.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak areas of Chlormadinone Acetate is NMT 1.0%.

Time span of measurement: About 1.5 times the retention time of Chlormadinone Acetate after the solvent peak.

Loss on drying NMT 0.5% (0.5 g, in vacuum, phosphorus pentoxide, 4 hours).

Residue on ignition NMT 0.1% (0.5 g).

Assay Weigh accurately about 20 mg each of Chlormadinone Acetate and chlormadinone acetate RS and dissolve in ethanol(95) to make exactly 100 mL. Pipet 5 mL each of these solutions, add ethanol(95) to make exactly 100 mL, and use these solutions as the test solution and the standard solution, respectively. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively at 285 nm as directed under the Ultraviolet-visible Spectroscopy.

Amount (mg) of chlormadinone acetate ($C_{23}H_{29}ClO_4$)
= Amount (mg) of chlormadinone acetate RS$\times \frac{A_T}{A_S}$

Packaging and storage Preserve in light-resistant, tight containers.

Chlorophyllin Copper Complex Sodium
클로로필린구리나트륨착염

Chlorophyllin Copper Complex Sodium is a sodium salt of chlorophyllin, obtained from chlorophyll by copper substitution.

Description Chlorophyllin Copper Complex Sodium is a bluish green to blackish green powder, and is odorless or has a slightly characteristic odor.
It is freely soluble in water and practically insoluble in ethanol or ether.
The pH of an aqueous solution of Chlorophyllin Copper Complex Sodium (1 in 100) is between 9.5 and 11.0.
It is hygroscopic.

Identification (1) Wet 1.0 g of Chlorophyllin Copper Complex Sodium with a small amount of sulfuric acid and slowly heat at a low temperature as much as possible to nearly ash. After cooling, wet it with a small amount of sulfuric acid and slowly heat until no white fumes appear. Then, ignite at 450 to 500 ℃ to make the residue completely ash. After cooling, put 10 mL of dilute hydrochloric acid and heat on a steam bath to dissolve, and filter, if necessary. Add water to make 10 mL and use this solution as the test solution. To 5 mL of the test solution, add 0.5 mL of sodium diethyldithiocarbamate TS; the resulting solution produces a brown precipitate.

(2) Take the test solution from (1) and perform the test according to the flame coloration of metal salt under the Flame Coloration; it exhibits a green color at first, and then a yellow color.

(3) With the test solution in the absorbance, determine the absorption spectrum according to the Ultraviolet-visible Spectroscopy; it exhibits absorption maxima, A_1 and A_2, between 403 nm and 407 nm and between 627 nm and 633 nm, respectively. And A_1/A_2 is 3.2 to 4.0 at the absorbance maximum wavelength.

Absorbance Weigh accurately about 0.1 g of Chlorophyllin Copper Complex Sodium and dissolve by adding water to make 100.0 mL. Take 1.0 mL of this solution, add phosphate buffer solution, pH 7.5, to make 100.0 mL, and gently shake to mix. Use this solution as the test solution. Measure the absorbance at the absorbance maximum wavelength at around 405 nm as quickly as possible, and calculate $E_{1cm}^{1\%}$ on the dried basis; it is beween 508 and 650.

Purity (1) ***Free copper ion***—Dissovle 1.0 g of Chlorophyllin Copper Complex Sodium in 50 mL of water, and use this solution as the test solution. With this solution, spot 2 μL each of the test solutions and the copper standard solution on a plate made of silica gel for thin-layer chromatography according to the Thin Layer Chromatography. Develop the plate with a mixture of *n*-butanol, water and acetic acid(100) (4 : 2 : 1) to a distance of about 10 cm, and dry the plate at 105 °C for 10 minutes. Spray evenly sodium diethyldithiocarbamate TS (1 in 1000); the spots from the standard solution and the test solution have the same R_f value and the spot from the test solution is not more intense than that from the standard solution.

Copper standard solution—Weigh exactly 0.393 g of copper sulfate, put in 100-mL volumetric flask, and dissolve in 60 mL of diluted hydrochloric acid (1 in 100). Add 2 to 3 drops of diluted sulfuric acid (1 in 20), shake well to mix, and then add diluted hydrochloric acid (1 in 100) to make 100 mL. Each mL of this solution contains 1 mg of copper (Cu).

(2) ***Arsenic***—Proceed with 0.5 g of Chlorophyllin Copper Complex Sodium according to Method 3 and

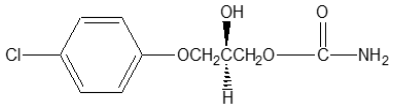
perform the test (NMT 4 ppm).

(3) ***Alkaline tar pigment***—Add 1 mL of sodium hydroxide (1 in 50) and 50 mL of ether to an aqueous solution (1 in 200) of Chlorophyllin Copper Complex Sodium, and shake to mix. Take the ether layer, wash twice with 15 mL of sodium hydroxide solution (1 in 50), add 5 mL of acetic acid(100) (1 in 10) diluted in ether, and shake to mix; the water layer is colorless.

Loss on drying NMT 5.0% (1 g, 105 °C, 2 hours).

Packaging and storage Preserve in tight containers.

Chlorphenesin Carbamate
클로르페네신카르바메이트



and enantiomer

$C_{10}H_{12}ClNO_4$: 245.66

[3-(4-Chlorophenoxy)-2-hydroxypropyl]carbamate [*886-74-8*]

Chlorphenesin Carbamate, when dried, contains NLT 98.0% and NMT 102.0% of chlorphenesin carbamate ($C_{10}H_{12}ClNO_4$).

Description Chlorphenesin Carbamate occurs as white crystals or a crystalline powder.
It is freely soluble in methanol, ethanol(95), or pyridine, and slightly soluble in water.
A solution of Chlorphenesin Carbamate in ethanol(95) (1 in 20) shows no optical rotation.

Identification (1) Determine the absorption spectra of solutions of Chlorphenesin Carbamate and chlorphenesin carbamate RS in ethanol(95) (3 in 200000) as directed under the Ultraviolet-visible spectrophotometry; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Chlorphenesin Carbamate and chlorphenesin carbamate RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) Perform the Flame Coloration (2) with Chlorphenesin Carbamate; it exhibits a green color.

Melting point Between 88 and 91 ºC.

Purity (1) ***Heavy metals***—Weigh 2.0 g of Chlorphenesin Carbamate, dissolve in 20 mL of ethanol(95), and add 2 mL of dilute acetic acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution by adding 20 mL of ethanol(95), 2 mL of dilute acetic acid, and water to 2.0 mL of lead standard solution to make 50 mL (NMT 10 ppm).

(2) ***Arsenic***—Proceed with 1.0 g of Chlorphenesin Carbamate according to Method 3 and perform the test (NMT 2 ppm).

(3) ***Chlorphenesin-2-carbamate***—Dissolve 0.10 g of Chlorphenesin Carbamate in 20 mL of a mixture of hexane for liquid chromatography and 2-propanol (7 : 3), and use this solution as the test solution. With 10 μL of the test solution, perform the test as directed under the Liquid Chromatography according to the following conditions. Determine the peak area, A_a, of chlorphenesin carbamate and the peak area, A_b, of chlorphenesin-2-carbamate as directed in the automatic integration method; the ratio, $A_b/(A_a + A_b)$, is not greater than 0.007.

Operating conditions

Detector: An ultraviolet photometer (wavelength: 280 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 30 cm in length, packed with silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: A mixture of hexane, 2-propanol, and acetic acid(100) (700 : 100 : 1).

Flow rate: Adjust the flow rate so that the retention time of chlorphenesin carbamate is about 9 minutes.

System suitability

Test for required detectability: Weigh 1 mL of the test solution, add a mixture of hexane for liquid chromatography and 2-propanol (7 : 3) to make 100 mL, and use this solution as the system suitability solution. Take 5 mL of the system suitability solution and add a mixture of hexane for liquid chromatography and 2-propanol (7 : 3) to make 10 mL. Confirm that the peak area of chlorphenesin carbamate obtained from 10 μL of this solution is between 40% and 60% of the peak area of chlorphenesin carbamate from the system suitability solution.

System performance: Dissolve 0.1 g of Chlorphenesin Carbamate in 50 mL of methanol. To 25 mL of this solution, add 25 mL of dilute sodium hydroxide TS and warm at 60 °C for 20 minutes. To 20 mL of this solution, add 5 mL of 1 mol/L hydrochloric acid TS, put 20 mL of ethyl acetate, and shake well to mix. Allow it to stand, and take the ethyl acetate layer separately. Proceed with 10 μL of this solution according to the above conditions; chlorphenesin, chlorphenesin carbamate and chlorphenesin-2-carbamate are eluted in this order with the relative retention times of chlorphenesin and chlorphenesin-2-carbamate to the retention time of chlorphenesin carbamate being about 0.7 and 1.2, respectively, and with the resolution of chlorphenesin and chlorphenesin carbamate being NLT 2.0.

System repeatability: Repeat the test 6 times with 10 μL of the system suitability solution according to the

above conditions; the relative standard deviation of the peak area of chlorphenesin carbamate is NMT 2.0%.

(4) ***Other related substances***—Dissolve 0.10 g of Chlorphenesin Carbamate in 10 mL of ethanol(95), and use this solution as the test solution. Pipet 1 mL of this solution, and add ethanol(95) to make exactly 20 mL. Pipet 2 mL of this solution, add ethanol(95) to make exactly 20 mL, and use this solution as the standard solution. With the test solution and the standard solution, perform the test as directed under the Thin Layer Chromatography. Spot 50 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of ethyl acetate, methanol, and ammonia water(28) (17 : 2 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Allow it to stand in iodine vapor for 20 minutes; the spot other than the principal spot obtained from the test solution is NMT 1, and not more intense than the spot from the standard solution.

Loss on drying NMT 0.2% (1 g, in vacuum, silica gel, 4 hours).

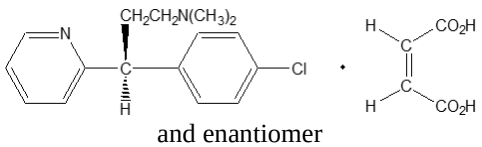
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.5 g of Chlorphenesin Carbamate, previously dried, dissolve in 20 mL of pyridine, add exactly 50 mL of 0.1 mol/L potassium hydroxide-ethanol solution, and warm at 70 °C for 40 minutes. After cooling, add 100 mL of ethanol(95) and titrate an excessive amount of potassium hydroxide with 0.1 mol/L hydrochloric acid VS (indicator: 1 mL of thymol blue TS). The endpoint of the titration is when the color of the solution changes from blue through bluish green to yellow. Perform a blank test in the same manner.

Each mL of 0.1 mol/L potassium hydroxide-ethanol VS
= 24.566 mg of $C_{10}H_{12}ClNO_4$

Packaging and storage Preserve in tight containers.

Chlorpheniramine Maleate
클로르페니라민말레산염



and enantiomer

$C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$: 390.86
(*Z*)-but-2-Enedioic acid; [3-(4-chlorophenyl)-3-(pyridin-2-yl)propyl]dimethylamine [*113-92-8*]

Chlorpheniramine Maleate, when dried, contains NLT 98.0% and NMT 101.0% of *d*-chlorpheniramine maleate ($C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$).

Description Chlorpheniramine Maleate occurs as white fine crystals.
It is very soluble in acetic acid(100), freely soluble in water or methanol, and sparingly soluble in ethanol(95).
It dissolves in dilute hydrochloric acid.
An aqueous solution of Chlorpheniramine Maleate (1 in 20) shows no optical rotation.

Identification (1) Determine the absorption spectra of the solutions of Chlorpheniramine Maleate and chlorpheniramine maleate RS in 0.1 mol/L hydrochloric acid TS (3 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Chlorpheniramine Maleate and chlorpheniramine maleate RS, previously dried, as directed in the paste method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) Dissolve 0.1 g of Chlorpheniramine Maleate in 5 mL of methanol, and use this solution as the test solution. Separately, dissolve 56 mg of maleic acid in 10 mL of methanol, use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on a plate made of silica gel for thin-layer chromatography. Develop the plate with a mixture of ether, methanol, acetic acid(100) and water (70 : 20 : 7 : 3) as the developing solvent to a distance of about 12 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm); of the two spots obtained from the test solution, one spot shows the same intensity as the spot obtained from the standard solution, and their R_f values are the same.

Melting point Between 130 and 135 °C.

pH Dissolve 1.0 g of Chlorpheniramine Maleate in 100 mL of newly boiled and cooled water; the pH of this solution is between 4.0 and 5.5.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Chlorpheniramine Maleate in 50 mL of water; the resulting solution is clear and colorless.

(2) ***Heavy metals***—Proceed with 1.0 g of Chlorpheniramine Maleate as directed under Method 4 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Related substances***—Dissolve 0.10 g of Chlorpheniramine Maleate in 100 mL of the mobile phase, and use this solution as the test solution. Pipet 3 mL of this solution, and add the mobile phase to make exactly 100 mL. Pipet 2 mL of this solution, add the mobile phase to make exactly 20 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following con-

ditions. Determine the peak area of each solution by the automatic integration method; the peak area other than maleic acid and chlopheniramine obtained from the test solution is not greater than two thirds times the peak area of chlopheniramine from the standard solution. Also, the total area of peaks other than maleic acid and chlorpheniramine obtained from the test solution is not larger than the peak area of chlorpheniramine from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 225 nm).

Column: A stainless steel column 3.9 mm in internal diameter and 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: Dissolve 8.57 g of ammonium dihydrogen phosphate and 1 mL of phosphoric acid in water to make 1000 mL. To 800 mL of this solution, add 200 mL of acetonitrile.

Flow rate: Adjust the flow rate so that the retention time of chlopheniramine is about 11 minutes.

System suitability

Test for required detectability: Weigh accurately 2.5 mL of the standard solution and add the mobile phase to make exactly 25 mL. Verify that the peak area of chlopheniramine obtained from 20 μL of this solution is equivalent to 7% - 13% of the peak area of chlopheniramine obtained from the standard solution.

System performance: Proceed with 20 μL of the standard solution under the above operating conditions; the number of theoretical plates and the symmetry factor of the peak of chlopheniramine are NLT 4000 plates and NMT 2.0, respectively.

System repeatability: Repeat the test 6 times with 20 μL each of the standard solution according to the above operating conditions; the relative standard deviation of the peak areas of chlopheniramine is NMT 4.0%.

Time span of measurement: About 4 times -the retention time of chlopheniramine after the solvent peak.

Loss on drying NMT 0.5% (1 g, 105 °C, 3 hours).

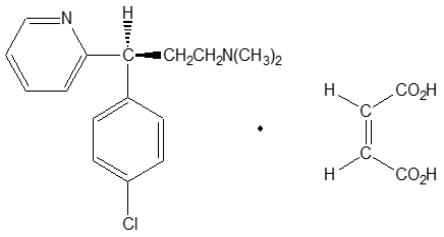
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.4 g of Chlorpheniramine Maleate, previously dried, dissolve in 20 mL of acetic acid(100), and titrate with 0.1 mol/L perchloric acid VS (indicator: 2 drops of methylrosanilinium chloride TS). However, the endpoint of the titration is when the violet color of the solution turns to bluish green and then finally to green. Perform a blank test in the same manner and make any necessary correction.

Each mL of 1 mol/L perchloric acid VS
= 19.543 mg of $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$

Packaging and storage Preserve in light-resistant, tight containers.

d-Chlorpheniramine Maleate
d-클로르페니라민말레산염



$C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$: 390.86

(*Z*)-but-2-Enedioic acid; (3*S*)-[3-(4-chlorophenyl)-3-(pyridin-2-yl)propyl]dimethylamine [*2438-32-6*]

d-Chlorpheniramine Maleate, when dried, contains NLT 99.0% and NMT 101.0% of *d*-chlorpheniramine maleate ($C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$).

Description *d*-Chlorpheniramine Maleate occurs as a white crystalline powder.
It is odorless and has a bitter taste.
It is very soluble in methanol or acetic acid(100) and is freely soluble in dimethylformamide or ethanol(95).
It dissolves in dilute hydrochloric acid.

Identification (1) Determine the absorption spectra of the solutions of *d*-Chlorpheniramine Maleate and *d*-chlorpheniramine maleate RS in 0.1 mol/L hydrochloric acid TS (3 in 100000) as directed under the Ultraviolet-visible spectrophotometry; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of *d*-Chlorpheniramine Maleate and *d*-chlorpheniramine maleate RS, previously dried, as directed in the paste method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) Dissolve 0.1 g of *d*-Chlorpheniramine Maleate in 5 mL of methanol, and use this solution as the test solution. Separately, dissolve about 56 mg of maleic acid in 10 mL of methanol, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Develop the plate with a mixture of ether, methanol, acetic acid(100) and water (70 : 20 : 7 : 3) as the developing solvent to a distance of about 12 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm); of the two spots obtained from the test solution, one spot shows the same intensity to the spot obtained from the standard solution,

and their R_f values are the same.

Optical rotation $[\alpha]_D^{20}$: Between +39.5° and +43.0° (0.5 g after drying, dimethylformamide, 10 mL, 100 mm).

Melting point Between 111 and 115 ℃.

pH Dissolve 1.0 g of *d*-Chlorpheniramine Maleate in 100 mL of newly boiled and cooled water; the pH of this solution is between 4.0 and 5.0.

Absorbance $E_{1cm}^{1\%}$ (265 nm): Between 210 nm and 220 nm (5 mg after drying, 0.25 mol/L sulfuric acid TS, 250 mL).

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of *d*-Chlorpheniramine Maleate in 50 mL of water; the resulting solution is clear and colorless.

(2) ***Heavy metals***—Proceed with 1.0 g of *d*-Chlorpheniramine Maleate according to Method 4 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Related substances***—Dissolve about 0.10 g of *d*-Chlorpheniramine Maleate in 100 mL of the mobile phase and use this solution as the test solution. Pipet 3 mL of this solution, and add the mobile phase to make exactly 100 mL. Pipet 2 mL of this solution, add the mobile phase to make exactly 20 mL, and use this solution as the standard solution. Pipet 20 μL each of the test solution and the standard solution, and perform the test as directed under the Liquid Chromatography according to the following conditions. Determine the peak area of each solution by the automatic integration method; the peak area other than maleic acid and *d*-chlopheniramine obtained from the test solution is not greater than two thirds times the peak area of *d*-chlopheniramine from the standard solution. Also, the total area of peaks other than maleic acid and *d*-chlorpheniramine obtained from the test solution is not larger than the peak area of *d*-chlorpheniramine from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 225 nm).

Column: A stainless-steel column about 3.9 mm in internal diameter and 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 μ*m* in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: Dissolve 8.57 g of ammonium dihydrogen phosphate and 1 mL of phosphoric acid in water to make 1000 mL. To 800 mL of this solution, add 200 mL of acetonitrile.

Flow rate: Adjust the flow rate so that the retention time of *d*-chlopheniramine is about 11 minutes.

System suitability

Test for required detectability: Weigh accurately 2.5 mL of the standard solution and add the mobile phase to make exactly 25 mL. Verify that the peak area of *d*-chlopheniramine obtained from 20 μL of this solution is equivalent to 7 to 13% of the peak area of *d*-chlopheniramine obtained from the standard solution.

System performance: Proceed with 20 μL of the standard solution according to the above operating conditions; the number of theoretical plates of *d*-chlopheniramine peak is NLT 4000 plates with the symmetry factor being NMT 2.0.

System repeatability: Repeat the test 6 times with 20 μL each of the standard solution according to the above operating conditions; the relative standard deviation of the peak areas of *d*-chlopheniramine is NMT 4.0%.

Time span of measurement: About 4 times the retention time of *d*-chlopheniramine after the solvent peak

Loss on drying NMT 0.5% (1 g, 65 ℃, 4 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.3 g of *d*-Chlorpheniramine Maleate, previously dried, dissolve in 20 mL of acetic acid(100), and titrate with 0.1 mol/L perchloric acid VS (indicator: 2 drops of methylosaniline chloride TS). However, the endpoint of the titration is when the violet color of the solution turns to bluish green and then finally to green. Perform a blank test in the same manner and make any necessary correction.

Each mL of 1 mol/L perchloric acid VS
= 19.543 mg of $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$

Packaging and storage Preserve in light-resistant, tight containers.

Chlorpheniramine Maleate Injection
클로르페니라민말레산염 주사액

Chlorpheniramine Maleate Injection is an aqueous solution for injection, which contains NLT 95.0% and NMT 105.0% of the labeled amount of dl-chlorpheniramine maleate (C16H19FO2·C4H4O4 : 390.86).

Method of preparation Prepare as directed under Injections, with Chlorpheniramine Maleate.

Description Chlorpheniramine Maleate Injection occurs as a clear, colorless liquid.

pH— Between 4.5 and 7.0.

Identification Weigh an amount of Chlorpheniramine Maleate Injection, equivalent to 25 mg of chlorpheniramine maleate, according to the labeled amount, add 5 mL of sodium hydroxide TS, and extract with 10 mL of hex-

ane. Wash the hexane layer with 10 mL of water, shake with 0.5 g of anhydrous sodium sulfate for several minutes to mix, and filter. Evaporate the solution on a steam bath at about 50 ºC in vacuum, and determine the Mid-infrared spectrum of the residue as directed under the liquid film method under the Mid-infrared spectrophotometry: it exhibits absorption at the wavenumbers of about 2940 cm^{-1}, 2810 cm^{-1}, 2770 cm^{-1}, 1589 cm^{-1}, 1491 cm^{-1}, 1470 cm^{-1}, 1434 cm^{-1}, 1091 cm^{-1} and 1015 cm^{-1}.

Sterility Meets the requirements.

Bacterial endotoxins Less than 8.8 EU per mg of Chlorpheniramine Maleate Injection.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Extractable volume of injections Meets the requirements.

Assay Take exactly an amount of Chlorpheniramine Maleate Injection, equivalent to about 3 mg of chlorpheniramine maleate, put into a 100-mL separatory funnel, add 20 mL of water and 2 mL of sodium hydroxide TS, and extract twice with 50 mL each of ether. Combine the ether extracts, wash with 20 mL of water, and then extract with 20 mL, 20 mL and 5 mL of 0.25 mol/L sulfuric acid TS successively. Combine all the extracts, and add 0.25 mol/L sulfuric acid TS to make exactly 50 mL. Pipet 10 mL of this solution, add 0.25 mol/L sulfuric acid TS to make exactly 50 mL, and use this solution as the test solution. Separately, weigh accurately about 30 mg of chlorpheniramine maleate RS, previously dried at 105 ℃ for 3 hours, and dissolve in water to make exactly 200 mL. Pipet 20 mL of this solution, put into a 100-mL separatory funnel, add 2 mL of sodium hydroxide TS, and extract twice with 50 mL each of ether. Proceed in the same manner as the test solution and use this solution as the standard solution. Perform the test with the test solution and the standard solution as directed under the Ultraviolet-visible Spectroscopy and determine the absorbances, A_T and A_S, at 265 nm.

Amount (mg) of chlorpheniramine maleate ($C_{20}H_{38}N_4O_4$)
= Amount (mg) of chlorpheniramine maleate RS
$$\times \frac{A_T}{A_S} \times \frac{1}{10}$$

Packaging and storage Preserve in light-resistant, hermetic containers.

Chlorpheniramine Maleate Powder
클로르페니라민말레산염 산

Chlorpheniramine Maleate Powder contains NLT 93.0% and NMT 107.0% of the labeled amount of *d*-chlorpheniramine maleate ($C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$: 390.86)

Method of preparation Prepare as directed under Powders, with Chlorpheniramine Maleate.

Identification Weigh an amount of Chlorpheniramine Maleate Powder, equivalent to 50 mg of chlorpheniramine maleate according to the labeled amount, add 40 mL of 0.1 mol/L hydrochloric acid TS, shake to mix, and filter. Put the filtrate into a separatory funnel and wash with 40 mL of hexane. Add 10 mL of sodium hydroxide TS and extract with 20 mL of hexane. Wash the hexane layer by adding 5 mL of water. If necessary, centrifuge, add 0.5 g of anhydrous sodium sulfate to the hexane extract, shake for several minutes to mix, and filter. Evaporate this solution in vacuum on a steam bath at about 50 °C, and determine the absorption of the residue as directed under the liquid film method under the Mid-infrared spectrophotometry; it exhibits absorption at the wavenumbers of about 2940 cm^{-1}, 2810 cm^{-1}, 2770 cm^{-1}, 1589 cm^{-1}, 1491 cm^{-1}, 1470 cm^{-1}, 1434 cm^{-1}, 1091 cm^{-1} and 1015 cm^{-1}.

Particle size distribution estimation by analytical sieving Meets the requirements.

Uniformity of dosage units (distribution) Meets the requirements.

Assay Weigh accurately an amount of Chlorpheniramine Maleate Powder, equivalent to about 4 mg of chlorpheniramine maleate ($C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$), add 70 mL of the internal standard solution, and shake to mix for 15 minutes. Add internal standard solution again to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 20 mg of chlorpheniramine maleate RS, previously dried at 105 ℃ for 3 hours, and add internal standard solution to make exactly 100 mL. Pipet 20 mL of the resulting solution, add the internal standard solution to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 30 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the ratios, Q_T and Q_S, of the peak area of chlopheniramine to that of the internal standard.

Amount (mg) of chlorpheniramine maleate ($C_{20}H_{38}N_4O_4$)
= Amount (mg) of chlorpheniramine maleate RS$\times \frac{Q_T}{Q_S} \times \frac{1}{5}$

Internal standard solution—Add water to 7 mL of a solution of methyl *p*-hydroxybenzoate in methanol (1 in

1000) to make 1000 mL.

Operating conditions

Detector: An ultraviolet photometer (wavelength: 265 nm).

Column: A stainless steel column 4.6 mm in internal diameter and 15 cm in length with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: Dissolve 1 g of sodium 1-heptanesulfonate in 900 mL of water, add 10 mL of acetic acid(100), and then add water to make 1000 mL. To 650 mL of this solution, add 350 mL of acetonitrile.

Flow rate: Adjust the flow rate so that the retention time of chlopheniramine is about 8 minutes.

System suitability

System performance: Proceed with 30 μL of the standard solution according to the above conditions; internal standard solution and chlopheniramine are eluted in this order with the resolution being NLT 2.0.

System repeatability: Repeat the test 6 times with 30 μL each of the standard solution according to the above operating conditions; the relative standard deviation of the peak area ratios of chlopheniramine to that of the internal standard is NMT 1.0%.

Time span of measurement: About 4 times the retention time of chlopheniramine after the solvent peak.

Packaging and storage Preserve in tight containers.

Chlorpheniramine Maleate Tablets
클로르페니라민말레산염 정

Chlorpheniramine Maleate Tablets contain NLT 93.0% and NMT 107.0% of the labeled amount of chlorpheniramine maleate ($C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$: 390.86).

Method of preparation Prepare as directed under Tablets, with Chlorpheniramine Maleate Tablets.

Identification Weigh an amount of Chlorpheniramine Maleate Tablets, previously powdered, equivalent to 50 mg of chlorpheniramine maleate, according to the labeled amount, add 40 mL of 0.1 mol/L hydrochloric acid TS, shake to mix, and filter. Place the filtrate in a separatory funnel, and wash with 40 mL of hexane. Next, add 10 mL of sodium hydroxide TS, and extract with 20 mL of hexane. Add 5 mL of water to the hexane layer, and wash with water. Centrifuge, if necessary, add 0.5 g of anhydrous sodium sulfate to the hexane extract, shake for several minutes to mix, and filter. Filter this solution under reduced pressure on a steam bath at about 50 °C to evaporate, and determine the infrared spectra of the residue as directed under the liquid film method under the Mid-infrared Spectroscopy; it exhibits absorptions at the wavenumbers of about 2940 cm^{-1}, 2810 cm^{-1}, 2770 cm^{-1}, 1589 cm^{-1}, 1491 cm^{-1}, 1470 cm^{-1}, 1434 cm^{-1}, 1091 cm^{-1} and 1015 cm^{-1}.

Dissolution Perform the test with 1 tablet of Chlorpheniramine Maleate Tablets at 50 revolutions per minute according to Method 2, using 500 mL of 0.01 mol/L hydrochloric acid TS as the dissolution medium. Take the dissolved solution after 30 minutes from the start of the test and filter. Discard the first 10 mL of the filtrate, pipet V mL of the subsequent filtrate, add the dissolution medium to make exactly V' mL, and use this solution as the test solution. Separately, weigh accurately an appropriate amount of chlorpheniramine maleate RS, dissolve in the dissolution medium to obtain the same concentration as the test solution, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at the absorbance maximum wavelength of about 265 nm as directed under the Ultraviolet-visible Spectroscopy, using the dissolution medium as a control solution. It meets the requirements when the dissolution rate in 30 minutes is NLT 80% (Q).

Dissolution rate (%) with respect to the labeled amount of chlorpheniramine maleate ($C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$)

$$= C_S \times \frac{A_T}{A_S} \times \frac{V'}{V} \times \frac{1}{C} \times 50000$$

C_S: Concentration (mg/mL) of the standard solution

C: Labeled amount (mg) of chlorpheniramine maleate ($C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$) in 1 tablet

Uniformity of dosage units It meets the requirements when the procedure for content uniformity is performed according to the following method.

Take 1 of Chlorpheniramine Maleate Tablets, add 10 mL of water, and shake well to disintegrate. Add water to make exactly V mL of a solution containing about 80 μg of chlorpheniramine maleate ($C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$) per mL, and filter through a membrane filter with a pore size of NMT 0.5 μm. Weigh accurately 5 mL of the filtrate, add exactly 2.5 mL of the internal standard solution, and add water to make exactly 10 mL. Use this solution as the test solution. Separately, dry the chlorpheniramine maleate RS at 105 °C for 3 hours, weigh accurately about 20 mg, and add water to make exactly 100 mL. Weigh accurately 20 mL of this solution, add accurately 25 mL of internal standard solution and water to make 100 mL, and use this solution as the standard solution. Perform the test with 30 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak area ratios, Q_T and Q_S, of chlorpheniramine maleate to that of the internal standard.

Amount (mg) of chlorpheniramine maleate ($C_{20}H_{38}N_4O_4$)
= Amount (mg) of chlorpheniramine maleate RS

$$\times \frac{Q_T}{Q_S} \times \frac{V}{250}$$

Internal standard solution—add water to 7 mL of a solution of butyl p-hydroxybenzoate in methanol (1 in 250) to make 1000 mL.

Assay Weigh accurately the mass of NLT 20 Chlorpheniramine Maleate Tablets, and powder. Weigh accurately an amount, equivalent to about 4 mg of chlorpheniramine maleate ($C_{20}H_{38}N_4O_4$), add 70 mL of the internal standard solution, and shake for 15 minutes to mix. Add the internal standard solution again to make exactly 100 mL, filter through a membrane filter with a pore size of NMT 0.5 μm, and use the filtrate as the test solution. Separately, dry chlorpheniramine maleate RS at 105 °C for 3 hours, weigh accurately about 20 mg, and add the internal standard solution to make exactly 100 mL. Pipet 20 mL of this solution, add the internal standard solution to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 30 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions and determine the peak area ratios, Q_T and Q_S, of chlorpheniramine to that of the internal standard for the test solution and the standard solution, respectively.

Amount (mg) of chlorpheniramine maleate ($C_{20}H_{38}N_4O_4$)
= Amount (mg) of chlorpheniramine maleate RS
$$\times \frac{Q_T}{Q_S} \times \frac{1}{5}$$

Internal standard solution—Add water to 7 mL of a solution of butyl p-hydroxybenzoate in methanol (1 in 1000) to make 1000 mL.

Operating conditions

Detector: An ultraviolet photometer (wavelength: 265 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: Dissolve 1 g of sodium 1-heptanesulfonate in 900 mL of water, add 10 mL of acetic acid(100), and add water again to make 1000 mL. To 650 mL of this solution, add 350 mL of acetonitrile.

Flow rate: Adjust the flow rate so that the retention time of chlorpheniramine is about 8 minutes.

System suitability

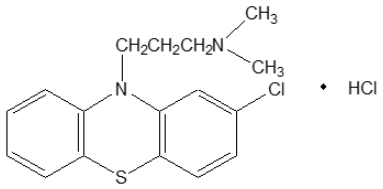
System performance: Proceed with 30 μL of the standard solution under the above operating conditions; the internal standard and chlorpheniramine are eluted in this order with the resolution being NLT 2.0.

System repeatability: Repeat the test 6 times with 30 μL each of the standard solution as directed under the above conditions; the relative standard deviation of the peak area ratios of chlorpheniramine to that of the internal standard is NMT 1.0%.

Time span of measurement: About 4 times the retention time of chlorpheniramine after the solvent peak.

Packaging and storage Preserve in tight containers.

Chlorpromazine Hydrochloride
클로르프로마진염산염



$C_{17}H_{19}ClN_2S \cdot HCl$: 355.33

3-(2-Chlorophenothiazin-10-yl)-*N*,*N*-dimethylpropan-1-amine hydrochloride [*69-09-0*]

Chlorpromazine Hydrochloride, when dried, contains NLT 99.0% and NMT 101.0% of chlorpromazine hydrochloride ($C_{17}H_{19}ClN_2 S \cdot HCl$).

Description Chlorpromazine Hydrochloride occurs as a white to pale yellow, crystalline powder and has no odor or a faint, characteristic odor.

It is very soluble in water, freely soluble in acetic acid(100) or ethanol(95), sparingly soluble in acetic anhydride, and practically insoluble in ether.

It is gradually colored by light.

Identification (1) Determine the infrared spectra of Chlorpromazine Hydrochloride and chlorpromazine hydrochloride RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared spectrophotometry; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) Dissolve 0.5 g of Chlorpromazine Hydrochloride in 5 mL of water, add 2 mL of ammonia TS, heat on a steam bath for 5 minutes, cool, and filter. Acidify the filtrate with dilute nitric acid; the resulting solution responds to the Qualitative Analysis (2) for chloride.

Melting point Between 194 and 198 ℃.

pH Dissolve 1.0 g of Chlorpromazine Hydrochloride in 20 mL of freshly boiled and cooled water; the pH of this solution is between 4.0 and 5.0.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Chlorpromazine Hydrochloride in 20 mL of water; the solution is clear and colorless to pale yellow.

(2) ***Heavy metals***—Proceed with 1.0 g of Chlorpromazine Hydrochloride according to Method 2 and perform the test. Prepare the control solution with 2.0 mL

of lead standard solution (NMT 20 ppm).

(3) ***Related substances (other alkylated phenothiazine)***—Weigh accurately about 50 mg of Chlorpromazine Hydrochloride, previously dried, dissolve in methanol to make exactly 10 mL, shake to mix, and use this solution as the test solution. Separately, weigh accurately about 50 mg of chlorpromazine hydrochloride RS, dissolve in methanol to make a 10 mL solution with a concentration of 5 mg per mL, and use this solution as the standard stock solution. Pipet 1 mL of this solution, add the methanol to make 20 mL, then pipet 1 mL of this solution, add methanol to make a 10 mL solution with a concentration of 25 μ*g* per mL, and use this solution as the standard solution. Spot 10 μL each of the test solution, the standard stock solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography under the Thin Layer Chromatography. Next, develop the plate with a mixture of ether and ethyl acetate saturated with ammonia water(28) (1:1) as a developing solvent to a distance of about 10 cm, and air-dry the plate for 20 minutes. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot obtained from the test solution are neither larger nor more intense than the spots from the diluted standard solution (NMT 0.5%).

Loss on drying NMT 0.5% (1 g, 105 ℃, 2 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh exactly about 0.7 g of Chlorpromazine Hydrochloride, previously dried, dissolve in 50 mL of a mixture of acetic anhydride and acetic acid(100) (7 : 3), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 1 mol/L perchloric acid VS
= 35.533 mg of $C_{17}H_{19}ClN_2S{\cdot}HCl$

Packaging and storage Preserve in light-resistant, tight containers.

Chlorpromazine Hydrochloride Injection
클로르프로마진염산염 주사액

Chlorpromazine Hydrochloride Injection is an aqueous solution for injection and contains NLT 95.0% and NMT 105.0% of the labeled amount of chlorpromazine hydrochloride ($C_{17}H_{19}ClN_2S{\cdot}HCl$: 355.33).

Method of preparation Prepare as directed under Injections, with Chlorpromazine Hydrochloride.

Description Chlorpromazine Hydrochloride Injection occurs a clear, colorless to pale yellow liquid.

pH—Between 4.0 and 6.5.

Identification (1) Perform the test with a volume of Chlorpromazine Hydrochloride Injection, equivalent to 5 mg of Chlorpromazine Hydrochloride according to the labeled amount, as directed under the Identification (1) under Chlorpromazine Hydrochloride.

(2) Perform the test with a volume of Chlorpromazine Hydrochloride Injection, equivalent to 0.1 g of Chlorpromazine Hydrochloride according to the labeled amount, as directed under the Identification (2) under Chlorpromazine Hydrochloride.

Sterility Meets the requirements

Bacterial endotoxins Less than 6.9 EU per mg of Chlorpromazine Hydrochloride.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Extractable volume of injections Meets the requirements.

Assay Take exactly a volume of Chlorpromazine Hydrochloride Injection, equivalent to about 0.15 g of chlorpromazine hydrochloride ($C_{17}H_{19}ClN_2S{\cdot}HCl$), add 30 mL of water and 10 mL of a solution of sodium hydroxide (1 in 5), and extract twice with 30 mL each of ether and three times with 20 mL each of ether. Wash with 10 mL each of water until the washings of all ether extracts combined do not exhibit a red color. Concentrate the ether extracts on a steam bath to about 20 mL, add 5 g of anhydrous sodium sulfate, allow to stand for 20 minutes, and filter through absorbent cotton. Wash with ether, combine the washings with the filtrate, and evaporate the ether on a steam bath. Dissolve the residue in 50 mL of acetone for non-aqueous titration and 5 mL of acetic acid(100) and titrate with 0.05 mol/L perchloric acid VS (indicator: 3 drops of bromocresol green-methylrosaniline chloride TS). The endpoint of titration is when the color of the solution changes from purple to bluish purple. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.05 mol/L perchloric acid VS
= 17.767 mg of $C_{17}H_{19}ClN_2S{\cdot}HCl$

Packaging and storage Preserve in light-resistant, hermetic containers. Colored containers may be used.

Chlorpromazine Hydrochloride Tablets
클로르프로마진염산염 정

Chlorpromazine Hydrochloride Tablets contain NLT 93.0% and NMT 107.0% of chlorpromazine hydrochloride ($C_{17}H_{19}ClN_2S \cdot HCl$: 355.33).

Method of preparation Prepare as directed under Tablets, with Chlorpromazine Hydrochloride.

Identification The retention time of the major peak obtained from the test solution and the standard solution under the Assay and the ultraviolet absorption spectrum at 200 to 400 nm are the same.

Purity ***Related substances (other related alkylation of phenothiazine)***—Weigh accurately NLT 20 Chlorpromazine Hydrochloride Tablets, and powder. Weigh accurately an amount, equivalent to about 50 g according to the labeled amount, and transfer to a stoppered centrifuge tube, add 10 mL of methanol, shake vigorously to mix, and centrifuge. Use this solution as the test solution. In the case of sugar-coated tablets, wash the coated sugar with water in advance to remove the sugarcoating. Separately, weigh accurately 50 mg of chlorpromazine hydrochloride RS, dissolve in methanol to make 10 mL to obtain a solution containing about 5 mg per mL, and use this solution as the standard stock solution. Take exactly 1 mL of this solution and add methanol to make 20 mL. Then, take again exactly 1 mL of this solution, add methanol to make 10 mL, prepare a solution containing 25 μg in 1 mL, and use this solution as the standard solution. Spot 10 μL each of the test solution, the standard stock solution and the standard solution on a thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography as directed under the Thin Layer Chromatography. Next, develop the plate with a mixture of ethyl acetate (1:1) saturated with ether and ammonia water(28) as a developing solvent to a distance of about 10 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot obtained from the test solution are not larger or not more intense than the spots from the standard solution (NMT 0.5%).

Dissolution Perform the test with 1 tablet of Chlorpromazine Hydrochloride Tablets at 75 revolutions per minute according to Method 2 under the Dissolution, using 900 mL of Solution 2 as the dissolution medium. Take more than 20 mL of the dissolution medium 60 minutes after starting the test, and filter by membrane filter with a pore size of NMT 0.8 μm. Discard the first 10 mL of the filtrate, take exactly V mL of the subsequent filtrate, and add Solution 2 according to the labeled amount to obtain a solution containing about 5.6 μg of chlorpromazine hydrochloride ($C_{17}H_{19}ClN_2S \cdot HCl$), and make it exactly V' mL. Use the clear supernatant as the test solution. Separately, dry chlorpromazine hydrochloride RS at 105 °C for 2 hours, weigh accurately about 90 mg, and dissolve in Solution 2 to make exactly 200 mL. Pipet 5 mL of this solution, and add Solution 2 to make exactly 100 mL. Pipet again 5 mL of this solution, add Solution 2 to make exactly 20 mL, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at the wavelength of 254 nm as directed under the Ultraviolet-visible Spectroscopy.
NLT 75% of the labeled amount of Chlorpromazine Hydrochloride is dissolved in 60 minutes.

Dissolution rate (%) with respect to the labeled amount of chlorpromazine hydrochloride ($C_{17}H_{19}ClN_2S \cdot HCl$)

$$= W_S \times \frac{A_T}{A_S} \times \frac{V'}{V} \times \frac{1}{C} \times 2$$

W_S: Amount (mg) of chlorpromazine hydrochloride RS

C: Labeled amount (mg) of chlorpromazine hydrochloride ($C_{17}H_{19}ClN_2S \cdot HCl$) in 1 tablet

Uniformity of dosage units Meets the requirements.

Assay Perform this test using a light-resistant container, protected from direct sunlight. Weigh accurately the mass of NLT 20 Chlorpromazine Hydrochloride Tablets, and powder. Weigh accurately an amount, equivalent to about 50 mg of chlorpromazine hydrochloride ($C_{17}H_{19}ClN_2S \cdot HCl$), add 60 mL of a mixture of diluted phosphoric acid (1 in 500) and ethanol(99.5) (7 : 3), and sonicate for 5 minutes. Shake vigorously for 20 minutes to mix, add a mixture of diluted phosphoric acid (1 in 500) and ethanol(99.5) (1 : 1) to make exactly 100 mL, and filter through a membrane filter with a pore size of NMT 0.45 μm. Discard 3 mL of the first filtrate, take exactly 2.5 mL of the subsequent filtrate, add exactly 5 mL of the internal standard solution, and add a mixture of diluted phosphoric acid (1 in 500) and ethanol(99.5) (1:1) to make exactly 25 mL, and use this solution as the test solution. Separately, dry the chlorpromazine hydrochloride RS at 105 °C for 2 hours, weigh accurately about 25 mg, and dissolve in a mixture of diluted phosphoric acid (1 in 500) and ethanol(99.5) (1 : 1) to make exactly 100 mL. Take exactly 5 mL of this solution, add exactly 5 mL of the internal standard solution and then a mixture of diluted phosphoric acid (1 in 500) and ethanol(99.5) (1 : 1) to make exactly 25 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak area ratios, Q_T and Q_S, of chlorpromazine hydrochloride to that of the internal standard.

Amount (mg) of chlorpromazine hydrochloride ($C_{17}H_{19}ClN_2S \cdot HCl$)
= Amount (mg) of chlorpromazine hydrochloride RS

$$\times \frac{Q_T}{Q_S} \times 2$$

Internal standard solution—A solution of ethylparaben in a mixture of diluted phosphoric acid (1 in

500) and ethanol(99.5) (1 : 1) (1 in 4500).

Operating conditions

Detector: An ultraviolet absorbance photometer (wavelength: 256 nm). However, use a photo-diode array detector (200 to 400 nm) when the Identification is performed.

Column: A stainless steel column about 4.6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: A mixture of diluted 0.05 mol/L sodium dihydrogen phosphate TS (1 in 2) and acetonitrile (27 : 13).

Flow rate: Adjust the flow rate so that the retention time of chlorpromazine is about 15 minutes.

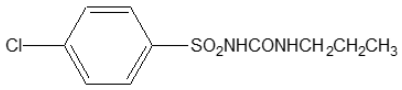
System suitability

System performance: Proceed with 10 μL of the standard solution according to the above conditions; the internal standard and chlorpromazine are eluted in this order with the resolution being NLT 10.

System repeatability: Repeat the test 6 times with 10 μL of the standard solution according to the above operating conditions; the relative standard deviation of the peak area ratios of chlorpromazine to that of the internal standard is NMT 1.0%.

Packaging and storage Preserve in light-resistant, tight containers.

Chlorpropamide
클로르프로파미드



$C_{10}H_{13}ClN_2O_3S$: 276.74

1-[(4-Chlorobenzene)sulfonyl]-3-propylurea [*94-20-2*]

Chlorpropamide, when dried, contains NLT 98.0% and NMT 101.0% of chlorpropamide ($C_{10}H_{13}ClN_2O_3S$).

Description Chlorpropamide occurs as white crystals or a crystalline powder, and is odorless.

It is freely soluble in acetone, soluble in ethanol(95), slightly soluble in ether, and practically insoluble in water.

Identification (1) Dissolve 80 mg of Chlorpropamide and chlorpropamide RS each in 50 mL of methanol. Pipet 1 mL each of these solutions and add 0.01 mol/L hydrochloric acid TS to make 200 mL. Determine the absorption spectra of the resulting solutions as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Chlorpropamide and chlorpropamide RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) Perform the test with Chlorpropamide as directed under the Flame Coloration (2); a green color is observed.

Melting point Between 127 and 131 °C.

Purity (1) ***Acid***—Add 150 mL of water to 3.0 g of Chlorpropamide, warm at 70 °C for 5 minutes, allow to stand in iced water for 1 hour, and filter. To 25 mL of the filtrate, add 2 drops of methyl red TS and 0.30 mL of 0.1 mol/L sodium hydroxide TS; the solution exhibits a yellow color.

(2) ***Chloride***—To 40 mL of the filtrate obtained in (1), add 6 mL of dilute nitric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 0.25 mL of 0.01 mol/L hydrochloric acid (NMT 0.011%).

(3) ***Sulfate***—To 40 mL of the filtrate obtained in (1), add 1 mL of dilute hydrochloric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 0.35 mL of 0.005 mol/L sulfuric acid (NMT 0.021%).

(4) ***Heavy metals***—Proceed with 2.0g of Chlorpropamide according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(5) ***Selenium***—Weigh about 0.2 g of Chlorpropamide and combust as directed under the Oxygen Flask Combustion, using 25 mL of diluted nitric acid (1 in 30) as an absorbent. Use the combustion flask with a volume of 1 L. After burning, wash the stopper and the inner wall of the flask with 10 mL of water, and use 20 mL of water to move the solution in the combustion flask into a 150-mL beaker. Heat lightly until it boils, boil for 10 minutes, allow to cool to the room temperature, and use this solution as the test solution. Separately, pipet 6.0 mL of standard selenium stock solution, add 25 mL of diluted nitric acid (1 in 30) and 25 mL of water, and use this solution as the standard solution. To each of the test and standard solutions, add diluted ammonia water(28) (1 in 2) to adjust the pH to 2.0 ± 0.2, add water to dilute exactly to 60 mL, and use 10.0 mL of water to move the diluted solution to a separatory funnel. Then, wash the separatory funnel with 10 mL of water. Add 0.2 g of hydroxylamine hydrochloride, and stir to dissolve. Then, immediately add 5.0 mL of 2,3-diaminonaphthalene TS, put a stopper, stir to mix, and allow to stand at the room temperature for 100 minutes. To the resulting mixture, add 5.0 mL of cyclohexane, shake hard for two minutes, and allow to stand. If layers are separated, remove the water layer, centrifuge cyclohexane extracts, remove water, and take the cyclohexane layer. With these solutions and a control solution prepared with 25 mL of water added to 25 mL of diluted nitric acid (1 in 30) in the same way,

perform the test as directed under the Ultraviolet-visible Spectroscopy. Determine the absorption at the absorption maximum wavelength around 380 nm; the absorption of the solution from the test solution is not larger than the absorption from the standard solution (NMT 30 ppm).

(6) ***Related substances***—Weigh 0.60 g of Chlorpropamide, dissolve in acetone to make exactly 10 mL, and use this solution as the test solution. Pipet 1 mL of this solution, add acetone to make exactly 300 mL, and use this solution as the standard solution (1). Separately, dissolve 60 mg of 4-chlorobenzenesulfonamide RS in acetone to make exactly 300 mL, and use this solution as the standard solution (2). With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution, the standard solution (1), and the standard solution (2) on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Develop the plate with a mixture of cyclohexane, 3-methyl-1-butanol, methanol and ammonia water(28) (15: 10 : 5 : 1) as the developing solvent to a distance of about 10 cm and air-dry the plate. Dry the plate at 100℃ for 1 hour, sprinkle sodium hypochlorite TS evenly, and then air-dry for 15 minutes. Sprinkle potassium iodide starch TS evenly; the spot obtained from the test solution, of which location corresponds to that of the spot from the standard solution (2), is not more intense than the spot obtained from the standard solution (2). The spots other than the principal spot from the test solution and the above spot are not more intense than those from the standard solution (1).

Loss on drying NMT 0.5% (1 g, 105 ℃, 3 hours).

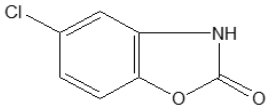
Residue on ignition NMT 0.2% (1 g).

Assay Weigh accurately about 0.5 g of Chlorpropamide, previously dried, dissolve in 30 mL of neutralized ethanol, add 20 mL of water, and titrate with 0.1 mol/L sodium hydroxide VS (indicator: 3 drops of phenolphthalein TS).

Each mL of 0.1 mol/L sodium hydroxide VS
= 27.674 mg of $C_{10}H_{13}ClN_2O_3S$

Packaging and storage Preserve in well-closed containers.

Chlorzoxazone
클로르족사존



$C_7H_4ClNO_2$: 169.57
5-Chloro-2,3-dihydro-1,3-benzoxazol-2-one [*95-25-0*]

Chlorzoxazone contains NLT 98.0% and NMT 102.0% of chlorzoxazone ($C_7H_4ClNO_2$), calculated on the dried basis.

Description Chlorzoxazone occurs as white to pale yellow crystals or a crystalline powder. It is odorless, tasteless and a little irritant.
It is freely soluble in *N*,*N*-Dimethylformamide, soluble in methanol, ethanol(95) or acetone, slightly soluble in ether, and practically insoluble in water.

Identification (1) Determine the absorption spectra of solutions of Chlorzoxazone and chlorzoxazone RS in methanol (1 in 50000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit a maximum and a minimum of absorption at the same wavelengths.

(2) Determine the infrared spectrum of Chlorzoxazone and chlorzoxazone RS as directed in the potassium bromide disk method under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Melting point Between 189 and 194 ℃.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Chlorzoxazone according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Related substances***—Weigh accurately an appropriate amount of Chlorzoxazone, dissolve in methanol to prepare a solution containing 20 mg in 1 mL, and use this solution as the test solution. Separately, weigh accurately an appropriate amount of 2-amino-4-chlorophenol RS (previously dried at 105 ℃ for 2 hours), dissolve in methanol to prepare a solution containing 100 μg in 1 mL, and use this solution as the standard solution (1). Also, dissolve in methanol to prepare a solution containing 50 μg in 1 mL, and use this solution as the standard solution (2). With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution, the standard solution (1), and the standard solution (2) on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of cyclohexane and acetone (2 : 1) as the developing solvent to a distance of about 15 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot obtained from the test solution are not more intense than the spot from the standard solution (1) (NMT 0.5%). Also, allow to stand in iodine vapor; the spots other than the principal spot obtained from the test solution are not greater and not more intense than the spot from the standard solution (2) (NMT 0.25%).

Loss on drying NMT 0.5% (1 g, 105 ℃, 2 hours).

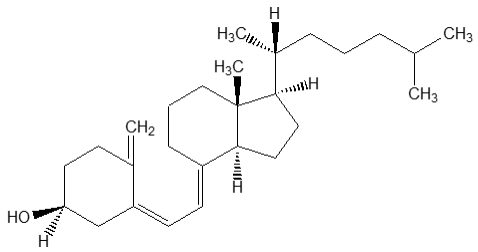
Residue on ignition NMT 0.15% (1 g).

Assay Weigh accurately about 50 mg of Chlorzoxazone and chlorzoxazone RS, (previously dried at 105 ºC for 2 hours), dissolve in methanol to make exactly 100 mL, respectively. Pipet 4 mL each of these solutions, add methanol to make exactly 100 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with the test solution and the standard solution as directed under the Ultraviolet-visible Spectroscopy, using methanol as a control solution, and determine the absorbances, A_T and A_S, at the wavelength of 282 nm.

$$\text{Amount (mg) of chlorzoxazone } (C_7H_4ClNO_2) = \text{Amount (mg) of chlorzoxazone RS} \times \frac{A_T}{A_S}$$

Packaging and storage Preserve in tight containers.

Cholecalciferol
콜레칼시페롤



Vitamin D_3 $C_{27}H_{44}O$: 384.64

(1*S*,3*Z*)-3-[(2*E*)-2-[(1*R*,3a*S*,7a*R*)-7a-Methyl-1-[(2R)-6-methylheptan-2-yl]-2,3,3a,5,6,7-hexa-hydro-1*H*-inden-4-ylidene]ethylidene]-4-methylidenecyclohexan-1-ol [*67-97-0*]

Cholecalciferol contains NLT 97.0% and NMT 103.0% of cholecalciferol ($C_{27}H_{44}O$).

Description Cholecalciferol occurs as a white crystalline powder and is odorless.
It is freely soluble in ethanol(95), chloroform, ether or isooctane, and practically insoluble in water.
It is affected by air or light.

Melting point— Between 84 and 88 ℃.
Transfer Cholecalciferol into a capillary tube, dry for 3 hours using a desiccator (in vacuum, NMT 2.67 kPa), seal the capillary tube, and put in a bath heated to a temperature of about 10 ℃ lower than the predicted melting point. Then heat at a rate of 3 ℃ per minute, and measure the melting point.

Identification (1) Dissolve 0.5 mg of cholecalciferol in 5 mL of chloroform, and add 0.3 mL of acetic anhydride and 0.1 mL of sulfuric acid and shake to mix; the solution exhibits a red color, then immediately changes to violet, then blue, then finally green.

(2) Determine the infrared spectra of cholecalciferol and cholecalciferol RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wave numbers.

Optical rotation $[\alpha]_D^{20}$: Between +103° and +112° (50 mg, ethanol(95), 10 mL, 100 mm) For this test, dissolve within 30 minutes after opening, and measure within 30 minutes of preparing the solution.

Absorbance $E_{1cm}^{1\%}$ (265 nm): Between 450 and 490 (10 mg, ethanol(95), 1000 mL).

Purity ***7-Dehydrocholesterol***—Dissolve 10 mg of cholecalciferol in 2.0 mL of diluted ethanol (9 in 10), then add a solution of 20 mg digitonin dissolved in 2.0 mL of diluted ethanol (9 in 10) and let stand for 18 hours; no precipitate forms.

Assay Weigh accurately about 30 mg each of cholecalciferol and cholecalciferol RS and add isooctane to each to make exactly 50 mL. Pipet 10 mL each of these solutions, add exactly 3 mL of internal standard solution to each solution, and add the mobile phase to make 50 mL. Use these solutions as the test solution and the standard solution, respectively. Perform the test with 10 μL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the ratio of the peak area of cholecalciferol to that of the internal standard Q_T and Q_S. Perform the test using light-resistant containers, avoiding contact with air or oxidizing agents.

$$\text{Amount (mg) of cholecalciferol } (C_{27}H_{44}O) = \text{Amount (mg) of cholecalciferol RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of dimethyl phthalate in isooctane (1 in 100).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and 10 cm to 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 to 10 μm in particle diameter).

Mobile phase: A mixture of hexane and *n*-amyl alcohol (997 : 3).

Flow rate: Adjust the flow rate so that the retention time of cholecalciferol is about 25 minutes.

Selection of column: Dissolve 15 mg of cholecalciferol RS in 25 mL of isooctane. Transfer the solution to a flask, heat for 2 hours in an oil bath with a reflux condenser, and quickly chill to room temperature. Transfer the solution to a quartz test tube and irradiate for 3 hours under a short-wavelength lamp (main wavelength: 254 nm) and a long-wavelength lamp (main wavelength: 365 nm). Pipet 10 mL of this solution and add the mobile

phase to make 50 mL. Proceed with 10 μL of this solution according to the above conditions; the ratios of the retention times of previtamin D_3, transvitamin D_3 and tachysterol $_3$ are about 0.5, about 0.6 and about 1.1, respectively, and the resolutions between previtamin D_3 and transvitamin D_3 and between cholecalciferol and tachysterolD_3 NLT 1.0, respectively.

Packaging and storage Place in light-resistant, well-closed containers, substituting air with nitrogen, and store in a cold place.

Cholecalciferol and Calcium Carbonate Capsules
콜레칼시페롤·탄산칼슘 캡슐

Cholecalciferol and Calcium Carbonate Capsules contain NLT 90.0% and NMT 150.0% of the labeled amount of cholecalciferol ($C_{27}H_{44}O$: 384.64) and NLT 90.0% and NMT 110.0% of the labeled amount calcium carbonate ($CaCO_3$: 100.09).

Method of preparation Prepare as directed under Capsules, with Cholecalciferol and Calcium Carbonate.

Identification (1) ***Cholecalciferol***—Perform the test with Cholecalciferol and Calcium Carbonate Capsules as directed under the Analysis for Vitamins.

(2) ***Calcium in calcium carbonate***—Dissolve the contents of Cholecalciferol and Calcium Carbonate Capsules equivalent to 0.5 g of calcium carbonate in 10 mL of dilute hydrochloric acid, boil and cool. Neutralize by adding ammonia TS; the solution responds to the Qualitative Analysis (3) for calcium salt.

(3) ***Carbonate in calcium carbonate***—Cholecalciferol and Calcium Carbonate Capsules respond to the Qualitative Analysis (1) for carbonate.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay (1) ***Cholecalciferol***—Weigh accurately the contents of NLT 20 capsules of Cholecalciferol and Calcium Carbonate Capsules. Weigh accurately an amount equivalent to about 30 mg of cholecalciferol ($C_{27}H_{44}O$) and about 30 mg of cholecalciferol RS, and add isooctane to make 50 mL. Pipet 10.0 mL each of these solutions, add 3.0 mL of the internal standard solution to each, add the mobile phase to make 50 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the ratios Q_T and Q_S, of the peak area of cholecalciferol, to that of the internal standard. However, perform the test with light-resistant containers, avoiding contact with air or other oxidizing agents as much as possible.

$$\text{Amount (mg) of cholecalciferol } (C_{27}H_{44}O) = \text{Amount (mg) of cholecalciferol RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of dimethyl phthalate in isooctane (1 in 100).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column with about 4 mm in internal diameter and 10 to 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm to 10 μm in particle diameter).

Mobile phase: A mixture of hexane and n-amyl alcohol (997 : 3).

Flow rate: Adjust the flow rate so that the retention time of cholecalciferol is about 25 minutes.

Selection of column: Dissolve 15 mg of cholecalciferol RS in 25 mL of isooctane. Put this solution to a flask with a reflex condenser, heat in an oil bath for 2 hours, and cool to room temperature quickly. Transfer this solution to a quartz test tube, expose to ultraviolet rays (main wavelength: 254 nm and 365 nm), and combine 10 mL of this solution and the mobile phase to make 50 mL. Proceed with 10 μL of this solution under the above operating conditions; the ratio of the retention times of previtamin D_3, transvitamin D_3 and tachysterol D_3 to that of cholecalciferol are about 0.5, 0.6 and 1.1, respectively. Resolutions of previtamin D_3 and transvitamin D_3, and cholecalciferol and tachysterol D_3 are NLT 1.0, respectively.

(2) ***Calcium carbonate***—Weigh accurately the contents of NLT 20 capsules of Cholecalciferol and Calcium Carbonate Capsules. Weigh an amount equivalent to 200 mg of calcium carbonate ($CaCO_3$), put in a crucible, ignite at 800 ℃ to incinerate, and cool. Dissolve this residue in 10 mL of water and 3 mL of 3 mol/L hydrochloric acid, and add water to make 150 mL. Add 15 mL of 1 mol/L sodium hydroxide TS to this solution, and titrate with 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS until the color changes from reddish purple to blue (indicator: 300 mg of hydroxynaphthol blue). Prepare the blank test solution by adding 15 mL of 1 mol/L sodium hydroxide TS to 150 mL of water, perform a blank test in the same manner and make any necessary correction.

$$\text{Each mL of 0.05 mol/L disodium ethylenediaminetetraacetate VS} = 5.004 \text{ mg of } CaCO_3$$

Packaging and storage Preserve in well-closed containers.

Cholecalciferol and Calcium Carbonate Tablets
콜레칼시페롤·탄산칼슘 정

Cholecalciferol and Calcium Carbonate Tablets contain NLT 90.0% and NMT 150.0% of the labeled amount of cholecalciferol ($C_{27}H_{44}O$: 384.64) and NLT 90.0% and NMT 110.0% of the labeled amount of calcium carbonate ($CaCO_3$: 100.09).

Method of preparation Prepare as directed under Tablets, with Cholecalciferol and Calcium Carbonate.

Identification (1) ***Cholecalciferol***—Perform the test with Cholecalciferol and Calcium Carbonate Tablets as directed under the Analysis for Vitamins.

(2) ***Calcium of calcium carbonate***—Dissolve an amount of Cholecalciferol and Calcium Carbonate Tablets equivalent to 0.5 g of calcium carbonate in 10 mL of dilute hydrochloric acid, and boil. After cooling, neutralize by adding ammonia TS; this solution responds to the Qualitative Analysis (3) for calcium salt.

(3) ***Carbonate of calcium carbonate***—Cholecalciferol and Calcium Carbonate Tablets responds to the Qualitative Analysis (1) for carbonate.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

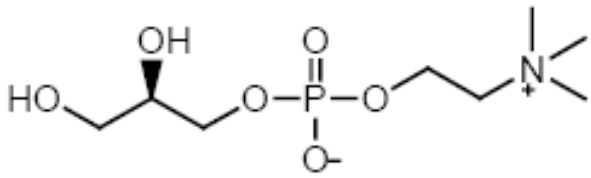
Assay (1) ***Cholecalciferol***—Weigh accurately the mass of NLT 20 tablets of Cholecalciferol and Calcium Carbonate Tablets, powder, and perform the test as directed under the Analysis for Vitamins.

(2) ***Calcium carbonate***—Weigh accurately the mass of NLT 20 tablets of Cholecalciferol and Calcium Carbonate Tablets, and powder. Weigh accurately an amount, equivalent to about 200 mg of calcium carbonate ($CaCO_3$), put in a crucible, ignite at 800℃ to incinerate, and cool. Dissolve this residue in 10 mL of water and 3 mL of 3 mol/L hydrochloric acid, and add water to make 150 mL. Add 15 mL of 1 mol/L sodium hydroxide TS to this solution, and titrate with 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS until the color changes from reddish purple to blue (indicator: 300 mg of hydroxynaphthol blue). Add 15 mL of 1 mol/L sodium hydroxide TS to 150 mL of water, perform a blank test in the same manner, and make any necessary correction.

Each mL of 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS
= 5.004mg of $CaCO_3$

Packaging and storage Preserve in well-closed containers.

Choline Alphoscerate
콜린알포세레이트



$C_8H_{20}NO_6P$: 257.20

(*R*)-2-[[(2,3-Dihydroxypropoxy)hydroxyphosphinyl]oxy]-*N*,*N*,*N*-trimethyl-ethanaminium, inner salt, [*28319-77-9*]

Choline Alphoscerate contains NLT 98.0% and NMT 102.0% of choline alphoscerate ($C_8H_{20}NO_6 \cdot HCl$: 257.20), calculated on the anhydrous basis.

Method of preparation If there is any possibility of glycidol or chloropropanediol to be mixed according to the manufacturing process of Choline Alphoscerate, take caution with starting material, manufacturing process, and intermediate material control to minimize the residue of impurities in consideration of risk assessment results. If necessary, the manufacturing process may be verified by the test data proving that no quality risk exists in the final drug substance.

Description Choline Alphoscerate occurs as a clear, colorless and viscous fluid.
It is freely soluble in water, methanol and ethanol, sparingly soluble in 1-butanol, and insoluble in acetone, ethyl acetate and ether.

Identification Weigh 0.2 g each of Choline Alphoscerate and choline alphoscerate RS, dissolve in 1 mL of methanol, and use these solutions as the test solution and the standard solution, respectively. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Develop the plate with a mixture of acetone, methanol, water and acetic acid(100) (30 : 24 : 12 : 12) as the developing solvent to a distance of about 15 cm, and air-dry the plate. Evenly spray the plate with a solution of 1.25 g of potassium permanganate and 12 g of sodium hydroxide dissolved in 300 mL of water as a coloring agent; the R_f values of the spots from the test solution and the standard solution are the same.

Optical rotation $[\alpha]_D^{20}$: Between -2.40° and -2.80° (2.5 g, calculated on the anhydrous basis, water, 25 mL, 100 mm).

pH Between 5.0 and 7.0 (10% aqueous solution).

Purity (1) ***Chloride***—Perform the test with 1 g of Cho-

line Alphoscerate as directed under the Chloride. Prepare the control solution with 0.53 mL of 0.01 mol/L hydrochloric acid (NMT 0.02%).

(2) ***Sulfate***—Perform the test with 1 g of Choline Alphoscerate as directed under the Sulfate. Prepare the control solution with 0.4 mL of 0.005 mol/L sulfuric acid (NMT 0.02%).

(3) ***Phosphoric acid ion***—Weigh 1 g of Choline Alphoscerate, dissolve in 10 mL of water, add 5 mL of a mixture of ammonium molybdate-sulfuric acid TS and ammonium metavanadate TS (1 : 1) and allow to stand for 5 minutes; the yellow color that appears is not more intense than the color of the control solution. For the control solution, add 5 mL of a mixture of ammonium molybdate-sulfuric acid TS and ammonium metavanadate TS (1 : 1) to 10 mL of standard phosphate solution.

Ammonium metavanadate TS—Add water to 0.2 g of ammonium vanadate (NH_4VO_3, 116.98) to make 400 mL.

(4) ***Heavy metals***—Proceed with 2.0 g of Choline Alphoscerate according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(5) ***Related substances***—Dissolve 1.0 g of Choline Alphoscerate in 10 mL of methanol and use this solution as the test solution. Pipet 0.5 mL of this solution, add methanol to make exactly 100 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Develop the plate with a mixture of acetone, methanol, water and acetic acid(100) (30 : 24 : 12 : 12) as the developing solvent to a distance of about 15 cm, and air-dry the plate. Evenly spray the plate with a solution of 1.25 g of potassium permanganate and 12 g of sodium hydroxide dissolved in 300 mL of water as a coloring agent; the spots other than the principal spot from the test solution are not greater or more intense than the spots from the standard solution (0.5%). Also, the sum of the spots other than the principal spot from the test solution is NMT 2.0%.

Water NLT 14.0% and NMT 16.0% (volumetric titration, direct titration).

Assay Weigh accurately an amount of Choline Alphoscerate equivalent to about 0.3 g of choline alphoscerate, calculated on the anhydrous basis, dissolve in 5 mL of mercuric acetate TS, dissolve in 50 mL of acetic anhydride, and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS

= 25.72 mg of $C_8H_{20}NO_6P$

Packaging and storage Preserve in light-resistant, tight containers.

Choline Alphoscerate Capsules
콜린알포세레이트 캡슐

Choline Alphoscerate Capsules contain NLT 95.0% and NMT 105.0% of the labeled amount of choline alphoscerate ($C_8H_{20}NO_6P$: 257.20).

Method of preparation Prepared as directed under Capsules, with Choline Alphoscerate.

Identification (1) Weigh the contents of Choline Alphoscerate Capsules equivalent to 0.4 g of choline alphoscerate, add methanol to make 2 mL, and use this solution as the test solution. Separately, weigh about 0.2 g of choline alphoscerate RS, dissolve in 1 mL of methanol, and use this solution as the standard solution. Perform the test with these solutions as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on a thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of acetone, methanol, water and acetic acid(100) (30 : 24 : 12 : 12) (as the developing solvent) to a distance of about 15 cm, and air-dry the plate. Evenly spray the plate with a solution of 1.25 g of potassium permanganate and 12 g of sodium hydroxide dissolved in 300 mL of water as a coloring agent; the R_f values of the spots of the test solution exhibits an R_f value corresponding to that of the standard solution.

(2) The retention times of the major peaks of the test solution correspond to those of the standard solution, as obtained in the Assay.

Dissolution Take 1 capsule of Choline Alphoscerate Capsules, proceed with 900 mL of water as the dissolution medium at 50 revolutions per minute according to Method 2 under the Dissolution, and perform the test. Take the dissolved solution 45 minutes after starting the test, filter and use the filtrate as the test solution. Separately, weigh accurately about 111.1 mg of choline alphoscerate RS, and dissolve in water to make exactly 25 mL. Filter the resulting solution, pipet 5 mL of the filtrate, add water to make exactly 50 mL, and use this solution as the standard solution. Perform the test with 50 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas of choline alphoscerate, A_T and A_S, in each solution. Meets the requirements if the dissolution rate of Choline Alphoscerate Capsules for 45 minutes is NLT 85%.

Dissolution rate (%) of the labeled amount of choline

$$\text{alphoscerate } (C_8H_{20}NO_6P) = W_S \times \frac{A_T}{A_S} \times \frac{1}{C} \times 360$$

W_S: Amount (mg) of choline alphoscerate RS

C: Labeled amount (mg) of choline alphoscerate ($C_8H_{20}NO_6P$) in 1 tablet

Operating conditions

Detector: A differential refractometer

Column: A stainless steel column with about 4.6 mm in internal diameter and about 25.0 cm in length, packed with aminopropylsilyl silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 38 °C.

Mobile phase: 60% acetonitrile.

Flow rate: 1.5 mL/min

System suitability

System repeatability: Repeat the test 6 times with 50 μL each of the standard solution according to the above operating conditions; the relative standard deviation of the peak area for choline alphoscerate is NMT 2.0%.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the contents of NLT 20 capsules of Choline Alphoscerate Capsules. Weight accurately an amount equivalent to about 4 g of Choline Alphoscerate Capsules, add 500 mL of water, crush with ultrasonic waves, add water to make exactly 1000 mL with shaking and stirring. Pipet 20 mL of this solution, add water to make 50 mL, filter through a membrane filter (0.45 μm), and use the filtrate as the test solution. Separately, weigh accurately about 0.4 g of choline alphoscerate RS, add water to make exactly 250 mL, and use this solution as the standard solution. Perform the test with 50 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas of choline alphoscerate, A_T and A_S, in each solution.

$$\text{Amount (mg) of choline alphoscerate} = \text{Amount (mg) of choline alphoscerate RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: A differential refractometer

Column: A stainless steel column about 4.6 mm in internal diameter and about 25.0 cm in length, packed with aminopropyl sylilated silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: 60% acetonitrile.

Temperature: A constant temperature of about 38 °C.

Flow rate: 1.5 mL/min

Packaging and storage Preserve in tight containers.

Chorionic Gonadotropin
태반성성선자극호르몬

Gonadotropin, chorionic [*9002-61-3*]

Chorionic Gonadotropin is a dried form of gonadotropin obtained from the urine of healthy pregnant women through a process of virus removal or inactivation.

Each mg of Chorionic Gonadotropin contains NLT 2500 chorionic gonadotropin units. Also, each mg of protein contains NLT 3000 chorionic gonadotropin units.

Chorionic Gonadotropin contains NLT 80.0% and NMT 125.0% of the labeling unit.

Description Chorionic Gonadotropin occurs as a white to pale yellowish brown powder and is odorless.
It is freely soluble in water and practically insoluble in ether.

Identification With Y_3 and Y_4 obtained from the Assay, calculate b using the following equation; b is NMT 120.

$$b = \frac{E}{I}$$
$$E = \frac{Y_3 - Y_4}{f}$$
$$I = \log \frac{T_H}{T_L}$$

f: The number of test animals in one group

Purity (1) ***Clarity and color of solution***—Dissolve 50 mg of Chorionic Gonadotropin in 5 mL of Isotonic Sodium Chloride Injection; the resulting solution is colorless to pale yellow and clear.

(2) ***Estrogen***—Weigh accurately an amount equivalent to 100 units based on the labeled units, dissolve in 0.5 mL of isotonic sodium chloride injection, and use this as the injection. Inject subcutaneously to 3 female white rats or mice that have been at least 2 weeks after castration. After injection, collect vaginal secretions twice a day for three consecutive days, on the 3rd, 4th, and 5th days, and spread a thin layer of these secretions onto a glass slide. After drying, stain with Giemsa TS, wash with water, dry, and examine under a microscope; any sign of estrus does not appear.

Loss on drying NMT 5.0% (0.1 g, in vacuum, phosphorus pentoxide, 4 hours).

Bacterial endotoxins Less than 0.03 EU per unit of Chorionic Gonadotropin.

Abnormal toxicity Take an appropriate amount of Chorionic Gonadotropin, make the solution containing 120 units per mL, and use this solution as the test solution. Use at least two healthy and well-nourished marmots

weighing about 350 g each. Administer an intraperitoneal injection of 5.0 mL of the test solution per marmot, and observe them for at least 7 days; none of the marmots exhibit abnormalities.

Inactivity Perform the Assay and the following test with Chorionic Gonadotropin; Chorionic Gonadotropin contains NLT 3000 units of placental chorionic gonadotropin per mg of protein.

(1) ***Test solution***—Prepare a solution by adding an appropriate amount of water according to the labeled amount of Chorionic Gonadotropin so that 1 mL of the solution contains about 500 units.

(2) ***Standard solution***—Weigh accurately 10 mg of bovine serum albumin, and dissolve in water to make exactly 20 mL. To this solution, add water to make four different standard solutions containing exactly 300, 200, 100, and 50 μg of each bovine serum albumin per mL.

(3) **Procedure**—Pipet 0.5 mL each of the four standard solutions and 0.5 mL of the test solution, transfer into glass test tubes with a internal diameter of about 18 mm and a length of about 130 mm, add exactly 5 mL of alkaline copper TS to each tube, and shake to mix. Warm it on a steam bath for 10 minutes, add exactly 0.5 mL of diluted Folin TS (1 in 2), shake to mix, and warm it on a steam bath for 20 minutes. To these solutions, proceed in the same manner by using 0.5 mL of water, and use this solution as the control solution. Perform the test as directed under the Ultraviolet-visible Spectroscopy to measure the absorbances at the wavelength of 750 nm.
Using the absorbance obtained from each standard solution, prepare a calibration curve by plotting absorbance on the y-axis and concentration on the x-axis. Use this calibration curve to determine the amount of protein in the test solution and calculate the content in the sample.

Assay (1) ***Test animals***—Use a healthy female white mice with a weight of about 45 g.

(2) ***Standard solution***—Dissolve chorionic gonadotropin RS in bovine serum albumin-Isotonic Sodium Chloride Injection to make solutions containing 7.5, 15, 30, and 60 units per 2.5 mL of this solution, respectively. Inject each of these solutions into four groups of test animals, each consisting of 5 animals according to the procedure (4), and measure the ovarian weight. Separately, inject bovine serum albumin-Isotonic Sodium Chloride Injection into one group, and use this as the control group. Based on the test results, the concentration of the standard substance, which is estimated to result in ovarian mass about 2.5 times that of the control group, is set as the concentration of the low-concentration standard solution. The concentration of the high-concentration standard solution is set at 1.5 to 2.0 times the concentration of the low-concentration standard solution. Dissolve the chorionic gonadotropin RS in bovine serum albumin-Isotonic Sodium Chloride Injection so that the concentration of this solution matches the predetermined concentration of the high-concentration standard solution and low-concentration standard solution, and use these solutions as the high-concentration standard solution S_H and the low-concentration standard solution S_L.

(3) ***Test solution***—Weigh accurately an appropriate amount of Chorionic Gonadotropin according to the labeling unit, dissolve in bovine serum albumin-Isotonic Sodium Chloride Injection to make solutions containing the same number of units in the same volume, and use these solutions as the high-concentration test solution T_H, and the low-concentration test solution T_L.

(4) ***Procedure***—Divide the test animals into four groups, A, B, C, and D, each with at least 10 individuals in a randomized manner. Inject subcutaneously 0.5 mL of S_H, S_L, T_H, and T_L to each group once a day for 5 days. On the 6th day, extract the ovaries, remove attached fat and other unnecessary tissues, absorb lightly with filter paper, and measure the ovarian mass immediately.

(5) ***Calculation***—The ovarian masses obtained from S_H, S_L, T_H, and T_L are denoted as y_1, y_2, y_3, and y_4, respectively. Sum the values of y_1, y_2, y_3, and y_4 for each group to obtain Y_1, Y_2, Y_3, and Y_4, respectively.

The number of units in each mg of Chorionic Gonadotropin = Anti log M × (the units per mL of the high-concentration standard solution) × $\frac{b}{a}$

$$M = \frac{IY_a}{Y_b}$$

$$I = \log\frac{S_H}{S_L} = \log\frac{T_H}{T_L}$$

$$Y_a = -Y_1 + Y_2 + Y_3 - Y_4$$

$$Y_b = Y_1 + Y_2 + Y_3 + Y_4$$

a: Sampling amount (mg)

b: Total volume (mL) of the high-concentration test solution with the sample dissolved in bovine serum albumin-Isotonic Sodium Chloride Injection

However, according to the following equation, F' is smaller than F_1 for n calculated based on S^2. Also, calculate L (P = 0.95) according to the following equation; L is NMT 0.3. If F' exceeds F_1 or L exceeds 0.3, increase the number of test animals or adjust the experimental conditions until these values are not exceeded, and repeat the test.

$$F = \frac{(Y_1 - Y_2 - Y_3 + Y_4)^2}{4fs^2}$$

$$s2 = \frac{\sum y^2 - \frac{Y}{f}}{n}$$

$$L = 2\sqrt{(C-1)(CM^2 + 0.09062)}$$

$$C = \frac{Y_b^2}{Y_b^2 - 4fs^2t^2}$$

$$Y = Y_1^2 + Y_2^2 + Y_3^2 + Y_4^2$$

$$n = 4(f\text{-}1)$$

f: The number of test animals in each group
$\sum y^2$: Sum of the squares of y_1, y_2, y_3, and y_4 for each group
t^2: The values in the table for s^2 calculated for different values of n.

n	$t^2 = F$	n	$t^2 = F$	n	$t^2 = F$
1	161.45	13	4.667	25	4.242
2	18.51	14	4.600	26	4.225
3	10.129	15	4.543	27	4.210
4	7.709	16	4.494	28	4.196

12	4.747	24	4.260		

Packaging and storage Preserve in light-resistant, tight containers in a cold place.

Chorionic Gonadotrophin for Injection
주사용 태반성성선자극호르몬

Chorionic Gonadotrophin for Injection is a preparation for injection, which is dissolved before use. It contains NLT 80.0% and NMT 125.0% of the labeled units of chorionic gonadotrophin.

Method of preparation Prepare as directed under Injections, with Chorionic Gonadotrophin.

Description Chorionic Gonadotrophin for Injection occurs as a white to pale yellowish brown powder or a mass. It is freely soluble in water.

Identification Perform the test as directed under the Identification of Chorionic Gonadotrophin.

Loss on drying NMT 5.0% (1.0 g, in vacuum, phosphorus pentoxide, 4 hours).

Sterility Meets the requirements.

Bacterial endotoxins Less than 0.03 EU per 1 unit of Chorionic Gonadotrophin for Injection.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Perform the test as directed under the Assay under Chorionic Gonadotrophin. The ratio of the quantified units to the labeled units is calculated by the following equation.

The ratio of the quantified units to the labeled units
= Antilog M

Packaging and storage Preserve in light-resistant, hermetic containers, and in a cold place.

Chromium in Dried Yeast
크롬함유건조효모

Chromium in Dried Yeast is prepared by culturing yeast in a culture medium containing chromium to make chromium to organically bind to the yeast.

Chromium in Dried Yeast contains NLT 500 μg of chromium (Cr : 52.00) per g.

Description Chromium in Dried Yeast occurs as a white or light gray powder and has taste and smell of yeast.

Identification Similar intensities of absorption are exhibited at the same wavelengths when measured as directed under the Assay.

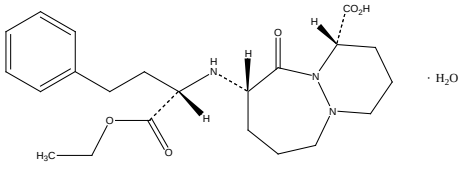
Loss on drying NMT 6.0% (1 g, 70 ℃, 3 hours).

Residue on ignition NMT 8.0% (1 g).

Assay Weigh accurately about 0.1 g of Chromium in Dried Yeast and perform the test as directed under the Analysis for Minerals.

Packaging and storage Preserve in light-resistant, tight containers.

Cilazapril Hydrate
실라자프릴수화물



Cilazapril $C_{22}H_{31}N_3O_5 \cdot H_2O$: 435.51
(1*S*,9*S*)-9-{[(2*S*)-1-Ethoxy-1-oxo-4-phenylbutan-2-yl]amino}-10-oxo-octahydro-1*H*-pyridazino[1,2-a][1,2]diazepine-1-carboxylic acid monohydrate [*92077-78-6*]

Cilazapril Hydrate contains NLT 98.5% and NMT 101.5% of cilazapril hydrate ($C_{22}H_{31}N_3O_5 \cdot H_2O$), calculated on the anhydrous basis.

Description Cilazapril Hydrate occurs as white to yellowish white crystals or a crystalline powder.
It is very soluble in methanol, freely soluble in ethanol(99.5) or acetic acid(100), and slightly soluble in water.
It is gradually changed to yellow by light.

Identification (1) To 4 mL of an aqueous solution of Cilazapril Hydrate (1 in 1000), add 2 mL of Dragendorff's TS; an orange precipitate is produced.

(2) Determine the infrared spectra of Cilazapril Hydrate and cilazapril hydrate RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy, respectively; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Optical rotation $[\alpha]_{365\,nm}^{20}$: Between -383° and -399° [0.2 g calculated on the anhydrous basis, 0.067 mol/L phosphate buffer solution (pH 7.0), 50 mL, 100 mm)].

Purity (1) ***Chloride***—Perform the test using 1.0 g of Cilazapril Hydrate. Prepare the control solution with 0.25 mL of 0.01 mol/L hydrochloric acid TS (NMT 0.009%).

(2) ***Sulfate***—Dissolve 1.0 g of Cilazapril Hydrate in 40 mL of water and 1.5 mL of dilute hydrochloric acid, and add water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.4 mL of 0.005 mol/L sulfuric acid TS (NMT 0.019%).

(3) ***Heavy metals***—Proceed with 1.0g of Cilazapril Hydrate according to Method 4, and perform the test. However, use 10 mL of a solution of magnesium nitrate in ethanol(95) (1 in 8). Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(4) ***Related substance I***—Dissolve 0.20 g of Cilazapril Hydrate in methanol to make exactly 5 mL, and use this solution as the test solution. Separately, weigh accurately 2 mg of cilazapril related substance I {1,1-Dimethylethyl (1*S*,9*S*)-9-[[(*S*)-1-(ethoxycarbonyl)-3-phenylpropyl]amino]-10-oxooctahydro-6*H*-pyridazino[1,2-α][1,2]diazepine-1-carboxylate} RS, dissolve in methanol to make exactly 50 mL, and use this solution as the standard solution (1). Dissolve 5 mg each of cilazapril related substance I RS and Cilazapril Hydrate in methanol to make exactly 10 mL, and use this solution as the standard solution (2). With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution, the standard solution (1) and the standard solution (2) on a plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of ethyl acetic acid, methanol, hexane, acetic acid and water (60 : 15 : 15: 5) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Spray evenly a mixture of 12 w/v% ascetic acid and bismuth potassium iodide TS (10 : 1) on the plate, and then spray hydrogen peroxide TS; the spots of related substance I from the test solution are not more intense than those from the standard solution (1) (NMT 0.1%). However, the test is valid when the two spots obtained from the standard solution (2) are clearly separated.

(5) ***Other related substances***—Weigh accurately 25 mg of Cilazapril Hydrate, dissolve in the mobile phase to make exactly 50 mL, and use this solution as the test solution. To 1.0 mL of the test solution, add the mobile phase to make exactly 50 mL, and to 5.0 mL of this solution, add the mobile phase to make exactly 20 mL, and use this solution as the standard solution (1). Separately, dissolve 10 mg of cilazapril related substance IV {(1S,9S)-9-[[(R)-1-(Ethoxycarbonyl)-3-phenylpropyl]amino]-10-oxooctahydro-6H-pyridazino[1,2-a][1,2]diazepine-1-carboxylic acid} RS in the test solution to make exactly 20 mL, and use this solution as the standard solution (2). Perform the test with 20 μL each of the test solution and the standard solution (1) according to the following conditions, as directed under the Liquid Chromatography. The peak area corresponding to related substance IV from the test solution is not greater than 0.4 times the major peak area from the standard solution (1) (0.2%), the peak area corresponding to cilazapril related substance II {(1S,9S)-9-[[(S)-1-Carboxy-3-phenylpropyl]amino]-10-oxooctahydro-6H-pyridazino[1,2-a][1,2]diazepine-1-carboxylic acid} is not greater than the major peak area from the standard solution (1) (0.5%), the peak area corresponding to cilazapril related substance III {ethyl (1S,9S)-9-[[(S)-1-(ethoxycarbonyl)-3-phenylpropyl]amino]-10-oxooctahydro-6H-pyridazino[1,2-a][1,2]diazepine-1-carboxylate} is not greater than 0.2 times the major peak area from the standard solution (1) (0.1%), the peak areas other than the major peak and peaks of related substances II, III, and IV of the test solution is not greater than 0.2 times the major peak area from the standard solution (1) (0.1%), and the total area of all peaks other than the major peak is not greater than 2 times the major peak area from the standard solution (1). However, the peaks with areas smaller than 0.1 times the major peak area obtained from the standard solution (1) and the peak area of related

substance I are excluded.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 214 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: Add 10mL of triethylamine to 750 mL of water to mix, add phosphoric acid to adjust the pH to 2.3, add 200mL of tetrahydrofuran, and mix.

Flow rate: 1 mL/min

System suitability

Test for required detectability: Proceed with 20 μL each of the test solution and the standard solution (1) under the above conditions; the relative retention times of related substances II, IV and III to the peak retention time of cilazapril are about 0.6, 0.9 and 1.6, respectively.

System performance: Adjust the sensitivity of the system so that the height of the major peak obtained from the standard solution (1) by testing under the above conditions using 20 μL each of the standard solution (1) and standard solution (2) is NLT 50% of the full scale of the data collection device; the resolution of the cilazapril peak and related substance IV peak obtained from the standard solution (2) is NLT 2.5.

Time span of measurement: About 2 times the peak retention time of cilazapril. If related substance I with relative retention time between 4 and 5 is present, it is eluted.

Water Between 3.5% and 5.0% (0.3 g, volumetric titration, direct titration).

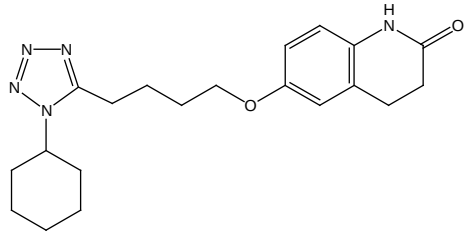
Residue on ignition 0.1% (1 g).

Assay Weigh accurately about 0.3 g of Cilazapril Hydrate, dissolve in 10 mL of ethanol(95), add water to make 50 mL, and titrate with 0.1 mol/L sodium hydroxide VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS
= 41.75 mg of $C_{22}H_{31}N_3O_5 \cdot H_2O$

Packaging and storage Preserve in well-closed containers.

Cilostazol
실로스타졸



$C_{20}H_{27}N_5O_2$: 369.46

6-[4-(1-Cyclohexyltetrazol-5-yl)butoxy]-3,4-dihydro-1*H*-quinolin-2-one [*73963-72-1*]

Cilostazol, when dried, contains NLT 98.5% and NMT 101.5% of cilostazol ($C_{20}H_{27}N_5O_2$).

Description Cilostazol occurs as white to pale yellowish white crystals or a crystalline powder.
It is slightly soluble in methanol, ethanol(99.5) and acetonitrile, and practically insoluble in water.

Identification (1) Determine the absorption spectra of solutions of Cilostazol and Cilostazol RS in methanol (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Cilostazol and Cilostazol RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy, respectively; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Melting point Between 158 and 162 ℃.

Purity (1) ***Heavy metals***—Proceed with 2.0 g of Cilostazol according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Related substances***—Dissolve 25 mg of Cilostazol in 25 mL of acetonitrile, and use this solution as the test solution. Pipet 1 mL of the test solution, and add acetonitrile to make exactly 100 mL. Pipet 10 mL of this solution, add acetonitrile to make exactly 50 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak area of each solution by the automatic integration method; the each peak area other than cilostazol obtained from the test solution is not larger than 0.7 times the peak area of cilostazol from the standard solution. Also, the sum of peak areas other than the peak of cilostazol from the test solution is not larger than 1.2 times the peak area of cilostazol from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 15 cm in length, packed with silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: A mixture of hexane, ethyl acetate and methanol (10 : 9 : 1).

Flow rate: Adjust the flow rate so that the retention time of cilostazol is about 7 minutes.

System suitability

Test for required detectability: Pipet 1 mL of the standard solution, and add acetonitrile to make exactly 10 mL. Confirm that the peak area of cilostazol obtained from 10 μL of this solution is equivalent to 7 to 13% of that of the standard solution.

System performance: Pipet 1 mL of the test solution, add 1 mL of a solution prepared by dissolving 5 mg of 3,4-dihydro-6-hydroxy-2(1H)-quinolinone in 10 mL of acetonitrile, and add acetonitrile to make exactly 100 mL. Proceed with 10 μL of this solution under the above conditions; 3,4-dihydro-6-hydroxy-2(1H)-quinolinone and cilostazol are eluted in this order with the resolution between these peaks being NLT 9.0.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution under the above conditions; the relative standard deviation of the peak area of cilostazol is NMT 2.0%.

Time span of measurement: About 3 times the retention time of cilostazol beginning after the solvent peak.

Loss on drying NMT 0.1% (1 g, 105 °C, 2 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 50 mg each of Cilostazol and Cilostazol RS, previously dried, dissolve each in methanol, add exactly 5 mL of the internal standard solution, and add methanol to make 50 mL. Take 1 mL each of these solutions, add methanol to make 10 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 10 μL each of these solutions as directed under the Liquid Chromatography according to the following conditions, and determine the peak area ratios, Q_T and Q_S, of cilostazol to that of the internal standard.

$$\text{Amount (mg) of cilostazol } (C_{20}H_{27}N_5O_2) = \text{Amount (mg) of cilostazol RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of benzophenone in methanol (1 in 250).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: A mixture of water, acetonitrile and methanol (10 : 7 : 3).

Flow rate: Adjust the flow rate so that the retention time of cilostazol is about 9 minutes.

System suitability

System performance: Proceed with 10 μL of the standard solution under the above conditions; cilostazol and the internal standard are eluted in this order with the resolution between these peaks being NLT 9.0.

System repeatability: Repeat the test 5 times with 10 μL each of the standard solution under the above conditions; the relative standard deviation of the peak area ratio of cilostazol to that of the internal standard is NMT 1.0%.

Packaging and storage Preserve in well-closed containers.

Cilostazol Tablets
실로스타졸 정

Cilostazol Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of cilostazol ($C_{20}H_{27}N_5O_2$: 369.46).

Method of preparation Prepare as directed under tablets, with Cilostazol.

Identification Weigh an amount of Cilostazol Tablets, previously powdered, equivalent to 50 mg of cilostazol according to the labeled amount, add 10 mL of acetone, mix well, and centrifuge. Take the clear supernatant and use the solution as the test solution. Separately, dissolve 25 mg of cilostazol RS in 5 mL of acetone and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 6 μL each of the test solution and the standard solution on a thin-layer chromatographic plate of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of ethyl acetate, acetonitrile, methanol and formic acid (75 : 25 : 5 : 1) as the developing solvent to a distance of about 12 cm and air-dry the plate. Spray evenly Dragendorff's TS on the plate; the principal spots from the test solution and the standard solution are orange and have the same R_f value.

Dissolution Perform the test with 1 tablet of Cilostazol Tablets at 50 revolutions per minute according to Method 2 under the Dissolution, using 900 mL of sodium lauryl sulfate solution (3 in 1000) as the dissolution medium.

Take NLT 20 mL of the dissolved solution 45 minutes for a 50 mg tablet and 60 minutes for a 100 mg tablet after starting the test and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard the first 10 mL of the filtrate, take accurately *V* mL of the subsequent filtrate, add the solution of sodium lauryl sulfate (3 in 1000) to make exactly *V'* mL of a solution having known concentration of about 5.6 μg of cilostazol ($C_{20}H_{27}N_5O_2$) per mL according to the labeled amount, and use this solution as the test solution. Separately, weigh accurately about 28 mg of cilostazol RS, previously dried at 105 °C for 2 hours, and dissolve in methanol to make exactly 100 mL. Pipet 4 mL of this solution, add the solution of sodium lauryl sulfate (3 in 1000) to make exactly 200 mL, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution at 257 nm as directed under the Ultraviolet-visible Spectroscopy using the solution of sodium lauryl sulfate (3 in 1000) as the control solution. It meets the requirements when the dissolution rates of 50 mg of Cilostazol Tablets and 100 mg of Cilostazol Tablets in 45 minutes are NLT 75% and NLT 70%, respectively.

Dissolution rate (%) with respect to the labeled amount of cilostazol ($C_{20}H_{27}N_5O_2$)

$$= \text{Amount (mg) of cilostazol RS} \times \frac{A_T}{A_S} \times \frac{V'}{V} \times \frac{1}{C} \times 18$$

C: Labeled amount of cilostazol ($C_{20}H_{27}N_5O_2$) in 1 table

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately and powder NLT 20 tablets of Cilostazol Tablets. Weigh accurately an amount, equivalent to about 50 mg of cilostazol ($C_{20}H_{27}N_5O_2$), add exactly 5 ml of the internal standard solution, and add methanol to make 50 mL. Shake well to mix for 10 minutes. Take 1 mL of this solution, add methanol to make 10 mL, filter through a membrane filter with a pore size not exceeding 0.5 μm, and use the filtrate as the test solution. Separately, weigh accurately about 50 mg of cilostazol RS, dissolve in methanol, add exactly 5 ml of the internal standard solution, and add methanol to make 50 mL. Take 1 mL of this solution, add methanol to make exactly 10 mL, and use the solution as the standard solution. Perform the test with each 10 μL of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions and determine the ratios, Q_T and Q_S, of the peak area of cilostazol to that of the internal standard.

Amount (mg) of cilostazol ($C_{20}H_{27}N_5O_2$)

$$= \text{Amount (mg) of cilostazol RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of benzophenone in methanol (1 in 250).

Operating conditions

Proceed as directed under the operating conditions described in the Assay under Cilostazol.

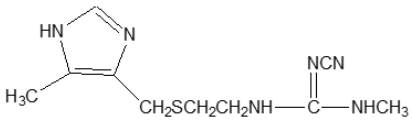
System suitability

System performance: Proceed as directed under the system suitability in the Assay under Cilostazol.

System repeatability: Repeat the test 6 times with each 10 μL of the standard solution according to the above conditions; the relative standard deviation of the peak area ratio of cilostazol to the internal standard is NMT 1.5%.

Packaging and storage Preserve in well-closed containers.

Cimetidine
시메티딘



$C_{10}H_{16}N_6S$: 252.34

2-Cyano-1-methyl-3-{2-[(5-methyl-1*H*-imidazol-4-yl)methylsulfanyl]ethyl}guanidine [*70059-30-2*]

Cimetidine, when dried, contains NLT 99.0% and NMT 101.0% of cimetidine ($C_{10}H_{16}N_6S$).

Description Cimetidine occurs as a white crystalline powder. It is odorless and has a bitter taste.
It is freely soluble in methanol or in acetic acid(100), sparingly soluble in ethanol(95), slightly soluble in water and practically insoluble in ether.
It dissolves in dilute hydrochloric acid.
It is gradually colored by light.

Identification (1) To 0.1 mL of a solution of Cimetidine in ethanol(95) (1 in 100), add 5 mL of citric acid-acetic anhydride TS and heat on a steam bath for 15 minutes; the resulting solution exhibits a purple color.

(2) Determine the infrared spectra of Cimetidine and cimetidine RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

pH Dissolve 0.5 g of Cimetidine in 50 mL of freshly boiled and cooled water, shake for 5 minutes to mix, and filter; the pH of this solution is between 9.0 and 10.5.

Melting point Between 140 and 144 °C.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Cimetidine in 10 mL of methanol; the resulting solution is colorless to pale yellow and clear.

(2) ***Heavy metals***—Proceed with 2.0 g of Cimetidine according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Arsenic***—Dissolve 1.0 g of Cimetidine in 5 mL of dilute hydrochloric acid and perform the test using this solution as the test solution (NMT 2 ppm).

(4) ***Related substances***—Dissolve 0.5 g of Cimetidine in 10 mL of methanol and use this solution as the test solution. Pipet 1 mL of this solution and add methanol to make exactly 100 mL. Pipet 1 mL of this solution, add methanol to make exactly 10 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under the Thin Layer Chromatography. Spot 4 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate using a mixture of ethyl acetate, methanol and ammonia water(28) (21 : 2 : 2) as the developing solvent to a distance of about 15 cm, air-dry the plate, and then dry further at 80 ℃ for 30 minutes. Allow the plate to stand in iodine vapor for 45 minutes; the spots other than the principal spot obtained from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 0.5% (1 g, 105 ℃, 3 hours).

Residue on ignition NMT 0.25%. (1 g).

Assay Weigh accurately about 0.24 g of Cimetidine, previously dried, dissolve in 75 mL of acetic acid(100), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 25.234 mg of $C_{10}H_{16}N_6S$

Packaging and storage Preserve in light-resistant, well-closed containers.

Cimetidine Tablets
시메티딘 정

Cimetidine Tablets contains NLT 90.0% and NMT 110.0% of the labeled amount of cimetidine ($C_{10}H_{16}O_6$: 252.34).

Method of preparation Prepare as directed under Tablets, with Cimetidine.

Identification The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

Dissolution Perform the test with 1 tablet of Cimetidine Tablets at 100 revolutions per minute according to Method 1 under the Dissolution, using 900 mL of 0.01 mol/L hydrochloric acid TS as the dissolution medium. Take the dissolved solution 15 minutes after starting the Dissolution and, if necessary, dilute with 0.01 mol/L hydrochloric acid TS. Use this solution as the test solution. Separately, weigh accurately an appropriate amount of cimetidine RS, dissolve in 0.01 mol/L hydrochloric acid TS to make it the same concentration as the test solution, and use this solution as the standard solution. Perform the test with the test solution and the standard solution as directed under the Ultraviolet-visible Spectroscopy, using 0.01 mol/L hydrochloric acid TS as a control, and determine the absorbance at the absorbance maximum wavelength (λmax) of about 218 nm.

It meets the requirements if the dissolution rate of Cimetidine Tablets in 15 minutes is NLT 80%.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 tablets of Cimetidine Tablets and powder. Weigh accurately a portion of powder, equivalent to about 0.1 g of cimetidine ($C_{10}H_{16}N_6S$), add 50 mL of methanol, shake for 2 minutes to mix, add 40 mL of water, sonicate for 15 minutes, and add water to make exactly 250 mL. To 5.0 mL of this solution, add the mobile phase to it make exactly 200 mL, and use this solution as the test solution. Separately, weigh accurately about 20 mg of cimetidine RS and dissolve in a mixture of water and methanol (4 : 1) to make exactly 50 mL. To 5.0 mL of this solution, add the mobile phase to make exactly 200 mL, and use this solution as the standard solution. Perform the test with 50 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions and determine the peak areas, A_T and A_S, of cimetidine.

Amount (mg) of cimetidine ($C_{10}H_{16}N_6$)
$= \text{Amount (mg) of cimetidine RS} \times \frac{A_T}{A_S} \times 5$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

Column: A stainless steel column about 3.9 mm in internal diameter and about 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 μm to 10 μm in particle diameter).

Mobile phase: Add 0.3 mL of phosphoric acid and water to 200 mL of methanol to make 1000 mL.

Flow rate: 2 mL/min

System suitability

System repeatability: Repeat the test 6 times with 50 μL of the standard solution under the above operating conditions; the relative standard deviation of the peak area of cimetidine is NMT 2.0%.

Packaging and storage Preserve in well-closed containers.

Cimetidine, Aldioxa and Magnesium Aluminosilicate Tablets
시메티딘·알디옥사·규산알루민산마그네슘 정

Cimetidine, Aldioxa and Magnesium Aluminosilicate Tablets contain NLT 90.0% and NMT 110.0% of the labeled amounts of cimetidine ($C_{10}H_{16}N_6S$: 252.34), aldioxa ($C_4H_7AlN_4O_5$: 218.10), magnesium oxide (MgO: 40.30) in magnesium aluminosilicate, and total aluminum oxide in magnesium aluminosilicate and aldioxa (Al_2O_3: 101.96).

Method of preparation Prepare as directed under Tablets, with Cimetidine, Aldioxa, and Magnesium Aluminosilicate.

Identification (1) ***Cimetidine***—The major peaks of the test solution and standard solution obtained under the Assay are the same in the retention time.

(2) ***Aldioxa***—The major peaks of the test solution and standard solution obtained under the Assay are the same in the retention time.

(3) ***Magnesium aluminometasilicate***—(i) To 0.5 g of Cimetidine, Aldioxa and Magnesium Aluminosilicate Tablets, add 5 mL of dilute sulfuric acid (1 in 3), heat until white fumes are evolved, cool, add 20 mL of water, then filter. Use the residue in Identification (3). Add ammonia TS to the filtrate to neutralize, and filter the obtained precipitate. Use the filtrate in Identification (2). The solution obtained by adding dilute hydrochloric acid to the residue responds to the Qualitative Analysis for aluminum salt.

(ii) The filtrate obtained in Identification (1) responds to the Qualitative Analysis for magnesium.

(iii) Wash the residue obtained in Identification (1) with 30 mL of water, add 2 mL of methylene blue solution (1 in 10,000), and wash with 30 mL of water again; a blue precipitate is produced.

Acid-neutralizing capacity Weigh accurately the mass of NLT 20 tablets of Cimetidine, Aldioxa and Magnesium Aluminosilicate Tablets, and powder. The volume of 0.1 mol/L hydrochloric acid consumed for daily dose (6 tablets) as directed under the Acid-neutralizing Capacity, is NLT 135 mL.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay (1) ***Cimetidine and aldioxa***—Weigh accurately the mass of NLT 20 tablets of Cimetidine, Aldioxa and Magnesium Aluminosilicate Tablets, and powder. Weigh accurately a portion of powder, equivalent to about 50 mg of cimetidine ($C_{10}H_{16}N_6S$) and about 50 mg of aldioxa ($C_4H_7AlN_4O_5$), and add 0.1 mol/L hydrochloric acid to make exactly 100 mL. Sonicate the resulting solution for about 20 minutes, filter the solution through a membrane filter with a pore size of 0.45 μm, discard the first 2 mL of the filtrate, and use the subsequent filtrate as the test solution. Separately, weigh accurately about 50 mg of cimetidine RS and about 50 mg of aldioxa RS, add 80 mL of 0.1 mol/L hydrochloric acid, sonicate for about 20 minutes, and add 0.1 mol/L hydrochloric acid to make exactly 100 mL. Use this solution as the standard solution. Take exactly 10 μL each of the test solution and the standard solution, perform the test as directed under the Liquid Chromatography according to the following operating conditions, and determine the peak areas of cimetidine and aldioxa, A_{T1}, A_{S1}, A_{T2} and A_{S2}, for each solution.

$$\text{Amount (mg) of cimetidine } (C_{10}H_{16}N_6S) = \text{Amount (mg) of cimetidine RS} \times (A_{T1} / A_{S1})$$

$$\text{Amount (mg) of aldioxa } (C_4H_7AlN_4O_5) = \text{Amount (mg) of aldioxa RS} \times (A_{T2} / A_{S2})$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: Use mobile phases A and B to control a stepwise or gradient elution-wise as follows.

Mobile phase A: A mixture of 0.01 mol/L potassium phosphate buffer solution (pH 8.0) and methanol (9 : 1).

Mobile phase B: A mixture of methanol and 0.01 mol/L potassium phosphate buffer solution (pH 8.0) (9 : 1).

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0-3	100	0
3-10	100 → 0	0 → 100
10-15	0	100

Flow rate: 1.0 mL/min

System suitability

System performance: Proceed with 10 μL of the standard solution according to the above operating conditions; aldioxa and cimetidine peaks are eluted in this order with the resolution being NLT 14.0.

System repeatability: Repeat the test 6 times with 10 μL of the standard solution under the above operating conditions; the relative standard deviation of the peak areas of aldioxa and cimetidine is NMT 1.0%.

(2) ***Total aluminum oxide in magnesium aluminosilicate and aldioxa***—Weigh accurately the mass of NLT 20 tablets of Cimetidine, Aldioxa and Magnesium Aluminosilicate Tablets and powder. Weigh accurately a portion of powder equivalent to about 25 mg of aluminum oxide (Al_2O_3), dissolve in 3.5 mL of dilute hydrochloric acid by heating on a steam bath for 15 minutes, cool, and add water to make exactly 100 mL. Centrifuge this solution, and use the clear supernatant as the test solution. Pipet 25 mL of the test solution, add exactly 20 mL of 0.02 mol/L ethylenediaminetetraacetic acid disodium salt VS, add 8 mL of acetic acid-ammonium acetate buffer solution (pH 4.8) and 20 mL of water, boil for 5 minutes, and cool it. Add 50 mL of ethanol(95), and titrate with 0.02 mol/L zinc sulfate VS (indicator: 2 mL of dithizone TS). The endpoint of the titration is when the color of the solution changes from light dark green to light red. Perform a blank test in the same manner and make any necessary correction.

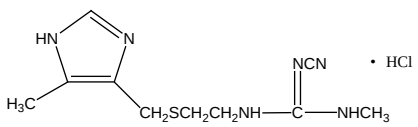
Each mL of 0.02 mol/L ethyldiaminetetraacetic acid disodium salt VS
= 1.020 mg of Al_2O_3

(3) ***Magnesium oxide in magnesium aluminosilicate***—Pipet 25 mL of the test solution obtained in Assay (2), add 50 mL of water and 10 mL of triethanolamine solution (1 in 2), and shake to mix well, and add 5 mL of ammonia-ammonium chloride buffer solution (pH 10.7). Titrate with 0.02 mol/L ethylenediaminetetraacetic acid disodium salt VS (indicator: 0.04 g of eriochrome black T-sodium chloride). The endpoint is when the reddish purple color of the solution appears with the blue color persisting for 30 seconds. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.02 mol/L ethylenediaminetetraacetic acid disodium salt VS
= 0.8060 mg of MgO

Packaging and storage Preserve in well-closed containers.

Cimetidine Hydrochloride
시메티딘염산염



$C_{10}H_{16}N_6S \cdot HCl$: 288.80
2-Cyano-1-methyl-3-{2-[(5-methyl-1*H*-imidazol-4-yl)methylsulfanyl]ethyl}guanidine hydrochloride [*70059-30-2*]

Cimetidine Hydrochloride contains NLT 98.0% and NMT 102.0% of cimetidine hydrochloride ($C_{10}H_{16}N_6S \cdot HCl$), calculated on the dried basis.

Description Cimetidine Hydrochloride occurs as a white crystalline powder.
It is freely soluble in water and sparingly soluble in ethanol(95).

Identification (1) Weigh 15 mg of Cimetidine Hydrochloride and cimetidine hydrochloride RS, respectively, and dissolve in 0.05 mol/L sulfuric acid TS to make exactly 100 mL. Add 0.05 mol/L sulfuric acid TS to 5.0 mL each of these solutions to make exactly 50 mL, and use these solutions as the test solution and the standard solution, respectively. Determine the absorption spectra of these solutions as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Cimetidine Hydrochloride and cimetidine hydrochloride RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) An aqueous solution of Cimetidine Hydrochloride responds to the Qualitative Analysis (2) for chloride.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Cimetidine Hydrochloride according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Related substances***—Weigh accurately 0.1 g of Cimetidine Hydrochloride, add the mobile phase to make exactly 250 mL, and use this solution as the test solution. Pipet 1.0 mL of the test solution, add the mobile phase to make exactly 500 mL, and use this solution as the standard solution. Perform the test with 50 μL each of the test and the standard solutions as directed under the Liquid Chromatography according to the following conditions. Determine the peak area of each solution by the automatic integration method and calculate the amount of each related substance; the amount of each related substance is NMT 0.2%, and the total amount of related substances is NMT 1.0%.

Content (%) of each related substance
$$= 0.2 \times \frac{A_i}{A_S}$$

A_i: Peak area of each related substance obtained from the test solution

A_S: Peak area of each related substance obtained from the standard solution

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: Dissolve 0.94 g of sodium 1-hexanesulfonate in 240 mL of methanol, and add 0.3 mL of phosphoric acid and water to make 1000 mL.

Flow rate: 2 mL/minute

System suitability

System performance: Weigh 50 mg of Cimetidine Hydrochloride, dissolve in 100 mL of 1 mol/L hydrochloric acid TS, heat on a steam bath for 10 minutes, and cool. Pipet 1.0 mL of this solution and add the mobile phase to make 250 mL. Proceed with 50 μL of this solution under the above operating conditions; the resolution between the peaks of cimetidine and cimetidine amide analogue is NLT 4.0. Also, proceed with 50 μL of the standard solution under the above operating conditions; the mass distribution ratio is NLT 3.0 and the number of theoretical plates is NLT 2000.

System repeatability: Repeat the test 6 times with 50 μL of the standard solution under the above operating conditions; the relative standard deviation of the peak area of cimetidine is NMT 7.0%.

Loss on drying NMT 0.5% (1 g, 105 °C, 2 hours).

Residue on ignition NMT 0.2% (1 g).

Assay Weigh accurately about 0.115 g of Cimetidine Hydrochloride, dissolve in 50 mL of water, and add 50 mL of methanol and water to make exactly 250 mL. Add the mobile phase to 5.0 mL of this solution to make exactly 200 mL, and use this solution as the test solution. Separately, weigh accurately about 50 mg of cimetidine hydrochloride RS, add a mixture of water and methanol (80 : 20) to make exactly 100 mL. Add the mobile phase to 5.0 mL of this solution to make exactly 200 mL, and use this solution as the standard solution. Perform the test with 50 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak area of cimetidine, A_T and A_S, respectively.

Amount (mg) of cimetidine hydrochloride ($C_{10}H_{16}N_6S \cdot HCl$)

$$= \text{Amount (mg) of cimetidine hydrochloride RS} \times \frac{A_T}{A_S} \times 2.5$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

Column: A stainless steel column about 3.9 mm in internal diameter and about 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: Add 0.3 mL of phosphoric acid and water to 200 mL of methanol to make 1000 mL.

Flow rate: About 2 mL/minute.

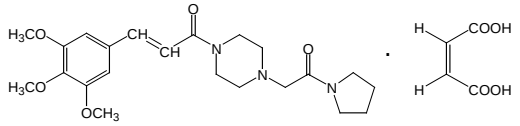
System suitability

System performance: Proceed with 50 μL of the standard solution under the above operating conditions; the mass distribution ratio is NLT 0.6 and the number of theoretical plates is NLT 1000.

System repeatability: Repeat the test 5 times with 50 μL of the standard solution under the above operating conditions; the relative standard deviation of the peak area of cimetidine is NMT 2.0%.

Packaging and storage Preserve in light-resistant, tight containers.

Cinepazide Maleate
시네파지드말레산염



$C_{22}H_{31}N_3O_5 \cdot C_4H_4O_4$: 533.58

1-[4-[2-Oxo-2-(1-pyrrolidinyl)ethyl]-1-piperazinyl]-3-(3,4,5-trimethoxyphenyl)-2-propen-1-one (2*Z*)-2-butenedioate (1:1), [*26328-04-1*]

Cinepazide Maleate contains NLT 98.0% and NMT 101.0% of cinepazide maleate ($C_{22}H_{31}N_3O_5 \cdot C_4H_4O_4$).

Description Cinepazide Maleate occurs as a white to pale yellow powder. It is almost odorless and has a bitter taste.

It is very soluble in formic acid or in acetic acid(100), freely solution in water, soluble in chloroform, sparingly soluble in ethanol(95) and practically insoluble in ether. It dissolves in dilute hydrochloric acid.

Melting point—About 175 °C (with decomposition).

Identification (1) To 5 mL of the aqueous solution of Cinepazide Maleate (1 in 25), add 5 drops of Reinecke salt TS; a pale reddish brown precipitate is formed.

(2) Determine the infrared spectrum of Cinepazide Maleate, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; it exhibits absorption at the wavenumbers of about 1660 cm^{-1}, 1617 cm^{-1}, 1583 cm^{-1}, 1503 cm^{-1}, 1483 cm^{-1}, 1122 cm^{-1}, 998 cm^{-1} and 867 cm^{-1}.

pH Between 3.4 and 4.0 (1.0 g, water, 100 mL).

Absorption $E_{1cm}^{1\%}$ (304 nm): Between 384 and 420 (after drying, 20 mg, 0.1 mol/L hydrochloric acid TS, 2000 mL).

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Cinepazide Maleate in 10 mL of water; the resulting solution is colorless to pale yellow and clear.

(2) ***Chloride***—Proceed with 1.0 g of Cinepazide Maleate and perform the test as directed under the Chloride. Prepare the control solution with 0.40 mL of 0.01 mol/L hydrochloric acid VS (NMT 0.014%).

(3) ***Heavy metals***—Proceed with 2.0 g of

Cinepazide Maleate according to Method 2 under the Heavy Metals and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(4) ***Arsenic***—Proceed with 1.0 g of Cinepazide Maleate according to Method 3 under the Arsenic and perform the test (NMT 2 ppm).

(5) ***Related substances***—Dissolve 0.10 g of Cinepazide Maleate in 10 mL of a mixture of chloroform, ethanol(95) and acetic acid(100) (8 : 2 : 1) and use this solution as the test solution. Pipet 1 mL of this solution, add a mixture of chloroform, ethanol(95) and acetic acid(100) (8 : 2 : 1) to make exactly 100 mL and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of chloroform, ethanol(95) and acetic acid(100) (8 : 2 : 1) to a distance of about 10 cm, and air-dry the plate. Allow the plate to stand in iodine vapor for 30 minutes; the spots other than the principal spot obtained from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 0.3% (1 g, in vacuum, phosphorus pentoxide, 80 ℃, 3 hours).

Residue on ignition NMT 0.10% (1 g).

Assay Weigh accurately about 0.45 g of Cinepazide Maleate, previously dried, dissolve in 2 mL of formic acid, add 50 mL of acetic acid(100), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 53.36 mg of $C_{26}H_{35}N_3O_9$

Packaging and storage Preserve in tight containers.

Cinepazide Maleate Injection
시네파지드말레산염 주사액

Cinepazide Maleate Injection contains NLT 95.0% and NMT 105.0% of the labeled amount of cinepazide maleate ($C_{22}H_{31}N_3O_5 \cdot C_4H_4O_4$: 533.58).

Method of preparation Prepare as directed under Injections, with Cinepazide Maleate.

Identification Weigh an amount of Cinepazide Maleate Injection, equivalent to 0.1 g of cinepazide maleate according to the labeled amount, dissolve in water to make 10 mL, and use the solution as the test solution. Separately, weigh 0.1 g of cinepazide maleate RS, dissolve in water to make 10 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot each 10 μL of the test solution and the standard solution on a thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate using a mixture of isopropanol and 0.1 mol/L of boric acid (85 : 15) as the developing solvent to a distance of about 10 cm and air-dry the plate. Examine the plate under ultraviolet rays (main wavelength: 254 nm) or spray the plate with a solution of 0.5% potassium permanganate in 1 mol/L sodium hydroxide; the R_f values of the spots obtained from the test solution and the standard solution are the same.

pH Between 3.3 and 5.3.

Sterility Meets the requirements.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Extractable volume of injections Meets the requirements.

Assay Weigh accurately an amount of Cinepazide Maleate Injection, equivalent to about 85 mg of cinepazide maleate ($C_{22}H_{31}N_3O_5 \cdot C_4H_4O_4$) according to the labeled amount, transfer to a 250-mL Erlenmeyer flask with a stopper, add 25 mL of water, 75 mL of chloroform, 5 mL of acetate buffer (pH 2.8) and 5 mL of the indicator, and mix well. Titrate with 0.01 mol/L sodium docusate VS. Add 5 mL of 0.01 mol/L sodium docusate VS at first and continue to titrate very slowly. Add 0.01 mol/L sodium docusate VS until the color of the indicator changes from green to grayish pink. After each addition, stir vigorously and allow to stand for 30 seconds. Perform a blank test in the same manner and make any necessary correction.

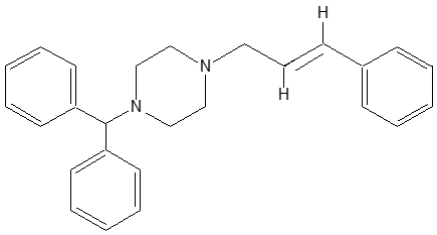
Each mL of 0.01 mol/L Sodium docusate VS
= 5.336 mg of $C_{22}H_{31}N_3O_5 \cdot C_4H_4O_4$

0.01 mol/L Sodium docusate—Weigh accurately about 4.446 g of anhydrous sodium docusate, dissolve in water to make exactly 1000 mL, and standardize as follows. Weigh accurately about 0.35 g of cinepazide maleate RS, previously dried, dissolve in water to make exactly 100 mL, and use the solution as the cinepazide maleate standard solution (prepare before use). Put exactly 10 mL of the standard solution to a 250-mL Erlenmeyer flask, add 15 mL of water, 75 mL of chloroform, 5 mL of acetate buffer (pH 2.8) and 5 mL of the indicator (prepare before use), prepared by mixing a solution of 15 mg of *p*-dimethylaminoazobenzen dissolved in 20 mL of chloroform and a solution of 15 mg of Oraset Blue B dissolved in 3 mL of acetic acid(100) and adding chloroform to

make 500 mL, mix well, and titrate with 0.01 mol/L sodium docusate VS. Add 5 mL of 0.01 mol/L sodium docusate VS at first and continue to titrate very slowly. Add 0.01 mol/L sodium docusate VS until the color of the indicator changes from green to grayish pink. After each addition, stir vigorously and allow to stand for 30 seconds. Perform a blank test in the same manner and make any necessary correction.

Packaging and storage Preserve in hermetic containers.

Cinnarizine
신나리진



$C_{26}H_{28}N_2$: 368.51

1-Benzhydryl-4-[(*E*)-3-phenylprop-2-enyl]piperazine [*298-57-7*]

Cinnarizine contains NLT 99.0% and NMT 101.0% of cinnarizine ($C_{26}H_{28}N_2$), calculated on the dried basis.

Description Cinnarizine occurs as a white powder.
It is freely soluble in dichloromethane, soluble in acetone, slightly soluble in methanol or ethanol(95), and practically insoluble in water.

Identification (1) Add 0.2 g of anhydrous citric acid to 20 mL of acetic anhydride, dissolve by heating on a steam bath at 80 °C for 10 minutes, and add about 20 mg of Cinnarizine; a purple color develops.

(2) Determine the infrared spectra of Cinnarizine and cinnarizine RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy, respectively; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) Dissolve 10 mg of Cinnarizine in methanol to make 20 mL, and use this solution as the test solution. Separately, dissolve 10 mg of cinnarizine RS in methanol to make 20 mL, and use this solution as the standard solution (1). Dissolve 10 mg each of cinnarizine RS and flunarizine hydrochloride RS in methanol to make 20 mL, and use this solution as the standard solution (2). With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on a plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of acetone, methanol and 1 mol/L sodium chloride solution (50 : 30 : 20) to a distance of about 15 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength 254 nm); the R_f value of the principal spot from the test solution are the same with that from the standard solution (1). This test is valid when the two spots from the standard solution (2) are clearly separated.

Melting point Between 118 and 122 °C.

Purity (1) ***Clarity and color of solution*—**Dissolve 0.5 g of Cinnarizine in dichloromethane to make 20 mL. The solution is clear and not more intense than the following control solution.

Control solution—To a mixture of 24 mL of iron(III) chloride hexahydrate colorimetric stock solution, 10 mL of cobalt(II) chloride hexahydrate colorimetric stock solution and 4 mL of copper(II) sulfate pentahydrate colorimetric stock solution, add 62 mL of 1 w/v% hydrochloric acid to mix. To 2.5 mL of this solution, add 97.5 mL of 1 w/v% hydrochloric acid to mix.

(2) ***Acidity or alkalinity*—**Suspend 0.5 g of Cinnarizine in 15 mL of water, boil for 2 minutes, cool, and filter. Put water into the filtrate to make 20 mL, and use this solution as the test solution. To 10 mL of the test solution, add two drops of phenolphthalein TS and 0.25 mL of 0.01 mol/L sodium hydroxide solution; the solution exhibits a pink color. Add two drops of methyl red TS and 0.25 mL of 0.01 mol/L hydrochloric acid to 10 mL of the test solution; the solution exhibits a red color.

(3) ***Heavy metals*—**Dissolve 1.0 g of Cinnarizine in a mixture of acetone and water (85 : 15), add dilute hydrochloric acid to completely dissolve, and add a mixture of acetone and water (85 : 15) to make 20 mL. Use this solution as the test solution. Add a mixture of acetone and water (85 : 15) to 1.0 mL of lead standard stock solution to make exactly 100mL, and use this solution as the standard solution. To 12 mL of the test solution, add 2 mL of acetate buffer solution (pH 3.5) to mix, add 1.2 mL of thioacetamide TS to mix, and allow to stand for 2 minutes. The color of this solution is not more intense than the solution prepared by mixing 10 mL of the standard solution with 2 mL of the test solution and proceeding in the same manner (NMT 20 ppm).

(4) ***Related substances*—**Dissolve 25.0 mg of Cinnarizine in methanol to make exactly 100 mL, and use this solution as the test solution. Separately, dissolve 12.5 mg of cinnarizine RS and 15.0 mg of flunarizine hydrochloride RS in methanol to make exactly 100 mL. Add methanol to1.0 mL of this solution to make exactly 20 mL, and use the solution as the standard solution (1). Add methanol to 1.0 mL of the test solution to make 100 mL, put methanol into 5.0 mL of this solution to make 20 mL, and use this solution as the standard solution (2). Perform the test with 10 μL each of methanol (as the blank test solution), the test solution and the standard solutions as directed under the Liquid Chromatography according to the following conditions. The area of any peak other than the major peak obtained from the test solution is not

greater than the area of the major peak from the standard solution (2) (0.25%) and the sum of the peak areas other than the major peak obtained from the test solution is not more than twice the area of the major peak from the standard solution (2) (0.5%). However, exclude any peak with an area less than 0.2 times the area of the major peak from the standard solution (2).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 230 nm).

Column: A stainless steel column about 4.0 mm in internal diameter and about 10 cm in length, packed with base-deactivated octadecylsilanized silica gel for liquid chromatography (3 μm in particle diameter).

Mobile phase: Use mobile phases A and B to control stepwise or based on the gradient elution as follows.

Mobile phase A: 1 w/v% ammonium acetate solution.

Mobile phase B: 0.2 vol% solution of acetic acid(100) in acetonitrile.

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 - 20	75 → 10	25 → 90
20 - 25	10	90
25 - 30	75	25
30 = 0	75	25

Flow rate: 1.5 mL/min

System suitability

System performance: Adjust the sensitivity of the system so that the height of the major peak obtained by testing under the above conditions using the standard solution (2) is at least 50% of the full scale of the data collection device. Proceed with the standard solution (1) under the above conditions; the retention times are about 11 minutes for cinnarizine and about 11.5 minutes for flunarizine with the resolution of the peaks of cinnarizine and flunarizine being NLT 5.0. If necessary, adjust the time program for the gradient elution control.

Loss on drying NMT 0.5% (1 g, in vacuum, 60 ℃, 4 hours).

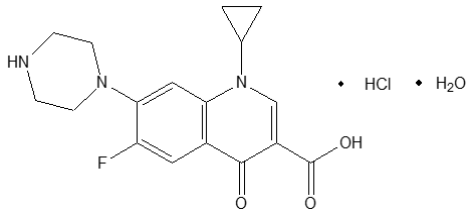
Residue on ignition NMT 0.1% (2 g).

Assay Weigh accurately 0.15 g of Cinnarizine, dissolve in 50 mL of a mixture of ethyl methyl ketone and acetic acid(100) (7 : 1), and titrate with 0.1 mol/L perchloric acid VS (indicator: 4 drops of 1-naphtholbenzein TS). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 18.426 mg of $C_{26}H_{28}N_2$

Packaging and storage Preserve in light-resistant, well-closed containers.

Ciprofloxacin Hydrochloride Hydrate
시프로플록사신염산염수화물



Ciprofloxacin Hydrochloride

$C_{17}H_{18}FN_3O_3 \cdot HCl \cdot H_2O$: 385.82

1-Cyclopropyl-6-fluoro-4-oxo-7-(piperazin-1-yl)quinoline-3-carboxylic acid hydrate hydrochloride [*86393-32-0*]

Ciprofloxacin Hydrochloride Hydrate contains NLT 98.0% and NMT 102.0% of ciprofloxacin hydrochloride ($C_{17}H_{18}FN_3O_3 \cdot HCl \cdot H_2O$), calculated on the anhydrous basis.

Description Ciprofloxacin Hydrochloride Hydrate occurs as a pale yellow crystalline powder.

It is sparingly soluble in water, slightly soluble in acetic acid(31) or methanol, very slightly soluble in ethanol(99.5), and practically insoluble in acetone, acetonitrile, ethyl acetate, hexane or dichloromethane.

Identification (1) Determine the infrared spectra of Ciprofloxacin Hydrochloride Hydrate and ciprofloxacin hydrochloride hydrate RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) Weigh and dissolve 0.1 g of Ciprofloxacin Hydrochloride Hydrate in water to make 10 mL, and use this solution as the test solution. Separately, weigh and dissolve 0.1 g of ciprofloxacin hydrochloride hydrate RS to make 10 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on a thin layer chromatographic plate made of silica gel for thin-layer chromatography. Allow it to stand for 15 minutes in ammonia gas. Next, develop the plate with a mixture of dichloromethane, methanol, ammonia water(28) and acetonitrile (4 : 4 : 2 : 1) as the developing solvent to a distance of about 15 cm, and air-dry the plate. Examine under ultraviolet light (main wavelengths: 254 nm and 365 nm); the R_f value of the principal spots obtained from the test solution and the standard solution is the same.

(3) An aqueous solution of Ciprofloxacin Hydrochloride Hydrate (1 in 50) responds to the Qualitative Analysis for chloride.

pH Dissolve 1.0 g of Ciprofloxacin Hydrochloride Hydrate in 40 mL of freshly boiled and cooled water. The pH of this solution is between 3.0 and 4.5.

Purity (1) ***Heavy metals***—Weigh and proceed with 1.0 g of Ciprofloxacin Hydrochloride Hydrate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Sulfate***—Perform the test with 0.375 g of Ciprofloxacin Hydrochloride Hydrate. Prepare the control solution with 0.30 mL of 0.005 mol/L sulfuric acid (NMT 0.04%).

(3) ***Fluoroquinolone acid***—Weigh an appropriate amount of ciprofloxacin hydrochloride hydrate RS, dissolve in water to make a solution containing 10 mg per mL, and use this solution as the test solution. Separately, weigh accurately 5.0 mg of fluoroquinolone acid RS, add 50 μL of ammonia TS, and add water to make 50 mL. Take 2.0 mL of this solution, add water to make 10 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on a thin layer chromatographic plate made of silica gel for thin-layer chromatography. Allow the plate to stand for 15 minutes in the container containing 50 mL of ammonia TS, then develop the plate with a mixture of dichloromethane, methanol, ammonia water(28) and acetonitrile (4 : 4 : 2 : 1) as the developing solvent to a distance of about 15 cm, and air-dry the plate for 15 minutes. Examine under ultraviolet light (main wavelength: 254 nm); any spot from the test solution, of which the R_f value is identical to that of the principal spot from the standard solution, is not larger and is not more intense than the principal spot from the standard solution (NMT 0.2%).

4) ***Related substances***—Perform the test according to the operating conditions as directed under the Assay. Determine each peak area A_i and the total area A_T for all peaks other than the major peak from the test solution, and calculate the content of each related substance in the test solution according to the following equation:

$$\text{Content (\%) of each related substance} = 100 \times \frac{A_i}{A_S}$$

Ciprofloxacin ethylenediamine analogue and each related substance are NMT 0.2% and the sum of all related substances is NMT 0.5%.

Water Between 4.7% and 6.7% (0.5 g, volumetric titration, direct titration).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 25 mg of Ciprofloxacin Hydrochloride Hydrate, dissolve in mobile phase to make exactly 50 mL, and use this solution as the test solution. Separately, weigh accurately an appropriate amount of ciprofloxacin hydrochloride hydrate RS (previously determine the content of water), add the mobile phase to make a solution containing 0.5 mg per mL and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas of ciprofloxacin hydrochloride hydrate, A_T and A_S, in each solution.

$$\text{Amount (mg) of ciprofloxacin hydrochloride hydrate } (C_{17}H_{18}FN_3O_3 \cdot HCl \cdot H_2O) = 50 \times C \times \frac{A_T}{A_S}$$

C: Concentration of ciprofloxacin hydrochloride hydrate in the standard solution (mg/mL), calculated on the anhydrous basis

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 278 nm).

Column: A stainless steel column, about 4 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (about 5 μm to 10 μm in particle diameter).

Column temperature: A constant temperature of about 30 °C.

Mobile phase: A mixture of 0.025 mol/L phosphoric acid, adjusted pH to 3.0 ± 0.1 with triethylamine, and acetonitrile (87:13).

Flow rate: 1.5 mL/min

System suitability

System performance: Dissolve ciprofloxacin ethylenediamine analogue RS in the ciprofloxacin standard solution to make a solution containing 0.5 mg per mL. Proceed with 10 μL of this solution according to the above conditions; ciprofloxacin ethylenediamine analogue and ciprofloxacin are eluted in this order with the resolution between these peaks being NLT 6.

System repeatability: Repeat the test 6 times according to the above conditions with 10 μL of the standard solution each time; the relative standard deviation of the peak areas of ciprofloxacin is NMT 1.5%.

Packaging and storage Preserve in light-resistant, tight containers.

Ciprofloxacin Hydrochloride Tablets
시프로플록사신염산염 정

Ciprofloxacin Hydrochloride Tablets

Ciprofloxacin Hydrochloride Tablets contain NLT 90.0% and NMT 110.0% of ciprofloxacin ($C_{17}H_{18}FN_3O_3$: 331.34).

Method of preparation Prepare as directed under Tablets, with Ciprofloxacin Hydrochloride Hydrate.

Identification (1) The retention times of the major peaks from the test solution and the standard solution prepared as directed under the Assay are the same.

(2) Place a number of tablets, equivalent to 1.5 g of Ciprofloxacin Hydrochloride Hydrate, in a suitable flask with 750 mL of water, sonicate for about 20 minutes, and add water to make 1000 mL. Centrifuge a portion of this suspension and use the clear supernatant obtained as the test solution. Separately, dissolve a suitable amount of ciprofloxacin hydrochloride hydrate RS in water to obtain a solution containing 1.5 mg per mL and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot each 10 μL of the test solution and standard solution on a thin layer chromatographic plate made of silica gel for thin-layer chromatography. Allow the plate to stand in ammonia gas for about 15 minutes and develop the plate with a mixture of dichloromethane, methanol, ammonia TS and acetonitrile (4 : 4 : 2 : 1) as the developing solvent to a distance of about 15 cm in an unsaturated developing chamber. Remove the plate and air-dry for about 15 minutes. Examine under ultraviolet light (main wavelength: 254 nm and 366 nm); the R_f values of the principal spots from the test solution and the standard solution are the same.

Dissolution Perform the test with 1 tablet of Ciprofloxacin Hydrochloride Tablets at 50 revolutions per minute according to Method 2 under the Dissolution, using 900 mL of 0.01 mol/L hydrochloric acid as the dissolution medium. Take the dissolved solution 30 minutes after starting the test and filter. If necessary, dilute with the dissolution medium and use the resulting solution as the test solution. Separately, weigh accurately an appropriate amount of ciprofloxacin hydrochloride hydrate RS, dissolve in the dissolution solution to the same concentration as the test solution, and use this solution as the standard solution. Determine the absorbances of the test solution and the standard solution at the absorbance maximum wavelength of about 276 nm as directed under the Ultraviolet-visible Spectroscopy, using the dissolution solution as a control solution.

It meets the requirements when the dissolution rate of Ciprofloxacin Hydrochloride Tablets in 30 minutes is NLT 80%.

Uniformity of dosage units Meets the requirements.

Assay Take 5 tablets of Ciprofloxacin Hydrochloride Tablets, add 400 mL of water, sonicate for about 20 minutes, and add water to make exactly 500 mL. Take accurately an appropriate amount of Ciprofloxacin Hydrochloride Tablets, add water to obtain a solution having known concentration of about 0.3 mg of ciprofloxacin per mL according to the labeled amount of ciprofloxacin ($C_{17}H_{18}FN_3O_3$), and use the solution as the test solution. Separately, weigh accurately an appropriate amount of ciprofloxacin hydrochloride hydrate RS (previously determine the water content), dissolve in water to obtain a solution having known concentration of about 0.3 mg of Ciprofloxacin Hydrochloride Tablets per mL, and use the solution as the standard solution. Perform the test with each 10 μL of the test solution and the standard solution as directed under the Liquid Chromatography according to the operating conditions described in the Assay under Ciprofloxacin Hydrochloride Hydrate and determine the peak areas, A_T and A_S, of ciprofloxacin for the test solution and the standard solution, respectively.

$$\text{Amount (mg) of ciprofloxacin in 1 tablet} = C \times \frac{L}{D} \times \frac{A_T}{A_S} \times \frac{331.35}{367.81}$$

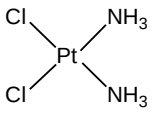
C: Concentration (mg/mL) of ciprofloxacin hydrochloride in the standard solution, calculated on the anhydrous basis

L: Amount (mg) of ciprofloxacin in 1 tablet

D: Concentration (mg/mL) of ciprofloxacin hydrochloride in the test solution

Packaging and storage Preserve in tight containers.

Cisplatin
시스플라틴



$Cl_2H_6N_2Pt$: 300.04

(*SP*-4-2)-Diamminedichloridoplatinum [*15663-27-1*]

Cisplatin, when dried, contains NLT 98.0% and NMT 102.0% of cisplatin ($Cl_2H_6N_2Pt$).

Description Cisplatin occurs as a yellow crystalline powder.

It is sparingly soluble in ammonium peroxydisulfate, slightly soluble in water and practically insoluble in ethanol(99.5).

Identification (1) Add 2 to 3 drops of tin(II) chloride dihydrate solution (1 in 100) to 5 mL of aqueous solution of Cisplatin (1 in 2000); a brown precipitate is produced.

(2) Determine the absorption spectra of the solutions of Cisplatin and cisplatin RS, respectively, in a solution of sodium chloride (1 in 2000) in 0.01 mol/L hydrochloric acid TS (9 in 1000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared spectra of Cisplatin and cisplatin RS as directed in the potassium bromide disk

method under the Mid-infrared Spectroscopy, respectively; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(4) An aqueous solution of Cisplatin (1 in 2000) responds to the Qualitative Analysis (1) for chloride.

Crystallinity Meets the requirements.

Purity ***Trichloroammineplatinate***—Perform this procedure using light-resistant vessels. Dissolve 50 mg of Cisplatin in a sodium chloride solution (9 in 1000) to make exactly 100 mL and use this solution as the test solution. Separately, dissolve 10 mg of trichloroammineplatinate, previously dried at 80 ºC for 3 hours, in a sodium chloride solution (9 in 1000) to make exactly 200 mL. To 2.0 mL of this solution, add a sodium chloride solution (9 in 1000) to make exactly 20 mL and use this solution as the standard solution. Perform the test with 40 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine peak area of each solution of trichloroammineplatinate by the automatic integration method; the peak area from the test solution is not larger than the peak area from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 209 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with quartanaryammonium group introduced octadecylsilanized silica gel for liquid chromatography (10 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: A solution of ammonium sulfate (1 in 800).

Flow rate: Adjust the flow rate so that the retention time of trichloroammineplatinate is about 8 minutes.

System suitability

System performance: Proceed with 40 μL of the standard solution under the above operating conditions; the number of theoretical plates and the symmetry factor of the peak of trichloroammineplatinate are NLT 1500 and NMT 2.0, respectively.

System repeatability: Repeat the test 6 times with 40 μL each of the standard solution under the above operating conditions; the relative standard deviation of the peak area of trichloroammineplatinate is NMT 3.0%.

Loss on drying NMT 0.1% (1 g, 105 °C, 4 hours).

Assay Perform this procedure using light-resistant vessels. Weigh accurately about 25 mg each of Cisplatin and cisplatin RS, previously dried, add ammonium peroxydisulfate to make exactly 25 mL and use the solutions as the test solution and the standard solution, respectively. Perform the test with exactly 40 μL each of these solutions as directed under the Liquid Chromatography according to the following conditions, and determine peak area of cisplatin, A_T and A_S, by the automatic integration method, respectively.

$$\text{Amount (mg) of cisplatin } (Cl_2H_6N_2Pt) = \text{Amount (mg) of cisplatin RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 310 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with aminopropylsilyl silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: A mixture of ethyl acetate, methanol, water and ammonium peroxydisulfate (25 : 16 : 5 : 5).

Flow rate: Adjust the flow rate so that the retention time of cisplatin is about 4 minutes.

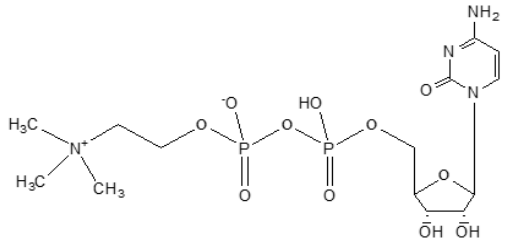
System suitability

System performance: Proceed with 40 μL of the standard solution under the above operating conditions; the number of theoretical plates and the symmetry factor of the peak of cisplatin are NLT 3000 and NMT 2.0, respectively.

System repeatability: Repeat the test 6 times with 40 μL each of the standard solution under the above operating conditions; the relative standard deviation of the peak area of cisplatin is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Citicoline
시티콜린



$C_{14}H_{26}N_4O_{11}P_2$: 488.32

Cytidine 5′-(trihydrogen diphosphate) *P′*-[2-(trimethylammonio)ethyl] ester inner salt, [*987-78-0*]

Citicoline, when dried, contains NLT 98.0% and NMT 102.0% of citicoline ($C_{14}H_{26}N_4O_{11}P_2$).

Description Citicoline occurs as a white, crystalline powder and is odorless.

It is very soluble in water, and practically insoluble in ethanol, acetone or chloroform.

It is very hygroscopic.

Identification (1) Put 0.2 g of Citicoline in a crucible, moisten with 4 drops of sodium hydroxide TS, and char carefully while heating gently. Add 10 mL of dilute nitric acid, heat on a steam bath for 30 minutes, add 10 mL of water, and filter. Neutralize the filtrate with sodium hydroxide TS; the resulting solution responds to the Qualitative Analysis for phosphates.

(2) To 1 mg of Citicoline, add 3 mL of dilute hydrochloric acid and heat on a steam bath for 30 minutes. Blow bromine away by air, and add 0.2 mL of orcin in ethanol (1 in 10). Next, add 3 mL of diluted ammonium iron(II) sulfate in hydrochloric acid (1 in 100), and heat on a steam bath; the resulting solution exhibits a green color.

(3) Dissolve 0.1 g of Citicoline in 5 mL of dilute hydrochloric acid, and heat on a steam bath for 60 minutes. Next, cool with water, and add 1mL of reinecke salt TS; a pale red precipitate is produced.

(4) With a solution dissolved 3 mg of Citicoline in 200 mL of hydrochloric acid TS, determine the absorption spectrum as directed under the Ultraviolet-visible Spectroscopy; it exhibits maximum at the wavelength between 276 nm and 282nm.

pH Between 2.5 and 3.5 (1% aqueous solution).

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Citicoline in 8 mL of water; the solution is colorless and clear.

(2) ***Ammonium***—Perform the test with 0.20 g of Citicoline. Prepare the control solution with 10.0 mL of ammonium RS (NMT 0.05%).

(3) ***Heavy metals***—Proceed with 2.0 g of Citicoline according to Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(4) ***Arsenic***—Proceed with 1.0 g of Citicoline according to Method 3 and perform the test (NMT 2 ppm).

(5) ***Free phosphoric acid***—Dissolve 0.1 g of Citicoline in 10 mL of water, add 1 mL of a solution of ammonium molybdate in 0.5 mol/L sulfuric acid (1 in 40) and 0.5 mL of 1-amino-2-naphthol-4-sulfonic acid TS, and allow to stand for 5 minutes; the color of the solution is not more intense than that of the following control solution.

Control solution—To 4.0 mL of phosphoric acid RS, add water to make 10 mL, and proceed with this solution in the same manner.

(6) ***5′-Cytidylic acid***—With the ion-exchange resin column used in the preparation of the test solution under the Assay elute with 0.01 mol/L hydrochloric acid using a 100-mL volumetric flask as a collecting vessel. Collect the running solution to make 100 mL, determine the absorbance A_T of this solution at the wavelength of 280 nm using the blank test solution prepared in the same manner as the test solution as the control solution, Calculate the amount of 5'-cytidylic acid using the A_T, weight (W_T mg) of the sample in the Assay, the amount of the reference standards (W_S mg), the absorbance (A_S) of the reference standards obtained from the Assay and the dry weight loss of the reference standards (L_S%) according to the following equation; the amount of 5′-cytidylic acid is NMT 1.0%.

$$\text{Amount (mg) of 5′-cytidylic acid } (C_{14}H_{25}N_4O_{11}P_2) = \frac{W_S}{W_T} \times \frac{1}{2} \times 0.6618 \times \frac{100 - L_S}{100 - L_T} \times \frac{A_T}{A_S} \times 100$$

L_T: dry weight loss of the sample

0.6618 = Molecular weight ratio of 5′-cytidylic acid ($C_9H_{14}N_3O_8P$) and citicoline ($C_{14}H_{26}N_4O_{11}P_2$)

Loss on drying NMT 5.0% (1 g, in vacuum, phosphorus pentoxide, 100 ℃, 4 hours)

Assay Weigh accurately about 0.1 g each of Citicoline and citicoline RS and dissolve in water to make exactly 100 mL. Take 3.0 mL each of these solutions and pass through the strongly basic ion exchange resin column. Next, elute with diluted 0.1 mol/L sodium chloride TS (1 in 10) using a 200-mL volumetric flask containing 20.0 mL of 0.1 mol/L hydrochloric acid TS as a collecting vessel, collect the running solutions to make 200 mL, and use these solutions as the test solution and the standard solution, respectively. With the test solution and the standard solution, perform the test as directed under the Ultraviolet-visible Spectroscopy using the blank test solution as the control solution, and determine the absorbances, A_T and A_S, at 280 nm.

$$\text{Amount (mg) of citicoline } (C_{14}H_{26}N_4O_{11}P_2) = \text{Amount (mg) of citicoline RS} \times \frac{A_T}{A_S}$$

Packaging and storage Preserve in tight containers in a cold place.

Citicoline Injection
시티콜린 주사액

Citicoline Injection contains NLT 90.0% and NMT 130.0% of the labeled amount of citicoline ($C_{14}H_{26}N_4O_{11}P_2$: 488.32).

Method of preparation Prepare as directed under Injections, with Citicoline.

Identification (1) Put about 4 mL of Citicoline Injection in a crucible, evaporate to dryness on a steam bath, add 4 drops of sodium hydroxide TS, and heat gently with care to carbonize slowly. Add 10 mL of dilute nitric acid and heat on a steam bath. Then, add 10 mL of water, filter,

and neutralize the filtrate with sodium hydroxide TS. This solution responds to the Qualitative Analysis for phosphate.

(2) To about 0.02 mL of Citicoline Injection, add 3 mL of dilute hydrochloric acid and 1 mL of bromine TS, heat on a steam bath for 30 minutes, and blow bromine away with air. To this solution, add 0.2 mL of orcin in ethanol solution (1 in 10) and 3 mL of ammonium ferric sulfate in hydrochloric acid solution (1 in 1000), and heat on a steam bath for 20 minutes; the solution exhibits a green color.

(3) To 2 mL of Citicoline Injection, add 2 mL of hydrochloric acid, heat on a steam bath for 60 minutes, cool, and add 1 mL of Reinecke salt; a pale precipitate is formed.

(4) To 0.1 mL of Citicoline Injection, add 0.1 mol/L hydrochloric acid to make 100 mL. Take 10 mL of this solution, and dilute with 0.01 mol/L hydrochloric acid to make 100 mL. Determine the absorption spectrum using 0.01 mol/L hydrochloric acid as a blank; the spectrum exhibits a maximum at 279 ± 3 nm.

pH Between 6.0 and 8.0.

Sterility Meets the requirements.

Bacterial endotoxins Less than 0.6 EU per mg of citicoline.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

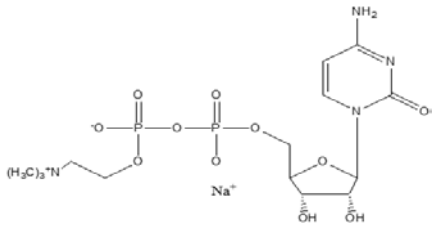
Extractable volume of injections Meets the requirements.

Assay Weigh exactly an amount of Citicoline Injection, equivalent to 0.1 g of citicoline ($C_{14}H_{26}N_4O_{11}P_2$) according to the labeled amount, add water to make exactly 100 mL, and shake well to mix. Pipet 3 mL of this solution and elute a column packed with strong base ion exchange resin column. Collect the eluate into a 200-mL volumetric flask, previously filled with 20 mL of 0.1 mol/L hydrochloric acid, and elute the column with 0.01 mol/L sodium chloride. Combine the eluates to make exactly 200 mL and use the solution as the test solution. Separately, weigh accurately about 0.1 g of citicoline RS and add water to make exactly 100 mL. Pipet 3 mL of this solution, proceed in the same manner as for the preparation of the test solution, and use the resulting solution as the standard solution. Determine the absorbance, A_T and A_S, of the test solution and the standard solution at 280 nm as directed under the Ultraviolet-visible Spectroscopy.

Amount (mg) of citicoline ($C_{14}H_{26}N_4O_{11}P_2$)
= Amount (mg) of citicoline RS × (A_T / A_S)

Packaging and storage Preserve in hermetic containers.

Citicoline Sodium
시티콜린나트륨



$C_{14}H_{25}O_{11}N_4P_2Na$: 510.31

P'-[2-(Trimethylammonio)ethyl] cytidine 5'-(trihydrogen diphosphate) ester sodium salt, [*33818-15-4*]

Citicoline Sodium, when dried, contains NLT 98.0% and NMT 101.0% of citicoline sodium ($C_{14}H_{25}O_{11}N_4P_2Na$).

Description Citicoline Sodium occurs as a white, crystalline powder and is odorless.
It is very soluble in water, and practically insoluble in ethanol, ether or chloroform.

Identification (1) Put 0.2 g of Citicoline Sodium in a porcelain crucible, moisten with 4 drops of sodium hydroxide TS, and char carefully while heating gently. Add 10 mL of dilute nitric acid, heat on a steam bath for 30 minutes, add 10 mL of water, and filter. Neutralize the filtrate with sodium hydroxide TS; the resulting solution responds to the Qualitative Analysis for phosphates.

(2) To 1 mg of Citicoline Sodium, add 3 mL of dilute hydrochloric acid and 1 mL of bromine TS, heat on a steam bath for 30 minutes, and blow bromine away by air. Add 0.2 mL of orcin in ethanol solution (1 in 10), add 3 mL of ammonium iron(III) sulfate 12-hydrate in hydrochloric acid solution (1 in 1000), and heat on a steam bath for 20 minutes; the resulting solution exhibits a green color.

(3) To 0.1 g of Citicoline Sodium, add 5 mL of dilute hydrochloric acid, and heat on a steam bath for 60 minutes, cool with water, and add 1 mL of reinecke salt TS; a pale red precipitate is produced.

(4) Dissolve 0.5 g each of Citicoline Sodium and citicoline sodium RS in water to make 50 mL, and perform the test under the same operating conditions for testing related substances; the R_f values of the spots obtained from the test solution and the standard solution are the same.

(5) Weigh about 0.15 g of Citicoline Sodium and dissolve in water to make 100.0 mL. Take 10.0 mL of this solution, transfer to a 1000-mL volumetric flask, and fill 0.1 mol/L potassium chloride-hydrochloric acid buffer solution, pH 2.0, to the gauge line. Next, determine the absorbance using 0.1 mL of

potassium chloride-hydrochloric acid buffer solution, pH 2.0, as the control solution; it exhibits a maximum at the wavelength around 282 nm.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Citicoline Sodium in 20 mL of water; the solution is colorless and clear.

(2) ***Chloride***—Perform the test with 0.5 g of Citicoline Sodium according to the Chloride and. Prepare the control solution with 0.14 mL of 0.01 mol/L hydrochloric acid (NMT 0.01%)

(3) ***Iron***—Prepare the test solution with 0.5 g of Citicoline Sodium as directed in Method 1 under the Iron and perform the test according to Method A. Prepare the control solution with 5.0 mL of iron standard solution (NMT 0.01%).

(4) ***Heavy metals***—Proceed with 1.0 g of Citicoline Sodium according to Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(5) ***Arsenic***—Proceed with 2.0 g of Citicoline Sodium according to Method 1 and perform the test (NMT 1 ppm).

(6) ***Related substances***—Weigh 0.5 g of Citicoline Sodium and citicoline sodium RS, dissolve in water to make 50 mL, and perform the test with these solutions as directed under the Paper Chromatography. Spot 5 mL of the test solution and the standard solution onto the filter paper, air-dry the filter paper, and develop with a mixture of ethanol, 1 mol/L ammonium acetate and 1 mol/L ammonia TS, pH 7.0 (5 : 4). After air-drying the filter paper, spray 2% ninhydrin-acetone solution, allow to stand at 90 °C for 10 minutes, and observe the colors and positions of the spots; no other spots appear on the filter paper.

Loss on drying NMT 5.0% (1 g, in vacuum, phosphorus pentoxide, 100 ℃, 4 hours).

Assay Weigh accurately about 0.15 g of Citicoline Sodium, previously dried, and dissolve in water to make exactly 100 mL. Pipet 10 mL of this solution, transfer to a 100-mL volumetric flask, add potassium chloride-hydrochloric acid buffer solution, pH 2.0 exactly up to the gauge line, and use the solution as the test solution. Separately, weigh accurately about 0.15 g citicoline sodium RS, previously dried, proceed in the same manner as the test solution, and use this solution as the standard solution. With the test solution and the standard solution, determine the absorbances A_T and A_S at the wavelength of 280 nm using the blank test solution as the control solution.

$$\text{Amount (mg) of citicoline sodium } (C_{14}H_{25}O_{11}N_4P_2Na) = \text{Amount (mg) of citicoline sodium RS} \times \frac{A_T}{A_S}$$

Packaging and storage Preserve in tight containers.

Citicoline Sodium Injection
시티콜린나트륨 주사액

Citicoline Sodium Injection contains NLT 90.0% and NMT 130.0% of the labeled amount of citicoline sodium ($C_{14}H_{25}O_{11}N_4P_2Na$: 510.31).

Method of preparation Prepare as directed under Injections, with Citicoline Sodium.

Identification (1) Weigh accurately an amount of Citicoline Sodium Injection, equivalent to about 0.2 g of citicoline according to the labeled amount, and add 4 drops of sodium hydroxide TS. Heat gently to carbonize, add 10 mL of dilute nitric acid, and filter. Neutralize the filtrate with sodium hydroxide TS; the resulting solution responds to the Qualitative Analysis for phosphate.

(2) Weigh accurately an amount of Citicoline Sodium Injection, equivalent to about 0.1 g of citicoline according to the labeled amount. Add 5 mL of dilute hydrochloric acid, heat on a steam bath for 60 minutes, cool, and add 1 mL of Reinecke salt TS; a pale red precipitate is formed.

(3) Weigh accurately an amount of Citicoline Sodium Injection, equivalent to about 0.15 g of citicoline according to the labeled amount. Add 0.1 mol/L of hydrochloric acid to make 100 mL, pipet 1 mL of this solution, and add 0.01 mol/L hydrochloric acid to make 100.0 mL. Determine the absorption spectrum using 0.01 mol/L hydrochloric acid as a control solution; the spectrum exhibits a maximum at about 280 nm.

Sterility Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Extractable volume of injections Meets the requirements.

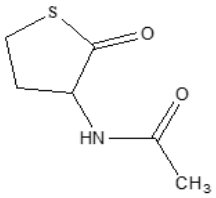
Assay Weigh accurately an amount of Citicoline Sodium Injection, equivalent to about 0.1 g of citicoline according to the labeled amount. Add water to make exactly 100 mL, pipet 3 mL of the solution, and pass through a strong base ion exchange resin column. Collect the running solution into a 200-mL flask, previously filled with 20 mL of 0.1 mol/L hydrochloric acid, and pass through 0.1 mol/L sodium chloride for complete elution. Combine the running solutions to make 200.0 mL and use the solution as the test solution. Separately, weigh accurately about 0.1 g of citicoline sodium RS, previously dried, and proceed in the same manner as for the preparation of the test solution. Use the resulting solution as the standard solution. Determine the absorbance, A_T and A_S, of the test

solution and the standard solution at 280 nm as directed under the Ultraviolet-visible Spectroscopy.

Amount (mg) of citicoline sodium ($C_{14}H_{25}O_{11}N_4P_2Na$)
= Amount (mg) of citicoline sodium RS × $\frac{A_T}{A_S}$

Packaging and storage Preserve in hermetic containers.

Citiolone
시티올론



$C_6H_9NO_2S$: 159.21
2-Acetamido-4-mercaptobutyric acid γ-thiolactone, [*1195-16-0*]

Citiolone, when dried, contains NLT 99.0% and NMT 101.0% of citiolone ($C_6H_9NO_2S$).

Description Citiolone occurs as a white crystalline powder and has a slight sulfur-like odor.
It is soluble in water, chloroform and ethanol(95).

Identification (1) Dissolve 10 mg of Citiolone in 5 mL of methanol, add 0.5 mL of ethanolic potassium hydroxide TS, shake to mix, and add 0.5 mL of saturated sodium nitroprusside methanol solution; the resulting solution exhibits a red color.

(2) Dissolve 20 mg of Citiolone in ethanol(99.5), and add ethanol(99.5) to make 100 mL. Take 10 mL of this solution, add ethanol(99.5) to make 100 mL, and use this solution as the test solution. Determine the absorption spectrum of the test solution using ethanol(99.5) as the control solution; it exhibits a maximum at the wavelength of around 235 nm.

Melting point Between 108 and 112 ℃.

Purity (1) ***Acyclic substances***—Dissolve 0.2 g of Citiolone in 20 mL of water, and add 0.2 mL of 0.05 mol/L Iodine solution; the solution exhibits a yellow color for several minutes.

(2) Perform the test under the Thin Layer Chromatography according to the conditions in (i) and (ii) below; no additional spots should appear, and also there should be no development of color on spraying 0.2% ninhydrin solution.

(i) Dissolve 10 mg of Citiolone in 10 mL of methanol, and use this solution as the test solution. Perform the test with the solution as directed under the Thin Layer Chromatography. Spot the test solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of n-butanol, water and acetic anhydride (4 : 1 : 1), and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the R_f value of the spot obtained from the test solution is 0.53.

(ii) Dissolve 10 mg of Citiolone in 10 mL of methanol, and use this solution as the test solution. Perform the test with the solution as directed under the Thin Layer Chromatography. Spot the test solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of chloroform, methanol and acetic anhydride (7 : 2 : 1) and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the R_f value of the spot obtained from the test solution is 0.68.

Loss on drying NMT 0.2% (1.0 g, 80 ℃, in vacuum, 2 hours).

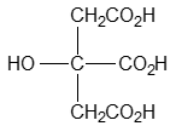
Residue on ignition NMT 0.2% (1 g).

Assay Weigh accurately about 0.3 g of Citiolone, previously dried, dissolve in 40 mL of water, add 20 mL of sodium hydroxide TS, and shake to mix well for 5 minutes. Next, adjust the pH to between 2 and 3 by adding slowly dilute hydrochloric acid, and titrate with 0.05 mol/L of iodine VS (indicator: starch TS). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.05 mol/L iodine VS
= 15.92 mg of $C_6H_9NO_2S$

Packaging and storage Preserve in tight containers.

Anhydrous Citric Acid
시트르산



$C_6H_8O_7$: 192.12
2-Hydroxypropane-1,2,3-tricarboxylic acid [77-92-9]

Anhydrous Citric Acid contains NLT 99.5% and NMT 100.5% of anhydrous citric acid (C6H8O7), calculated on the anhydrous basis.

Description Anhydrous Citric Acid is colorless crystals, white grains or a crystalline powder.
It is very soluble in water and freely soluble in ethanol(95).

Melting point—About 153 °C (with decomposition).

Identification Determine the infrared spectra of Anhydrous Citric Acid and citric acid monohydrate RS, previously dried at 105± 2°C for 2 hours, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Purity **(1)** ***Clarity and color of solution—Turbidity*** Dissolve about 2.0 g of Anhydrous Citric Acid in water to make 10 mL, and use this solution as the test solution. Take an appropriate amount each of the test solution, the control suspension (1), the control suspension (2) and water, transfer to colorless and transparent test tubes (15 - 25 mm × 40 mm), and observe the test tubes from the top for 5 minutes under a sufficient daylight against a black background that provides enough contrast to differentiate between the control suspension (1) and water, and between control suspension (1) and control suspension (2); the test solution is clear like water and is not more turbid than the control suspension (1).

◦ *Control suspension*—Pipet 25 mL of hydrazinium sulfate TS, previously allowed to stand for 4 to 6 hours, and add to a solution obtained by dissolving 2.5 g of hexamethylenetetramine in 25 mL of water, mix well, and allow the mixture to stand for 24 hours. Store the solution in a glass container and use it within 2 months. Pipet 15 mL of this suspension, and add water to make exactly 1000 mL before use.

◦ *Control suspension (1*)—Pipet 5 mL of the control suspension, and add water to make exactly 100 mL.

◦ *Control suspension (2)*—Pipet 10 mL of the control suspension, and add water to make exactly 100 mL.

Color Dissolve 2.0 g of Anhydrous Citric Acid in water to make 10 mL, and use this solution as the test solution. Take an appropriate amount each of the test solution and water, transfer to colorless and transparent test tubes (15 to 25 mm × 40 mm), and observe the test tubes from the side under a sufficient sunlight against a white background that provides enough contrast to differentiate the color; the color of the test solution is not more intense than that of water. If the color of the test solution is more intense than that of water, compare the color of the test solution with the colors of the control solutions (1), (2) and (3) in the same manner as above. In this case, the color of the test solution is not more intense than those of the control solutions (1), (2) and (3).

◦ *Control solution (1)*—To 1.5 mL of cobalt(II) chloride hexahydrate colorimetric stock solution and 6.0 mL of iron(III) chloride hexahydrate colorimetric stock solution, add diluted hydrochloric acid (1 in 10) to make 1000 mL.

◦ *Control solution (2)*—To 2.5 mL of cobalt(II) chloride hexahydrate colorimetric stock solution, 6.0 mL of iron(III) chloride hexahydrate colorimetric stock solution and 1.0 mL of copper sulfate colorimetric stock solution, add diluted hydrochloric acid (1 in 10) to make 1000 mL.

◦ *Control solution (3)*—To 0.15 mL of cobalt(II) chloride hexahydrate colorimetric stock solution, 7.2 mL of iron(III) chloride hexahydrate colorimetric stock solution and 0.15 mL of copper(II) sulfate pentahydrate colorimetric stock solution, add diluted hydrochloric acid (1 in 10) to make 1000 mL.

(2) ***Sulfate***—Dissolve 2.0 g of Anhydrous Citric Acid in water to make 30 mL, and use this solution as the test solution. Separately, dissolve 0.181 g of potassium sulfate in diluted ethanol(95) (3 in 10) to make exactly 500 mL. Pipet 5 mL of this solution, and add diluted ethanol(95) (3 in 10) to make exactly 100 mL. To 4.5 mL of this solution, add 3 mL of a solution of barium chloride dihydrate (1 in 4), shake to mix, and allow to stand for 1 minute. To 2.5 mL of this solution, add 15 mL of the test solution and 0.5 mL of acetic acid(31), and allow to stand for 5 minutes; the resulting solution is not more turbid than the following control solution (NMT 0.015%).

◦ *Control solution*—Dissolve 0.181g of potassium sulfate in water to make 500 mL. Pipet 5 mL of this solution, and add water to make exactly 100 mL. Instead of the test solution, proceed with 15 mL of this solution in the same manner as in the preparation of the test solution, and use this solution as the control solution.

(3) ***Oxalic acid***—To a solution of 0.80 g of Anhydrous Citric Acid dissolved in 4 mL of water, add 3 mL of hydrochloric acid and 1 g of zinc, and boil for 1 minute. Allow to stand for 2 minutes, take the clear supernatant, add 0.25 mL of a phenylhydrazinium hydrochloride solution (1 in 100), heat to boiling, and cool rapidly. To this solution, add an equal volume of hydrochloric acid and 0.25 mL of potassium hexacyanoferrate(III) solution (1 in 20), shake to mix, and allow to stand for 30 minutes; the color of the resulting solution is not more intense than the concurrently prepared control solution (NMT 0.036% as anhydrous oxalic acid).

◦ *Control solution*—Add 3 mL of hydrochloric acid and 1 g of zinc to 4 mL of oxalic acid dihydrate solution (1 in 10000).

(4) ***Aluminum***—Perform the test when used in the manufacturing of hemodialysis preparations. Dissolve 20.0 g of Anhydrous Citric Acid in 100 mL of water, add 10 mL of acetic acid-ammonium acetate buffer solution, pH 6.0, extract with 20 mL, 20 mL and 10 mL of 0.5% chloroform solutions of 8-hydroxyquinoline to collect in a 50-mL volumetric flask, and add chloroform to make 50 mL. Use this solution as the test solution. Separately, dissolve 0.352 g of aluminum potassium sulfate in a small amount of water, add 10 mL of dilute sulfuric acid, and then add water to make 100 mL. Pipet 1.0 mL of this solution and add water to make 100 mL before use. Take 2.0 mL of this solution, add 10 mL of acetic acid-ammonium acetate buffer solution, pH 6.0, and add 98 mL of water. Extract in the same procedure as the test solution, combine the extracts in a 50-mL volumetric flask, add chloroform to make 50 mL, and use this solution as the standard solution. To 10 mL of acetic acid-ammonium acetate buffer solution, pH 6.0, add 100 mL of water, extract with chloroform in the same manner as the test solution, and use this solution as the blank test solution. Perform the test with the test solution and the

standard solution as directed under the Fluorescence Spectroscopy using the blank test solution as the blank, and determine the fluorescence intensity at the excitation wavelength of 392 nm and the fluorescence wavelength of 518 nm; the fluorescence intensity obtained from the test solution is not greater than that of the standard solution (NMT 0.2 ppm).

(5) ***Readily carbonizable substances***—Rinse a Nessler tube with 10 mL of sulfuric acid, and decant for 10 minutes. Add 1.0 g of Anhydrous Citric Acid to the Nessler tube, add 10 mL of sulfuric acid, immediately heat at 90 °C on a water bath for 1 hour, and cool rapidly. Take 2.0 mL each of this solution and matching fluids for color K, transfer to test tubes with an outer diameter of 12 mm, and observe the test tubes from the side against a white background; the color of the solution is not more intense than that of matching fluids for color K.

Water NMT 1.0% (2 g, volumetric titration, direct titration).

Residue on ignition NMT 0.1% (1 g).

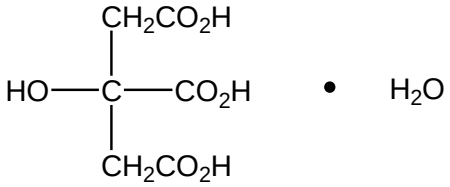
Bacterial endotoxins Less than 0.5 EU/mg per mL of citric acid, when used in the manufacturing of parenteral preparations without a procedure for the removal of bacterial endotoxins.

Assay Weigh accurately about 0.55 g of Anhydrous Citric Acid, dissolve in 50 mL of water, and titrate with 1 mol/ L sodium hydroxide VS (indicator: 2 drops of phenolphthalein TS).

Each mL of 1 mol/L sodium hydroxide VS
= 64.03 mg of $C_6H_8O_7$

Packaging and storage Preserve in tight containers.

Citric Acid Hydrate
시트르산수화물



Citric Acid $C_6H_8O_7 \cdot H_2O$: 210.14
2-Hydroxypropane-1,2,3-tricarboxylic acid hydrate [5949-29-1]

Citric Acid Hydrate contains NLT 99.5% and NMT 100.5% of citric acid ($C_6H_8O_7$: 192.12), calculated on the anhydrous basis.

When used in the manufacturing of hemodialysis preparations, it is labeled accordingly.

Description Citric Acid Hydrate is colorless crystals, white grains or a crystalline powder.
It is very soluble in water and freely soluble in ethanol(99.5).
It effloresces in dry air.

Identification Determine the infrared spectra of Citric Acid Hydrate and citric acid monohydrate RS, previously dried at 105 °C ± 2 for 2 hours, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Purity (1) ***Clarity and color of solution—Turbidity*** Dissolve about 2.0 g of Citric Acid Hydrate in water to make 10 mL, and use this solution as the test solution. Take an appropriate amount each of the test solution, the control suspension (1), the control suspension (2) and water, transfer to colorless and transparent test tubes (15 - 25 mm × 40 mm), and observe the test tubes from the top for 5 minutes under a sufficient daylight against a black background that provides enough contrast to differentiate between the control suspension (1) and water, and between control suspension (1) and control suspension (2); the test solution is clear like water and is not more turbid than the control suspension (1).

Control suspension—Pipet 25 mL of hydrazinium sulfate TS, previously allowed to stand for 4 to 6 hours, and add to a solution obtained by dissolving 2.5 g of hexamethylenetetramine in 25 mL of water, mix well, and allow the mixture to stand for 24 hours. Store the solution in a glass container and use it within 2 months. Pipet 15 mL of this suspension, and add water to make exactly 1000 mL before use.

Control suspension (1)— Pipet 5 mL of the control suspension, and add water to make exactly 100 mL.

Control suspension (2)— Pipet 10 mL of the control suspension, and add water to make exactly 100 mL.

Color Dissolve 2.0 g of Citric Acid Hydrate in water to make 10 mL, and use this solution as the test solution. Take an appropriate amount each of the test solution and water, transfer to colorless and transparent test tubes (15 to 25 mm × 40 mm), and observe the test tubes from the side under a sufficient sunlight against a white background that provides enough contrast to differentiate the color; the color of the test solution is not more intense than that of water. If the color of the test solution is more intense than that of water, compare the color of the test solution with the colors of the control solutions (1), (2) and (3) in the same manner as above. In this case, the color of the test solution is not more intense than those of the control solutions (1), (2) and (3).

Control solution (1)— To 1.5 mL of cobalt(II) chloride hexahydrate colorimetric stock solution and 6.0 mL

of iron(III) chloride hexahydrate colorimetric stock solution, add diluted hydrochloric acid (1 in 10) to make 1000 mL.

Control solution (2)— To 2.5 mL of cobalt(II) chloride hexahydrate colorimetric stock solution, 6.0 mL of iron(III) chloride hexahydrate colorimetric stock solution and 1.0 mL of copper sulfate colorimetric stock solution, add diluted hydrochloric acid (1 in 10) to make 1000 mL.

Control solution (3)— To 0.15 mL of cobalt(II) chloride hexahydrate colorimetric stock solution, 7.2 mL of iron(III) chloride hexahydrate colorimetric stock solution and 0.15 mL of copper(II) sulfate pentahydrate colorimetric stock solution, add diluted hydrochloric acid (1 in 10) to make 1000 mL.

(2) ***Sulfate***— Dissolve 2.0 g of Citric Acid Hydrate in water to make 30 mL, and use this solution as the test solution. Separately, dissolve 0.181 g of potassium sulfate in diluted ethanol(95) (3 in 10) to to make exactly 500 mL. Pipet 5 mL of this solution, and add diluted ethanol(95) (3 in 10) to make exactly 100 mL. To 4.5 mL of this solution, add 3 mL of a solution of barium chloride dihydrate (1 in 4), shake to mix, and allow to stand for 1 minute. To 2.5 mL of this solution, add 15 mL of the test solution and 0.5 mL of acetic acid(31), and allow to stand for 5 minutes; the resulting solution is not more turbid than the following control solution (NMT 0.015%).

Control solution—Dissolve 0.181g of potassium sulfate in water to make 500 mL. Pipet 5 mL of this solution, and add water to make exactly 100 mL. Instead of the test solution, proceed with 15 mL of this solution in the same manner as in the preparation of the test solution, and use this solution as the control solution.

(3) ***Oxalic acid***— To a solution of 0.80 g of Anhydrous Citric Acid dissolved in 4 mL of water, add 3 mL of hydrochloric acid and 1 g of zinc, and boil for 1 minute. Allow to stand for 2 minutes, take the clear supernatant, add 0.25 mL of a phenylhydrazinium hydrochloride solution (1 in 100), heat to boiling, and cool rapidly. To this solution, add an equal volume of hydrochloric acid and 0.25 mL of potassium hexacyanoferrate(III) solution (1 in 20), shake to mix, and allow to stand for 30 minutes; the color of the resulting solution is not more intense than the concurrently prepared control solution (NMT 0.036% as anhydrous oxalic acid).

Control solution— Add 3 mL of hydrochloric acid and 1 g of zinc to 4 mL of oxalic acid dihydrate solution (1 in 10000).

(4) ***Aluminum***— Perform the test when used in the manufacturing of hemodialysis preparations. Dissolve 20.0 g of Anhydrous Citric Acid in 100 mL of water, add 10 mL of acetic acid-ammonium acetate buffer solution, pH 6.0, extract with 20 mL, 20 mL and 10 mL of 0.5% chloroform solutions of 8-hydroxyquinoline to collect in a 50-mL volumetric flask, and add chloroform to make 50 mL. Use this solution as the test solution. Separately, dissolve 0.352 g of aluminum potassium sulfate in a small amount of water, add 10 mL of dilute sulfuric acid, and then add water to make 100 mL. Pipet 1.0 mL of this solution and add water to make 100 mL before use. Take 2.0 mL of this solution, add 10 mL of acetic acid-ammonium acetate buffer solution, pH 6.0, and add 98 mL of water. Extract in the same procedure as the test solution, combine the extracts in a 50-mL volumetric flask, add chloroform to make 50 mL, and use this solution as the standard solution. To 10 mL of acetic acid-ammonium acetate buffer solution, pH 6.0, add 100 mL of water, extract with chloroform in the same manner as the test solution, and use this solution as the blank test solution. Perform the test with the test solution and the standard solution as directed under the Fluorescence Spectroscopy using the blank test solution as the blank, and determine the fluorescence intensity at the excitation wavelength of 392 nm and the fluorescence wavelength of 518 nm; the fluorescence intensity obtained from the test solution is not greater than that of the standard solution (NMT 0.2 ppm).

(5) ***Readily carbonizable substances***—Rinse a Nessler tube with 10 mL of sulfuric acid for readily carbonizable substances, and decant for 10 minutes. Add 1.0 g of Citric Acid Hydrate to the Nessler tube, add 10 mL of sulfuric acid, immediately heat at 90 °C on a water bath for 1 hour, and cool rapidly. Take 2.0 mL each of this solution and matching fluids for color K, transfer to test tubes with an outer diameter of 12 mm, and observe the test tubes from the side against a white background; the color of the solution is not more intense than that of matching fluids for color K.

Water Between 7.5% and 9.0% (0.5 g, volumetric titration, direct titration).

Residue on ignition NMT 0.1% (1 g).

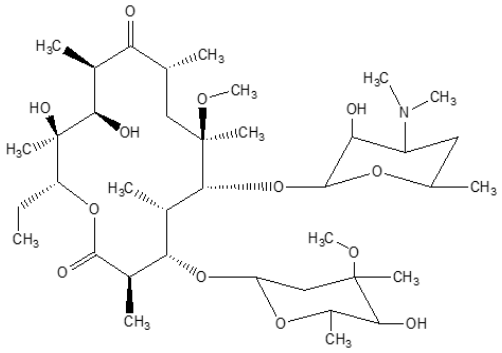
Bacterial endotoxins Less than 0.5 EU per mg of citric acid hydrate when used in the manufacturing of parenteral preparations without a procedure for the removal of bacterial endotoxins.

Assay Weigh accurately about 0.55 g of Citric Acid Hydrate, dissolve in 50 mL of water, and titrate with 1 mol/L sodium hydroxide VS (indicator: 2 drops of phenolphthalein TS).

Each mL of 1 mol/L sodium hydroxide VS
= 64.03 mg of $C_6H_8O_7$

Packaging and storage Preserve in tight containers.

Clarithromycin
클래리트로마이신



$C_{38}H_{69}NO_{13}$: 747.95
(3*R*,4*S*,5*S*,6*R*,7*R*,9*R*,11*R*,12*R*,13*S*,14*R*)-6-[(2*S*,3*R*,4*S*,6*R*)-4-(Dimethylamino)-3-hydroxy-6-methyloxan-2-yl]oxy-14-ethyl-12,13-dihydroxy-4-[(2R,4R,5S,6S)-5-hydroxy-4-methoxy-4,6-dimethyloxan-2-yl]oxy-7-methoxy-3,5,7,9,11,13-hexamethyl-oxacyclotetradecane-2,10-dione [*81103-11-9*]

Clarithromycin is a derivative of erythromycin. Clarithromycin contains NLT 950 μg and NMT 1050 μg (potency) of clarithromycin ($C_{38}H_{69}NO_{13}$) per mg, calculated on the anhydrous basis.

Description Clarithromycin occurs as a white crystalline powder and has a bitter taste.
It is soluble in acetone or chloroform, slightly soluble in methanol or ethanol(95), and practically insoluble in water.

Identification (1) Take 5 mg of Clarithromycin, add 2 mL of sulfuric acid and shake to mix; the solution exhibits a reddish brown color.

(2) Add 2 mL of acetone to 3 mg of Clarithromycin, then add 2 mL of hydrochloric acid; the solution exhibits an orange color and immediately changes to red to dark violet.

(3) Determine the infrared spectra of Clarithromycin and clarithromycin RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both exhibit similar intensities of absorption at the same wavenumbers.

(4) Dissolve 10 mg of Clarithromycin and clarithromycin RS in 4 mL of chloroform and use these solutions as the test solution and the standard solution, respectively. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of chloroform, methanol and ammonia solution(28) (100 : 5 : 1) to a distance of about 15 cm, and air-dry the plate. Spray evenly sulfuric acid on the plate, and heat it at 105 ℃ for 10 minutes; the R_f values of the spots obtained from the test and standard solutions are the same, and the spots have a dark purple color.

Crystallinity Meets the requirements.

Optical rotation $[\alpha]_D^{20}$: Between -87° and -97° (0.25 g calculated on the anhydrous basis, chloroform, 25 mL, 100 mm).

Melting point Between 220 and 227 ℃.

pH Dissolve 50 mg of Clarithromycin in methanol to make 20 mL. Take 10 mL of this solution and add water to make 20 mL; the pH of this solution is between 8.0 and 10.0.

Purity (1) ***Heavy metals***—Proceed with 2.0 g of Clarithromycin as directed under Method 4 and perform the test. Prepare the control solution with 2.0 mL of standard lead solution (NMT 10 ppm).

(2) ***Arsenic***—Proceed with 1.0 g of Clarithromycin as directed under Method 3 and perform the test (NMT 2 ppm).

(3) ***Related substances***—Weigh accurately 0.1 g of Clarithromycin, dissolve in the mobile phase to make exactly 20 mL, and use this solution as the test solution. Separately, weigh accurately about 10 mg of clarithromycin RS, dissolve in the mobile phase to make exactly 20 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid chromatography according to the following conditions and determine the peak area of each solution by automatic integration method; the amount of each related substance in the test solution is NMT 2.0% of clarithromycin, calculated on the anhydrous basis, and the total amount of related substances is NMT 5.0%. However, exclude any peaks smaller than 0.05%.

Content (%) of each related substance in Clarithromycin, calculated on the anhydrous basis

$$= \times \frac{W_S}{W_T} \times \frac{A_i}{A_S} \times 100$$

Total content (%) of related substances in Clarithromycin, calculated on the anhydrous basis

$$= \times \frac{W_S}{W_T} \times \frac{\sum A_i}{A_S} \times 100$$

W_S: Amount taken (mg) of clarithromycin RS

W_T: Amount of taken (mg) of Clarithromycin, calculated on the anhydrous basis

A_S: Peak area of each clarithromycin in the standard solution

A_i: Peak area of each related substance in the test solution

$\sum A_i$: Sum of peak areas other than clarithromycin in the test solution

Operating conditions

For the detector, column, column temperature, mobile phase and flow rate, proceed as directed under the operating conditions in the Assay.

System suitability

System performance: Proceed as directed under the system suitability under the Assay.

Test for required detectability: Pipet 2 mL of the standard solution, add the mobile phase to make exactly 10 mL, and use this solution as the system suitability solution. Confirm that the peak area of clarithromycin obtained from 10 μL of this solution is equivalent to 14% to 26% of the peak area of clarithromycin obtained from the standard solution.

System repeatability: Repeat the test 6 times with 10 μL of the system suitability solution under the above conditions; the relative standard deviation of the peak area of clarithromycin is NMT 3.0%.

Time span of measurement: About 5 times the retention time of the major peak from 2 minutes after introduction of the test solution.

Water NMT 2.0% (0.5 g, volumetric titration, direct titration).

Residue on ignition NMT 0.1% (2.0 g).

Assay Weigh accurately about 0.1 g (potency) of Clarithromycin and clarithromycin RS and dissolve each in the mobile phase to make exactly 20 mL. Pipet 2 mL of these solutions, add 2 mL of the internal standard solution, then add the mobile phase to make exactly 20 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid chromatography according to the following conditions, and determine the ratios, Q_T and Q_S, of the peak area of clarithromycin to that of the internal standard.

$$\text{Potency (μg) of clarithromycin } (C_{38}H_{69}NO_{13}) = \text{Potency (μg) of clarithromycin RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of propyl p-hydroxybenzoate in the mobile phase (1 in 20000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 210 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 ℃.

Mobile phase: A mixture of 0.05 mol/L potassium dihydrogen phosphate TS (pH 2.0) and methanol (2 : 3).

0.05 mol/L potassium dihydrogen phosphate TS (pH 2.0) —Add phosphoric acid to 0.05 mol/L potassium dihydrogen phosphate TS to adjust the pH to 2.0.

Flow rate: 1.0 mL/min

System suitability

System performance: Proceed with 10 μL of the standard solution according to the above conditions; the internal standard and clarithromycin are eluted in this order with the resolution being NLT 1.5.

System repeatability: Repeat the test 6 times with 10 μL of the standard solution under the above conditions; the relative standard deviation of the peak area ratio of clarithromycin to that of the internal standard is NMT 1.0%.

Packaging and storage Preserve in well-closed containers.

Clarithromycin for Injection
주사용 클래리트로마이신

Clarithromycin for Injection is a preparation for injection, which is dissolved before use. Clarithromycin for Injection contains NLT 90.0% and NMT 120.0% of the labeled amount of clarithromycin ($C_{38}H_{69}NO_{13}$: 747.96).

Method of preparation Prepare as directed under Injections, with Clarithromycin.

Description Clarithromycin for Injection occurs as a white or milky white powder.

Identification The retention time of the major peaks of the test solution correspond to those of the standard solution, as obtained in the Assay.

pH Dissolve Clarithromycin for Injection in water to make 50 mg (potency) per mL; the pH of the solution is 4.8 to 6.0.

Water NMT 5.0% (0.2 g, volumetric titration, direct titration).

Sterility Meets the requirements.

Bacterial endotoxins Less than 0.15 EU per mg (potency) of clarithromycin.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately about 0.5 g (potency) of clarithromycin ($C_{38}H_{69}NO_{13}$), according to the labeled potency of Clarithromycin for Injection, add methanol and shake vigorously to prepare a solution containing about 5 mg (potency) of clarithromycin per mL. Pipet 2 mL of this solution, add 2 mL of the internal standard solution, add the mobile phase to make exactly 20 mL, filter, and use this solution as the test solution. Separately, weigh accurately about 50 mg (potency) of clarithromycin RS, dissolve in methanol and prepare a solution containing about 5 mg (potency) of clarithromycin RS per mL. Pipet 2 mL of this solution, add 2 mL of the internal standard solution, add the mobile phase to make exactly 20 mL and filter. Use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions and determine the peak area ratios for clarithromycin, Q_T and Q_S, to the peak area of the internal standard for each solution.

$$\text{Potency (μg) of clarithromycin } (C_{38}H_{69}NO_{13}) = \text{Potency of clarithromycin RS (μg)} \times \frac{Q_T}{Q_S} \times 10$$

Internal standard solution—A solution of propyl p-hydroxybenzoate in the mobile phase (1 in 20000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 210 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 ℃.

Mobile phase: A mixture of methanol and 0.05 mol/L potassium dihydrogen phosphate TS (pH 2.0) (3 : 2).

Flow rate: 1.0 mL/min

System suitability

System performance: Proceed with 10 μL of the standard solution according to the above conditions; the internal standard and clarithromycin are eluted in this order with the resolution being NLT 3.0.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution according to the above conditions, the relative standard deviation of peak area ratios of clarithromycin to the peak area of the internal standard is NMT 1.0%.

0.05 mol/L potassium dihydrogen phosphate TS (pH 2.0)—Add phosphoric acid to 0.05 mol/L potassium dihydrogen phosphate TS to adjust the pH to 2.0.

Packaging and storage Preserve in hermetic containers.

Clarithromycin for Syrup
시럽용 클래리트로마이신

Clarithromycin for Syrup is a syrup which is suspended before use and contains NLT 90.0% and NMT 120.0% of the labeled amount of clarithromycin ($C_{38}H_{69}NO_{13}$: 747.96).

Method of preparation Prepare as directed under Syrups, with Clarithromycin.

Identification (1) Perform the test as directed in Identification (4) under Clarithromycin.

(2) The retention times of the major peaks obtained from the test solution and the standard solution in the Assay are the same.

pH Dissolve Clarithromycin for Syrup as labeled; the pH of this solution is 4.0 to 5.4.

Loss on drying NMT 2.0% (1.0 g, 0.7 kPa, 60 ℃, 3 hours).

Dissolution Perform the test with 10 mL of a solution of Clarithromycin for Syrup suspended as labeled at 50 revolutions per minute according to Method 2 at 37 ± 0.5 ℃, using 900 mL of 0.05 mol/L potassium dihydrogen phosphate buffer solution (pH 6.8) as the dissolution medium. Take NLT 20 mL of the dissolved solution 45 minutes after the start of the test, and filter through a membrane filter with a pore size of NMT 0.5 μm. Discard the first 10 mL of the filtrate, pipet the subsequent V mL, add the mobile phase to make exactly V□ mL so that each mL contains about 200 μg (potency) of clarithromycin ($C_{38}H_{69}NO_{13}$) according to the labeled amount, and use this solution as the test solution. Separately, weigh accurately about 50 mg (potency) of clarithromycin RS and dissolve in methanol to make exactly 25 mL. Pipet 5 mL of this solution, add the mobile phase to make exactly 50 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, or clarithromycin. Meets the requirements if the dissolution rate of Clarithromycin for Syrup in 45 minutes is NLT 80% of the labeled potency.

$$\text{Dissolution rate (\%) with respect to the labeled amount of clarithromycin } (C_{38}H_{69}NO_{13}) = \frac{Potency\ (mg)\ of\ clarithromycin\ RS}{W_S} \times \frac{A_T}{A_S} \times \frac{V'}{V} \times \frac{1}{C} \times 360$$

W_S: Amount taken (g) of Clarithromycin for Syrup in 10 mL of suspension

C: Labeled amount [mg (potency)] of clarithromycin ($C_{38}H_{69}NO_{13}$) in 1 g

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 210 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: Add phosphoric acid to a mixture of methanol and 0.067 mol/L potassium dihydrogen phosphate solution (65 : 35) to adjust pH to 4.0.

Flow rate: 1.0 mL/min

Uniformity of dosage units (distribution) Meets the requirements.

Assay Perform the test as directed in the Assay under Clarithromycin. Weigh accurately an amount of Clarithromycin for Syrup equivalent to about 0.5 g (potency) of clarithromycin ($C_{38}H_{69}NO_{13}$) according to the labeled potency, add 40 mL of water and shake to mix. Add methanol to make exactly 100 mL, then shake vigorously to mix for 30 minutes. Pipet 2 mL of this solution, add exactly 2 mL of the internal standard solution, add the mobile phase to make exactly 20 mL, and use this solution as the test solution. Separately, weigh about 50 mg (potency) of clarithromycin RS and dissolve in methanol to prepare a solution containing 5 mg (potency) per mL. Pipet 2 mL of this solution, add exactly 2 mL of the internal standard solution, add the mobile phase to make exactly 20 mL, and use this solution as the standard solution.

Packaging and storage Preserve in tight containers.

Clarithromycin Tablets
클래리트로마이신 정

Clarithromycin Tablets contain NLT 90.0% and NMT 107.0% of the labeled amount of clarithromycin ($C_{38}H_{69}NO_{13}$: 747.95).

Method of preparation Prepare as directed under Tablets, with Clarithromycin.

Identification Weigh an amount of Clarithromycin Tablets, previously powdered, equivalent to 60 mg (potency) of clarithromycin, add 40 mL of acetone, shake for 10 minutes, and centrifuge for 5 minutes at 4000 rotations per minute. Take 30 mL of the clear supernatant, and determine the infrared spectra of the residues as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; it exhibits absorption at the wavenumbers of about 2980 cm^{-1}, 2940 cm^{-1}, 1734 cm^{-1}, 1693 cm^{-1}, 1459 cm^{-1}, 1379 cm^{-1} and 1171 cm^{-1}.

Water NMT 7.0% (0.1 g, volumetric titration, direct titration).

Uniformity of dosage units Meets the requirements.

Dissolution Perform the test with 1 tablet of Clarithromycin Tablets at 50 revolutions per minute according to Method 2 under the Dissolution, using 900 mL of 0.05 mol/L dibasic sodium phosphate-citric acid buffer solution (pH 6.0) as the dissolution solution. Take NLT 20 mL of the dissolved solution after 30 minutes from the start of the Dissolution, and filter through a membrane filter with a pore size of NMT 0.45 μm. Discard 10 mL of the first filtrate, pipet V mL of the subsequent filtrate, and add the mobile phase to obtain exactly V′ mL of a solution containing about 28 μg (potency) of clarithromycin ($C_{38}H_{69}NO_{13}$) per mL according to the labeled amount, and use this solution as the test solution. Separately, weigh accurately about 28 mg (potency) of clarithromycin RS, and dissolve in acetonitrile for liquid chromatography to make exactly 100 mL. Pipet 5 mL of this solution, add the mobile phase to make exactly 50 mL, and use this solution as the standard solution. Perform the test with 100 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas of clarithromycin, A_T and A_S, in each solution. Meets the requirements if the dissolution rate of Clarithromycin Tablets in 30 minutes is NLT 75%.

Dissolution rate (%) of the labeled amount of clarithromycin ($C_{38}H_{69}NO_{13}$)

$$= W_S \times \frac{A_T}{A_S} \times \frac{V'}{V} \times \frac{1}{C} \times 90$$

W_S: Amount [mg (potency)] of clarithromycin RS

C: Labeled amount [mg (potency)] of clarithromycin ($C_{38}H_{69}NO_{13}$) in 1 tablet

Operating conditions

Proceed as directed under the operating conditions under the Assay.

System suitability

System performance: Proceed with 100 μL of the standard solution according to the above conditions; the symmetry factor of the clarithromycin peak is NMT 2.0.

System repeatability: Repeat the test 6 times with 100 μL each of the standard solutions according to the above conditions; the relative standard deviation of the peak area of clarithromycin is NMT 2.0%.

Assay Weigh accurately the mass of NLT 20 Clarithromycin Tablets, and powder. Weigh accurately the appropriate amount, add the mobile phase to obtain a solution

containing about 8 mg (potency) of clarithromycin ($C_{38}H_{69}NO_{13}$) per mL according to the labeled amount, and ultrasonicate. After dispersing the particles into small pieces, add accurately 1 mL of the internal standard solution (1) per 100 mg (potency) of clarithromycin ($C_{38}H_{69}NO_{13}$) according to the labeled amount. Then, add again the mobile phase to make a solution containing about 5 mg (potency) of clarithromycin ($C_{38}H_{69}NO_{13}$) per mL according to the labeled amount, sonicate for 10 minutes with occasional strong shaking, and centrifuge for 15 minutes at 4000 rotations per minute. The clear supernatant is filtered through a membrane filter with a pore size of NMT 0.45 μm. Discard the first 3 mL of the filtrate, take 2 mL of the subsequent filtrate, add the mobile phase to make 20 mL, and use this solution as the test solution. Separately, weigh accurately about 50 mg (potency) of clarithromycin RS, and dissolve in the mobile phase to make exactly 10 mL. Pipet 2 mL of this solution, add exactly 2 mL of the internal standard solution (2), add the mobile phase again to make 20 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak area ratios, Q_T and Q_S, of clarithromycin to the peak area of the internal standard.

Potency (μg) of clarithromycin ($C_{38}H_{69}NO_{13}$)
= Potency (μg) of clarithromycin RS × Q_T / Q_S

Internal standard solution—(1) A solution of propyl p-hydroxybenzoate in the mobile phase (1 in 1000).

Internal standard solution—(2) Pipet 1 mL of the internal standard solution (1), and add the mobile phase to make exactly 20 mL.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 210 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: A mixture of 0.05 mol/L potassium dihydrogen phosphate TS (pH 2.0) and methanol (2 : 3).

0.05 mol/L potassium dihydrogen phosphate TS (pH 2.0)—Add phosphoric acid to 0.05 mol/L potassium dihydrogen phosphate TS, and adjust pH to 2.0.

Flow rate: 1.0 mL/min

System suitability

System performance: Proceed with 10 μL of the standard solution according to the above conditions; the internal standard and clarithromycin are eluted in this order with the resolution between their peaks being NLT 3.

System repeatability: Repeat the test 6 times with 10 μL of the standard solution under the above conditions; the relative standard deviation of the peak area ratios of clarithromycin to the peak area of the internal standard is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Clarithromycin Delayed-Release Tablets
클래리트로마이신 서방정

Clarithromycin Delayed-Release Tablets contain NLT 90.0% and NMT 120.0% of the labeled amount of clarithromycin ($C_{38}H_{69}NO_{13}$: 747.96).

Method of preparation Prepare as directed under Tablets, with Clarithromycin.

Identification (1) Powder Clarithromycin Delayed-Release Tablets, extract with chloroform to obtain a concentration of 2.5 mg of clarithromycin per mL, and perform the test as directed under the Identification (4) of Clarithromycin.

(2) The retention times of the major peaks obtained from the test solution and the standard solution in the Assay are the same.

Dissolution Perform the test with 1 tablet of Clarithromycin Delayed-Release Tablets at 50 revolutions per minute according to Method 2 under the Dissolution, using 900 mL of 0.21 mol/L phosphate buffer solution (pH 4.0). Take the dissolved solution 2, 8, and 20 hours after the start of the Dissolution to filter, if necessary, add 0.21 mol/L phosphate buffer solution (pH 4.0) to contain about 560 μg (potency) of clarithromycin ($C_{38}H_{69}NO_{13}$) per mL according to the labeled amount. Dilute and use this solution as the test solution. Separately, weigh accurately about 28 mg (potency) of clarithromycin RS, dissolve in 7 mL of acetonitrile, add 0.21 mol/L phosphate buffer solution (pH 4.0) to make exactly 50 mL, and use this solution as the standard solution. Perform the test with 50 μL each of the test solution and the standard solution as directed under the Assay. Meets the requirements if the dissolution rate for 2 hours is NMT 15%, for 8 hours is 35% to 65%, and for 20 hours is NLT 60%.

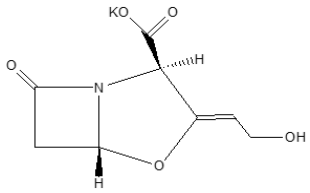
Uniformity of dosage units Meets the requirements.

Assay Perform the test according to the Assay under Clarithromycin. However, weigh accurately the mass of NLT 20 Clarithromycin Delayed-Release Tablets, and powder. Weigh accurately an amount equivalent to about 0.5 g (potency) according to the labeled potency, add it to methanol, and shake vigorously to mix and make a solution containing 5 mg (potency) per mL. Pipet 2 mL of this solution, add 2 mL of the internal standard solution,

then add the mobile phase to make exactly 20 mL, and use this solution as the test solution. Separately, weigh accurately about 50 mg (potency) of clarithromycin RS, and dissolve it in methanol to make a solution containing 5 mg (potency) per mL. Pipet 2 mL of this solution, add 2 mL of the internal standard solution, then add the mobile phase to make exactly 20 mL, and use this solution as the standard solution.

Packaging and storage Preserve in tight containers.

Clavulanate Potassium
클라불란산칼륨



$C_8H_8KNO_5$: 237.25
Potassium(2*R*,3*Z*,5*R*)-3-(2-hydroxyethylidene)-7-oxo-4-oxa-1-azabicyclo[3.2.0]heptane-2-carboxylate [*61177-45-5*]

Clavulanate Potassium contains between 810 μg and 860 μg (potency) of clavulanic acid ($C_8H_9NO_5$: 199.16) per mg, calculated on the anhydrous basis.

Description Clavulanate Potassium occurs as a white to pale yellowish white crystalline powder.
It is very soluble in water, soluble in methanol, and slightly soluble in ethanol(95).

Identification (1) Add 5 mL of imidazole TS to 1 mL of aqueous solutions (1 in 5000) of Clavulanate Potassium and clavulanic acid RS, heat for 12 minutes on a steam bath at 30 ℃, cool, and determine the absorption spectra according to the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Clavulanate Potassium and clavulanate potassium RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) Clavulanate Potassium responds to the Qualitative Analysis (1) for potassium salt.

Optical rotation $[\alpha]_D^{20}$: Between +53° and +63° (0.5 g calculated on the anhydrous basis, 50 mL of water, 100 mm).

Purity (1) ***Heavy metals***—Proceed with 2.0 g of Clavulanate Potassium according to Method 2 and perform the test. Prepare the control solution with 4.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Arsenic***—Proceed with 1.0 g of Clavulanate Potassium according to Method 3 and perform the test (NMT 2 ppm).

(*3*) ***Related substances***—Weigh accurately about 0.1 g (potency) of Clavulanate Potassium, dissolve in mobile phase A water to make 10 mL, and use this solution as the test solution. Pipet 1 mL of this solution, add the mobile phase A to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak area of each solution according to the automatic integration method; each peak area other than the peak of clavulanic acid from the test solution is not greater than the peak area of clavulanic acid from the standard solution. The sum of the peak areas other than the peak area of clavulanic acid in the test solution is NMT 2 times the peak area of clavulanic acid in the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 230 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 100 mm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: Control the mixing ratio of mobile phase A and mobile phase B stepwise or via the gradient elution as follows.

Mobile phase A: 0.05 mol/L dibasic sodium phosphate solution adjusted to pH 4.0 with phosphoric acid.

Mobile phase B: A mixture of mobile phase A and methanol (1 : 1).

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 - 4	100	0
4 - 15	100 → 0	0 → 100
15 - 25	0	100

Flow rate: 1.0 mL/min

System suitability

Test for required detectability: Pipet 1 mL of the standard solution and add the mobile phase A to make exactly 10 mL. Confirm that the peak area of clavulanic acid obtained from 20 μL of this solution is between 7% and 13% of the peak area of clavulanic acid obtained from 20 μL of the standard solution.

System performance: Weigh accurately about 10 mg each of clavulanic acid and amoxicillin, and add the mobile phase A to make exactly 100 mL. Proceed with 20 μL of this solution according to the above conditions; the resolution between clavulanic acid and amoxicillin is NLT 8, and the number of theoretical plates of clavulanic

acid is NLT 2500.

System repeatability: Repeat the test 3 times with 20 μL of the standard solution according to the above conditions; the relative standard deviation of the peak area for clavulanic acid is NMT 2.0%.

Time span of measurement: About 6 times the retention time of clavulanic acid.

Water NMT 1.5% (5 g, volumetric titration, direct titration).

Sterility It meets the requirements when used in a sterile preparation. However, it is excluded in cases where there is a terminal sterilization process in the manufacturing of sterile preparations.

Bacterial endotoxins It is less than 0.03 EU per mg (potency) of clavulanate potassium when used for the manufacturing of sterile preparations.

Assay Weigh accurately about 12.5 mg (potency) each of Clavulanate Potassium and clavulanic acid RS, dissolve in 30 mL water, add exactly 5 mL of internal standard solution, and then add water to make 50 mL. Use these solutions as the test solution and the standard solution, respectively. Perform the test with 5 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the peak area ratios, Q_T and Q_S of clavulanic acid to the peak area of the internal standard for each solution, respectively.

$$\text{Potency (μg) of clavulanic acid } (C_8H_9NO_5) = \text{Potency (μg) of clavulanic acid RS} \times \frac{Q_T}{Q_S}$$

Separately, weigh accurately about 0.3 g of iron, sulfanilamide, dissolve in 30 mL of methanol, and add water to make 100 mL.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 230 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: Dissolve 1.36 g of sodium acetate hydrate in 900 mL of water, adjust pH to 4.5 with acetic acid (2 in 5), add 30 mL of methanol, and add water to make 1000 mL.

Flow rate: Adjust the flow rate so that the retention time of clavulanic acid is about 6 minutes.

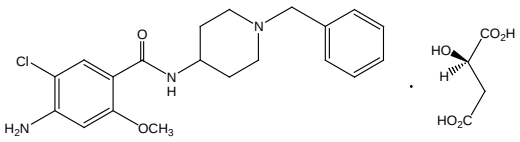
System suitability

System performance: Proceed with 5 μL of the standard solution under the above conditions; clavulanic acid and internal standard are eluted in this order with the resolution being NLT 4.

System repeatability: Repeat the test 6 times with 5 μL each of the standard solutions as directed under the above conditions, the relative standard deviation of peak area ratios of clavulanic acid to that of the internal standard is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Clebopride Malate
클레보프리드말산염



and enantiomer

$C_{20}H_{24}ClN_3O_2 \cdot C_4H_6O_5$: 507.96

4-[(4-Amino-5-chloro-2-methoxybenzoyl)amino]-1-benzylpiperidinium 3-carboxy-2-hydroxypropanoate [*57645-91-7*]

Clebopride Malate, when dried, contains NLT 98.5% and NMT 101.0% of clebopride malate ($C_{20}H_{24}ClN_3O_2 \cdot C_4H_6O_5$).

Description Clebopride Malate occurs as a white crystalline powder.

It is sparingly soluble in methanol or water, slightly soluble in ethanol(95), and practically insoluble in dichloromethane.

Melting point—About 164 °C (with decomposition).

Identification (1) Dissolve 20 mg of Clebopride Malate in 1 mL of sulfuric acid, add 1 mL of 2-naphthol solution and expose to sunlight; the solution exhibits a yellow color with blue fluorescence.

(2) Dissolve 20.0 mg each of Clebopride Malate and clebopride malate RS in water to make 100 mL; add water to 10.0 mL of the resulting solution to make 100 mL, and use these solutions as the test solution and the standard solution. Determine the absorption spectra of both solutions as directed under the Ultraviolet-visible Spectroscopy: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared spectra of Clebopride Malate and clebopride malate RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both exhibit similar intensities of absorption at the same wavenumbers.

(4) Dissolve 5 mg of Clebopride Malate in ethanol(95) to make 10 mL and use this solution as the test solution. Separately, dissolve 5 mg of clebopride malate RS in ethanol(95) to make 10 mL, and use this solution as the standard solution (1). Dissolve 5 mg of clebopride

malate RS and 5 mg of metoclopramide hydrochloride RS in ethanol(95) to make 10 mL, and use this solution as the standard solution (2). With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution, the standard solution (1) and the standard solution (2) in 10 mm bands on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of toluene, methanol, acetone and ammonia water (70 : 14 : 14 : 2) to a distance of about 15 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254nm); the R_f values of the principal spots obtained from the test solution and the standard solution (1) are the same.

This test is valid when performed in the same manner with the standard solution (2) and the two spots are clearly separated.

3-naphthol solution—Dissolve 5 g of 2-naphthol in 40 mL of 2 mol/L sodium hydroxide TS and add water to make 100 mL. Prepare before use.

pH Dissolve 1.0 g of Clebopride Malate in water to make 100 mL; pH of this solution is between 3.8 and 4.2.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Clebopride Malate in water to make 100 mL; the resulting solution is clear and colorless.

(2) ***Chloride***—Dissolve 1.0 g of Clebopride Malate in 20 mL of acetic acid(100), add 6 mL of dilute nitric acid and water to make 50 mL, and use this solution as the test solution. Prepare the control solution by mixing 20 mL of acetic acid(100), 6 mL of dilute nitric acid and 0.25 mL of 0.01 mol/L hydrochloric acid, then add water to make 50 mL (NMT 0.009%).

(3) ***Sulfate***—Dissolve 2.0 g of Clebopride Malate in 20 mL of acetic acid(100), add water to make 50 mL, and use this solution as the test solution. Prepare the control solution by mixing 20 mL of acetic acid(100) and 0.42 mL of 0.005 mol/L sulfuric acid, then add water to make 50 mL (NMT 0.01%).

(4) ***Heavy metals***—Proceed with 2.0 g of Clebopride Malate as directed under Method 2 under the Heavy Metals and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(5) ***Related substances***—Weigh accurately about 0.10 g of Clebopride Malate and dissolve in 10 mL of the mobile phase, and use this solution as the test solution. Pipet 0.2 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak area obtained from each solution according to the automatic integration method; the sum of peak areas other than clebopride for the test solution is not greater than the peak area of clebopride for the standard solution.

Operating conditions

Detector: An ultravioletphotometer (wavelength: 240 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanizedanized silica gel for liquid chromatography (7 μm in particle diameter).

Column temperature: A constant temperature of about 25 ℃.

Mobile phase: Dissolve 3.85 g of ammonium acetate in water to make 500 mL, and filter through a membrane filter of pore size NMT 0.5 μm. Add 600 mL of methanol to 400 mL of the filtrate.

Flow rate: Adjust the flow rate so that the retention time of clebopride is about 15 minutes.

System suitability

Test for required detectability: Pipet 10 mL of the standard solution and add water to make exactly 100 mL. Confirm that the peak area of clebopride obtained from 10 mL of this solution is equivalent to between 7% and 13% of the peak area of clebopride obtained from the standard solution.

System performance: Dissolve 30 mg of Clebopride Malate and 5 mg of propyl p-hydroxybenzoate in the mobile phase to make 100 mL. Proceed with 10 mL of this solution according to the above conditions; propyl p-hydroxybenzoate and clebopride are eluted in this order with the resolution between these peaks being NLT 3.

System repeatability: Repeat the test 6 times according to the above conditions with 10 μL of the standard solution each time; the relative standard deviation of the peak areas of clebopride is NMT 2.5%.

Time span of measurement: About 2 times the retention time of clebopride.

Loss on drying NMT 0.5% (1 g, 105 ℃, constant mass).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.4 g of Clebopride Malate, dissolve in 50 mL of acetic acid(100), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 50.80 mg of $C_{20}H_{24}ClN_3O_2 \cdot C_4H_6O_5$

Packaging and storage Preserve in light-resistant, well-closed containers.

Clebopride Malate and Simethicone Capsules
클레보프리드말산염·시메티콘 캡슐

Clebopride Malate and Simethicone Capsules con-

tain NLT 90.0% and NMT 110.0% of the labeled amount of clebopride malate ($C_{20}H_{24}ClN_3O_2 \cdot C_4H_6O_5$: 507.96) and NLT 85.0% and NMT 115.0% of the labeled amount of polydimethylsiloxane ([-$(CH_3)_2$SiO-]n).

Method of preparation Prepare as directed under Capsules, with Clebopride Malate and Simethicone.

Identification (1) ***Clebopride malate***—Weigh an amount of Clebopride Malate and Simethicone Capsules equivalent to about 5 mg of clebopride malate, add 10 mL of dehydrated ethanol, dissolve by heating, filter the solution, and use the filtrate as the test solution. Separately, dissolve 5 mg of clebopride malate RS in 10 mL of anhydrous ethanol, and use this solution as the standard solution. Spot 10 μL each of the test solution and the standard solution on a thin-layer chromatographic plate made of silica gel for silica gel with fluorescent indicator for thin-layer chromatography, develop the plate with a mixture of strong ammonia water, acetone, methanol and toluene (2 : 14 : 14 : 70) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the Rf values and the colors of the spots obtained from the standard solution and the test solution are the same.

(2) ***Simethicone***—Perform the test with Clebopride Malate and Simethicone Capsules as directed under the Assay; both exhibit absorption at the same wavenumber.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.
