Flow rate: Adjust the flow rate so that the retention time of pranoprofen is about 10 minutes.

System suitability

Detection sensitivity: Adjust the detection sensitivity so that the peak height of pranoprofen obtained from 10 μL of the standard solution is between 10 mm and 20 mm.

System performance: Dissolve 4 mg each of Pranoprofen and ethylparaben in 200 mL of the mobile phase. Proceed with 10 μL of this solution according to the above conditions; pranoprofen and ethylparaben are eluted in this order with the resolution being NLT 2.1.

Time span of measurement: About 3 times the retention time of pranoprofen.

Loss on drying NMT 0.5% (1 g, in vacuum, phosphorus pentoxide, 4 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.4 g of Pranoprofen, previously dried, dissolve in 70 mL of a mixture of acetic anhydride and acetic acid(100) (7 : 3), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 25.527 mg of $C_{15}H_{13}NO_3$

Packaging and storage Preserve in light-resistant, tight containers.

Pranoprofen Syrup
프라노프로펜 시럽

Pranoprofen Syrup contains NLT 93.0% and NMT 107.0% of the labeled amount of pranoprofen ($C_{15}H_{13}NO_3$: 255.27).

Method of preparation Prepare as directed under Syrups, with Pranoprofen.

Identification (1) Take an amount of Pranoprofen Syrup, equivalent to 30 mg of pranoprofen, according to the labeled amount, and add 20 mL of water and 20 mL of ethyl acetate to extract. Take the ethyl acetate layer, dehydrate with anhydrous sodium sulfate, filter, then evaporate the filtrate to dryness in vacuum. Dissolve the residue in 20 mL of sulfuric acid, take 2 mL of the resulting solution, and heat under direct flame; the solution turns brown then a dark reddish purple. Separately, take 2 mL of the solution dissolved in sulfuric acid, and add 3 drops of potassium bichromate TS; the solution exhibits a reddish yellow color.

(2) The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

pH Between 4.0 and 6.0.

Uniformity of dosage units (distribution) Meets the requirements.

Assay Take exactly an amount of Pranoprofen Syrup, equivalent to about 75 mg of pranoprofen ($C_{15}H_{13}NO_3$), and add the mobile phase to make exactly 100 mL. Pipet 2 mL of this solution, add 5 mL of the internal standard solution, then add the mobile phase to make exactly 50 mL, and use this solution as the test solution. Separately, weigh accurately about 75 mg of pranoprofen RS, previously dried (in vacuum, phosphorus pentoxide, 4 hours), and proceed in the same manner as the test solution. Use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak area ratios, Q_T and Q_S, of pranoprofen to that of internal standard, respectively.

Amount (mg) of pranoprofen ($C_{15}H_{13}NO_3$)
= Amount (mg) of pranoprofen RS × (Q_T / Q_S)

Internal standard solution—A solution of dimethyl phthalate in the mobile phase (1 in 870).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 278 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 35 °C.

Mobile phase: A mixture of phosphoric acid (1 in 600) and acetonitrile (3 : 2)

Flow rate: 2 mL/min

System suitability

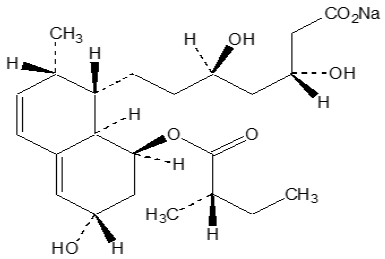
System performance: Proceed with 20 μL of the standard solution according to the above conditions; pranoprofen and the internal standard are eluted in this order with the resolution being NLT 2.

System suitability

System repeatability: Repeat the test 6 times with 20 μL each of pranoprofen standard solution according to the above conditions; the relative standard deviation is NMT 2.0%.

Packaging and storage Preserve in light-resistant, tight containers.

Pravastatin Sodium
프라바스타틴나트륨



$C_{23}H_{35}NaO_7$: 446.51
Sodium(3*R*,5*R*)-3,5-dihydroxy-7-((1*S*,2*S*,6*S*,8*S*,8a*R*)-6-hydroxy-2-methyl-8-(((*S*)-2-methylbutanoyl)oxy)-1,2,6,7,8,8a-hexahydro-naphthalen-1-yl)heptanoate
[*81131-70-6*]

Pravastatin Sodium contains NLT 98.5% and NMT 101.0% of pravastatin sodium ($C_{23}H_{35}NaO_7$), calculated on the anhydrous and solvent-free basis.

Description Pravastatin Sodium occurs as a white or yellowish white powder or crystalline powder.
It is freely soluble in water or methanol, and soluble in ethanol(99.5).
It is hygroscopic.

Identification (1) Determine the absorption spectra of aqueous solutions of Pravastatin Sodium and pravastatin sodium RS (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectrum of Pravastatin Sodium as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; it exhibits absorption at the wavenumbers of about 2970 cm^{-1}, 2880 cm^{-1}, 1727 cm^{-1} and 1578 cm^{-1}.

(3) A solution of Pravastatin Sodium (1 in 10) responds to the Qualitative Analysis (1) for sodium salt.

Optical rotation $[\alpha]_D^{20}$: +153° to +159° (on the anhydrous and solvent-free basis, 0.1 g, water, 20 mL, 100 mm).

pH Dissolve 1.0 g of Pravastatin Sodium in 20 mL of freshly boiled and cooled water; the pH of this solution is between 7.2 and 8.2.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Pravastatin Sodium according to Method 2 and perform the test. Prepare the control solution with 1.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Related substances***—Dissolve 0.1 g of Pravastatin Sodium in 100 mL of a mixture of water and methanol (11 : 9) and use this solution as the test solution. Pipet 10 mL of this solution, and add a mixture of water and methanol (11 : 9) to make exactly 100 mL. Pipet 5 mL of this solution, add a mixture of water and methanol (11 : 9) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak area of each solution according to the automatic integration method; the peak area other than pravastatin from the test solution is not greater than 0.2 times the peak area of pravastatin from the standard solution. Also, the sum of peak area other than the major peak obtained from the test solution is not greater than the area of the major peak from the standard solution. Preserve the test solution and the standard solution at 15 ℃ or below.

Operating conditions

For the detector, column, mobile phase and flow rate, proceed as directed in the operating conditions under the Assay.

System suitability

Test for required detectability: Pipet 5 mL of the standard solution, and add a mixture of water and methanol (11 : 9) to make exactly 50 mL. Confirm that the peak area of pravastatin obtained from 10 μL of this solution is equivalent to 7% to 14% of that from the standard solution.

System performance: Dissolve 5 mg of pravastatin sodium in 50 mL of a mixture of water and methanol (11 : 9). Perform the test with 10 μL of this solution according to the above conditions; the number of theoretical plate and the symmetry factor of the peak of pravastatin are NLT 3500 and NMT 1.6, respectively.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area of pravastatin is NMT 2.0%.

Time span of measurement: About 2.5 times the retention time of pravastatin after the solvent peak.

Water NMT 4.0% (0.5 g, volumetric titration, direct titration).

Assay Weigh accurately about 0.1 g of Pravastatin Sodium, and dissolve in a mixture of water and methanol (11 : 9) to make exactly 100 mL. Pipet 10 mL of this solution, add exactly 10 mL of the internal standard solution, add a mixture of water and methanol (11 : 9) to make 100 mL, and use this solution as the test solution. Separately, weigh accurately about 30 mg of pravastatin 1,1,3,3-tetramethylbutylammonium RS (previously determine the water with 0.5 g by direct titration in volumetric titration), and dissolve in a mixture of water and methanol (11 : 9) to make exactly 25 mL. Pipet 10 mL of this solution, add 10 mL of the internal standard solution exactly, add a mixture of water and methanol (11 : 9) to make 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the ratio of the peak areas of pravastatin to that of the internal standard, Q_T and Q_S.

Amount (mg) of pravastatin sodium ($C_{23}H_{35}NaO_7$)

$$= W_S \times \frac{Q_T}{Q_S} \times 4 \times 1.0518$$

W_S: Amount (mg) of pravastatin in the amount of pravastatin 1,1,3,3-tetramethylbutylammonium RS taken, calculated on the anhydrous basis

Internal standard solution—A solution of ethyl p-hydroxybenzoate in a mixture of water and methanol (11 : 9) (3 in 4000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 238 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 ℃.

Mobile phase: A mixture of water, methanol, acetic acid(100) and triethylamine (550 : 450 : 1 : 1).

Flow rate: Adjust the flow rate so that the retention time of pravastatin is about 21 minutes.

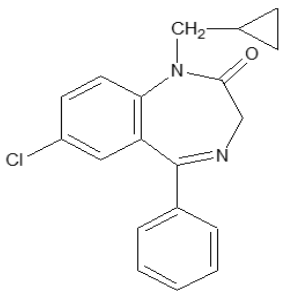
System suitability

System performance: Proceed with 10 μL of the standard solution according to the above conditions; the internal standard and pravastatin are eluted in this order with the resolution being NLT 10.

System repeatability: Repeat the test 6 times with 10 μL of the standard solution according to the above conditions; the relative standard deviation of the peak area ratios of pravastatin to that of the internal standard is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Prazepam
프라제팜



$C_{19}H_{17}ClN_2O$: 324.80

7-Chloro-1-(cyclopropylmethyl)-5-phenyl-1*H*-benzo[e][1,4]diazepin-2(3*H*)-one [*2955-38-6*]

Prazepam, when dried, contains NLT 98.5% and NMT 101.0% of prazepam ($C_{19}H_{17}ClN_2$ O).

Description Prazepam occurs as white to pale yellow crystals or a crystalline powder and is odorless.
It is freely soluble in acetone, soluble in acetic anhydride, sparingly soluble in anhydrous ethanol or ether and practically insoluble in water.

Identification (1) Dissolve 10 mg of Prazepam in 3 mL of sulfuric acid and examine under ultraviolet light (wavelength of 365 nm); the resulting solution exhibits a grayish blue fluorescence.

(2) Dissolve 10 mg of each of Prazepam and prazepam RS in 1000 mL of a solution of sulfuric acid in anhydrous ethanol (3 in 1000), and determine the absorption spectra as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared spectra of Prazepam and prazepam RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(4) Perform the test with Prazepam as directed under the Flame Coloration (2); it exhibits a green color.

Melting point Between 145 and 148 ℃.

Purity (1) ***Chloride***—Take 1.0 g of Prazepam, add 50 mL of water, and allow to stand for 1 hour with occasional shaking, and filter. Pipet 20 mL of the filtrate, add 6 mL of dilute nitric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 40 mL of 0.01 mol/L hydrochloric acid (NMT 0.036%).

(2) ***Sulfate***—Take 20 mL of the filtrate obtained from (1) and add 1 mL of dilute hydrochloric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 0.40 mL of 0.005 mol/L sulfuric acid (NMT 0.048%).

(3) ***Heavy metal***—Proceed with 2.0 g of Prazepam according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(4) ***Arsenic***—Proceed with 1.0 g of Prazepam according to Method 3 and perform the test (NMT 2 ppm).

(5) ***Related substances***—Dissolve 0.40 g of Prazepam in 10 mL of acetone and use this solution as the test solution. Pipet 1 mL of this solution and add acetone to make exactly 20 mL. Pipet 1 mL of this solution, add acetone to make exactly 25 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of chloroform and acetone (9 : 1) as a developing solvent to a distance of about 10 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot obtained from the test

solution are not more intense than the spots from the standard solution.

Loss on drying NMT 0.2% (1 g, 105 ℃, 2 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.4 g of Prazepam, previously dried, dissolve in 60 mL of acetic anhydride, and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid
= 32.480 mg of $C_{19}H_{17}ClN_2O$

Packaging and storage Preserve in tight containers.

Prazepam Tablets
프라제팜 정

Prazepam Tablets contain NLT 93.0% and NMT 107.0% of prazepam ($C_{19}H_{17}ClN_2O$: 324.80).

Method of preparation Prepare as directed under Tablets, with Prazepam.

Identification (1) Weigh an amount of Prazepam Tablets, previously powdered, equivalent to 50 mg of prazepam according to the labeled amount, add 25 mL of acetone, shake to mix, and then filter. Take 5 mL of the filtrate, evaporate to dryness on a steam bath, and dissolve the residue in 3 mL of sulfuric acid. With this solution, perform the test as directed under the Identification (1) of Prazepam.

(2) Take a portion of powdered Prazepam Tablets, equivalent to 20 mg of prazepam according to the labeled amount, add 200 mL of a solution of sulfuric acid in dehydrated ethanol (3 in 1000), shake well and filter. To 5 mL of the filtrate and add a solution of sulfuric acid in dehydrated ethanol (3 in 1000) to make 50 mL, and determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry: it exhibits maxima between 241 nm and 245 nm, between 283 nm and 287 nm and between 363 nm and 367 nm and minima between 263 nm and 267 nm and between 334 nm and 338 nm.

Dissolution Perform the test with 1 tablet of Fluoxymesterone Tablets at 100 revolutions per minute according to Method 1, using 900 mL of 0.1 mol/L hydrochloric acid TS as the dissolution medium. Take 20 mL of the dissolved solution 30 minutes after starting the test, and filter through a membrane filter with a pore size of NMT 0.8 μm. Discard the first 10 mL of the filtrate, take exactly *V* mL of the subsequent filtrate, add 0.1 mol/L hydrochloric acid TS to make exactly *V'* mL of a solution containing about 5 μg of prazepam ($C_{19}H_{17}ClN_2O$) per mL according to the labeled amount, and use this solution as the test solution. Separately, weigh accurately about 5 mg of prazepam RS, previously dried at 105 ℃ for 2 hours, dissolve in 200 mL of 0.1 mol/L hydrochloric acid TS, shake to mix, and if necessary, sonicate to dissolve. Then, add 0.1 mol/L hydrochloric acid TS to make exactly 1000 mL, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at the wavelength of 240 nm as directed under the Ultraviolet-visible Spectroscopy.
The acceptable dissolution criterion is NLT 80% of Prazepam Tablets dissolved in 30 minutes.

Dissolution rate (%) of the labeled amount of prazepam ($C_{19}H_{17}ClN_2O$)

$$= W_S \times \frac{A_T}{A_S} \times \frac{V'}{V} \times \frac{90}{C}$$

*W*s: Amount (mg) of the reference standard
C: Labeled amount (mg) of prazepam ($C_{19}H_{17}ClN_2O$) in 1 tablet

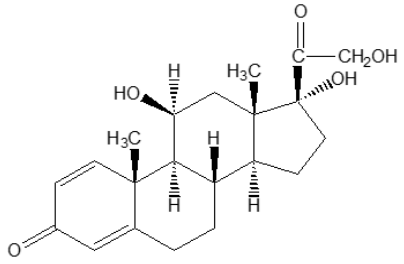
Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 tablets of Prazepam Tablets, and powder. Weigh accurately an amount of the powder, equivalent to about 50 mg of prazepam ($C_{19}H_{17}ClN_2O$), add 30 mL of acetone, shake well to mix, and then centrifuge. Take the clear supernatant. Repeat the same procedure 2 times using 30 mL of acetone, combine all the clear supernatant, and evaporate to dryness on a steam bath. Dissolve the residue in 50 mL of a mixture of acetic anhydride and acetic acid(100) (7 : 3), and titrate with 0.02 mol/L of perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.02 mol/L perchloric acid VS
= 6.496 mg of $C_{19}H_{17}ClN_2O$

Packaging and storage Preserve in tight containers.

Prednisolone
프레드니솔론



$C_{21}H_{28}O_5$: 360.44
(8*S*,9*S*,10*R*,11*S*,13*S*,14*S*,17*R*)-11,17-dihydroxy-17-(2-

hydroxyacetyl)-10,13-dimethyl-6,7,8,9,10,11,12,13,14,15,16,17-dodecahydro-3*H*-cyclopenta[a]phenanthren-3-one [*50-24-8*]

Prednisolone, when dried, contains NLT 97.0% and NMT 102.0% of prednisolone ($C_{21}H_{28}O_5$).

Description Prednisolone occurs as a white, crystalline powder.
It is soluble in methanol or ethanol(95), slightly soluble in ethyl acetate or chloroform, and very slightly soluble in water.

Melting point—About 235 ℃ (with decomposition).

Identification (1) To 2 mg of Prednisolone, add 2 mL of sulfuric acid; in 2 to 3 minutes, the resulting solution exhibits a deep red color with no fluorescence. Add 10 mL of water carefully to this solution; the color of the resulting solution fades and a gray, flocculent precipitate is formed.

(2) Determine the infrared spectra of Prednisolone and prednisolone RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers. If any difference appears between the spectra, dissolve each in ethyl acetate, evaporate to dryness and perform the test in the same manner with the residues.

Optical rotation $[\alpha]_D^{20}$: Between +113° and +119° (0.2 g after drying, ethanol(95), 20 mL, 100 mm).

Purity (1) ***Selenium*—**To 0.10 g of Prednisolone, add 0.5 mL of a mixture of perchloric acid and sulfuric acid (1 : 1) and 2 mL of nitric acid. Then, heat the mixture until the brown gas no longer evolves and the reaction solution turns clear and exhibits a pale yellow color. After cooling, add 4 mL of nitric acid to this solution, add water to make exactly 50 mL, and use this solution as the test solution. Separately, pipet 3 mL of standard selenium stock solution, add 0.5 mL of a mixture of perchloric acid and sulfuric acid (1 : 1), 6 mL of nitric acid and water to make exactly 50 mL, and use this solution as the standard solution. Perform the test with the test solution and the standard solution as directed under the Atomic Absorption Spectroscopy according to the following conditions, and determine the absorbance A_T for the test solution and A_S for the standard solution when the reading of the display/recording unit rapidly rises and, then, reaches a plateau; A_T is smaller than A_S (NMT 30 ppm).
This test is performed using a hydride generator and a heating cell.

Lamp: Selenium hollow-cathode lamp
Wavelength: 196.0 nm
Atomizing temperature: When an electric furnace is used, the temperature is set at about 1000 ℃.
Carrier gas: Nitrogen or argon

(2) ***Related substances*—**Weigh about 20.0 mg of Prednisolone, add exactly 2 mL of a mixture of methanol and chloroform (1 : 1), and use this solution as the test solution. Separately, weigh accurately 20.0 mg of hydrocortisone RS and 10.0 mg of prednisolone acetate RS, dissolve in a mixture of methanol and chloroform (1 : 1) to make exactly 100 mL, and use this solution as the standard solution (1) and the standard solution (2). With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution, the standard solution (1), and the standard solution (2) on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of acetone, toluene, and diethylamine (55 : 45 : 2) as the developing solvent to a distance of about 15 cm, and air-dry the plate (However, do not put a filter paper into the developing chamber). Spray evenly alkaline blue tetrazolium TS; the spots obtained from the test solution at locations equivalent to the spots from the standard solution (1) and the standard solution(2) are not more intense than the spots obtained from the standard solution (1) and the standard solution (2). Also, spots other than the principal spot and those of hydrocortisone and prednisolone acetate do not appear in the test solution.

Loss on drying NMT 1.0% (0.5 g, 105 ℃, 3 hours).

Residue on ignition NMT 0.1% (0.5 g).

Assay Weigh accurately about 25 mg each of Prednisolone and prednisolone RS, previously dried, dissolve each in 50 mL of methanol, and add exactly 25 mL each of the internal standard solution and methanol to make 100 mL. Take 1 mL each of these solutions, add the mobile phase to make respectively 10 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the peak area ratios, Q_T and Q_S, of prednisolone to the peak area of internal standard of each solution, respectively.

$$\text{Amount (mg) of prednisolone } (C_{21}H_{23}O_5) = \text{Amount (mg) of prednisolone RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of methyl *p*-hydroxybenzoate in methanol (1 in 2000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 247 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with fluorosilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 ℃.

Mobile phase: A mixture of water and methanol (13 : 7).

Flow rate: Adjust the flow rate so that the retention

time of prednisolone is about 15 minutes.

System suitability

System performance: Dissolve 25 mg of Prednisolone and 25 mg of hydrocortisone in 100 mL of methanol. To 1 mL of this solution, add the mobile phase to make 10 mL. Proceed with 25 μL of this solution according to the above conditions; hydrocortisone and prednisolone are eluted in this order with the resolution being NLT 1.5.

System repeatability: Repeat the test 6 times with 20 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area ratios of prednisolone to the peak area of the internal standard is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Prednisolone Tablets
프레드니솔론 정

Prednisolone Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of prednisolone ($C_{21}H_{28}O_5$: 360.44).

Method of preparation Prepare as directed under Tablets, with Prednisolone.

Identification (1) Weigh an amount of Prednisolone Tablets, previously powdered, equivalent to 50 mg of prednisolone according to the labeled amount, add 10 mL of chloroform, shake to mix for 15 minutes, filter, and evaporate the filtrate to dryness on a steam bath. Perform the test with the residue, previously dried at 105 ℃ for 1 hour, as directed under the Identification (1) of Prednisolone.

(2) Determine the infrared spectra of the residue from (1) and prednisolone RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers. If any difference appears between these spectra, dissolve each in ethyl acetate, evaporate ethyl acetate, and perform the test with the residue in the same manner.

Dissolution Perform the test with 1 tablet of Prednisolone Tablets at 100 revolutions per minute according to Method 2, using 900 mL of water as the dissolution medium. Take NLT 20 mL of the dissolution medium 20 minutes after starting the test and filter through a membrane filter with a pore size of NMT 0.8 μm. Discard the first 10 mL of the filtrate and use the subsequent filtrate as the test solution. Separately, weigh accurately about 10 mg of prednisolone RS, previously dried at 105 ℃ for 3 hours, and dissolve in ethanol(95) to make exactly 100 mL. Pipet 5 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at the absorbance maximum wavelength at about 242 nm, as directed under the Ultraviolet-visible Spectroscopy.

It meets the requirements if the dissolution rate of Prednisolone Tablets in 20 minutes is NLT 70%.

$$\text{Dissolution rate (\%) of the labeled amount of prednisolone } (C_{21}H_{23}O_5) = W_S \times \frac{A_T}{A_S} \times \frac{45}{C}$$

Ws: Amount (mg) of the reference standard

C: Labeled amount (mg) of prednisolone ($C_{21}H_{28}O_5$) in 1 tablet

Uniformity of dosage units It meets the requirements when the procedure for content uniformity is performed according to the following procedure.

Take 1 tablet of Prednisolone Tablets, and shake to mix with 10 mL of water until the tablet is disintegrated. Next, add 50 mL of methanol, shake for 30 minutes to mix, then add methanol to make exactly 100 mL, and centrifuge. Pipet χ mL of the clear supernatant, add methanol to make *V* mL of a solution containing about 10 μg of prednisolone ($C_{21}H_{28}O_5$) per mL, and use this solution as the test solution. Separately, weigh accurately about 10 mg of prednisolone RS, previously dried at 105 ℃ for 3 hours, dissolve in 10 mL of water and 50 mL of methanol, and then add methanol to make exactly 100 mL. Pipet 5 mL of this solution, add methanol to make 50 mL, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at the wavelength of 242 nm as directed under the Ultraviolet-visible Spectroscopy.

$$\text{Amount (mg) prednisolone } (C_{21}H_{23}O_5) = \text{Amount (mg) of prednisolone RS} \times \frac{A_T}{A_S} \times \frac{V}{10} \times \frac{1}{x}$$

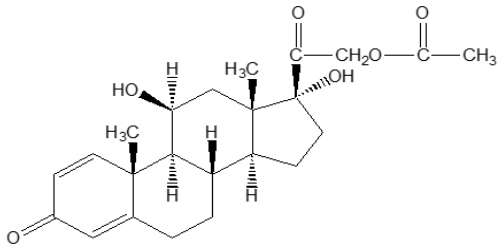
Assay Weigh accurately the mass of NLT 20 tablets of Prednisolone Tablets, and powder using an agate mortar. Weigh accurately a portion of the powder, equivalent to about 5 mg of prednisolone ($C_{21}H_{28}O_5$), add 1 mL of water, and shake gently. Then, add exactly 5 mL of the internal standard solution, add 15 mL of methanol, and shake vigorously for 20 minutes to mix. To 1.0 mL of this solution add the mobile phase to make exactly 10 mL, and filter through a membrane filter with a pore size NMT 0.45 μm. Discard the first 3 mL of the filtrate and use the subsequent filtrate as the test solution. Separately, weigh accurately about 25 mg of prednisolone RS, previously dried at 105 ℃ for 3 hours, dissolve in 50 mL of methanol, add exactly 25 mL of the internal standard solution, and add methanol to make 100 mL. To 1 mL of this solution, add the mobile phase to make 10 mL, and use this solution as the standard solution. Perform the test as directed under the Assay of Prednisolone.

$$\text{Amount (mg) prednisolone } (C_{21}H_{23}O_5) = \text{Amount (mg) of prednisolone RS} \times \frac{Q_T}{Q_S} \times \frac{1}{5}$$

Internal standard solution—A solution of methyl parahydoxybenzoate in methanol (1 in 2000).

Packaging and storage Preserve in tight containers.

Prednisolone Acetate
프레드니솔론아세테이트



$C_{23}H_{30}O_6$: 402.48

2-((8*S*,9*S*,10*R*,11*S*,13*S*,14*S*,17*R*)-11,17-Dihydroxy-10,13-dimethyl-3-oxo-6,7,8,9,10,11,12,13,14,15,16,17-dodecahydro-3*H*-cyclopenta[a]phenanthren-17-yl)-2-oxoethyl acetate [*52-21-1*]

Prednisolone Acetate, when dried, contains NLT 96.0% and NMT 102.0% of prednisolone acetate ($C_{23}H_{30}O_6$).

Description Prednisolone Acetate occurs as a white crystalline powder.
It is slightly soluble in methanol, ethanol(95), ethanol(99.5) or chloroform, and practically insoluble in water.

Melting point—About 235 ℃ (with decomposition).

Identification (1) To 2 mg of Prednisolone Acetate, add 2 mL of sulfuric acid; in 2 to 3 minutes, the resulting solution exhibits a deep red color and a gray, flocculent precipitate is produced.

(2) Determine the infrared spectra of Prednisolone Acetate and prednisolone acetate RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers. If any difference appears between the two spectra, dissolve each in ethanol(99.5), evaporate the ethanol(99.5), and perform the test in the same manner with the residues.

Optical rotation $[\alpha]_D^{20}$: Between +128° and +137° (after drying, 70 mg, methanol, 20 mL, 100 mm).

Purity ***Related substances***—Dissolve 0.20 g of Prednisolone Acetate in 10 mL of a mixture of chloroform and methanol (9 : 1), and use this solution as the test solution. Separately, weigh 20 mg each of prednisolone, cortisone acetate and hydrocortisone acetate, and dissolve in exactly 10 mL of a mixture of chloroform and methanol (9 : 1). Pipet 1 mL of this solution, add a mixture of chloroform and methanol (9 : 1) to make exactly 10 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of dichloromethane, ether, methanol and water (385 : 75 : 40 : 6) as the developing solvent to a distance of about 15 cm and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm); the spots obtained from the test solution corresponding to those from the standard solution is not more intense than that obtained from the standard solution. Also, any spot other than the principal spot and the spots of prednisolone, cortisone acetate and hydrocortisone acetate do not appear from the test solution.

Loss on drying NMT 1.0% (0.5 g, 105 ℃, 3 hours).

Residue on ignition NMT 0.1% (0.5 g).

Assay Weigh accurately about 10 mg each of Prednisolone Acetate and prednisolone acetate RS, previously dried, dissolve in 60 mL of methanol, add exactly 2 mL each of the internal standard solution, and add methanol to make exactly 100 mL. Use these solutions as the test solution and the standard solution, respectively. Perform the test with 10 μL each of the test solution and the standard solution according to the following conditions as directed under the Liquid Chromatography, and calculate the peak height ratios, Q_T and Q_S, of prednisolone acetate to that of the peak height of the internal standard.

$$\text{Amount (mg) prednisolone acetate } (C_{23}H_{30}O_6) = \text{Amount (mg) of prednisolone acetate RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of butylparaben in methanol (3 in 1000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.0 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 ℃.

Mobile phase: A mixture of water and acetonitrile (3 : 2).

Flow rate: Adjust the flow rate so that the retention time of prednisolone acetate is about 10 minutes.

System suitability

System performance: Proceed with 10 mL of the standard solution according to the above conditions; prednisolone acetate and the internal standard are eluted in this order with the resolution being NLT 10.

System repeatability: Repeat the test 6 times with 10 mL each of the standard solution according to the above conditions; the relative standard deviation of the

peak height ratios of prednisolone acetate to that of the internal standard is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Prednisolone Sodium Succinate for Injection
주사용 프레드니솔론숙시네이트나트륨

Prednisolone Sodium Succinate for Injection is a preparation for injection which is reconstituted before use. Prednisolone Sodium Succinate for Injection contains NLT 72.4% and NMT 83.2% of prednisolone sodium succinate ($C_{25}H_{31}NaO_8$: 482.51) and the equivalent of NLT 90.0% and NMT 110.0% of the labeled amount of prednisolone ($C_{21}H_{28}O_5$: 360.44).

The amount of Prednisolone Sodium Succinate for Injection is labeled as the amount of prednisolone ($C_{21}H_{28}O_5$)

Method of preparation Prepare as directed under Injections with Prednisolone Succinate, adding dried sodium carbonate or sodium hydroxide. Prednisolone Sodium Succinate for Injection contains a suitable buffering agent.

Description Prednisolone Sodium Succinate for Injection occurs as a white powder or light, porous mass.
It is freely soluble in water.
It is hygroscopic.

Identification (1) Add 2 mL of sulfuric acid to 2 mg of Prednisolone Sodium Succinate for Injection; the solution exhibits a dark red color after 2 to 3 minutes and does not exhibit fluorescence. To this solution add 10 mL of water cautiously: the color disappears and a gray, flocculent precipitate is formed.

(2) Dissolve 10 mg of Prednisolone Sodium Succinate for Injection in 1 mL of methanol, add 1 mL of Fehling's TS and heat; an orange to red precipitate is formed.

(3) Dissolve 0.1 g of Prednisolone Sodium Succinate for Injection in 2 mL of sodium hydroxide TS, allow to stand for 10 minutes and filter. Filter the precipitate, add 1 mL of dilute hydrochloric acid to the filtrate and shake to mix, filter as needed, adjust the pH to about 6 by adding diluted ammonia TS (1 in 10), and add 2 to 3 drops of iron(III) chloride TS; a brown precipitate is formed.

(4) Prednisolone Sodium Succinate for Injection responds to the Qualitative Analysis (1) for sodium salt.

pH Dissolve 1 g of Prednisolone Sodium Succinate for Injection in 40 mL of water; the pH of this solution is between 6.5 and 7.2.

Purity ***Clarity and color of solution***—Dissolve 0.25 g of Prednisolone Sodium Succinate for Injection in 10 mL of water; the solution is clear and colorless.

Loss on drying NMT 2.0% (0.15 g, in vacuum, phosphorus pentoxide, 60 ℃, 3 hours).

Sterility Meets the requirements.

Bacterial endotoxins Less than 2.4 EU per mg of prednisolone.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Take a number of Prednisolone Sodium Succinate for Injection equivalent to about 0.10 g of prednisolone ($C_{21}H_{28}O_5$), dissolve the contents in diluted methanol (1 in 2), and put in a 100-mL volumetric flask. Wash each container with diluted methanol (1 in 2), combine the washings in a volumetric flask, then add diluted methanol (1 in 2) to make exactly 100 mL. Pipet 4 mL of this solution, and add diluted methanol (1 in 2) to make exactly 50 mL. Pipet 5.0 mL of this solution, add exactly 5 mL of the internal standard solution, shake to mix, and use this solution as the test solution. Separately, weigh accurately about 25 mg of prednisolone succinate RS (previously dried under vacuum at 60 ℃ for 6 hours in a phosphorus pentoxide desiccator) and dissolve in methanol to make exactly 25 mL. Pipet 5 mL of this solution, and add diluted methanol (1 in 2) to make exactly 50 mL. Pipet 5 mL of this solution, add exactly 5 mL of the internal standard solution, mix by shaking and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the ratio of the peak area of prednisolone succinate to that of the internal standard Q_T and Q_S.

$$\text{Amount (mg) of prednisolone sodium succinate } (C_{25}H_{31}NaO_8) = \text{Amount (mg) of prednisolone succinate RS } (C_{25}H_{32}O_8) \times \frac{Q_T}{Q_S} \times 5 \times 1.048$$

$$\text{Amount (mg) of prednisolone } (C_{21}H_{28}O_5) = \text{Amount (mg) of prednisolone succinate RS } (C_{25}H_{32}O_8) \times \frac{Q_T}{Q_S} \times 5 \times 0.783$$

Internal standard solution—A solution of propyl p-hydroxybenzoate in diluted methanol (1 in 2) (1 in 25000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octa-

decylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: Dissolve 0.32 g of tetra n-butylammonium bromide, 3.22 g of sodium monohydrogen phosphate and 6.94 g of potassium dihydrogen phosphate in 1000 mL of water. To 840 mL of this solution, add 1160 mL of methanol.

Flow rate: Adjust the flow rate so that the retention time of prednisolone succinate is about 15 minutes.

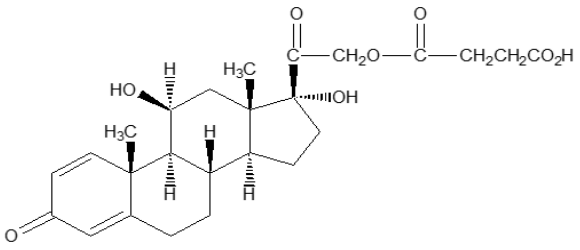
System suitability

When the procedure is run with 10 μL of the standard solution under the above operating conditions, prednisolone succinate and the internal standard are eluted in this order with the resolution between their peaks being NLT 6.0.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution under the above operating conditions; the relative standard deviation of the peak area ratios of prednisolone succinate to that of the internal standard is NMT 1.0%.

Packaging and storage Preserve in hermetic containers.

Prednisolone Succinate
프레드니솔론숙시네이트



$C_{25}H_{32}O_8$: 460.52

4-(2-((8*S*,9*S*,10*R*,11*S*,13*S*,14*S*,17*R*)-11,17-dihydroxy-10,13-dimethyl-3-oxo-6,7,8,9,10,11,12,13,14,15,16,17-dodecahydro-3*H*-cyclopenta[a]phenanthren-17-yl)-2-oxoethoxy)-4-oxobutanoic acid [*2920-86-7*]

Prednisolone Succinate, when dried, contains NLT 97.0% and NMT 103.0% of prednisolone succinate ($C_{25}H_{32}O_8$).

Description Prednisolone Succinate occurs as a white, fine, crystalline powder and is odorless.

It is freely soluble in methanol, soluble in ethanol(95), and very slightly soluble in water or ether.

Melting point—About 205 °C (with decomposition).

Identification (1) To 2 mg of Prednisolone Succinate, add 2 mL of sulfuric acid; in 2 to 3 minutes, the resulting solution exhibits a deep red color with no fluorescence. Add 10 mL of water carefully to this solution; the deep red color of the solution fades and a gray, flocculent precipitate is produced.

(2) Determine the infrared spectra of Prednisolone Succinate and prednisolone succinate RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Optical rotation $[\alpha]_D^{20}$: Between +114° and +120° (67 mg, after drying, methanol, 10 mL, 100 mm).

Purity ***Related substances***—Weigh 0.10 g of Prednisolone Succinate, dissolve in methanol to make exactly 10 mL, and use this solution as the test solution. Separately, weigh 30 mg of prednisolone and dissolve in methanol to make exactly 10 mL, pipet 1 mL of this solution, add methanol to make exactly 10 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of ethyl acetate and ethanol(95) (2 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot obtained from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 0.5% (1 g, in vacuum, phosphorus pentoxide, 60 °C, 6 hours).

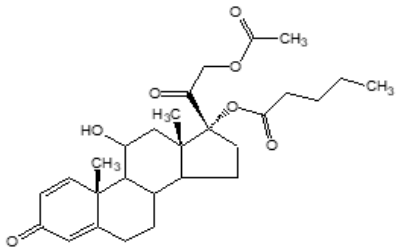
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 10 mg each of Prednisolone Succinate and prednisolone succinate RS, previously dried, and dissolve by adding methanol to make exactly 100 mL. Pipet 5 mL each of these solutions, add methanol to make exactly 50 mL, and use these solutions as the test solution and the standard solution, respectively. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at the wavelength of 242 nm as directed under the Ultraviolet-visible Spectroscopy.

$$\text{Amount (mg) of prednisolone succinate } (C_{25}H_{32}O_8) = \text{Amount (mg) of prednisolone succinate RS} \times \frac{A_T}{A_S}$$

Packaging and storage Preserve in tight containers.

Prednisolone Valeroacetate
프레드니솔론발레로아세테이트



$C_{28}H_{38}O_7$: 486.60

[(8*S*,9*S*,10*R*,11*S*,13*S*,14*S*,17*R*)-17-(2-Acetyloxyacetyl)-11-hydroxy-10,13-dimethyl-3-oxo-7,8,9,11,12,14,15,16-octahydro-6*H*-cyclopenta[a]phenanthren-17-yl] pentanoate, [*72064-79-0*]

Prednisolone Valeroacetate, when dried, contains NLT 98.0% and NMT 101.0% of prednisolone valeroacetate ($C_{28}H_{38}O_7$).

Description Prednisolone Valeroacetate occurs as a white, crystalline powder. It is odorless.
It is freely soluble in acetone, ethyl acetate, and chloroform, soluble in methanol or ethanol(99.5), slightly soluble in ether, and practically insoluble in water or hexane.

Identification (1) Add 4 mL of isoniazid TS to 1 mL of a solution of Prednisolone Valeroacetate in methanol (1 in 10000), and heat on a steam bath for 2 minutes; the resulting solution exhibits a yellow color.

(2) Add 2 mL of sulfuric acid to 2 mg of Prednisolone Valeroacetate; the resulting solution gradually exhibits a yellow or yellowish brown color without fluorescence.

(3) Dissolve 10 mg of Prednisolone Valeroacetate in 2 mL of methanol, add 1 mL of Fehling's TS, and heat; an orange or red precipitate is formed.

(4) Add 2 mL of sodium hydroxide-ethanol TS to 50 mg of Prednisolone Valeroacetate, and heat on a steam bath for 5 minutes. After cooling, add 2 mL of diluted sulfuric acid (2 in 7), and heat slowly for 1 minute; the odor of ethyl valerate is perceptible.

(5) Weigh accurately 0.3 g of Prednisolone Valeroacetate, and dissolve in 2000 mL of methanol. Take 10 mL of this solution, add methanol to make exactly 100 mL, and determine the absorption spectrum of the resulting solution as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum between 242 nm and 244 nm.

(6) Determine the infrared spectra of 1 mg each of Prednisolone Valeroacetate and prednisolone valeroacetate RS, previously dried at 105 ℃ for 3 hours, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers. If any difference appears between the spectra, dissolve each in acetone, respectively, evaporate to dryness, and perform the test in the same manner with the residues.

Melting point Between 184 and 188 ℃.

Optical rotation $[\alpha]_D^{20}$: Between +45° and +49° (after drying, 0.1 g, ethanol(95), 10 mL, 100 mm).

Purity (1) ***Clarity and color of solution***—Add 0.2 g of Prednisolone Valeroacetate to 10 mL of ethanol(99.5), and warm to dissolve; the solution is colorless and clear.

(2) ***Heavy metals***—Proceed with 1.0 g of Prednisolone Valeroacetate according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Arsenic***—Proceed with 1.0 g of Prednisolone Valeroacetate according to Method 3, and perform the test (NMT 2 ppm).

(4) ***Other steroids*—**Weigh 0.1 g of Prednisolone Valeroacetate, dissolve in methanol to make exactly 10 mL, and use this solution as the test solution. Pipet 1 mL of this solution, add methanol to make exactly 100 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Develop the plate with a mixture of n-hexane, ethyl acetate and methanol (6 : 5 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Spray evenly alkaline blue tetrazolium TS on the plate; the spots other than the principal spot from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 0.5% (0.5 g, 105 ℃, 3 hours).

Assay Weigh accurately about 50 mg each of Prednisolone Valeroacetate and prednisolone valeroacetate RS, previously dried, dissolve in methanol to make exactly 50 mL. Pipet 5 mL each of these solutions, add exactly 5 mL each of the internal standard solution, add methanol to make exactly 50 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 5 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions and calculate the peak area ratios, Q_T and Q_S, of prednisolone valeroacetate to that of the internal standard.

$$\text{Amount (mg) of prednisolone valeroacetate } (C_{28}H_{38}O_7) = \text{Amount (mg) of prednisolone valeroacetate RS (mg)} \times (Q_T / Q_S)$$

Internal standard solution—A solution of dexamethasone acetate in methanol (1 in 1000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 243 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 30 ℃.

Mobile phase: A mixture of methanol and water (10 : 3).

Flow rate: Adjust the flow rate so that the retention time of prednisolone valeroacetate is about 10 minutes.

System suitability

System performance: Proceed with 5 μL of the standard solution according to the above conditions; the internal standard and prednisolone valeroacetate are eluted in this order with the resolution being NLT 8.

Packaging and storage Preserve in tight containers.

Prednisolone Valeroacetate Cream
프레드니솔론발레로아세테이트 크림

Prednisolone Valeroacetate Cream contains NLT 90.0% and NMT 110.0% of the labeled amount of prednisolone valeroacetate ($C_{28}H_{38}O_7$: 486.60).

Method of preparation Prepare as directed under Creams, with Prednisolone Valeroacetate.

Identification (1) Take 20 mL of the test solution obtained from the Assay and evaporate to dryness on a steam bath under a nitrogen atmosphere. Dissolve the residue in 1 mL of methanol, and use this solution as the test solution. Separately, weigh 6 mg of prednisolone valeroacetate RS, dissolve in 10 mL of methanol, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution onto a plate made of silica gel with fluorescence indicator for thin-layer chromatography. Next, develop the plate with a mixture of chloroform, ethyl acetate and methanol (50 : 10 : 3) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Spray the plate evenly with alkaline blue tetrazolium TS; the R_f value and the color of the spots obtained from the test solution and the standard solutions are the same.

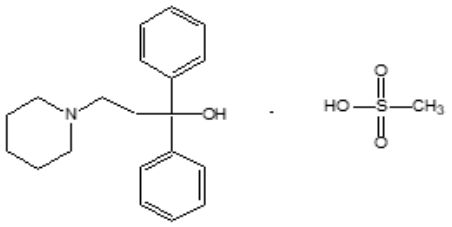
(2) The test solution from the Assay exhibits a yellow color, and measure the absorption spectra as directed under Ultraviolet-visible Spectroscopy using the blank test solution in the Assay as the control solution; it exhibit a maximum at the wavelength of around 406 nm.

Assay Weigh accurately an amount of Prednisolone Valeroacetate Cream, equivalent to about 1.5 mg of prednisolone valeroacetate ($C_{28}H_{38}O_7$), add 10 mL of hexane and 10 mL of a mixture of methanol and water (9 : 1), shake well to mix, then centrifuge. Take the methanol and water mixture layer, then extract the hexane layer again in the same manner using 10 mL and 5 mL of a mixture of methanol and water (9 : 1), then combine the methanol and water mixture layer. To this solution, add 10 mL of water and extract with 10 mL and 5 mL of chloroform, combine the extracts, add 10 mL of water, shake well to mix, and then centrifuge. Discard the water layer, take the chloroform layer, and concentrate the chloroform layer in vacuum on a steam bath. Dissolve the residue in methanol and pipet 25 mL, and use this solution as the test solution. Centrifuge, if necessary, and use the clear supernatant as the test solution. Separately, weigh accurately about 30 mg of prednisolone valeroacetate RS, and add methanol to make exactly 50 mL. Pipet 1 mL of this solution, add methanol to make exactly 10 mL, and use this solution as the standard solution. Pipet 2 mL each of the standard solution and the test solution, add 7.0 mL of isoniazid TS, respectively, seal, and heat for 60 minutes on a steam bath maintained at 50 ℃. After cooling, add methanol to make exactly 10 mL. Separately, determine the absorbances, A_T and A_S, at the wavelength of 406 nm as directed under Ultraviolet-visible Spectroscopy, using a solution prepared by proceeding with methanol in the same manner as the control solution.

Amount (mg) of prednisolone valeroacetate ($C_{28}H_{38}O_7$)
= Amount (mg) of prednisolone valeroacetate RS
× (A_T / A_S) × 0.05

Packaging and storage Preserve in tight containers.

Pridinol Mesilate
프리디놀메실산염



$C_{20}H_{25}NO \cdot CH_3SO_3H$: 391.52

1,1-Diphenyl-1-piperidinepropanol·methanesulfonate (1:1), [*6856-31-1*]

Pridinol Mesilate, when dried, contains NLT 98.0% and NMT 101.0% of pridinol mesilate ($C_{20}H_{25}NO \cdot CH_4O_3S$).

Method of preparation If there is any possibility of alkyl methanesulfonate esters (methyl, ethyl, isopropyl, etc.) to be introduced as potential impurities by the manufacturing process of Pridinol Mesilate, take caution with starting materials, manufacturing process, and intermediate materials and control them to minimize the residue of impurities in consideration of risk assessment results. If necessary, the manufacturing process may be verified by the test data proving that no quality risk exists in the final drug substance.

Description Pridinol Mesilate occurs as a white fine power with a faint characteristic odor.

It is freely soluble in chloroform, sparingly soluble in water or ethanol(95), slightly soluble in acetone, and practically insoluble in ether or petroleum ether.

The pH of an aqueous solution of Pridinol Mesilate (1 in 50) is between 5.0 and 6.0.

Identification (1) Dissolve 0.1 g of Pridinol Mesilate in 5 mL of water and add 2 mL of ammonia TS; a precipitate is produced. Collect the precipitates, wash with water, and dry at 105 °C for 1 hour; the melting point of the precipitates is between 120 and 121 °C.

(2) Add 2 to 3 drops of reinecke salt TS to 1 mL of an aqueous solution of Pridinol Mesilate (1 in 500); a pale red precipitate is produced.

(3) Place 0.1 g of Pridinol Mesilate in a porcelain crucible and add 0.3 g of potassium nitrate. Mix well and melt carefully. Add 2 to 3 mL of water, boil for a while, and add 1 mL of barium nitrate TS; a milky white precipitate is produced.

Barium nitrate TS—Dissolve 6.5 g of barium nitrate in water to make 100 mL (0.25 mol/L).

(4) Determine the absorption spectrum of an aqueous solution of Pridinol Mesilate (1 in 2500) as directed under the Ultraviolet-visible Spectroscopy; it exhibits maxima between 251 nm and 254 nm (A_1), and between 256 nm and 259 nm (A_2), respectively, and the ratio of the maximum absorbances, A_1/A_2, is between 0.85 and 0.89.

(5) Pridinol Mesilate responds to the Qualitative Analysis for mesylate.

Melting point Between 160 and 162 °C.

Purity (1) ***Clarity and color of solution***—Add 5 mL of water to 0.10 g of Pridinol Mesilate and shake to dissolve; the solution is clear.

(2) ***Chloride***—Dissolve 0.5 g of Pridinol Mesilate in 30 mL of methanol and add 6 mL of dilute nitric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution by adding water to 30 mL of methanol, 6 mL of dilute nitric acid and 0.40 mL of 0.01 mol/L hydrochloric acid to make 50 mL (NMT 0.028%).

(3) ***Sulfate***—Dissolve 0.5 g of Pridinol Mesilate in 30 mL of methanol and add 1 mL of dilute hydrochloric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution by adding water to 30 mL of methanol, 1 mL of dilute hydrochloric acid and 0.40 mL of 0.005 mol/L sulfuric acid to make 50 mL (NMT 0.038%).

(4) ***Heavy metals***—Proceed with 1.0g of Pridinol Mesilate according to Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(5) ***Arsenic***—Proceed with 1.0 g of Pridinol Mesilate according to Method 3 and perform the test (NMT 2 ppm).

Loss on drying NMT 1.0% (0.5 g, 105 °C, 3 hours).

Residue on ignition NMT 0.3% (0.5 g).

Assay Weigh accurately about 0.5 g of Pridinol Mesilate, previously dried, dissolve in 50 mL of a mixture of acetic acid(100) for nonaqueous titration and acetic anhydride (1 : 4), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 39.152 mg of $C_{20}H_{25}NO{\cdot}CH_3SO_3H$

Packaging and storage Preserve in well-closed containers.

Pridinol Mesilate Injection
프리디놀메실산염 주사액

Pridinol Mesilate Injection contains NLT 95. 0% and NMT 105.0% of the labeled amount of pridinol mesilate ($C_{20}H_{25}NO{\cdot}CH_3SO_3H$: 391.53).

Method of preparation Prepare as directed under Injections, with Pridinol Mesilate.

Identification Take an amount of Pridinol Mesilate Injection equivalent to 4 mg of pridinol mesilate according to the labeled amount, add ethanol to make 2 mL, and use this solution as the test solution. Separately, add 20 mL of ethanol to 40 mg of pridinol mesilate RS, heat to dissolve, and use this solution as the standard solution. With these solutions, spot 10 μL each of the test solution and the standard solution on a thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography as directed under the Thin Layer Chromatography, develop the plate with a mixture of methanol and strong ammonia water (100 : 1.5) (as the developing solvent) to a distance about 10 cm, and air-dry the plate. Spray hexachloroplatinic (IV) acid-potassium iodide TS on the plate; the spot of the test solution exhibits an R_f value and color corresponding to that of the standard solution.

pH Between 5.0 and 7.0.

Sterility Meets the requirements.

Bacterial endotoxins Less than 150 EU per mg of pridinol mesilate.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets requirements.

Extractable volume of injections Meets the requirements.

Assay Pipet an amount of Pridinol Mesilate Injection, equivalent to about 4 mg of pridinol mesilate ($C_{20}H_{25}NO \cdot CH_3SO_3H$), dissolve in a mixture of methanol and diluted phosphoric acid (1 in 1000) (1 : 1) to make exactly 100 mL, filter, and use this solution as the test solution Separately, weigh accurately about 20 mg of pridinol mesilate RS and dissolve in a mixture of methanol and diluted phosphoric acid (1 in 1000) (1 :1) to make exactly 100 mL. Pipet 10 mL of this solution, add a mixture of methanol and diluted phosphoric acid (1 in 1000) (1 : 1) to make exactly 50 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions and determine the peak areas, A_T and A_S, of the test solution and the standard solution, respectively.

$$\text{Amount (mg) of pridinol mesilate } (C_{20}H_{25}NO \cdot CH_3SO_3H) = \text{Amount (mg) of pridinol mesilate RS} \times \frac{A_T}{A_S} \times \frac{1}{5}$$

Operating condition

Detector: An ultraviolet absorption photometer (wavelength: 215 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of methanol with 0.005 mol/L sodium 1-octanesulfonate and diluted phosphoric acid (1 in 1000) (3 : 2).

Flow rate: 1.0 mL/min

Packaging and storage Preserve in light-resistant, hermetic containers.

Pridinol Mesilate Tablets
프리디놀메실산염 정

Pridinol Mesilate Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of pridinol mesilate ($C_{20}H_{25}NO \cdot CH_3SO_3H$: 391.52).

Method of preparation Prepare as directed under Tablets, with Pridinol Mesilate.

Identification Weigh an amount of Pridinol Mesilate Tablets, previously powdered, equivalent to 40 mg of pridinol mesilate according to the labeled amount, add 50 mL of sodium monohydrogen phosphate-citric acid buffer solution, pH 4.0, shake well to mix, and filter. Perform the test with the filtrate as directed below.

(1) Add 2 mL of Reinecke salt TS to 10 mL of the filtrate; a pale red precipitate is formed.

(2) Add 2 mL of sodium hydroxide TS to 10 mL of the filtrate; a white precipitate is formed. Add 30 mL of ether and shake well to mix. Take the ether layer, wash it with 10 mL of water, add 0.5 g of anhydrous sodium sulfate, shake well to mix, and filter. Evaporate the ether solution to dryness on a steam bath, and dissolve the residue by adding 1 mL of sulfuric acid; the resulting solution exhibits an orange-red color. Add 10 mL of water again; it is decolorized.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 tablets of Pridinol Mesilate Tablets, and powder them. Weigh accurately an amount of the powder, equivalent to 40 mg of pridinol mesilate ($C_{20}H_{25}NO \cdot CH_3SO_3H$), add 50 mL of diluted phosphoric acid (1 in 1000), and shake for 30 minutes using an ultrasonic shaker. Add 10.0 mL of internal standard solution to this solution, add methanol to make 100 mL, filter it through a membrane filter (pore size of 0.45 μm), and use this solution as the test solution. Separately, weigh accurately about 20 mg of pridinol mesilate RS, previously dried at 105 ℃ for 3 hours, add 5.0 mL of internal standard solution, add a mixture of methanol and diluted phosphoric acid (1 in 1000) (1 : 1) to make 50 mL, and use this solution as the standard solution. Perform the test with 3 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the ratios, Q_T and Q_S, of the peak area of pridinol mesilate to that of the internal standard solution.

$$\text{Amount (mg) of pridinol mesilate } (C_{20}H_{25}NO \cdot CH_3SO_3H) = \text{Amount (mg) of pridinol mesilate RS} \times \frac{Q_T}{Q_S} \times 2$$

Internal standard solution—A solution of butyl p-hydroxybenzoate in methanol (13 in 5000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 215 nm).

Column: A stainless steel column, about 4 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography.

Column temperature: A constant temperature of about 55 ℃.

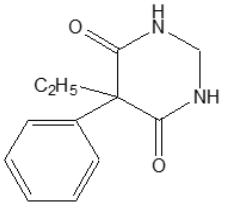
Mobile phase: A mixture of methanol with 0.005 mol/L sodium 1-octanesulfonate and diluted phosphoric acid (1 in 1000) (3 : 2).

Flow rate: Adjust the flow rate so that the retention time of pridinol mesilate is about 6 minutes.

Selection of column: Proceed with 3 μL of the standard solution according to the above conditions; use a column where pridinol mesilate and internal standard are eluted in this order with the resolution being NLT 2.

Packaging and storage Preserve in well-closed containers.

Primidone
프리미돈



$C_{12}H_{14}N_2O_2$: 218.25
5-Ethyl-5-phenyldihydropyrimidine-4,6(1*H*,5*H*)-dione
[*125-33-7*]

Primidone, when dried, contains NLT 98.5% and NMT 101.0% of primidone ($C_{12}H_{14}N_2O_2$).

Description Primidone occurs as a white crystalline powder or granule. It is odorless and has a slightly bitter taste.
It is soluble in *N*,*N*-dimethylformamide, sparingly soluble in pyridine, slightly soluble in ethanol(95), very slightly soluble in water, and practically insoluble in ether.

Identification (1) Heat 0.5 g of Primidone with 5 mL of diluted sulfuric acid (1 in 2); the odor of formaldehyde is perceptible.

(2) Mix 0.2 g of Primidone with 0.2 g of anhydrous sodium carbonate and heat; the gas evolved changes wet red litmus paper to blue.

Melting point Between 279 and 284 ℃.

Purity (1) ***Clarity and color of solution***—Dissolve 0.10 g of Primidone in 10 mL of *N*,*N*-dimethylformamide; the solution is colorless and clear.

(2) ***Heavy metals***—Proceed with 2.0 g of Primidone according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(3) ***2-ethyl-2-phenylmalonediamide***—Dissolve 0.10 g of Primidone in 2 mL of pyridine, add exactly 2.0 mL of the internal standard solution, then add 1 mL of bistrimethylsilyl acetamide, shake well to mix, and heat at 100 °C for 5 minutes. Cool, add pyridine to make 10 mL, and use this solution as the test solution. Separately, dissolve 50 mg of 2-ethyl-2-phenylmalonediamide in pyridine to make exactly 100 mL. Pipet 2.0 mL of this solution, add exactly 2.0 mL of the internal standard solution, proceed in the same manner as the test solution, and use this solution as the standard solution. Perform the test with each 2 μL of the test solution and the standard solution as directed under the Gas Chromatography according to the following operating conditions and determine the ratios, Q_T and Q_S, of the peak area of 2-ethyl-2-phenylmalonediamide to that of the internal standard for the test solution and the standard solution, respectively; Q_T is not larger than Q_S.

Internal standard solution—A solution of stearyl alcohol in pyridine (1 in 2000).

Operating conditions

Detector: A flame ionization detector

Column: A column, about 3 mm in internal diameter and about 1.5 m in length, packed with diatomaceous earth for gas chromatography (125 μm to 150 μm in particle diameter) coated with 50% phenylmethlysilicone polymer for gas chromatography (3% of diatomaceous earth).

Column temperature: A constant temperature of about 195 °C.

Carrier gas: Nitrogen

Flow rate: Adjust the flow rate so that the retention time of stearyl alcohol is 8 - 9 minutes.

System suitability

System performance: Perform the test with 2 μL of the standard solution according to the above operating conditions; 2-ethyl-2-phenylmalondiamide and the internal standard are eluted in this order, and the peak resolution is NLT 3.

System repeatability: Repeat the test 5 times with 2 μL of the standard solution under the above operating conditions; the relative standard deviation of the ratio of the peak area of 2-ethyl-2-phenylmalondiamide to that of the internal standard is NMT 1.5%.

(4) ***Related substances***—Weigh accurately about 100 mg of Primidone, dissolve in methanol to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 100 mg of primidone RS, dissolve in methanol to make exactly 100 mL, and use this solution as the standard solution (1). To 0.1 mL of the standard solution (1), add methanol to make exactly 100 mL and use this solution as the standard solution (2). Perform the test with each 10 μL of the test solution and the standard solution (2) as directed under the Liquid Chromatography according to the following conditions. Determine individual peak area of each solution by the automatic integration method and calculate the amount of related substances in the test solution; primidone related substance I {2-ethyl-2-phenylmalonamide}, phenobarbital, primidone related substance II {2-phenylbutyramide}, 2-cyano-2-phenylbutylamide and 2-phenylbutyric acid, appearing at a relative retention time of about 0.5, about 1.4, about 1.6, about 1.8, and about 2.0 to primidone, respectively, are NMT 0.1%, and phenylpropylpimidone appearing at a relative retention time of about 2.8, is NMT 0.3%. Any other related substance is NMT 0.1%, and the total amount of related substances is NMT 0.5%. Exclude any related substance the percent peak area of which is NMT 0.05%. Determine the peak areas of primidone related substance I, primidone related substance II, 2-cyano-2-phenylbutylamide and 2-phenylbutyric acid by dividing the peak areas determined by the automatic integration method by their relative response factors, 0.67, 0.67, 0.71, and 0.77, respectively.

Content (%) of each related substance

$$= 100 \times \frac{A_i}{A_S} \times \frac{C_S}{C_T}$$

A_i: Peak area of each related substance in the test solution

A_S: Peak area of primidone in the standard solution

C_S: Concentration (μg/mL) of primidone in the standard solution

C_T: Concentration (μg/mL) of primidone in the test solution

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 215 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 10 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm to 10 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: Adjust the mobile phase using a stepwise change or gradient elution by mixing mobile phase A and mobile phase B as directed under the following table.

Mobile phase A: Dissolve 1.36 g of potassium dihydrogen phosphate in 1000 mL of water.

Mobile phase B: Methanol

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 - 1.0	75	25
1.0 - 6.0	75 → 40	25 → 60
6.0 - 8.0	40	60
8.0 - 8.5	40 → 75	60 → 25
8.5 - 10.0	75	25

Flow rate: 3.2 mL/min

System suitability

System performance: Proceed with 10 μL of the standard solution (2) according to the above operating conditions; the symmetry factor of the primidone peak is NMT 2. Dissolve 0.1 mg of phenobarbital RS and 0.1 mg of primidone related substance II RS in 10 mL of the standard solution (1) and use this solution as the system suitability solution. Proceed with 10 μL of the system suitability solution according to the above operating conditions, phenobarbital and primidone related substance II are eluted in this order with the resolution of the two peaks being NLT 2.5.

System repeatability: Perform the test 5 times with each 10 μL of the standard solution (2) according to the above operating conditions; the relative standard deviation of the primidone peak area is NMT 5.0%.

Loss on drying NMT 0.5% (1 g, 105 °C, 2 hours).

Residue on ignition NMT 0.2% (1 g).

Assay Weigh accurately about each 20 mg of Primidone and primidone RS, previously dried, dissolve each in 20 mL of ethanol(95) by warming. After cooling, add ethanol(95) to make exactly 25 mL and use these solutions as the test solution and the standard solution, respectively. With these solutions, determine the absorbance at the absorbance maximum wavelength of about 257 nm (A_1) and at the absorbance minimum wavelength of about 254 nm and 261 (A_2 and A_3, respectively) as directed under the Ultraviolet-visible Spectroscopy, using ethanol(95) as the control solution.

$$\text{Amount (mg) of primidone } (C_{12}H_{14}N_2O_2) = \text{Amount (mg) of primidone RS} \times \frac{(2A_1-A_2-A_3)_T}{(2A_1-A_2-A_3)_S}$$

where $(2A_1\text{-}A_2\text{-}A_3)_T$ refers to the values from the test solution, and $(2A_1\text{-}A_2\text{-}A_3)_S$ refers to the values from the standard solution.

Packaging and storage Preserve in tight containers.

Primidone Tablets
프리미돈 정

Primidone Tablets contain NMT 95.0% and NLT 105.0% of the labeled amount of primidone ($C_{12}H_{14}N_2O_2$: 218.25).

Method of preparation Prepare as directed under Tablets, with Primidone.

Identification The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

Purity ***Related substances*—**Weigh accurately the mass of NLT 20 tablets of Primidone Tablets, and power them. Weigh accurately an amount of the powder equivalent to about 250 mg of primidone ($C_{12}H_{14}N_2O_2$), and dissolve in 90mL of methanol. Sonicate this solution for 15 minutes, then shake and mix for about 20 minutes until all solid materials are dispersed. Next, cool this solution at room temperature, and add water to make exactly 250 mL. Filter through a filter with a pore size of 0.45 μm, discard the first 5 mL of the filtrate, and use the subsequent filtrate as the test solution. Separately, weigh accurately about 5 mg of primidone RS, dissolve in methanol to make exactly 100 mL, use this solution as the standard solution (1). Add diluent to 2 mL of standard solution (1) to make exactly 50 mL, and use this solution as standard solution (2). Perform the test with 20 μL each of the test solution and the standard solution (2) as directed under the Liquid Chromatography according to the following conditions. Determine each peak area of each solution as directed in the automatic integration method, and calculate the amount of each related substance in the test solution; the amounts of primidone related substance I {2-ethyl-2-phenylmalonamide} with a relative retention time to primidone of about 0.5, phenobarbital with that of

about 1.6, primidone-related substance II {2-phenylbutyramide} with that of about 1.9 and 2-phenylbutyric acid with that of about 4.1 are NMT 0.1%. Any other related substance is NMT 0.1%, and the total amount of related substances is NMT 0.3%. However, exclude the related substances accounting for NMT 0.025%. To calculate the peak areas of primidone related substance I, primidone related substance II and 2-phenylbutyric acid, divide the areas determined by the automatic integration method by the correction factors of 0.76, 0.92, and 0.91, respectively.

$$\text{Content (\%) of each related substance} = 100 \times \frac{A_{\mathrm{i}}}{A_{\mathrm{S}}} \times \frac{C_{\mathrm{S}}}{C_{\mathrm{T}}}$$

A_T: Peak area of each related substance in the test solution

A_S: Peak area of primidone in the standard solution

C_S: Concentration (μg/mL) of primidone in the standard solution

C_T: Concentration (μg/mL) of primidone in the test solution

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

Column: A stainless steel column 4.6 mm in internal diameter and about 10 cm in length with octadecylsilanized silica gel for liquid chromatography (3 μm in particle diameter).

Column temperature: A constant temperature of about 35 °C.

Mobile phase: A mixture of potassium dihydrogen phosphate solution (6.8 in 1000), tetrahydrofuran and methanol (65 : 0.5 : 35).

Flow rate: 1.3 mL/min

System suitability

System performance: Dissolve 20 mg of primidone related substance I RS in 100 mL of methanol. Add diluent to 10 mL of this solution to make exactly 100 mL, and use this solution as the primidone related substance I standard solution. Dissolve 1 mL of primidone related substance I standard solution and 0.8 mL of standard solution (2) in the diluent to make exactly 20 mL, and use this solution as the system suitability solution. Proceed with 20 μL of this solution under the above operating conditions; the resolution of primidone related substance I and primidone is NLT 4.0.

System repeatability: Repeat the test 5 times with 10 μL each of the standard solution (2) according to the above operating conditions; the relative standard deviation of the peak areas of primidone is NMT 5.0%.

Diluent—A mixture of methanol and water (35 : 65).

Dissolution Perform the test with 1 tablet of Primidone Tablets at 50 revolutions per minute according to Method 2, using 900 mL of water as the dissolution medium. Take the dissolved solution after 60 minutes from starting of the test, filter, dilute with the dissolution solution, if necessary and use this solution as the test solution. Separately, weigh accurately a portion of Primidone RS, previously dried at 105 ℃ for 2 hours, add the water to make the same concentration with the dissolution solution and use this solution as the standard solution. Perform the test with the test solution and the standard solution as directed under the Ultraviolet-visible Spectroscopy, using the dissolution medium as a control solution, and determine the absorbances at the absorbance maximum wavelength of around 257 nm.

It meets the requirements if the dissolution rate of Primidone Tablets in 60 minutes is NLT 75%.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 tablets of Primidone Tablets, and powder them. Weigh accurately an amount of the powder equivalent to about 0.25 g of primidone ($C_{12}H_{14}N_2O_2$), place it in a 250-mL volumetric flask, add exactly 125 mL of methanol, and sonicate for 15 minutes. Shake for at least 20 minutes to sufficiently dissolve, add methanol to make exactly 250 mL, and filter through a filter with a pore size of 0.45 μm. Discard the first 5 mL of the filtrate, and collect NLT 10 mL of the subsequent filtrate. Take exactly 2.5 mL of the filtrate, add the mobile phase to make exactly 50 mL, and use this solution as the test solution. Separately, weigh accurately about 25 mg of primidone RS (previously dried at 105 °C for 2 hours), add methanol to make exactly 50 mL, and use this solution as the standard stock solution. Pipet 1 mL of this solution, add the mobile phase to it make exactly 10 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine each peak area of both solutions as directed in the automatic integration method, and calculate the peak area ratios, A_T and A_S, of primidone.

$$\text{Content (\%) of primidone } (C_{12}H_{14}N_2O_2) = 100 \times A_T / A_S \times C_S / C_T$$

A_T: Peak area of primidone in the test solution

A_S: Peak area of primidone in the standard solution

C_S: Concentration (μg/mL) of primidone in the standard solution

C_T: Concentration (μg/mL) of primidone in the test solution

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

Column: A stainless-steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: 35 °C

Flow rate: 1.0 mL/min

Mobile phase: A mixture of potassium dihydrogen phosphate solution (6.8 in 1000), tetrahydrofuran and methanol (650 : 5 : 350).

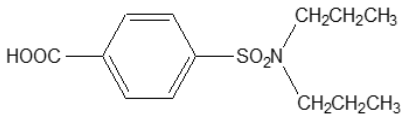
System suitability

System performance: Proceed with 20 μL of the standard solution according to the above conditions; the number of theoretical plates is NLT 3000 plates with the symmetry factor being NMT 2.0.

System repeatability: Repeat the test 6 times with 20 μL of the standard solution according to the above conditions; the relative standard deviation of the peak areas for primidone is NMT 2.0%.

Packaging and storage Preserve in tight containers.

Probenecid
프로베네시드



$C_{13}H_{19}NO_4S$: 285.36

4-(Dipropylsulfamoyl)benzoic acid [*57-66-9*]

Probenecid, when dried, contains NLT 98.0% and NMT 101.0% of probenecid ($C_{13}H_{19}NO_4$ S: 285.36).

Description Probenecid occurs as white crystals or a crystalline powder. It is odorless and has a slightly bitter taste initially, followed by unpleasant bitter taste.

It is sparingly soluble in ethanol(95), slightly soluble in ether and practically insoluble in water.

It dissolves in sodium hydroxide TS or ammonia TS.

Melting point—Between 198 and 200 ℃.

Identification (1) Heat Probenecid; the odor of sulfur dioxide is perceptible.

(2) Determine the absorption spectra of solutions of Probenecid and probenecid RS in ethanol(95) (1 in 50000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

Purity (1) ***Acid***—Dissolve 2.0 g of Probenecid in 100 mL of water and heat on a steam bath for 30 minutes with occasional shaking. After cooling, filter the solution, add 1 drop of phenolphthalein TS and 0.50 mL of 0.1 mol/L sodium hydroxide solution to the filtrate; the resulting solution exhibits a red color.

(2) ***Chloride***—Take 1.0 g of Probenecid, add 100 mL of water and 1 mL of nitric acid, and heat on a steam bath for 30 minutes with occasional shaking. After cooling, if necessary, add water to make 100 mL, and filter. Use 50 mL of the filtrate as the test solution and perform the test. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid (NMT 0.021%).

(3) ***Sulfate***—To 1.0 g of Probenecid, add 100 mL of water and 1 mL of hydrochloric acid and heat on a steam bath for 30 minutes with occasional shaking. After cooling, if necessary, add water to make 100 mL, and filter. Use 50 mL of the filtrate as the test solution and perform the test. Prepare the control solution with 0.40 mL of 0.005 mol/L sulfuric acid VS (NMT 0.038%).

(4) ***Heavy metals***—Proceed with 2.0 g of Probenecid according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (10 ppm).

(5) ***Arsenic***—Proceed with 1.0 g of Probenecid according to Method 3 and perform the test (NMT 2 ppm).

(6) ***Selenium***—Weigh accurately 0.1 g of Probenecid, add 0.1 g of magnesium oxide to mix, put into a combustion flask and combust as directed under the Oxygen Flask Combustion, using 25 mL of diluted nitric acid (1 in 30) as an absorbent. Use a combustion flask with a volume of 1000 mL, combust, wash the stopper and the inner wall of the flask with 10 mL of water, and use 20 mL of water to transfer the solution in the combustion flask into a 150-mL beaker. Heat lightly until it boils, boil for 10 minutes, allow it to cool down at room temperature, and use this solution as the test solution. Separately, pipet 3.0 mL of standard selenium stock solution, add 25 mL of diluted nitric acid (1 in 30) and 25 mL of water, and use this solution as the standard solution. Add diluted ammonia water(28) (1 in 2) to each of the test and standard solutions, adjust the pH to 2.0 ± 0.2, add water to dilute exactly to 60 mL, and add 10 mL of water to transfer to a separatory funnel. Then, wash the separatory funnel with 10 mL of water. To each, add 0.2 g of hydroxylamine hydrochloride, and stir to dissolve. Then, immediately add 5.0 mL of 2,3-diaminonaphthalene TS, put a stopper, stir to mix, and allow to stand at the room temperature for 100 minutes. To the resulting mixture, add 5.0 mL of cyclohexane, shake vigorously for two minutes, and allow to stand. If the layer is separated, remove the water layer, centrifuge cyclohexane extracts, remove water, and take the cyclohexane layer. With these solutions and a control solution prepared by adding 25 mL of water to 25 mL of diluted nitric acid (1 in 30) proceeding in the same manner, perform the test as directed under the Ultraviolet-visible Spectroscopy. Determine the absorbance at the absorbance maximum wavelength around 380 nm; the absorbance of the solution obtained from the test solution is not larger than the absorbance from the standard solution (NMT 30 ppm).

(7) ***Related substances***—Weigh accurately 50 mg of Probenecid, add the mobile phase to make 100 mL, and use this solution as the test solution. Perform the test with 20 μL each of the test solution as directed under the Liquid Chromatography according to the following operating conditions, determine each peak area other than the solvent by the automatic integration method, and calculate the amount of each related substance by the percentage peak area method; the amount of each related substance is NMT 0.5% and the amount of total related substances is NMT 2.0%.

Content (%) of each related substance

$$= 100 \times \frac{A_i}{A_S}$$

A_i: Peak area of each related substance obtained from the test solution

A_S: Total area of all peaks from the test solution

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 3.9 mm in internal diameter and about 30cm in length, packed with phenyl silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of sodium phosphate solution and a solution of acetic acid(100) in acetonitrile (1 in 100) (1 : 1).

Flow rate: 1 mL/min

System suitability

System performance: Weigh accurately about 50 mg of probenecid RS, dissolve in the mobile phase to make 100 mL, and use this solution as the system suitability solution. With 20 μL of this solution, proceed according to the above conditions; the number of theoretical plate and the symmetry factor are NLT 3900 and NMT 2.3, respectively.

System repeatability: Repeat the test 6 times with 20 μL each of the system suitability solution according to the above conditions; the relative standard deviation is NMT 1.5%.

Sodium phosphate solution: Prepare a 0.05 mol/L solution of dibasic sodium phosphate using a solution of acetic acid(100) (1 in 100) as the solvent, and then adjust the pH to 3.0 with phosphoric acid.

Loss on drying NMT 0.5% (1 g, 105 ℃, 4 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.5 g of Probenecid, previously dried, dissolve in 50 mL of neutralized ethanol, and titrate with 0.1 mol/L sodium hydroxide VS (indicator: 3 drops of phenolphthalein TS).

Each mL of 0.1 mol/L sodium hydroxide VS
= 28.536 mg of $C_{13}H_{19}NO_4S$

Packaging and storage Preserve in well-closed containers.

Probenecid Tablets
프로베네시드 정

Probenecid Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of probenecid ($C_{13}H_{19}NO_4S$: 285.36).

Method of preparation Prepare as directed under Tablets, with Probenecid.

Identification (1) Weigh an amount of Probenecid Tablets, previously powdered, equivalent to 0.5 g of probenecid according to the labeled amount, add 50 mL of ethanol(95) and 1 mL of 1 mol/L hydrochloric acid TS, shake to mix, and filter. Evaporate the filtrate on a steam bath to make about 20 mL. After cooling, filter the resulting precipitate, recrystallize with 50 mL of dilute ethanol, and dry at 105 ºC for 4 hour; the melting point of the crystals is between 198 and 200 ºC. With the precipitate, perform the test as directed under the Identification (1) of Probenecid.

(2) Determine the absorption spectrum of an ethanol(95) solution (1 in 50000) of dried crystals of (1) as directed under the Ultraviolet-visible Spectroscopy; it exhibits maxima at the wavelengths between 224 nm and 226 nm and between 247 nm and 249 nm, and a minimum between 234 nm and 236 nm.

Dissolution Perform the test with 1 tablet of Probenecid Tablets at 50 revolutions per minute according to Method 2, using 900 mL of Solution 2 for dissolution test as the dissolution medium. Take NLT 30 mL of the dissolution medium 30 minutes after starting the test and filter through a membrane filter with a pore size of NMT 0.8 μm. Discard the first 10 mL of the filtrate, take exactly *V* mL of the subsequent filtrate, add Solution 2 for dissolution test to make exactly *V'* mL, so that each mL contains about 14 μg of probenecid ($C_{13}H_{19}NO_4S$) according to the labeled amount, and use this solution as the test solution. Separately, weigh accurately about 70 mg of probenecid RS, previously dried at 105 ℃ for 4 hours, and dissolve in Solution 2 for dissolution test to make exactly 100mL. Pipet 1 mL of this solution, add Solution 2 for dissolution test to make exactly 50 mL, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at the wavelength of 244 nm as directed under the Ultraviolet-visible Spectroscopy.

Meets the requirements if the dissolution rate of Probenecid Tablets in 30 minutes is NLT 80%.

Dissolution rate (%) of the labeled amount of probenecid ($C_{13}H_{19}NO_4S$)

$$= W_S \times \frac{A_T}{A_S} \times \frac{V'}{V} \times \frac{1}{C} \times 18$$

W_S: Amount (mg) of probenecid RS

C: Labeled amount (mg) of probenecid ($C_{13}H_{19}NO_4S$) per tablet

Uniformity of dosage units Meets the requirements.

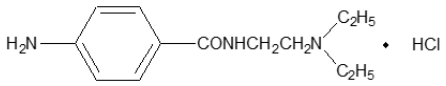
Assay Weigh accurately the mass of NLT 20 tablets of Probenecid Tablets, and powder them. Weigh accurately an amount of the powder equivalent to about 0.25 g of probenecid ($C_{13}H_{19}NO_4S$), dissolve in 30 mL of water and 2 mL of 1 mol/L hydrochloric acid TS, and then dissolve in 30 mL of ethanol(99.5). Next, add ethanol(99.5)

to make exactly 100 mL, centrifuge this solution, take exactly 3 mL of the supernatant, and add 1 mL of 0.1 mol/L hydrochloric acid TS and ethanol(99.5) to make exactly 50 mL. Take exactly 5 mL of this solution again, add ethanol(99.5) to make exactly 50 mL, and use this solution as the test solution. Separately, weigh accurately about 0.125 g of probenecid RS, previously dried at 105 °C for 4 hours, and dissolve in 1 mL of 1 mol/L hydrochloric acid TS and 15 mL of water, and add ethanol(99.5) to make exactly 50 mL. Take exactly 3 mL of this solution, dissolve in 2 mL of 1 mol/L hydrochloric acid TS, add ethanol(99.5) to make exactly 50 mL. Take exactly 5 mL of this solution, add ethanol(99.5) to make exactly 50 mL, and use this solution as the standard solution. Perform the test with the test solution and the standard solution as directed under the Ultraviolet-visible Spectroscopy, using a solution prepared by adding ethanol(99.5) to 1 mL of 0.1 mol/L hydrochloric acid TS to make exactly 50 mL as a control solution, and determine the absorbances, A_T and A_S at the wavelength of 248 nm.

$$\text{Amount (mg) of probenecid } (C_{13}H_{19}NO_4S) = \text{Amount (mg) of probenecid RS} \times \frac{A_T}{A_S} \times 2$$

Packaging and storage Preserve in well-closed containers.

Procainamide Hydrochloride
프로카인아미드염산염



$C_{13}H_{21}N_3O \cdot HCl$: 271.79

4-Amino-*N*-(2-diethylaminoethyl)benzamide hydrochloride [*614-39-1*]

Procainamide Hydrochloride, when dried, contains NLT 98.0% and NMT 101.0% of procainamide hydrochloride ($C_{13}H_{21}N_3O \cdot HCl$).

Description Procainamide Hydrochloride occurs as a white to pale yellow crystalline powder.
It is very soluble in water and soluble in ethanol(99.5).
It is hygroscopic.

Identification (1) Determine the infrared spectra of Procainamide Hydrochloride and procainamide hydrochloride RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) An aqueous solution of Procainamide Hydrochloride (1 in 20) responds to the Qualitative Analysis for chloride.

Melting point Between 165 and 169 °C.

pH Dissolve 1.0 g of Procainamide Hydrochloride in 10 mL of water; the pH of this solution is between 5.0 and 6.5.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Procainamide Hydrochloride in 10 mL of water; the resulting solution is clear.

(2) ***Heavy metals***—Proceed with 2.0 g of Procainamide Hydrochloride according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Arsenic***—Proceed with 1.0 g of Procainamide Hydrochloride according to Method 1 and perform the test. (NMT 2 ppm).

(4) ***Related substances***—Weigh 50 mg of Procainamide Hydrochloride, dissolve in 100 mL of the mobile phase, and use this solution as the test solution. Pipet 1 mL of this solution, and add the mobile phase to make exactly 50 mL. Next, pipet 2 mL of this solution, add the mobile phase to make exactly 20 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution by the percentage peak area method under the Liquid Chromatography according to the following conditions; the sum of peak areas other than the peak area of procainamide hydrochloride obtained from the test solution is not greater than the peak area of procainamide hydrochloride from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 270 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: A mixture of pH 3.0 0.02 phosphate buffer solution and methanol (9 : 1).

Flow rate: Adjust the flow rate so that the retention time of procainamide hydrochloride is 9 minutes.

System suitability

Test for required detectability: Pipet 10 mL of the standard solution and add the mobile phase to make exactly 20 mL. Confirm that the peak area of procainamide obtained from 10 μL of this solution is equivalent to 40 to 60% of the peak area of procainamide from the standard solution.

System performance: Proceed with 10 μL of the standard solution according to the above conditions; the number of theoretical plates and the symmetry factor of the peak of procainamide are NLT 10000 and NMT 1.5, respectively.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area of procainamide is NMT 2.0%.

Time span of measurement: About 2 times the retention time of procainamide.

Loss on drying NMT 0.3% (2 g, 105 °C, 4 hours).

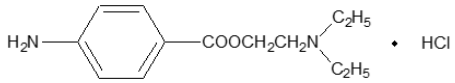
Residue on ignition NMT 0.1% (2 g).

Assay Weigh accurately about 0.5 g of Procainamide Hydrochloride, previously dried, and dissolve in 50 mL of a mixture of acetic anhydride and acetic acid(100) (7 : 3), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 1 mol/L perchloric acid VS
= 27.179 mg of $C_{13}H_{21}N_3O \cdot HCl$

Packaging and storage Preserve in tight containers.

Procaine Hydrochloride
프로카인염산염



$C_{13}H_{20}N_2O_2 \cdot HCl$: 272.77
2-(Diethylamino)ethyl4-aminobenzoate hydrochloride
[*51-05-8*]

Procaine Hydrochloride, when dried, contains NLT 99.0% and NMT 101.0% of procaine hydrochloride ($C_{13}H_{20}N_2O_2 \cdot HCl$).

Description Procaine Hydrochloride occurs as white crystals or a crystalline powder.
It is very soluble in ethanol(95), soluble in ethanol(95) and practically insoluble in ether.

Identification (1) Determine the absorption spectra of aqueous solutions of Procaine Hydrochloride and procaine hydrochloride RS (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Procaine Hydrochloride and procaine hydrochloride RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) An aqueous solution of Procaine Hydrochloride (1 in 10) responds to the Qualitative Analysis for chloride.

Melting point Between 155 and 158°C.

pH Dissolve 1.0 g of Procaine Hydrochloride in 20 mL of water; the pH of this solution is between 5.0 and 6.0.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Procaine Hydrochloride in 10 mL of water; the solution is clear and colorless.

(2) ***Heavy metals***—Proceed with 1.0 g of Procainamide Hydrochloride according to Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Related substances***—Weigh 1.0 g of Procainamide Hydrochloride, add 5 mL of ethanol(95), shake well to mix and dissolve, add water to make exactly 10 mL, and use this solution as the test solution. Separately, weigh 0.010 g of 4-aminobenzoic acid, dissolve in ethanol(95) to make exactly 20 mL. Pipet 1 mL of this solution, add 4 mL of ethanol(95) and water to make exactly 10 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on a plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of dibutyl ether, n-hexane, and acetic acid(100) (20 : 4 : 1) as the developing solvent to a distance of about 10 cm, air-dry the plate, and then heat further at 105 °C for 10 minutes. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot obtained from the test solution are not more intense than the spots from the standard solution However, the principal spot from the test solution remains at the origin.

Loss on drying NMT 0.5% (1 g, silica gel, 4 hours).

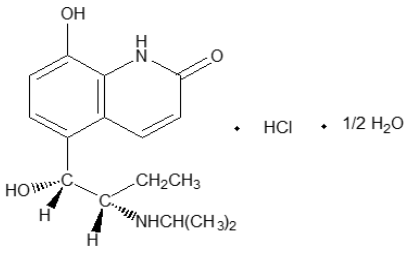
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.4 g of Procainamide Hydrochloride, previously dried, dissolve in 5 mL of hydrochloric acid and 60 mL of water, add 10 mL of potassium bromide solution (3 in 10), and cool at NMT 15 °C. Then, titrate with 0.1 mol/L sodium nitrite VS (potentiometric titration under the Titrimetry).

Each mL of 0.1 mol/L sodium nitrite VS
= 27.277 mg of $C_{13}H_{20}N_2O_2 \cdot HCl$

Packaging and storage Preserve in well-closed containers.

Procaterol Hydrochloride Hydrate
프로카테롤염산염수화물



and enantiomer

Procaterol Hydrochloride

$C_{16}H_{22}N_2O_3 \cdot HCl \cdot ½H_2O$: 335.83

(1*RS*,2*SR*)-8-Hydroxy-5-[1-hydroxy-2-(isopropylamino)butyl]-quinolin-2(1*H*)-one hydrochloride hemihydrate [*62929-91-3, anhydrous*]

Procaterol Hydrochloride Hydrate contains NLT 98.5% and NMT 101.0% of procaterol hydrochloride ($C_{16}H_{22}N_2O_3 \cdot HCl$: 326.82), calculated on the anhydrous basis.

Description Procaterol Hydrochloride Hydrate occurs as white to pale yellowish white crystals or a crystalline powder.

It is soluble in water, formic acid or methanol, slightly soluble in ethanol(95), and practically insoluble in ether.

The pH of a solution of 1.0 g of Procaterol Hydrochloride Hydrate dissolved in 100 mL of water is between 4.0 and 5.0.

It is gradually colored by light.

An aqueous solution of Procaterol Hydrochloride Hydrate (1 in 20) shows no optical rotation.

Melting point—About 195 °C (with decomposition).

Identification (1) Determine the absorption spectra of aqueous solutions of Procaterol Hydrochloride Hydrate and procaterol hydrochloride hydrate RS (7 in 1000000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Procaterol Hydrochloride Hydrate and procaterol hydrochloride hydrate RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) An aqueous solution of Procaterol Hydrochloride Hydrate (1 in 50) responds to the Qualitative Analysis for chloride.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Procaterol Hydrochloride Hydrate in 30 mL of water; the resulting solution is clear. The color of this solution is not more intense than that of the following control solution.

Control solution—Take 3.0 mL of colorimetric stock solution of iron(III) chloride hexahydrate and add water to make 50 mL.

(2) ***Heavy metals***—Proceed with 2.0 g of Procaterol Hydrochloride Hydrate according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Related substances***—Dissolve 0.10 g of Procaterol Hydrochloride Hydrate in 100 mL of diluted methanol (1 in 2) and use this solution as the test solution. Pipet 1 mL of this solution, add diluted methanol (1 in 2) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 2 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak area of each solution by the automatic integration method; the total area of peaks other than procaterol from the test solution is not larger than the peak area of procaterol from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: Add 230 mL of methanol and 10 mL of acetic acid(100) into 760 mL of a solution of 0.87 g of sodium 1-heptanesulfonate dissolved in 1000 mL of water.

Flow rate: Adjust the flow rate so that the retention time of procaterol is about 15 minutes.

System suitability

Detection sensitivity: Adjust the sensitivity so that the peak height of procaterol obtained from 2 μL of the standard solution is NLT 10 mm.

System performance: Dissolve 20 mg each of Procaterol Hydrochloride Hydrate and threoprocaterol hydrochloride in 100 mL of diluted methanol (1 in 2) Pipet 15 mL of this solution, and add diluted methanol (1 in 2) to make 100 mL. Proceed with 2 μL of this solution as directed under the above operating conditions; procaterol and threoprocaterol hydrochloride are eluted in this order with the resolution being NLT 3.

Time span of measurement: About 2.5 times the retention time of procaterol after the solvent peak.

Water Between 2.5% and 3.3% (0.5 g, volumetric titration, direct titration).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.25 g of Procaterol Hydrochloride Hydrate, add 2 mL of formic acid, warm to dissolve, add exactly 15 mL of 0.1 mol/L perchloric acid, add 1 mL of acetic anhydride, and heat on a steam bath

for 30 minutes. After cooling, add 60 mL of acetic anhydride, and titrate the excess perchloric acid with 0.1 mol/L sodium acetate VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner.

Each mL of 0.1 mol/L perchloric acid VS
= 32.682 mg of $C_{16}H_{22}N_2O_3 \cdot HCl$

Packaging and storage Preserve in light-resistant, well-closed containers.

Procaine Hydrochloride Injection
프로카인염산염 주사액

Procaine Hydrochloride Injection is an aqueous solution for injection. Procaine Hydrochloride Injection contains NLT 95.0% and NMT 105.0% of the labeled amount of procaine hydrochloride ($C_{13}H_{20}N_2O_2 \cdot HCl$: 272.77).

Method of preparation Prepare as directed under Injections, with Procaine Hydrochloride.

Description Procaine Hydrochloride Injection occurs as a clear, colorless liquid.

Identification (1) Take an amount of Procaine Hydrochloride Injection, equivalent to 10 mg of procaine hydrochloride according to the labeled amount, and determine the absorption spectra as directed under Ultraviolet-visible Spectroscopy; it exhibits maxima at the between 219 nm and 223 nm and between 289 nm and 293 nm.

(2) Procaine Hydrochloride Injection responds to the Qualitative Tests (2) for chloride.

pH Between 3.3 and 6.0.

Sterility Meets the requirements.

Bacterial endotoxins Less than 0.6 EU per mg of procaine hydrochloride. As for injections administered within the spinal canal, procaine hydrochloride is less than 0.02 EU per mg.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Extractable volume of injections Meets the requirements.

Assay Pipet an amount of Procaine Hydrochloride Injection equivalent to about 20 mg of procaine hydrochloride ($C_{13}H_{20}N_2O_2 \cdot HCl$), and add the mobile phase to make exactly 20 mL. Pipet 5 mL of the resulting solution, add exactly 5 mL of the internal standard solution, and then add the mobile phase to make 20 mL. Use this solution as the test solution. Separately, weigh accurately about 20 mg of Procaine Hydrochloride RS, previously dried in a desiccator (silica gel) for 4 hours and dissolve in the mobile phase to make exactly 20 mL. Pipet 5 mL of this solution, add exactly 5 mL of the internal standard solution, add the mobile phase to make exactly 20 mL, and use this solution as the standard solution. Perform the test with 5 μL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the ratio of the peak area of procaine to that of the internal standard Q_T and Q_S.

Amount (mg) of procaine hydrochloride ($C_{13}H_{20}N_2O_2 \cdot HCl$)
= Amount (mg) of procaine hydrochloride RS $\times \frac{Q_T}{Q_S}$

Internal standard solution—A solution of caffeine in the mobile phase (1 in 1000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: Add phosphoric acid to 0.05 mol/L potassium dihydrogen phosphate TS to adjust the pH to 3.0. With this solution, prepare an 800 mL of solution containing 0.1% of sodium 1-pentanesulfonate and add 200 mL of methanol.

Flow rate: Adjust the flow rate so that the retention time of procaine is about 10 minutes.

System suitability

System performance: Proceed with 5 μL of the standard solution under the above operating conditions; procaine and the internal standard are eluted in this order with the resolution being NLT 8.

System repeatability: Repeat the test 6 times with 5 μL each of the standard solution according to the above conditions; the relative standard deviation of ratios of the peak area of procaine to that of the internal standard is NMT 1.0%.

Packaging and storage Preserve in hermetic containers.

Procaterol Hydrochloride Tablets
프로카테롤염산염 정

Procaterol Hydrochloride Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of procaterol hydrochloride hydrate ($C_{16}H_{22}N_2O_3 \cdot HCl \cdot 1/2H_2O$: 335.83).

Method of preparation Prepare as directed under Tablets, with Procaterol Hydrochloride Hydrate.

Identification (1) Weigh an amount of Procaterol Hydrochloride Tablets, equivalent to about 2 mg of procaterol hydrochloride hydrate according to the labeled amount, add 5 mL of water, shake to mix, and centrifuge. Filter, if necessary, and use the filtrate as the test solution. Spot 15 μL of the test solution onto filter paper while air-drying, and then spray Dragendorff's TS for spraying evenly; the spot exhibits an orange color.

(2) Weigh an amount of Procaterol Hydrochloride Tablets, equivalent to about 0.1 mg of procaterol hydrochloride according to the labeled amount, add 20 mL of 0.01 mol/L hydrochloric acid TS, shake to mix, and filter. Determine the absorption spectrum of the filtrate as directed under the Ultraviolet-visible Spectroscopy; it exhibits maxima at wavelengths of around 233 nm, and between 293 nm and 297 nm.

Dissolution Perform the test with 1 tablet of Procaterol Hydrochloride Tablets at 50 revolutions per minute according to Method 2, using 500 mL of water as the dissolution medium. Take the dissolution medium 30 minutes after starting the dissolution test, and filter it. Discard the first 10 mL of the filtrate, pipet *V* mL of the subsequent filtrate, add water to make exactly *V*′ mL so that each mL contains about 0.1 μg of procaterol hydrochloride according to the labeled amount, and use this solution as the test solution. Separately, weigh accurately about 10 mg of procaterol hydrochloride RS, and dissolve in the mobile phase to make exactly 200 mL. Pipet 2 mL of this solution and add the mobile phase to make exactly 100 mL. Take exactly 5 mL of this solution, add the dissolution medium to make exactly 50 mL, and use this solution as the standard solution. Perform the test with 50 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of procaterol hydrochloride (C16H22N2O3 HCl) in each solution. Meets the requirements if the dissolution rate of Procaterol Hydrochloride Tablets in 30 minutes is NLT 70%.

Dissolution rate (%) of the labeled amount of procaterol hydrochloride hydrate (C16H22N2O3 HCl.1/2H2O)

$$= W_S \times \frac{V'}{V} \times \frac{A_T}{A_S} \times \frac{1}{C} \times 0.5 \times 1.0276$$

*W*s: Amount (mg) of procaterol hydrochloride RS

C: Labeled amount (mg) of ($C_{16}H_{22}N2O_3$·HCl·1/2H_2O) per tablet

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: A mixture of sodium 1-pentanesulfonate solution (0.87 in 1000), methanol and acetic acid(100) (76 : 23 : 1).

Flow rate: 1.0 mL/min

System suitability

System repeatability: Repeat the test 6 times with 50 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak areas of procaterol hydrochloride is NMT 2.0%.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 tablets of Procaterol Hydrochloride Tablets, and powder them. Weigh accurately an amount of the powder equivalent to about 0.2 mg of procaterol hydrochloride hydrate ($C_{16}H_{22}N_2O_3$·HCl·1/2 H_2O), and add 10.0 mL of the internal standard solution. Next, add 1/300 mol/L phosphoric acid to make 100 mL, filter, and use the filtrate as the test solution. Separately, weigh accurately about 50 mg of procaterol hydrochloride RS (previously measure the moisture content), and add 1/300 mol/L phosphoric acid to make 100 mL. Take exactly 4.0 mL of this solution and add 1/300 mol/L phosphoric acid to make 100 mL. Pipet 10.0 mL of this solution, add 10.0 mL of the internal standard solution, add 1/300 mol/L phosphoric acid to make 100 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak area ratios, Q_T and Q_S, of procaterol hydrochloride to the peak area of the internal standard solution.

Amount (mg) of procaterol hydrochloride ($C_{16}H_{22}N_2O_3$·HCl)

= Amount (mg) of procaterol hydrochloride RS, calculated on the anhydrous basis $\times \frac{Q_T}{Q_S} \times \frac{1}{250} \times 1.0276$

Internal standard solution—Weigh 10 mg of *N*-phenylglycine, dissolve in 70 mL of water, add 1 mL of 1/3 mol/L phosphoric acid, and add water to make 100 mL.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

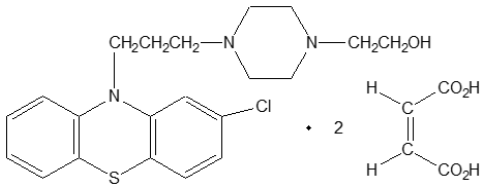
Column: A stainless steel column about 4.0 mm in internal diameter and about 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 μm to 10 μm in particle diameter).

Mobile phase: A mixture of 2% acetic acid,·methanol and acetonitrile (8: 1.5 : 0.5).

Flow rate: 1 mL/min

Packaging and storage Preserve in well-closed containers.

Prochlorperazine Maleate
프로클로르페라진말레산염



$C_{20}H_{24}ClN_3S \cdot 2C_4H_4O_4$: 606.09
2-Chloro-10-[3-(4-methyl-1-piperazinyl)propyl]-10*H*-phenothiazine (*Z*)-but-2-enedioate [*84-02-6*]

Prochlorperazine Maleate, when dried, contains NLT 98.0% and NMT 101.0% of prochlorperazine maleate ($C_{20}H_{24}ClN_3S \cdot 2C_4H_4O_4$).

Description Prochlorperazine Maleate occurs as a white to pale yellow powder. It is odorless and has a slightly bitter taste.
It is slightly soluble in acetic acid(100), very slightly soluble in water or ethanol(95), and practically insoluble in ether.
It is gradually colored to red by light.

Melting point—Between 195 and 203 ℃ (with decomposition).

Identification (1) Dissolve 5 mg of Prochlorperazine Maleate in 5 mL of sulfuric acid; the resulting solution exhibits a red color, and this color slowly get more intense.
Take half of this solution and heat it; the resulting solution exhibits a purple color. Add a drop of potassium dichromate TS to the remaining solution; a greenish brown color develops, and changes to a brown color if allowed to stand.

(2) Dissolve 0.2 g of Prochlorperazine Maleate in 5 mL of sodium hydroxide (1 in 10) and extract 3 times with 3 mL each of ether [the aqueous layer is used in the test in (4)]. Combine the ether extracts and evaporate to dryness on a steam bath. Add 10 mL of methanol to the residue, warm to dissolve, add this solution to 30 mL of a solution of 2,4,6-trinitrophenol in methanol (1 in 75), warmed to 50 ℃, and allow to stand for 1 hour. Filter and collect the crystals, wash with a small amount of methanol, and dry at 105 ℃ for 1 hour; the crystals melt between 252 and 258℃ (with decomposition).

(3) Add 10 mL of hydrobromic acid to 0.5 g of Prochlorperazine Maleate, and heat under a reflux condenser for 10 minutes. After cooling, add 100 mL of water and filter using a glass filter (G 4). Wash the residue three times with 10 mL each of water and dry at 105 ℃ for 1 hour; it melts between 195 and 198 ℃ (with decomposition).

(4) To the aqueous layer in (2), add boiling stones and heat on a steam bath for 10 minutes. After cooling, add 2 mL of bromine TS, heat on a steam bath for 10 min, and then heat further to boiling. After cooling, add 2 drops of this solution to 3 mL of a solution of resorcinol in sulfuric acid (1 in 300) dropwise, and heat on a steam bath for 15 minutes; the resulting solution exhibits a purple color.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Prochlorperazine Maleate according to Method 2 and perform the test. Prepare the control solution with 1.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Related substances***—Weigh accurately 100 mg of Prochlorperazine Maleate, dissolve in 10 mL of a mixture of methanol and 1 mol/L sodium hydroxide (9 : 1) and use this solution as the test solution. Separately, weigh accurately 10 mg of prochlorperazine maleate RS, dissolve in 50 mL of a mixture of methanol and 1 mol/L sodium hydroxide (9 : 1) and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 20 μL each of the test solution and the standard solution on the plate made of silica gel with fluorescent indicator for thin-layer chromatography, develop the plate with a mixture of methanol and ammonia water(28) (100 : 1) as the developing solvent to a distance of about 15 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelengths: 254 nm and 365 nm); the spots other than the principal spot obtained from the test solution are not larger or not more intense than the spots from the standard solution (NMT 2.0%). Disregard the spots left on the origin.

Loss on drying NMT 1.0% (1 g, 105℃, 3 hours)

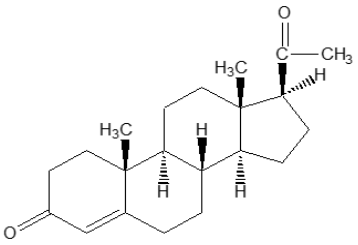
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.3 g of Prochlorperazine Maleate, previously dried, add 60 mL of acetic acid(100), warm while stirring to dissolve, and cool. Then, titrate with 0.05 mol/L perchloric acid VS (indicator: 0.5 mL of 1-naphtholbenzein TS). However, the endpoint of the titration is when the solution changes from an orange color to a green color. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.05 mol/L perchloric acid VS
= 15.152 mg of $C_{20}H_{24}ClN_3S \cdot 2C_4H_4O_4$

Packaging and storage Preserve in light-resistant, tight containers.

Progesterone
프로게스테론



$C_{21}H_{30}O_2$: 314.46

(8*S*,9*S*,10*R*,13*S*,14*S*,17*S*)-17-Acetyl-10,13-dimethyl-1,2,6,7,8,9,11,12,14,15,16,17-dodecahydrocyclopenta[a]phenanthren-3-one [*57-83-0*]

Progesterone, when dried, contains NLT 97.0% and NMT 103.0% of progesterone ($C_{21}H_{30}O_2$).

Description Progesterone occurs as white crystals or a crystalline powder.
It is soluble in methanol or ethanol(99.5) and practically insoluble in water.

Identification (1) Determine the absorption spectra of the solutions of Progesterone and progesterone RS in ethanol(99.5) (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Progesterone and progesterone RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers. If any difference appears between the two spectra, dissolve each in ethanol(95), evaporate, and perform the test in the same manner with the residues.

Optical rotation $[\alpha]_D^{20}$: Between +184° and +194° (after drying, 0.2 g, ethanol(99.5), 10 mL, 100 mm).

Melting point Between 128 and 133 ℃ or 120 and 122 ℃.

Purity ***Related substances***—Weigh 80 mg of Progesterone, dissolve in 2 mL of methanol, and use this solution as the test solution. Pipet 1 mL of this solution, add methanol to make exactly 100 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of chloroform and diethylamine (19 : 1) as the developing solvent to a distance of about 15 cm and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot obtained from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 0.5% (0.5 g, in vacuum, phosphorus pentoxide, 4 hours).

Residue on ignition NMT 0.1% (0.5 g).

Assay Weigh accurately about 10 mg each of Progesterone and progesterone RS, previously dried, and dissolve in ethanol(99.5), respectively, to make exactly 100 mL. Pipet 5.0 mL each of these solutions, add ethanol(99.5) to make exactly 50 mL and use these solutions as the test solution and the standard solution, respectively. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at the absorbance maximum wavelength around 241 nm as directed under the Ultraviolet-visible Spectroscopy.

$$\text{Amount (mg) of progesterone } (C_{21}H_{30}O_2) = \text{Amount (mg) of progesterone RS} \times \frac{A_T}{A_S}$$

Packaging and storage Preserve in light-resistant, tight containers.

Progesterone Injection
프로게스테론 주사액

Progesterone Injection is an oily injection and contains NLT 95.0% and NMT 105.0% of the labeled amount of progesterone ($C_{21}H_{30}O_2$: 314.46).

Method of preparation Prepare as directed under Injections, with Progesterone.

Description Progesterone Injection occurs as a clear, colorless to pale yellow distillate.

Identification Take 1 mL of Progesterone Injection, add 1 mL of diluted ethanol (9 in 10), shake well to mix, take the ethanol layer, add 1 mL of petroleum benzene, shake to mix, and take the ethanol layer. Use this solution as the test solution. Separately, weigh about 5 mg of progesterone RS, dissolve in 1 mL of ethanol(99.5), and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 2 μL each of the test solution and the standard solution on a thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of ether and diethylamine (19 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Spray evenly sulfuric acid on the plate, and heat at 105 ℃ for 10 minutes; the R_f values of the spots obtained from the test solution and the standard solution are the same.

Sterility Meets the requirements.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Extractable volume of injections Meets the requirements.

Assay First, measure the specific gravity of Progesterone Injection. Weigh accurately a mass equivalent to 1 mL of Progesterone Injection, add 2 mL of tetrahydrofuran and shake to mix, and then add ethanol(99.5) to make exactly *V* mL of a solution containing 0.5 mg of progesterone ($C_{21}H_{30}O_2$). Pipet 2 mL of this solution, add exactly 10 mL of the internal standard solution, and add ethanol(99.5) to make exactly 20 mL. Use this solution as the test solution. Separately, weigh accurately about 10 mg of progesterone RS (dried previously under vacuum for 4 hours in a phosphorus pentoxide desiccator), dissolve in 2 mL of tetrahydrofuran, and add ethanol(99.5) to make exactly 20 mL. Pipet 2 mL of this solution, add 10 mL of internal standard solution, then add ethanol(99.5) to make exactly 20 mL, and use this solution as the standard solution. Perform the test with 5 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the ratio of the peak area of progesterone to that of the internal standard Q_T and Q_S.

Amount (mg) of progesterone ($C_{21}H_{30}O_2$) per mL of progesterone injection

$$= \text{Amount (mg) of progesterone RS} \times \frac{Q_T}{Q_S} \times \frac{V}{20}$$

Internal standard solution—A solution of testosterone propionate in ethanol(99.5) (1 in 4000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 241 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 35 °C.

Mobile phase: A mixture of acetonitrile and water (7 : 3).

Flow rate: Adjust the flow rate so that the retention time of progesterone is about 6 minutes.

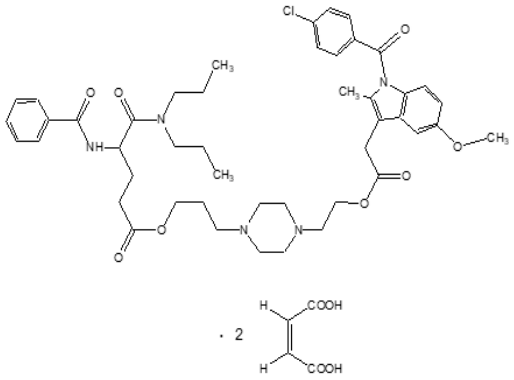
System suitability

System performance: Proceed with 5 μL of the standard solution according to the above conditions; progesterone and the internal standard are eluted in this order with the resolution being NLT 9.

System repeatability: Repeat the test 6 times with 5 μL each of the standard solution according to the above conditions; the relative standard deviation of ratios of the peak area of progesterone to that of the internal standard is NMT 1.0%.

Packaging and storage Preserve in light-resistant, hermetic containers.

Proglumetacin Dimaleate
프로글루메타신말레산염



$C_{46}H_{58}ClN_5O_8 \cdot 2C_4H_4O_4$: 1076.59

2-[4-[3-[[4-(Benzoylamino)-5-(dipropylamino)-1,5-dioxopentyl]oxy]propyl]-1-piperazinyl]ethyl 1-(4-chlorobenzoyl)-5-methoxy-2-methyl-1*H*-indole-3-acetic acid ester·(2*Z*)-2-butenedioate (1:2), [*59209-40-4*]

Proglumetacin Dimaleate contains NLT 97.5% and NMT 101.0% of proglumetacin dimaleate ($C_{46}H_{58}ClN_5O_8 \cdot 2C_4H_4O_4$), calculated on the anhydrous basis.

Description Proglumetacin Dimaleate occurs as a pale yellow crystalline powder.

It is freely soluble in dimethylformamide, dimethylsulfoxide, and acetic acid(100), soluble in chloroform and methanol, slightly soluble in ethanol and 1,2-propylene glycol and practically insoluble in water.

Melting point—Between 145 and 148 °C.

Identification Weigh 0.15 g of Proglumetacin Dimaleate, dissolve in methanol to make 15 mL, and use this solution as the test solution. Separately, weigh 0.15 g of proglumetacin dimaleate RS, dissolve in methanol to make 15 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography (with a fluorescence indicator). Develop the plate with a mixture of 1-butanol, water and acetic acid (100) (5 : 2 : 2) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm) or spray Dragendorff's TS; the spot of the test solution exhibits an Rf value and color corresponding to that of the standard solution.

Purity (1) ***Chloride***—Weigh 0.5 g of Proglumetacin Dimaleate, and perform the test as directed under the Chloride. Prepare the control solution with 3.5 mL of 0.02 mol/L hydrochloric acid (NMT 0.5%).

(2) ***Sulfate***— Weigh 0.5 g of Proglumetacin Dimaleate, and perform the test as directed under the Sulfate. Prepare the control solution with 2.5 mL of 0.01

mol/L sulfuric acid (NMT 0.5%).

(3) ***Heavy metals***—Proceed with 2.0 g of Proglumetacin Dimaleate according to Method 2 under the Heavy Metals and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(4) ***Arsenic***—Proceed with 1.0 g of Proglumetacin Dimaleate according to Method 3 under the Arsenic (NMT 2 ppm).

Water NMT 0.5%.

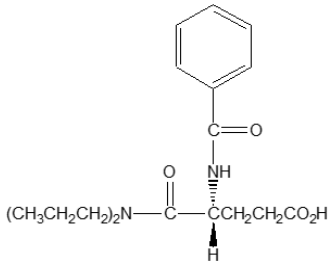
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.6 g of Proglumetacin Dimaleate, dissolve in 50 mL of acetic acid(100), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 53.83 mg of $C_{46}H_{58}N_4O_8 \cdot 2C_4H_4O$

Packaging and storage Preserve in well-closed containers.

Proglumide
프로글루미드



and enantiomer

$C_{18}H_{26}N_2O_4$: 334.41

(4*RS*)-4-Benzamido-5-(dipropylamino)-5-oxo-pentanoic acid [*6620-60-6*]

Proglumide, when dried, contains NLT 98.5% and NMT 101.0% of proglumide ($C_{18}H_{26}N_2O_4$).

Description Proglumide occurs as white crystals or a crystalline powder.
It is freely soluble in methanol, soluble in ethanol(95), slightly soluble in ether and practically insoluble in water.
A solution of Proglumide in methanol (1 in 10) shows no optical rotation.

Identification (1) Put 0.5 g of Proglumide in a round-bottomed ampoule, add 5 mL of hydrochloric acid, seal the ampoule and heat carefully at 120 ºC for 3 hours. After cooling, collect crystals produced, wash the crystals with 50 mL of water, and dry at 100 ºC for 1 hour; the melting point of the crystals is between 121 and 124 ºC.

(2) Determine the infrared spectra of Proglumide and proglumide RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Melting point Between 148 and 150 ºC.

Absorbance $E_{1cm}^{1\%}$ (225 nm): Between 384 and 414 (4 mg after drying, methanol, 250 mL).

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Proglumide according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Arsenic***—Weigh 1.0 g of Proglumide, add 10 mL of a solution of magnesium nitrate in ethanol(95) (1 in 10) and 1.5 mL of hydrogen peroxide, burn the ethanol, proceed according to Method 3 and perform the test (NMT 2 ppm).

(3) ***Related substances***—Dissolve 0.10 g of Proglumide in 5 mL of methanol and use this solution as the test solution. Pipet 1 mL of this solution, add methanol to make exactly 200 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on a plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of cyclohexane, ethyl acetate, acetic acid(100) and methanol (50 : 18 : 5 : 4) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 366 nm); any spot other than the principal spot obtained from the test solution is not more intense than the spot from the standard solution.

Loss on drying NMT 0.1% (1 g, in vacuum, phosphorus pentoxide, 60 ºC, 3 hours).

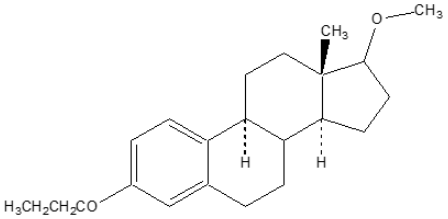
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.16 g of Proglumide, previously dried, dissolve in 40 mL of methanol, add 40 mL of water, and titrate with 0.1 mol/L sodium hydroxide VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS
= 33.441 mg of $C_{18}H_{26}N_2O_4$

Packaging and storage Preserve in well-closed containers.

Promestriene
프로메스트리엔



$C_{22}H_{32}O_2$: 328.49

(8*R*,9*S*,13*S*,14*S*)-17-Methoxy-13-methyl-3-propoxy-6,7,8,9,11,12,14,15,16,17-decahydrocyclopenta[a]phenanthrene, [*39219-28-8*]

Promestriene, when dried, contains NLT 97.0% and NMT 103.0% of promestriene ($C_{22}H_{32}O_2$).

Description Promestriene occurs as a white to creamy crystalline powder.
It is soluble in methanol, ethanol(95) and chloroform and petroleum ether and practically insoluble in water.

Identification (1) Determine the absorption spectrum of a solution of Promestriene in methanol (1 in 100) as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum around the wavelength of 288 nm.

(2) Determine the infrared spectra of Promestriene and promestriene RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) Dissolve 10 mg of Promestriene in 1 mL of methanol, and use this solution as the test solution. Weigh 10 mg of promestriene RS, dissolve in 1 mL of methanol, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of benzene and ethyl acetate (19 : 1) as the developing solvent to a distance of about 15 cm, and air-dry the plate. Spray 20% sulfuric acid on the plate; the spot of the test solution exhibits an Rf value corresponding to that of the standard solution.

Melting point Between 65 and 67 °C.

Optical rotation $[\alpha]_D^{20}$: Between +60° and + +69° (after drying, 0.2 g, ethanol(95), 10 mL, 100 mm).

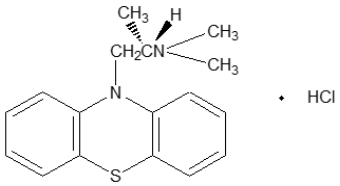
Loss on drying NMT 1.0% (0.5 g, in vacuum, phosphorus pentoxide, 50 °C, 3 hours)

Assay Weigh accurately about 10 mg of Promestriene, previously dried, dissolve in ethanol(99.5) to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 10 mg of promestriene RS, add ethanol(99.5) to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances for the test solution and the standard solution, A_T and A_S, at 288 nm as directed under the Ultraviolet-visible Spectroscopy, using ethanol(99.5) as the control solution.

Amount (mg) of promestriene ($C_{22}H_{32}O_2$)
= Amount (mg) of promestriene RS × (A_T / A_S)

Packaging and storage Preserve in tight containers.

Promethazine Hydrochloride
프로메타진염산염



and enantiomer

$C_{17}H_{20}N_2S{\cdot}HCl$: 320.88

(*RS*)-*N*,*N*-dimethyl-1-(10*H*-phenothiazin-10-yl)propan-2-amine hydrochloride [*58-33-3*]

Promethazine Hydrochloride, when dried, contains NLT 98.0% and NMT 101.0% of promethazine hydrochloride ($C_{17}H_{20}N_2O{\cdot}HCl$).

Description Promethazine Hydrochloride occurs as a white to pale yellow powder.
It is very soluble in water, freely soluble in ethanol(95) or acetic acid(100), slightly soluble in acetic anhydride and practically insoluble in ether.
It is gradually colored by light.
An aqueous solution of Promethazine Hydrochloride (1 in 25) shows no optical rotation.

Melting point—About 223 °C (with decomposition).

Identification (1) Determine the absorption spectra of aqueous solutions of Promethazine Hydrochloride and promethazine hydrochloride RS (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Promethazine Hydrochloride and promethazine hydrochloride RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) Dissolve 0.5 g of Promethazine Hydrochloride in 5 mL of water, add 2 mL of ammonia TS, and filter. To 5 mL of the filtrate, add dilute nitric acid to acidify; the solution responds to the Qualitative Analysis (2) for chloride.

pH Dissolve 1.0 g of Promethazine Hydrochloride in 10

mL of water; the pH of this solution is between 4.0 and 5.5.

Purity (1) ***Clarity and color of solution***—Perform the test while protected from direct sunlight. Dissolve 1.0 g of Promethazine Hydrochloride in 10 mL of water; the solution is clear and colorless.

(2) ***Heavy metals***—Proceed with 1.0 g of Promethazine Hydrochloride according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Related substances***—Perform the test while protected from direct sunlight Dissolve 0.10 g of Promethazine Hydrochloride in 5 mL of ethanol(95) and use this solution as the test solution. Pipet 1 mL of this solution, add ethanol(95) to make exactly 200 mL, and use this solution as the standard solution (1). Separately, weigh 20 mg of isopromethazine hydrochloride RS, dissolve in ethanol(95) to make 100 mL, and use this solution as the standard solution (2). With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution, standard solution (1) and standard solution (2) on a plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of methanol and diethylamine (19 : 1) as the developing solvent to a distance of about 12 cm and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm); the spot obtained from the test solution at a location equivalent to the spot obtained from the standard solution (2) is not more intense than the spot of the standard solution (2). Also, the spots other than the principal spot from the test solution are not more intense than those obtained from the standard solution (1).

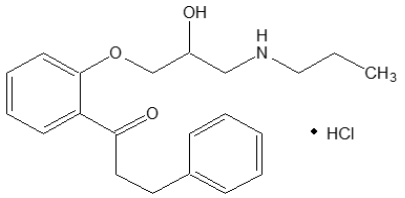
Loss on drying NMT 0.5% (1 g, 105 ℃, 3 hours)

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.5 g of Promethazine Hydrochloride, previously dried, and dissolve in 50 mL of a mixture of acetic anhydride and acetic acid(100) (7 : 3), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Packaging and storage Preserve in light-resistant, tight containers.

Propafenone Hydrochloride
프로파페논염산염



$C_{21}H_{27}NO_3 \cdot HCl$: 377.91

1-{2-[2-Hydroxy-3-(propylamino)propoxy] phenyl}-3-phenylpropan-1-one hydrochloride [*14222-60-7*]

Propafenone Hydrochloride contains NLT 98.0% and NMT 102.0% of propafenone hydrochloride ($C_{21}H_{27}NO_3 \cdot HCl$), calculated on the dried basis.

Description Propafenone Hydrochloride occurs as a white powder.
It is soluble in methanol or hot water, slightly soluble in ethanol(95) or chloroform, very slightly soluble in acetone, and practically insoluble in ether or toluene.

Identification (1) Determine the infrared spectra of Propafenone Hydrochloride and propafenone hydrochloride RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) Dissolve 0.5 g of Propafenone Hydrochloride in 50 mL of water by heating and adjust the pH to 9.5 - 10.0 with 0.1 mol/L sodium hydroxide TS; a precipitate is formed. After cooling, filter, and add 1 mL of 6 mol/L nitric acid and 2 to 3 drops of 0.1 mol/L silver nitrate TS to the filtrate; a precipitate is formed, and it dissolves upon the addition of 2 to 3 drops of ammonia water(28).

Melting point Between 171 and 175 ℃.

pH Dissolve 0.5 g of Propafenone Hydrochloride in 100 mL of water; the pH of the solution is between 5.0 and 6.2.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Propafenone Hydrochloride in 30 mL of hot water; the resulting solution is clear.

(2) ***Heavy metals***—Proceed with 1.0 g of Propafenone Hydrochloride according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Related substances***—Weigh accurately about 0.10 g of Propafenone Hydrochloride, dissolve in 20 mL of the mobile phase from the operating conditions 1, and use this solution as the test solution. Pipet 2 mL of this solution and dissolve in 50 mL of the mobile phase from the operating conditions 1. Pipet 2.5 mL of this solution, add 2.5 mL of a solution of diphenylphthalate in methanol (1 in 2000), add the mobile phase from the operating conditions 1 to make exactly 100 mL, and use this solution as the standard solution. Perform the test with each 10 μL of the test solution and the standard solution as directed under the Liquid Chromatography according to

operating conditions 1 and operating conditions 2. Determine the area of each peak from the test solution by the automatic integration method. The area of any peak other than the propafenone peak from the test solution is not larger than the peak area of propafenone from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column, about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silical gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: Dissolve 4.6 g of sodium 1-nonanesulfonate and 2.3 g of phosphoric acid in water to make exactly 1000 mL and filter with a membrane filter with a pore size of 0.45 μm. To 900 mL of this solution, add 600 mL of acetonitrile.

Flow rate: Adjust the flow rate so that the retention time of diphenylphthalate is about 39 minutes.

System suitability

System performance: Dissolve 12 mg of propafenone hydrochloride and 50 mg of isopropyl benzoate in 100 mL of methanol. Proceed with 10 μL of this solution according to the above operating conditions; propafenone and isopropyl benzoate are eluted in this order with the resolution of these peaks being NLT 5.

System repeatability: Perform the test 6 times with each 10 μL of the standard solution according to the above operating conditions; the relative standard deviation of the peak area of propafenone is NMT 2.0%.

Time span of measurement: About as long as the retention time of diphenylphthalate after the solvent peak.

Operating conditions 2

Detector, column and column temperature: Proceed as directed under the operating condition 1.

Column: A stainless steel column, about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silical gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: Dissolve 7.33 g of sodium 1-nonanesulfonate and 2.3 g of phosphoric acid in water to make exactly 1000 mL and filter with a membrane filter with a pore size of 0.45 μm. To 700 mL of this solution, add 700 mL of acetonitrile.

Flow rate: Adjust the flow rate so that the retention time of diphenylphthalate is about 11 minutes.

System suitability

System performance: Dissolve 12 mg of propafenone hydrochloride and 50 mg of isopropyl benzoate in 100 mL of methanol. Proceed with 10 μL of this solution according to the above operating conditions; propafenone and isopropyl benzoate are eluted in this order with the resolution of these peaks being NLT 21.

System repeatability: Perform the test 6 times with each 10 μL of the standard solution according to the above operating conditions; the relative standard deviation of the peak area of propafenone is NMT 2.0%.

Time span of measurement: About 2.5 times the retention time of the diphenylphthalate after the solvent peak.

Loss on drying NMT 0.5% (1 g, 105 ℃, constant mass).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.25 g of Propafenone Hydrochloride and propafenone hydrochloride RS (previously measure the loss on drying in the same manner as Propafenone Hydrochloride), dissolve each in the mobile phase to make exactly 200 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with each 10 μL of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions and determine the areas, A_T and A_S, of propafenone hydrochloride from each solution.

Amount (mg) of propafenone hydrochloride ($C_{21}H_{27}NO_3 \cdot HCl$)
= Amount (mg) of propafenone hydrochloride RS, calculated on the dried basis $\times \frac{A_T}{A_S}$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 210 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 to 10 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: Dissolve 1.36 g of potassium dihydrogen phosphate in 980 mL of water, adjust the pH to 3.0 with phosphoric acid, and add water to make 1000 mL. To 570 mL of this solution, add 430 mL of acetonitrile.

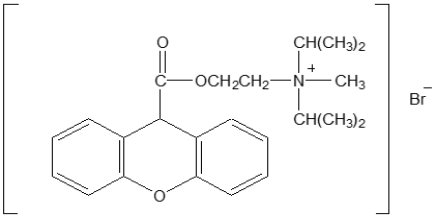
Flow rate: Adjust the flow rate so that the retention time of propafenone hydrochloride is about 5 minutes.

System suitability

System repeatability: Perform the test 6 times with 20 μL of the standard solution according to the above operating conditions; the relative standard deviation of the peak area of propafenone hydrochloride is NMT 2.0%.

Packaging and storage Preserve in light-resistant, tight containers.

Propantheline Bromide
프로판텔린브롬화물



$C_{23}H_{30}BrNO_3$: 448.39

N-Isopropyl-*N*-methyl-*N*-{2-[(9*H*-xanthen-9-ylcarbonyl)oxy]ethyl}propan-2-aminium bromide [*50-34-0*]

Propantheline Bromide, when dried, contains NLT 98.0% and NMT 102.0% of propantheline bromide ($C_{23}H_{30}BrNO_3$).

Description Propantheline Bromide occurs as a white to yellowish white crystalline powder. It is odorless and has a very bitter taste.

It is very soluble in water, acetic acid(100), ethanol(95) or chloroform, soluble in acetic anhydride, and practically insoluble in ether.

Dissolve about 1.0 g of Propantheline Bromide in 50 mL of water; the pH of the solution is between 5.0 and 6.0.

Melting point—About 161 ºC (with decomposition, after drying).

Identification (1) To 5 mL of an aqueous solution of Propantheline Bromide (1 in 50), add 10 mL of sodium hydroxide TS, heat to boiling. Again, continue heating for 2 minutes, cool to 60 °C, and add 5 mL of dilute hydrochloric acid. After cooling, collect the precipitates, wash thoroughly with water, recrystallize from dilute ethanol, and dry at 105 °C for 1 hour; the melting point of the crystals is between 217 and 222 °C.

(2) Dissolve 10 mg of the crystals obtained from (1) in 5 mL of sulfuric acid; the solution exhibits a vivid yellow to yellowish red color.

(3) To 5 mL of an aqueous solution of Propantheline Bromide (1 in 50), add 2 mL of dilute nitric acid; the solution responds to the Qualitative Analysis (1) for bromide.

Purity ***Related substances***—Weigh accurately about 60 mg of Propantheline Bromide, dissolve in the mobile phase to make exactly 200 mL, and use this solution as the test solution. Separately, weigh accurately a suitable amount of 9-bromohydroxypropantheline RS, xanthantanoic acid RS and xanthon RS, dissolve in the mobile phase to obtain a solution containing 6.0 μg of 9-bromohydroxypropantheline and 1.5 μg each of xanthantanoic acid and xanthon per mL, and use this solution as the standard solution. Perform the test with each 50 μL of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak areas, A_T and A_S, from the test solution and the standard solution, respectively; xanthantinoic acid and xanthone are NMT 0.5%, 9-bromohydroxyproprntheline is NMT 2.0%, and among the peaks, except the solvent peak other than the major peak from the test solution, the total area of the peaks of which the percentage area is NLT 0.1% is NMT 3.0%.

$$\text{Content (\%) of related substances} = 20 \times \frac{C}{C_X} \times \frac{A_T}{A_S}$$

C: Concentration (μg/mL) of each related substance in the standard solution

C_x: Concentration (μg/mL) of propantheline bromide in the test solution

$$\text{Content (\%) of all unidentified related substances, which is NLT 0.1\%} = \frac{A_i}{A_t}$$

A_i: Peak area of any unidentified peak

A_t: Total area of all peaks

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 mm).

Column: A stainless steel column, about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm to 10 μm in particle diameter).

Mobile phase: A mixture of acetonitrile and pH 3.5 buffer solution (55 : 45).

Flow rate: 2.0 mL/min

System suitability

System performance: Proceed with 50 μL of the standard solution according to the above operating conditions; the resolution between the least resolved peaks is NLT 1.2.

System repeatability: Perform the test 6 times with each 50 μL of the standard solution according to the above operating conditions; the relative standard deviation of each peak area is NMT 6.0%.

pH 3.5 buffer solution—Prepare as directed under the Assay under Propantheline Bromide Tablets.

Loss on drying NMT 0.5% (2 g, 105 ºC, 4 hours).

Residue on ignition NMT 0.1% (1 g).

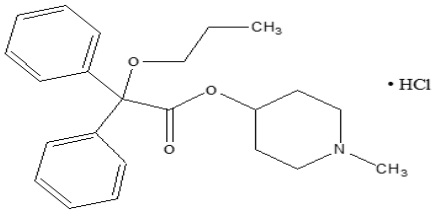
Assay Weigh accurately about 1.0 g of Propantheline Bromide, previously dried, dissolve in 50 mL of a mixture of acetic anhydride and acetic acid(100) (7 : 3), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 44.84 mg of $C_{23}H_{30}BrNO_3$

Packaging and storage Preserve in well-closed contain-

ers.

Propiverine Hydrochloride
프로피베린염산염



$C_{23}H_{29}NO_3 \cdot HCl$: 403.94

α-Phenyl-α-propoxy-benzeneacetic acid 1-methyl-4-piperidinyl ester hydrochloride, [*54556-98-8*]

Propiverine Hydrochloride, when dried, contains NLT 98.5% and NMT 101.0% of propiverine hydrochloride ($C_{23}H_{29}NO_3 \cdot HCl$).

Description Propiverine Hydrochloride occurs as white crystals or a crystalline powder. It is freely soluble in methanol, chloroform, or acetic acid(100), soluble in water or anhydrous ethanol, sparingly soluble in acetonitrile, slightly soluble in acetone, and practically insoluble in ethyl acetate, ether or hexane.

Identification (1) Determine the infrared spectra of Propiverine Hydrochloride and propiverine hydrochloride RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) To 5 mL of an aqueous solution of Propiverine Hydrochloride (1 in 100), add 6 mL of ethyl acetate and 3 drops of silver nitrate TS; a white precipitate is formed. The precipitate does not dissolve in 0.5 mL of dilute nitric acid and dissolves on addition of 2 mL of ammonia TS with shaking to mix.

Melting point Between 212 and 216 °C.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Propiverine Hydrochloride in 20 mL of methanol; the solution is colorless and clear.

(2) ***Sulfate*—**Proceed with 0.4 g of Propiverine Hydrochloride according to the Sulfate in the General tests and perform the test. Prepare the control solution with 0.4 mL of 0.005 mol/L sulfuric acid (NMT 0.048%).

(3) ***Heavy metals***—Proceed with 1.0 g of Propiverine Hydrochloride according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(4) ***Arsenic*—**Proceed with 1.0g of Propiverine Hydrochloride according to Method 3 and perform the test. Prepare the control solution with 2.0 mL of arsenic standard solution (NMT 2 ppm).

(5) ***Related substances*—**Weigh accurately 50 mg of Propiverine Hydrochloride, dissolve in 100 mL of the mobile phase, and use this solution as the test solution. Pipet 1 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with each 15 μL of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak areas of each peak from the test solution and the standard solution by the automatic integration method; the area of the peak at the relative retention time of about 0.28 to the propiverine peak from the test solution is not larger than 3/10 of the propiverine peak area from the standard solution. The total area of the peaks other than the propiverine peak and the peaks above from the test solution is not larger than 1/10 of the propiverine peak area from the standard solution. The total area of the peaks other than the propiverine peak from the test solution is not larger than 1/2 of the propiverine peak from the standard solution.

Operating conditions

For the detector, column, column temperature, mobile phase and flow rate, proceed as directed in the operating conditions under the Assay.

Time span of measurement: About 2.5 times the retention time of propiverine, beginning after the solvent peak

System suitability

Test for required detectability: Pipet 1 mL of the standard solution and add the mobile phase to make exactly 20 mL. Confirm that the peak area of propiverine obtained from 15 μL of this solution is equivalent to 3.5% to 6.5% of that obtained from propiverine of the standard solution.

System performance: Perform the test with 15 μL of the standard solution according to the above operating conditions; the number of theoretical plates and symmetry factor of the propiverine peak are NLT 7000 and NMT 1.5, respectively.

System repeatability: Perform the test 6 times with each 15 μL of the standard solution according to the above operating conditions; the relative standard deviation of the propiverine peak area is NMT 2.0%.

Loss on drying NMT 1.0% (1 g, 105 °C, 3 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about each 50 mg of Propiverine Hydrochloride and propiverine hydrochloride RS, previously dried, and dissolve in the mobile phase to make exactly 100 mL. Pipet each 10 mL of these solutions, add the mobile phase to make exactly 50 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with each 15 μL of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the propiverine peak areas, A_T and A_S.

Amount (mg) of propiverine hydrochloride ($C_{23}H_{29}NO_3 \cdot HCl$)
= Amount (mg) of propiverine hydrochloride RS $\times \frac{A_T}{A_S}$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 210 nm).

Column: A stainless steel column, about 4.6 mm in internal diameter and 15 cm in length, packed with phenylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: A mixture of mobile phase A and acetonitrile (29 : 21).

Mobile phase A—Dissolve 2.21 g of potassium dihydrogen phosphate and 1.51 g of 1-sodium octanesulfonate in 650 mL of water and adjust pH to 3.2 with phosphoric acid.

Flow rate: 1.0 mL/min

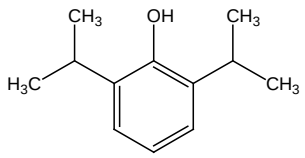
System suitability

System performance: Proceed with 15 μL of the standard solution and perform the test; the number of theoretical plates and symmetry factor of the propiverine peak are NLT 6000 and NMT 2.0, respectively.

System repeatability: Perform the test 6 times with each 15 μL of the standard solution according to the above operating conditions; the relative standard deviation of the propiverine peak area is NMT 1.0%.

Packaging and storage Preserve in well-closed containers.

Propofol
프로포폴



$C_{12}H_{18}O$: 178.27

2,6-Diisopropylphenol [*2078-54-8*]

Propofol contains NLT 98.0% and NMT 102.0% of propofol ($C_{12}H_{18}O$).

Description Propofol occurs as a clear, colorless or pale yellow liquid.

It is very soluble in methanol or ethanol(95), slightly soluble in cyclohexane or 2-propanol, and very slightly soluble in water.

Identification (1) Determine the infrared spectra of Propofol and propofol RS as directed under the liquid film method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Refractive index n_D^{20}: Between 1.5125 and 1.5145.

Purity (1) ***Related substance I***—Weigh accurately 0.5 g of Propofol, dissolve in hexane to make exactly 10 mL, and use this solution as the test solution. Separately, dissolve exactly 5 mg of propofol related substance I [(2,6-bis(1-methylethyl)-1,4-benzoquinone] in hexane to make exactly 100 mL and use this solution as the standard solution. Perform the test with each 20 μL of the test solution and the standard solution according to the operating conditions in the Assay as directed under the Liquid Chromatography. The peak area of related substance I from the test solution is NMT 5 times that of related substance I from the standard solution.

Time span of measurement: About 6 times the retention time of propofol

(2) ***Related substances***—Weigh accurately 1.0 g of Propofol, dissolve in hexane to make exactly 10 mL, and use this solution as the test solution. Pipet 1.0 mL of the test solution, dilute with hexane to make exactly 100 mL. Pipet 1.0 mL of the resulting solution, dilute with to make exactly 10 mL, and use this solution as the standard solution. Perform the test with each 10 μL of the test solution and the standard solution according to the operating conditions in the Assay as directed under the Liquid Chromatography. The peak area of propofol related substance II [2-(1-methylethoxy)-1,3-bis(1-methylethyl)benzene] is NMT 0.4 times the peak area of propofol from the standard solution (0.2%, response factor of 0.2). The peak area of propofol related substance III [3,3',5,5'-tetrakis(1-methylethyl)biphenyl-4,4'-diol} is NMT 0.4 times the peak area of propofol from the standard solution (0.01%, response factor of 4.0). Total area of the peaks other than propofol and two related substances above is NMT 0.5 time the peak area of propofol from the standard solution (0.05%); the total amount of all related substances, including related substance II and III, is NMT 0.3%. Exclude any peaks of which the peak area is NMT 0.25 times the peak area of propofol from the standard solution.

Assay Weigh accurately about 0.24 g of Propofol, dissolve in hexane to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 0.24 g of propofol RS, dissolve in hexane to make exactly 100 mL, and use this solution as the standard solution. Perform the test with each 10 μL of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions and determine the peak areas, A_T and A_S, of propofol from each solution.

Amount (mg) of propofol ($C_{12}H_{16}O$)
= Amount (mg) of propofol RS $\times \frac{A_T}{A_S}$

Operating conditions

Detector: An ultraviolet absorption photometer

(wavelength: 275 nm).

Column: A stainless steel column, about 5 mm in internal diameter and about 20 cm in length, packed with silica gel for liquid chromatography (50 μm in particle diameter).

Mobile phase: A mixture of hexane, acetonitrile and ethanol(95) (990 : 7.5 : 1).

Flow rate: 2.0 mL/min

System suitability

System performance: Proceed with 10 μL of the system suitability solution (I) according to the above operating conditions; related substance I (retention time: about 2.5 minutes) and propofol (retention time: about 3 minutes) are eluted in this order with the resolution being NLT 4.0. Proceed with 10 μL of the system suitability solution (II) according to the above operating conditions; the relative retention times of related substance II and III to that of propofol is about 0.5 and about 5, respectively.

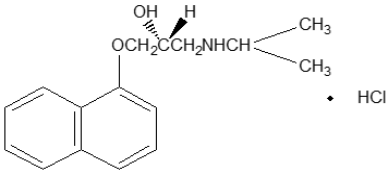
Time span of measurement: About 5 times the retention time of propofol.

System suitability solution (I)—Dissolve 5 mg of propopol RS and 15 mg of related substance I RS in hexane to make 50 mL.

System suitability solution (II)—Dissolve 1.0 g of propopol RS in hexane to make 10 mL.

Packaging and storage Preserve in light-resistant, tight containers, filled with inert gas.

Propranolol Hydrochloride
프로프라놀롤염산염



and enantiomer

$C_{16}H_{21}NO_2 \cdot HCl$: 295.80

(*RS*)-1-(Isopropylamino)-3-(naphthalen-1-yloxy)propan-2-ol hydrochloride [*318-98-9*]

Propranolol Hydrochloride, when dried, contains NLT 99.0% and NMT 101.0% of propranolol hydrochloride ($C_{16}H_{21}NO_2 \cdot HCl$).

Description Propranolol Hydrochloride occurs as a white crystalline powder. It is odorless and has a bitter taste.

It is freely soluble in methanol, soluble in water, acetic acid(100) or ethanol(95), sparingly soluble in chloroform, and practically insoluble in ether.

The pH of a solution of 1.0 g of Propranolol Hydrochloride dissolved in 100 mL of water is between 5.0 and 6.0.

It is colored by light.

Identification (1) Determine the absorption spectra of solutions of Propranolol Hydrochloride and propranolol hydrochloride RS in methanol (1 in 50000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Propranolol Hydrochloride and propranolol hydrochloride RS, previously dried, as directed in the potassium chloride disk method under the Mid-infrared Spectroscopy, respectively; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) An aqueous solution of Propranolol Hydrochloride (1 in 50) responds to the Qualitative Analysis (2) for chloride.

Melting point Between 163 and 166 ℃.

Purity (1) ***Clarity and color of solution*—**Dissolve 1.0 g of Propranolol Hydrochloride in 20 mL of water; the solution is colorless and clear.

(2) ***Heavy metals***—Proceed with 1.0 g of Propranolol Hydrochloride according to Method 4 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Related substances***—Dissolve 20 mg of Propranolol Hydrochloride in 10 mL of the mobile phase and use this solution as the test solution. Pipet 2 mL of this solution and add the mobile phase to make exactly 100 mL. Pipet 1 mL of this solution, add the mobile phase to make exactly 10 mL, and use this solution as the standard solution. Perform the test with each exactly 20 μL of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak areas of each solution by the automatic integration method; the area of any peak other than the propranolol peak from the test solution is not larger than 1/2 times the area of the propranolol peak from the standard solution. The total area of the peaks other than the propranolol peak from the test solution is not larger than 2 times the area of the propranolol peak from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 292 nm).

Column: A stainless steel column, about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: Dissolve 1.6 g of sodium lauryl sulfate and 0.31 g of tetrabutylammonium phosphate in 450 mL of water, add 1 mL of sulfuric acid and 550 mL of acetonitrile for liquid chromatography, and adjust the pH to 3.3 with 2 mol/L sodium hydroxide TS.

Flow rate: Adjust the flow rate so that the retention time of propranolol is about 4 minutes.

System suitability

Test for required detectability: Take exactly 5 mL of the standard solution and add the mobile phase to make exactly 20 mL. Confirm that the peak area of propranolol obtained from 20 μL of this solution is between 17% and 33% of that of propranolol from the standard solution.

System performance: Proceed with 20 μL of the standard solution according to the above operating conditions and perform the test; the number of theoretical plates and symmetry factor of the propranolol peak are NLT 3000 plates and NMT 2.0, respectively.

System repeatability: Perform the test 6 times with each 20 μL of the standard solution according to the above operating conditions; the relative standard deviation of the area of the propranolol peak is NMT 2.0%.

Time span of measurement: About 5 times the retention time of propranolol.

Loss on drying NMT 0.5% (1 g, 105 ℃, 4 hours).

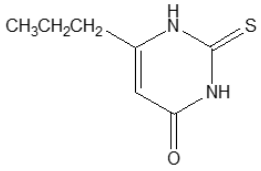
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.5 g of Propranolol Hydrochloride, previously dried, and dissolve it in 50 mL of a mixture of acetic anhydride and acetic acid(100) (7 : 3), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 29.580 mg of $C_{16}H_{21}NO_2 \cdot HCl$

Packaging and storage Preserve in light-resistant, well-closed containers.

Propylthiouracil
프로필티오우라실



$C_7H_{10}N_2OS$: 170.23
6-Propyl-2-thioxo-2,3-dihydropyrimidin-4(1*H*)-one [*51-52-5*]

Propylthiouracil, when dried, contains NLT 98.0% and NMT 101.0% of propylthiouracil ($C_7H_{10}N_2OS$).

Description Propylthiouracil occurs as a white powder. It is odorless and has a bitter taste.
It is sparingly soluble in ethanol(95) and very slightly soluble in water or ether.
It dissolves in sodium hydroxide TS or ammonia TS.

Identification (1) To 20 mg of Propylthiouracil, add 7 mL of bromine TS, shake well to mix for 1 minute, and heat until the color of bromine TS disappears. Cool, filter, and add 10 mL of barium hydroxide TS to the filtrate; a white precipitate is produced. The color of the precipitate does not turn purple within 1 minute.

(2) Take 5 mL of a hot saturated solution of Propylthiouracil, add 2 mL of a solution of sodium pentacyanoammine ferroate (1 in 100); a green color develops.

Melting point Between 218 and 221 ℃.

Purity (1) ***Sulfate***—Triturate Propylthiouracil to very finely powder, take 0.75 g of the Propylthiouracil powder, add 25 mL of water, and heat on a steam bath for 10 minutes. Cool, filter, and wash the residue with water to obtain 30 mL of the filtrate. To 10 mL of the filtrate, add 1 mL of dilute hydrochloric acid and water to make 50 mL. Use this solution as the test solution to perform the test. Prepare the control solution with 0.40 mL of 0.005 mol/L sulfuric acid (NMT 0.077%).

(2) ***Heavy metals***—Proceed with 1.0 g of Propylthiouracil according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Selenium***—Proceed with 0.2 g of Propylthiouracil as directed under the Oxygen Flask Combustion, using 25 mL of diluted nitric acid (1 in 30) as absorbent. Use a 1 L combustion flask. After combustion, wash the stopper and the inside of the flask with 10 mL of water. Transfer the liquid inside the flask to a 150-mL beaker using 20 mL of water. Heat gently to boil, boil for another 10 minutes, cool to room temperature, and use this solution as the test solution. Separately, pipet 6 mL of standard selenium stock solution, add 25 mL of diluted nitric acid (1 in 30) and 25 mL of water, and use this solution as the standard solution. Adjust the pH of the test solution and standard solution to 2.0 ± 0.2 with diluted ammonia water(28) (1 in 2), add water to make exactly 60 mL, transfer to a separatory funnel using 10 mL of water, and wash the separatory funnel with 10 mL of water. Add 0.2 g of hydroxylamine, dissolve by stirring, immediately add 5 mL of 2,3-diaminonaphthalene TS, and put a stopper. Mix by stirring and allow to stand at room temperature for 100 minutes. Add 5.0 mL of cyclohexane, shake vigorously for 2 minutes, and allow to stand until the layers are separated. Remove the water layer, centrifuge the cyclohexane extract to remove water, and take the cyclohexane layer. With these solutions and the control solution prepared in the same way with 25 mL of water added to 25 mL of diluted nitric acid (1 in 30), perform the test as directed under the Ultraviolet-visible Spectroscopy. Determine the absorption at the absorbance maximum wavelength of about 380 nm; the absorption of the solution prepared with the test solution is not greater than the absorption from the standard solution (NMT 30 ppm).

(4) ***Related substances***—Weigh accurately about 100 mg of Propylthiouracil, dissolve in methanol to make exactly 10 mL, and use this solution as the test solution. Separately, weigh accurately 10 mg of propylthiouracil RS, dissolve in methanol to make exactly 50 mL, and use this solution as the standard solution. With these solu-

tions, perform the test as directed under the Thin Layer Chromatography. Spot each 10 μL of the test solution and the standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of toluene, ethyl acetate and formic acid (10 : 9 : 1) to a distance of about 15 cm and air-dry the plate. Examine the plate under ultraviolet light (main wavelengths: 254 nm and 365 nm); the spots other than the principal spot obtained from the test solution are not larger or not more intense than those from the standard solution (NMT 2.0%). Disregard any spots remaining at the starting line.

(5) ***Thiourea***—To 0.30 g of Propylthiouracil, add 50 mL of water, attach a reflux condenser, and heat to dissolve for 5 minutes. Cool and filter. To 10 mL of the filtrate, add 3 mL of ammonia TS, shake well, and add 2 mL of silver nitrate TS; the color of the resulting solution is not more intense than the following control solution.

Control solution—Weigh accurately 60 mg of thiourea and dissolve in water to make exactly 100 mL. Pipet 2 mL of this solution and add water to make exactly 100 mL. Take 10 mL of this solution and proceed in the same manner.

Loss on drying NMT 0.5% (1 g, 105 ℃, 2 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.3 g of Propylthiouracil, previously dried, and add 30 mL of water. Add 30 mL of 0.1 mol/L sodium hydroxide to this solution, heat to boil, and dissolve by stirring. Wash down the solid residue inside the flask with a small volume of water and add 50 mL of 0.1 mol/L silver nitrate with stirring. Boil gently for 5 minutes, add 1 mL to 2 mL of bromothymol blue TS, and titrate with 0.1 mol/L sodium hydroxide VS until a persistent bluish green color develops. Determine the total volume of 0.1 mol/L sodium hydroxide VS consumed.

Each mL of 0.1 mol/L sodium hydroxide VS
= 8.512 mg of $C_7H_{10}N_2OS$

Packaging and storage Preserve in light-resistant, well-closed containers.

Propylthiouracil Tablets
프로필티오우라실 정

Propylthiouracil Tablets contain NLT 93.0% and NMT 107.0% of the labeled amount of propylthiouracil ($C_7H_{10}N_2OS$: 170.23).

Method of preparation Prepare as directed under Tablets, with Propylthiouracil.

Identification Weigh an amount of Propylthiouracil Tablets, previously powdered, equivalent to 0.3 g of propylthiouracil ($C_7H_{10}N_2OS$) according to the labeled amount, add 5 mL of ammonia TS, and allow to stand for 5 minutes shaking occasionally. Then add 10 mL of water and centrifuge. Add acetic acid to the clear supernatant, collect the resulting precipitates by filtering, recrystallize with water, and dry at 105 °C for 1 hour; the melting point is 218 to 221 °C. With the precipitates, perform the test as directed under the Identification of Propylthiouracil.

Dissolution Perform the test with 1 tablet of Propylthiouracil Tablets at 75 revolutions per minute according to Method 2 under the Dissolution, using 900 mL of Solution 2 for dissolution test as the dissolution medium. Take NLT 20 mL of the dissolution medium 30 minutes after starting the test and filter through a membrane filter with a pore size of NMT 0.8 μm. Discard the first 10 mL of the filtrate and use the subsequent filtrate as the test solution. Separately, weigh accurately about 50 mg of propylthiouracil RS, previously dried at 105 ℃ for 3 hours, dissolve in Solution 2 for dissolution test to make exactly 1000 mL, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at the wavelength of 274 nm as directed under the Ultraviolet-visible Spectroscopy.
Meets the requirements if the dissolution rate of Propylthiouracil Tablets in 30 minutes is NLT 80%.

Dissolution rate (%) of the labeled amount of propylthiouracil ($C_7H_{10}N_2OS$)

$$= W_S \times \frac{A_T}{A_S} \times \frac{1}{C} \times 90$$

*W*s: Amount (mg) of reference standards
C: Labeled amount (mg) of propylthiouracil ($C_7H_{10}N_2OS$) per tablet

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 tablets of Propylthiouracil Tablets, and powder them. Weigh accurately an amount of the powder equivalent to about 50 mg of propylthiouracil ($C_7H_{10}N_2OS$), add 150 mL of Solution 2 for dissolution test, sonicate to disperse the particles into small pieces, and add Solution 2 for dissolution test to make exactly 200 mL. Filter this solution through a membrane filter with a pore size of NMT 0.45 μm. Discard the first 5 mL of the filtrate, take exactly 2 mL of the subsequent filtrate, add Solution 2 for dissolution test to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 50 mg of propylthiouracil RS, dried at 105 °C for 2 hours, and dissolve in Solution 2 for dissolution test to make exactly 200 mL. Pipet 2 mL of this solution, add Solution 2 for dissolution test to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at 274 nm as directed under the

Ultraviolet-visible Spectroscopy.

$$\text{Amount (mg) of propylthiouracil } (C_7H_{10}N_2OS) = \text{Amount (mg) of propylthiouracil RS} \times \frac{A_T}{A_S}$$

Packaging and storage Preserve in light-resistant, well-closed containers.

Protamine Sulfate
프로타민황산염

Protamine Sulfate is a sulfate of protamine, obtained from the mature seminal glands of fish of the family *Salmonidae*. Protamine Sulfate binds with heparin, and binds to NLT 100 units heparin sodium per mg of protamine sulfate, calculated on the dried basis.

Description Protamine Sulfate occurs as a white to pale yellowish gray powder.
It is sparingly soluble in water and practically insoluble in ethanol(95) or ether.

Identification (1) Dissolve 1 mg of Protamine Sulfate in 2 mL of water, add 5 drops of 0.1 g of 1-naphthol dissolved in 100 mL of diluted ethanol (7 in 10) and 5 drops of sodium hypochlorite TS, and add sodium hydroxide TS to alkalize; the resulting solution exhibits a vivid red color.

(2) Add 5 mg of Protamine Sulfate to 1 mL of water, dissolve by warming, and add 1 drop of sodium hydroxide solution (1 in 10) and 2 drops of copper(II) sulfate TS; the resulting solution exhibits a purple color.

(3) A solution of Protamine Sulfate (1 in 20) responds to the Qualitative Analysis for sulfate.

pH Dissolve 1.0 g of Protamine Sulfate in 100 mL of water; the pH of this solution is between 6.5 and 7.5.

Absorbance Measure the absorbance of a 1.0% aqueous solution of Protamine Sulfate as directed under Ultraviolet-visible Spectroscopy using water as the control solution; the difference in absorbance at the wavelengths of 260 nm and 280 nm is NMT 0.1.

Purity (1) ***Clarity and color of solution***—Dissolve 0.10 g of Protamine Sulfate in 10 mL of water; the resulting solution is clear and colorless.

(2) ***Heavy metals***—Weigh 1.0 g of Protamine Sulfate, add 0.5 g of magnesium oxide to mix, and carbonize. After cooling, ignite for 1 hour at NMT 800 ℃ to incinerate. Cool, then dissolve the residue in a mixture of hydrochloric acid and water (1 :1). Add 0.1 mL of phenolphthalein TS and add ammonia water(28) dropwise until the solution turns pale red. Allow to cool, add acetic acid(100) until the color disappears, and add another 0.5 mL. Filter and wash, if necessary. Add water to make 20 mL and use this solution as the test solution. Separately, proceed in the same manner as in the test solution using 2.0 mL of lead standard solution instead of Protamine Sulfate. To 10 mL of this solution, add 2 mL of the test solution and use this solution as the control solution. Separately, add 2 mL of the test solution to 10 mL of water and use this solution as the blank test solution. To 12 mL each of the test solution, the control solution and the blank test solution, add 2 mL of acetate buffer solution, pH 3.5, mix, add 1.2 mL of thioacetamide TS, and immediately mix. Allow the mixture to stand for 2 minutes; the color of the test solution is not more intense than that of the control solution (NMT 20 ppm).

System suitability—The control solution exhibits a faint brown color compared to the blank test solution. To the test solution, add 2.0 mL of lead standard solution. Then, to 10 mL of this solution, add 2 mL of the test solution, and use this solution as the system suitability solution. The system suitability solution is more intense than or equal to the control solution.

(3) ***Mercury***—Weigh 2.0 g of Protamine Sulfate, put in a 250-mL Erlenmeyer flask with a glass stopper, then add 20 mL of a mixture of nitric acid and sulfuric acid (1 : 1). Connect a reflux condenser and boil for 1 hour. Cool, then carefully add water to dilute. Boil again until nitric acid fumes are no longer produced. Cool, carefully add water to make 200 mL, then filter. Transfer 50 mL of the filtrate to a separatory funnel, and extract multiple times using a small amount of chloroform until the chloroform layer becomes colorless. Discard the chloroform layer, add 25 mL of dilute sulfuric acid, 115 mL of water and 10 mL of hydroxylamine hydrochloride solution (2 in 10), then titrate with dithizone solution; vigorously shake the mixture to mix, and titrate until a bluish green color is produced (NMT 10 ppm).

Each mL of dithizone solution = 1 μg of Hg

Dithizone solution—Dissolve 40.0 mg of dithizone in 1000 mL of chloroform. Pipet 30.0 mL of this solution and add chloroform to make 100 mL.

Loss on drying NMT 5.0% (1 g, 105 ℃, 3 hours).

Abnormal toxicity Dissolve 0.5 mg of Protamine Sulfate in 0.5 mL of water for injection, and inject intravenously for 15 to 30 seconds to each of 5 healthy mice weighing 17 to 24 g. Use animals in which no abnormalities are observed for NLT 5 days prior to the test. No animals die when observed for 24 hours after administration. If one animal dies, repeat the test with 5 animals, and make sure no animal dies during the 24 hour post-dosage observation.

Nitrogen content Weigh accurately about 10 mg of Protamine Sulfate, and perform the test as directed under the Nitrogen Determination; the amount of nitrogen (N: 14.01) is NLT 22.5% and NMT 25.5%, calculated on the dried basis.

Sulfate Weigh accurately about 0.150 g of Protamine Sulfate, dissolve in 75 mL of water, add 5 mL of hydrochloric acid TS, and boil while slowly adding 10 mL of barium chloride TS. Close the lid, allow to stand for 1 hour on a steam bath, then filter. Wash the residue with hot water several times, dry, then ignite to a constant mass. Multiply 0.4117 to the amount of residue obtained; the amount is NLT 16% and NMT 22%, calculated on the dried basis.

Heparin-binding test (1) ***Test solution A***—Weigh accurately 15 mg of Protamine Sulfate, dissolve in water to make exactly 100 mL, and use this solution as the test solution. Prepare 3 of the same test solution, and use these solutions as the test solutions (A1), (A2) and (A3).

(2) ***Test solution B***—Pipet 10 mL each of test solutions (A1), (A2) and (A3), add exactly 5 mL of water to each, and use these solutions as test solutions (B1), (B2) and (B3).

(3) ***Test solution C***—Pipet 10 mL each of test solutions (A1), (A2) and (A3), add exactly 20 mL of water to each, and use these solutions as test solutions (C1), (C2) and (C3).

(4) ***Standard heparin sodium solution***—Weigh accurately a certain amount of heparin sodium RS, dissolve in water to prepare a solution containing 20 units per mL, and use this solution as the standard solution.

(5) ***Procedure***—Pipet 2 mL of the test solution, put in a cell for spectrophotometry, add standard heparin sodium solution dropwise, and mix. Then measure the transmission rate at 500 nm as directed under the Ultraviolet-visible Spectroscopy. Determine the amount *V* mL of standard solution consumed until a sudden change in transmission rate is observed. Repeat 2 times for each ***test*** solution to carry out a total of 18 tests.

(6) ***Calculation***—Using the amount consumed (mL) of the standard solution obtained from each test solution, calculate the amount of heparin binding to 1 mg of Protamine Sulfate according to the following formula, and calculate the average for the 18 total tests. Here, the test is valid when the relative standard deviation of the 6 results obtained from test solutions A, B and C is NMT 5%, and the relative standard deviation of the 6 results from each of the test solution combinations (A1, B1, C1), (A2, B2, C2) and (A3, B3, C3) is NMT 5%.

$$\text{Amount (heparin units) of heparin binding to 1 mg of Protamine Sulfate} = \text{Concentration of the standard solution (heparin units/mL)} \times V \frac{50}{W_T} \times d$$

W_T: Amount (mg) of sample, calculated on the anhydrous basis

d: Dilution factor of each test solution with respect to test solution (A)

Packaging and storage Preserve in tight containers.

Protamine Sulfate Injection
프로타민황산염 주사액

Protamine Sulfate Injection is an aqueous solution for injection. Protamine Sulfate Injection contains NLT 92.0% and NMT 108.0% of the labeled amount of protamine sulfate and binds to NLT 100 units of heparin sodium per mg of protamine sulfate.

Method of preparation Prepare as directed under Injections, with Protamine Sulfate.

Description Protamine Sulfate Injection occurs as a colorless liquid, and is odorless or has the odor of the preservative.

Identification (1) Take an amount of Protamine Sulfate Injection equivalent to 1 mg of Protamine Sulfate according to the labeled amount, add water to make 2 mL, and proceed as directed under the Identification (1) under Protamine Sulfate.

(2) Take an amount of Protamine Sulfate Injection equivalent to 5 mg of Protamine Sulfate according to the labeled amount, add water to make 1 mL, and proceed as directed under the Identification (2) under Protamine Sulfate.

(3) Protamine Sulfate Injection responds to the Qualitative Analysis for sulfate.

pH Between 5.0 and 7.0.

Sterility Meets the requirements.

Bacterial endotoxins Less than 6.0 EU per mg of protamine sulfate.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Extractable volume of injections Meets the requirements.

Assay (1) ***Protein content***—Weigh accurately an amount of Protamine Sulfate Injection equivalent to about 10 mg of Protamine Sulfate, put in a Kjeldahl flask, and evaporate to dryness on a steam bath through air, and perform the test according to the Nitrogen Determination. Determine the amount protein, calculating 0.24 mg of nitrogen (N : 14.01) as 1 mg of protein.

(2) ***Heparin binding capacity test***—Perform the test as directed under the Heparin binding capacity test under Protamine sulfate, and determine the amount of reactive heparin sodium binding per mg of protein. The test solution for (A) is prepared as follows. Weigh accurately an amount of Protamine Sulfate Injection equivalent to 15.0 mg of Protamine Sulfate, add water to make exactly 100

mL, and use this solution as the test solution. Prepare 3 units of the same test solution, and use these as test solutions (A1), (A2) and (A3). The amount of reactive heparin sodium per mg of Protamine Sulfate Injection according to the labeled amount is NLT 100 units.

Packaging and storage Preserve in hermetic containers.

Protease
프로테아제

Protease is an enzyme preparation with protein digestion activity, prepared from a useful mycetoma of the genus *Bacillus*, the genus *Aspegillus* or the genus *Streptomyces*, and contains NLT 90.0% of the digestive power unit of the labeled amount.

Description Protease occurs as a white to pale yellow or pale brown powder and has a characteristic odor.

Identification Weigh about 10 mg of Protease, add it to 10 mL of gelatin solution (2 in 10), previously warmed to 40℃, shake to mix, and makes it reaction at 40 ℃ for 5 minutes; the viscosity of the solution decreases.

pH Dissolve 1.0 g of Protease in 100 mL of water; the pH of this solution is between 6.7 and 8.3.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Protease according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Arsenic***—Proceed with 1.0 g of Protease according to Method 3, and perform the test (NMT 1 ppm).

Loss on drying NMT 5.0% (1 g, 105℃, 2 hours).

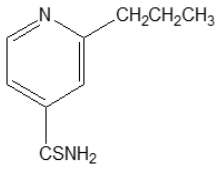
Assay (1) ***Test solution***—Dissolve Protease in phosphate buffer solution, pH 7.4, to adjust to contain 15 to 25 protein digestion activity units per mL, and use this solution as the test solution.

(2) ***Substrate solution***—Use the substrate solution 2 in the Assay for protein digestion activity under the Digestive Power. However, adjust the pH to 7.4.

(3) ***Procedure***—Proceed as directed under the Assay for protein digestion activity under the Digestive Power. However, use trichloroacetic acid B as the precipitation TS.

Packaging and storage Preserve in tight containers.

Prothionamide
프로티온아미드



$C_9H_{12}N_2S$: 180.27
2-Propylpyridine-4-carbothioamide [*14222-60-7*]

Prothionamide, when dried, contains NLT 98.0% and NMT 101.0% of prothionamide ($C_9H_{12}N_2S$).

Description Prothionamide occurs as yellow crystals or a crystalline powder and has a slightly distinctive odor.
It is freely soluble in methanol or acetic acid(100), soluble in ethanol(95), slightly soluble in ether, and practically insoluble in water.
It dissolves in dilute hydrochloric acid or dilute sulfuric acid.

Identification (1) Mix 50 mg of Prothionamide with 0.1 g of 1-chloro-2,4-dinitrobenzene, transfer about 10 mg of the mixture to a test tube, and heat over a small flame for several seconds to melt. After cooling, add 3 mL of potassium hydroxide-ethanol TS; the resulting solution exhibits a red to orange color.

(2) Put 0.5 g of Prothionamide in a 100-mL beaker, add 20 mL of sodium hydroxide TS, and heat to dissolve while shaking occasionally; the generated gas changes a moistened red litmus paper to blue. Again, gently boil this solution until it reaches 3 - 5 mL, cool it, then slowly add 20 mL of acetic acid(100) and heat it on a steam bath; the generated gas changes the moistened lead acetate paper to black. Concentrate the solution to 3 - 5 mL while blowing air on a steam bath, cool, add 10 mL of water, mix well, filter with suction, quickly recrystallize the residue with water, and dry in a desiccator (in vacuum, silica gel) for 6 hours; the melting point is 198 to 203 ℃ (with decomposition).

Melting point Between 142 and 145 ºC.

Purity (1) ***Clarity and color of solution***—Dissolve about 0.5 g of Prothionamide in 20 mL of ethanol(95); the resulting solution clear and yellow.

(2) ***Acidity***—Dissolve 3.0 g of Prothionamide in 20 mL of methanol by warming, add 100 mL of water, shake to mix in iced water to precipitate crystals, then filter. Take 80 mL of the filtrate, bring it to room temperature, add 0.8 mL of cresol red TS and 0.20 mL of 0.1 mol/L sodium hydroxide TS; the resulting solution exhibits a red color.

(2) ***Heavy metals***—Proceed with 1.0 g of Prothionamide according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(4) ***Arsenic***—Proceed with 0.6 g of Prothionamide

according to Method 3 and perform the test. However, add 10 mL of a solution of magnesium nitrate in ethanol(95) (1 in 50), add 1.5 mL of hydrogen peroxide(30), and ignite to burn (NMT 3.3 ppm).

Loss on drying NMT 0.5% (1 g, 80 ℃, 3 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.3 g of Prothionamide, previously dried, dissolve in 50 mL of acetic acid(100), and titrate with 0.1 mol/L perchloric acid VS (indicator: 2 mL of 1-naphtholbenzein TS). However, the endpoint of the titration is when the color changes from orange to dark reddish brown. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 18.03 mg of $C_9H_{12}N_2S$

Packaging and storage Preserve in light-resistant, well-closed containers.

Prothionamide Tablets
프로티온아미드 정

Prothionamide Tablets contain NLT 92.5% and NMT 107.5% of the labeled amount of prothionamide ($C_9H_{12}N_2S$: 180.27).

Method of preparation Prepare as directed under Tablets, with Prothionamide.

Identification The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

Dissolution Perform the test with 1 tablet of Prothionamide Tablets at 100 revolutions per minute according to Method 2 under the Dissolution, using 900 mL of Solution 1 for dissolution test as the dissolution medium. Take the dissolved solution 45 minutes after starting the dissolution test, and filter it. Discard the first 10 mL of the filtrate, pipet *V* mL of the subsequent filtrate, add dissolution medium to obtain exactly V' mL of a solution containing about 100 μg of prothionamide ($C_9H_{12}N_2S$) according to the labeled amount, and use this solution as the test solution. Separately, weigh accurately about 10 mg of prothionamide RS, dissolve in dissolution medium to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of prothionamide ($C_9H_{12}N_2S$) in each solution. Meets the requirements if the dissolution rate of Prothionamide Tablets in 45 minutes is NLT 80%.

Dissolution rate (%) of the labeled amount of prothionamide ($C_9H_{12}N_2S$)

$$= W_S \times \frac{V'}{V} \times \frac{A_T}{A_S} \times \frac{1}{C} \times 900$$

W_S: Amount (mg) of prothionamide RS
C: Labeled amount (mg) of prothionamide ($C_9H_{12}N_2S$) per tablet

Operating conditions
Detector: An ultraviolet absorption photometer (wavelength: 254 nm).
Column: A stainless steel column about 4.6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).
Column temperature: A constant temperature of about 40 °C.
Mobile phase: A mixture of 0.1 mol/L sodium dihydrogen phosphate TS, acetonitrile and anhydrous acetic acid (72 : 28 : 1).
Flow rate: 1.0 mL/min
System suitability
System repeatability: Repeat the test 6 times with 10 μL of the standard solution according to the above conditions; the relative standard deviation of the peak areas of prothionamide is NMT 2.0%.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately and finely powder NLT 20 tablets of Prothionamide Tablets. Weigh accurately an amount of the powder, equivalent to about 20 mg of prothionamide ($C_9H_{12}N_2S$), add methanol to make exactly 200 mL, and use this solution as the test solution. Separately, weigh accurately about 20 mg of prothionamide RS, transfer it into 200-mL volumetric flask, prepare in the same manner as the test solution, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography, and determine the peak areas, A_T and A_S, of prothionamide, respectively, in each solution.

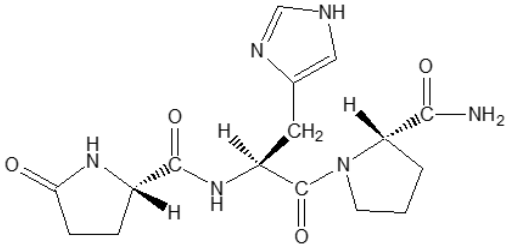
Amount (mg) of prothionamide ($C_9H_{12}N_2S$)

$$= Amount\ (mg)\ of\ \text{prothionamide RS} \times \frac{A_T}{A_S}$$

Operating conditions
Detector: An ultraviolet absorption photometer (wavelength: 254 nm).
Column: A stainless steel column about 4 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 to 10 μm in particle diameter).
Column temperature: A constant temperature of about 30 °C.
Mobile phase: A mixture of 0.1 mol/L sodium dihydrogen phosphate TS, acetonitrile and acetic acid(100) (720 : 280 : 10).
Flow rate: 1 mL/min

Packaging and storage Preserve in well-closed containers.

Protirelin
프로티렐린



$C_{16}H_{22}N_6O_4$: 362.38
(2*S*)-*N*-{(2*S*)-1-[(*S*)-2-Carbamoylpyrrolidin-1-yl]-3-(1*H*-imidazol-4-yl)-1-oxopropan-2-yl}-5-oxopyrrolidine-2-carboxamide [*24305-27-9*]

Protirelin contains NLT 98.5% and NMT 101.0% of protirelin ($C_{16}H_{22}N_6O_4$), calculated on the anhydrous basis.

Description Protirelin occurs as a white powder.
It is freely soluble in water, methanol, acetic acid(100) or ethanol(95).
It is hygroscopic.

Identification (1) Put 10 mg of Protirelin in a hard glass test tube, add 0.5 mL of 6 mol/L hydrochloric acid TS, seal the top of the test tube, and carefully heat it at 110 °C for 5 hours. After cooling, open it, transfer the contents to a beaker, and evaporate to dryness on a steam bath. Dissolve the residue in 1 mL of water and use this solution as the test solution. Separately, dissolve 80 mg of L-glutamic acid, 0.12 g of L-histidine hydrochloride and 60 mg of L-proline in 20 mL of water, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of 1-butanol, water, acetic acid (100) and pyridine (4: 1: 1 : 1) as the developing solvent to a distance of about 12 cm, and dry the plate at 100 °C for 30 minutes. Spray a solution of ninhydrin in acetone (1 in 50) evenly on the plate and heat the plate at 80 ℃ for 5 minutes; the three spots obtained from the test solution have the same color and R_f value as each corresponding spot obtained from the standard solution.

(2) Determine the infrared spectra of Protirelin and protirelin RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wave numbers.

Optical rotation $[\alpha]_D^{20}$: Between -66.0° and -69.0° (0.1 g calculated on the anhydrous basis, water, 20 mL, 100 mm).

pH Dissolve 0.2 g of Protirelin in 10 mL of water; the pH of this solution is between 7.5 and 8.5.

Purity (1) ***Clarity and color of solution***—Dissolve 0.1 g of Protirelin in 10 mL of water; the solution is clear and colorless.

(2) ***Heavy metals***—Proceed with 1.0 g of Protirelin according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Related substances***—Dissolve 0.20 g of Protirelin in 10 mL of water, and use this solution as the test solution. Pipet 1 mL of this solution, add water to make exactly 200 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution onto the plate (1) made of silica gel for thin-layer chromatography, and drop 5 μL of the test solution onto the plate (2) made of silica gel for thin-layer chromatography. Next, develop the plates with a mixture of 1-butanol, water, acetic acid(100), and pyridine (4: 2: 1 : 1) as the developing solvent to a distance of about 12 cm, and dry the plates at 100 °C for 30 minutes. Spray a mixture of a solution of sulfamic acid in 1 mol/L hydrochloric acid TS (1 in 200) and sodium nitrite solution (1 in 20) (1 : 1) evenly onto the plate (1) and air-dry the plate. Spray a sodium carbonate solution (1 in 10) evenly onto the plate; the spots other than the principal spot from the test solution are not more intense than the spot from the standard solution. Additionally, spay an solution of ninhydrin in acetone (1 in 50) evenly onto the plate (2) and heat at 80 °C for 5 minutes; no colored spot appear.

Water NMT 5.0% (0.1 g, volume titration, direct titration).

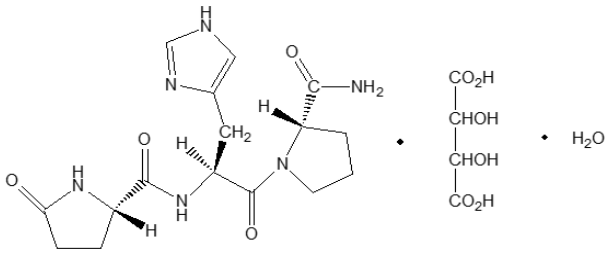
Residue on ignition NMT 0.3% (0.2 g).

Assay Weigh accurately about 70 mg of Protirelin, dissolve it in 50 mL of acetic acid(100) and titrate with 0.02 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.02 mol/L perchloric acid VS
= 7.248 mg of $C_{16}H_{22}N_6O_4$

Packaging and storage Preserve in tight containers.

Protirelin Tartrate Hydrate
프로티렐린타르타르산염수화물



Protirelin Tartrate $C_{16}H_{22}N_6O_4 \cdot C_4H_6O_6 \cdot H_2O$: 530.49
(2*S*)-*N*-{(2*S*)-1-[(*S*)-2-Carbamoylpyrrolidin-1-yl]-3-(1H-imidazol-4-yl)-1-oxopropan-2-yl}-5-oxopyrrolidine-2-carboxamide
(2*R*,3*R*)-2,3-dihydroxybutanedioate hydrate [*53935-32-3*, anhydride]

Protirelin Tartrate Hydrate contains NLT 98.5% and NMT 101.0% of protirelin tartrate ($C_{16}H_{22}N_6O_4 \cdot C_4H_6O_6$: 512.47), calculated on the anhydrous basis.

Description Protirelin Tartrate Hydrate occurs as white to pale yellowish white crystals or a crystalline powder.
It is freely soluble in water, sparingly soluble in acetic acid(100), and practically insoluble in ethanol(95) or ether.

Melting point—About 187 °C (with decomposition).

Identification (1) To 1 mL of an aqueous solution of Protirelin Tartrate Hydrate (1 in 1000), add 2 mL of a solution of 4-nitrobenzenediazonium fluoroborate (1 in 2000) and 2 mL of boric acid-potassium chloride-sodium hydroxide buffer solution, pH 9.0; the resulting solution exhibits a red color.

(2) Dissolve 30 mg of Protirelin Tartrate Hydrate in 5 mL of sodium hydroxide TS and put 1 drop of copper(II) sulfate TS; the resulting solution exhibits a violet color.

(3) Weigh 0.2 g of Protirelin Tartrate Hydrate, add 5.0 mL of 6 mol/L hydrochloric acid TS, and boil under a reflux condenser for 7 hours. After cooling, take 2.0 mL of this solution, evaporate to dryness on a steam bath, dissolve the residue in 2.0 mL of water, and use the solution as the test solution. Separately, weigh 22 mg of L-glutamic acid, 32 mg of L-histidine hydrochloride and 17 mg of L-proline, add 2.0 mL of 0.1 mol/L hydrochloric acid TS, warm to dissolve, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 2 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of 1-butanol, water, acetic acid(100) and pyridine (4: 1: 1 : 1) as the developing solvent to a distance of about 12 cm, and dry the plate at 100 °C for 30 minutes. Spray a solution of ninhydrin in acetone (1 in 50) evenly onto the plate and heat the plate at 80 °C for 5 minutes; the three spots from the test solution have the same color and R_f value as each corresponding spot from the standard solution.

(4) An aqueous solution of Protirelin Tartrate Hydrate (1 in 40) responds to the Qualitative Analysis for tartrate.

Optical rotation $[\alpha]_D^{20}$: Between -50.0° and -53.0° (0.5 g calculated on the anhydrous basis, water, 25 mL, 100 mm).

pH Dissolve 1.0 g of Protirelin Tartrate Hydrate in 100 mL of water; the pH of this solution is between 3.0 and 4.0.

Purity (1) ***Clarity and color of solution***—Dissolve 0.10 g of Protirelin Tartrate Hydrate in 10 mL of water; the solution is clear and colorless.

(2) ***Heavy metals***—Proceed with 1.0 g of Protirelin Tartrate Hydrate according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Arsenic***—Weigh 1.0 g of Protirelin Tartrate Hydrate and transfer to a porcelain crucible. Add 10 mL of a solution of magnesium nitrate in ethanol(95) (1 in 10), ignite the ethanol to burn, and then heat gradually to incinerate. If a charred substance still remains by this method, moisten with a small amount of nitric acid, and ignite to incinerate. After cooling, to the residue, add 10 mL of dilute hydrochloric acid, and heat on a steam bath to dissolve. Use this solution as the test solution and perform the test (NMT 2 ppm).

(4) ***Related substances***—Dissolve 0.60 g of Protirelin Tartrate Hydrate in 10 mL of water, and use this solution as the test solution. Pipet 1 mL of this solution, add water to make exactly 200 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution onto the plate (1) made of silica gel for thin-layer chromatography, and drop 5 μL of the test solution onto the plate (2) made of silica gel for thin-layer chromatography. Next, develop the plates using a mixture of chloroform, methanol and ammonia water(28) (6 : 4: 1) as the developing solvent to a distance of about 10 cm, and dry the plates at 100 °C for 30 minutes. Spray a mixture of a solution of sulfamic acid in 1 mol/L hydrochloric acid solution (1 in 200) and sodium nitrite solution (1 in 20) (1 : 1) evenly onto the plate (1) and air-dry the plate. Next, spray sodium carbonate solution(1 in 10) evenly onto the plate; the spots other than the principal spot from the test solution are not more intense than the spot from the standard solution. Additionally, spay an solution of ninhydrin in acetone (1 in 50) evenly onto the plate (2) and heat at 80 °C for 5 minutes; no colored spots appear.

Water NMT 4.5% (0.2 g, volume titration, direct titration).

Residue on ignition NMT 0.2% (0.5 g).

Assay Weigh accurately about 0.5 g of Protirelin Tartrate Hydrate, add 80 mL of acetic acid(100), dissolve by warming, and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a

blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 51.25 mg of $C_{16}H_{22}N_6O_4 \cdot C_4H_6O_6$

Packaging and storage Preserve in well-closed containers.

Protirelin Tartrate Injection
프로티렐린타르타르산염 주사액

Protirelin Tartrate Injection is an aqueous solution for injection and contains NLT 95.0% and NMT 105.0% of the labeled amount of protirelin tartrate ($C_{16}H_{22}N_6O_4 \cdot C_4H_4O_6$: 510.455).

Method of preparation Prepare as directed under Injections, with Protirelin Tartrate.

Description Protirelin Tartrate Injection is colorless and transparent.

Identification (1) Add 5 mL of water to 0.5 mL of Protirelin Tartrate Injection, add 1 mL of 1 mol/L hydrochloric acid solution of sulfanilic acid (1 in 100) and 1 mL of dilute sodium nitrite TS (1 in 2) while chilling in iced water and shake to mix, allow to stand in the ice bath for 3 minutes, add 3 mL of sodium carbonate TS, and shake to mix; the resulting solution exhibits an orange red color.

(2) Add 5 mL of sodium hydroxide TS to 0.5 mL of Protirelin Tartrate Injection, boil for 5 minutes, cool, and add 5 mL of 1 mol/L hydrochloric acid to neutralize. To 5 mL of this solution, add 1 mL of pyridine, 1 mL of ascorbic acid solution (3 in 2000) and 1 mL of diluted ninhydrin TS (1 in 2), heat for 15 minutes on a steam bath, cool, and shake to mix; the resulting solution exhibits a violet color.

pH Between 5.5 and 6.5.

Sterility Meets the requirements.

Bacterial endotoxins Less than 102.74 EU per mg of protirelin tartrate.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets requirements.

Extractable volume of injections Meets the requirements.

Purity ***Related substances***—Spot 50 μL of Protirelin Tartrate Injection on a thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of chloroform, methanol and strong ammonia water (6 : 4 : 1) (as the developing solvent) to a distance of about 10 cm, and air-dry the plate. Evenly spray the plate with Pauly's TS; no spots appear other than the spots for protirelin tartrate (orange red) and sorbitol (white to pale yellow).

Assay Pipet an amount of Protirelin Tartrate Injection equivalent to about 7.5 mg of protirelin tartrate ($C_{16}H_{22}N_6O_4 \cdot C_4H_4O_6$), add water to make exactly 200 mL, and use this solution as the test solution. Separately, weigh accurately about 75 mg protirelin tartrate RS and dissolve in water to make exactly 200 mL. Pipet 10 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Pipet 4 mL each of the test solution, the standard solution and water, place each in a 25-mL volumetric flask, and cool in iced water. Add 1.0 mL of a 1 mol/L hydrochloric acid solution of sulfanilic acid (1 in 100) and 1.0 mL of diluted sodium nitrite TS (1 in 2), shake to mix, cool in iced water for 5 minutes, add 3.0 mL of sodium carbonate TS, shake to mix, allow to stand for exactly 1 minute, and add methanol to make exactly 25 mL. With the test solution and the standard solution, perform the test as directed under the Ultraviolet-visible Spectroscopy using the blank test solution as a control solution, and determine the absorbances, A_T and A_S, at the absorbance maximum wavelength near 410 nm.

Amount (mg) of protirelin tartrate ($C_{16}H_{22}N_6O_4 \cdot C_4H_4O_6$)
= Amount (mg) of protirelin tartrate × (A_T / A_S) × 0.1

Packaging and storage Preserve in hermetic containers.

Prozyme
프로자임

Prozyme is prepared by the following process: extract enzymes cultured in wheat bran inoculated with *Aspergillus melleus*, purify the extracted enzymes, followed by vacuum-drying at low temperatures. 1 g of Prozyme has a protein digestion activity of NLT 56000 units.

Description Prozyme occurs as a white to pale yellow powder.
It is soluble in water and insoluble in methanol.
It exhibits maximum digestive power at pH between 6.0 and 8.0.

Identification Weigh 10 mg of Prozyme, put into 10 mL of gelatin solution (2 in 10), previously warmed at 40 °C, shake vigorously for 1 minute, and allow it to stand for 5 minutes at 40 °C; the viscosity of the gelatin solution decreases (protein digestion activity).

Loss on drying NMT 10.0% (1 g, 105 °C, 4 hours).

Protein digestion activity assay Weigh accurately about

1.0 g of Prozyme, dilute with pH 8.0 phosphate buffer solution by 200000, and use this solution as the test solution. Take 1.0 mL of 1.5% casein solution into a test tube (15 × 150 mm), place the tube on a steam bath at 37 ± 0.2 ℃, and warm for 5 minutes. Add 1.0 mL of the test solution, shake quickly to mix, react exactly for 60 minutes on a steam bath at 37 ± 0.2 ℃. Add 2.0 mL of 0.4 mol/L trichloroacetic acid, allow it to stand for 25 minutes on a steam bath at 37 ± 0.2 ℃, and filter. Take 1.0 mL of the filtrate, and put into a test tube (18 × 180 mm), add 5 mL of 0.4 mol/L sodium carbonate solution and 1 mL of Folin TS (1 in 5), shake well to mix, and incubate for 20 minutes on a steam bath at 37 ± 0.2 ℃. With this solution, perform the test as directed under the Ultraviolet-visible Spectroscopy, and determine the absorbance A around layer thickness of 1 cm and wavelength of 660 nm. Separately, proceed in the same manner with water instead of the test solution, and determine absorbance A_1. One unit of protein digestion activity is defined as the amount when amino acid equivalent to 100 μg of tyrosine is produced in 1 mL of the test solution under the above conditions.

$$\text{Protein digestion activity per g (unit)} = \frac{A - A_1}{100} \times F \times n$$

However, F is the amount of tyrosine obtained from the calibration curve as follows, n is the dilution factor of the test solution.

Drawing a tyrosine calibration curve—Prepare tyrosine solution with 0.1 mol/L hydrochloric acid so that 10 μg, 20 μg, 30 μg, 40 μg, and 50 μg each of tyrosine can be contained per mL. To 1 mL of these solutions, add 5 mL of 0.4 mol/L sodium carbonate solution, then add 1 mL of Folin TS (1 in 5) and mix. Allow the mixtures to stand for 20 minutes at 37 ± 0.2 ℃ to color. Determine the absorbances of these solutions, A_{T10}, A_{T20}, A_{T30}, A_{T40} and A_{T50}. At the same time, determine the absorbance A_{T10} of 0.1 mol/L hydrochloric acid solution of tyrosine without adding the coloring solution. Next, calculate the F value according to the following formula.

$$F = \frac{\frac{10}{A_{T10}-A_{T0}} + \frac{20}{A_{T20}-A_{T0}} + \frac{30}{A_{T30}-A_{T0}} + \frac{40}{A_{T40}-A_{T0}} + \frac{50}{A_{T50}-A_{T0}}}{5}$$

Packaging and storage Preserve in tight containers.

Prozyme and Pancreatin Capsules
프로자임·판크레아틴 캡슐

Prozyme and Pancreatin Capsules contain total protein digestion activity in prozyme and pancreatin NLT 90.0% of the labeled amount.

Method of preparation Prepare as directed under Capsules, with Prozyme and Pancreatin.

Identification (1) Dissolve the contents of 1 capsule of Prozyme and Pancreatin Capsules in 10 mL of 0.1 mol/L phosphate buffer solution (pH 8.0), and heat 2 mL of this solution at 40 ℃. Add 10 mL of gelatin solution (2 in 10) in resulting solution, shake to mix, and allow it to stand for 5 minutes at 40 ℃; the viscosity of the gelatin solution decreases (protein digestion activity).

(2) Perform the test as directed under the Assay; it shows positive.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay ***Total protein digestion activity***—Weigh accurately the contents of NLT 20 capsules of Prozyme and Pancreatin Capsules. Weigh accurately an amount equivalent to 1 capsule of Prozyme and Pancreatin Capsules, dissolve in 0.02 mol/L phosphate buffer solution (pH 8.0) to make 500 mL., Add phosphate buffer solution (pH 8.0) in 10.0 mL of this solution to make 100 mL, and use this solution as the test solution. Pipet 1.0 mL of 1.5% milk casein solution (pH 8.0) into a test tube (15 × 150 mm), put it on a steam bath at 37 ± 0.2 ℃, and warm for 5 minutes. Add 1.0 mL of the test solution, shake quickly to mix, and react exactly for 60 minutes on a steam bath at 37 ± 0.2 ℃. Add 2.0 mL of 0.4 mol/L trichloroacetic acid in the resulting solution, allow it to stand for 25 minutes on a steam bath at 37 ± 0.2 ℃, and filter. Take 1.0 mL of the filtrate and put into a test tube (18 × 180 mm), add 5 mL of 0.4 mol/L sodium carbonate solution and 1 mL of Folin TS (1 in 5), shake well to mix, and incubate for 20 minutes on a steam bath at 37 ± 0.2 ℃. With this solution, perform the test as directed under the Ultraviolet-visible Spectroscopy and determine the absorbance A at the wavelength of 660 nm. Separately, proceed in the same manner with water instead of the test solution, and determine absorbance A_1.

$$\text{Protein digestion activity (unit) in 1 g} = \frac{A - A_1}{1000} \times F \times n$$

Where, F is the amount of tyrosine obtained from the calibration curve as follows, n is the dilution factor of the test solution.

Definition of potency—One unit of protein digestion activity is defined as the amount when amino acid equivalent to 100 μg of tyrosine is produced in 1 mL of the test solution under the above conditions.

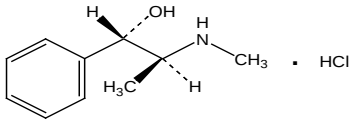
Calibration curve of tyrosine—Prepare tyrosine solution with 0.1 mol/L hydrochloric acid so that 10 μg, 20 μg, 30 μg, 40 μg, and 50 μg each of tyrosine can be contained per mL. To 1 mL of these solutions, add 5 mL of 0.4 mol/L sodium carbonate solution, add 1 mL of Folin TS (1 in 5), and mix. Allow the mixtures to stand for 20 minutes at 37 ± 0.2 ℃ to color. Determine the ab-

sorbances of these solutions, A_{T10}, A_{T20}, A_{T30}, A_{T40}, *and* A_{T50}. At the same time, determine the absorbance A_{T0} of 0.1 mol/L hydrochloric acid solution of tyrosine without adding the Folin TS. Calculate the F value according to the following formula.

$$F = \frac{\frac{10}{A_{T10}-A_{T0}} + \frac{20}{A_{T20}-A_{T0}} + \frac{30}{A_{T30}-A_{T0}} + \frac{40}{A_{T40}-A_{T0}} + \frac{50}{A_{T50}-A_{T0}}}{5}$$

Packaging and storage Preserve in tight containers.

Pseudoephedrine Hydrochloride
슈도에페드린염산염



C10H15NO·HCl : 201.69

(1*S*,2*S*)-2-(Methylamino)-1-phenylpropan-1-ol hydrochloride [*345-78-8*]

Pseudoephedrine Hydrochloride contains NLT 98.0% and NMT 102.0% of pseudoephedrine hydrochloride (C10H15NO·HCl), calculated on the dried basis.

Description Pseudoephedrine Hydrochloride occurs as white fine crystals or a powder. It has a slightly characteristic odor.

It is very soluble in water, freely soluble in ethanol(95), and slightly soluble in chloroform.

Identification (1) Determine the infrared spectra of Pseudoephedrine Hydrochloride and pseudoephedrine hydrochloride RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; it exhibit similar intensities of absorption at the same wavenumbers.

(2) An aqueous solution of Pseudoephedrine Hydrochloride (1 in 50) responds to the Qualitative Analysis (2) for chloride.

Optical rotation $[\alpha]_D^{20}$: Between +61.0° and +62.5° (0.5 g, calculated on the dried basis, water, 10 mL, 100 mm).

Melting point Between 182 and 186 ℃.

pH Dissolve 1.0 g of Pseudoephedrine Hydrochloride in 20 mL of water. The pH of this solution is between 4.6 and 6.0.

Purity ***Related substances***—Dissolve 0.1 g of Pseudoephedrine Hydrochloride in ethanol(95) to make exactly 10 mL and use this solution as the test solution. Separately, dissolve 1.0, 5.0, 10.0 and 20.0 mg each of pseudoephedrine hydrochloride RS in respective ethanol(95) to make exactly 100 mL each, and use these solutions as the standard solutions (1), (2), (3) and (4), respectively. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 20 μL each of the test solution and the standard solutions on the plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of ethanol(95), acetic acid(100) and water (10 : 3 : 1) as the developing solvent to a distance of about 15 cm, and dry the plate for 2 hours with a hot air blow. Expose the plate to iodine vapor for NLT 30 minutes; the amount of total related substances calculated by comparing the intensities of the spots other than the principal spot obtained from the test solution against spots from the standard solution is NMT 2.0%.

Loss on drying NMT 0.5% (1 g, 105 ℃, 3 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately 100 mg of Pseudoephedrine Hydrochloride, place in a 100-mL volumetric flask, add water to mix, and fill the flask to the gauge line, Use this solution as the test solution. As necessary, the concentration of the test solution can be diluted to 0.1 mg/mL stepwise. Weigh accurately a certain amount of pseudoephedrine hydrochloride RS, dissolve in water to make a solution having a concentration of 0.1 mg/mL per mL, and use this solution as the standard solution (1). Separately, weigh accurately a certain amount each of pseudoephedrine hydrochloride RS and ephedrine sulfate RS, dissolve both in water to make a solution having a concentration of 0.1 mg and 0.002 mg per mL, respectively, and use this solution as the standard solution (2). Perform the test with 10 μL each of the test solution and the standard solution (1) as directed under the Liquid Chromatography, and determine the peak areas, A_T and A_S, of pseudoephedrine hydrochloride, respectively.

$$\text{Amount (mg) of pseudoephedrine hydrochloride } (C_{10}H_{15}NO\cdot HCl) = 100 \times \frac{A_T}{A_S} \times \frac{C_S}{C_T}$$

C_S: Concentration (mg/mL) of pseudoephedrine in the standard solution

C_T: Concentration (mg/mL) of pseudoephedrine in the test solution

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 206 nm).

Column: A stainless steel column, about 3.0 mm in internal diameter and about 15 cm in length, packed with phenyl silica gel for liquid chromatography (3.5 μm in particle diameter).

Mobile phase: Mix well 5 mL of triethylamine and 1000 mL of water and adjust the pH to 6.8 with phosphoric acid. To 900 mL of this solution, add 100 mL of water.

Flow rate: 0.6 mL/min

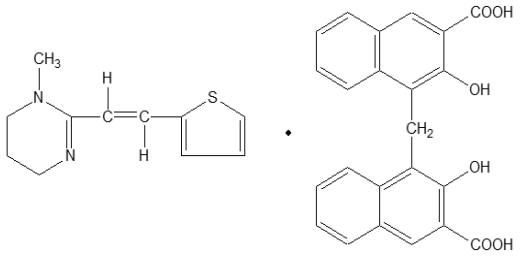
System suitability

System performance: Proceed with 10 μL of the standard solution (2) according to the above conditions; the relative retention times of ephedrine and pseudoephedrine are 0.9 and 1.0, respectively, with the resolution being NMT 2, and the symmetry factor of pseudoephedrine is NMT 2.0.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution (2) according to the above conditions; the relative standard deviation of the peak area ratio is NMT 2.0%.

Packaging and storage Preserve in light-resistant, tight containers.

Pyrantel Pamoate
피란텔파모산염



$C_{11}H_{14}N_2S \cdot C_{23}H_{16}O_6$: 594.68

4-[(3-Carboxy-2-hydroxynaphthalen-1-yl)methyl]-3-hydroxynaphthalene-2-carboxylic acid [*22204-24-6*]

Pyrantel Pamoate, when dried, contains NLT 98.0% and NMT 101.0% of pyrantel pamoate ($C_{11}H_{14}N_2S \cdot C_{23}H_{16}O_6$).

Description Pyrantel Pamoate occurs as a pale yellow to yellow crystalline powder, and is odorless and tasteless.
It is sparingly soluble in *N*,*N*-dimethylformamide, very slightly soluble in methanol or ethanol(95), and practically insoluble in water, ethyl acetate, ether or chloroform.

Melting point—Between 256 and 264 ℃ (with decomposition).

Identification (1) To 50 mg of Pyrantel Pamoate, add 10 mL of methanol and 1 mL of a mixture of hydrochloric acid and methanol (1 : 1), shake strongly the resulting solution to mix; yellow precipitates is formed. Filter this solution and use the filtrate as the test solution. Use the precipitates for the test of (2). To 0.5 mL of the test solution, add 1 mL of a solution of 2,3-indolinedione in sulfuric acid (1 in 1000); the solution exhibits a red color.

(2) Take the precipitate obtained from (1), wash with methanol, and dry at 105 ℃ for 1 hour. Weigh 10 mg of the dried precipitate, add 10 mL of methanol, shake to mix, and filter. Add one drop of iron(III) chloride TS to 5 mL of the filtrate; the resulting solution exhibits a green color.

(3) Weigh 0.1 g each of Pyrantel Pamoate and pyrantel pamoate RS, dissolve them in 50 mL of *N*,*N*-dimethylformamide, and add methanol to make 200 mL. Pipet 2 mL each of these solutions and add a solution of hydrochloric acid in methanol (9→ 1000) to make 100 mL. Determine the absorption spectra of these solutions as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(4) Determine the infrared spectra of Pyrantel Pamoate and pyrantel pamoate RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Purity (1) ***Chloride***—Weigh 1.0 g of Pyrantel Pamoate, add 10 mL of dilute nitric acid and 40 mL of water, heat on a steam bath while shaking to mix for 5 minutes. After cooling, add water to make 50 mL, and filter the solution. Pipet 20 mL of the filtrate, add 2 mL of dilute nitric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 0.40 mL of 0.01 mol/L hydrochloric acid solution (NMT 0.036%).

(2) ***Sulfate***—Weigh 0.75 g of Pyrantel Pamoate, add 5 mL of dilute hydrochloric acid and water to make 100 mL, warm on a steam bath while shaking to mix for 5 minutes. After cooling, add water to make 100 mL, and filter the solution. Take 20 mL of the filtrate and add water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 0.45 mL of 0.005 mol/L sulfuric acid (NMT 0.144%).

(3) ***Heavy metals***—Proceed with 1.0 g of Pyrantel Pamoate according to Method 2 and perform the test. Prepare the control solution with 3.0 mL of lead standard solution (NMT 30 ppm).

(4) ***Iron***—Weigh accurately 1.33 g of Pyrantel Pamoate, perform the test directed under the Residue on ignition. To the resulting residue, add 3 mL of hydrochloric acid and 2 mL of nitric acid, and evaporate to dryness on a steam bath. Dissolve the residue in 2 mL of hydrochloric acid on heating gently. Add 18 mL of hydrochloric acid additionally, and add water to make 50 mL. Pipet 5.0 mL of this solution, add water to make 47 mL and use this solution as the test solution. Separately, add water to 1.0 mL of iron standard solution to make 45 mL, add 2 mL of hydrochloric acid, and use this solution as the standard solution. To the test solution and the standard solution, add 50 mg of ammonium peroxydisulfate and 3 mL of 30% ammonium thiocyanate solution, and mix them; the color obtained from the test solution is not more intense than that from the standard solution (NMT 75 ppm).

(5) ***Arsenic***—Proceed with 1.0 g of Pyrantel Pamoate according to Method 3 and perform the test (NMT 2 ppm).

(6) ***Related substances***—Perform the test using a light-resistant container. Dissolve 0.10 g of Pyrantel Pamoate in 10 mL of *N*,*N*-dimethylformamide, and use this solution as the test solution. Pipet 1 mL of this solution, add *N*,*N*-dimethylformamide to make exactly 100 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin

Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on a plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, acetic acid(100) and water (3 : 1 : 1) to a distance of about 10 cm, and air-dry the plate. Expose to ultraviolet light (principal wavelength: 254 nm); the spots other than pyrantel and pamoate obtained from the test solution are not more intense than the spots (R_f value of about 0.3) of pyrantel from the standard solution.

Loss on drying NMT 1.0% (1 g, 105 ℃, 2 hours).

Residue on ignition NMT 0.3% (1 g).

Assay Weigh accurately about 0.5 g of Pyrantel Pamoate, previously dried, add 25 mL of chloroform and 25 mL of sodium hydroxide TS, shake to mix for 15 minutes, and then extract. Extract again in the same manner twice with 25 mL each of chloroform. Filter the chloroform extracts by using a funnel with 5 g of anhydrous sodium sulfate placed on cotton wool each time. Combine all chloroform extracts, add 30 mL of acetic acid(100), and titrate with 0.1 mol/L perchloric acid VS (indicator: 2 drops of methylosaniline chloride TS). Perform a blank test in the same manner.

Each mL of 1 mol/L perchloric acid VS
= 59.47 mg of $C_{11}H_{14}N_2S \cdot C_{23}H_{16}O_6$

Packaging and storage Preserve in tight containers.

Pyrantel Pamoate Tablets
피란텔파모산염 정

Pyrantel Pamoate Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of pyrantel pamoate ($C_{11}H_{14}N_2S$: 260.31).

Method of preparation Prepare as directed under Tablets, with Pyrantel Pamoate.

Identification (1) Dilute appropriate amounts of Pyrantel Pamoate Tablets and pyrantel pamoate RS with 0.05 mol/L methanolic ammonium hydroxide solution to obtain solutions containing 8 mg of pyrantel pamoate per mL. Shake to mix, centrifuge, take the clear supernatant, and use as the test solution and the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 100 μL each of the test solution and the standard solution on a thin-layer chromatographic plate made of silica gel for thin-layer chromatography (with a fluorescent indicator). Shake a mixture of water, formic acid and methyl isobutyl ketone (1 : 1 : 2), and take the supernatant. Next, develop the plate with the supernatant as a developing solvent to a distant of about 18 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 365 nm); the spots from the test solution and the standard solution are the same in R_f value.

(2) The retention times of the major peaks obtained from the test solution and the standard solution are the same.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 tables of Pyrantel Pamoate Tablets, and powder them. Weigh accurately an amount of the powder, equivalent to about 80 mg of pyrantel pamoate ($C_{11}H_{14}N_2S$), add the mobile phase to make exactly 100 mL, and filter. Pipet 1 mL of the filtrate, add the mobile phase to make exactly 10 mL, and use this solution as the test solution. Perform the test with exactly 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of pyrantel pamoate in each solution.

Amount (mg) of pyrantel pamoate ($C_{11}H_{14}N_2S$)
= Amount (mg) of pyrantel pamoate RS × (A_T/ A_S)

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 288 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with porous silica gel for liquid chromatography (5 μm to 10 μm in particle diameter).

Mobile phase: A mixture of acetonitrile, water, acetic acid and diethylamine (92.8 : 3 : 3 : 1.2). However, adjust the retention time by adjusting the mixing ratio of acetonitrile while maintaining the ratio of acetic acid(100), water and diethylamine (1 : 1 : 0.4).

Flow rate: 1.0 mL/min

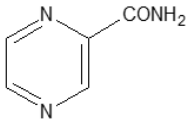
System suitability

System performance: The resolution of pyrantel and pamoate is NLT 10.0. The number of theoretical plates, the symmetry factor, the relative standard deviation of repeated injection, and the retention time of pyrantel are NLT 8000, NMT 0.3 and NMT 1.0% and NLT 2.5 times, respectively. The relative retention times of pyrantel and pamoate are 0.6 and 1.0, respectively.

When preparing a pyrantel pamoate solution, use a light-resistant container or block unnecessary bright light, and conduct the test quickly.

Packaging and storage Preserve in light-resistant, well-closed containers.

Pyrazinamide
피라진아미드



$C_5H_5N_3O$: 123.11

Pyrazine-2-carboxamide [*98-96-4*]

Pyrazinamide, when dried, contains NLT 99.0% and NMT 101.0% of pyrazinamide ($C_5H_5N_3O$).

Description Pyrazinamide occurs as white crystals or a crystalline powder. It is odorless and has a slightly bitter taste.

It is sparingly soluble in water and slightly soluble in ethanol(95) or acetic anhydride.

Identification (1) Determine the absorption spectra of the solutions of Pyrazinamide and pyrazinamide RS in 0.1 mol/L hydrochloric acid TS (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Pyrazinamide and pyrazinamide RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Melting point Between 188 and 193 ºC.

Purity (1) ***Heavy metals***—Proceed with 2.0 g of Pyrazinamide according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Related substances***—Dissolve 0.10 of Pyrazinamide in 10 mL of methanol and use this solution as the test solution. Pipet 1 mL of this solution, add methanol to make exactly 200 mL, and use it as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 20 μL each of the test solution and the standard solution on a plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of 1-butanol, water and acetic acid(100) (3 : 1 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Observe the plate under ultraviolet light (main wavelength: 254 nm); any spot other than the principal spot obtained from the test solution is not more intense than the spot from the standard solution.

Loss on drying NMT 0.5% (1 g, in vacuum, silica gel, 4 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.1 g of Pyrazinamide, previously dried, dissolve in 50 mL of acetic anhydride, and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 12.31 mg of $C_5H_5N_3O$

Packaging and storage Preserve in well-closed containers.

Pyrazinamide Tablets
피라진아미드 정

Pyrazinamide Tablets contain NLT 93.0% and NMT 107.0% of the labeled amount of pyrazinamide ($C_5H_5N_3O$: 123.11).

Method of preparation Prepare as directed under Tablets, with Pyrazinamide.

Identification (1) Powder Pyrazinamide Tablets, weight an amount of the powder, equivalent to about 1 g of pyrazinamide, add about 75 mL of isopropanol, heat on a steam bath, and filter while it's hot. Allow to cool, filter the crystals that form and dry at 105 ºC for 1 hour. Determine the absorption spectra of the aqueous solutions (1 in 100000) of the crystals so obtained and Pyrazinamide RS, respectively, under Ultraviolet-visible Spectrophotometry: both spectra exhibit maximum and minimum at the same wavenumbers. Determine the absorption spectra of the crystal solution and Pyrazinamide RS at the absorbance maximum wavelength at about 268 nm, respectively: the difference is NMT 3.0%.

(2) Take 20 mg of the crystals obtained in Identification (1), add 5 mL of 5 mol/L sodium hydroxide and heat gently: the odor of ammonia is perceptible.

Dissolution Perform the test with 1 tablet of Pyrazinamide Tablets at 50 revolutions per minute according to Method 2, using 900 mL of water as the dissolution medium. Take the dissolved solution after 45 minutes from start of the test, filter, dilute with water, if necessary and use this solution as the test solution. Separately, weigh accurately a portion of Pyrazinamide RS, add water to make constant concentration and use this solution as the standard solution. Determine the absorbances of the test solution and the standard solution at the absorbance maximum wavelength of about 268 nm as directed under Ultraviolet-visible Spectrophotometry using the water as the blank. It meets the requirements if the dissolution rate of Pyrazinamide Tablets in 45 minutes is NLT 75%.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 tables of Pyrazinamide Tablets, and powder them. Weigh accurately a portion of the powder, equivalent to about 0.1 g of pyrazinamide ($C_5H_5N_3O$) and transfer with the aid of 300 mL of water to a volumetric flask. After sonication for 10 minutes, add water to make exactly 500 mL and mix.

Filter this solution, discard the first portion of the filtrate, take exactly 20 mL of the subsequent filtrate, add water to make 100 mL and use this solution as the test solution. Separately, weigh accurately about 0.1 g of Pyrazinamide RS, add water to make exactly 500 mL, pipet 20 mL of this solution, add water to make exactly 100 mL and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of pyrazinamide in each solution.

$$\text{Amount (mg) of pyrazinamide } (C_5H_5N_3O) = \text{Amount (mg) of pyrazinamide RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 270 nm).

Column: A stainless steel column about 3.9 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 μm to 10 μm in particle diameter).

Mobile phase: To phosphate buffer solution, pH 8.0, add phosphoric acid to adjust the pH to 3.0. To 1000 mL of this solution, add 10 mL of acetonitrile, mix, and filter.

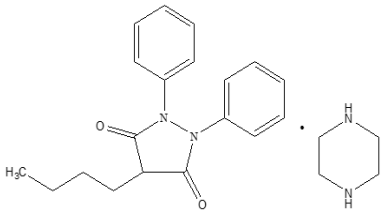
Flow rate: 1 mL/min

System suitability

Selection of column: Proceed with 10 μL of the standard solution according to the above operating conditions; the number of theoretical plates and the symmetry factor of the pyrazinamide peak are NLT 2500 and NMT 1.5, respectively. Then, to 1 mL of hydrochloric acid, add the standard solution to make 5 mL, allow to stand in a boiling water bath for 5 minutes, cool, and proceed according to the above conditions; pyrazinoic acid and pyrazinamide are eluded in this order with the resolution being NLT 6.0.

Packaging and storage Preserve in well-closed containers.

Pyrazinobutazone
피라지노부타존



$C_{19}H_{20}N_2O_2 \cdot C_4H_{10}N_2$: 394.51

Piperazine 4-butyl-1,2-diphenyl-3,5-pyrazolidine dione (1 : 1), [*4985-25-5*]

Pyrazinobutazone contains NLT 74.3% and NMT 82.1% of phenylbutazone ($C_{19}H_{20}N_2O_2$: 308.37) and NLT 20.7% and NMT 22.9% of piperazine ($C_4H_{10}N_2$: 86.14).

Description Pyrazinobutazone occurs as a white to light yellow powder, and has a slight odor and a bitter taste.
It is freely soluble in methanol, soluble in ethanol(95) or tetrahydrofuran, and slightly soluble in water.

Melting point Between 140 and 141 ºC.

Identification Dissolve 50 mg of Pyrazinobutazone in methanol to make 10 mL, and use this solution as the test solution. Separately, weigh 40 mg of phenylbutazone RS and 10 mg of piperazine RS, respectively, dissolve each in methanol to make 10 mL, and use these solutions as the standard solutions. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot the test solution and the standard solutions on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of methanol and ammonia water(28) (20 : 0.3) to a distance of about 15 cm, and air-dry the plate. Examine phenylbutazone under ultraviolet light (main wavelength: 254 nm), and examine piperazine by spraying evenly Dragendorff's TS. The R_f values of spots obtained from the test solution and the standard solutions are the same.

pH Weigh 1.0 g of Pyrazinobutazone, dissolve in 20 mL of neutralized methanol and 100 mL of water; the pH of the resulting solution is between 6.7 and 7.8.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Pyrazinobutazone according to Method 3 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Arsenic***—Proceed with 0.2 g of Pyrazinobutazone according to Method 2 and perform the test (NMT 10 ppm).

(3) ***Blue impurities***—Weigh 2.0 g of Pyrazinobutazone, put into a 50-mL Nessler tube, and add methanol to the gauge line. Put 0.4 mL of the control solution containing 1 mg of azobenzene in 1 mL of methanol into another Nessler tube, add methanol to the gauge line, and compare the colors of the Nessler tubes; the test solution is not more intense than the control solution (NMT 200 ppm as the control solution of azobenzene).

Loss on drying NMT 1.0% (0.2 g, in vacuum, phosphorus pentoxide, 16 hours).

Residue on ignition NMT 0.5% (1 g).

Assay (1) ***Phenylbutazone***—Weigh accurately about 0.3 g of Pyrazinobutazone, dissolve in 30 mL of dimethylformamide, and titrate with 0.1 mol/L potassium hydroxide-ethanol VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L potassium hydroxide-ethanol VS

= 30.84 mg of $C_{19}H_{20}N_2O_2$

(2) ***Piperazine***—Weigh accurately about 0.15 g of Pyrazinobutazone, dissolve in 80 mL of acetic acid(100) for non-aqueous titration and 30 mL of nitromethane, and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 1 mol/L perchloric acid VS
= 4.307 mg of $C_4H_{10}N_2$

Packaging and storage Preserve in tight containers.

Pyrazinobutazone Capsules
피라지노부타존 캡슐

Pyrazinobutazone Capsules contain phenylbutazone ($C_{19}H_{20}N_2O_2$: 308.37) equivalent to NLT 70.3% and NMT 85.7% of the labeled amount of pyrazinobutazone and piperazine ($C_4H_{10}N_2$: 86.14) equivalent to NLT 19.7% and NMT 23.7% of the same.

Method of preparation Prepare as directed under Capsules, with Pyrazinobutazone.

Identification Weigh an amount of Pyrazinobutazone Capsules, equivalent to 0.3 g of pyrazinobutazone according to the labeled amount, add 50 mL of ethanol, shake well to mix, filter, and use the filtrate as the test solution. Weigh 40 mg of phenylbutazone RS, dissolve in methanol to make 10 mL, and use this solution as the standard phenylbutazone solution. Separately, weigh 10 mg of piperazine RS, dissolve in methanol to make 10 mL, and use this solution as the standard piperazine solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot each of the test solution and the standard solutions on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of methanol and ammonia water(28) (20 : 0.3) as the developing solvent to a distance of about 15 cm, and air-dry the plate. Examine the plate for phenylbutazone under ultraviolet light (main wavelength: 254 nm) and spray evenly Dragendorff's TS on the plate to detect piperazine. The R_f values of the spots obtained from the test solution and the standard solution are the same.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay (1) ***Phenylbutazone***—Weigh accurately the mass of the contents of NLT 20 capsules of Pyrazinobutazone Capsules. Weigh accurately an amount equivalent to about 0.3 g of pyrazinobutazone ($C_{23}H_{30}N_4O_2$), add 30 mL of chloroform and heat for 30 minutes under a reflux condenser. After cooling, add chloroform to make exactly 50 mL, shake to mix, filter and use the filtrate as the test solution. Pipet 20 mL of the test solution, and evaporate chloroform to dryness on a steam bath. To the residue, add 30 mL of dimethylformamide and dissolve by warming. Titrate the solution with 0.1 mol/L potassium hydroxide-ethanol VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L potassium hydroxide-ethanol VS
= 30.84 mg of $C_{19}H_{20}N_2O_2$

(2) ***Piperazine***—Pipet 10 mL of the test solution from (1), and evaporate chloroform to dryness on a steam bath. Dissolve the residue in 30 mL of acetic acid(100) for non-aqueous titration and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 4.307 mg of $C_4H_{10}N_2$

Packaging and storage Preserve in well-closed containers.

Pyrethrin Extract
피레트린 엑스

Pyrethrin Extract is extracted from dried leaves of *Chrysanthemum cinerariaefolium* (Compositae), and contains NLT 90.0% and NMT 110.0% of the labeled amount of total pyrethrin [pyrethrin I($C_{21}H_{28}O_3$: 328.45) and pyrethrin II($C_{22}H_{28}O_5$: 372.45)].

Description Pyrethrin Extract occurs as a yellowish brown to reddish brown liquid and has a characteristic odor.
It is miscible with methanol, ethanol(95), acetone, dichloromethane, chloroform, ether, toluene and kerosene.
It is insoluble in water.

Identification (1) Dissolve an amount of Pyrethrin Extract, equivalent to 50 mg of total pyrethrin, in 100 mL of kerosene. To 2 mL of the solution, add 5 mL of a mixture of phosphoric acid and ethyl acetate (4 : 1), shake to mix for 1 minute, and heat the solution on a steam bath for 3 minutes; the solution turns red.

(2) Dissolve an amount of Pyrethrin Extract, equivalent to 50 mg of total pyrethrin, and about 10 mg of allethrin each in 20 mL of acetone, and use them as the test and control solutions, respectively. Perform the test with these solutions as directed under the Gas chromatograph according to the conditions below; the peaks of pyrethrin I and pyrethrin II from the test solution elute at the relative retention times of about 2.50 and of about 11.0, re-

spectively, to the allethrin peak of the control solution.

Operating conditions

Detector: A flame ionization detector

Column: A glass column about 3 mm in internal diameter and about 1 m in length, packed with silane-treated diatomaceous earth for gas chromatography (150 μm - 180 μm in particle diameter), coated with 50% phenyl-methyl silicon polymer for gas chromatography at a rate of 2%.

Column temperature: A constant temperature of about 205 °C.

Flow rate: Adjust the flow rate so that the retention time of allethrin is about 2.7 minutes.

Selection of column: Proceed with 1 μL of the test solution under the above conditions; select the column where the resolution between the peak of allethrin and the peak with the relative retention time to allethrin of 1.61 is NLT about 3.0.

Purity (1) ***Heavy metals***—Proceed with 0.2 g of Pyrethrin Extract according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 100 ppm).

(2) ***Arsenic***—Proceed with 0.2 g of Pyrethrin Extract according to Method 3 and perform the test (NMT 10 ppm).

Assay The sum of the amounts of pyrethrin I and pyrethrin II is taken as the amount of total pyrethrin.

(1) ***Pyrenthrin I***—Weight accurately the amount of Pyrethrin Extract, equivalent to about 0.1 g of total pyrethrin, add it to 75 mL of ether, shake gently to dissolve, and move to a separatory funnel. Wash the used container with a small amount of ether, add the washing to the separatory funnel, and wash the separatory funnel twice with 50 mL of sodium hydroxide solution (1 in 100) and once with 50 mL of water. Combine the washings, salt out with sodium chloride, then add 50 mL of ether, and shake to mix. Wash the ether layer with 15 mL of water, combine the entire ether solution, and completely evaporate the ether on a steam bath.

Add 15 mL of 0.5 mol/L potassium hydroxide-ethanol solution to the residue, heat on a steam bath under a reflux condenser for 1.5 hours, and then completely evaporate the ether. Add 100 mL of water to the residue and shake well to dissolve. Add 1 g of acid clay, add 17 mL of barium chloride TS, shake to mix, and add water to make exactly 250 mL. Next, pipet 200 mL of the filtrate into a steam distillation flask, neutralize it with dilute sulfuric acid (1 in 20) (indicator: 2 drops of phenolphthalein TS), add 1 mL of dilute sulfuric acid (1 in 20) and carry out steam distillation until about 250 mL of distillate is obtained. Take the distillate in a separatory funnel, add 50 mL of toluene, shake vigorously to mix for 2 - 3 minutes, add a small amount of sodium chloride when turbidity forms, and shake gently to separate. Mix the water layer with 50 mL of toluene on shaking, move the toluene solution to each separatory funnel, and wash each with 10.0 mL of water twice. Combine the entire toluene solution in one separatory funnel, add exactly 10 mL of 0.02 mol/L sodium hydroxide VS, add 5 mL of water, shake vigorously for about 2 minutes. Allow to stand for a while, and titrate the excess sodium hydroxide with 0.01 mol/L sulfuric acid VS (indicator: 2 drops of phenolphthalein TS). Perform a blank test in the same way and make necessary correction.

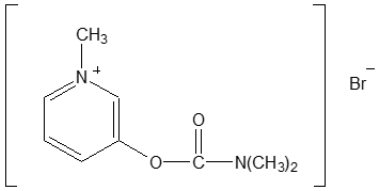
Each mL of 0.02 mol/L sodium hydroxide VS
= 6.569 mg of $C_{21}H_{28}O_3$

(2) ***Pyrenthrin II***—Cool the entire distillate obtained from steam distillation in (1), filter it with suction, and wash the container and the filter paper twice with 10 mL of water each. Combine the washings with the filtrate, saturate with sodium chloride, and transfer to a separatory funnel. Extract three times with 50 mL each of ether, and transfer each ether extract to each separatory funnel. Wash each separatory funnel three times with 10 mL of water, combine the entire ether solution, evaporate the ether on a steam bath. Dry the residue at 100 °C for 10 minutes, dissolve in 2 mL of ethanol(95), add 20 mL of water, and heat to boiling, cool. After filtering if necessary, titrate with 0.02 mol/L sodium hydroxide VS (indicator: 2 drops of phenolphthalein TS). Perform a blank test in the same way and make necessary correction.

Each mL of 0.02 mol/L sodium hydroxide VS
= 3.724 mg of $C_{22}H_{28}O_5$

Packaging and storage Preserve in tight containers.

Pyridostigmine Bromide
피리도스티그민브롬화물



$C_9H_{13}BrN_2O_2$: 261.12

(1-Methylpyridin-1-ium-3-yl) *N*,*N*-dimethylcarbamate bromide [*101-26-8*]

Pyridostigmine Bromide, when dried, contains NLT 98.5% and NMT 101.0% of pyridostigmine bromide ($C_9H_{13}BrN_3O_3$).

Description Pyridostigmine Bromide occurs as a white or almost white, crystalline powder. It is odorless or has a slightly characteristic odor.

It is very soluble in water, freely soluble in acetic acid(100) or ethanol(95), and practically insoluble in ether.

Dissolve 1.0 g of Pyridostigmine Bromide in 10 mL of water; the pH of this solution is between 4.0 and 6.0.

It is deliquescent.

Identification (1) Dissolve 20 mg of Pyridostigmine Bromide in 10 mL of water, and add 5 mL of reinecke salt TS; pale red precipitates are formed.

(2) Add 0.6 mL of sodium hydroxide TS to 0.1 g of Pyridostigmine Bromide; an unpleasant odor of dimethylamine is perceptible.

(3) Determine the absorption spectra of the solutions of Pyridostigmine Bromide and pyridostigmine bromide RS in 0.1 mol/L hydrochloric acid TS (1 in 30000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(4) An aqueous solution of Pyridostigmine Bromide (1 in 50) responds to the Qualitative Analysis for bromide.

Melting point Between 153 and 157 ºC.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Pyridostigmine Bromide in 10 mL of water; the solution is clear and colorless.

(2) ***Heavy metals***—Proceed with 1.0 g of Pyridostigmine Bromide according to Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Arsenic***—Proceed with 1.0 g of Pyridostigmine Bromide according to Method 1 and perform the test (NMT 2 ppm).

(4) ***Related substances***—Dissolve 0.10 g of Pyridostigmine Bromide in 10 mL of ethanol(95) and use this solution as the test solution. Pipet 2 mL of the test solution, and add ethanol(95) to make exactly 10 mL. Pipet 1 mL of this solution, add ethanol(95) to make exactly 25 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on a plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of methanol, chloroform and ammonium chloride TS (5 : 4 : 1) to a distance of about 12 cm, and air-dry the plate. Observe the plate under ultraviolet light (main wavelength: 254 nm); any spot other than the principal spot obtained from the test solution is not more intense than the spot from the standard solutions.

Loss on drying NMT 2.0% (1 g, in vacuum, phosphorus pentoxide, 100 ℃, 5 hours).

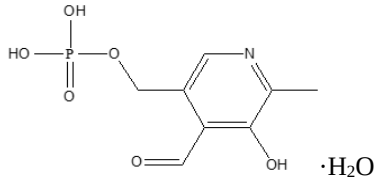
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.3 g of Pyridostigmine Bromide, previously dried, dissolve in 10 mL of acetic acid(100), add 40 mL of acetic anhydride, and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 26.112 mg of $C_9H_{13}BrN_2O_2$

Packaging and storage Preserve in hermetic containers.

Pyridoxal Phosphate Hydrate
피리독살포스페이트수화물



·H_2O

$C_8H_{10}NO_6P·H_2O$: 265.16
3-Hydroxy-2-methyl-5-[(phosphonooxy)methyl]-4-pyridinecarboxaldehyde, [*41468-25-1*]

Pyridoxal Phosphate Hydrate contains NLT 98.0% and NMT 101.0% of pyridoxal phosphate ($C_8H_{10}NO_6P$: 247.14), calculated on the anhydrous basis.

Description Pyridoxal Phosphate Hydrate occurs as a yellowish white to pale yellow crystalline powder. It is odorless.
It is slightly soluble in water, and practically insoluble in ethanol(95), acetone, chloroform or ether.
It dissolves in dilute hydrochloric acid, dilute nitric acid or sodium hydroxide TS. It is affected by light.

Identification (1) To 1 mL of an aqueous solution of Pyridoxal Phosphate Hydrate (1 in 2000), add one drop of iron(III) chloride TS; the resulting solution exhibits an orange color.

(2) To 1 mL of an aqueous solution of Pyridoxal Phosphate Hydrate (1 → 20000), add one drop of a freshly prepared solution of 2,6-dibromoquinonechlorimide in ethanol(95) (1 in 4000); the solution exhibits blue.

(3) Determine the absorption spectrum of the test solution of the Assay as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum between 386 nm and 390 nm.

(4) Add 10 mL of nitric acid and 10 mL of strong hydrogen peroxide water to 0.3 mg of Pyridoxal Phosphate Hydrate, evaporate to dryness on a steam bath, and heat again. If the residue is colored, add small amounts of nitric acid and strong hydrogen peroxide water, and repeat the procedure in the same manner. Dissolve the residue in 5 mL of water, and filter the solution if necessary. This solution responds to the Qualitative Analysis for phosphate.

pH Between 3.0 and 3.5 (0.05% aqueous solution).

Purity (1) ***Clarity and color of solution***—Dissolve 0.5 g of Pyridoxal Phosphate Hydrate in 10 mL of sodium hydroxide TS; the resulting solution is clear and pale yellow to yellow.

(2) ***Heavy metals***—Proceed with 2.0 g of Pyridoxal Phosphate Hydrate according to Method 2 and perform

the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Arsenic***—Dissolve 1.0 g of Pyridoxal Phosphate Hydrate in 5 mL of dilute hydrochloric acid and use this solution as the test solution (NMT 2 ppm).

(4) ***Free phosphoric acid***—Dissolve 0.10 g of Pyridoxal Phosphate Hydrate in 5 mL of dilute nitric acid, and add water to make 30 mL. Next, add 10 mL of ammonium molybdate TS, shake to mix, allow to stand for 10 minutes, add 10 mL of 1-butanol, and shake strongly to mix; the color of 1-butanol layer is not more intense than the following control solution. Prepare the control solution by pipetting 20 mL of standard phosphoric acid and proceeding in the same manner as the test solution (NMT 0.5%).

Water Between 6.0% and 9.0% (0.1 g, volumetric titration, direct titration. However, use a solution of 50 g of imidazole dissolved in 100 mL of the solvent instead of methanol for water determination).

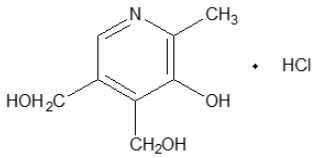
Solvent—1-methoxy-2-propanol of 80%, ethanol(99.5) of 18%, imidazole of 1% and imidazole hydrobromide acid of 1%.

Assay Weigh accurately about 45 mg of Pyridoxal Phosphate Hydrate, and add phosphate buffer solution, pH 6.8, to make exactly 250 mL. Pipet 10 mL of this solution, add phosphate buffer solution, pH 6.8, to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 45 mg of pyridoxal phosphate hydrate RS (water previously measured), proceed in the same manner as the test solution, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at the absorbance maximum wavelength around 388 nm as directed under the Ultraviolet-visible Spectroscopy, using phosphate buffer solution, pH 6.8, as the control solution.

Amount (mg) of pyridoxal phosphate hydrate ($C_8H_{10}NO_6P$)
= Amount (mg) of pyridoxal phosphate hydrate RS calculated on the anhydrous basis × (A_T/A_S)

Packaging and storage Preserve in light-resistant, well-closed containers.

Pyridoxine Hydrochloride
피리독신염산염



Vitamin B6 Hydrochloride $C_8H_{11}NO_3 \cdot HCl$: 205.64
4,5-Bis(hydroxymethyl)-2-methylpyridin-3-ol hydrochloride [*58-56-0*]

Pyridoxine Hydrochloride, when dried, contains NLT 98.0% and NMT 101.0% of pyridoxine hydrochloride ($C_8H_{11}NO_3 \cdot HCl$).

Description Pyridoxine Hydrochloride occurs as a white to pale yellow crystalline powder.
It is freely soluble in water, slightly soluble in ethanol(99.5), and practically insoluble in acetic anhydride or acetic acid(100).
It is gradually affected by light.

Melting point—About 206 °C (with decomposition).

Identification (1) Determine the absorption spectra of the solutions of Pyridoxine Hydrochloride and pyridoxine hydrochloride RS in 0.1 mol/L hydrochloric acid TS (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectrum of Pyridoxine Hydrochloride and pyridoxine hydrochloride RS, previously dried, as directed in the potassium chloride disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) An aqueous solution of Pyridoxine Hydrochloride (1 in 10) responds to the Qualitative Analysis for chloride.

pH Dissolve 1.0 g of Pyridoxine Hydrochloride in 50 mL of water; the pH of this solution is between 2.5 and 3.5.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Pyridoxine Hydrochloride in 20 mL of water; the solution is clear and colorless.

(2) ***Heavy metals***—Proceed with 1.0 g of Pyridoxine Hydrochloride according to Method 1 and perform the test. Prepare the control solution with 3.0 mL of lead standard solution (NMT 30 ppm).

(3) ***Related substances***—Dissolve 1.0 g of Pyridoxine Hydrochloride in 10 mL of water, and use this solution as the test solution. Pipet 2.5 mL of this solution and add water to make exactly 100 mL. Pipet 1 mL of this solution, add water to make exactly 10 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 2 μL each of the test solution and the

standard solution on a plate of silica gel for thin-layer chromatography. After air-drying, develop the plate with a mixture of acetone, tetrahydrofuran, *n*-hexane and ammonia water(28) (65 : 13 : 13 : 9) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Spray evenly a solution (1 in 20) of sodium carbonate decahydrate in diluted ethanol(99.5) (3 in 10) on the plate, and air-dry the plate. Spray, again, evenly a solution (1 in 1000) of 2,6-dibromo-*n*-1,4-benzoquinone monoimine in ethanol(99.5), and air-dry the plate; the spots other than the principal spot from the test solution are not more intense than the spot from the standard solution.

Loss on drying NMT 0.3% (1 g, in vacuum, silica gel, 4 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 40 mg of Pyridoxine Hydrochloride, previously dried, and dissolve in water to make exactly 100 mL. Pipet 5 mL of this solution, add water to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 40 mg of pyridoxine hydrochloride RS, previously dried in a desiccator for 4 hours (in vacuum, silica gel), and dissolve in water to make exactly 100 mL. Pipet 5 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Proceed with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas of pyridoxine hydrochloride, A_T and A_S.

Amount (mg) of pyridoxine hydrochloride ($C_8H_{11}NO_3$.HCl)
= Amount (mg) of pyridoxine hydrochloride RS × (A_T / A_S)

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 280 nm).

Column: A stainless steel column about 4 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: Dissolve 1.0 g of sodium 1-hexanesulfonate in 750 mL of water, and add 250 mL of methanol and 10 mL of acetic acid(31).

Flow rate: 1.0 mL/min

System suitability

System repeatability: Repeat the test 6 times with 20 μL of the standard solution according to the above operating conditions; the relative standard deviation of the peak area of pyridoxine is NMT 2.0%.

Each mL of 1 mol/L perchloric acid VS
= 20.56 mg of $C_8H_{11}NO_3$·HCl

Packaging and storage Preserve in light-resistant, tight containers.

Pyridoxine Hydrochloride Injection
피리독신염산염 주사액

Vitamin B6 Hydrochloride Injection

Pyridoxine Hydrochloride Injection is an aqueous injection and contains NLT 95.0% and NMT 105.0% of the labeled amount of pyridoxine hydrochloride ($C_8H_{11}NO_3$·HCl : 205.64).

Method of preparation Prepare as directed under Injections, with Pyridoxine Hydrochloride.

Description Pyridoxine Hydrochloride Injection occurs as a clear and colorless to pale yellow liquid.
It is gradually affected by light.

pH—Between 3.0 and 6.0.

Identification The retention times of the major peaks and the ultraviolet absorption spectra at 190 nm to 300 nm obtained from the test solution and the standard solution under the Assay are the same.

Sterility Meets the requirements.

Bacterial endotoxins Less than 3.0 EU per mg of pyridoxine hydrochloride.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Extractable volume of injections Meets the requirements.

Assay Pipet an amount of Pyridoxine Hydrochloride Injection equivalent to about 40 mg of pyridoxine hydrochloride ($C_8H_{11}NO_3$·HCl), and add water to make exactly 100 mL. Take exactly 5 mL of this solution, add exactly 5 mL of the internal standard solution, add water to make exactly 100 mL, and use this solution as the standard solution. Separately, weigh accurately about 40 mg of Pyridoxine Hydrochloride RS, previously dried in a desiccator (in vacuum, silica gel) for 4 hours, and dissolve in and water to make exactly 100 mL. Pipet 5 mL of this solution, add exactly 5 mL of the internal standard solution, add water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the operating conditions under the Assay of Pyridoxine Hydrochloride Tablets.

Amount (mg) of pyridoxine hydrochloride ($C_8H_{11}NO_3$·HCl)
= Amount (mg) of pyridoxine hydrochloride RS× $\frac{Q_T}{Q_S}$

Internal standard solution—Weigh 50 mg of anhydrous caffeine RS and dissolve in water to make 100 mL.

Packaging and storage Preserve in light-resistant, hermetic containers.

33.3% Pyridoxine Hydrochloride Powder
피리독신염산염 3배산

33.3% Pyridoxine Hydrochloride Powder contains NLT 32.6% of pyridoxine hydrochloride ($C_8H_{11}NO_3$·HCl : 205.64), calculated on the anhydrous basis.

Method of preparation Prepare by finely dispersing Pyridoxine Hydrochloride in edible fatty acid. 33.3% Pyridoxine Hydrochloride Powder is a drug substance.

Description 33.3% Pyridoxine Hydrochloride Powder occurs as a white to pale yellow powder.

Identification (1) Add 1 drop of iron(III) chloride TS to 1 mL of aqueous solution of 33.3% Pyridoxine Hydrochloride Powder (1 in 1000); the solution exhibits a yellowish brown color. Add 1 drop of hydrochloric acid to the solution; the solution turns yellow.

(2) Add 2 mL of freshly prepared ethanol solution of 2,6-dibromquinonchlorimide (1 in 4000) and 1 drop of ammonia TS to 1 mL of aqueous solution of 33.3% Pyridoxine Hydrochloride Powder; the solution exhibits a blue color. Add 1 mL of saturated boric acid solution to 1 mL of aqueous solution of 33.3% Pyridoxine Hydrochloride Powder and proceed in the same manner; the solution does not exhibit a blue color.

(3) A filtrate of aqueous solution of 33.3% Pyridoxine Hydrochloride Powder (1 in 10) responds to the Qualitative Analysis for chloride.

Water NMT 1.0% (0.5 g, volumetric titration, direct titration).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.7 g of 33.3% Pyridoxine Hydrochloride Powder, add 5 mL of acetic acid(100) and 5 mL of acetic anhydride, and dissolve by heating over weak heat. After cooling, add 30 mL of acetic anhydride, and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 20.564 mg of $C_8H_{11}NO_3$·HCl

Packaging and storage Preserve in light-resistant, tight containers.

Pyridoxine Hydrochloride Tablets
피리독신염산염 정

Vitamin B6 Hydrochloride Tablets

Pyridoxine Hydrochloride Tablets contain NLT 95.0% and NMT 115.0% of the labeled amount of pyridoxine hydrochloride ($C_8H_{11}NO_3$·HCl : 205.64).

Method of preparation Prepare as directed under Tablets, with Pyridoxine Hydrochloride.

Identification The retention times of the major peaks and the ultraviolet absorption spectra at 190 nm - 300 nm obtained from the test solution and the standard solution under the Assay are the same, respectively.

Dissolution Perform the test with 1 tablet of Pyridoxine Hydrochloride Tablets at 50 revolutions per minute according to Method 2, using 900 mL of water as the dissolution medium. Take NLT 20 mL of the dissolution medium 45 minutes after starting the test, and filter through a membrane filter with a pore size of NMT 0.8 μm. Discard the first 10 mL of the filtrate and use the subsequent filtrate as the test solution. Dilute with the dissolution medium suitably, if necessary. Separately, weigh accurately about 10 mg of pyridoxine hydrochloride RS and dissolve it in ethanol(95) to make exactly 100 mL. Pipet 5 mL of this solution, add water to make exactly 50 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas of pyridoxine, A_T and A_S, in each solution. Meets the requirements if the dissolution rate of Pyridoxine Hydrochloride Tablets in 45 minutes is NLT 75%.

Dissolution rate (%) for the labeled amount of pyridoxine hydrochloride ($C_8H_{11}NO_3$·HCl)

$$= W_S \times \frac{Q_T}{Q_S} \times \frac{90}{C}$$

W_S: Amount (mg) of pyridoxine hydrochloride RS

C: Labeled amount (mg) of pyridoxine hydrochloride ($C_8H_{11}NO_3$·HCl) per tablet

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 280 nm, photo-diode array detector (190 nm to 300 nm)).

Column: A stainless steel column about 3.9 mm in internal diameter and 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 μm to 10 μm in particle diameter).

Mobile phase: A mixture of water, methanol and acetic acid(100) (73 : 27 : 1). Dissolve 0.14 g of sodium 1-hexanesulfonate in 100 mL.

Flow rate: 1 mL/min

System suitability

System performance: Weigh 20 mg of pyridoxine hydrochloride RS and 20 mg of riboflavin RS, put in a mixture of water, acetonitrile and acetic acid(100) (94 : 5 : 1), dissolve at 65 ℃ - 70 ℃ with shaking occasionally, and then cool the resulting solution immediately. Add the mixture of water, acetonitrile and acetic acid(100) (94 : 5 : 1) to make 200 mL. Proceed with 10 μL of this solution according to the above conditions; pyridoxine and riboflavin are eluded in this order.

System repeatability: Repeat the test 5 times with 10 μL each of the above solution according to the above conditions; the relative standard deviation of the peak areas of pyridoxine is NMT 3.0%.

Uniformity of dosage units It meets the requirements when the procedure for content uniformity is performed according to the following procedure.

Transfer 1 tablet of Pyridoxine Hydrochloride Tablets, previously finely powdered, to a 500-mL volumetric flask containing about 300 mL of water, shake for about 30 minutes, and dilute with water to volume. Filter a portion of the mixture, discarding the first 25 mL of the filtrate. Dilute a suitable aliquot of the subsequent filtrate quantitatively and stepwise with diluted hydrochloric acid (1 in 100) so that the concentration of pyridoxine hydrochloride is about 10 μg per mL and use these solutions test solution. Dissolve about 10 mg of Pyridoxine Hydrochloride RS, accurately weighed, in diluted hydrochloric acid (1 in 100) to make exactly 100 mL. Pipet 5.0 mL of this solution and dilute with diluted hydrochloric acid (1 in 100) to make exactly 50 mL and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at the absorbance maximum wavelength at about 290 nm, as directed under Ultraviolet-visible Spectrophotometry.

$$\text{Amount (mg) of pyridoxine hydrochloride } (C_8H_{11}NO_3.HCl) = \frac{T}{D} \times C \times \frac{A_T}{A_S}$$

T: Labeled amount (mg) of pyridoxine hydrochloride per tablet of Pyridoxine Hydrochloride Tablets

D: Dilution factor

C: Concentration (μg/mL) of the standard solution

Assay Weigh accurately the mass of NLT 20 tablets of Pyridoxine Hydrochloride Tablets, and powder them. Weigh accurately a portion of the powder, equivalent to about 40 mg of pyridoxine hydrochloride ($C_8H_{11}NO_3$·HCl), add water and shake to mix for 15 minutes. Extract with water to make the volume exactly 100 mL. Discard the first 10 mL of the filtrate, take exactly 5 mL of the subsequent filtrate and 5 mL of internal standard solution, add water to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 40 mg of pyridoxine hydrochloride RS, previously dried in a desiccator for 4 hours (in vacuum, silica gel), and dissolve in water to make exactly 100 mL. Pipet 5 mL of the solution, add exactly 5 mL of the internal standard solution, dilute with water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak area ratios of pyridoxine, Q_T and Q_S, to those of the internal standard in each solution, respectively.

$$\text{Amount (mg) of pyridoxine hydrochloride } (C_8H_{11}NO_3.HCl) = \text{Amount (mg) of pyridoxine hydrochloride RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—Weigh accurately about 50 mg of Anhydrous Caffeine RS, and dissolve in with water to make 100mL.

Operating conditions

Detector: An ultraviolet absorbance photometer (wavelength: 280 nm). However, a photo-diode array detector (190 nm to 300 nm) is used when the Identification is performed.

Column: A stainless steel column about 4 mm in internal diameter and 15 cm to 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm to 10 μm in particle diameter).

Mobile phase: Dissolve 1.0 g of sodium 1-hexanesulfonate in 750 mL of water, and add 250 mL of methanol and 10 mL of acetic acid(31).

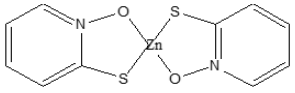
Flow rate: Adjust the flow rate so that the retention time of pyridoxine is about 5 minutes.

System suitability

Selection of column: Proceed with 20 μL of the standard solution under the above conditions; pyridoxine and the internal standard are eluted in this order with the resolution being NLT 3.0.

Packaging and storage Preserve in light-resistant, tight containers.

Pyrithione Zinc
피리티온아연



$(C_5H_4ONS)_2Zn$: 317.70

(T-4)-Bis[1-hydroxy-*O*)-2(1*H*)-pyridinethionato-S2]-zinc, [*13463-41-7*]

Pyrithione Zinc, when dried, contains NLT 90.0% and NMT 101.0% of pyrithione zinc [$(C_5H_4ONS)_2Zn$: 317.70].

Description Pyrithione Zinc occurs as a yellowish, grayish white powder and is odorless.

It is soluble in dimethlyl sulfoxide, sparingly soluble in dimethylformamide or chloroform, and practically insoluble in water or ethanol.
It dissolves in sodium hydroxide TS.

Melting point Between 225 and 235 ℃ (with decomposition).

Identification (1) Incinerate 1 g of Pyrithione Zinc, and dissolve the residue in dilute hydrochloric acid; the solution responds to the Qualitative Analysis for zinc salt.

(2) Put 10 mg of Pyrithione Zinc in a test tube, add a small piece of sodium metal, melt it by heating over low heat while stirring with a glass rod, dissolve in 5 mL of water, and filter. Add 1 mL of lead TS to the filtrate; black precipitates are formed.

(3) Put 5 mg of Pyrithione Zinc in a test tube, add 10 mg of 2,4-dinitrochlorobenzene, and heat over low heat for about 1 hour. Add 4 mL of potassium hydroxide-ethanol TS; the solution exhibits a dark reddish brown color.

(4) Dissolve 0.1 g of Pyrithione Zinc in 5 mL of sodium hydroxide TS, add 1 mL of copper sulfate TS; a dark green precipitate develops.

Purity (1) ***Chloride***—Weigh and incinerate 2.5 g of Pyrithione Zinc, add 10 mL of water, boil for 5 minutes, cool, add water to make 100 mL, and filter. Proceed with 25 mL of the filtrate as the test solution and perform the test as directed under the Chloride. Prepare the control solution with 0.4 mL of 0.01 mol/L hydrochloric acid VS (NMT 0.025%).

(2) ***Arsenic***—Add 0.5 g of potassium nitrate and 0.5 g of anhydrous sodium carbonate to 0.2 g of Pyrithione Zinc, ignite to melt. After cooling, add 15 mL of dilute sulfuric acid, heat until white smoke does not appear, add water to make the test solution 5 mL, proceed as directed under the Arsenic, and perform the test (NMT 10 ppm).

(3) ***Lead***—Weigh 1.0 g of Pyrithione Zinc, add 20 mL of concentrated nitric acid, shake to mix, and heat to dissolve. Heat again and concentrate the solution to make 7 mL. Cool quickly to room temperature, add water to make 100 mL, and use this solution as the test solution. Proceed with 20 mL of this solution, and perform the test as directed under the Heavy Metals (NMT 25 ppm).

Loss on drying NMT 0.5% (1 g, 105 ℃, 4 hours).

Residue on ignition Between 45.6% and 52.2% (1 g).

Assay Weigh accurately about 0.3 g of Pyrithione Zinc, previously dried, put in a 500 mL iodine flask, and dissolve with 20 mL of hydrochloric acid. Dissolve again in 200 mL of water, and titrate with 0.1 mol/L iodine VS (indicator: 3 mL of starch TS). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L iodine VS
= 15.885 mg of $(C_5H_4ONS)_2Zn$

Packaging and storage Preserve in light-resistant, tight containers.

Pyrithione Zinc Solution
피리티온아연 액

Pyrithione Zinc Solution is an aqueous suspension and contains NLT 47.0% and NMT 53.0% of pyrithione zinc [$(C_5H_4ONS)_2Zn$: 317.70].

Method of preparation Prepare as directed under Solutions with Pyrithione Zinc.

Description Pyrithione Zinc Solution occurs as a white aqueous suspension and has a slightly characteristic odor.

Identification (1) Put 1 g of Pyrithione Zinc Solution into a porcelain crucible, heat the crucible over lower heat, charr, and incinerate by ignition. After cooling, dissolve With 20 mL of 2 mol/L hydrochloric acid. Neutralize the portion of the resulting solution with sodium hydroxide TS; precipitates are formed. Add again excess sodium hydroxide TS, and add sodium sulfide TS; white precipitates are formed. Take the precipitates separately and add dilute acetic acid; the precipitates do not dissolve, but dissolves on adding dilute hydrochloric acid.

(2) Dissolve 10 mg of Pyrithione Zinc Solution in 0.5 mol/L sodium hydroxide TS to make 1000 mL, and determine the absorption spectrum of the resulting solution as directed under the Ultraviolet-visible Spectroscopy using 0.5 mol/L sodium hydroxide solution as the control solution; it exhibits maxima around 244 nm and 283 nm.

pH Between 5.0 and 8.0.

Assay Take exactly an amount of Pyrithione Zinc Solution, equivalent to about 50 mg of pyrithione zinc ($(C_5H_4ONS)_2Zn$) according to the labeled amount, add dimethlyl sulfoxide to make exactly 200 mL. Pipet 4 mL of the resulting solution, dissolve in 6 mL of the saturated solution of ethylenediaminetetraacetic acid disodium salt and 4 mL of 0.1% 2,2-dipyridyl disulfide solution, and add water to make exactly 100 mL, and warm on a steam bath (about 70 ℃). After cooling, use this solution as the test solution. Separately, weigh accurately about 50 mg of pyrithione zinc RS, proceed in the same manner as in the preparation of the test solution, and use this solution as the standard solution. Proceed with 20 mL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas of pyrithione zinc, A_T and A_S, from the test solution and the standard solution, respectively.

Amount (mg) of pyrithione zinc ($(C_5H_4ONS)_2Zn$)

$$= Amount\ (mg)\ of\ \text{pyrithione zinc RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 235 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: Control the mixing ratio of mobile phase A and mobile phase B in stages or gradient elution as follows.

Mobile phase A: Acetonitrile

Mobile phase B: Water

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 - 10	30 → 90	70 → 10
10 - 15	90 → 30	10 → 70
15 - 20	30	70

Flow rate: 0.8 mL/min

Packaging and storage Preserve in light-resistant, tight containers.

Pyrithione Zinc Suspension
피리티온아연 현탁액

Pyrithione Zinc Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of pyrithione zinc [$(C_5H_4ONS)_2Zn$: 317.70].

Method of preparation Prepare as directed under Suspensions, with Pyrithione Zinc and Pyrithione Zinc solution.

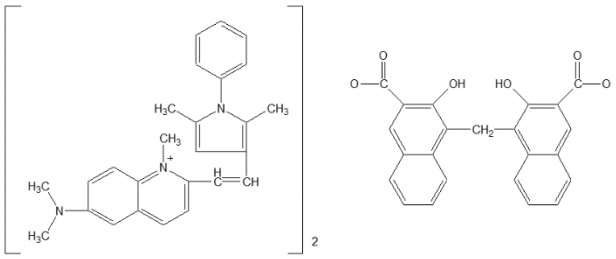
Identification Shake Pyrithione Zinc Suspension well to mix, take an amount of Pyrithione Zinc Suspension, equivalent to 10 mg of pyrithione zinc, and add 1 mL of 1 mol/L sodium hydroxide TS and 9 mL of acetonitrile. Warm to dissolve, cool, filter, and use the filtrate as the test solution. Separately, weigh 10 mg of pyrithione zinc RS, add 1 mL of 1 mol/L sodium hydroxide TS and 9 mL of acetonitrile, warm to dissolve, and use as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on a thin-layer chromatographic plate made of aluminum oxide with fluorescence indicator for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, methanol and acetic acid(100) (20 : 1 : 1) as the developing solvent, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the colors and R_f values of the spots obtained from the test solution and the standard solution are the same.

Assay Pipet an amount of Pyrithione Zinc Suspension, equivalent to 20 mg of pyrithione zinc [$(C_5H_4ONS)_2Zn$], and put it in a 100-mL beaker. Add 50 mL of dimethylformamide, stir using a stirrer, completely separate (using a glass rod, if necessary), and then filter into a 200-mL volumetric flask. Wash the beaker and filter paper three times with 40 mL each of dimethylformamide to filter, combine the filtrate and washings, add dimethylformamide to make exactly 200 mL, and use this solution as the test solution. Separately, weigh accurately about 20 mg of pyrithione zinc RS, dissolve in dimethylformamide to make exactly 200 mL, and use this solution as the standard solution. Take exactly 10.0 mL each of the test solution and the standard solution, and add 0.2 mL of 4.5% iron(III) chloride solution to develop color. After 5 minutes, perform the test with the solution, using dimethylformamide as a control solution, under the Ultraviolet-visible Spectroscopy, and determine the absorbances A_T and A_S at the wavelength of 596 nm.

$$\text{Amount (mg) of pyrithione zinc } [(C_5H_4ONS)_2Zn] = \text{Amount (mg) of pyrithione zinc RS} \times \frac{A_T}{A_S}$$

Packaging and storage Preserve in light-resistant, tight containers.

Pyrvinium Pamoate
피르비늄파모산염



$C_{75}H_{70}N_6O_6$: 1151.40

3-Carboxy-1-[(3-carboxy-2-oxidonaphthalen-1-yl)methyl]naphthalen-2-olate [*3546-41-6*]

Pyrvinium Pamoate contains NLT 96.0% and NMT 104.0% of pyrvinium pamoate ($C_{75}H_{70}N_6O_6$), calculated on the anhydrous basis.

Description Pyrvinium Pamoate occurs as a bright orange or blackish orange crystalline powder.
It is very soluble in acetic acid(100), slightly soluble in chloroform or methoxyethanol, very slightly soluble in ethanol(95), and practically insoluble in water or ether.

Identification (1) Determine the absorption spectrum of a solution of acetic acid of Pyrvinium Pamoate in methanol (1 in 200), prepared according to the Assay, as directed under the Ultraviolet-visible Spectroscopy; it exhibits maxima at about 358 nm and 505 nm, and the absorbance ratio, A_{505}/A_{358}, is between 1.93 and 2.07.

(2) Determine the infrared spectra of Pyrvinium

Pamoate and pyrvinium pamoate RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Water NMT 6.0% (0.2 g, volumetric titration, direct titration, use a mixture of methanol and chloroform (1 : 1) instead of methanol for water determination).

Residue on ignition NMT 0.5% (1 g)

Assay Weigh accurately 0.25 g each of Pyrvinium Pamoate and pyrvinium pamoate RS (water previously measured), dissolve each in 125 mL of acetic acid(100), and add methanol exactly to make exactly 250 mL. Pipet 5 mL each of these solutions, add the methanol to make exactly 500 mL, and use them as the test solution and the standard solution, respectively. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at the absorbance maximum wavelength of about 505 nm as directed under the Ultraviolet-visible Spectroscopy, using methanol as the control solution.

$$\text{Amount (mg) Pyrvinium Pamoate } (C_{75}H_{70}N_6O_6) = \text{Amount (mg) of pyrvinium pamoate RS} \times \frac{A_T}{A_S}$$

Packaging and storage Preserve in light-resistant, tight containers.

Pyrvinium Pamoate Syrup
피르비늄파모산염 시럽

Pyrvinium pamoate syrup contains NLT 0.90 w/v% and NMT 1.10 w/v% of pyrvinium ($C_{26}H_{28}N_3^+$: 382.52).

Method of preparation Prepare as directed under Syrups, with Pyrvinium Pamoate.

Description Pyrvinium pamoate syrup occurs as a dark red, opaque suspensions.

Identification Determine the absorption spectra, between 300nm and 600 nm, of the test solution and the standard solution obtained in the Assay as directed under the Ultraviolet-visible Spectroscopy; both solutions exhibit similar intensities of absorption at the same wavenumbers.

pH Between 6.0 and 8.0.

Uniformity of dosage units (distribution) Meets the requirements.

Assay Shake Pyrvinium Pamoate Syrup well to remove any air bubbles, transfer an amount equivalent to 50 mg (about 5 mL) of pyrvinium ($C_{26}H_{28}N_3^+$) to a 250-mL volumetric flask, and then rinse the pipet with 10 mL of methanol. Dissolve in 100 mL of acetic acid(100) and fill up methanol to the gauge line to mix. Take 3.0 mL of this solution in a 100-mL volumetric flask, fill up methanol to the gauge line to mix, and use this solution as the test solution. Separately, weigh accurately an appropriate amount of pyrvinium pamoate RS (water content is previously measured), dissolve in acetic acid(100) at a ratio of 4 mL per 3 mg of pyrvinium pamoate, dilute with methanol to obtain a solution containing 9 μg per mL, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at the maximum wavelength of absorbance of about 505 nm as directed under the Ultraviolet-visible Spectroscopy, using methanol as the control solution.

$$\text{Amount (w.v\%) of pyrvinium } (C_{26}H_{28}N_3^+) = 0.1677 \times C \times \frac{A_T}{A_S} \times 0.6644$$

C: Concentration of the standard solution (μg/mL)

Packaging and storage Preserve in light-resistant, tight containers.

Pyrvinium Pamoate Tablets
피르비늄파모산염 정

Pyrvinium Pamoate Tablets contain NLT 92.0% and NMT 108.0% of the labeled amount of pyrvinium ($C_{26}H_{28}N_3^+$: 382.52).

Method of preparation Prepare as directed under Tablets, with Pyrvinium Pamoate.

Identification Perform the test according to the Identification of Pyrvinium Pamoate Syrup.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Perform the test by using a light-resistant container. Take a number of tablets of Pyrvinium Pamoate Tablets, equivalent to about 0.5 g of pyrvinium ($C_{26}H_{28}N_3^+$), put in a 500-mL volumetric flask, add 25 mL of water and 25 mL of acetone, and heat on a steam bath while shaking to mix for 10 minutes. Add 250 mL of acetone (100) to the warmed liquid, heat again for 5 minutes, cool the solution, and add methanol to make exactly 500 mL. Centrifuge a portion of the resulting solution until the supernatant becomes transparent, pipet 3 mL of the clear supernatant, add methanol to make exactly 500 mL, and use this solution as the test solution. Separately, weight accurately an appreciate amount of the pyrvinium pamoate RS (water content is previously measured), dis-

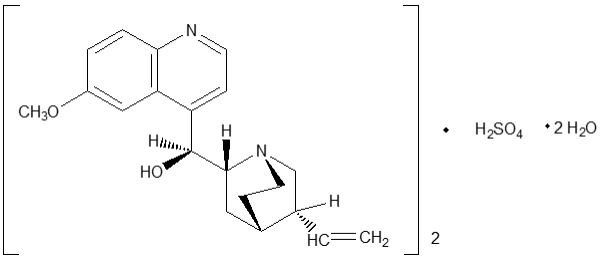
solve in acetic acid(100) at a ratio of 1 mL of acetic acid to 3 mg of pyrvinium pamoate, dilute with methanol to make a solution containing about 9 μg per mL, and use this solution as the standard solution. Determine the absorbances, AT and AS, a control solution and the standard solution, respectively, at the absorbance maximum wavelength of about 505 nm as directed under Ultraviolet-visible Spectrophotometry, using methanol as the blank.

$$\text{Content (w/v\%) of pyrvinium } (C_{26}H_{28}N_3^+) = 83.3\times C \times \frac{A_T}{A_S} \times 0.6644$$

C: Concentration of the standard solution (μg/mL)

Packaging and storage Preserve in light-resistant, tight containers.

Quinidine Sulfate Hydrate
퀴니딘황산염수화물



Quinidine Sulfate $(C_{20}H_{24}N_2O_2)_2\cdot H_2SO_4\cdot 2H_2O$: 782.94
(*S*)-[(2*R*,5*R*)-5-Ethenyl-1-azabicyclo[2.2.2]octan-2-yl]-(6-methoxyquinolin-4-yl) methanol; sulfuric acid; dihydrate [*6591-63-5*]

Quindine Sulfate Hydrate, when dried, contains NLT 98.5% and NMT 101.0% of quinidine sulfate $[(C_{20}H_{24}N_2O_2)_2\cdot H_2SO_4$: 746.91].

Description Quindine Sulfate Hydrate occurs as a white crystal, is odorless and has a very bitter taste.
It is freely soluble in ethanol(95) or hot water, sparingly soluble in water, and practically insoluble in ether.
It, previously dried, is freely soluble in chloroform.
It is gradually changed to dark brown by light.

Optical rotation $[\alpha]_D^{20}$: Between +275° and +287° (0.5 g after drying, 0.1 mol/L sodium hydroxide, 25 mL, 100 mm).

Identification (1) Dissolve 10 mg of Quindine Sulfate Hydrate in 10 mL of water and add 2 to 3 drops of dilute hydrochloric acid; the solution exhibits a blue fluorescence.

(2) Add 1 to 2 drops of bromine TS and 1 mL of ammonia TS to 5 mL of the aqueous solution of Quindine Sulfate Hydrate (1 in 1000); the solution exhibits a green color.

(3) Add 1 mL of silver nitrate TS to 5 mL of aqueous solution of Quindine Sulfate Hydrate (1 in 100) and dissolve by stirring with a glass rod and allow to stand; a white precipitate forms. Add nitric acid in drops to the solution; the precipitate dissolves.

(4) Dissolve 0.4 g of Quindine Sulfate Hydrate in 20 mL of water and 1 mL of dilute hydrochloric acid; the solution responds to the Qualitative Analysis for sulfate.

pH Dissolve 1.0 g of Quindine Sulfate Hydrate in 100 mL of freshly boiled and cooled water. The pH of this solution is between 6.0 and 7.0.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Quindine Sulfate Hydrate according to Method 2 and perform the test. Prepare the control solution with 1.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Chloroform and ethanol-insoluble components***—Add 15 mL of a mixture of chloroform and ethanol(99.5) (2 : 1) to 2.0 g of Quindine Sulfate Hydrate, heat for 10 minutes at 50 ℃ and cool, and filter under weak suction using a glass filter weighed beforehand; wash the residue 5 times using 10 mL each of a mixture of chloroform and ethanol(99.5) (2 : 1), and dry for 1 hour at 105 ℃; the amount is NMT 2.0 mg.

(3) ***Related substances***—Dissolve about 20 mg of Quindine Sulfate Hydrate in the mobile phase to make exactly 100 mL and use this solution as the test solution. Separately, weigh 25 mg of cinchonine RS and dissolve in the mobile phase to make exactly 100 mL. Pipet 2 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 50 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak area of each solution by the automatic integration method and calculate the amount corresponding to each peak by the percentage peak area method; the amount of dihydroquinidine sulfate is NMT 15.0%, and Quinidine Sulfate and dihydroquinine sulfate are NMT 1.0%, respectively. The total area of the peaks other than the major peak is not greater than the peak area of cinchonine from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 235 nm).

Column: A stainless steel column about 4 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 μm in particle diameter).

Mobile phase: A mixture of water, acetonitrile, methanesulfonic acid TS and dimethylamine solution (1 in 10) (43 : 5 : 1 : 1).

Flow rate: Adjust the flow rate so that the retention time of quinine is about 10 minutes.

System suitability

Detection sensitivity: Adjust the sensitivity so that the peak height of cinchonidine obtained from 50 μL of the standard solution is between 5 mm and 10 mm.

System performance: Dissolve 10 mg each of Quindine Sulfate Hydrate and quinine sulfate in 5 mL of methanol, and add the mobile phase to make 50 mL. Proceed with 50 μL of this solution according to the above conditions; quinidine, quinine, dihydroquinidine and dihydroquinine are eluted in this order with the resolution between quindine and quinine and between quinine and dihydroquinidine being NLT 1.2, respectively.

Time span of measurement: About 2 times the retention time of quinine after the solvent peak.

(4) ***Readily carbonizable substances***—Weigh 0.2 of Quindine Sulfate Hydrate and perform the test. The color of this solution is not more intense than that of the Matching Fluid for Color M.

Loss on drying NMT 5.0% (1 g, 130 ℃, 3 hours).

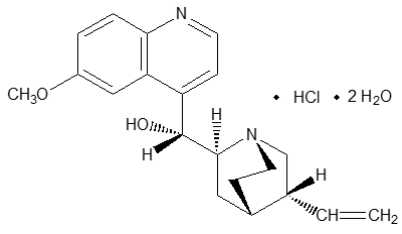
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.5 g of Quindine Sulfate Hydrate, previously dried, dissolve in 20 mL of acetic acid(100), add 80 mL of acetic anhydride, and titrate with 0.1 mol/L perchloric acid VS (indicator: 3 drops of methylrosaniline chloride TS). However, the endpoint of the titration is when the violet color of this solution turns to blue and then finally to bluish green. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 24.897 mg of $(C_{20}H_{24}N_2O_2)_2 \cdot H_2SO_4$

Packaging and storage Preserve in light-resistant, well-closed containers.

Quinine Hydrochloride Hydrate
퀴닌염산염수화물



Quinine Hydrochloride

$C_{20}H_{24}N_2O_2 \cdot HCl \cdot 2H_2O$: 396.91

(*R*)-[(2*S*,4*S*,5*R*)-5-Ethenyl-1-azabicyclo[2.2.2]octan-2-yl]-(6-methoxyquinolin-4-yl) methanol dihydrate hydrochloride [*6119-47-7*]

Quinine Hydrochloride Hydrate, when dried, contains NLT 98.5% and NMT 101.0% of Quinine Hydrochloride ($C_{20}H_{24}N_2O_2 \cdot$ HCl: 360.88).

Description Quinine Hydrochloride Hydrate occurs as a white crystal, is odorless and has a very bitter taste. It is very soluble in ethanol(99.5), freely soluble in ethanol(95), acetic acid(100) or acetic anhydride, sparingly soluble in water, and practically insoluble in ether. It, previously dried, is freely soluble in chloroform.
The color of Quinine Hydrochloride Hydrate is gradually changed to brown by light.

Identification (1) An aqueous solution (1 in 50) of Quinine Hydrochloride Hydrate does not exhibit fluorescence. Add 100 mL of water and 1 drop of dilute sulfuric acid to 1 mL of this solution; a blue fluorescence is exhibited.

(2) Add 1 to 2 drops of bromine TS and 1 mL of ammonia TS to 5 mL of the aqueous solution of Quinine Hydrochloride Hydrate (1 in 1000); the solution exhibits a green color.

(3) Add 1 mL of dilute nitric acid and 1 mL of silver nitrate TS to 5 mL of the aqueous solution of Quinine Hydrochloride Hydrate (1 in 50); a white precipitate is formed. Isolate the precipitate and add a surplus amount of ammonia TS; the precipitate dissolves.

Optical rotation $[\alpha]_D^{20}$: Between -245° and -255° (0.5 g after drying, 0.1 mol/L sodium hydroxide TS, 25 mL, 100 mm).

pH Dissolve 1.0 g of Quinine Hydrochloride Hydrate in 100 mL of freshly boiled and cooled water. The pH of this solution is between 6.0 and 7.0.

Purity (1) ***Sulfate***—Weigh 1.0 g of Quinine Hydrochloride Hydrate and perform the test. Prepare the control solution with 1.0 mL of 0.005 mol/L sulfuric acid (NMT 0.048%).

(2) ***Barium salt***—Add 10 mL of water to 0.5 g of Quinine Hydrochloride Hydrate, heat to dissolve, and add 1 mL of dilute hydrochloric acid; no turbidity is produced.

(3) ***Chloroform and ether-insoluble components***—Add 15 mL of a mixture of chloroform and ethanol(99.5) (2 : 1) to 2.0 g of Quinine Hydrochloride Hydrate, heat for 10 minutes at 50 ℃ and cool, and filter under weak suction using a glass filter (G4) weighed beforehand. Wash the residue 5 times with 10 mL of a mixture of chloroform and ethanol(99.5) (2 : 1) each time, and dry for 1 hour at 105 ℃; the amount is NMT 2.0 mg.

(4) ***Related substances***—Weigh 20 mg of Quinine Hydrochloride Hydrate, dissolve in the mobile phase to make exactly 100 mL, and use this solution as the test solution. Separately, weigh 25 mg of cinchonidine and dissolve in the mobile phase to make exactly 100 mL. Pipet 2 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 50 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak area of each solution by the automatic integration method, and calculate the amount corresponding to each peak by the percentage peak area method; the amount of dihydroquinine hydrochloride is

NMT 10.0%, and the total area of the peaks other than the major peak is not greater than the peak area of cinchonidine from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 235 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silical gel for liquid chromatography (10 μm in particle diameter).

Mobile phase: A mixture of water, acetonitrile, methanesulfonic acid TS and diethylamine solution (1 in 10) (43 : 5 : 1 : 1).

Flow rate: Adjust the flow rate so that the retention time of quinine is about 10 minutes.

System suitability

Detection sensitivity: Adjust the sensitivity so that the peak height of cinchonidine obtained from 50 μL of the standard solution is between 5 mm and 10 mm.

System performance: Dissolve 10 mg each of Quinine Hydrochloride Hydrate and quinidine sulfate in 5 mL of methanol, and add the mobile phase to make 50 mL. Proceed with 50 μL of this solution according to the above conditions; quinidine, quinine, dihydroquinidine and dihydroquinine are eluted in this order with the resolution between quinidine and quinine and between quinine and dihydroquinidine being NLT 1.2, respectively.

Time span of measurement: About 2 times the retention time of quinine after the solvent peak.

(5) ***Readily carbonizable substances***—Proceed with 0.25 g of Quinine Hydrochloride Hydrate and perform the test. The color of this solution is not more intense than that of the Matching Fluid for Color M.

Loss on drying NMT 10.0% (1 g, 105 ℃, 5 hours).

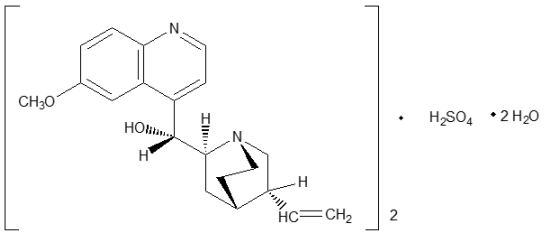
Residue on ignition NMT 0.1% (1 g).

Assay Weigh exactly about 0.4 g of Quinine Hydrochloride Hydrate, previously dried, dissolve in 100 mL of a mixture of acetic anhydride and acetic acid(100) (7 : 3), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 18.044 mg of $C_{20}H_{24}N_2O_2 \cdot HCl$

Packaging and storage Preserve in light-resistant, well-closed containers.

Quinine Sulfate Hydrate
퀴닌황산염수화물



Quinine Sulfate

$(C_{20}H_{24}N_2O_2)_2 \cdot H_2SO_4 \cdot 2H_2O$: 782.94

(*R*)-[(2*S*,5*R*)-5-Ethenyl-1-azabicyclo[2.2.2] octan-2-yl]-(6-methoxyquinolin-4-yl) methanol; sulfuric acid; dihydrate [*6119-70-6*]

Quinine Sulfate Hydrate, contains NLT 98.5% and NMT 101.0% of quinine sulfate [$(C_{20}H_{24}N_2O_2)_2 \cdot H_2SO_4$: 746.91] on the dried basis.

Description Quinine Sulfate Hydrate occurs as white crystals or a crystalline powder, which is odorless and has a very bitter taste.

It is freely soluble in acetic acid(100), soluble in hot ethanol, sparingly soluble in hot water, slightly soluble in water, ethanol(95), ethanol(99.5) or chloroform, and practically insoluble in ether.

It is gradually changed to brown slowly by light.

Identification (1) Determine the absorption spectra of aqueous solutions of Quinine Sulfate Hydrate and quinine sulfate hydrate RS (1 in 2000) as directed under the Ultraviolet-visible spectrophotometry; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectrum of Quinine Sulfate Hydrate and quinine sulfate hydrate RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) Dissolve 0.4 g of Quinine Sulfate Hydrate in 20 mL of water and 1 mL of dilute hydrochloric acid; the solution responds to the Qualitative Analysis for sulfate.

Optical rotation $[\alpha]_D^{20}$: Between -235° and -245° (0.75 g after drying, 0.1 mol/L sodium hydroxide TS, 25 mL, 100 mm).

pH Add 2.0 g of Quinine Sulfate Hydrate to 20 mL of freshly boiled and cooled water, shake to mix, and filter; the pH of this solution is between 5.5 and 7.0.

Purity (1) ***Heavy metals***—Proceed with 2.0 g of Quinine Sulfate Hydrate according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Chloroform and ethanol-insoluble components***—Add 15 mL of a mixture of chloroform and ethanol(99.5) (2 : 1) to 2.0 g of Quinine Sulfate Hydrate, heat for 10 minutes at 50 ℃ and cool, and filter under weak suction using a glass filter weighed beforehand; wash the residue 5 times using 10 mL each of a mixture of chloroform and ethanol(99.5) (2 : 1), and dry for 1 hour at

105 ℃; the amount is NMT 2.0 mg.

(3) ***Related substances***—Dissolve about 20 mg of Quinine Sulfate Hydrate, accurately weighed, in the mobile phase to make exactly 100 mL and use this solution as the test solution. Separately, weigh 25 mg of cinchonidine RS and dissolve in the mobile phase to make exactly 100 mL. Pipet 2 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 50 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak area of each solution by the automatic integration method, and calculate the amount of dihydroquinidine hydrochloride by the percentage peak area method; it is NMT 5%. The total area of the peaks other than the major peak and the above peaks is not greater than the peak area of cinchonidine from the standard solution.

Operating conditions

Detector: An ultraviolet photometer (wavelength: 235 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 μm in particle diameter).

Mobile phase: A mixture of water, acetonitrile, methanesulfonic acid TS and diethylamine solution (1in 10) (43 : 5 : 1 : 1).

Flow rate: Adjust the flow rate so that the retention time of quinine is about 10 minutes.

System suitability

Detection sensitivity: Adjust the sensitivity so that the peak height of cinchonidine obtained from 50 μL of the standard solution is between 5 mm and 10 mm.

System performance: Dissolve 10 mg of each of Quinine Sulfate Hydrate and quinidine sulfate in 5 mL of methanol, and add the mobile phase to make 50 mL. Proceed with 50 μL of this solution according to the above conditions; quinidine, quinine, dihydroquinidine and dihydroquinine are eluted in this order with the resolution between quinidine and quinine and between quinine and dihydroquinidine being NLT 1.2, respectively.

Time span of measurement: About 2 times the retention time of quinidine after the solvent peak.

Loss on drying NMT 5.0% (1 g, 105 ℃, 3 hours).

Residue on ignition NMT 0.1% (1 g).

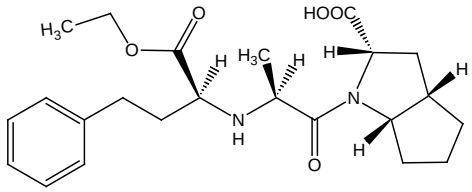
Assay Weigh accurately about 0.5 g of Quinine Sulfate Hydrate, dissolve in 20 mL of acetic acid(100), add 80 mL of acetic anhydride, and titrate with 0.1 mol/L perchloric acid VS (indicator: 2 drops of methylrosaniline chloride TS). However, the endpoint of the titration is when the violet color of this solution turns to blue and then finally to bluish green. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS

= 24.90 mg of $(C_{20}H_{24}N_2O_2)_2 \cdot H_2SO_4$

Packaging and storage Preserve in light-resistant, well-closed containers.

Ramipril
라미프릴



$C_{23}H_{32}N_2O_5$: 416.51

(2*S*,3a*S*,6a*S*)-1-[(2*S*)-2-[[(2*S*)-1-Ethoxy-1-oxo-4-phenylbutan-2-yl]amino]propanoyl]-3,3a,4,5,6,6a-hexahydro-2*H*-cyclopenta[b]pyrrole-2-carboxylic acid [*87333-19-5*]

Ramipril, when dried, contains NLT 98.0% and NMT 101.0% ramipril ($C_{23}H_{32}N_2O_5$).

Description Ramipril occurs as a white or almost white, crystalline powder.
It is freely soluble in methanol and sparingly soluble in water.

Identification Determine the infrared spectra of Ramipril and Ramipril RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Melting point Between 105 and 112 ℃.

Optical rotation $[\alpha]_D^{20}$: Between +32° and +38° (after drying, 0.25 g, 0.1 mol/L methanol hydrochloric acid TS, 25 mL, 100 mm).

Purity (1) ***Palladium*** —Weigh accurately about 0.2 g of Ramipril, dissolve in a mixture of water and nitric acid (997 : 3) to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 50 mg of palladium, dissolve in 9 mL of hydrochloric acid, and add water to be exactly 100 mL. Take an appropriate amount of this solution, add a mixture of water and nitric acid (997 : 3) so that the solution contains 0.02, 0.03 and 0.05 μg per mL, and use this solution as the standard solution. Weigh accurately 0.15 g of magnesium nitrate, add a mixture of water and nitric acid (997 : 3) to make exactly 100 mL, and use this solution as the blank test. Perform the test with 20 μL of the test solution, 20 μL of the standard solution and 10 μL of the blank test solution according to the following conditions as directed under the calibration curve under the Atomic Absorption Spectroscopy and determine the concentration of palladium; it is NMT 0.002%.

$$\text{Content (\%) of palladium} = 0.1 \times \frac{\text{Concentration of palladium in test solution from eqalign calibration curve (μg/mL)}}{\text{Concentration of ramipril in test solution (mg/mL)}}$$

Gas: Air–acetylene or hydrogen
Lamp: Palladium hollow cathode lamp
Wavelength: 247.6 nm

(2) ***Related substances***—Weigh accurately about 125 mg of Ramipril, dissolve in the mobile phase B to make exactly 5 mL, and use this solution as the test solution. Pipet 1 mL of this solution and add the mobile phase to make exactly 100 mL. Pipet 5 mL of this solution, add the mobile phase to make exactly 10 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions. Determine the peak area of each solution as directed in the automatic integration method and calculate the amount of each related substance; as for the Ramipril related substance I with 0.77 of the relative retention time for ramipril from the test solution, ramipril related substance II with 1.28 of the relative retention time and ramipril related substances III with 1.56 of the relative retention time and ramipril related substances IV with 1.65 of the relative retention time, the total amount is NMT 0.5%. Any other individual unidentified related substances are NMT 0.1%, and the total related substances is NMT 1.0%. However, it is excluded in cases where the peak is smaller than 0.05%.

$$\text{Content (\%) of each related substance} = \frac{A_T}{A_S} \times rf \times \frac{1}{2}$$

A_T: Peak area of each related substances from the test solution
A_S: Peak area of ramipril from the standard solution
rf: Correction factor of each peak of related substances to that of the ramipril peak
Ramipril related substance I: 1.04
Ramipril related substance II: 1.14
Ramipril related substance III: 2.13
Ramipril related substance IV: 1.21
Other related substances: 1.00

Operating conditions
Detector: An ultraviolet absorption photometer (wavelength: 210 nm).
Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 μm in particle diameter).
Column temperature: A constant temperature of about 65 °C.
Mobile phase: Use mobile phases A and B to control stepwise or based on the gradient elution as follows.
Mobile phase A: Dissolve 2.0 g of sodium perchlorate in a mixture of 800 mL of water and 0.5 mL of triethylamine, adjust the pH to 3.6 ± 0.1 with phosphoric acid, and mix after adding 200 mL of acetonitrile.
Mobile B: Dissolve 2.0 g of sodium perchlorate in a mixture of 300 mL of water and 0.5 mL of triethylamine, adjust the pH to 2.6 ± 0.1 with phosphoric acid, and mix after adding 700 mL of acetonitrile.

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 - 6	90	10
6 - 7	90 → 75	10 → 25
7 - 20	75 → 65	25 → 35
20 - 30	65 → 25	35 → 75
30 - 40	25	75
40 - 45	25 → 90	75 → 10
45 - 55	90	10

Flow rate: 1.3 mL/minute
System suitability
Test for required detectability: Take exactly 1 mL of the standard solution and add the mobile phase to make exactly 10 mL. Proceed with 20 μL of this solution according to the above conditions and confirm that the signal-to-noise ratio of the ramipril peak is NLT 10.
System performance: Proceed with 20 μL of the standard solution, perform the test according to the above conditions and adjust so that the retention time of ramipril is between 16 and 19 minutes in the stage where the capacity ratio is 75 : 25.
System repeatability: Repeat the test 6 times with 20 μL of the standard solution according to the above operating conditions; the relative standard deviation of the peak area of ramipril is NMT 2.0%.

Loss on drying NMT 0.2% (1 g, in vacuum, 60 ℃, 6 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.3 g of Ramipril, dissolve in 25 mL of methanol, add 25 mL of water, and titrate with 0.1 mol/L sodium hydroxide VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS
= 41.651 mg of $C_{23}H_{32}N_2O_5$

Packaging and storage Preserve in tight containers.

Ramipril Tablets
라미프릴 정

Ramipril Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of ramipril ($C_{23}H_{32}N_2O_5$:

416.51).

Method of preparation Prepare as directed under Tablets, with Ramipril.

Identification The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

Dissolution Perform the test with 1 tablet of Ramipril Tablets at 75 revolutions per minute according to Method 2 under the Dissolution, using 500 mL of 0.1 mol/L hydrochloric acid solution as the dissolution medium. Filter the solution 30 minutes after starting the dissolution and use this solution as the test solution. Separately, weigh accurately an appropriate amount of ramipril RS, add the dissolution medium to make the same concentration as the test solution, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Assay under Ramipril Tablets. Meets the requirements if the dissolution rate of Ramipril Tablets in 30 minutes is NLT 75%.

Uniformity of dosage units It meets the requirements when the procedure for content uniformity is performed as directed under the Assay.

Assay Weigh accurately the mass of NLT 20 tables of Ramipril Tablets and powder. Weigh accurately an amount equivalent to about 10 mg of ramipril ($C_{23}H_{32}N_2O_5$), add 0.1 mol/L hydrochloric acid TS, and shake for about 10 minutes to make 50 mL. Use this solution as the test solution Separately, weigh accurately about 10 mg of ramipril RS and dissolve in 0.1 mol/L hydrochloric acid to make 50 mL. Use the resulting solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions and determine the peak areas, A_T and A_S, of ramipril for the test solution and the standard solution, respectively.

$$\text{Amount (mg) of ramipril } (C_{23}H_{32}N_2O_5) = \text{Amount (mg) of ramipril RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 210 nm).

Column: A stainless steel column about 4 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 μL in particle diameter).

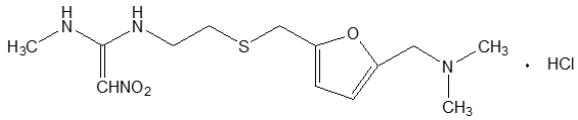
Mobile phase: A mixture of the buffer solution and acetonitrile (60 : 40), adjusted the pH to 2.1 ± 0.1 with 85% phosphoric acid.

Flow rate: 1.0 mL/min

Buffer solution: Dissolve 14 g of sodium perchlorate monohydrate and 5.8 g of 85% phosphoric acid in 1000 mL of water and adjust the pH to 2.5 ± 0.1 with triethylamine.

Packaging and storage Preserve in tight containers.

Ranitidine Hydrochloride
라니티딘염산염



$C_{13}H_{22}N_4O_3S \cdot HCl$: 350.86

(*E*)-*N*-(2-(((5-((Dimethylamino)methyl)furan-2-yl)methyl)thio)ethyl)-*N*-methyl-2-nitroethene-1,1-diamine hydrochloride [*66357-59-3*]

Ranitidine Hydrochloride contains NLT 97.5% and NMT 102.0% of ranitidine hydrochloride ($C_{13}H_{22}N_4O_3S \cdot HCl$), calculated on the dried basis.

Description Ranitidine Hydrochloride occurs as a white to pale yellow, crystalline powder and is odorless.
It is very soluble in water, freely soluble in methanol and practically insoluble in ethanol(99.5).
It is hygroscopic.
It is gradually colored by light.

Melting point—About 160 ℃ (with decomposition).

Identification (1) Determine the absorption spectra of Ranitidine Hydrochloride and Ranitidine Hydrochloride RS (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Ranitidine Hydrochloride and Ranitidine Hydrochloride RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) An aqueous solution of Ranitidine Hydrochloride (1 in 50) responds to the Qualitative Analysis for chloride.

pH Dissolve 1.0 g of Ranitidine Hydrochloride in 100 mL of water; the pH of this solution is between 4.5 and 6.0.

Purity (1) ***Clarity and color of solution***—An aqueous solution of Ranitidine Hydrochloride (1 in 10) is pale yellow to light yellow and is clear.

(2) ***Heavy metals***—Proceed with about 2.0 g of Ranitidine Hydrochloride according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Arsenic***—Weigh about 1.0 g of Ranitidine Hydrochloride and perform the test according to Method 4 (NMT 2 ppm).

(4) ***Related substances***—Dissolve about 0.2 g of

Ranitidine Hydrochloride in 10 mL of methanol and use this solution as the test solution. Weigh accurately about 20 mg of Ranitidine Hydrochloride, dissolve in 10 mL of methanol, pipet1 mL of this solution, and add methanol to make 10 mL. Use this solution as the standard solution (1). Dilute the standard solution (1) with methanol and make the standard solution (2) containing 0.1 mg in 1 mL, the standard solution (3) containing 60 μg in 1 mL, and the standard solution (4) containing 10 μg in 1 mL. Separately, weigh accurately and dissolve ranitidine related substances I {5-[[(2-aminoethyl)thio]methyl]-N,N,-dimethyl-2-furanmethylamine,hemifumarate} in methanol, make a solution containing 1.3 mg of ranitidine related substances I RS in 1 mL, and use it as the resolution solution. Also, weigh accurately ranitidine related substances II [[N,N'-bis{2-[({5-[dimethylamino)methyl]-2-furanyl}methyl)thio]ethyl}-2-nitro-1,1-ethenediamine] RS, dissolve in methanol, make a solution containing about 1 mg in 1 mL, and use this solution as the identification solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution, the standard solution (1), the standard solution (2), the standard solution (3), the standard solution (4) and the identification solution on the plate made of silica gel with fluorescent indicator for thin-layer chromatography. Separately, drop 10 μL of the test solution in the same plate and drop 10 μL of the resolution solution on the top. Develop the plate with a mixture of ethyl acetate, 2-propanol, ammonia water(28) and water (25 : 15 : 5 : 1) as a developing solvent to a distance of about 15 cm, and air-dry the plate. Expose the plate to iodine steam; none of the spot from the test solution equivalent to the R_f value of the principal spot from the identification solution is larger or more intense than the principal spot from the standard solution (2) (NMT 0.5%). Also, another spot from the test solution is not larger or not more intense than the principal spot from the standard solution (3) (NMT 0.3%). The sum of all the spots other than the principal spot from the test solution is NMT 1.0%. One spot appears in the chromatogram of the standard solution (4), and the principal spot is completely separated from the mixed chromatogram of the test solution and the separation solution.

Loss on drying NMT 0.75% (1 g, 60 ℃, in vacuum, 3 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.1 g of Ranitidine Hydrochloride, transfer to a 100-mL volumetric flask, and dissolve by adding the mobile phase, and fill the flask up to the gauge line. Pipet 1.0 mL of this solution, transfer to a 10-mL volumetric flask, add the mobile phase up to the gauge line, and use this solution as the test solution. Separately, weigh accurately an appropriate amount of Ranitidine Hydrochloride RS, dissolve in mobile phase so that 1 mL contains 0.1 μg, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak areas, A_T and A_S, for the test solution and the standard solution, respectively.

$$\text{Amount (mg) of ranitidine hydrochloride } (C_{13}H_{22}N_4O_3S\cdot HCl) = C \times \frac{A_T}{A_S} \times 1000$$

C: Concentration (mg/mL) of the standard solution

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 322 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and between 20 and 30 cm in length, packed with octadecylsilanized silica gel (3 μm to 10 μm in particle diameter).

Mobile phase: A deaerated and filtered mixture of methanol and 0.1 mol/L ammonium acetate TS (85 : 15).

Flow rate: 2 mL/minute

System suitability

System performance: Weigh accurately an appropriate amount of Ranitidine Hydrochloride RS and ranitidine related substances III [N-{2[({5-[dimethylamino)methyl]-2-furanyl}methyl)sulfinyl]ethyl}-N'-methyl-2-nitro-1,1-ethyldiamine] RS and dissolve in the mobile phase so that 1 mL each of the solution contains 0.1 mg of Ranitidine Hydrochloride RS and 0.01 mg of Ranitidine Hydrochloride related substances III. Proceed with 10 μL each of these solutions according to the above operating conditions; the resolution between the two components is NLT 1.5, the symmetry factor is NMT 2.0, and the plate number is NLT 700.

System repeatability: Repeat the test 6 times with 10 μL of the standard solution according to the above operating conditions; the relative standard deviation of the peak area of ranitidine is NMT 2.0%

Packaging and storage Preserve in light-resistant, tight containers.

Ranitidine Hydrochloride Tablets
라니티딘염산염 정

Ranitidine Hydrochloride Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of ranitidine ($C_{13}H_{22}N_4O_3S$: 314.40).

Method of preparation Prepare Ranitidine Hydrochloride Tablets as directed under Tablets, with Ranitidine Hydrochloride.

Identification (1) The R_f values of the principal spots from the test solution and standard solution of the related substance test are the same.

(2) The retention time of the major peak of the test

solution corresponds to that of the standard solution, as obtained in the Assay.

(3) Weigh an amount of Ranitidine Hydrochloride Tablets, previously powdered, equivalent to 0.1 g of Ranitidine Hydrochloride according to the labeled amount, add 2 mL of water, shake to mix, and filter. The filtrate responds to the Qualitative Analysis for chloride.

Purity ***Related substances***—Take a suitable quantity of tablets and put them to methanol, shake and mix to have complete crumbling of tablets, and filter. Take a suitable amount of the filtrate and make a methanol solution having known concentration of 20 mg of ranitidine (corresponds to 22.3 mg of ranitidine hydrochloride) per mL. Use this solution as the test solution. Weigh accurately a suitable amount of ranitidine hydrochloride RS and dissolve it in methanol. Make a solution containing 0.22 mg per mL and use this solution as the standard stock solution. Take a suitable amount of this standard stock solution and dilute it with methanol to make standard solution (1) containing 110 μg per mL, standard solution (2) containing 66 μg per mL, standard solution (3) containing 22 μg per mL, and standard solution (4) containing 11 μg per mL. Weigh accurately and dissolve ranitidine related substances I {5-[[(2-aminoethyl)thio]methyl]-N,N,-dimethyl-2-furanmethylamine,hemifumarate} in methanol, make a solution containing 1.27 mg of ranitidine related substances per mL, and use it as the resolution solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution, standard stock solution, and standard solutions (1), (2), (3) and (4) on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Separately, drop 10 μL of the test solution on the same plate and drop 10 μL of the resolution solution on the top. After drying, develop the plate with a mixture of ethyl acetate, 2-propanol, ammonia water(28) and water (25 : 15 : 5 : 1) as the developing solvent to a distance of about 15 cm, and air-dry the plate. Allow the plate to stand in iodine vapor; the spots other than the principal spot obtained from the test solution are not more intense than the principal spot from the standard solution (1). Spot 1 other than the principal spot is also not more intense than that from the standard solution (1) (NMT 0.5%). Also, it is not more intense than the spots other than the principal spot obtained from the standard solution (2) (NMT 0.3%) The sum of all the spots other than the principal spot obtained from the test solution is NMT 2.0%. The system is suitable if the principal spots obtained from the test solution and resolution solution are completely separated, and one spot is observed in the standard solution (4).

Dissolution Perform the test with 1 tablet of Ranitidine Hydrochloride Tablets at 50 revolutions per minute according to Method 2 under the Dissolution Test, using 900 mL of water as the dissolution solution. Take 20 mL of the dissolved solution 45 minutes after starting the dissolution test and filter by a membrane filter with a pore size of not exceeding 0.8 μm. Discard the first 10 mL of the filtrate and use the subsequent filtrate as the test solution. Separately, weigh accurately about 0.22 g of Ranitidine Hydrochloride RS and dissolve in water to make exactly 100 mL. Pipet 1 mL of this solution and add water to make 100 mL. Pipet 1 mL of this solution, add water to make 100 mL, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at the absorbance maximum wavelength of about 314 nm as directed under the Ultraviolet-visible Spectroscopy, using the dissolution medium as the control solution.

It meets the requirements if the dissolution rate of Ranitidine Hydrochloride Tablets in 45 minutes is NLT 80%.

Uniformity of Dosage Units It meets the requirements when the procedure for content uniformity is performed as directed under the Assay.

Assay Weigh accurately NLT 20 Ranitidine Hydrochloride Tablets and powder. Weigh accurately an amount equivalent to about 10 Ranitidine Hydrochloride Tablets and add more than 250 mL of the mobile phase, shake and mix until completely dispersed, and then filter. Take a suitable amount of the filtrate and dilute it with the mobile phase to have the same concentration as that of the standard solution. Use this solution as the test solution. Separately, weigh accurately an appropriate amount of Ranitidine Hydrochloride RS, and dissolve in the mobile phase to make a solution of exact concentration containing about 0.12 mg per mL. Use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the operating conditions in the Assay. Determine the peak areas, A_T and A_S, of ranitidine for the test solution and the standard solution, respectively.

$$\text{Amount (mg) of Ranitidine } (C_{13}H_{22}N_4O_3S) = C \times \frac{A_T}{A_S} \times \frac{314.40}{350.87} \times \frac{L}{D}$$

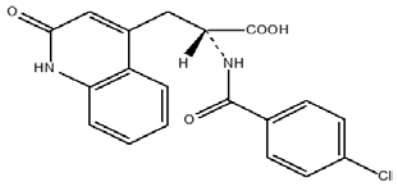
C: Concentration (mg/mL) of standard solution

L: Labeled amount (mg) of Ranitidine in 1 tablet

D: Concentration (mg/mL) of Ranitidine in the test solution according to the labeled amount of ranitidine in 1 tablet

Packaging and storage Preserve in light-resistant, tight containers.

Rebamipide
레바미피드



and enantiomer

$C_{19}H_{15}ClN_2O_4$: 370.79

(2*RS*)-2-(4-Chlorobenzoylamino)-3-(3-oxo-1,2-dihydroquinolin-4-yl)propanoic acid, [*90098-04-7*]

Rebamipide, when dried, contains NLT 99.0% and NMT 101.0% of rebamipide ($C_{19}H_{15}ClN_2O_4$: 370.79).

Description Rebamipide occurs as a white to pale yellow crystalline powder. It is odorless and has a bitter taste.

It is freely soluble in *N*,*N*-dimethylformamide, very slightly soluble in methanol or ethanol and practically insoluble in water or ether.

A solution of Rebamipide in *N*,*N*-dimethylformamide (1 in 20) shows no optical rotation.

Melting point—Between 288 and 294 ℃ (with decomposition).

Identification (1) Perform the Flame Coloration (2) with Rebamipide; the resulting solution exhibits a green color.

(2) Determine the absorption spectrum of a solution of Rebamipide in methanol (7 in 1000000) as directed under the Ultraviolet-visible Spectroscopy; it exhibits absorption maxima at the wavelengths between 228 nm and 232 nm and between 327 nm and 331 nm.

(3) Determine the infrared absorption spectrum of Rebamipide as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; it exhibits absorption at the wavenumbers of about 3280 cm^{-1}, 1730 cm^{-1}, 1644 cm^{-1}, 1602 cm^{-1}, 1540 cm^{-1} and 760 cm^{-1}.

Purity (1) ***Clarity and color of solution***—Weigh 1.0 g of Rebamipide, and dissolve in 20 mL of *N*,*N*-dimethylformamide acid TS; the resulting solution is clear and colorless.

(2) ***Chloride***—Weigh about 0.5 g of Rebamipide, dissolve in 40 mL of *N*,*N*-dimethylformamide, and add 6 mL of dilute nitric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 0.40 mL of 0.01 mol/L hydrochloric acid VS (NMT 0.028%).

(3) ***Heavy metals***—Proceed with about 2.0 g of Rebamipide according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(4) ***Arsenic***—Prepare the test solution with about 1.0 g of Rebamipide according to Method 3 under the Arsenic (NMT 2 ppm).

(5) ***m-Chloro isomer***—Weigh accurately about 20 mg of Rebamipide, dissolve in 5 mL of *N*,*N*-dimethylformamide, add 50% *N*,*N*-dimethylformamide solution to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 20 mg of *m*-chloro isomer, dissolve in 5 mL of *N*,*N*-dimethylformamide, and add 50% *N*,*N*-dimethylformamide solution to make exactly 100 mL (standard solution 1). Pipet 2.0 mL of this solution and add 50% *N*,*N*-dimethylformamide solution to make exactly 100 mL. Pipet 5 mL of this solution, add 50% *N*,*N*-dimethylformamide solution to make exactly 20 mL, and use this solution as the standard solution (standard solution 2). Perform the test with 20 μL each of the test solution and the standard solution 2 according to the following conditions as directed under the Liquid Chromatography. Determine the peak areas of m-chloro isomer in each solutions, AT and AS according to the automatic integration method; A_T is not larger than A_S (NMT 0.5%).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel (5 μm in particle diameter).

Column temperature: Room temperature

Mobile phase: Dissolve 0.58 g of anhydrous sodium monohydrogen phosphate and 2.0 g of potassium dihydrogen phosphate in 1000 mL of water, and filter through a membrane filter with a pore size of NMT 0.45 μm. Take 830 mL of the filtrate and add 170 mL of acetonitile.

Flow rate: Adjust the flow rate so that the retention time of rebamipide is about 20 minutes.

Selection of column: Take 10 mL of the test solution and add 50 μL of the standard solution (1). Proceed with 20 μL of this solution according to the above operating conditions; *m*-chloro isomer and rebamipide are eluted in this order, and the ratio of height between rebamipide peak and *m*-chloro isomer on the peak height of m-chloro isomer is NMT 0.6.

Detection sensitivity: Adjust so that the peak height of *m*-chloro obtained from 20 μL of the standard solution (2) is 5 mm to 10 mm.

Time span of measurement: The range until the termination of peak Elution of Rebamipide.

m-chloro iomer—2-(3-Chlorobenzoylamino)-3-[2(1*H*)-quinolinon-4-yl]propionic acid

(6) ***Debenzoylated isomer*** —Use the test solution in (5) as the test solution. Weigh accurately 12 mg of *debenzoylated isomer* as free base, calculated on the dehydrated basis, dissolve in 10 mL of 0.05 mol/L potassium hydroxide TS, and add 50% *N*,*N*-dimethylformamide solution to make exactly 100 mL. Pipet 2 mL of this solution and add 50% *N*,*N*-dimethylformamide solution to make exactly 100 mL. Pipet 5 mL of this solution, add 50% dimethylformamide solution to make exactly 20 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution according to the following conditions as directed under the Liquid Chromatography Determine the peak areas of debenzoylated isomer A_T and A_S, for each solu-

tion according to the automatic integration method; A_T is not greater than A_S (NMT 0.3%).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 15 cm in length, packed with Aminopropylsilanized silica gel for liquid chromatography (5 μm to 10 μm in particle diameter).

Mobile phase: Dissolve 0.58 g of anhydrous sodium monohydrogen phosphate and 2.0 g of potassium dihydrogen phosphate in 1000 mL of water, and filter through a membrane filter with a pore size of NMT 0.45 μm. Take 200 mL of the filtrate and add 800 mL of acetonitile.

Flow rate: Adjust the flow rate so that the retention time of debenzoylated isomer is about 10 minutes.

Selection of column: Adjust so that the peak height of debenzoylated isomer obtained from 20 μL of the standard solution is 5 mm to 10 mm.

Debenzoyl—2-Amino-3-[2(1*H*)-quinolinone-4-yl]propionate·2HCl

(7) ***Related substances***—Use the test solution in (5) as the test solution. Pipet 2 mL of this solution and add 50% *N*,*N*-dimethylformamide solution to make exactly 100 mL. Pipet 5.0 mL of this solution, add 50% *N*,*N*-dimethylformamide solution to make exactly 20 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution according to the following conditions as directed under the Liquid Chromatography. Determine the peak area of each solution according to automatic integration method; the total area of the peak other than rebamipide from the test solution is not greater than the peak area of rebamipide from the standard solution (NMT 0.5%).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel (5 μm in particle diameter).

Mobile phase: A mixture of water, acetonitrile and acetic acid(100) (70 : 30 : 1).

Flow rate: Adjust the flow rate so that the retention time of rebamipide is about 8 minutes.

Selection of column: Weigh accurately 20 mg of *p*-chlorobenzoic acid, dissolve in exactly 5 mL of *N*,*N*-dimethylformamide, and add 50% dimethylformamide solution to make exactly 100 mL. Pipet 5 mL each of this solution and the test solution, add 50% *N*,*N*-dimethylformamide solution to make exactly 100 mL. Proceed with 20 μL of this solution according to the above operating conditions; use a column from which rebamipide and *p*-chlorobenzoic acid are eluted in this order with the resolution between their peaks being NLT 8.

Detection sensitivity: Adjust so that the peak height of rebamipide obtained from 20 μL of the standard solution is 5 mm to 10 mm.

Time span of area measurement: About 3 times the retention time of rebamipide from the solvent peak.

Loss on drying NMT 3.0% (1 g, 105 °C, 2 hours).

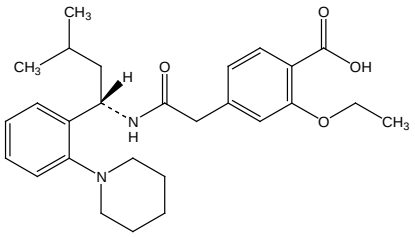
Residue on ignition NMT 0.10% (1 g).

Assay Weigh accurately about 0.6 g of Rebamipide, previously dried, dissolve in 60 mL of *N*,*N*-dimethylformamide, and titrate with 0.1 mol/L potassium hydroxide VS. (indicator: 2 drops of phenol red TS) The endpoint of titration is when the pale yellow color of the solution turns purple. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L potassium hydroxide VS
= 37.08mg of $C_{19}H_{15}ClN_2O_4$

Packaging and storage Preserve in well-closed containers.

Repaglinide
레파글리니드



$C_{27}H_{36}N_2O_4$: 452.59

(*S*)-2-Ethoxy-4-[2-(3-methyl-1-[2-(piperidin-1-yl)phenyl]butylamino)-2-oxoethyl]benzoic acid [*135062-02-1*]

Repaglinide contains NLT 98.0% and not more 101.0% of repaglinide ($C_{27}H_{36}N_2O_4$), calculated on the dried basis.

Description Repaglinide occurs as a white solid.
It is soluble in methanol.

Melting point—Between 132 and 136 ℃.

Identification (1) Determine the absorption spectra of solutions of Repaglinide and Repaglinide RS in methanol (1 in 40000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Repaglinide and Repaglinide RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Repaglinide according to Method 2 and perform the test. Prepare the control solution with 1.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Related substances***—Weigh accurately about 100 mg of Repaglinide, dissolve in methanol to make exactly 10 mL, and use this solution as the test solution. Pipet 1 mL of this solution and add methanol to make exactly 100 mL. Pipet 1 mL of this solution, add methanol to make exactly 10 mL, and use this solution as the standard solution. Perform the test with 3 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak area of each solution according to the automatic integration method and determine the amount of related substances; repaglinide related substances I with 1.2 of the relative retention time for repaglinide from the test solution, repaglinide related substances II with 0.2 of the relative retention time or repaglinide related substances III with 0.9 of the relative retention time is NMT 0.1%, and the total related substances is NMT 0.5%. However, exclude any peaks smaller than 0.05%.

$$\text{Content (\%) of related substances} = \frac{A_T}{A_S} \times rf \times \frac{1}{10}$$

A_T: Peak area of each related substance from the test solution

A_S: Peak area of repaglinide from the standard solution

rf: The correction factor for each related substance for repaglinide peak

Repaglinide related substances I: 3.36
Repaglinide related substances II: 0.68
Repaglinide related substances III: 0.93
Other related substances: 1.00

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 240 nm).

Column: A stainless steel column about 4.6 mm in inside diameter and about 12.5 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 45 ℃.

Mobile phase: Use mobile phases A and B to control stepwise or based on the gradient elution as follows.

Mobile phase A: Dissolve 3 g of potassium dihydrogen phosphate in 1000 mL of water, and adjust pH to 7.0 with 1 mol/L sodium hydroxide TS.

Mobile phase B: Methanol

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0	40	60
0 - 2	40 → 30	60 → 70
2 - 8	30	70
8 - 12	30 → 10	70 → 90
12 - 15	10	90

Flow rate: 1.0 mL/min

System suitability

Test for required detectability: Pipet 5 mL of the standard solution and add the mobile phase to make exactly 10 mL. Proceed with 3 μL of this solution according to the above conditions; confirm that the signal-to-noise ratio of repaglinide peak is NLT 10.

System performance: Proceed with 3 μL of the standard solution according to the above conditions; the symmetry factor for repaglinide peak is NLT 0.8 and NMT 2.0.

System repeatability: Repeat the test 6 times with 3 μL of the standard solution according to the above conditions; the relative standard deviation of the peak area of repaglinide is NMT 10%.

Isomer Perform the test without exposure to light, using light-resistant containers. Weigh exactly 10 mg of Repaglinide, add methanol to make exactly 10 mL, and use this solution as the test solution. Dissolve an appropriate amount of repaglinide enantiomer {2-ethoxy-4-[2-({(1R)-3-methyl-1-[2-(piperidin-1-yl)phenyl]butyl}amino)-2-oxoethyl]benzoic acid} RS in methanol to make a concentration of 2.0 μg/mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions; the amount of repaglinide enantiomer is NMT 0.2%.

$$\text{Content (\%) of repaglinide enantiomer} = (C_S/C_T) \times (A_i/A_S) \times 100$$

C_S: Concentration (mg/mL) of repaglinide enantiomer in the standard solution

C_T: Concentration (mg/mL) of repaglinide in the test solution

A_i: Peak area of repaglinide enantiomer obtained from the test solution

A_S: Peak area of repaglinide enantiomer obtained from the standard solution

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 240 nm).

Column: A stainless steel column about 4.0 mm in internal diameter and about 10 cm in length, packed with silica gel for liquid chromatography (5 μm in particle diameter, α1-acid glycoprotein).

Use mobile phases A and B to control stepwise or based on the gradient elution as follows.

Mobile phase A: Dissolve 1 g of potassium dihydrogen phosphate in 1000 mL of water and adjust pH to 4.7 with 2N sodium hydroxide TS or phosphoric acid.

Mobile phase B: Acetonitrile

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 - 4	80 → 60	20 → 40
4 - 6	60	40

Flow rate: 1.0 mL/min
Injection volume: 10 μL
System suitability

Test for required detectability: Proceed with solutions of 1.0 mg/mL of repaglinide RS and 0.02 mg/mL of repaglinide enantiomer RS in methanol as the system suitability solution according to the above conditions; the resolution between repaglinide and repaglinide enantiomer is NLT 1.5.

Loss on drying NMT 0.5% (30 mg, 105 ℃, constant mass).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 25 mg each of Repaglinide and Repaglinide RS, dissolve in methanol to make exactly 50 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions and determine the peak areas A_T and A_S of repaglinide.

$$\text{Amount (mg) of repaglinide } (C_{27}H_{36}N_2O_4) = \text{Amount (mg) of repaglinide RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 240 nm).

Column: A stainless steel column about 4.6 mm in inside diameter and about 12.5 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 45 ℃.

Mobile phase: A mixture of phosphate buffer solution and methanol (200 : 800).

Flow rate: 1.0 mL/min

System suitability

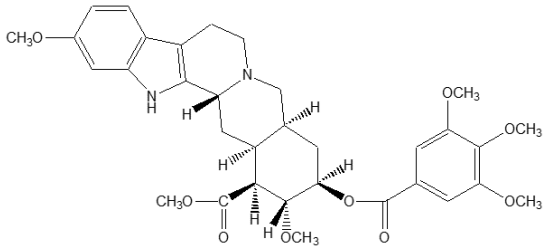
System performance: Dissolve 25 mg of repaglinide RS and 2 mg of repaglinide related substance II RS in methanol to make 50 mL and proceed with 10 μL of this solution according to the above conditions; the relative retention time is 1.0 and 0.4, respectively.

System repeatability: Repeat the test 5 times with 10 μL of the standard solution according to the above conditions; the relative standard deviation of the peak area of repaglinide is NMT 2.0%.

Phosphate buffer solution—Add phosphoric acid in potassium dihydrogen phosphate solution (1 in 1000) and adjust pH to 2.5.

Packaging and storage Preserve in tight containers.

Reserpine
레세르핀



$C_{33}H_{40}N_2O_9$: 608.68

Methyl(1*R*,15*S*,17*R*,18*R*,19*S*,20*S*)-6,18-dimethoxy-17-(3,4,5-trimethoxybenzoyl)oxy-1,3,11,12,14,15,16,17,18,19,20,21-dodecahydroyohimban-19-carboxylate [*50-55-5*]

Reserpine, when dried, contains NLT 96.0% and NMT 101.0% of reserpine ($C_{33}H_{40}N_2O_9$).

Description Reserpine occurs as white to pale yellow crystals or a crystalline powder.
It is freely soluble in acetic acid(100) or chloroform, slightly soluble in acetonitrile, very slightly soluble in ethanol(95), and practically insoluble in water or ether.
It is affected by light.

Identification (1) To 1 mg of Reserpine, add 1 mL of vanillin-hydrochloric acid TS and warm; the resulting solution exhibits a vivid purple color.

(2) Determine the absorption spectra of solutions of Reserpine and reserpine RS in acetonitrile (1 in 50,000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared spectra of Reserpine and Reserpine RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Optical rotation $[\alpha]_D^{20}$: Between -114° and -127° (0.25 g after drying, chloroform, 25 mL, 100 mm).

Purity ***Related substances***—Perform this procedure without exposure to daylight, using a light-resistant container. Dissolve 50 mg of Reserpine in 50 mL of acetonitrile, and use this solution as the test solution. Pipet 3 mL of this solution, add acetonitrile to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak area of each solution as directed in the automatic integration method; the sum of peak areas other than reserpine from the test solution is not greater than the peak area of

reserpine from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 268 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: A mixture of pH 3.0 0.05 mol/L potassium dihydrogen phosphate and acetonitrile (13 : 7).

Flow rate: Adjust the flow rate so that the retention time of reserpine is about 20 minutes.

System suitability

Detection sensitivity: Adjust the sensitivity so that the peak height of reserpine obtained from 10 μL of the standard solution is about 20 mm.

System performance: Dissolve 10 mg of Reserpine and 4 mg of butyl p-hydroxybenzoate in 100 mL of acetonitrile. To 5 mL of this solution, add acetonitrile to make 50 mL. Proceed with 20 μL of this solution according to the operating conditions in the Assay; reserpine and butyl p-hydroxybenzoate are eluted in this order with the resolution being NLT 2.0.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak areas of reserpine is NMT 2.0%.

Time span of measurement: About 2 times the retention time of reserpine.

Loss on drying NMT 0.5% (0.2 g, in vacuum, 60 ℃, 3 hours).

Residue on ignition NMT 0.2% (0.2 g).

Assay Perform this procedure without exposure to daylight, using a light-resistant container. Weigh accurately about 10 mg each of Reserpine and Reserpine RS, previously dried, and dissolve each in acetonitrile to make exactly 100 mL. Pipet 5 mL each of the solution, add 10 mL of internal standard solution, 5 mL of acetonitrile and water to make 50 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the peak area ratios, Q_T and Q_S, of reserpine to the internal standard, respectively.

$$\text{Amount (mg) of reserpine } (C_{33}H_{40}N_2O_9) = \text{Amount (mg) of reserpine RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of butyl p-hydroxybenzoate in acetonitrile (1 in 50,000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 268 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: A mixture of pH 3.0 0.05 mol/L potassium dihydrogen phosphate and acetonitrile (11 : 9).

Flow rate: Adjust the flow rate so that the retention time of reserpine is about 10 minutes.

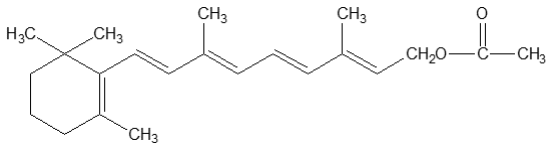
System suitability

System performance: Proceed with 20 μL of the standard solution according to the above conditions; reserpine and the internal standard are eluted in this order with the resolution being NLT 2.0.

System repeatability: Repeat the test 6 times with 20 μL each of the standard solution according to the above conditions; the relative standard deviation of the ratios of the peak area of reserpine to that of the internal standard is NMT 2.0%.

Packaging and storage Preserve in light-resistant, tight containers.

Retinol Acetate
레티놀아세테이트



Vitamin A Acetate $C_{22}H_{32}O_2$: 328.49

(2*E*,4*E*,6*E*,8*E*)-3,7-Dimethyl-9-(2,6,6-trimethylcyclohexen-1-yl)nona-2,4,6,8-tetraenylacetate [*127-47-9*]

Retinol Acetate is synthetic retinol acetate or a combination of synthetic retinol acetate and vegetable oil, containing NLT 2,500,000 vitamin A units per gram. A suitable antioxidant may be added.

Retinol Acetate contains NLT 95.0% and NMT 105.0% of the labeling unit.

Description Retinol Acetate occurs as pale yellow to yellowish red crystals or a ointment-like material. It has a non-rancid, slightly characteristic odor.

It, when powdered, is very soluble in chloroform or ether, freely soluble in petroleum ether, soluble in ethanol(95) or 2-propanol, and is practically insoluble in water.

It is affected by air or light.

Identification Weigh an amount equivalent to 15,000 units of Retinol Acetate and Retinol Acetate RS, dissolve each in 5 mL of petroleum ether, and use these solutions as the test solution and the standard solution, respectively. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-

layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of cyclohexane and ether (12 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Spray evenly antimony(III) chloride TS on the plate; the colors and R_f values of the principal spot obtained from the test solution and the blue spot from the standard solution are the same.

Purity (1) ***Acid value***—NMT 2.0. Weigh accurately 5.0 g of Retinol Acetate and perform the test.

(2) ***Peroxide***—Weigh accurately 5 g of Retinol Acetate, place in a 250 mL stoppered Erlenmeyer flask, add 50 mL of a mixture of Acetic acid(100) and isooctane (3 : 2), and dissolve by shaking gently to mix. Pass gently about 600 mL of nitrogen through this solution to replace the air in the flask. While passing the nitrogen again, add 0.1 mL of saturated potassium iodide TS, immediately stopper the flask, and mix by shaking in a constant circular motion for 1 minute. Add 30 mL of water, stopper the flask, and mix by shaking vigorously for 5 to 10 seconds. Titrate this solution with 0.01 mol/L sodium thiosulfate VS. However, the endpoint of the titration is when the blue color obtained by adding 0.5 mL of starch TS becomes decolorized as the solution near the endpoint turns pale yellow. Calculate the amount of peroxide according to the following equation; the value is NMT 10 meq/kg.

$$\text{Amount (meq/kg) of peroxide} = (V / W)\times 10$$

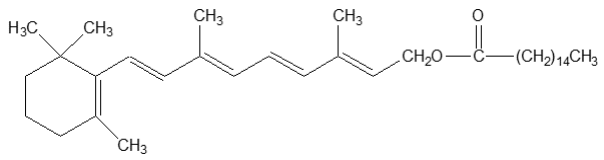
V: Volume (mL) of 0.01 mol/L sodium thiosulfate VS consumed

W: Amount (g) of Retinol Acetate taken

Assay Perform the test according to Method 1 under the Vitamin A Assay.

Packaging and storage Preserve in light-resistant, tight containers, by almost fully filling the container or replacing the air of an empty space with nitrogen, in a cold place.

Retinol Palmitate
레티놀팔미테이트



Vitamin A Palmitate $C_{36}H_{60}O_2$: 524.86

(2*E*,4*E*,6*E*,8*E*)-3,7-Dimethyl-9-(2,6,6-tri-methylcyclohexen-1-yl)nona-2,4,6,8-tetraenyl hexadecanoate

[*79-81-2*]

Retinol Palmitate is synthetic retinol palmitate or a combination of synthetic retinol palmitate and vegetable oil, containing NLT 1,500,000 vitamin A units per gram.

A suitable antioxidant may be added.

Retinol Palmitate contains NLT 95.0% and NMT 105.0% of the labeling unit.

Description Retinol Palmitate occurs as a pale yellow to yellowish red, solid oil phase or oil phase material. It has a non-rancid, slightly characteristic odor.
It is very soluble in petroleum ether, slightly soluble in ethanol(95), and practically insoluble in water.
It is decomposed by air or light.

Identification Take an amount equivalent to 15,000 units each of Retinol Palmitate and Retinol Palmitate RS, dissolve each in 5 mL of petroleum ether, and use these solutions as the test solution and the standard solution, respectively. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of cyclohexane and ether (12 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Spray evenly antimony(III) chloride TS on the plate; the colors and R_f values of the principal spot obtained from the test solution and the blue spot from the standard solution are the same.

Purity (1) ***Acid value***—NMT 2.0. Weigh accurately 5.0 g of Retinol Palmitate and perform the test.

(2) ***Peroxide***—Weigh accurately 5 g of Retinol Palmitate, place in a 250 mL stoppered Erlenmeyer flask, add 50 mL of a mixture of Acetic acid(100) and isooctane (3 : 2), and dissolve by shaking gently to mix. Pass gently about 600 mL of nitrogen through this solution to replace the air in the flask. While passing the nitrogen again, add 0.1 mL of saturated potassium iodide TS, immediately stopper the flask, and shake to mix in a constant circular motion for 1 minute. Add 30 mL of water, stopper the flask, and mix by shaking vigorously for 5 to 10 seconds. Titrate this solution with 0.01 mol/L sodium thiosulfate VS. However, the endpoint of the titration is when the blue color obtained by adding 0.5 mL of starch TS is decolorized as the solution near the endpoint turns pale yellow. Calculate the amount of peroxide according to the following equation; the value is NMT 10 meq/kg.

$$\text{Amount (meq/kg) of peroxide} = (V / W)\times 10\ \text{mol/L}$$

V: Volume (mL) of 0.01 mol/L sodium thiosulfate VS consumed

W: Amount (g) of Retinol Palmitate taken

Assay Perform the test according to Method 1 under the Vitamin A Assay.

Packaging and storage Preserve in light-resistant, tight containers, as almost well-filled or under nitrogen atmos-

phere, and in a cold place.

Retinol Palmitate Oil
레티놀팔미테이트유

Vitamin A Palmitate Oil

Retinol Palmitate Oil contains NLT 1000,000 IU of retinol palmitate ($C_{36}H_{60}O_2$: 524.87) (vitamin A) per g.

Method of preparation Prepare Retinol Palmitate Oil by adding tocopherol, antioxidant and vegetable oil to retinol palmitate.

Description Retinol Palmitate Oil occurs as a greenish yellow to yellow oily liquid.

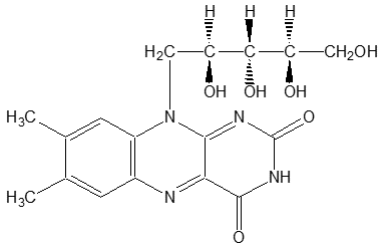
Identification Perform the test with Retinol Palmitate Oil as directed under the Identification of Retinol Palmitate under the Analysis for Vitamins.

Acid value NMT 2.0.

Assay Perform the test with Retinol Palmitate Oil as directed under the Assay of Retinol Palmitate under the Analysis for Vitamins.

Packaging and storage Preserve in light-resistant, tight containers.

Riboflavin
리보플라빈



Vitamin B_2 $C_{17}H_{20}N_4O_6$: 376.36

7,8-Dimethyl-10-[(2*S*,3*S*,4*R*)-2,3,4,5-tetrahydroxypentyl]benzo[g]pteridine-2,4-dione [*83-88-5*]

Riboflavin, when dried, contains NLT 98.0% and NMT 101.0% of Riboflavin ($C_{17}H_{20}N_4O_6$).

Description Riboflavin occurs as yellow to orange crystals and has a slight odor.
It is very slightly soluble in water and practically insoluble in ethanol(95), acetic acid(100) or ether.
It dissolves in sodium hydroxide TS.
A saturated solution of Riboflavin is neutral.
It is decomposed by light.

Melting point—About 290 °C (with decomposition).

Identification (1) An aqueous solution of Riboflavin (1 in 100000) is pale yellowish green and has an intense yellowish green fluorescence. To 5 mL of this solution, add 20 mg of sodium hydrosulfite; the color and fluorescence of the solution disappear, but reappear slowly on shaking the mixture in air. This fluorescence disappears upon the addition of dilute hydrochloric acid or sodium hydroxide TS.

(2) Transfer 10 mL of a solution of Riboflavin (1 in 100000) into a glass-stoppered test tube, add 1 mL of sodium hydroxide TS, and illuminate with a fluorescence lamp of 10 to 30 watts at 20 cm distance for 30 minutes at 20 to 40 ℃. Acidify with 0.5 mL of acetic acid(31), add 5 mL of chloroform, and shake well to mix; the chloroform layer shows a yellowish green fluorescence.

(3) Determine the absorption spectra of solutions of Riboflavin and Riboflavin RS in phosphate buffer solution, pH 7.0 (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

Optical rotation $[\alpha]_D^{20}$: Between -128° and -142°. Weigh accurately about 0.1 g of Riboflavin, previously dried, dissolve in exactly 4 mL of dilute sodium hydroxide TS, add 10 mL of freshly boiled and cooled water, and add exactly 4.0 mL of aldehyde-free alcohol while shaking well to mix. Add freshly boiled and cooled water to make exactly 20 mL, and determine the optical rotation in a 100 mm cell within 30 minutes after preparing the solution.

Purity ***Lumiflavin***—To 25 mg of Riboflavin, add 10 mL of ethanol-free chloroform, shake to mix for 5 minutes, and filter. The color of the filtrate is not more intense than that of the following control solution.

Control solution—Take 2.0 mL of $\frac{1}{60}$ mol/L potassium dichromate, and add water to make exactly 1000 mL.

Loss on drying NMT 1.5% (0.5 g, 105 ℃, 2 hours).

Residue on ignition NMT 0.2% (1 g).

Assay Perform the test without exposure to daylight, using light-resistant vessels. Weigh accurately about 15 mg of Riboflavin, previously dried, dissolve in 800 mL of diluted acetic acid(100) (1 in 400) by warming, cool, add water to make exactly 1000 mL, and use this solution as the test solution. Separately, weigh accurately about 15 mg of Riboflavin RS, previously dried at 105 ℃ for 2 hours, dissolve in 800 mL of diluted acetic acid(100) (1 in 400) by warming, cool, and add water to make exactly 1000 mL. Use this solution as the standard solution. Perform the test with the test solution and the standard solution as directed under the Ultraviolet-visible Spectroscopy using water as the control solution, and determine the absorbances, A_T and A_S, at a wavelength of 445 nm. Add 20 mg of sodium hydrosulfite to 5 mL of each solution, shake until it decolorized, and immediately measure the

absorbances, A_T and A_S of these solutions.

$$\text{Amount (mg) of Riboflavin } (C_{17}H_{20}N_4O_6) = \text{Amount (mg) of Riboflavin RS} \times \frac{A_T - A_{T'}}{A_S - A_{S'}}$$

Packaging and storage Preserve in light-resistant, tight containers.

33.3% Riboflavin Powder
리보플라빈 3배산

33.3% riboflavin powder contains NLT 32.6% of riboflavin ($C_{17}H_{20}N_4O_6$: 376.36), calculated on the anhydrous basis.

Method of preparation Prepare by finely dispersing Riboflavin in edible fatty acid. A corn starch may be added. 33.3% Riboflavin Powder is a drug substance.

Description 33.3% Riboflavin Powder occurs a yellow to orangey yellow powder.

Identification Perform the test with 33.3% Riboflavin Powder as directed under the Identification for Riboflavin in the Pharmacopoeia.

Water NMT 1.0% (0.5 g, volumetric titration, direct titration).

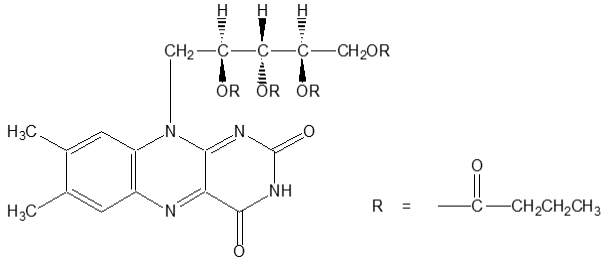
Residue on ignition NMT 0.1% (1 g).

Assay Perform the test using light-resistant containers. Weigh accurately an amount of 33.3% Riboflavin Powder, equivalent to about 15 mg of riboflavin, add 800 mL of diluted acetic acid(100) (1 in 400), and warm to dissolve. After cooling, add water to make 1000 mL, and use this solution as the test solution. Separately, dry riboflavin RS at 105 ℃ for 2 hours. Weigh accurately about 15 mg, add 800 mL of diluted acetic acid(1 in 400), warm to dissolve, cool, add water to make 1000 mL, and use this solution as the standard solution. Perform the test with the test solution and the standard solution as directed under the Ultraviolet-visible Spectroscopy using water as a control solution, and determine the absorbances, A_T and A_S, at a wavelength of 445 nm. Add sodium hydrosulfite in an amount of 20 mg per 5 mL of each solution, shake to mix until decolorized, and immediately measure the absorbances, A_T and A_S of these solutions.

$$\text{Amount (mg) of riboflavin } (C_{27}H_{20}N_4O_6) = \text{Amount (mg) of riboflavin RS} \times \frac{A_T - A_{T'}}{A_S - A_{S'}}$$

Packaging and storage Preserve in light-resistant, tight containers.

Riboflavin Butyrate
리보플라빈부티레이트



$C_{33}H_{44}N_4O_{10}$: 656.72

[(2*R*,3*S*,4*S*)-2,3,4-Tri(butanoyloxy)-5-(7,8-dimethyl-2,4-dioxobenzo[g]pteridin-10-yl)pentyl] butanoate [*752-56-7*]

Riboflavin Butyrate, when dried, contains NLT 98.5% and NMT 101.0% of Riboflavin Butyrate ($C_{33}H_{44}N_4O_{10}$).

Description Riboflavin Butyrate occurs as orange crystals or a crystalline powder and has a characteristic odor and a slightly bitter taste.
It is freely soluble in methanol, ethanol(95) or chloroform, slightly soluble in ether, and practically insoluble in water.
It is decomposed by light.

Identification (1) A solution of Riboflavin Butyrate in ethanol(95) (1 in 100000) shows a pale yellow color with intense yellowish green fluorescence. To this solution, add dilute hydrochloric acid or sodium hydroxide TS; the fluorescence disappears.

(2) Dissolve 10 mg of Riboflavin Butyrate in 5 mL of ethanol(95), and add 2 mL of a mixture of sodium hydroxide (3 in 20) and hydroxylamine hydrochloride (3 in 20) (1 : 1), and shake well to mix. Add 0.8 mL of hydrochloric acid and 0.5 mL of iron(III) chloride TS, and add 8 mL of ethanol(95); the resulting solution exhibits a deep reddish brown color.

(3) Determine the absorption spectra of solutions of Riboflavin Butyrate and Riboflavin Butyrate RS in ethanol (4 in 250000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

Melting point Between 146 and 150 ºC.

Purity (1) ***Chloride***—Dissolve 2.0 g of Riboflavin Butyrate in 10 mL of methanol, add 24 mL of dilute nitric acid and water to make exactly 100 mL, shake well to mix, and allow to stand for 10 minutes. Filter, discard the first 10 mL of the filtrate, and use the subsequent filtrate as the test solution. To 25 mL of the test solution, add water to make exactly 50 mL, add 1 mL of silver nitrate TS, and allow to stand for 5 minutes; the turbidity of the solution is not more intense than that of the following control solution.

Control solution—To 25 mL of the test solution, add 1 mL of silver nitrate TS, allow to stand for 10 minutes, and filter. Wash the precipitate with 5 mL of water 4 times, combine the washings with the filtrate, add 0.30 mL of 0.01 mol/L hydrochloric acid and water to make exactly 50 mL, add again 1 mL of water, and mix (NMT 0.021%).

(2) ***Heavy metals***—Proceed with about 2.0 g of Riboflavin Butyrate as directed under Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Free acid***—Take 1.0 g of Riboflavin Butyrate, add 50 mL of freshly boiled and cooled water, shake to mix, and filter. Take 25 mL of the filtrate, add 0.50 mL of 0.01 mol/L sodium hydroxide TS and 2 drops of phenolphthalein TS; the color of the solution is red.

(4) ***Related substances***—Dissolve 0.10 g of Riboflavin Butyrate in 10 mL of chloroform, and use this solution as the test solution. Pipet 1.0 mL of the test solution and add chloroform to make exactly 50 mL. Pipet 5 mL of this solution, add chloroform to make exactly 20 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of chloroform and 2-propanol (9 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 0.5% (1 g, in vacuum, silica gel, 4 hours).

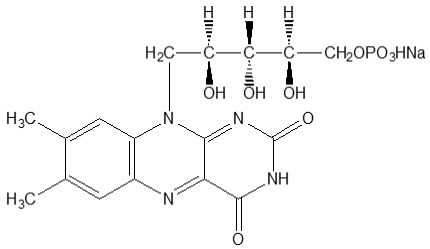
Residue on ignition NMT 0.1% (1 g).

Assay Perform the test in a light-resistant container away from direct sunlight. Weigh accurately about 40 mg of Riboflavin Butyrate, previously dried, and dissolve in ethanol(95) to make exactly 500 mL. Pipet 10 mL of this solution, add ethanol(95) to make exactly 50 mL, and use this solution as the test solution. Separately, weigh accurately about 50 mg of Riboflavin RS, previously dried at 105 ℃ for 2 hours, dissolve in 150 mL of diluted acetic acid(100) (2 in 75) by warming, cool, and add water to make exactly 500 mL. Pipet 5 mL of this solution, add ethanol(95) to make exactly 50 mL, and use this solution as the standard solution. Determine the absorbances, A_T and A_S of the test solution and the standard solution, respectively, at a wavelength of 445 nm as directed under the Ultraviolet-visible Spectroscopy.

Amount (mg) of Riboflavin Butyrate ($C_{33}H_{44}N_4O_{10}$)
= Amount (mg) of riboflavin RS $\times \frac{A_T}{A_S} \times 1.7449 \times \frac{1}{2}$

Packaging and storage Preserve in light-resistant, tight containers.

Riboflavin Sodium Phosphate
리보플라빈포스페이트나트륨



Vitamin B2 Phosphate
Riboflavin Phosphate $C_{17}H_{20}N_4NaO_9P$: 478.33
Sodium[(2*S*,3*R*,4*R*)-5-(7,8-dimethyl-2,4-dioxobenzo[g]pteridin-10-yl)-2,3,4-trihydroxypentyl] hydrogen phosphate [*130-40-5*]

Riboflavin Sodium Phosphate contains NLT 92.0% and NMT 101.0% of Riboflavin Sodium Phosphate ($C_{17}H_{20}N_4NaO_9P$), calculated on the anhydrous basis.

Description Riboflavin Sodium Phosphate occurs as a yellow to orange crystalline powder. It is odorless and has a slightly bitter taste.
It is soluble in water and practically insoluble in ethanol(95), chloroform or ether.
It is decomposed by light.
It is very hygroscopic.

Identification (1) A solution of Riboflavin Sodium Phosphate (1 in 100000) is pale yellowish green and has an intense yellowish green fluorescence. To 5 mL of the solution, add 20 mg of sodium hydrosulfite; the color and fluorescence of the solution disappear, but reappear slowly on shaking the mixture in air. This fluorescence disappears upon the addition of dilute hydrochloric acid or sodium hydroxide TS.

(2) Transfer 10 mL of a solution of Riboflavin Sodium Phosphate (1 in 100000) into a glass-stoppered test tube, add 1 mL of sodium hydroxide TS, illuminate with a fluorescence lamp of 10 to 30 watts at 20 cm distance for 30 minutes between 20 and 40 ℃, acidify with 0.5 mL of acetic acid(31), and shake with 5 mL of chloroform; the chloroform layer shows a yellowish green fluorescence.

(3) Determine the absorption spectra of solutions of Riboflavin Sodium Phosphate and riboflavin sodium phosphate RS in phosphate buffer solution, pH 7.0 (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(4) Take 50mg of Riboflavin Sodium Phosphate, add 10 mL of nitric acid, evaporate on a steam bath to dryness, and ignite. Boil the residue with 10 mL of diluted nitric acid (1 in 50) for 5 minutes, After cooling, neutralize with ammonia TS, and filter, if necessary; the fil-

trate responds to the Qualitative Analysis for sodium salt and phosphate.

Optical rotation $[\alpha]_D^{20}$: Between + 38° and +43° (0.3 g calculated on the anhydrous basis, 5 mol/L hydrochloric acid TS, 20 mL, 100 mm).

pH Dissolve 0.20 g of Riboflavin Sodium Phosphate in 20 mL of water; the pH of the resulting solution is between 5.0 and 6.5.

Purity (1) ***Clarity and color of solution***—Dissolve 0.20 g of Riboflavin Sodium Phosphate in 10 mL of water; the solution is clear and yellow to orange.

(2) ***Heavy metal***—Proceed with 2.0 g of Riboflavin Sodium Phosphate according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Lumiflavin***—To 35 mg of Riboflavin Sodium Phosphate, add 10 mL of ethanol-free chloroform, shake to mix for 5 minutes, and filter. The color of the filtrate is not more intense than that of the following control solution.

Control solution—To 3.0 mL of 1/60 mol/L potassium dichromate, add water to make 1000 mL.

(4) ***Free phosphoric acid***—Weigh accurately about 0.4 g of Riboflavin Sodium Phosphate, dissolve in water to make exactly 100 mL, and use this solution as the test solution. Pipet 5 mL each of the test solution and phosphoric acid standard solution, transfer to 25 mL volumetric flasks, add 2.5 mL of ammonium molybdate-sulfuric acid TS and 1 mL of 1-amino-2-naphthol-4-sulfonic acid TS, respectively. Shake to mix, add water to make exactly 25 mL, and allow to stand for 30 minutes at 20 ± 1 ℃. Perform the test with these solutions as directed under the Ultraviolet-visible Spectrophotometry, using a solution prepared with 5 mL of water in the same manner as the blank, and determine the absorbances, A_T and A_S, of the test solution and the phosphoric acid standard solution at a wavelength of 740 nm; the free phosphoric acid content is NMT 1.5%.

$$\text{Content (\%) of free phosphoric acid } (H_3PO_4) = \frac{A_T}{A_S} \times \frac{1}{W} \times 257.8$$

W: Amount (mg) of Riboflavin Sodium Phosphate calculated on the anhydrous basis

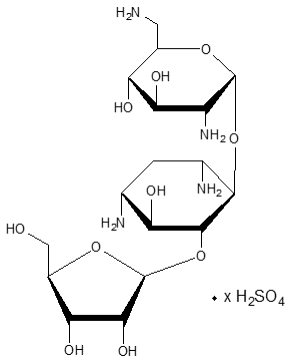
Water Transfer 25 mL of a mixture of methanol for water determination and ethylene glycol for water determination (1 : 1) to a dry flask for titration, and titrate with a test solution for water determination to the endpoint. Weigh accurately about 0.1 g of Riboflavin Sodium Phosphate, and quickly transfer to the titration flask, add a certain amount of the excess test solution for water determination, stir to mix for 10 minutes, and perform the test; the water content is NMT 10.0%.

Assay Perform the test without exposure to daylight, using light-resistant vessels. Weigh accurately about 0.1 g of Riboflavin Sodium Phosphate, and dissolve in diluted acetic acid(100) (1 in 500) to make exactly 1000 mL. Pipet 10 mL of this solution, add diluted acetic acid(100) (1 in 500) to make exactly 50 mL, and use this solution as the test solution. Separately, weigh accurately about 15 mg of Riboflavin RS, previously dried at 105 ℃ for 2 hours, dissolve in 800 mL of diluted acetic acid(100) (1 in 400) by warming, cool, add water to make exactly 1000 mL, and use this solution as the standard solution. Perform the test with the test solution and the standard solution as directed under the Ultraviolet-visible Spectrophotometry, using water as the blank. Determine the absorbances, A_T and A_S, at 445 nm. Add 20 mg of sodium hydrosulfite to 5 mL of each solution, shake until decolorized, and immediately measure the absorbances, A_T' and A_S', of the solutions.

$$\text{Amount (mg) of riboflavin sodium phosphate } (C_{17}H_{20}N_4NaO_9P) = \text{Potency (mg) of riboflavin RS} \times \frac{A_T - A_{T'}}{A_S - A_{S'}} \times 1.2709 \times 5$$

Packaging and storage Preserve in light-resistant, tight containers.

Ribostamycin Sulfate
리보스타마이신황산염



$C_{17}H_{34}N_4O_{10}\cdot xH_2SO_4$

5-Amino-2-(aminomethyl)-6-[4,6-diamino-2-[(2*S*,4*R*,5*R*)-3,4-dihydroxy-5-(hydroxy-methyl)oxolan-2-yl]oxy-3-hydroxycyclohexyl]oxyoxane-3,4-diol; sulfuric acid [*53797-35-6*]

Ribostamycin Sulfate is a peptide compound with antibacterial activity produced by the growth *Streptomyces ribosidificus*.

Ribostamycin Sulfate contains NLT 680 μg and NMT 780 μg (potency) of ribostamycin ($C_{17}H_{34}N_4O_{10}$: 454.47) per mg, calculated on the dried basis.

Description Ribostamycin Sulfate occurs as a white to pale yellow powder.

It is very soluble in water and practically insoluble in ethanol(95).

Identification (1) Dissolve 0.12 g each of Ribostamycin Sulfate and ribostamycin sulfate RS in 20 mL of water and use these solutions as the test solution and the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solutions and the standard solutions on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Develop the plate with potassium dihydrogen phosphate (3 in 40) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Spray evenly 0.2% ninhydrin-water saturated 1-butanol TS on the plate, and heat the plate at 100 ℃ for 10 minutes; the principal spot obtained from the test solution and the spots from the standard solution exhibit a purplish brown color, and their R_f values are identical.

(2) An aqueous solution of Ribostamycin Sulfate (1 in 5) responds to the Qualitative Analysis (1) for sulfate.

Optical rotation $[\alpha]_D^{20}$: Between +42° and +49° (0.25 g, after drying, 25 mL of water, 100 mm).

pH Dissolve 1.0 g (potency) of Ribostamycin Sulfate in 20 mL of water; the pH of this solution is between 6.0 and 8.0.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Ribostamycin Sulfate in 5 mL of water; the resulting solution is clear and colorless to pale yellow.

(2) ***Heavy metals***—Proceed with 1.0 g of Ribostamycin Sulfate according to Method 1 and perform the test. Prepare the control solution with 3.0 mL of lead standard solution (NMT 30 ppm).

(3) ***Arsenic***—Proceed with 1.0 g of Ribostamycin Sulfate according to Method 1 and perform the test (NMT 2 ppm).

(4) ***Related substances***—Dissolve 0.12 g of Ribostamycin Sulfate in water to make 20 mL, and use this solution as the test solution. Pipet 5 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Develop the plate with potassium dihydrogen phosphate (3 in 40) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Spray evenly 0.2% ninhydrin-water saturated 1-butanol TS on the plate and heat the plate at 100 ℃ for 10 minutes; the spots other than the principal spot obtained from the test solution are not more intense than those from the standard solution.

Loss on drying NMT 5.0% (0.5 g, NMT 0.67 kPa, 60 ℃, 3 hours).

Residue on ignition NMT 1.0% (1 g).

Sterility It meets the requirements when Ribostamycin Sulfate is used in sterile preparations. However it is exempt from the requirements when there is a final sterilization process in the manufacturing process of sterile preparations.

Bacterial endotoxins Less than 0.50 EU per mg (potency) of ribostamycin when used for the manufacturing of sterile preparations.

Assay ***Cylinder plate method*** (1) Medium: Agar media for seed and base layer Use the medium of the Microbial Assays for Antibiotics (A) (2) (a) ① ⓐ.

(2) Test organism: Use *Bacillus subtilis* ATCC 6633 as the test organism.

(3) Weigh accurately an amount of Ribostamycin Sulfate, equivalent to about 20 mg (potency), and dissolve in water to make exactly 50 mL. Take exactly an appropriate amount of this solution, dilute with 0.1 mol/L phosphate buffer solution, pH 8.0, to make solutions containing 20 μg (potency) and 5 μg (potency) per mL, and use these solutions as the high concentration test solution and the low concentration test solution, respectively. Separately, weigh accurately an amount of ribostamycin sulfate RS, previously dried, equivalent to about 20 mg (potency), and dissolve in diluted phosphate buffer solution, pH 6.0, (1 in 2) to make exactly 50 mL, and use this solution as the standard stock solution. Preserve the standard stock solution below 5 to 15 ℃, and use it within 20 days. Pipet an appropriate amount of the standard stock solution, dilute with 0.1 mol/L phosphate buffer solution, pH 8.0, to make solutions containing 20 μg (potency) and 5 μg (potency) per mL, and use these solutions as the high concentration standard solution and the low concentration standard solution, respectively. With these solutions, perform the test as directed under the Microbial Assays for Antibiotics (A) (8).

Packaging and storage Preserve in tight containers.

Ribostamycin Sulfate for Injection
주사용 리보스타마이신황산염

Ribostamycin Sulfate for Injection is an injection, which is dissolved before use. Ribostamycin Sulfate for Injection contains NLT 90.0% and NMT 120.0% of the labeled amount of ribostamycin ($C_{17}H_{34}N_4O_{10}$: 454.48).

Method of preparation Prepare Ribostamycin Sulfate for Injection as directed under Injections, with Ribostamycin Sulfate.

Description Ribostamycin Sulfate for Injection occurs as a white to yellowish white powder.

Identification (1) Dissolve an amount of Ribostamycin Sulfate for Injection, equivalent to 10 mg (potency) of ribostamycin sulfate, in 2 mL of water, add 3 mL of an-

throne TS; the resulting solution exhibits a blue to greenish blue color.

(2) Dissolve an amount of Ribostamycin Sulfate for Injection, equivalent to 20 mg (potency) of ribostamycin sulfate in 2 mL of 1/15 mol/L phosphate buffer solution (pH 5.6), add 1 mL of ninhydrin TS, and heat to boiling; the resulting solution exhibits a bluish purple color.

pH Dissolve Ribostamycin Sulfate for Injection in water to make 50 mg (potency) per mL; the pH of the solution is between 6.0 and 8.0.

Sterility Meets the requirements.

Bacterial endotoxins Less than 0.50 EU per mg (potency) of ribostamycin.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Uniformity of dosage units Meets the requirements.

Loss on drying NMT 5.0% (0.1 g, 0.7 kPa, 60 ºC, 3 hours).

Assay ***Cylinder plate method*** (1) Medium: Use the medium of the Microbial Assays for Antibiotics (A) (2) (a) ① ⓐ.

(2) Test organism: Use *Bacillus subtilis* ATCC 6633 as the test organism.

(3) Weigh accurately an amount of Ribostamycin Sulfate for Injection equivalent to about 0.1 g (potency) of ribostamycin sulfate according to the labeled potency, add sterile purified water, and shake well to mix to make exactly 200 mL. Take an appropriate amount of this solution and dilute with 0.1 mol/L phosphate buffer solution (pH 8.0) to obtain a solution having known concentrations of 20.0 μg and 5.0 μg (potency) per mL, and use them as the high-concentration test solution and the low-concentration test solution, respectively. Separately, weigh accurately an amount of ribostamycin RS equivalent to about 20 mg (potency), and dissolve in 0.05 mol/L phosphate buffer (pH 6.0) to obtain the standard stock solution having known concentrations of 400 μg (potency) per mL. Store the standard stock solution at 5 to 15 °C and use within 20 days. Pipet an appropriate amount of this standard stock solution and dilute with 0.1 mol/L phosphate buffer (pH 8.0) to obtain a solution having concentrations of 20.0 μg and 5.0 μg (potency) per mL, and use them as the high concentration standard solution and the low concentration standard solution, respectively. With these solutions, perform the test according (A) (8) under the Microbial Assays for Antibiotics.

Packaging and storage Preserve in hermetic containers.

Ribostamycin Sulfate Injection
리보스타마이신황산염 주사액

Ribostamycin Sulfate Injection contains NLT 90.0% and NMT 120.0% the labeled amount of ribostamycin ($C_{17}H_{34}N_4O_{10}$: 454.48).

Method of preparation Prepare Ribostamycin Sulfate Injection as directed under Injections, with Ribostamycin Sulfate.

Description Ribostamycin Sulfate Injection occurs as a clear, pale yellow liquid.

Identification (1) Dissolve an amount of Ribostamycin Sulfate Injection, equivalent to 10 mg(potency) of ribostamycin sulfate in 2 mL of water, add 3 mL of anthrone TS; the resulting solution exhibits a blue to greenish blue color.

(2) When dissolve an amount of Ribostamycin Sulfate Injection, equivalent to 20 mg(potency) of ribostamycin sulfate in 2 mL of 1/15 mol/L phosphate buffer solution (pH 5.6), add 1 mL of ninhydrin TS, and삽입 heat to boiling; the resulting solution exhibits a bluish purple color.

pH Between 4.5 and 6.5.

Sterility Meets the requirements.

Bacterial endotoxins Less than 0.50 EU per mg (potency) of ribostamycin.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Extractable volume of injections Meets the requirements.

Assay ***Cylinder plate method*** (1) Medium: Use the medium of the Microbial Assays for Antibiotics (A) (2) (a) ① ⓐ.

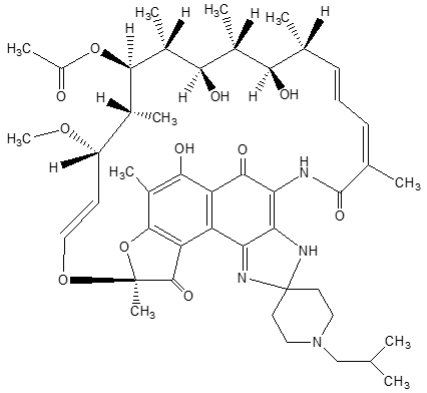
(2) Test organism: Use *Bacillus subtilis* ATCC 6633 as the test organism.

(3) Weigh accurately an amount of Ribostamycin Sulfate Injection, equivalent to 0.1 g (potency) of ribostamycin sulfate according to the labeled potency, add sterile purified water to make exactly 200mL. Take an appropriate amount of this solution and dilute with 0.1 mol/L phosphate buffer solution (pH 8.0) to obtain a solution having known concentrations of 20.0 μg and 5.0 μg (potency) per mL, and use them as the high-concentration test solution and the low-concentration test solution, respectively. Separately, weigh accurately an amount of ribostamycin RS equivalent to about 20 mg (potency) of

ribostamycin, add 0.05 mol/L phosphate buffer (pH 6.0), dissolve to make the standard stock solution containing 400 μg (potency) per mL. Store the standard stock solution at 5 to 15 °C and use within 20 days. Pipet an appropriate amount of this standard stock solution and dilute with 0.1 mol/L phosphate buffer (pH 8.0) to obtain a solution having known concentrations of 20.0 μg and 5.0 μg (potency) per mL, and use them as the high concentration standard solution and the low concentration standard solution, respectively. With these solutions, perform the test as directed under the Microbial Assays for Antibiotics (A) (8).

Packaging and storage Preserve in hermetic containers.

Rifabutin
리파부틴



$C_{46}H_{62}N_4O_{11}$: 847.01

(9*S*,12*E*,14*S*,15*R*,16*S*,17*R*,18*R*,19*R*,20*S*,21*S*,22*E*,24*Z*)-6,16,18,20-Tetrahydroxy-1‘-isobutyl-14-methoxy-7,9,15,17,19,21,25-heptamethylspiro[9,4-(epoxypentadeca[1,11,13]trienimino)-2*H*-furo[2‘,3‘:7,8]naphth[1,2-*d*]imidazole-2,4‘-piperidine]-5,10,26-(3*H*,9*H*)-trione-16-acetate [*72559-06-9*]

Rifabutin contains 950 μg to 1020 μg (potency) per mg of rifabutin ($C_{46}H_{62}N_4O_{11}$: 847.01), calculated on the anhydrous basis.

Description Rifabutin occurs as a purple powder.
It is soluble in methanol or chloroform, sparingly soluble in ethanol(95) and slightly soluble in water.

Identification (1) Determine the infrared spectra of Rifabutin and rifabutin RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

Purity (1) ***Heavy metals*—**Proceed with 1.0 g of Rifabutin according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Related substances*—**Perform the test according to the Assay, measure each peak area of the test solution by automatic integration method, and calculate each value in accordance with the percentage peak area method; the percentage of each related substance, other individual substances and all related substances is NMT 1.0%, 0.5% and 3.0%, respectively, with relative retention times to Rifabutin being 0.5, 0.6, 0.8 and 1.4.

(3) ***Isobutylpiperidone*—**Weigh accurately about 0.1 g (potency) of Rifabutin, dissolve in a mixture of chloroform and methanol (1 : 1) to make 10 mg (potency), and use this solution as the test solution. Separately, weigh accurately about 0.1 g of isobutylpiperidone RS, dissolve in a mixture of chloroform and methanol (1 : 1) to make 1 mg per mL, take 0.5, 1.0, 2.0, 5.0 and 10.0 mL respectively, and dissolve in a mixture of chloroform and methanol (1 : 1) to make 100 mL. Use these solutions as the standard solutions (S_1, S_2, S_3, S_4 and S_5). Perform the test with these solutions as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solutions and the standard solutions (S_1, S_2, S_3, S_4 and S_5) onto the thin-layer chromatographic plate made of silica gel for thin-layer chromatography (with a fluorescent indicator) and develop the plate with a mixture of petroleum ether (60 - 80℃) and acetone (10 : 3) to a distance of about 10 cm. Air-dry the thin-layer chromatographic plate, expose it to iodine vapor for 5 minutes, and evenly spray 5% starch TS; The violet spots of Isobutylpiperidone from the test solution are not darker than those of the S_4 standard solution (NMT 0.5%).

Water NMT 2.5% (0.5 g, volumetric titration, direct titration).

Residue on ignition NMT 0.3% (1 g).

Assay Weigh accurately about 50 mg (potency) each of Rifabutin and rifabutin RS, dissolve in the mobile phase to make exactly 50 mL, respectively. Take 2 mL of each solution, add the mobile phase to make exactly 20 mL, and use these solutions as the test and standard solutions. Measure the peak area of Rifabutin in the test and standard solution, A_T and *As*, respectively, by testing 10 μL each of the test and standard solutions as directed under Liquid Chromatography according to the following conditions.

$$\text{Potency (μg) of Rifabutin } (C_{46}H_{62}N_4O_{11}) = \text{Potency (μg) of rifabutin RS} \times \frac{A_T}{A_S} \times \frac{100}{100-m}$$

m: water (%)

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column of about 4.7 mm in internal diameter and 11 cm in length is filled with 5

μm octadecylsilanized silica gel for liquid chromatography.

Mobile phase: Add 2 mol/L sodium hydroxide TS to a mixture of 2 mol/L of 0.1 mol/L potassium dihydrogen phosphate TS and acetonitrile (1 : 2), and adjust the pH to 6.5.

Flow rate: 1.0 mL/min

Packaging and storage Preserve in light-resistant, tight containers.

Rifabutin Capsules
리파부틴 캡슐

Rifabutin Capsules contain NLT 90.0% and NMT 120.0% the labeled amount of rifabutin ($C_{46}H_{62}N_4O_{11}$: 847.01).

Method of preparation Prepare as directed under Capsules, with Rifabutin.

Identification (1) Weigh 0.2 g each of Rifabutin Capsules and rifabutin RS (potency), dissolve in 200 mL of methanol, filter, and take 2 mL of the filtrate each. Add methanol to make 100 mL and use these solutions as the test solution and the standard solution, respectively. Determine the absorption spectra of the test solution and the standard solution as directed under the Ultraviolet-visible Spectroscopy; both the test solution and the standard solution exhibit an absorption maximum at the same wavelengths.

(2) The retention times of the major peaks from the test solution and the standard solution obtained under the Assay are the same.

Purity ***Related substances***—Weigh accurately an amount of NLT 20 capsules of Rifabutin Capsules equivalent to 25 mg (potency) of rifabutin, dissolve in 5 mL of acetonitrile, add the mobile phase to make 50 mL, and filter with a filter (pore size: 0.5 μm). Use this solution as the test solution. Perform the test with 10 μL of the test solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak area of the test solution by the automatic integration method and calculate each amount in accordance with the percentage peak area method; the percentage of each related substance, other individual substances and all related substances is NMT 1.0%, 0.5% and 4.5%, respectively, with relative retention times to rifabutin being 0.5, 0.6, 0.8 and 1.4.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless-steel column about 4.6 mm in internal diameter and about 12.5 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: To a mixture of acetonitrile and 0.1 mol/L of potassium dihydrogen phosphate TS (1 : 1), add 2 mol/L sodium hydroxide TS to adjust the pH 6.5.

Flow rate: about 1.0 mL/min

System suitability

System performance: Dissolve 10 mg of rifabutin in 2 mL of methanol, add 1 mL of 2 mol/L sodium hydroxide, allow to stand for 4 minutes, and add 1 mL of 2 mol/L hydrochloric acid. Dilute with the mobile phase to make 50 mL. Perform the test with these solutions according to the above conditions; 1 major peak and 2 sub peaks appear at the relative retention time of 0.5, 0.6, 0.8 and 1.0 for the peak area of rifabutin, and the resolution of rifabutin and the relative retention time of the peak area of rifabutin for about 0.8 peak is NLT 1.3. Proceed with the system suitability solution according to the above conditions; the number of theoretical plates is NLT 2000.

System repeatability: Weigh accurately 25 mg of rifabutin RS, dissolve in 5 mL of acetonitrile, add acetonitrile to make exactly 50 mL, and use this solution as the system suitability solution. Repeat the test 6 times with this solution each of these solutions under the above operating conditions; the relative standard deviation of the peak areas is NMT 2.0%.

Dissolution Perform the test with 1 capsule of Rifabutin Capsules at 100 revolutions per minute according to Method 1, using 900 mL of 0.01 mol/L hydrochloric acid TS as the test solution. After 45 minutes from the start of the test, take NLT 20 mL of the dissolved solution and filter. Take *V* mL of the filtrate, add the dissolution medium to make exactly *V'* mL of a solution having a known concentration of about 13.0 μg (potency) of rifabutin per mL according to the labeled amount, and use this solution as the test solution. Separately, weigh accurately about 13 mg of rifabutin RS and dissolve it in 100 mL of the test solution. Pipet 10 mL of this solution, add the test solution to make exactly 100 mL, and use this solution as the standard solution. With the test solution and the standard solution, perform the test as directed under the Ultraviolet-visible Spectroscopy using the blank test solution as a control solution, and determine the absorbances, A_T and A_S, at 280 nm. Meets the requirements if the dissolution rate in 45 minutes is NLT 75.0%.

Dissolution rate (%) with respect to the labeled amount of rifabutin ($C_{46}H_{62}N_4O_{11}$)

$$= \text{Potency (mg) of rifabutin RS} \times \frac{A_T}{A_S} \times \frac{V'}{V} \times \frac{1}{C} \times 90$$

C: Labeled amount [mg (potency)] of rifabutin ($C_{46}H_{62}N_4O_{11}$) in 1 capsule

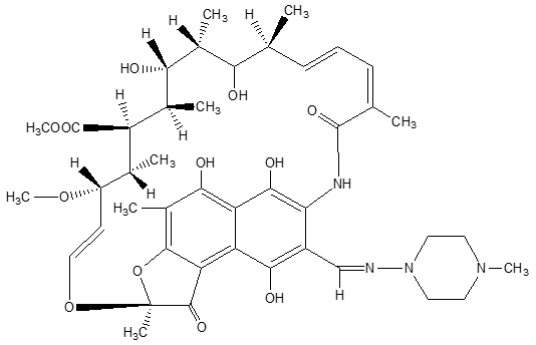
Uniformity of dosage units Meets the requirements.

Assay Proceed as directed under the Assay under Rifabutin. Weigh accurately the contents of NLT 20 capsules of Rifabutin Capsules, powder if necessary, weigh

accurately an amount equivalent to about 50 mg (potency) of rifabutin, and add the mobile phase to make exactly 50 mL. Take 2 mL of this solution, add the mobile phase to make exactly 20 mL, filter, and use this solution as the test solution.

Packaging and storage Preserve in light-resistant, tight containers.

Rifampicin
리팜피신



$C_{43}H_{58}N_4O_{12}$: 822.94

(2*S*,12*Z*,14*E*,16*S*,17*S*,18*R*,19*R*,20*R*,21*S*,22*S*,23*R*,24*E*)-5,6,9,17,19-Pentahydroxy-23-methoxy-2,4,12,16,18,20,22-heptamethyl-8-(4-methyl-piperazin-1-yliminomethyl)-1,11-dioxo-1,2-dihydro-2,7-(Epoxy-pentadeca[1,11,13]trien-imino)naphtho[2,1-*b*]furan-21-yl acetate [*13292-46-1*]

Rifampicin is a derivative of a substance having antibacterial activity produced by the growth of *Streptomyces mediterranei*.

Rifampicin contains NLT 970 μg and NMT 1020 μg (potency) of rifampicin ($C_{43}H_{58}N_4O_{12}$) per mg.

Description Rifampicin occurs as orange to reddish brown crystals or a crystalline powder.
It is slightly soluble in water, methanol, ethanol(95) or acetonitrile.

Identification (1) To 5 mL of solutions of Rifampicin and rifampicin RS in methanol (1 in 5000), add 0.05 mol/L phosphate buffer solution (pH 7.0) to make 100 mL. Determine the absorption spectra of these solutions as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Rifampicin and rifampicin RS as directed in the potassium bromide disk under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

pH Suspend 0.1 g of Rifampicin in 10 mL of water; the pH of a suspension is between 4.0 and 6.0.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Rifampicin according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Arsenic***—Proceed with 1.0 g of Rifampicin according to Method 3 and perform the test (NMT 2 ppm).

(3) ***Related substances***—Weigh accurately about 0.10 g of Rifampicin, add in acetonitrile to make exactly 50 mL, and use this solution as the test stock solution. Pipet 5 mL of this solution, add diluent to make exactly 50 mL, and use this solution as the test solution. Separately, pipet 1 mL of the test stock solution, and add acetonitrile to make exactly 100 mL. Pipet 5.0 mL of this solution, add diluent to make exactly 50 mL, and use this solution as the standard solution. Perform the test with 50 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak area by the automatic integration method; the peak area of the related substances with a relative retention time of about 0.7 with respect to the rifampicin peak obtained from the test solution is not larger than 1.5 times the peak area of rifampicin from the standard solution (1.5%), the peak area of related substances other than rifampicin and the ones eluted at the relative retention time of about 0.7 obtained from the test solution is not larger than the rifampicin peak area from the standard solution (1%), and the sum of these peak areas is not larger than 3.5 times the rifampicin peak area from the standard solution (3.5%).

Diluent—Weigh accurately 2.1 g of citric acid monohydrate, 13.4 g of dibasic potassium phosphate and 3.1 g of potassium dihydrogen phosphate, dissolve in water to make 1000 mL, and mix this solution and acetonitrile (3 : 1).

Operating conditions

Proceed as directed under the operating conditions under the Assay.

System suitability

Test for required detectability: Pipet 2 mL of the standard solution and add diluent to make exactly 20 mL. Confirm that the peak area of rifampicin obtained from 50 μL of this solution is equivalent to 7% to 13% of the peak area of rifampicin obtained from 50 μL of the standard solution.

System performance: To 5 mL of a solution of rifampicin in acetonitrile (1 in 5000), add 1 mL of a solution of butyl p-hydroxybenzoate in acetonitrile (1 in 5000), and add diluent to make exactly 50 mL. Proceed with 50 μL of this solution under the above conditions; butyl p-hydroxybenzoate and rifampicin are eluted in this order with the resolution being NLT 1.5.

System repeatability: Repeat the test 6 times with 50 μL each of the standard solutions according to the above conditions; the relative standard deviation of the peak areas of rifampicin is NMT 2.0%.

Time span of measurement: About 3 times the retention time of rifampicin.

Loss on drying NMT 2.0% (1.0 g, NMT 0.67 kPa, 60 ℃, 3 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 40 mg (potency) of Rifampicin and rifampicin RS, and dissolve in acetonitrile to make exactly 200 mL. Pipet 10 mL each of these solutions, add citric acid-phosphate-acetonitrile TS to make 50 mL, and use these solutions as the test solution and standard solution. Prepare the test solution and the standard solution before use. With 50 μL each of the test solution and the standard solution, perform the test as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas A_T and A_S of rifampicin.

$$\text{Potency (μg) of rifampicin } (C_{43}H_{58}N_4O_{12}) = \text{Potency (μg) of rifampicin RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 10 cm in length, packed with octylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: Take 4.2 g of citric acid monohydrate and 1.4 g of sodium perchlorate, dissolve in a mixture of water, acetonitrile, and pH 3.1 phosphate buffer (11 : 7 : 2) to make exactly 1000 mL, and use this solution as the mobile phase.

pH 3.1 phosphate buffer—Dissolve 136.1 g of potassium dihydrogen phosphate in 500 mL of water, add 6.3 mL of phosphoric acid, and add water to make exactly 1000 mL.

Flow rate: 2.0 mL/min

System suitability

System performance: To 5 mL of a solution of rifampicin in acetonitrile (1 in 5000), add 1 mL of a solution of butyl p-hydroxybenzoate in acetonitrile (1 in 5000), add citric acid-phosphate-acetonitrile TS to make 50 mL. Proceed with 50 μL of this solution under the above conditions; butyl p-hydroxybenzoate and rifampicin are eluted in this order with the resolution being NLT 1.5.

System repeatability: Repeat the test 5 times with 50 μL each of the standard solutions according to the above conditions; the relative standard deviation of the peak areas of rifampicin is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Rifampicin Capsules
리팜피신 캡슐

Rifampicin Capsules contain NLT 93.0% and NMT 105.0% the labeled amount of rifampicin ($C_{43}H_{58}N_4O_{12}$: 822.94).

Method of preparation Prepare as directed under Capsules, with Rifampicin.

Identification (1) Take out the content of Rifampicin Capsules, mix well, and powder, if necessary. Dissolve an amount equivalent to 20 mg (potency) according to the labeled potency in 100 mL of methanol and filter. Add 0.05 mol/L phosphate (pH 7.0) to 5 mL of the filtrate to make 100 mL and determine the absorption spectrum of this solution as directed under the Ultraviolet-visible Spectroscopy; it exhibits maxima between 234 and 238 nm, 252 and 256 nm, 331 and 335 nm and 472 and 476 nm.

(2) Weigh about 0.1 g (potency) of Rifampicin Capsules according to the labeled potency, transfer to a glass-stoppered flask, and add 10 mL of methanol. Mix by shaking vigorously for several minutes, filter, and use this solution as the test solution. Separately, weigh an appropriate amount of rifampicin RS, dissolve in methanol to obtain a solution having known concentration of 5 mg per mL, and use this solution as the standard solution. Perform the test with these solutions as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solutions and the standard solution to the thin-layer chromatographic plate made of silica gel for thin-layer chromatography, develop the plate with a mixture of chloroform and ethanol (2 : 1) as the developing solvent, and air-dry the plate. The R_f values of the red spots obtained from the test solution and the standard solution are the same.

Purity ***Related substances***—Perform this test immediately after the test solution and the standard solution are prepared. Weigh accurately the mass of the content from NLT 20 capsules of Rifampicin Capsules, and power. Weigh accurately an amount of Rifampicin Capsules equivalent to about 20 mg (potency) according to the labeled potency and dissolve in acetonitrile to make exactly 10 mL. Pipet 2 mL of this solution, add a mixture of methanol and acetonitrile (1 : 1) to make exactly 20 mL, and use this solution as the test solution. Separately, weigh accurately about 20 mg (potency) of rifampicin RS and dissolve in acetonitrile to make exactly 10 mL. Pipet 2 mL of this solution and add a mixture of methanol and acetonitrile (1 : 1) to make exactly 20 mL. Pipet 1 mL of this solution, add a mixture of methanol and acetonitrile (1 : 1) to make exactly 50 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions and determine the peak area of each solution by calculating the peak area of each solution with auto-

matic integration method; the amount of quinone of the relative retention time of 0.5 of rifampicin from the test solution is NMT 4.0% and of N-oxide of the relative retention time of 1.2 is NMT 1.5%. The amount of each related substance other than the above peaks is NMT 1.5% and the sum of related substances is 2.0%. However, the peak area of quinone and N-oxide is the area calculated by the automatic integration method with the correction factor of 1.24 and 1.16 each.

$$\text{Content (\%) of related substances} = \frac{W_S}{W_T} \times \frac{A_i}{A_S} \times 2$$

W_S: Amount [mg (potency)] of rifampicin RS

W_T: Amount [mg (potency)] of Rifampicin Capsules taken

A_S: Peak area from the standard solution

A_i: Peak area of each related substance

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in internal diameter and 25 cm in length, packed with octylsilane silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: Dissolve 2.1 g of sodium perchlorate, 6.5 g of citric acid monohydrate and 2.3 g of potassium dihydrogen phosphate in 1100 mL of water and add 900 mL of acetonitrile.

Flow rate: Adjust the flow rate so that the retention time of rifampicin is about 12 minutes.

System suitability

Test for required detectability: Pipet 1 mL of the standard solution, and add a mixture of methanol and acetonitrile (1 : 1) to make exactly 20 mL. Confirm that the peak area of rifampicin obtained with 20 μL of this solution is equivalent to 3.5% to 6.5% peak area of rifampicin in the standard solution.

System performance: Proceed with 20 μL of the standard solution according to the above operating conditions; the number of theoretical plates of rifampicin peak are NLT 2500 plates with the symmetry factor being NMT 4.0.

System repeatability: Repeat the test 6 times with 20 μL each of the standard solutions according to the above conditions; the relative standard deviation of the peak areas of rifampicin is NMT 2.0%.

Time span of measurement: About 2.5 times the retention time of rifampicin.

Loss on drying NMT 3.0% (0.1 g, in vacuum, 60 °C, 3 hours).

Dissolution Perform the test with 1 capsule of Doxycycline Capsules at 100 revolutions per minute according to Method 1 under the Dissolution, using 900 mL of 0.1 mol/L hydrochloric acid TS as the dissolution medium. Take the dissolved solution after 45 minutes from the start of the test and filter. Discard the first 10 mL of the filtrate, pipet V mL of the subsequent filtrate, add the dissolution medium to make exactly V' mL, and use this solution as the test solution. Separately, weigh accurately an appropriate amount of rifampicin RS, previously dried, dissolve it in the dissolution medium to make it the same concentration as the test solution, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at the absorbance maximum wavelength of about 475 nm as directed under the Ultraviolet-visible Spectroscopy, using the dissolution medium as a control solution. It meets the requirements when the dissolution rate in 45 minutes is NLT 75% (Q).

$$\text{Dissolution rate (\%) with respect to the labeled amount of rifampicin } (C_{43}H_{58}N_4O_{12}) = C_S \times \frac{A_T}{A_S} \times \frac{V'}{V} \times \frac{1}{C} \times 90000$$

Cs: Concentration [mg (potency)/mL] of the standard solution

C: Labeled amount [mg (potency)] of rifampicin ($C_{43}H_{58}N_4O_{12}$) in 1 capsule

Uniformity of dosage units It meets the requirements when performing the mass variation test.

Assay Weigh accurately the contents of NLT about 20 capsules of Rifampicin Capsules. Weigh accurately an amount equivalent to about 75 mg (potency) of Rifampicin Capsules according to the labeled potency and dissolve in a mixture of methanol and acetonitrile (1 : 1) to make exactly 50 mL. Pipet 10 mL of this solution and add acetonitrile to make exactly 50 mL. Pipet 5 mL of this solution, dissolve 2.1 g of citric acid monohydrate, 27.6 g of disodium hydrogen phosphate dodecahydrate solution and 3.1 g of Potassium dihydrogen phosphate in 1000 mL of a mixture of water and acetonitrile (3 : 1), add this solution to make exactly 50 mL, and use this solution as the test solution. Separately, weigh accurately about 30 mg (potency) of rifampicin RS, dissolve it in 20 mL of a mixture of methanol and acetonitrile (1 : 1), add acetonitrile to make exactly 100 mL. Pipet 5 mL of this solution, dissolve 2.1 g of citric acid monohydrate, 27.6 g of dibasic sodium phosphate and 3.1 g of potassium dihydrogen phosphate in 1000 mL of a mixture of water and acetonitrile (3 : 1), add this solution to make exactly 50 mL, and use this solution as the standard solution. Pipet 50 μL each of the test solution and the standard solution, perform the test as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas A_T and A_S of rifampicin for each solution.

$$\text{Potency (μg) of rifampicin } (C_{43}H_{58}N_4O_{12}) = \text{Potency (μg) of rifampicin RS} \times \frac{A_T}{A_S} \times \frac{5}{2}$$

Operating conditions

Proceed as directed under the operating conditions in the Assay under Rifampicin.

System suitability

System performance: Dissolve about 30 mg (potency) of rifampicin RS in 20 mL of methanol and acetonitrile (1 : 1), and add acetonitrile to make 100 mL. Take 5 mL of this solution, add 2 mL of butyl p-hydroxybenzoate and acetonitrile (1 : 1) (1 in 5000) dissolved in a solution of 2.1 g of citric acid monohydrate, 27.6 g of dibasic sodium phosphate and 3.1 g of potassium dihydrogen phosphate dissolved in 1000 mL of a mixture of water and acetonitrile (3 : 1) to make 50 mL. Proceed with 50 μL of this solution under the above conditions; butyl p-hydroxybenzoate and rifampicin are eluted in this order with the resolution being NLT 1.5.

System repeatability: Repeat the test 5 times with 50 μL each of the standard solutions according to the above conditions; the relative standard deviation of the peak areas of rifampicin is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Rifampicin Tablets
리팜피신 정

Rifampicin Tablets contain NLT 90.0% and NMT 120.0% of the labeled amount of rifampicin tablets ($C_{43}H_{58}N_4O_{12}$: 822.95).

Method of preparation Prepare as directed under Tablets, with Rifampicin.

Identification Weigh an amount of Rifampicin Tablets, previously powdered, equivalent to 0.1 g (potency) according to the labeled potency, place it in a glass-stoppered flask, add 10 mL of methanol, shake vigorously to mix, filter the resulting solution, and test the filtrate in accordance with (2) of the Identification for Rifampicin Tablets.

Dissolution Proceed with 1 tablet of Rifampicin Tablets at 100 revolutions per minute according to Method 2 under the Dissolution, using 900 mL of Solution 2 as the test solution. Take the dissolved solution after 45 minutes from the start of the test and filter. Discard the first 10 mL of the filtrate, pipet V mL of the subsequent filtrate, add the test solution to obtain a solution having known concentration of 100 μg of rifampicin per mL according to the labeled amount. Make it exactly V′ mL and use this solution as the test solution. Separately, weigh accurately about 40 mg of rifampicin RS and add the test solution to make 200 mL. Pipet 25 mL of this solution, add the test solution to make exactly 50 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of rifampicin ($C_{43}H_{58}N_4O_{12}$) in each solution, respectively. Meets the requirements if the dissolution rate of Rifampicin Tablets in 45 minutes is NLT 75%.

Dissolution rate (%) with respect to the labeled amount of rifampicin ($C_{43}H_{58}N_4O_{12}$)

$$Ws \times \frac{V'}{V} \times \frac{A_T}{A_S} \times \frac{1}{C} \times 225$$

*W*s: Amount (mg) of rifampicin RS

C: Labeled amount (mg) of rifampicin ($C_{43}H_{58}N_4O_{12}$) in 1 tablet

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 30 °C.

Mobile phase: A mixture of 0.05 mol/L potassium dihydrogen phosphate TS (pH 3.5) and acetonitrile (40 : 60).

Flow rate: 0.5 mL/min

0.05 mol/L potassium dihydrogen phosphate TS (pH 3.5)—Add phosphoric acid to 0.05 mol/L potassium dihydrogen phosphate TS to adjust the pH to 3.5.

Uniformity of dosage units Meets the requirements.

Loss on drying NMT 3.0% (0.1 g, 0.7 kPa, 60 ºC, 3 hours).

Assay Weight NLT 20 tablets of Rifampicin Tablets, and powder. Weigh accurately an amount of the powder equivalent to about 0.1 g (potency) according to the labeled potency, and dissolve in methanol to make exactly 100 mL. Pipet 5 mL of this solution, add phosphate buffer solution TS (pH 7.0) to make exactly 50 mL, and use this solution as the test solution. Separately, weigh exactly about 0.1 g (potency) of rifampicin RS, dissolve in methanol to make exactly 100 mL. Pipet 5 mL of this solution, add phosphate buffer solution (pH 7.0) to make exactly 50 mL, and use this solution as the standard solution. Proceed with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas of rifampicin in each solution, A_T and A_S, respectively.

$$\text{Potency (μg) of rifampicin } (C_{43}H_{58}N_4O_{12}) = \text{Potency (μg) of rifampicin RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer

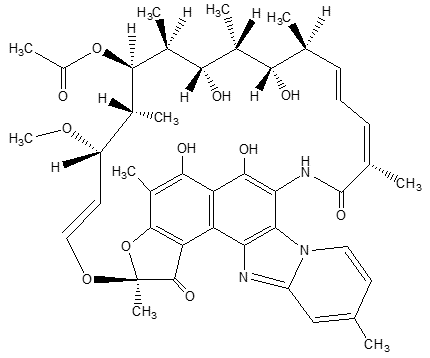
(wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 15 cm to 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 to 10 μm in particle diameter).

Mobile phase: Adjust the pH of 0.05 mol/L potassium dihydrogen phosphate solution to 3.5 with phosphoric acid. To 400 mL of the resulting solution, add 600 mL of acetonitrile to mix.

Packaging and storage Preserve in light-resistant, tight containers.

Rifaximin
리팍시민



$C_{43}H_{51}N_3O_{11}$: 785.88

(2*S*,16*Z*,18*E*,20*S*,21*S*,22*R*,23*R*,24*R*,25*S*,26*R*,27*S*,28*E*)-5,6,21,23-Tetrahydroxy-27-methoxy-2,4,11,16,20,22,24,26-octamethyl-1,15-dioxo-1,2-dihydro-2,7-(Epoxypentadeca[1,11,13]trienimino)benzofuro[4,5-*e*]pyrido[1,2-*a*]benzimidazol-25-yl acetate [*80621-81-4*]

Rifaximin contains NLT 980 μg (potency) of rifaximin ($C_{43}H_{51}N_3O_{11}$: 785.88) per mg, calculated on the anhydrous and solvent-free basis.

Description Rifaximin occurs as an orange powder.
It is soluble in methanol, acetone, chloroform or ethyl acetate, and practically insoluble in water.

Identification (1) Dissolve 15 mg (potency) of Rifaximin in methanol to make 10 mL. Take 1 mL of this solution, add methanol to make 100 mL, and determine the absorption spectrum as directed under the Ultraviolet-visible Spectroscopy; it exhibits absorption maxima at wavelengths of between 453 nm and 457 nm, between 370 nm and 374 nm, between 291 nm 295 nm and between 233 nm and 237 nm.

(2) Determine the infrared spectra of Rifaximin and rifaximin RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) Weigh about 50 mg (potency) each of Rifaximin and rifaximin RS, dissolve in 5 mL of methanol, and use these solutions as the test solution and the standard solution. Perform the test with these solutions as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography (with a fluorescent indicator), develop the plate with a mixture of chloroform and methanol (95 : 5) as a developing solvent. Air-dry the plate, and examine the plate under ultraviolet light (main wavelength: 254 nm); the R_f value and the color of the spots obtained from the test solution and the standard solutions are identical.

Crystal polymorphism Homogenize Rifaximin and rifaximin RS by pressing with a glass rod, mold the powder onto the packing part of the X-ray powder diffraction device holder, and perform the test according to the Characterization of Crystalline and Partially Crystalline Solids by X-ray Powder Diffraction; the angles in the range of 6.6°±0.2 ; 7.4°±0.2 ; 7.9°±0.2 ; 8.8°±0.2 ; 10.5°±0.2 ; 11.1°±0.2 ; 11.8°±0.2 ; 12.9°±0.2 ; 17.6°±0.2 ; 18.5°±0.2 ; 19.7°±0.2 ; 21.0°±0.2 ; 21.4°±0.2 ; 22.1°±0.2 represent the characteristic diffraction angles (2θ) of rifaximin α-form crystals.

Operating conditions

X-ray tube: Copper anode

Wavelength: Kα1 (1.540562 Å), Kα2 (1.544398 Å) (use nickel filter to suppress Kβ (1.392218 Å))

Detector: Sodium iodide scintillation counter

Tube current and voltage: 15 mA, 30 kV

Counting time: 1.3 seconds per step / 0.02°

Scanning range of diffraction angle (2θ): Between 2.0° and 35.0°.

Sample holder: Amorphous glass (isotropic 9200/2G, depth of 0.2 mm).

Purity (1) ***Ethanol***—Weigh accurately about 50 mg of Rifaximin, add 1 mL of the internal standard solution and *N*,*N*-dimethylformamide to make exactly 10 mL, and use this solution as the test solution. Separately, weigh accurately 0.25 g of ethanol(95) and add *N*,*N*-dimethylformamide to make exactly 50 mL. Pipet 1 mL of this solution, add 1 mL of the internal standard solution and *N*,*N*-dimethylformamide to make exactly 10 mL, and use this solution as the standard solution. Perform the test with 1 μL each of the test solution and the standard solution as directed under the Gas Chromatography according to the following conditions, and calculate the ratios, Q_T and Q_S, of the peak area of ethanol to that of the internal standard, respectively (NMT 0.5%).

$$\text{Ethanol content (\%)} = \frac{Q_T}{Q_S} \times \frac{\text{Amount (mg) of ethanol taken}}{\text{Amount (mg) of Rifaximin taken}} \times \frac{100}{50}$$

Internal standard solution—Weigh 1.5 g of 2-propanol and add *N*,*N*-dimethylformamide to make 100 mL.

Operating conditions

Detector: A hydrogen flame ionization detector

Column: A column about 0.53 mm in internal diameter and about 30 m in length, packed with diatomaceous earth for gas chromatography coated 100.0% with dimethyl polysiloxane.

Column temperature: Initially maintain at 60 ℃ for 2 minutes, raise the temperature at a rate of 25 ℃ per minute until it reaches 200 ℃, and maintain at 200 ℃ for 5 minutes.

Sample injection port and detector temperature: 220 ℃.

Carrier gas: Nitrogen

Flow rate: About 10 mL/min.

(2) ***Heavy metal***—Proceed with 1.0 g of Rifaximin according to Method 3 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Related substances***—Weigh accurately about 0.1 g (potency) of Rifaximin, dissolve in 10 mL of acetonitrile, add water to make exactly 25 mL, and use this solution as the test solution. With 20 μL of the test solution, perform the test as directed under the Liquid Chromatography according to the following conditions. Measure each peak area by the automatic integration method and calculate the amount by the area percentage (rifampicin Y: NMT 0.5%, individual related substances: NMT 0.2%, total related substances: NMT 2.0%).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 276 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: 40 °C

Mobile phase: A mixture of mobile phase A and mobile phase B (63 : 37).

Mobile phase A: A mixture of methanol and acetonitrile (1 : 1).

Mobile phase B: 0.05 mol/L ammonium formate TS (adjust the pH to 7.2 with ammonia TS).

Flow rate: About 1.4 mL/min.

Relative retention time: Rifaximin Y 0.67

Time span of measurement: About 3 times the retention time of rifaximin after the solvent peak.

Water NMT 2.5% (0.2 g, volumetric titration, direct titration).

Assay Weigh accurately about 40 mg (potency) each of Rifaximin and rifaximin RS and dissolve each in methanol to make exactly 100 mL. Pipet 10 mL each of these solutions, add 10 mL of internal standard solution, add the mobile phase to make exactly 100 mL, and use these solutions as the test solution and the standard solution. Perform the test with 5 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the ratios, Q_T and Q_S, of the peak area of rifaximin to that of the internal standard for the test solution and the standard solution.

$$\text{Potency (μg) of rifaximin } (C_{43}H_{51}N_3O_{11}) = \text{Potency of rifaximin RS (μg)} \times \frac{Q_T}{Q_S}$$

Internal standard solution—Weigh 45 mg of naproxen and dissolve in methanol to make 100 mL.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 276 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of mobile phase A and mobile phase B (65 : 35).

Mobile phase A: A mixture of methanol and acetonitrile (60 : 40).

Mobile phase B: To 1000 mL of 0.01 mol/L ammonium dihydrogen phosphate, add 1 g of sodium 1-heptanesulfonate, and adjust the pH to 3.0 with acetic acid.

Flow rate: About 1.5 mL/min.

Packaging and storage Preserve in light-resistant, tight containers.

Rifaximin Tablets
리팍시민 정

Roxithromycin Tablets contains NLT 90.0% and NMT 120.0% of rifaximin ($C_{43}H_{51}N_3O_{11}$: 785.88) of the labeled amount.

Method of preparation Rifaximin Tablets as directed under Tablets, with Rifaximin.

Identification Powder Rifaximin Tablets, dissolve an amount equivalent to about 50 mg (potency) of Rifaximin Tablets in 5 mL of methanol, and use this solution as the test solution. Separately, dissolve 50 mg (potency) of rifaximin RS in 5 mL of methanol, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography (with a fluorescent indicator), develop the plate with a mixture of chloroform and methanol (95 : 5) as a developing solvent. Air-dry the plate, and examine the plate under ultraviolet light (main wavelength: 254 nm); the *Rf* values of the spots obtained from the test solution and the standard solution are the same.

Dissolution Perform the test with 1 tablet of Rifaximin

Tablets at 50 revolutions per minute according to Method 2 under the Dissolution, using 900 mL of water containing 0.5% sodium lauryl sulfate as the dissolution medium.
Filter the medium 60 minutes after starting the test and use this solution as the test solution.
Separately, weigh accurately about 22.2 mg of rifaximin RS, dissolve in the fresh medium to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution according to the Liquid Chromatography under the following conditions, and determine the peak areas A_T and A_S of rifaximin ($C_{43}H_{51}N_3O_{11}$) in each solution.
The dissolution rate in 60 minutes of Rifaximin Tablets is NLT 80%.

Dissolution rate (%) with respect to the labeled amount of rifaximin ($C_{43}H_{51}N_3O_{11}$)

$$= W_S \times \frac{A_T}{A_S} \times \frac{1}{C} \times 900$$

*W*s: Amount (mg) of rifaximin RS
C: Labeled amount (mg) of rifaximin ($C_{43}H_{51}N_3O_{11}$) in 1 tablet

Operating conditions
Detector: An ultraviolet absorption photometer (wavelength: 370 nm).
Column: A stainless-steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).
Column temperature: A constant temperature of about 40 °C.
Mobile phase: A mixture of mobile phase A and mobile phase B (13 : 7).
Mobile phase A: A mixture of methanol and acetonitrile (3 : 2).
Mobile phase B: Add 1 g of sodium 1-heptanesulfonate to 1000 mL of 0.01 mol/L ammonium dihydrogen phosphate, and adjust the pH to 3.0 with acetic acid.
Flow rate: 1.0 mL/min
System suitability
System repeatability: Repeat the test 6 times with 10 μL of the standard solution according to the above conditions; the relative standard deviation of the peak area of rifaximin is NMT 2.0%.

Uniformity of dosage units Meets the requirements.

Water NMT 8.0% (0.1 g, volumetric titration, direct titration).

Assay Weigh accurately the mass of NLT 20 tablets of Rifaxamin Tablets, and powder. Then, weigh accurately an appropriate amount, equivalent to about 400 mg (potency), according to the labeled potency, and dissolve in methanol to make exactly 100 mL. Take 10.0 mL of this solution, add 10.0mL each of the internal standard solution, add the mobile phase to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 40 mg of rifaximin RS, and dissolve in methanol to make exactly 100 mL. Take 10.0 mL of this solution, put 10.0mL of the internal standard solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 5 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions, and determine the peak area ratios, Q_T and Q_S, of rifaximin to the peak area of the internal standard in each solution.

Potency (μg) of rifaximin ($C_{43}H_{51}N_3O_{11}$)
= Potency (μg) of rifaximin RS

$$\times \frac{Q_T}{Q_S} \times \frac{100}{(100 - m)}$$

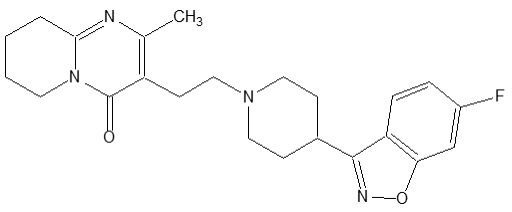
m: The sum of water (%) and ethanol (%) in Rifaximin Tablets

Internal standard solution—Weigh 45 mg of naproxen, and dissolve in methanol to make 100 mL.

Operating conditions
Detector: An ultraviolet absorption photometer (wavelength: 276 nm).
Column: A stainless-steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).
Mobile phase: A mixture of mobile phase A and mobile phase B (65 : 35).
Mobile phase A: A mixture of methanol and acetonitrile (60 : 40).
Mobile phase B: Add 1 g of sodium 1-heptanesulfonate to 1000 mL of 0.01 mol/L ammonium dihydrogen phosphate TS, and adjust the pH to 3.0 with acetic acid.
Flow rate: About 1.5 mL/min.

Packaging and storage Preserve in light-resistant, tight containers.

Risperidone
리스페리돈



$C_{23}H_{27}FN_4O_2$: 410.48
3-[2-[4-(6-Fluoro-1,2-benzoxazol-3-yl) piperidin-1-yl]ethyl]-2-methyl-6,7,8,9-tetra-

hydropyrido[1,2-a]pyrimidin-4-one [*106266-06-2*]

Risperidone contains NLT 99.0% and NMT 101.0% of risperidone ($C_{23}H_{27}FN_4O_2$), calculated on the dried basis.

Description Risperidone occurs as a white to pale yellow powder.
It is freely soluble in dichloromethane, sparingly soluble in alcohol and practically insoluble in water.
It dissolves in dilute hydrochloric acid.
It shows crystalline polymorphism.

Identification (1) Determine the absorption spectra of solutions of Risperidone and Risperidone RS in 2-propanol (1 in 40000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Risperidone and Risperidone RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers. If any difference appears between the spectra, dissolve each in the minimum possible volume of acetone, evaporate to dryness, and perform the test with the residue in the same manner.

Melting point Between 169 and 173 ℃.

Purity (1) ***Clarity and color of solution***—Dissolve 0.1 g of Risperidone in 0.75 w/v% of L-tartaric acid solution to make 100 mL; the resulting solution is clear and colorless.

(2) ***Heavy metals***—Proceed with 2.0 g of Risperidone according to Method 2 under the Heavy Metals and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Related substances***—Weigh accurately 0.10 g of Risperidone, add methanol to make exactly 100 mL, and use this solution as the test solution. To 1.0 mL of the test solution, add methanol to make exactly 100 mL. To 5.0 mL of this solution, add methanol to make exactly 25 mL, and use this solution as the standard solution. Perform the test with 10 μL each of methanol (blank test solution), the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions; each area of the peaks other than the major peak obtained from the test solution is not greater than that of the major peak obtained from the standard solution. In addition, the sum of the peak areas other than the major peak from the test solution is not greater than 1.5 times the area of the major peak from the standard solution. Exclude any peaks obtained from the blank test solution and any peaks having an area NMT 0.25 times the area of the major peak from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 260 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 10 cm in length, packed with base-deactivated octadecylsilanized silica gel for liquid chromatography (3 μm in particle diameter).

Mobile phase: Control the stepwise or gradient elution by mixing the mobile phases A and B as follows.

Mobile phase A: 0.5 w/v% ammonium acetate solution

Mobile phase B: Methanol

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 - 2	70	30
2 - 17	70 → 30	30 → 70
17 - 22	30	70

Flow rate: 1.5 mL/min

System suitability

Test for required detectability: Pipet 2 mL of the standard solution and add methanol to make exactly 20 mL. Confirm that the peak area of Risperidone obtained from 10 μL of this solution is equivalent to 7% to 13% of the peak area of Risperidone obtained from the standard solution.

System performance: Proceed with 10 μL of the standard solution according to the above conditions; the number of theoretical plates of Risperidone is NLT 1000 with the symmetry factor being NMT 2.0.

System repeatability: Repeat the test 6 times according to the above conditions with 10 μL each of the standard solution; the relative standard deviation of the peak area of Risperidone is NMT 2.0%.

Loss on drying NMT 0.5% (1 g, 105 ℃, 4 hours).

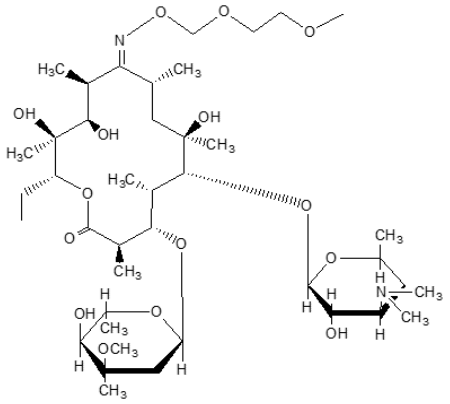
Residue on ignition NMT 0.1% (1 g, platinum crucible).

Assay Weigh accurately about 0.16 g of Risperidone, dissolve in 70 mL of a mixture of 2-butanone and acetic acid(100) (7 : 1), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 20.53 mg of $C_{23}H_{27}FN_4O_2$

Packaging and storage Preserve in tight containers.

Roxithromycin
록시트로마이신



$C_{41}H_{76}N_2O_{15}$: 837.05

(3*R*,4*S*,5*S*,6*R*,7*R*,9*R*,10*Z*,11*S*,12*R*,13*S*,14*R*)-6-[(2*S*,3*R*,4*S*,6*R*)-4-(Dimethylamino)-3-hydroxy-6-methyloxan-2-yl]oxy-14-ethyl-7,12,13-trihydroxy-4-[(2*R*,4*R*,5*S*,6*S*)-5-hydroxy-4-methoxy-4,6-dimethyloxan-2-yl]oxy-10-(2-methoxyethoxymethoxyimino)-3,5,7,9,11,13-hexamethyl-oxacyclotetradecan-2-one [*80214-83-1*]

Roxithromycin is a derivative of erythromycin.

Roxithromycin contains NLT 970 μg and NMT 1020 μg (potency) of roxithromycin ($C_{41}H_{76}N_2O_{15}$) per mg, calculated on the anhydrous basis.

Description Roxithromycin occurs as a white, crystalline powder.
It is freely soluble in ethanol(95) or acetone, soluble in methanol, sparingly soluble in acetonitrile and practically insoluble in water.

Identification Determine the infrared spectra of Roxithromycin and roxithromycin RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Optical rotation $[\alpha]_D^{20}$: Between -93° and -96° (0.5 g, calculated on the anhydrous basis, acetone, 50 mL, 100 mm).

Purity (1) ***Heavy metals***—Proceed with 2 g of Roxithromycin and perform the test according to Method 2. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Erythromycin and erythromycinoxime***—Weigh about 0.2 g (potency) of Roxithromycin, dissolve in methanol to make exactly 10 mL, and use this solution as the test solution. Separately, weigh 40 mg (potency) of erythromycin RS, dissolve in methanol to make exactly 100 mL, and use this solution as the erythromycin standard solution. Weigh 40 mg of erythromycinoxime RS, dissolve in methanol to make exactly 100 mL, and use this solution as the erythromycinoxime standard solution. With these tests and standard solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solutions, the erythromycin standard solution and the erythromycinoxime standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography, develop the plate with a mixture of toluene, chloroform and diethylamine (50 : 40 : 7) as the developing solvent. Take the plate out and dry the plate at 100 ℃ to 105 ℃ for 5 minutes. Prepare a color agent by dissolving 2.5 g of phosphomolybdic acid n-hydrate in 2.5 mL of sulfuric acid and 50 mL of acetic acid(100), spray evenly the agent on the plate, and heat the plate at 100 ℃ to 105 ℃; the spots obtained from the test solution are not greater or more intense than the spots from the erythromycin standard solution (R_f value: about 0.35) and the erythromycinoxime standard solution (R_f value: about 0.28) (NMT 2.0%, respectively).

(3) ***Related substances***—Weigh accurately 40 mg of Roxithromycin, dissolve in the mobile phase A to make exactly 10 mL, and use this solution as the test solution. Separately, weigh accurately about 20 mg of roxithromycin RS, and dissolve in the mobile phase A to make exactly 10 mL. Pipet 1.0 mL of this solution, add the mobile phase A to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the above operating conditions, and determine the peak area of each solution with the automatic integration method; the area of the peak having the relative retention time of about 1.05 for roxithromycin in the test solution is NMT 2 times the peak area of roxithromycin in the standard solution. Each peak area other than the peak having the relative retention time of 1.05 for roxithromycin is not greater than the peak area of roxithromycin in the standard solution, and the total area of peaks other than roxithromycin from the test solution is not greater than 6 times the peak area of roxithromycin from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 205 nm).

Column: A stainless steel column 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C

Mobile phase: Control the gradient elution by mixing the mobile phases A and B as directed under the following table.

Mobile phase A: To 200 mL of ammonium dihydrogen phosphate solution (17 in 100), add 510 mL of water, and adjust the pH to 5.3 with 2 mol/L sodium hydroxide TS. To this solution, add 315 mL of acetonitrile.

Mobile phase B: A mixture of acetonitrile and water (7 : 3).

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 - 38	100	0
38 - 39	100 → 90	0 → 10
39 - 80	90	10

Flow rate: Adjust so that the retention time of roxithromycin is about 21 minutes.

System suitability

Test for required detectability: Pipet 2 mL of the standard solution and add the mobile phase A to make exactly 10 mL. Confirm that the peak area of roxithromycin obtained from 20 μL of this solution is 15% to 25% of the peak area of roxithromycin from the standard solution.

System performance: Weigh 5 mg each of roxithromycin RS and *N*-demethylroxithromycin and dissolve in the mobile phase A to make 100 mL. Proceed with 20 μL of this solution according to the above conditions, *N*-demethylroxithromycin and roxithromycin are eluted in this order with the resolution being NLT 6.

System repeatability: Repeat the test five times with 20 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak areas of roxithromycin is NMT 2.0%

Water NMT 3.0% (0.3 g, volumetric titration, direct titration).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 20 mg (potency) each of Roxithromycin and roxithromycin RS, dissolve in the mobile phase to make exactly 10 mL, pipet 5 mL of these solutions, and add the mobile phase to make exactly 20 mL. Use these solutions as the test solution and the standard solution. Perform the test with exactly 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of roxithromycin.

$$\text{Potency (μg) of roxithromycin } (C_{41}H_{76}N_2O_{15}) = \text{Potency (μg) of roxithromycin RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 205 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silicagel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 30 °C.

Mobile phase: Dissolve 2.876 g of ammonium dihydrogen phosphate in 800 mL of water, add 30 mL of 10% tetrabutylammonium hydroxide, adjust the pH to 6.0 with phosphoric acid, and add water to make 1000 mL. To 999 mL of this solution, add 1701 mL of methanol.

Flow rate: 1.0 mL/min

System suitability

System performance: Proceed with 20 μL of the standard solution according to the above conditions; the symmetry factor of the roxithromycin peak is NMT 1.5.

System repeatability: Repeat the test six times with 20 μL each of the standard solutions according to the above conditions; the relative standard deviation of the peak area of roxithromycin is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Roxithromycin Granules
록시트로마이신 과립

Roxithromycin Granules contain NLT 90.0% and NMT 120.0% of the labeled amount of roxithromycin ($C_{41}H_{76}N_2O_{15}$: 837.05).

Method of preparation Prepare as directed under Granules, with Roxithromycin.

Identification (1) Weigh about 0.1 g (potency) of Roxithromycin Granules according to the labeled potency, add methanol while shaking to mix to make 100 mL, filter and use the filtrate as the test solution. Separately, dissolve 0.1 g (potency) of roxithromycin RS in methanol to make 100 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography, develop the plate with a mixture of toluene, ethyl acetate and diethylamine (50 : 20 : 7) as the developing solvent, and dry the plate at 100 to 105 ℃ for 5 minutes. Spray evenly the coloring agent, previously prepared by adding 2.5 mL of sulfuric acid and 50 mL of acetic acid(100) to 2.5 g of phosphomolybdic acid, warm at 100 to 105 ℃; the colors and R_f values of the spots obtained from the test solution and the standard solution are the same.

(2) The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

Particle size distribution estimation by analytical sieving Meets requirements.

Disintegration Meets the requirements.

Uniformity of dosage units (distribution) Meets the requirements.

Loss on drying NMT 3.0% (0.1 g, 0.7 kPa, 60 ℃, 3 hours).

Assay Weigh accurately about 0.1 g (potency) of Roxithromycin Granules according to the labeled potency,

dissolve in the mobile phase to make exactly 100 mL, and filter. Pipet 5 mL of the filtrate, add the mobile phase to make exactly 10 mL, and use this solution as the test solution. Separately, weigh accurately about 0.1 g (potency) of roxithromycin RS, proceed in the same manner as in the test solution, and use the resulting solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution according to the following conditions as directed under the Liquid Chromatography and determine the peak areas A_T and A_S of roxithromycin, respectively.

Amount [mg (potency)] of roxithromycin ($C_{41}H_{76}N_2O_{15}$)
= Amount [mg (potency)] of roxithromycin RS
× (A_T / A_S)

Operating conditions

Detector: An ultraviolet absorption spectrophotometer (wavelength: 205 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 250 mm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of approximately 30 °C.

Mobile phase: Dissolve 2.876 g of ammonium dihydrogen phosphate in 800 mL of water, add 30 mL of 10% tetrabutylammonium hydroxide, adjust the pH to 6.0 with phosphoric acid, and add water to make 1000 mL. Add 1701 mL of methanol to 999 mL of this solution.

Flow rate: 1.0 mL/min

System suitability

System performance: Proceed with 20 μL of the standard solution according to the above conditions; the symmetry factor of the roxithromycin peak is NMT 1.5.

System repeatability: Repeat the test six times with 20 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area of roxithromycin is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Roxithromycin Suspension
록시트로마이신 현탁액

Roxithromycin Suspension, as a suspension for internal use, contains NLT 90.0% and NMT 120.0% of the labeled amount of roxithromycin ($C_{41}H_{76}N_2O_{15}$: 837.05) per mg.

Method of preparation Prepare as directed under Suspensions, with Roxithromycin.

Identification Take 0.1 g (potency) of Roxithromycin Suspension according to the labeled potency, dissolve in methanol to make 100 mL, filter, and use the filtrate as the test solution. Separately, take 0.1 g (potency) of roxithromycin RS, dissolve in methanol to make 100 mL, and use this solution as the standard solution. Perform the test with the test solution and the standard solution as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography, develop the plate with a mixture of toluene, ethyl acetate and diethylamine (50 : 20 : 7) as the developing solvent, take out the plate, and dry at 100 to 105 ℃ for 5 minutes. Spray evenly a coloring agent, prepared by dissolving 2.5 mL of sulfuric acid and 50 mL of acetic acid(100) in 2.5 g of phosphomolybdic acid, onto the plate, and warm the plate at 100 to 105 ℃; the color and R_f values of the spots obtained from the test solution and the standard solution are the same.

pH Between 7.0 and 9.0.

Assay Perform the test as directed under the Assay under Roxithromycin Granules. Prepare the test solution by pipetting about 50 mg (potency) of Roxithromycin Suspension according to the labeled potency and dissolving in the mobile phase to make exactly 100 mL. Separately, prepare the standard solution by weighing accurately about 50 mg (potency) of roxithromycin RS and dissolving in the mobile phase to make exactly 100 mL.

Packaging and storage Preserve in tight containers.

Roxithromycin Tablets
록시트로마이신 정

Roxithromycin Tablets contains NLT 90.0% and NMT 120.0% of roxithromycin ($C_{41}H_{76}N_2O_{15}$: 837.05) of the labeled amount.

Method of preparation Prepare as directed under Tablets, with Roxithromycin.

Identification (1) Weigh an amount equivalent to 0.1 mg (potency) of Roxithromycin Tablets according to the labeled potency, add methanol, shake to dissolve to make 100 mL, and use the filtrate as the test solution. Separately, dissolve 0.1 mg (potency) roxithromycin RS in methanol to make 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography, develop the plate with a mixture of toluene, ethyl acetate and diethylamine (50 : 20 : 7), take the plate out, and dry the plate at 100 ℃ - 105 ℃ for 5 minutes. Prepare 2.5 g of phosphomolybdic acid in 2.5 mL of sulfuric acid and 50mL of acetic acid(100), spray evenly the agent on the plate, and heat the plate at 100 ℃ to 105 ℃; the colors and *R*f values of the spots from the test solution and the standard solution are the same.

(2) The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

Disintegration Perform the test with 1 tablet of Roxithromycin Tablets at 50 revolutions per minute according to Method 2 under the Dissolution, using 900 mL of the second solution as the dissolution solution. Take the dissolved solution 30 minutes after the start of the Dissolution, filter, and use the filtrate as the test solution. Separately, weigh accurately about 16.7 mg of roxithromycin RS, dissolve in 10 mL of methanol, add the test solution to make exactly 100 mL, and use this solution standard solution. Perform the test with 20 μL each of the test solution and the standard solution according to the Liquid Chromatography under the following conditions, and determine the peak areas A_T and A_S of roxithromycin ($C_{41}H_{76}N_2O_{15}$) in each solution. Meets the requirements if the dissolution rate of Roxithromycin Tablets in 30 minutes is NLT 80%.

$$\text{Dissolution rate (\%) the labeled amount of roxithromycin } (C_{41}H_{76}N_2O_{15}) = W_S \times \frac{V'}{V} \times \frac{A_T}{A_S} \times \frac{1}{C} \times 900$$

*W*s: Amount (mg) of roxithromycin RS

C: Labeled amount (mg) of roxithromycin ($C_{41}H_{76}N_2O_{15}$) in 1 tablet

Operating conditions

Detector: An ultraviolet absorption spectrophotometer (wavelength: 205 nm).

Column: A stainless-steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: A mixture of 0.1 mol/L ammonium dihydrogen phosphate, acetonitrile and water (2: 2 : 1).

Flow rate: 1.5 mL/min

System suitability

System repeatability: Repeat the test 6 times with 20 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak areas of roxithromycin is NMT 2.0%.

0.1 mol/L ammonium dihydrogen phosphate—Dissolve 11.5 g of ammonium dihydrogen phosphate in water to make 1000 mL.

Uniformity of dosage units Meets the requirements.

Water NMT 5.0% (0.2 g, volumetric titration, direct titration).

Assay Perform the test as directed under the Assay under Roxithromycin Granules. However, weigh accurately the mass of NLT 20 tablets of Roxithromycin Tablets, and powder it. Weigh accurately an amount equivalent to about 0.1 g (potency) according to the labeled potency, dissolve in the mobile phase to make exactly 100 mL, and filter. Pipet 5 mL of this solution, add the mobile phase to make exactly 10 mL, and use this solution as the test solution. Separately, weigh accurately about 0.1 g (potency) of roxithromycin RS, proceed in the same manner as in the test solution, and use this solution as the standard solution.

Packaging and storage Preserve in tight containers.

Royal Jelly and Hydrocortisone Cream
로얄젤리·히드로코르티손 크림

Royal Jelly and Hydrocortisone Cream contains NLT 90.0% of the labeled amount of 10-hydroxy-2-decenoic acid ($C_{10}H_{18}O_3$: 186.25) in royal jelly, and NLT 90.0% and NMT 110.0% of the labeled amount of hydrocortisone ($C_{21}H_{30}O_5$: 362.46).

Method of preparation Prepare as directed under Creams, with Royal Jelly and Hydrocortisone.

Identification (1) ***Royal jelly***—(i) Weigh an amount of Royal Jelly and Hydrocortisone Cream, equivalent to 50 mg of royal jelly, add 50 mL of acetone, extract, and filter. Evaporate to concentrate the filtrate under reduced pressure to make about 10 mL and use this solution as the test solution. Separately, weigh about 50 mg of Royal Jelly, add 50 mL of acetone, extract, and filter. Evaporate to concentrate the filtrate under reduced pressure to make about 10 mL and use this solution as the test solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution onto a thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of n-propanol and strong ammonia water (7 : 3) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light or spray iodine vapor; the multiple spots from the test solution have the same color and R_f value as the spots from the standard solution.

(ii) Perform the test with Royal Jelly and Hydrocortisone Cream as directed under the Assay; it exhibits peaks at the same retention times with the reference standards.

(2) ***Hydrocortisone*** —Perform the test with Royal Jelly and Hydrocortisone Cream as directed under the Assay; The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

Assay (1) ***10-hydroxy-2-decenoic acid in royal jelly***—Weigh accurately an amount of Royal Jelly and Hydrocortisone Cream, equivalent to about 5 mg of 10-hydroxy-2-decenoic acid, add 40 mL of methanol, soni-

cate for 20 minutes, and add methanol to make exactly 50 mL. Centrifuge this solution, pipet 2 mL of the clear supernatant, add methanol to make 10 mL, and use this solution as the test solution. Separately, weigh accurately about 5 mg of 10-hydroxy-2-decenoic acid RS and dissolve in methanol to make exactly 50 mL. Pipet 2 mL of this solution, add methanol to make 10 mL, use this solution as the test solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak area of10-hydroxy-2-decenoic acid, A_T and A_S, in each solution.

$$\text{Amount (mg) of 10-hydroxy-2-decenoic acid } (C_{10}H_{18}O_3) = \text{Amount (mg) of 10-hydroxy-2-decenoic acid RS} \times \frac{A_T}{A_S}$$

Operating conditions

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Detector: An ultraviolet absorption photometer (wavelength: 214 nm).

Mobile phase: A mixture of 2.5 mmol/L potassium dihydrogen phosphate TS (pH 3.0) and methanol (1 : 1).

Flow rate: 1.0 mL/min

System suitability

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution according to the above operating conditions; the relative standard deviation of the ratios of the peak area of 10-hydroxy-2-decenoic acid to that of the internal standard is NMT 1.0%.

2.5 mmol/L potassium dihydrogen phosphate TS (pH 3.0)—Dissolve 0.170 g of potassium dihydrogen phosphate in 980 mL of water, add phosphoric acid to adjust pH to 3.0, and add water to make 1000 mL.

(2) ***Hydrocortisone***—Weigh accurately an amount of Royal Jelly and Hydrocortisone Cream, equivalent to about 2.5 mg of hydrocortisone ($C_{21}H_{30}O_5$), add 80 mL of methanol, shake to mix, sonicate for 10 minutes, add methanol to make 100 mL, filter, and use this solution as the test solution. Separately, weigh accurately about 25 mg of hydrocortisone RS, dissolve in methanol to make 100 mL, pipet 5.0 mL of this solution, add methanol to make 50 mL, and use this solution as the standard solution. Perform the test with 15 μL each of the test solution and the standard solution as directed under the Liquid Chromatography and determine the peak area of hydrocortisone, A_T and A_S for each solution.

$$\text{Amount (mg) of hydrocortisone } (C_{21}H_{30}O_5) = \text{Amount (mg) of hydrocortisone RS} \times \frac{A_T}{A_S} \times$$

Operating conditions

Detector: An ultraviolet absorption spectrophotometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in internal diameter and about 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of methanol and water (70:30).

Flow rate: 0.9 mL/min

Packaging and storage Preserve in tight containers.

Ruscogenin and Neoruscogenin
루스코게닌류물질

Ruscogenin and Neoruscogenin contains NLT 60.0% of the sterol material extracted from the rhizoma of *Ruscus aculeatus*.

Description Ruscogenin and Neoruscogenin occurs as a yellow granular powder. It has a slightly characteristic odor.

Identification (1) Dissolve 10 mg of Ruscogenin and Neoruscogenin in 10 mL of chloroform, and use this as the test solution. Separately, proceed with about 10 mg of ruscogenin and neoruscogenin RS in the same manner as in the test solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of chloroform and acetone (7 : 3) as a developing solvent to a distance of about 10 cm, and air-dry the plate. Spray 10% phosphomolybdic acid-ethanol solution onto the plate. The Rf values and colors obtained from the test solution and the standard solution are the same.

(2) Dry Ruscogenin and Neoruscogenin at 105 ℃ for 4 hours, and perform the test with 3 mg of the resulting material as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; it exhibits absorption at the wavenumbers of 866 cm^{-1}, 900 cm^{-1}, 922 cm^{-1} and 982 cm^{-1}.

Purity ***Heavy metals***—Proceed with 1.0 g of Ruscogenin and Neoruscogenin according to Method 1 and perform the test. Prepare the control solution with 2.0 mL of the lead standard solution (NMT 20 ppm).

Water NMT 4.5% (0.2 g, volumetric titration, direct titration).

Assay Weigh accurately about 0.15 g of Ruscogenin and Neoruscogenin, place in a 100-mL volumetric flask, dissolve in 80% ethanol, and add 80% ethanol to make 100.0 mL. Put 5.0 mL of this solution to a 100-mL volumetric flask, add 80% ethanol to fill up to the gauge line,

and use this solution as the test solution. Separately, weigh accurately about 0.15 g of ruscogenin and neoruscogenin RS, put it in a 100-mL volumetric flask, dissolve in 80% ethanol, and add 80% ethanol to make 100.0 mL. Put 5.0 mL of this solution in a 100-mL volumetric flask, add 80% ethanol to fill up to the gauge line, and use this solution as the standard solution. Put 1.0 mL each of the test solution and standard solution in a test tube, respectively, heat and evaporate to dryness in a 70 ℃ water bath, add 0.5 mL of p-methylaminobenzaldehyde-sulfuric acid solution, and heat again in a 70 ℃ water bath for 30 minutes. After cooling to room temperature, add 10 mL of acetic acid(100) solution (12 in 100) to each, and shake well for 20 minutes. Perform the test with each of the resulting solutions, using a blank test solution for comparison, as directed under the Ultraviolet-visible Spectroscopy and determine the absorbance of each solution at the wavelength 521 ± 3 nm, A_T and A_S, respectively.

$$\text{Amount (mg) of ruscogenin and neoruscogenin} = \text{Amount (mg) of neoruscogenin RS} \times \frac{A_T}{A_S}$$

Packaging and storage Preserve in tight containers in a cold and dark place.

Safflower Oil, Tocopherol Acetate and Pyridoxine Hydrochloride Capsules
홍화유·토코페롤아세테이트·피리독신염산염 캡슐

Safflower Oil, Tocopherol Acetate and Pyridoxine Hydrochloride Capsules contain NLT 90.0% of the labeled amount of linoleic acid ($C_{18}H_{32}O_2$: 280.45) in safflower oil, NLT 90.0% and NMT 150.0% of the labeled amount of tocopherol acetate ($C_{31}H_{52}O_3$: 472.74) and pyridoxine hydrochloride ($C_8H_{11}NO_3$·HCl: 205.64).

Method of preparation Prepare as directed under Capsules, with Safflower Oil, Tocopherol Acetate and Pyridoxine Hydrochloride.

Identification (1) ***Tocopherol acetate and pyridoxine hydrochloride***—Perform the test with the contents of Safflower Oil, Tocopherol Acetate and Pyridoxine Hydrochloride Capsules as directed under the Analysis for Vitamins.

(2) ***Safflower oil***—Weigh 0.1 g of the contents of Safflower Oil, Tocopherol Acetate and Pyridoxine Hydrochloride Capsules, transfer to a brown flask, and add 30 mL of methanol and 3 mL of potassium hydroxide solution (1 in 2). Perform saponification under a reflux condenser at 90 ℃ for 30 minutes. After cooling, transfer the mixture to a separatory funnel, wash the flask with 20 mL of water, collect to a separatory funnel, and add dilute hydrochloric acid to acidify. Then, extract 3 times with 30 mL each of ether, collect the ether extracts and wash with water until the washings become neutral. Dry the ether extracts using anhydrous sodium sulfate, filter, concentrate the filtrate in vacuum, dissolve the residue in 5 mL of methanol, and use this solution as the test solution. Separately, weigh 10 mg of linoleic acid RS, dissolve in 10 mL of methanol, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography, Develop the plate with a mixture of heptane, ethanol, acetic acid and acetone (14 : 4 : 1 : 0.5) as the developing solvent to a distance of about 15 cm, and air-dry the plate. Spray evenly 50% sulfuric acid on the plate; the color and R_f values of the spots obtained from the test solution and the standard solution are the same.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay (1) ***Tocopherol acetate and pyridoxine hydrochloride***—Weigh accurately the mass of the contents of NLT 20 capsules of Safflower Oil, Tocopherol Acetate and Pyridoxine Hydrochloride Capsules and perform the test as directed under the Analysis for Vitamins.

(2) ***Linoleic acid in safflower oil***—Weigh accurately the mass of the contents of NLT 20 capsules of Safflower Oil, Tocopherol Acetate and Pyridoxine Hydrochloride Capsules. Weigh accurately an amount equivalent to 0.4 g of linoleic acid and dissolve in 100 mL of isooctane. Transfer 1 mL of this solution and 1 mL of the internal standard solution to a stoppered test tube, add 1.5 mL of 0.5 mol/L sodium hydroxide-methanol TS, and heat at 100 ℃ for 5 minutes for saponification. Cool this solution to 30 to 40 ℃, add 2 mL of boron trifluoride-methanol TS, and shake to mix. Then, heat for 5 minutes at 100 ℃ for derivatization, and cool to 30 to 40 ℃. Add 5 mL of saturated sodium chloride solution, shake to mix and take the isooctane layer in the upper layer. Remove water with anhydrous sodium sulfate and use this solution as the test solution. Separately, take 1 mL of a solution prepared by weighing accurately about 0.4 g of linoleic acid RS and dissolving in 100 mL of isooctane and 1 mL of internal standard solution and transfer to a stoppered test tube. Then, proceed in the same manner as the test solution and use this solution as the standard solution. Perform the test with the test solution and the standard solution as directed under the Gas Chromatography according to the following conditions, and determine the peak area ratios, Q_T and Q_S, to the internal standard for each solution.

$$\text{Amount (mg) of linoleic acid } (C_{18}H_{32}O_2) = \text{Amount (mg) of linoleic acid RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—Weigh accurately about 0.2 g of pentadecanoic acid and dissolve in 50 mL of isooctane to prepare the solution.

Operating conditions

Detector: A flame ionization detector

Sample injection port temperature: 240 ℃

Detector temperature: 250 ℃

Column temperature: Maintain at 140 ℃ for the first 5 minutes, increase at a rate of 5 ℃ per minute to 250 ℃ and maintain this temperature for 5 minutes.

Column: A capillary column, about 0.32 mm in internal diameter and about 30 m in length, coated with polyethylene glycol for gas chromatography 0.25 μm in thickness.

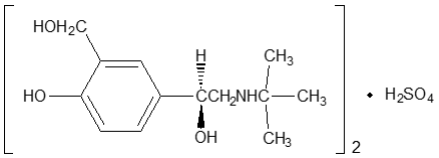
Carrier gas: Nitrogen

Flow rate: 1.0 mL/min

Split ratio: 5.0 : 1

Packaging and storage Preserve in tight containers.

Salbutamol Sulfate
살부타몰황산염



and enantiomer

$(C_{13}H_{21}NO_3)_2 \cdot H_2SO_4$: 576.70

Bis{*N*-*t*-butyl-2-hyroxy-2-[4-hydroxy-(3-hydroxymethyl)phenyl]ethanamine} sulfate [*51022-70-9*]

Salbutamol Sulfate, when dried, contains NLT 98.0% and NMT 101.0% of salbutamol sulfate [$(C_{13}H_{21}NO_3)_2 \cdot H_2SO_4$].

Description Salbutamol Sulfate occurs as a white powder.

It is freely soluble in water, slightly soluble in ethanol(95) or acetic acid(100), and practically insoluble in ether.

An aqueous solution of Salbutamol Sulfate (1 in 20) shows no optical rotation.

Identification (1) Determine the absorption spectra of the solutions of Salbutamol Sulfate and salbutamol sulfate RS in 0.1 mol/L hydrochloric acid TS (1 in 12500) as directed under the Ultraviolet-visible Spectrophotometry; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Salbutamol Sulfate and salbutamol sulfate RS, previously dried, according to the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) An aqueous solution of Salbutamol Sulfate (1 in 20) responds to the Qualitative Analysis for sulfate.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Salbutamol Sulfate in 20 mL of water; the solution is clear and colorless.

(2) ***Heavy metals***—Proceed with 1.0 g of Salbutamol Sulfate according to Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Related substances***—Dissolve 20 mg of Salbutamol Sulfate in 10 mL of water and use this solution as the test solution. Pipet 1 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the plate made of silica gel for thin-layer chromatography. Then, develop the plate with a mixture of ethyl acetate, 2-propanol, water, and ammonia water(28) (25 : 15 : 8 : 2) as the developing solvent to a distance of about 15 cm, and air-dry the plate. Allow the plate to stand for 5 minutes in a well-closed container saturated with diethylamine vapor, and spray evenly 4-nitrobenzenediazonium hydrochloride TS for spraying; the spots other than the principal spot from the test solution are not more intense than the spots from the standard solution.

(4) ***Boron***—Put about 50 mg of Salbutamol Sulfate and 5.0 mL of standard boron solution respectively into a platinum crucible, add 5 mL of potassium carbonate-sodium carbonate TS, and evaporate on a steam bath to dryness. After drying the mixture for 1 hour at 120 ℃, incinerate it by ignition. After cooling, add 0.5 mL of water and 3 mL of curcumin TS to the residue, and warm it gently on a steam bath for 5 minutes. After cooling, add 3 mL of acetic acid(100)-sulfuric acid TS to the mixture, mix, and allow it to stand for 30 minutes. Then, add ethanol(95) to make exactly 100 mL and filter it. Discard the first 10 mL of the filtrate and use the subsequent filtrate as the test solution and the standard solution. Perform the test with the test solution and the standard solution as directed under the Ultraviolet-visible Spectroscopy, using ethanol(95) as the control; the absorbance of the test solution at 555 nm is not greater than that of the standard solution.

Loss on drying NMT 0.5% (1 g, in vacuum at the pressure not exceeding 0.67 kPa, 100 ℃, 3 hours).

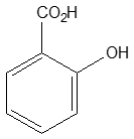
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.9 g of Salbutamol Sulfate, previously dried, add 50 mL of acetic acid(100), warm to dissolve, and cool. Then, titrate with 0.1 mol/L perchloric acid (indicator: 3 drops of methylrosaniline chloride TS). The endpoint of the titration is when the color of this solution changes from purple through blue to bluish green. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 57.67 mg $(C_{13}H_{21}NO_3)_2 \cdot H_2SO_4$

Packaging and storage Preserve in tight containers.

Salicylic Acid
살리실산



$C_7H_6O_3$: 138.12

2-Hydroxybenzoic acid [*69-72-7*]

Salicylic Acid, when dried, contains NLT 99.5% and NMT 101.0% of salicylic acid ($C_7H_6O_3$).

Description Salicylic Acid occurs as white crystals or a crystalline powder. It is odorless and has a slightly sour taste and irritant property.
It is freely soluble in ethanol(95), acetone or ether, and slightly soluble in water.

Identification (1) The Salicylic Acid aqueous solution (1 in 500) responds to the Qualitative Analysis (1) and (3) for salicylate.

(2) Determine the absorption spectra of solutions of Salicylic Acid and salicylic acid RS in ethanol(95) (3 in 200000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared spectra of Salicylic Acid and salicylic acid RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Melting point Between 158 and 161 ℃.

Purity (1) ***Chloride***—To 5.0 g of Salicylic Acid, add 90 mL of water and heat to dissolve. After cooling, add water to make 100 mL, and filter. Discard the first 20 mL of the filtrate, take the subsequent 30 mL of the filtrate, and add 6 mL of dilute nitric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 0.35 mL of 0.01 mol/L hydrochloric acid (NMT 0.008%).

(2) ***Sulfate***—Take 30 mL of the filtrate obtained in (1), add 1 mL of dilute hydrochloric acid, and put water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 0.35 mL of 0.005 mol/L sulfuric acid (NMT 0.011%).

(3) ***Heavy metals***—Dissolve 2.0 g of Salicylic Acid in 25 mL of acetone, and add 4 mL of sodium hydroxide TS and 2 mL of dilute acetic acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution by adding 25 mL of acetone, 2 mL of dilute acetic acid and water to 2.0 mL of lead standard solution to make 50 mL (NMT 10 ppm).

(4) ***Related substances***—To 0.50 g of Salicylic Acid, add the mobile phase to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately 10 mg of phenol, 25 mg of 4-hydroxyisophthalic acid and 50 mg of p-hydroxybenzoate, and dissolve in the mobile phase to make exactly 100 mL. To 1 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test and standard solutions as directed under the Liquid Chromatography according to the following conditions. Determine the peak areas from the respective solutions according to the automatic integration method. The peak areas of p-hydroxybenzoate, 4-hydroxyisophthalic acid and phenol in the test solution are not greater than those in the standard solution. The peak area other than salicylic acid in the test solution is not greater than that of 4-hydroxyisophthalic acid in the standard solution. The sum of all peak areas other than salicylic acid is not more than twice the peak area of p-hydroxybenzoate in the standard solution.

Operating conditions

Detector: An ultraviolet absorption spectrophotometer (wavelength: 270 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 35 °C.

Mobile phase: A mixture of water, methanol and acetic acid(100) (60 : 40 : 1).

Flow rate: Adjust the flow rate so that the retention time of salicylic acid is about 17 minutes.

System suitability

Detection sensitivity: Pipet 2 mL of the standard solution, and add the mobile phase to make exactly 10 mL. Proceed with 10 μL of this solution according to the operating method. The resultant peak areas of p-hydroxybenzoate, 4-hydroxyisophthalic acid and phenol are between 14% and 26% of the respective peaks obtained from 10 μL of the standard solution.

System performance: Dissolve 10 mg of phenol, 25 mg of 4-hydroxyisophthalic acid and 50 mg of p-hydroxybenzoate in 100 mL of the mobile phase. To 1 mL of this solution, add the mobile phase to make exactly 10 mL, and use this solution as the standard solution. Proceed according to the above conditions; p-hydroxybenzoate, 4-hydroxyisophthalic acid and phenol are eluted in this order with the resolution between 4-hydroxyisophthalic acid and phenol being NLT 4.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak areas of p-hydroxybenzoate, 4-hydroxyisophthalic acid and phenol is NMT 2.0%.

Time span of measurement: About twice the retention time of salicylic acid after the solvent peak.

(5) ***Sulfuric acid for readily carbonizable sub-***

***stances*—**Perform the test with 0.5 g of Salicylic Acid. The color of the solution is not more intense than that of the control solution C.

Loss on drying NMT 0.5% (2 g, silica gel, 3 hours).

Residue on ignition NMT 0.05%. (1 g).

Assay Weigh accurately about 0.5 g of Salicylic Acid, previously dried, dissolve in 25 mL of neutralized ethanol, and titrate with 0.1 mol/L sodium hydroxide VS (indicator: 3 drops of phenolphthalein TS).

Each mL of 0.1 mol/L sodium hydroxide VS
= 13.812 mg of $C_7H_6O_3$

Packaging and storage Preserve in well-closed containers.

Salicylic Acid and Lactic Acid Solution
살리실산·락트산 액

Salicylic Acid and Lactic Acid Solution contains NLT 90.0% and NMT 110.0% of the labeled amount of salicylic acid ($C_7H_6O_3$: 138.12) and lactic acid ($C_3H_6O_3$: 90.08).

Method of preparation Prepare as directed under Liquids, with Salicylic Acid and Lactic Acid. Preservative(s) may be used, if necessary.

Identification (1) ***Salicylic Acid***—Use Salicylic Acid and Lactic Acid Solution as the test solution. Separately, dissolve 100 mg of salicylic acid RS in a small amount of ethanol(95), and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of 1-hexane and acetic acid (20 : 0.7) as the developing solvent, and air-dry the plate. Spray evenly 2% iron(III) chloride TS, hexachloroplatinic(IV) acid TS, and then 50% sulfuric acid TS on the plate. The *Rf* values and colors of the spots from the test solution and the standard solution are the same.

(2) ***Lactic acid***— The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

Assay (1) ***Salicylic acid***—Pipet an amount, equivalent to 0.1 g of salicylic acid ($C_7H_6O_3$) according to the labeled amount of Salicylic Acid and Lactic Acid Solution. Add 20 mL of saturated solution of sodium bicarbonate and perform extraction 3 times with 20 mL of ether each time. Combine all the ether layers, perform extraction twice with 5 mL of saturated solution of sodium bicarbonate each time, and combine the extracts with the aforesaid saturated solution of sodium bicarbonate. Acidify with dilute hydrochloric acid, add ethanol(95) to make 100 mL, and use this solution as the test solution. Separately, weigh accurately about 0.1 g of salicylic acid RS, dissolve by adding dilute ethanol(95) (1 : 2) to make 100 mL, and use this solution as the standard solution. To 10.0 mL each of the test solution, the standard solution and the control solution (ethanol (95)), add 20 mL of 0.1 mol/L sodium hydroxide to each, shake for mixing, and allow to stand for 10 minutes. Add 20 mL of 0.1 mol/L hydrochloric acid to each, allow to stand for 10 minutes, and add water to make to 100 mL each. To 10.0 mL each of the respective solutions, add 5 mL of 0.5% iron(III) nitrate TS, add pH 2.0 hydrochloric acid-potassium chloride buffer solution to make 25 mL each, and allow to stand for exactly 10 minutes. Determine the absorbances, A_T and A_S, from the respective resulting solutions at the wavelength 530 nm as directed under the Ultraviolet-visible Spectroscopy.

Amount (mg) of salicylic acid ($C_7H_6O_3$)
$= \text{Amount (mg) of salicylic acid RS} \times \frac{A_T}{A_S}$

(2) ***Lactic acid***—Pipet an amount, equivalent to 0.2 g of lactic acid ($C_3H_6O_3$) according to the labeled amount of Salicylic Acid and Lactic Acid Solution. Add 20 mL of water and 10 mL of 1 mol/L sodium hydroxide, and boil on a steam bath for 10 minutes. After cooling, add water to make 50 mL. Centrifuge, take 10.0 mL of the supernatant, add the mobile phase to make 50 mL, and filter. Use this solution as the test solution. Separately, weigh accurately about 0.2 g of lactic acid RS and proceed in the same manner as in the preparation of the test solution, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak area, A_T and A_S of lactic acid from each of the solutions.

Amount (mg) of lactic acid ($C_3H_6O_3$)
$= \text{Amount (mg) of lactic acid RS} \times \frac{A_T}{A_S}$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 210 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 to 10 μm in particle diameter).

Mobile phase: 0.3 mol/L potassium dihydrogen phosphate TS (adjust the pH to 2.4 with phosphoric acid).

Packaging and storage Preserve in tight containers.

Salicylic Acid, Phenol and *dl*-Camphor Solution
살리실산·페놀·*dl*-캄파 액

Salicylic Acid, Phenol and *dl*-Camphor Solution contains NLT 90.0% and NMT 110.0% of salicylic acid ($C_7H_6O_3$: 138.12), phenol C_6H_6O: 94.11) and NLT 90.0% and NMT 130.0% of *dl*-camphor ($C_{10}H_{16}O$: 152.23) of the labeled amount.

Method of preparation Prepare as directed under the Liquids, with Salicylic Acid, Phenol and *dl*-Camphor.

Identification (1) ***Salicylic acid and dl-camphor***—Use Salicylic Acid, Phenol and *dl*-Camphor Solution as the test solution. Separately, dissolve 0.1 g each of salicylic acid RS and dl-camphor RS in a small amount of ethanol(95), and use these solutions as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot the test solution and the standard solution on a thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Develop the plate with a mixture of 1-hexane and acetic acid (20 : 0.7), and air-dry the plate. Spray 2% iron(III) chloride TS evenly on the plate, spray hexachloroplatinic(IV) acid TS evenly to the plate, and spray 50% sulfuric acid TS evenly to the plate; the spots obtained from the test solution show the same R_f value and color as the spots obtained from the standard solution.

(2) ***Phenol***—Take 20 mL of Salicylic Acid, Phenol and *dl*-Camphor Solution and evaporate it on a steam bath to 1 mL. Mix it with 20 mL of ether, wash 2 times with 10 mL each of saturated solution of sodium bicarbonate, take the ether layer, and evaporate to dryness on a steam bath. Then, perform the test according to the Identification under Phenol of Korean Pharmacopoeia (KP).

Assay (1) ***Salicylic acid***—Take accurately an amount of Salicylic Acid, Phenol and *dl*-Camphor Solution, equivalent to 15 mg of salicylic acid ($C_7H_6O_3$) according to the labeled amount, add the mobile phase to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 15 mg of salicylic acid RS, dissolve in the mobile phase to make 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under Liquid Chromatography according to the following operating conditions. Determine the peak areas, A_T and A_S, of salicylic acid for the test solution and the standard solution, respectively.

$$\text{Amount (mg) of salicylic acid } (C_7H_6O_3) = \text{Amount (mg) of salicylic Acid RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 280 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of 0.085% phosphoric acid and methanol (60 : 40).

Column temperature: A constant temperature of about 30 °C.

Flow rate: 1.0 mL/min

(2) ***Phenol***—Pipet an appropriate volume of Salicylic Acid, Phenol and *dl*-Camphor Solution, equivalent to 0.1 g of phenol (C_6H_6O), evaporate on a steam bath to 2 mL, and add 20 mL of 1 mol/L sodium hydroxide. Wash the solution 2 times with 10 mL each of ether, combine the ether layer, extract 2 times with 5 mL of 1 mol/L sodium hydroxide, and then combine the extract with the first 1 mol/L sodium hydroxide layer. Make the resulting solution acidic with dilute hydrochloric acid, saturate it with sodium bicarbonate, and extract it 5 times with 20 mL each of ether. Combine all ether layers, evaporate on a steam bath to dryness, add water to make 100 mL, and use this solution as the test solution. Separately, weigh accurately about 0.1 g of phenol RS, proceed in the same manner as the test solution, and use this solution as the standard solution. Pipet 10.0 mL each of the test solution, standard solution and control solution (water), add 1 mL of coloring agent, and allow the resulting solution to stand for 1 minute. Add 2 mL of 10% sodium bicarbonate solution, mix well while stirring, and add water to make 50 mL. Perform the test with the test solution and the standard solution as directed under the Ultraviolet-visible Spectroscopy, and determine the absorbance A_T and A_S at the wavelength of 470 nm.

$$\text{Amount (mg) of phenol} = \text{Amount (mg) of phenol RS} \times \frac{A_T}{A_S}$$

(3) ***dl-camphor***—Weigh accurately an amount of Salicylic Acid, Phenol and *dl*-Camphor Solution, equivalent to 500 mg of *dl*-camphor ($C_{10}H_{16}O$), according to the labeled amount. Add ethanol(99.5) to make exactly 100 mL. Pipet 2 mL of this solution, transfer it to a 10-mL volumetric flask, add 1 mL of the internal standard solution and ethanol(99.5) to make exactly 10 mL. Use this solution as the test solution. Separately, weigh accurately about 500 mg of *dl*-camphor RS and add ethanol(99.5) to make exactly 100 mL. Pipet 2 mL of this solution, transfer to a 10-mL volumetric flask, and add 1 mL of the internal standard solution and ethanol(99.5) to make exactly 10 mL. Use this solution as the standard solution. Perform the test with 2 μL each of the test solution and the standard solution as directed under the Gas Chromatography according to the following conditions, and calculate the peak area ratios, Q_T and Q_S, of *dl*-camphor to the internal standard.

$$\text{Amount (mg) of } dl\text{-camphor } (C_{10}H_{16}O) = \text{Amount (mg) of } dl\text{-camphor RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of biphenyl in ethanol(99.5) (1 in 20000).

Operating conditions

Detector: A hydrogen flame ionization detector

Column: A column, about 0.32 mm in internal diameter and 30 m in length, coated with dimethylpolysiloxane to 0.25 μm.

Column temperature: Maintain the temperature at 100 °C for 4 minutes, then raise to 140 °C at a rate of 40 °C per minute, and maintain it for 2 minutes. Raise the temperature again to 210 °C at a rate of 70 °C per minute.

Sample injection port temperature: 230 °C

Detector temperature: 230 °C

Carrier gas: Nitrogen

Flow rate: Between 150 and 160 mL/min.

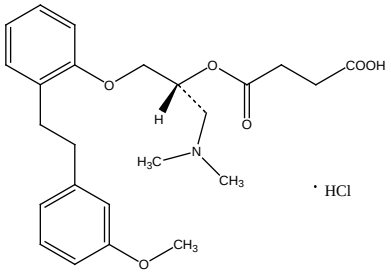
System suitability

System performance: Proceed with 2 μL of the standard solution under the above conditions; *dl*-camphor and the internal standard are eluted in this order with the resolution between these peaks being NLT 30 and the symmetry factor being NMT 1.5.

System repeatability: Repeat the test 6 times with 2 μL each of the standard solution under the above operating conditions; the relative standard deviation of the ratios of peak area of *dl*-camphor to that of the internal standard is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Sarpogrelate Hydrochloride
사르포그렐레이트염산염



and enantiomer

$C_{24}H_{31}NO_6 \cdot HCl$: 465.97

1-[2-(Dimethylamino)-1-[[2-[2-(3-methoxyphenyl)ethyl]phenoxy]methyl]ethyl hydrogen butanedioate hydrochloride [*135159-51-2*]

Sarpogrelate Hydrochloride contains NLT 98.5% and NMT 101.0% of sarpogrelate hydrochloride ($C_{24}H_{31}NO_6 \cdot HCl$: 465.97), calculated on the anhydrous basis.

Description Sarpogrelate Hydrochloride occurs as a white crystalline powder.

It is slightly soluble in water or ethanol(95).

It dissolves in 0.01 mol/L hydrochloric acid TS.

An aqueous solution of Sarpogrelate Hydrochloride (1 in 100) shows no optical rotation.

It shows polymorphism.

Identification (1) Determine the absorption spectra of the aqueous solutions of Sarpogrelate Hydrochloride and sarpogrelate hydrochloride RS in 0.01 mol/L hydrochloric acid TS (1 in 20000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Sarpogrelate Hydrochloride and sarpogrelate hydrochloride RS as directed in the potassium chloride disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers. If there is a difference between the two spectra, add acetone each, heat, suspend, filter, and recrystallize. Perform the test in the same manner with the separated crystals dried for 1 hour at 50 ℃.

(3) To 0.3 g of Sarpogrelate Hydrochloride, add 6 mL of sodium hydroxide TS, shake well to mix, and allow it to stand for 10 minutes. Filter this solution, add 1 mL of dilute nitric acid in 1 mL of the filtrate; this solution responds to the Qualitative Analysis for chloride.

Purity (1) ***Heavy metals***—Proceed with 2.0 g of Sarpogrelate Hydrochloride according to Method 4 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Arsenic***—Prepare the test solution with 2.0 g of Sarpogrelate Hydrochloride according to Method 4 and perform the test (NMT 1 ppm).

(3) ***Related substances***—Prepare the test solution and perform the test within 3 hours. Dissolve 20 mg of Sarpogrelate Hydrochloride in 10 mL of the mobile phase, and use this solution as the test solution. Pipet 2 mL of this solution, add the mobile phase to make exactly 200 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak area of each solution as directed in the automatic integration method; the peak area of decomposed substance A with a relative retention time to sarpogrelate of about 0.82 from the test solution is not greater than 1/5 of the peak area of sarpogrelate from the standard solution, and the peak area other than sarpogrelate and the above peak from the test solution is not greater than 1/10 of the peak area of sarpogrelate from the standard solution. The total area of the peaks other than sarpogrelate from the test solution is not greater than 1/ 2 of the peak area of sarpogrelate from the standard solution. The peak area of decomposed substance A with a relative retention time of about 0.82 to sarpogrelate is determined by mutiflying the area obtained by the automatic integration method by the relative response factor of 0.78.

Operating conditions

For the detector, column, column temperature, mobile phase and flow rate, comply with the operating con-

ditions under the Assay.

System suitability

Test for required detectability: Take exactly 5 mL of the standard solution, and add the mobile phase to make exactly 50 mL. The peak area of sarpogrelate obtained from 10 μL of this solution is equivalent to 7 to 13% of the peak area of sarpogrelate from the standard solution.

System performance: Dissolve 50 mg of Sarpogrelate in 20 mL of water and use this solution as the sarpogrelate hydrochloride stock solution. To 1 mL of this solution, add 2 mL of sodium hydroxide TS, shake well to mix, allow it to stand for 10 minutes, and add 3 mL of 1 mol/L hydrochloric acid TS. To this solution, add 1 mL of sarpogrelate hydrochloride stock solution and add the mobile phase to make 50 mL. Perform the test with 10 μL of this solution according to the above conditions; decomposed substance A and sarpogrelate are eluted in this order with the resolution being NLT 3.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak areas of sarpogrelate is NMT 2.0%

Time span of measurement: About 2.5 times the retention time of sarpogrelate after the solvent peak.

Water NMT 0.5% (0.1 g, coulometric titration).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 50 mg of Sarpogrelate Hydrochloride and sarpogrelate RS (determine the content of water before use, in the same manner as Sarpogrelate Hydrochloride), add exactly 2.5 mL each of the internal standard solution, add the mobile phase, and dissolve to make 50 mL. Pipet 5 mL each of these solutions, add the mobile phase to make exactly 50 mL, and use these solutions as the test solution and the standard solution. Perform the test with 10 μL each of these solutions as directed under the Liquid Chromatography according to the following conditions and calculate the ratios, Q_T and Q_S, of peak area of sarpogrelate to that of the internal standard, respectively.

$$\text{Amount (mg) of sarpogrelate hydrochloride } (C_{24}H_{31}NO_6\cdot HCl) = W_S \times \frac{Q_T}{Q_S}$$

W_S: Amount (mg) of sarpogrelate hydrochloride RS, calculated on the dried basis

Internal standard solution—A solution of isopropyl p-hydroxybenzoate in the mobile phase (3 in 1000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 272 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: A mixture of water, acetonitrile and trifluoroacetic acid (1300 : 700 : 1).

Flow rate: Adjust the flow rate so that the retention time of sarpogrelate is about 8 minutes.

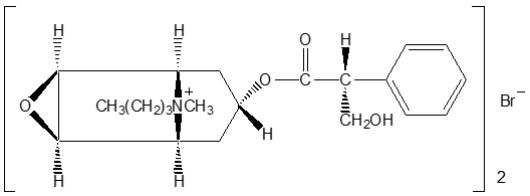
System suitability

System performance: Proceed with 10 μL of the standard solution according to the above conditions; sarpogrelate and the internal standard are eluted in this order with the resolution being NLT 3.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution according to the above conditions; the relative standard deviation of the ratios of the peak area of sarpogrelate to that of the internal standard is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Scopolamine Butylbromide
부틸스코폴라민브롬화물



Hyoscine Butylbromide $C_{21}H_{30}BrNO_4$: 440.37

(1*S*,2*S*,4*R*,5*R*,7*S*)-9-Butyl-7-[(2*S*)-3-hydroxy-2-phenylpropanoyloxy]-9-methyl-3-oxa-9-azoniatricyclo[3.3.1.$0^{2,4}$]nonane bromide [*149-64-4*]

Scopolamine Butylbromide, when dried, contains NLT 98.5% and NMT 101.0% of scopolamine butylbromide ($C_{21}H_{30}BrNO_4$).

Description Scopolamine Butylbromide occurs as white crystals or a crystalline powder.

It is very soluble in water, freely soluble in acetic acid(100), soluble in ethanol(95), sparingly soluble in methanol, slightly soluble in acetic anhydride, and practically insoluble in ether.

Melting point—About 140 °C (with decomposition).

Identification (1) To 1 mg of Scopolamine Butylbromide, add 3 to 4 drops of fuming nitric acid and evaporate to dryness on a steam bath. After cooling, dissolve the residue in 1 mL of *N*,*N*-dimethylformamide and add 6 drops of tetraethylammonium hydroxide TS; the solution exhibits a purple color.

(2) Determine the absorption spectra of solutions of Scopolamine Butylbromide and scopolamine butylbromide RS (1 in 1000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared spectra of Scopolamine Butylbromide and scopolamine butylbromide RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(4) An aqueous solution of Scopolamine Butylbromide (1 in 20) responds to the Qualitative Analysis for bromide.

Optical rotation $[\alpha]_D^{20}$: Between -18.0° and -20.0° (1 g after drying, water, 10 mL, 100 mm).

pH Dissolve 1.0 g of Scopolamine Butylbromide in 10 mL of water; the pH of this solution is between 5.5 and 6.5.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Scopolamine Butylbromide in 10 mL of water; the solution is clear and the color is not more intense than following control solution.

Control solution—To 0.5 mL of Matching fluid F for color, add diluted hydrochloric acid (1 in 40) to make 20 mL.

(2) ***Heavy metals***—Proceed with 2.0 g of Scopolamine Butylbromide according to Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Related substances***—Dissolve 0.10 g of Scopolamine Butylbromide, previously weighed, in the mobile phase to make exactly 10 mL and use this solution as the test solution. Separately, dissolve 10 mg of Scopolamine Hydrobromide, previously weighed, in the mobile phase to make exactly 100 mL. Pipet 10 mL of this solution. add the mobile phase to make exactly 50 mL and use this solution as the standard solution (1). Pipet 5 mL of the standard solution (1), add the mobile phase to make exactly 10 mL, and use this solution as the standard solution (2). Perform the test with 20 μL each of the test solution, standard solution (1) and standard solution (2) as directed under the Liquid Chromatography according to the following operating conditions. Determine each peak area of the solutions by the automatic integration method; the peak area of scopolamine from the test solution is not greater than that from the standard solution (2), and each area of the peaks other than the peak that appears first and the peak of scopolamine and butylscopolamine from the test solution are not greater than the peak area from the standard solution (1).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 210 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 15 cm to 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 μm in particle diameter).

Column temperature: A constant temperature of about 30 °C.

Mobile phase: Dissolve 2 g of sodium lauryl sulfate in 370 mL of water and adjust the pH with diluted phosphoric acid (1 in 10) to 3.6.

Flow rate: Adjust the flow rate so that the retention time of butylscopolamine is about 7 minutes.

System suitability

Detection sensitivity: Adjust the detection sensitivity so that the peak height of scopolamine obtained from 20 μL of the standard solution (2) is between 5 mm and 30 mm.

System performance: Dissolve 5 mg each of Scopolamine Butylbromide and scopolamine butylbromide RS in 50 mL of the mobile phase. Proceed with 20 μL of this solution according to the above conditions; scopolamine and butylscopolamine are eluted in this order with the resolution being NLT 5.

Time span of measurement: About twice the retention time of butylscopolamine.

Loss on drying NMT 1.0% (1 g, 105 ℃, 4 h.).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately 0.8 g of Scopolamine Butylbromide, previously dried, dissolve in 40 mL of acetic acid(100) and 30 mL of acetic anhydride, and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 44.04 mg of $C_{21}H_{30}BrNO_4$

Packaging and storage Preserve in tight containers.

Scopolamine Butylbromide and Acetaminophen Tablets
부틸스코폴라민브롬화물·아세트아미노펜 정

Scopolamine Butylbromide and Acetaminophen Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of scopolamine butylbromide ($C_{21}H_{30}BrNO_4$: 440.37) and acetaminophen ($C_8H_9NO_2$: 151.16).

Method of preparation Prepare as directed under Tablets, with Scopolamine Butylbromide and Acetaminophen.

Identification The retention times of the major peaks obtained from the test solution and the standard solution under the Assay are the same.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 Scopolamine Butylbromide and Acetaminophen Tablets, and powder the tablets. Weigh accurately an amount, equivalent to about 10 mg of scopolamine butylbromide ($C_{21}H_{30}BrNO_4$) and about 500 mg of acetaminophen ($C_8H_9NO_2$), and add water to make exactly 500 mL. Sonicate this solution for about 20 minutes, filter through a membrane filter with a pore size NMT 0.45 μm, discard the first 2 mL, and use the subsequent filtrate as the test solution. Separately, weigh accurately 10 mg of scopolamine butylbromide RS and 500 mg of acetaminophen RS, add water to make to make exactly 500 mL, and use the resulting solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions and determine the peak areas, A_{T1}, A_{T2}, A_{S1} and A_{S2}, of scopolamine butylbromide and acetaminophen in each solution.

$$\text{Amount (mg) of scopolamine butylbromide } (C_{21}H_{30}BrNO_4) = \text{Amount (mg) of scopolamine butylbromide RS} \times \frac{A_{T1}}{A_{S1}}$$

$$\text{Amount (mg) of acetaminophen } (C_8H_9NO_2) = \text{Amount (mg) of acetaminophen RS} \times \frac{A_{T2}}{A_{S2}}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 ℃.

Mobile phase: Control the mixing ratio of mobile phase A and mobile phase B stepwise or via the gradient elution as follows.

Mobile phase A: A mixture of 0.01 mol/L potassium phosphate buffer solution (pH 2.7) and acetonitrile (90 : 10).

Mobile phase B: Acetonitrile

Time after injection of sample (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 - 6	100 → 80	0 → 20
6 - 11	80 → 10	20 → 90

Flow rate: 1.0 mL/min

System suitability

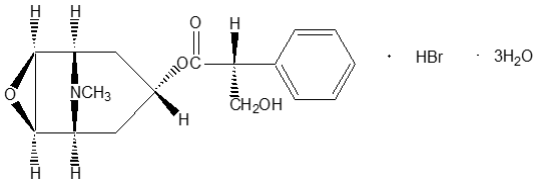
System performance: Proceed with 10 μL of the standard solution according to the above conditions; acetaminophen and scopolamine butylbromide are eluted in this order with the resolution being NLT 5.5.

System repeatability: Repeat the test 6 times with 10 μL of the standard solution according to the above conditions; the relative standard deviation of the peak areas of acetaminophen and scopolamine butylbromide is NMT 1.0%.

0.01 mol/L potassium phosphate buffer solution (pH 2.7)—Dissolve 1.36 g of potassium dihydrogen phosphate in water, adjust the pH to 2.7 with phosphoric acid, and add water to make 1000 mL.

Packaging and storage Preserve in well-closed containers.

Scopolamine Hydrobromide Hydrate
스코폴라민브롬화수소산염수화물



Scopolamine Hydrobromide

$C_{17}H_{21}NO_4 \cdot HBr \cdot 3H_2O$: 438.31

(1*S*,2*S*,4*R*,5*R*,7*S*)-9-Methyl-3-oxa-9-azatricyclo[3.3.1.02,4]non-7-yl(2*S*)-3-hydroxy-2-phenylpropanoate hydrobromide trihydrate [*6533-68-2*]

Scopolamine Hydrobromide Hydrate, when dried, contains NLT 98.5% of scopolamine hydrobromide (C17H21NO4·HBr : 384.27).

Description Scopolamine Hydrobromide Hydrate occurs as a colorless or white crystal, or white granule or a powder and odorless.

It is freely soluble in water, sparingly soluble in acetic acid(100) or ethanol(95) and practically insoluble in ether.

Identification (1) To 1 mg of Scopolamine Hydrobromide Hydrate, add 3 to 4 drops of fuming nitric acid, evaporate to dryness on a steam bath. Cool and dissolve the residue in 1 ml of *N*,*N*-Dimethylformamide, and add 6 drops of tetraethylammonium hydroxide TS; the resulting solution exhibits a purple color.

(2) An aqueous solution of Scopolamine Hydrobromide Hydrate (1 in 20) responds to the Qualitative Analysis for bromide.

Optical rotation $[\alpha]_D^{20}$: Between -24.0° and -26.0° (0.5 g after drying, water, 10 mL, 100 mm).

Melting point Between 195 and 199 ℃ (after drying, heat the bath fluid to 180 ℃ in advance).

Purity (1) ***Clarity and color of solution***—Dissolve 0.5 g of Scopolamine Hydrobromide Hydrate in 10 mL of water; the solution is colorless and clear.

(2) ***Acid***—Dissolve 0.50 g of Scopolamine Hydrobromide Hydrate in 15 mL of water, and add 0.50 ml of 0.02 mol/L sodium hydroxide and 1 drop of methyl red-methylene blue TS; the resulting solution is green.

(3) ***Atropine***—Dissolve 0.20 g of Scopolamine Hydrobromide Hydrate in 20 mL of water, add 0.60 mL of 0.002 mol/L potassium permanganate, and allow to stand for 5 minutes; the red color does not disappear.

(4) ***Related substances***—Dissolve 0.15 g of Scopolamine Hydrobromide Hydrate in 3 mL of water, and use this solution as the test solution.

(i) To 1 mL of the test solution, add 2 to 3 drops of ammonia TS; the solution does not become turbid.

(ii) To 1 mL of the test solution, add 2 to 3 drops of potassium hydroxide TS; the solution produces a white turbidity, but it disappears clearly in a little while.

Loss on drying NMT 13.0% (1.5 g, first dry in a desiccator (silica gel) for 24 hours, then dry at 105 ℃ for 3 hours).

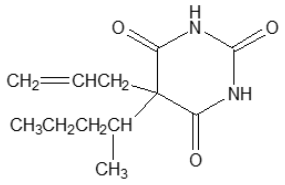
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.5 g of Scopolamine Hydrobromide Hydrate, previously dried, and dissolve in 10 mL of acetic acid(100) by warming. After cooling, add 40 mL of acetic anhydride and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank test in the same manner and make any necessary correction.

Each mL of 1 mol/L perchloric acid VS
= 38.426 mg of $C_{17}H_{21}NO_4 \cdot HBr$

Packaging and storage Preserve in light-resistant, tight containers.

Secobarbital
세코바르비탈



$C_{12}H_{18}N_2O_3$: 238.28

5-(Pentan-2-yl)-5-(prop-2-en-1-yl)pyrimidine-2,4,6(1*H*,3*H*,5*H*)-trione [*76-73-3*]

Secobarbital contains NLT 97.5% and NMT 100.5% of secobarbital ($C_{12}H_{18}N_2O_3$), calculated on the dried basis.

Description Secobarbital occurs as a white, amorphous or crystalline powder. It is odorless and has a slightly bitter taste.

It is very slightly soluble in water, freely soluble in ethanol(95) or ether, and soluble in chloroform.

It dissolves in sodium hydroxide TS or sodium carbonate solution.

The pH of the saturated solution of Secobarbital is about 5.6.

Identification Determine the infrared spectra of Secobarbital and secobarbital RS as directed in the paste method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Purity ***Isomer content***—Weigh accurately about 0.3 g of Secobarbital, dissolve in 5 mL of sodium hydroxide solution (1 in 100), add a solution prepared by dissolving 300 ± 5 mg of 4-nitrobromobenzyl in 10 mL of ethanol(95), and reflux for 30 minutes. After cooling, filter the formed precipitates through a small filter, and wash well with water. Recrystallize the precipitates with 25 mL of ethanol(95), and dry at 105 ℃ for 30 minutes; the melting point is between 156 and 161 ℃.

Loss on drying NMT 1.0% (1 g, silica gel, 18 hours).

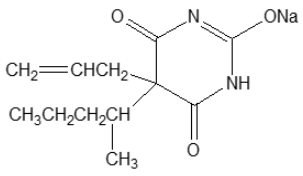
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.45 g of Secobarbital, and dissolve in 60 mL of dimethylformamide. While stirring to mix and avoiding absorption of carbon dioxide in the air, titrate with 0.1 mol/L sodium methoxide VS (indicator: 4 drops of thymol blue TS). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L sodium methoxide VS
= 23.828 mg of $C_{12}H_{18}N_2O_3$

Packaging and storage Preserve in tight containers.

Secobarbital Sodium
세코바르비탈나트륨



$C_{12}H_{17}N_2NaO_3$: 260.27

4,6-Dioxo-5-(pentan-2-yl)-5-(prop-2-en-1-yl)-1,4,5,6-tetrahydropyrimidin-2-olate [*309-43-3*]

Secobarbital Sodium contains NLT 98.5% and NMT 100.5% of secobarbital sodium ($C_{12}H_{17}N_2NaO_3$), calculated on the dried basis.

Description Secobarbital Sodium occurs as a white powder. It is odorless and has a bitter taste.

It is very soluble in water, soluble in ethanol(95) and practically insoluble in ether.

It is hygroscopic.
A solution of Secobarbital Sodium is decomposed when allowed to stand, and the decomposition is accelerated when heated.

Identification (1) Determine the infrared spectra of respective solutions of the residue obtained under Assay and Secobarbital RS in chloroform as directed under the solution method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) Ignite about 0.5 of Secobarbital Sodium. The residue exhibits bubbles when acid is added and responds to the Qualitative Analysis for sodium salt.

pH Dissolve 1.0 g of Secobarbital Sodium in 10 mL of water. The pH of this solution is between 9.7 and 10.5.

Purity (1) ***Clarity and color of solution*—**Dissolve 1.0 g of Secobarbital Sodium in 10 mL of freshly boiled and cooled water, and examine after 1 minute; the solution is clear with no insoluble substances.

(2) ***Heavy metals*—**Proceed with 1.0 g of Secobarbital Sodium as directed under Method 2 and perform the test. Prepare the control solution with 3.0 mL of lead standard solution (NMT 30 ppm).

(3) ***Isomer content*—**Weigh accurately about 0.3 g of Secobarbital Sodium, dissolve in 5 mL of sodium hydroxide solution (1 in 100), add a solution prepared by dissolving 0.3 g of 4-nitrobromobenzyl in 10 mL of ethanol(95), and reflux for 30 minutes. After cooling, filter the formed precipitates through a small filter, and wash well with water. Recrystallize the precipitates with 25 mL of ethanol(95), and dry at 105 ℃ for 30 minutes; the melting point is between 156 and 161 ℃.

Bacterial endotoxins Less than 0.9 EU/mg of secobarbital sodium, when used in a non-oral preparation without a further procedure for the removal of bacterial endotoxins.

Loss on drying NMT 3.0% (1 g, 80 ℃, 5 hours).

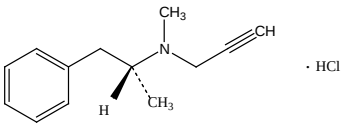
Assay Weigh accurately about 0.5 g of Secobarbital Sodium, and dissolve in 15 mL of water in a separatory funnel. To this, add 2 mL of hydrochloric acid, and shake well to mix. Extract the isolated secobarbital 8 times with 25 mL each of chloroform. To test for completion of the extraction, perform extraction with 10 mL of chloroform once more and then evaporate the solvent. The residue is NMT 0.5 mg. Filter the chloroform extract in a beaker, previously measured in the mass, and wash the separatory funnel and filter with a small amount of chloroform multiple times to filter. Combine the filtrate and washings, and evaporate to dryness on a steam bath while passing the air. To the residue, add 2 mL of ethanol(99.5), and evaporate to dryness. Again, add 2 mL of ethanol(99.5) to evaporate to dryness, and dry at 100 ℃ for 2 hours. After cooling, measure the mass.

Amount (mg) of secobarbital sodium ($C_{12}H_{17}N_2NaO_3$)

= Mass (mg) of residue × 1.092

Packaging and storage Preserve in tight containers.

Selegiline Hydrochloride
셀레길린염산염



$C_{13}H_{17}N \cdot HCl$: 223.74

(2*R*)-*N*-Methyl-*N*-prop-2-yn-1-yl-1-phenyl-propan-2-amine hydrochloride [*14611-52-0*]

Selegiline Hydrochloride contains NLT 98.0% and NMT 101.0% of selegiline hydrochloride ($C_{13}H_{17}N \cdot HCl$), calculated on the dried basis.

Description Selegiline Hydrochloride occurs as a white crystalline powder and is odorless.
It is freely soluble in water, chloroform or methanol.

Identification (1) Determine the absorption spectra of aqueous solutions of Selegiline Hydrochloride and selegiline hydrochloride RS (1 in 2000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Selegiline Hydrochloride and selegiline hydrochloride RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

(4) An aqueous solution of Selegiline Hydrochloride (1 in 50) responds to the Qualitative Analysis (2) for chloride.

Optic rotation $[\alpha]_D^{20}$: Between -10° and -12° (2.0 g, calculated on the dried basis, water, 20 mL, 100 mm).

Melting point Between 141 and 145 ℃.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Selegiline Hydrochloride according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Related substances***—Weigh accurately about 50 mg of Selegiline Hydrochloride, dissolve in the mobile phase to make exactly 50 mL, and use this solution as the test solution. Separately, to 10.0 mL of the system suitability solution, add the mobile phase to make exactly 100 mL, add the mobile phase to 10.0 mL of this solution to make exactly 50 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the

Liquid Chromatography according to the following conditions, and determine peak areas of each solution by the automatic integration method. Each related substances in the test solution is NMT 0.2% and the total amount of related substances is NMT 1.0%.

$$\text{Content (\%) of related substances} = 5000 \times \frac{C}{W} \times \frac{A_1}{A_S}$$

C: Concentration (mg/mL) of selegiline hydrochloride in the standard solution

W: Amount (mg) of Selegiline Hydrochloride taken

A_i: Peak area of each related substances obtained from the test solution

A_S: Peak area of selegiline obtained from the standard solution

Operating conditions

For the detector, column, mobile phase, flow rate, and system compatibility solution, proceed as directed in the operating conditions under the Assay.

System suitability

System performance: Proceed with 20 μL of the standard solution according to the above conditions; the resolution between methamphetamine and selegiline peaks is NLT 3.

System repeatability: Repeat the test 6 times with 20 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak areas of selegiline is NMT 5.0%.

Time span of measurement: 3 times the range of retention time of selegiline.

Loss on drying NMT 1.0% (1 g, 60 ℃, in vacuum, 3 hours).

Residue on ignition NMT 0.2% (1 g).

Assay Weigh accurately about 50 mg each of Selegiline Hydrochloride and selegiline hydrochloride RS, dissolve in the mobile phase to make exactly 50 mL, add the mobile phase to 10.0 mL of these solutions to make exactly 100 mL, and use these solutions as the text solution and the standard solution. Perform the test with 20 μL of each of these solutions as directed under the Liquid Chromatography according to the following conditions, and determine the areas A_T and A_S of the major peak of each solution.

$$\text{Amount (mg) of selegiline hydrochloride } (C_{13}H_{17}N\cdot HCl) = \text{amount (mg) of selegiline hydrochloride RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 205 nm).

Column: A stainless steel column about 3.9 mm in internal diameter and about 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 μm to 10 μm in particle diameter).

Mobile phase: A mixture of ammonium phosphate buffer solution and acetonitrile (80:20).

Flow rate: 1 mL/min

System suitability

System performance: Dissolve 10 mg of methamphetamine hydrochloride RS and 10 mg of selegiline hydrochloride RS in the mobile phase to make exactly 100 mL, and use this solution as the system suitability solution. With 20 μL of this solution, proceed according to the above conditions; the resolution between methamphetamine and selegiline peaks is not less 3.

System repeatability: Repeat the test 5 times with 20 μL each of the system suitability solution according to the above conditions; the relative standard deviation of the peak areas of selegiline is NMT 2.0%.

Ammonium phosphate buffer solution—Prepare 0.1 mol/L ammonium dihydrogen phosphate solution, and adjust the pH to 3.1 with phosphoric acid.

Packaging and storage Preserve in light-resistant, tight containers.

Selenium Powder 0.1%
셀레늄 가루0.1%

Selenium Powder 0.1% contains NLT 1 mg of selenium (Se : 78.96) per g.

Method of preparation Transfer 9.976 g of calcium hydrogen phosphate hydrate to a clean glass or plastic container, add 1000 mL of purified water (45 °C) and 24 g of sodium selenate, and dissolve it completely by stirring. Add this solution slowly into the mixer, and mix at a low speed. Dry in an oven until the water content reaches between 1% and 2%, grind the residue using a grinder, and pass it through a No. 16 sieve.

Description Selenium Powder 0.1% occurs as a white to grayish white powder and is odorless.

Identification (1) ***Calcium***—To 5 mL of an aqueous solution of Selenium Powder 0.1% (1 in 20), add 2 drops of methyl red TS (indicator), and neutralize with ammonia TS. Add dilute hydrochloric acid until the solution becomes acidic, and add ammonium hydroxide TS; a white precipitate is produced. The precipitate does not dissolve in acetic acid(100) and dissolves in hydrochloric acid. Moisten the precipitate with hydrochloric acid and place into the colorless flame of a Bunsen burner; it exhibits a yellowish red color.

(2) ***Phosphate***—To a neutral solution of Selenium Powder 0.1%, add silver nitrate TS: a yellow precipitate is produced. Add dilute nitric acid or ammonia TS subsequently; the precipitate dissolves.

(3) ***Sodium***—Place a small amount of Selenium Powder 0.1% into the colorless flame of a Bunsen burner; it exhibits a yellow color.

(4) Perform the test with Selenium Powder 0.1% and selenium powder 0.1% RS as directed under the Assay; the absorption spectrum of the test solution exhibits maxima at the same wavelengths as that of the standard solution.

Purity ***Lead***—Weigh 2.0 g of Selenium Powder 0.1% and perform the test as directed under the lead test in the US Pharmacopeia. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

Loss on drying NMT 3.0% (1 g, 105℃, 2 hours)

Assay Weigh accurately 0.5 g of Selenium Powder 0.1%, transfer to a 250-mL Erlenmeyer flask, add 5 mL of hydrochloric acid, 5 mL of nitric acid and 30 mL of water, and heat on a hot plate until it dissolves completely. After cooling, transfer the solution to a 200-mL volumetric flask, add diluent to make 200 mL, and use this solution as the test solution. Separately, weigh accurately about 1.0 g of selenium RS, transfer to a 100-mL volumetric flask, dissolve in 1 mL of dilute nitric acid (1 in 2) (warming gently, if necessary), add water to make 100 mL, and shake to mix. With this solution, prepare as follows and use the solution as the standard solution.

Element Name	Concentration of the standard solution (μg/mL)		
	High concentration	Medium concentration	Low concentration
Selenium	50	25	1

With the test solution and the standard solution, perform the test according to the Inductively Coupled Plasma Spectrochemistry at a wavelength of 196.03 nm, construct a calibration curve from the standard solution, and determine the concentration (μg/mL) of the test solution from the calibration curve.

$$\text{Content (\%) of selenium (Se)} = \frac{\text{Concentration (ppm) of selenium}}{\text{Amount (g) of sample taken}} \times \frac{1.0\ \text{g}}{5\ \text{(ppm)}} \times 100$$

5 ppm: A theoretical concentration of selenium per g of sample for 1.0 g of Selenium Powder 0.1% diluted 200 times.

Diluent—A mixture of 2% nitric acid and 6% hydrochloric acid (1 : 1).

Packaging and storage Preserve in tight containers.

Selenium in Dried Yeast
셀레늄함유건조효모

Selenium in Dried Yeast is obtained by cultivating yeast in a medium containing selenium and organically binding selenium to the yeast. Selenium in Dried Yeast contains NLT 540 μg of selenium (Se: 78.96) per g of the labeled amount.

Description Selenium in Dried Yeast occurs as yellowish brown to brown powder and has a yeast-like odor and taste.

Identification Weigh about 0.1 g of Selenium in Dried Yeast, add 10 mL of nitric acid, and heat at 60 °C for 10 minutes. Add 10 mL of water and 5 g of urea to this solution, heat to boiling, cool, and add 2 mL of potassium iodide solution (1 in 10); it exhibits a golden yellow to orange color and soon becomes dark.

Loss on drying NMT 7.0% (1 g, 100 °C, 5 hours).

Microbiological examination of non-sterile products The total aerobic microbial count is NMT 7,500 per g of Selenium in Dried Yeast.

Nitrogen NLT 8.0% (30 mg) (Nitrogen Determination).

Assay Weigh accurately Selenium in Dried Yeast, equivalent to about 0.1 mg of selenium and perform the test according to the selenium assay under the Analysis for Minerals.

Packaging and storage Preserve in light-resistant, tight containers.

Selenium in Dried Yeast and Tocopherol Acetate Capsules
셀레늄함유건조효모·
토코페롤아세테이트 캡슐

Selenium in Dried Yeast and Tocopherol Acetate Capsules contain NLT 90.0% and NMT 150.0% of the labeled amount of selenium (Se: 78.96) and tocopherol acetate ($C_{31}H_{52}O_3$: 472.75).

Method of preparation Prepare as directed under Capsules, with Selenium in Dried Yeast and Tocopherol Acetate.

Identification (1) ***Selenium in selenium in dried yeast***—Weigh an amount of Selenium in Dried Yeast and Tocopherol Acetate Capsules, equivalent to about 1 mg of selenium, according to the labeled amount, and perform the test as directed under the Analysis for Minerals.

(2) ***Tocopherol acetate***—Perform the test with Selenium in Dried Yeast and Tocopherol Acetate Capsules as directed under the Analysis for Vitamins.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay (1) ***Selenium in selenium in dried yeast***—Weigh accurately the mass of the contents of NLT 20 Selenium in Dried Yeast and Tocopherol Acetate Capsules, and perform the test as directed under the selenium assay of the Analysis for Minerals.

(2) ***Tocopherol acetate***—Weigh accurately the mass of the contents of NLT 20 Selenium in Dried Yeast and Tocopherol Acetate Capsules. Weigh accurately an amount equivalent to about 0.1 g of tocopherol acetate ($C_{31}H_{52}O_3$), and perform the test as directed under the tocopherol acetate assay of the Analysis for Vitamins.

Packaging and storage Preserve in tight containers.

Selenium in Dried Yeast, Chromium in Dried Yeast and Ascorbic Acid Capsules
셀레늄함유건조효모·크롬함유건조효모·아스코르브산 캡슐

Selenium in Dried Yeast, Chromium in Dried Yeast and Ascorbic Acid Capsules contain NLT 90.0% and NMT 150.0% of the labeled amount of selenium (Se: 78.96) in selenium in dried yeast, chromium (Cr: 52.00) in chromium in dried yeast, and ascorbic acid (C_6H8O_6: 176.13).

Method of preparation Prepare as directed under Capsules, with Selenium in Dried Yeast, Chromium in Dried Yeast, and Ascorbic Acid.

Identification (1) ***Selenium in selenium in dried yeast, chromium in chromium in dried yeast***—Perform the test with Selenium in Dried Yeast, Chromium in Dried Yeast and Ascorbic Acid Capsules as directed under the Analysis for Minerals.

(2) ***Ascorbic acid***—Perform the test with Selenium in Dried Yeast, Chromium in Dried Yeast and Ascorbic Acid Capsules as directed under the Analysis for Vitamins.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay (1) ***Selenium in selenium in dried yeast and chromium in chromium in dried yeast***—Weigh accurately the mass of contents of NLT 20 Selenium in Dried Yeast, Chromium in Dried Yeast and Ascorbic Acid Capsules, and perform the test as directed under the Assay for each component of the Analysis for Minerals.

(2) ***Cyanocobalamin***—Weigh accurately the mass of contents of NLT 20 Selenium in Dried Yeast, Chromium in Dried Yeast and Ascorbic Acid Capsules, and perform the test as directed under the Analysis for Vitamins.

Packaging and storage Preserve in well-closed containers.

Selenium Sulfide
황화셀레늄

Selenium Sulfide SeS_2: 143.09
[*7488-56-4*]

Selenium Sulfide contains NLT 52.0% and NMT 55.5% of selenium (Se: 78.96).

Description Selenium Sulfide occurs as reddish brown to orange crystals. It has a slight odor.
It is practically insoluble in water or organic solvents.

Identification (1) Filter 20 mL of the test solution from the Assay. To 10 mL of the filtrate, add 5 mL of water and 5 g of urea, and heat to boiling. After cooling, add 2 mL of potassium iodide solution (1 in 10); it exhibits an orange color, and the color immediately changes to a dark color.

(2) Allow to stand the solution obtained from (1) for 10 minutes, and then filter. To the filtrate, add 10 mL of barium chloride TS; the resulting solution is turbid.

Purity ***Soluble selenium compound***—Transfer 10.0 g of Selenium Sulfide into a 250-mL volumetric flask, add water, and shake to mix. Allow to stand for 1 hour while shaking occasionally, and filter. Pipet 10 mL of the filtrate, add 2 mL of 2.5 mol/L formic acid, add 50 mL of water, and shake to mix. Adjust the pH to 2.5 ± 0.5 if necessary. To this solution, add 2 mL of freshly prepared 3,3'-diaminobenzidine tetrahydrochloride solution (1 in 200), mix well, allow to stand for 45 minutes, and add ammonia TS to adjust the pH to 6.5 ± 0.5. Transfer this solution into a separatory funnel, add exactly 10 mL of toluene, and shake vigorously for 1 minute to mix. Discard the water layer, take the toluene layer, and use this solution as the test solution. Separately, pipet 50 mL of selenium standard stock solution, and add water to make 100 mL. Pipet 10 mL of this solution, add 2 mL of 2.5 mol/L formic acid, and proceed in the same manner as the test solution. Use this solution as the standard solution. Perform the test with the test solution and the standard solution as directed under the Ultraviolet-visible Spectroscopy. Without adding the test solution, the standard solution and Selenium Sulfide, proceed in the same manner as the test solution to make the blank test solution. Determine the absorption at a wavelength of 420 nm of the test solution and the standard solution as directed wavelength Ultraviolet-visible Spectroscopy using the blank test solution as the control solution (NMT 5 ppm).

Residue on ignition NMT 0.2% (1 g).

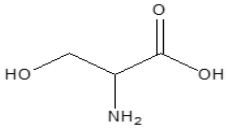
Assay Weigh accurately about 0.1 g of Selenium Sulfide, add 25 mL of fuming nitric acid, and decompose until it does not dissolve by gently heating. After cooling,

transfer this solution into a 250-mL volumetric flask filled with 100 mL of water, cool again, and add water to the gauge line to mix. Transfer 50 mL of this solution into a flask, add 25 mL of water and 10 g of urea, and heat to boiling. After cooling, add 3 mL of starch TS and 10 mL of potassium iodide solution (1 in 10), and immediately titrate with 0.05 mol/L sodium thiosulfate VS. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.05 mol/L sodium thiosulfate VS
= 0.987 mg of Se

Packaging and storage Preserve in well-closed containers.

DL-Serine
DL-세린



$C_3H_7NO_3$: 105.09
2-Amino-3-hydroxypropionic acid, [*302-84-1*]

DL-Serine, when dried, contains NLT 98.0% and NMT 102.0% of DL-serine ($C_3H_7NO_3$).

Description DL-Serine occurs as white crystals or a crystalline powder.
It is freely soluble in water and insoluble in ethanol(95) and in ether.

Melting point—About 246 ℃.

Identification To 5 mL of an aqueous solution of DL-Serine (1 in 1000), add 1 mL of 0.2% ninhydrin TS; the solution exhibits a bluish purple or violet color.

Purity (1) ***Arsenic*—**Proceed with 0.67 g of DL-Serine as directed under Method 3 and perform the test (NMT 3 ppm).

(2) ***Heavy metals*—**Proceed with 1.0 g of DL-Serine as directed under Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

Loss on drying NMT 0.3% (1 g, 105 ℃, 3 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 250 mg of DL-Serine, previously dried, add 25 mL of water, and heat on a steam bath to dissolve. After cooling, add 50 mL of water, add 2 to 3 drops of phenolphthalein TS, and titrate with 0.1 mol/L sodium hydroxide VS. The endpoint of titration is when the pink color persists for NLT 30 seconds. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS
= 10.51 mg of C3H7NO3

Packaging and storage Preserve in tight containers.

Silver Nitrate
질산은

$AgNO_3$: 169.87

[*7761-88-8*]

Silver Nitrate, when dried, contains NLT 99.8% and NMT 101.0% of silver nitrate ($AgNO_3$).

Description Silver Nitrate occurs as lustrous, colorless or white crystals.
It is very soluble in ethanol(95) and practically insoluble in ether.
It is gradually colored to gray to blackish gray by light.

Identification An aqueous solution of Silver Nitrate (1 in 50) responds to the Qualitative Analysis for silver salt and nitrate.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Silver Nitrate in 10 mL of freshly boiled and cooled water; the solution is colorless, clear and neutral.

(2) ***Bismuth, copper and lead***—To 5 mL of an aqueous solution of Silver Nitrate (1 in 10), add 3 mL of ammonia TS; the solution is colorless and clear.

Loss on drying NMT 0.2% (2 g, silica gel, light-resistant, 4 hours).

Assay Weigh accurately about 0.7 g of Silver Nitrate, previously powdered and dried, dissolve in 50 mL of water, add 2 mL of nitric acid, and titrate with 0.1 mol/L ammonium thiocyanate VS (indicator: 2 mL of ammonium iron(III) sulfate TS).

Each mL of 0.1 mol/L ammonium thiocyanate VS
= 16.987 mg of $AgNO_3$

Packaging and storage Preserve in light-resistant, tight containers.

Silver Protein
프로테인은

Silver Protein contains NLT 7.5% and NMT 8.5% of silver (Ag: 107.87), calculated as a compound of silver and protein.

Description Silver Protein occurs as a pale yellowish brown to brown powder. It is odorless.
1 g of Silver Protein is slowly soluble in 2 mL of water,

and practically insoluble in ethanol(95), ether or chloroform.
The pH of a solution of 1.0 g of Sliver Protein dissolved in 10 mL of water is between 7.0 and 8.5.
It is slightly hygroscopic.
It is affected by light.

Identification (1) To 10 mL of an aqueous solution of Sliver Protein (1 in 100), add 2 mL of dilute hydrochloric acid, shake occasionally to mix for 5 minutes, and then filter. Add 5 mL of sodium hydroxide solution (1 in 10) to the filtrate, add 2 mL of diluted copper(II) sulfate TS (2 in 25); the resulting solution exhibits a violet color.

(2) To 5 mL of an aqueous solution of Silver Protein (1 in 100), add iron(III) chloride TS dropwise; the color of the solution fades and a precipitate slowly forms.

(3) Ignite 0.2 g of Silver Protein to incinerate, add 1 mL of nitric acid to the residue, heat to dissolve, and add 10 mL of water; the resulting solution responds to the Qualitative Analysis (1) for silver salt.

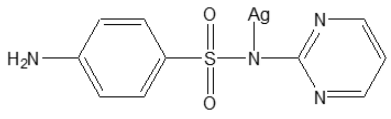
Purity ***Silver salt***—Dissolve 0.10 g of Silver Protein in 10 mL of water, filter, and add 1 mL of potassium chromate TS to the filtrate; the solution does not become turbid.

Assay Weigh accurately about 1 g of Silver Protein, put it to a 100-mL decomposition flask, add 10 mL of sulfuric acid, and boil under a funnel for 5 minutes. After cooling, carefully put 3 mL of nitric acid dropwise, and heat without boiling for 30 minutes. After cooling, add 1 mL of nitric acid and boil. If necessary, repeat this procedure until the solution is colorless when cooled. After cooling, transfer this solution to a 250-mL Erlenmeyer flask using 100 mL of water, and titrate with 0.1 mol/L ammonium thiocyanate VS (indicator: 3 mL of ammonium iron(III) sulfate TS).

Each mL of 0.1 mol/L ammonium thiocyanate VS
= 10.787 mg of Ag

Packaging and storage Preserve in light-resistant, tight containers.

Silver Sulfadiazine
설파디아진은



$C_{10}H_9AgN_4O_2S$: 357.14
Silver *N*-(4-aminobenzene)sulfonyl-*N'*-(pyrimidin-2-yl)azanide [*22199-08-2*]

Silver Sulfadiazine, when dried, contains NLT 99.0% and NMT 102.0% of silver sulfadiazine ($C_{10}H_9AgN_4O_2S$).

Description Silver Sulfadiazine occurs as a white to pale yellow crystalline powder. It is odorless.
It is practically insoluble in water, ethanol(95) or ether.
It is soluble in ammonia TS.
It is gradually colored by light.

Melting point—About 275 °C (with decomposition).

Identification Determine the infrared spectra of Silver Sulfadiazine and silver sulfadiazine RS, previously dried, as directed in the paste method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Purity (1) ***Nitrate***—Weigh 1.0 g of Silver Sulfadiazine, add 250 mL of water, and shake for 50 minutes to mix. Filter it and use the filtrate as the test solution. Separately, weigh accurately 0.25 g of potassium nitrate and dissolve in water to make 2000 mL. Pipet 5 mL of this solution, add water to make exactly 200 mL, and use this solution as the standard solution. Take 2.0 mL each of the test solution and the standard solution, and add 5 mL of a solution of chromotropic acid in sulfuric acid (1 in 10000) and sulfuric acid to make exactly 10 mL. Separately, perform the test with these solutions as directed under the Ultraviolet-visible Spectroscopy, using a solution prepared by taking exactly 2.0 mL of water and proceeding in the same manner as the control solution, and determine the absorbances, A_T and A_S, at 408 nm of wavelength; A_T is not greater than A_S (NMT 0.05%).

(2) ***Related substances***—Dissolve 50 mg of Silver Sulfadiazine in 5 mL of a mixture of ethanol(95) and ammonia water(28) (3:2), and use this solution as the test solution. Pipet 2 mL of this solution and add a mixture of ethanol(95) and ammonia water(28) (3:2) to make exactly 20 mL. Pipet 2 mL of this solution, add a mixture of ethanol(95) and ammonia water(28) (3:2) to make exactly 20 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography (fluorescent indicator added). Next, develop the plate with a mixture of chloroform, methanol, and ammonia water(28) (10:5:2) as the developing solvent to a distance of about 15 cm, and air-dry the plate. Examine the plate under ultraviolet rays (main wavelength: 254 nm); the spots other than the principal spot and the spot of the starting point obtained from the test solution are not more intense than the principal spots from the standard solution.

Loss on drying NMT 0.5% (1 g, in vacuum, phosphorus pentoxide, 80 °C, 4 hours).

Residue on ignition Between 41.0 and 45.0% (1 g).

Silver content Weigh accurately about 50 mg of Silver Sulfadiazine, previously dried, dissolve in 2 mL of nitric acid, and add water to make exactly 100 mL. Pipet 1 mL of this solution, add water to make exactly 100 mL, and

use this solution as the test solution. Separately, pipet an appropriate amount of the standard silver solution for atomic absorption spectroscopy, make 1.0 to 2.0 μg of silver per mL (Ag: 107.87), and use this solution as the standard solution. Perform the test with the test solution and the standard solution as directed under the atomic absorption spectroscopy according to the following conditions, and calculate the content of silver using the calibration curve made from the absorbance of the standard solution; NLT 28.7% and NMT 30.8%.

Gas: Air–acetylene
Lamp: Hollow cathode lamp
Wavelength: 328.1 nm

Assay Weigh accurately about 0.1 g each of Silver Sulfadiazine and silver sulfadiazine RS, previously dried, and dissolve in ammonia TS to make exactly 100 mL. Pipet 1 mL each of this solution, add water to make exactly 100 mL, and use these solutions as the test solutions and the standard solutions. With these solutions, pipet 1 mL of ammonia TS and add water to make exactly 100 mL, and determine the absorbances, A_T and A_S, at 255 nm of wavelength, using the resulting solution as the control solution.

Amount (mg) of silver sulfadiazine ($C_{10}H_9AgN_4O_2S$)
= Amount (mg) of silver sulfadiazine RS × $\frac{A_T}{A_S}$

Packaging and storage Preserve in light-resistant, tight containers.

Simaldrate
시말드레이트

Simaldrate contains NLT 18.1% and NMT 22.1% of aluminum oxide (Al_2O_3: 101.96) and NLT 12.9% and NMT 18.1% of magnesium oxide (MgO: 40.30), calculated on the dried basis.

Description Simaldrate occurs as a white powder or grains, and is odorless and tasteless.
It is practically insoluble in water or in ethanol(95).
To 1 g of Simaldrate, add 10 mL of dilute hydrochloric acid and heat; almost all is dissolved.

Identification (1) To 0.5 g of Simaldrate, add 5 mL of dilute sulfuric acid (1 in 3), heat until white smoke is evolved, cool, add 20 mL of water, and filter (use the residue for Identification (3)). Add ammonia TS to the filtrate to neutralize; a precipitation is formed. Filter this precipitation (use the filtrate for Identification (2)). The solution obtained by adding dilute hydrochloric acid to residue responds to the Qualitative Analysis for aluminum salt.

(2) The filtrate of Identification (1) responds to the Qualitative Analysis for magnesium salt.

(3) Wash the residue obtained in Identification (1) with 30 mL of water, add 2 mL of methylene blue solution (1 in 10000), and then wash with another 30 mL of water; the precipitate exhibits a blue color.

Purity (1) ***Soluble salts***—To 10 g of Simaldrate, add 150 mL of water and slowly boil for 15 minutes, while shaking well to mix. After cooling, add water to make 150 mL and centrifuge. Take 75 mL of the supernatant, add water to make 100 mL, and use this solution as the test solution. Take 25 mL of the test solution, evaporate it to dryness on a steam bath, and ignite it again at 700 ℃ for 2 hours; the amount is NMT 20 mg.

(2) ***Alkalinity***—Take 20 mL of the test solution from (1) and add 2 drops of phenolphthalein TS and 0.5 mL of 0.01 mol/L hydrochloric acid VS; the resulting solution is colorless.

(3) ***Chloride***—Take 10 mL of the test solution from (1) and add 6 mL of dilute nitric acid and water to make 50 mL. Use this solution as the test solution and perform the test as directed under the Chloride. Prepare the control solution with 0.75 mL of 0.01 mol/L hydrochloric acid VS (NMT 0.053%).

(4) ***Sulfate***—Take 2 mL of the test solution from (1) and add 1 mL of dilute hydrochloric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 1.0 mL of 0.005 mol/L sulfuric acid VS (NMT 0.48%).

(5) ***Heavy metals***—Weigh 1.0 g of Simaldrate, add 20 mL of water and 3 mL of hydrochloric acid, and evaporate to dryness on a steam bath. To the residue, add 2 mL of dilute acetic acid and 20 mL of water, boil for 2 minutes, filter, and wash the residue twice each time with 5 mL of water. Combine the filtrate and the washings, add 0.15 g of hydroxylamine hydrochloride, and heat to boil. After cooling, add 0.15 g of sodium acetate and water to make 50 mL. Use this solution as the test solution and perform the test as directed under the Heavy Metals. Evaporate 3 mL of hydrochloric acid to dryness on a steam bath. To the residue, add 3.0 mL of lead standard solution, 0.15 g of hydroxylamine hydrochloride, 0.15 g of sodium acetate and 2 mL of dilute acetic acid, and water to make 50 mL. Use this solution as the control solution (NMT 30 ppm).

(6) ***Iron***—Weigh 0.2 g of Simaldrate, add 8 mL of dilute hydrochloric acid, and boil for 1 minute. After cooling, add acetate-sodium acetate buffer solution (pH 4.5) for iron test to make 50 mL and centrifuge. Take 25 mL of the supernatant, add acetic acid-sodium acetate buffer solution (pH 4.5) to make 30 mL, and use this solution as the test solution. Perform the test according to Method A as directed under the Iron test methods under the General Tests.

Control solution—To 3 mL of standard iron standard solution, add 4 mL of dilute hydrochloric acid and acetate-sodium acetate buffer solution (pH 4.5) for iron test to make 30 mL. Proceed with this solution as the standard solution in the same way as in the preparation of the test solution.

(7) ***Arsenic***—Weigh 0.40 g of Simaldrate, add 10 mL of water and 1 mL of sulfuric acid, shake well to mix, cool, and use this solution as the test solution. Perform the test as directed under the Arsenic (NMT 5 ppm).

Loss on drying NMT 20.0% (1 g, 110 ℃, 7 hours).

Acid-neutralizing capacity Weigh accurately about 0.2 g of Simaldrate and transfer into a stoppered Erlenmeyer flask. Add exactly 100 mL of 0.1 mol/L hydrochloric acid VS, close the flask with a stopper, shake to mix at 37 ± 2 ℃ for 1 hour, and filter. Take 50.0 mL of the filtrate and titrate the excess hydrochloric acid with 0.1 mol/L sodium hydroxide VS, while shaking well to mix, until the pH becomes 3.5. 1 g of Simaldrate, calculated on the dried basis, consumes NLT 190 mL of 0.1 mol/L hydrochloric acid.

Assay (1) ***Aluminum oxide***—Weigh accurately about 0.5 g of Simaldrate, add 3.5 mL of dilute hydrochloric acid and 30 mL of water, and heat on a steam bath for 15 minutes. Add another 3.5 mL of hydrochloric acid, heat on a steam bath for 10 minutes, cool, and add water to make exactly 200 mL. Centrifuge this solution and use the supernatant as the test solution. Pipet 20 mL of the test solution, add exactly 20 mL of 0.02 mol/L ethylenediaminetetraacetic acid disodium salt VS, add 8 mL of acetic acid-ammonium acetate buffer solution (pH 4.8) and 20 mL of water. After boiling for 5 minutes and cooling, add 50 mL of ethanol(95) and titrate with 0.02 mol/L zinc sulfate VS (indicator: 2 mL of dithizone TS). However, The endpoint of the titration is when the color of the solution changes from pale dark green to pale red. Perform a blank test in the same manner and make any necessary correction.

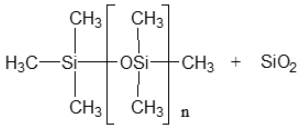
Each mL of 0.02 mol/L ethylenediaminetetraacetic acid disodium salt VS = 1.020 mg of Al_2O_3

(2) ***Magnesium oxide***—Pipet 50 mL of the test solution from Assay (1), add 50 mL of water and 10 mL of triethanolamine solution (1 in 2), and shake well to mix. Next, add 5 mL of ammonia-ammonium chloride buffer solution (pH 10.7) and titrate with 0.02 mol/L ethylenediaminetetraacetic disodium salt VS (indicator: 40 mg of eryochrome black T-sodium chloride indicator). However, The endpoint of the titration is when the color of the solution changes from reddish purple to blue and the blue color remains for 30 seconds. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.02 mol/L ethylenediaminetetraacetic acid disodium salt VS = 0.8060 mg of MgO

Packaging and storage Preserve in tight containers.

Simethicone
시메티콘



Poly(dimethylsiloxane), silicon dioxide [*8050-81-5*]

Simethicone is a mixture of methylated linear siloxane polymers containing repeating units of polydimethylsiloxane ($[-(CH_3)_2SiO-]_n$), stabilized with trimethylsiloxy ($[(CH_3)_3SiO-]$) as end-blocking units, and silicon dioxide. Simethicone contains NLT 90.5% and NMT 99.0% of polydimethylsiloxane ($[-(CH_3)_2SiO-]_n$), and NLT 4.0% and NMT 7.0% of silicon dioxide.

Description Simethicone occurs as a gray translucent, viscous liquid.
It is insoluble in water or ethanol(95).
The liquid phase is soluble in chloroform, ether and benzene but silicon dioxide remains as a residue in these solvents.

Identification Determine the absorbances of the test solution and the standard solution prepared according to the Assay using 0.5 mm cell as directed under the solution method under the Mid-infrared Spectroscopy; both spectra similar intensities of absorption at the same wavenumbers.

Purity ***Heavy metals***—Weigh 1.0 g of Simethicone, put in10 mL of chloroform to mix, and add additional chloroform to make 20 mL. Add 1.0 mL of a freshly prepared 0.002% solution of dithizone in chloroform, 0.5 mL of water and 9.5 mL of a mixture of ammonia TS and 0.2% solution of hydroxylamine hydrochloride (1 : 9), and use this solution as the test solution. Separately, add 1.0 mL of a freshly prepared 0.002% solution of dithizone in chloroform to 20 mL of chloroform, 0.5 mL of lead standard solution (10 μg/mL) and 0.5 mL of a mixture of ammonia TS and 0.2% solution of hydroxylamine hydrochloride (1 : 9), and use this solution as the standard solution. Shake vigorously these solutions for 1 minute, immediately; the red color of the test solution is not more intense than that of the standard solution. (NMT 5 μg/g).

Loss on drying NMT 18.0% (15.0 g, 200 °C, 4 hours).

Defoaming activity Dissolve 1.0 g of octoxynol 9 in 100 mL of water and use this solution as the foaming solution. Weigh accurately 0.2 g of simethicone and transfer into a 60-mL bottle. Add 50 mL of *t*-butyl alcohol, stopper the bottle, shake vigorously, and use this solution as the test solution. Warm the solution slightly, if necessary. Add 0.5 mL of the test solution dropwise to a clean, cylindrical 250-mL glass jar, fitted with a 50-mm cap, containing 100 mL of the foaming solution. Stopper the jar and clamp it in an upright position on a wrist-action

shaker, and then use a radius of 13.3 ± 0.4 cm (measured from center of shaft to center of bottle) and shake for 15 seconds with an arc of 10° per second at a frequency of 300 ± 30 strokes per minute. Record the time required for the foam to collapse. The time for the foam to collapse is determined at the instant the first portion of foam-free liquid surface appears, measured from the end of the shaking period. The defoaming activity time does not exceed 15 seconds.

Content of silicon dioxide Take 3.00 g each of Simethicone, simethicone RS and dimethicone (500 mm^2/s) into a screw-capped bottle, add 10.0 mL of *n*-hexane, stopper, and shake to mix. Use these solutions as the test solution, the standard solution, and the dimethicone solution, respectively. Perform the test with these solutions as directed under the solution method under the Mid-infrared Spectroscopy. Using fixed cells 0.1-mm in thickness, determine at the wavelength of 7 to 9 μm using *n*-hexane as the control solution. Determine the absorbances of the test solution, the standard solution and the dimethicone solution at the minimum absorbance wavelength of about 8.2 μm, obtained from the spectrum of the dimethicone solution.

$$\text{Content (\%) of silicon dioxide in simethicone} = \text{Content (\%) of silicon dioxide in the simethicone RS} \times \frac{A_T - A_D}{A_S - A_D}$$

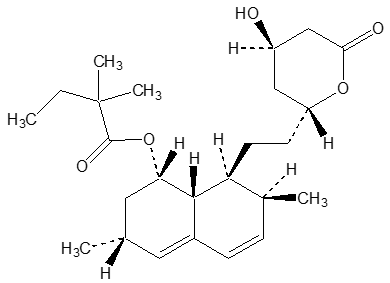
A_D: Absorbance of the dimethicone solution
A_T: Absorbance of the test solution
A_S: Absorbance of the standard solution

Assay Weigh accurately about 50 mg each of Simethicone and polydimethylsiloxane RS and transfer to a round, narrow-mouth, screw-capped, 120-mL flask, add 25.0 mL of toluene, and shake to disperse. Add 50 mL of diluted hydrochloric acid (2 in 5), stopper the bottle securely with a cap having an inert liner, and shake for 5 minutes, accurately timed, on a reciprocating shaker at a suitable rate about 200 oscillations per minute and a stroke of 38 ± 2 mm. Transfer the mixture to a 125-mL separatory funnel, and add about 5 mL of the upper toluene layer to a 15-mL screw-capped test tube containing 0.5 g of anhydrous sodium sulfate. Close the tube with a screw-cap having an inert liner, agitate vigorously, and centrifuge the mixture until a clear supernatant is obtained. Use these solutions as the test solution and the standard solution, respectively. Perform the test with these solutions as directed under the solution method under the Mid-infrared Spectroscopy using the control solution prepared by similarly proceeding 25.0 mL of toluene in the same manner as the test solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively at the absorbance maximum wavelength of about 7.9 μm, 0.5-mm in thickness.

$$\text{Amount (mg) of polydimethylsiloxane } ([-(CH_3)_2SiO-]_n) \text{ in simethicone} = \text{Concentration (mg/mL) of polydimethylsiloxane RS} \times \frac{A_T}{A_S} \times 25$$

Packaging and storage Preserve in tight containers.

Simvastatin
심바스타틴



$C_{25}H_{38}O_5$: 418.57
[(1*S*,3*R*,7*S*,8*S*,8*aR*)-8-[2-[(2*R*,4*R*)-4-Hydroxy-6-oxooxan-2-yl]ethyl]-3,7-dimethyl-1,2,6,7,8,8*a*-hexahydronaphthalen-1-yl] 2,2-dimethyl butanoate [*79902-63-9*]

Simvastatin contains NLT 98.0% and NMT 101.0% of simvastatin ($C_{25}H_{38}O_5$), calculated on the dried basis. Simvastatin may contain a suitable antioxidant.

Description Simvastatin occurs as a white powder.
It is freely soluble in methanol, ethanol(95) or chloroform, sparingly soluble in propylene glycol, very slightly soluble in hexane and practically insoluble in water.

Identification (1) Weigh 10 mg of Simvastatin and Simvastatin RS, respectively, dissolve in acetonitrile to make 100 mL, pipet 5.0 mL each of the solutions, and add acetonitrile to make 50 mL. Determine the absorption spectra of the solutions as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Simvastatin and Simvastatin RS as directed in the paste method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Optical rotation $[\alpha]_D^{25}$ Between +285° and +298° (after drying, 0.10 g, acetonitrile, 20 mL, 100 mm).

Purity (1) ***Clarity and color of solution*—**Dissolve 1.0 g of Simvastatin in 10 mL of methanol; the resulting solution is clear and transparent. Also, perform the test with this solution as directed under the Ultraviolet-visible Spectroscopy; the absorbance at a wavelength of 440 nm is NMT 0.10.

(2) ***Heavy metals***—Proceed with 1.0 g of Simvastatin according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Related substances***—Weigh accurately about 30

mg of Simvastatin, dissolve in a mixture of acetonitrile and 0.01 mol/L potassium dihydrogen phosphate TS (pH 4.0) (3 : 2) to make exactly 20 mL, and use this solution as the test solution. With 5 μL of the test solution, perform the test as directed under the Liquid Chromatography according to the following conditions. Determine each peak area of the test solution by the automatic integration method, and calculate the amount corresponding to each peak by the percentage peak area method; the amount of the related substance, having the relative retention times of 0.45, 0.80, 2.42, and 3.80 with respect to simvastatin, is NMT 0.2%, respectively, the amount of the related substance having the relative retention time of 2.38 is NMT 0.3%, the amount of the related substance having the relative retention time of 0.60 is NMT 0.4%, and each related substance other than simvastatin and other than those mentioned above is NMT 0.1%. The sum of the amounts of related substances other than simvastatin and the related substance having the relative retention time of about 0.60 with respect to simvastatin is NMT 1.0%.

Operating conditions

For the detector, column and column temperature, proceed as directed in the operating conditions under the Assay.

Mobile phase: Control the gradient elution by mixing mobile phases A and B with the ratio as directed under the following.

Mobile phase A: A mixture of diluted phosphoric acid (1 in 1000) and acetonitrile (1 : 1).

Mobile phase B: A solution of phosphoric acid in acetonitrile (1 in 1000).

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 - 4.5	100	0
4.5 - 4.6	100 → 95	0 → 5
4.6 - 8.0	95 → 25	5 → 75
8.0 - 11.5	25	75

Flow rate: 3.0 mL/min

System suitability

System performance: Proceed as directed under the system suitability under the Assay.

Test for required detectability: Pipet 0.5 mL of the test solution, add a mixture of acetonitrile and 0.01 mol/L potassium dihydrogen phosphate TS (pH 4.0) (3 : 2) to make exactly 100 mL, and use this solution as the system suitability solution. Pipet 2 mL of the system suitability solution, and add a mixture of acetonitrile and 0.01 mol/L potassium dihydrogen phosphate TS (pH 4.0) (3 : 2) to make exactly 10 mL. Confirm that the peak area of simvastatin obtained from 5 μL of this solution is equivalent to 16 to 24% of that from the system suitability solution.

System repeatability: Repeat the test 6 times with 5 μL each of the system suitability solution under the above conditions; the relative standard deviation of the peak areas of simvastatin is NMT 1.0%.

Time span of measurement: About 5 times the retention time of simvastatin.

(4) ***Lovastatin***—Calculate the content (%) of lovastatin from the peak areas of the test solution and the standard solution, A_T and A_S, respectively, as directed under the Assay; the percentage of lovastatin is NMT 1.0%.

$$\text{Content (\%) of lovastatin} = 10000 \times \frac{C}{W} \times \frac{A_T}{A_S}$$

C: Concentration (mg/mL) of lovastatin RS in the standard solution

W: Amount (mg) of Simvastatin taken

Loss on drying NMT 0.5% (1.0 g, in vacuum, 60 ℃, 3 hours).

Residue on ignition NMT 0.1% (1.0 g).

Assay Weigh accurately about 30 mg each of Simvastatin and Simvastatin RS (previously determine the loss on drying in the same manner as Simvastatin), dissolve each in a mixture of acetonitrile and 0.01 mol/L potassium dihydrogen phosphate (pH 4.0) (3 : 2) to make exactly 20 mL, and use these solutions as the test solution and standard solution, respectively. Perform the test as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of simvastatin in each solution.

$$\text{Amount (mg) of simvastatin } (C_{25}H_{38}O_5) = W_S \times \frac{A_T}{A_S}$$

W_S: Amount (mg) of simvastatin RS, calculated on the dried basis

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 238 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 33 mm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: A mixture of diluted phosphoric acid (1 in 1000) and acetonitrile (1 : 1).

Flow rate: Adjust the flow rate so that the retention time of simvastatin is about 3 minutes.

System suitability

System performance: Dissolve 3 mg of lovastatin in 2 mL of the standard solution. Proceed with 5 μL of this solution under the above operating conditions; lovastatin and simvastatin are eluted in this order with the resolution between these peaks being NLT 3.0.

System repeatability: Repeat the test 6 times with

5 μL each of the standard solution under the above operating conditions; the relative standard deviation of the peak areas of simvastatin is NMT 1.0%.

Packaging and storage Preserve in well-closed containers filled with nitrogen gas.

Simvastatin Tablets
심바스타틴 정

Simvastatin Tablets contain NLT 93.0% and NMT 107.0% of the labeled amount of simvastatin ($C_{25}H_{38}O_5$: 418.57).

Method of preparation Prepare as directed under Tablets, with Simvastatin.

Identification Weigh an amount of Simvastatin Tablets, previously powdered, according to the labelled amount, equivalent to 2.5 mg of simvastatin, add 25 mL of acetonitrile, sonicate for 15 minutes, and centrifuge. Take 2 mL of the clear supernatant, add acetonitrile to make 20 mL, and determine the absorption spectrum at 229 nm as directed under the Ultraviolet-visible Spectroscopy; it exhibits maxima between 229 nm and 233 nm, between 236 nm and 240 nm and between 245 nm and 249 nm.

Purity ***Related substances*—**Weigh accurately and powder NLT 20 tablets of Simvastatin Tablets. Weigh an amount of the powder, equivalent to 50 mg of simvastatin, add 200 mL of diluent, and sonicate for 15 minutes. Add diluent to make exactly 250 mL and centrifuge. Take 5 mL of the clear supernatant, add diluent to make exactly 10 mL, and use this solution as the test solution. Pipet 1 mL of this solution, add the diluent to make exactly 200 mL, and use this solution as the standard solution. Perform the test with each 10 μL of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak areas in the spectra of each solution by the automatic integration method; the area of the peak eluted at a relative retention time of about 0.5 to simvastatin from the test solution is not greater than 1.6 times the simvastatin peak area from the standard solution (not greater than 0.8%); the area of the peak eluted at a relative retention time of about 2.0 to simvastatin from the test solution is not greater than the simvastatin peak area from the standard solution (not greater than 0.5%). The areas of the peaks other than the simvastatin peak from the test solution are not greater than that of the simvastatin peak from the standard solution. The total area of the peaks other than the simvastatin peak from the test solution is not greater than 4 times the simvastatin peak area from the standard solution (not larger than 2.0%).

Diluent—A mixture of acetonitrile and 0.05 mol/L acetate butter (pH 4.0) (4 : 1).

Operating conditions

For the detector, column, column temperature, mobile phase and flow rate, proceed as directed in the operating conditions under the Assay.

Time span of measurement: About 2.5 times the retention time of simvastatin after the solvent peak.

System suitability

Test for required detectability: Pipet 2 mL of the standard solution and add the mobile phase to make exactly 10 mL. Perform the test with 10 μL of this solution and confirm that the peak area of simvastatin from the test solution is between 14% and 26% of that of simvastatin from the standard solution.

Proceed with 10 μL of the standard solution according to the above operating conditions and perform the test; the number of theoretical plates and symmetry factor of the simvastatin peak are NLT 6000 and between 0.9 and 1.1, respectively.

System repeatability: Repeat the test 6 times with each 10 μL of the standard solution according to the above operating conditions; the relative standard deviation of the simvastatin peak areas is NMT 2.0%.

Dissolution Perform the test with 1 tablet of Simvastatin Tablets at 50 revolutions per minute according to Method 2 under the Dissolution, using 900 mL of the dissolution medium prepared by adding water to 3 g of polysorbate 80 to make 1000 mL. Take NLT 10 mL of the dissolved solution at 45 minutes after starting the test and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard the first 5 mL of the filtrate, pipet *V* mL of the subsequent filtrate, add water to make *V'* mL according to the labelled amount to obtain a solution having known concentration of about 5.6 μg (potency) of simvastatin and use this solution as the test solution. Separately, weigh accurately 22 mg of simvastatin RS (previously measure the loss on drying under the same conditions as simvastatin) and dissolve in acetonitrile to make exactly 100 mL. Pipet 5 mL of this solution, add the mobile phase to make exactly 200 mL, and use this solution as the standard solution. Perform the test with each 20 μL of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions and determine the areas, A_T and A_S, from each solution. It meets the requirements if the dissolution rate of Simvastatin Tablets in 45 minutes is NLT 70%.

Dissolution rate (%) with respect to the labeled amount of simvastatin ($C_{25}H_{38}O_5$)

$$= W_S \times A_T / A_S \times V' / V \times 1 / C \times 45 / 2$$

W_S: Amount (mg) of simvastatin RS, calculated on the dried basis

C: Labeled amount (mg) of simvastatin ($C_{25}H_{38}O_5$) in 1 tablet

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 238 nm).

Column: A stainless steel column about 3.9 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 50 °C.

Mobile phase: A mixture of methanol and 0.02 mol/L potassium dihydrogen phosphate TS (4 : 1).

Flow rate: Adjust the flow rate so that the retention time of simvastatin is about 4 minutes.

System suitability

System performance: Proceed with 20 μL of the standard solution according to the above operating conditions and perform the test; the number of theoretical plates and symmetry factor of the simvastatin peak is NLT 3000 and NMT 2.0, respectively.

System repeatability: Repeat the test 6 times with each 20 μL of the standard solution according to the above operating conditions; the relative standard deviation of the peak areas of simvastatin is NMT 1.0%.

Uniformity of dosage units It meets the requirements when the test is performed according to the following procedure. Take 1 tablet of Simvastatin Tablets, add *V* / 20 mL of water, and sonicate. Add a mixture of acetonitrile and 0.05 mol/L acetate buffer (pH 4.0) (4 : 1) to make exactly 3*V* / 4 mL and sonicate for 15 minutes. After cooling, add a mixture of acetonitrile and 0.05 mol/L acetate buffer (pH 4.0) (4 : 1) to make exactly *V* mL to obtain a solution having known concentration of about 0.1 mg of simvastatin per mL. Centrifuge this solution and use the clear supernatant as the test solution. Perform the test as directed under the Assay.

Amount (mg) of simvastatin ($C_{25}H_{38}O_5$)
$= W_S \times A_T / A_S \times V / 200$

W_S: Amount (mg) of simvastatin RS, calculated on the dried basis

Assay Weigh accurately and powder NLT 20 tablets of Simvastatin Tablets. Weigh accurately an amount of the powder, equivalent to about 50 mg of simvastatin add 200 mL of a mixture of acetonitrile and 0.05 mol/L acetate buffer (pH 4.0) (4 : 1), and sonicate for 15 minutes. After cooling, add a mixture of acetonitrile and 0.05 mol/L acetate buffer (pH 4.0) (4 : 1) to make exactly 250 mL and centrifuge. Pipet 5 mL of the clear supernatant, add a mixture of acetonitrile and 0.05 mol/L acetate buffer (pH 4.0) (4 : 1) to make exactly 10 mL, and use this solution as the test solution. Separately, weigh accurately about 20 mg of simvastatin RS (Previously, measure the loss on drying beforehand under the same conditions as simvastatin.), add a mixture of acetonitrile and 0.05 mol/L acetate buffer (pH 4.0) (4 : 1) to make exactly 200 mL, and use the solution as the standard solution. Perform the test with each 10 μL of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions; determine the peak areas, A_T and *A*s, of simvastatin obtained from the solutions.

Amount (mg) of simvastatin ($C_{25}H_{38}O_5$)
$= W_S \times A_T / A_S \times 5 / 2$

W_S: Amount (mg) of simvastatin RS, calculated on the dried basis

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 238 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 45 °C.

Mobile phase: Dissolve 3.90 g of ammonium dihydrogen phosphate in 900 mL of water, adjust the pH to 4.5 with sodium hydroxide TS or phosphoric acid, and add water to make exactly 1000 mL. To 700 mL of this solution, add 1300 mL of acetonitrile.

Flow rate: Adjust the flow rate so that the retention time of simvastatin is about 9 minutes.

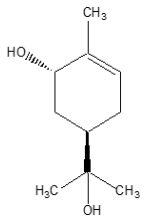
System suitability

System performance: Proceed with 10 μL of the standard solution according to the above operating conditions and perform the test; the number of theoretical plates and symmetry factor of the trimetazidine peak are NLT 6000 and between 0.9 and 1.1, respectively.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution under the above operating conditions; the relative standard deviation of the peak areas of simvastatin is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Sobrerol
소브레롤



$C_{10}H_{18}O_2$: 170.25

5-Hydroxy-α,α,4-trimethyl-3-cyclohexene-1-methanol; *p*-Menth-6-ene-2,8-diol, [*498-71-5*]

Sobrerol contains NLT 98.0% and NMT 101.0% of sobrerol ($C_{10}H_{18}O_2$), calculated on the anhydrous basis.

Description Sobrerol occurs as a white, crystalline powder, is odorless and has a slightly bitter taste.
It is freely soluble in methanol or ethanol(95), soluble in acetone, sparingly soluble in water or chloroform, slight-

ly soluble in ether, and practically insoluble in *n*-hexane. It is sparingly soluble in dilute acid or alkali.
The pH of a saturated solution of Sobrerol is between 4.4 and 5.0.

Identification (1) Dissolve about 10 mg of Sobrerol in 1 mL sulfuric acid, add 2 mL vanillin-ethanol solution; The resulting solution exhibits a reddish brown color, and changes to bluish purple on addition of 3 mL water.

(2) To 10 mg of Sobrerol, add 1 mL of a mixture of 0.5 mL of *p*-anisaldehyde, 1 mL of sulfuric acid and 50 mL acetic acid(100); the resulting solution is almost colorless, but changes to bright blue on heating gently.

(3) Determine the infrared spectra of Sobrerol and sobrerol RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(4) Dissolve 20 mg of Sobrerol in ethyl acetate to make 10 mL, and use this solution as the test solution. Dissolve 20 mg of sobrebol RS in ethyl acetate to make 10 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution onto a thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of ethyl acetate and anhydrous ethanol (8 : 1) as the developing solvent, and air-dry the plate. Spray a mixture of acetic acid, sulfuric acid and anisaldehyde (50 : 1 : 0.5) on the plate, heat at 110 ℃ for 15 minutes; the R_f values and colors of the spots obtained from the test solution and the standard solution are the same.

Refractive index n_D^{20}: Between 1.28 and 1.38 (10% anhydrous ethanol solution).

Melting point Between 131 and 132 ℃ (*dl-trans* form).

Boiling point Between 270 and 271 ℃ (*dl-trans* form).

Purity (1) ***Heavy metals***—Suspend 5.0 g of Sobrerol in 50 mL of water, filter, proceed with 10 mL of the filtrate according to Method 1, and perform the test. Prepare the control solution with 1.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Arsenic***—Proceed with 5 mL of the filtrate obtained from the heavy metals test according to the Arsenic and perform the test. (NMT 4 ppm).

Water NMT 0.1% (volumetric titration, direct titration).

Residue on ignition NMT 0.1% (1 g).

Assay Weight accurately 100 mg each of Sobrerol and sobrerol RS, and dissolve in methanol to make exactly 50 mL. Pipet 10 mL each of these solutions, add methanol to make exactly 20 mL, and use these solutions as the test solution and the standard solution. Pipet 10 μL each of the test solution and the standard solution, perform the test as directed under the Liquid Chromatography, and determine the peak area of sobrerol A_T and A_S from the test solution and the standard solution.

Amount (mg) of sobrerol ($C_{10}H_{18}O_2$)
= Amount (mg) of sobrerol RS × (A_T / A_S)

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 210 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: A mixture of 0.02 mol/L potassium dihydrogen phosphate and methanol (11 : 9).

Flow rate: 1.0 mL/min

System suitability

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak areas of sobrerol is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Sobrerol Capsules
소브레롤 캡슐

Sobrerol Capsules contain NLT 95.0% and NMT 105.0% of the labeled amount of sobrerol ($C_{10}H_{18}O_2$: 170.25).

Method of preparation Prepare as directed under Capsules, with Sobrerol.

Identification The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

Dissolution Perform the test with 1 capsule of Sobrerol Capsules at 100 revolutions per minute according to Method 2 under the Dissolution, using 900 mL of solution 2 for dissolution as the dissolution solution. Take the dissolved solution after 60 minutes from the start of the test and filter. Discard the first 10 mL of the filtrate, pipet *V* mL of the subsequent filtrate, add the dissolution medium to make exactly *V'* mL of a solution containing 110 μg of sobrerol per mL according to the labeled amount, and use this solution as the test solution. Separately, weigh accurately 110 mg of sobrerol RS, and dissolve in the dissolution medium to make 100 mL. Pipet 10 mL of this solution, add the dissolution medium to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and

determine the peak areas, A_T and A_S, of sobrerol in each solution. The acceptable dissolution criterion is NLT 70% of Sobrerol Capsules dissolved in 60 minutes.

Dissolution rate (%) of the labeled amount of sobrerol ($C_{10}H_{18}O_2$)
$= W_S \times (V' / V) \times (A_T / A_S) \times (1 / C)$

W_S: Amount (mg) of sobrerol RS
C: Labeled amount (mg) of sobrerol ($C_{10}H_{18}O_2$) in 1 tablet

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 210 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: A mixture of 0.02 mol/L potassium dihydrogen phosphate TS (pH 3.5) and methanol (1 : 1).

Flow rate: 1.0 mL/min

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 Sobrerol Capsules. Weigh accurately an amount equivalent to about 110 mg of sobrerol ($C_{10}H_{18}O_2$), and add the mobile phase to make exactly 100 mL. After filtering this solution, pipet 10 mL of the filtrate, add the mobile phase to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 110 mg of sobrerol RS, and add the mobile phase to make exactly 100 mL. Take 10 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of sobrerol in each solution.

Amount (mg) of sobrerol ($C_{10}H_{18}O_2$)
$=$ Amount (mg) of sobrerol RS $\times (A_T / A_S)$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 210 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: A mixture of 0.02 mol/L potassium dihydrogen phosphate TS (pH 3.5) and methanol (1 : 1).

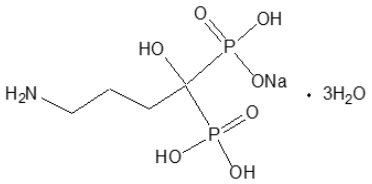
Flow rate: 1.0 mL/min

System suitability

System repeatability: Repeat the test 6 times with 10 mL of the standard solution according to the above conditions; the relative standard deviation of the peak area of sobrerol is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Sodium Alendronate Hydrate
알렌드론산나트륨수화물



$C_4H_{12}NNaO_7P_2 \cdot 3H_2O$: 325.12
Sodium hydrogen (4-amino-1-hydroxy-1-phosphonobutyl)phosphinate trihydrate [*121268-17-5*]

Sodium Alendronate Hydrate contains NLT 98.0% and NMT 102.0% of sodium alendronate ($C_4H_{12}NNaO_7P_2$: 257.07), calculated on the dried basis.

Description Sodium Alendronate Hydrate occurs as a white or almost white, crystalline powder.
It is soluble in water, very slightly soluble in methanol, and practically insoluble in dichloromethane.

Identification (1) Determine the infrared spectra of Sodium Alendronate Hydrate and sodium alendronate hydrate RS as directed in the paste method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) Sodium Alendronate Hydrate responds to the Qualitative Analysis (1) for sodium salt.

pH Dissolve 0.5 g of Sodium Alendronate Hydrate in 50 mL of water; the pH of the solution is between 4.0 and 5.0.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Sodium Alendronate Hydrate according to Method 2 and perform the test. Prepare the control solution with 1.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Related substances***—Weigh accurately 30 mg of Sodium Alendronate Hydrate, and dissolve in 2.94% sodium citrate solution to make exactly 50 mL. Take 5.0 mL of this solution, transfer into a 50 mL stoppered polypropylene centrifuge tube with 5 mL of 1.91% sodium borate, add 5 mL of acetonitrile and 5 mL of 0.4% 9-fluorenylmethyl chloroformate solution, prepared before use, shake for 45 seconds, and allow it to stand at room temperature for 30 minutes. Add 20 mL of dichloromethane, vigorously shake for 1 minute, and centrifuge for 5 to 10 minutes. Use the clear supernatant water layer as the test solution. Separately, proceed with 5.0 mL of

2.94% sodium citrate solution in the same manner as in the preparation of the test solution, and use this solution as the blank test solution. Perform the test with 20 μL each of the blank test solution and the test solution as directed under the Liquid Chromatography according to the following conditions. Exclude peaks with the same retention times as the peaks obtained from the blank test solution. Determine content (%) of each related substance from the test solution; the amount of each related substance is NMT 0.1%, and the total amount of all related substances is NMT 0.5%.

$$\text{Content (\%) of each related substance} = 100 \times \frac{A_\text{i}}{A_\text{S}}$$

Ai: Peak area of related substance
A_S: Sum of all peak areas of related substances

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 266 nm).

Column: A stainless steel column about 4.1 mm in internal diameter and 25 cm in length, packed with spherical styrene-
divinylbenzene copolymer for liquid chromatography (5 μm - 10 μm in particle diameter).

Column temperature: A constant temperature of about 45 °C.

Mobile phase: Control the mixing ratio of mobile phase A and mobile phase B stepwise or via the gradient elution as follows.

Mobile phase A: A mixture of buffer solution and acetonitrile (17 : 3).

Mobile phase B: A mixture of acetonitrile and buffer solution (7 : 3).

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0	100	0
0 - 15	100 → 50	0 → 50
15 - 25	50 → 0	50 → 100
25 - 27	0 → 100	100 → 0
27 - 32	100	0

Flow rate: 1.8 mL/min

System suitability

System performance: Weigh 60.0 mg of sodium alendronate hydrate RS, dissolve in 2.94% sodium citrate solution to make 100 mL, and use this solution as the standard stock solution. Take 5.0 mL of this solution, proceed in the same manner as in the preparation of the test solution, and use this solution as the standard solution. Separately, take 0.1 mL of this standard stock solution, add 2.94% sodium citrate solution to make 100 mL, take 5.0 mL of this solution, proceed in the same manner as in the preparation of the test solution, and use this solution as the diluted standard solution. Proceed with 20 mL each of the standard solution and the diluted standard solution according to the above conditions; the symmetry factor of major peaks obtained from the standard solution is NMT 2.0, and the peak at the same position obtained from the diluted standard solution is detected at a signal-to-noise ratio of NLT 3.

Buffer solution—Dissolve 5.88 g of sodium citrate dihydrate and 2.84 g of anhydrous sodium dihydrogen phosphate in water to make 2000 mL. To this solution, add phosphoric acid to adjust pH to 8.

Loss on drying Between 16.1% and 17.1% (1 g, in vacuum, 145 °C, constant mass).

Assay Weigh accurately about 25 mg of Sodium Alendronate Hydrate, and dissolve in 2.94% sodium citrate solution to make exactly 250 mL. Take 5.0 mL of this solution, transfer into a 50 mL stoppered polypropylene centrifuge tube containing 5 mL of 1.91% sodium borate, add 5 mL of acetonitrile and 5 mL of a solution of 0.05% 9-fluorenylmethyl chloroformate in acetonitrile, prepared before use, and shake for 30 seconds. Allow it to stand at room temperature for 25 minutes.
Add 25 mL of dichloromethane, vigorously shake, and centrifuge for 5 to 10 minutes. Use the clear supernatant water layer as the test solution. Separately, weigh accurately 10 mg of sodium alendronate hydrate RS, dissolve in 2.94% sodium citrate solution to make exactly 100 mL, and use this solution as the standard stock solution. Take 5.0 mL of this standard stock solution, and proceed in the same manner as in the preparation of the test solution, and use this solution as the standard solution. Also, proceed with 5.0 mL of 2.94% sodium citrate solution in the same manner as in the preparation of the test solution, and use this solution as the blank test solution. Perform the test with 10 μL each of the blank test solution, the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the area, A_T and A_S of the major peak from the test solution and the standard solution.

$$\text{Amount (mg) of sodium alendronate } (C_4H_{12}NNaO_7P_2) = 250 \times C \times \frac{A_\text{T}}{A_\text{S}}$$

C: Concentration (mg/mL) of anhydrous sodium alendronate in the standard stock solution

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 266 nm).

Column: A stainless steel column about 4.1 mm in internal diameter and 25 cm in length, packed with spherical styrene-
divinylbenzene copolymer for liquid chromatography (5 μm - 10 μm in particle diameter).

Column temperature: A constant temperature of about 35 °C.

Mobile phase: A mixture of buffer solution, acetonitrile and methanol (70 : 25 : 5).

Flow rate: 1.8 mL/min

System suitability

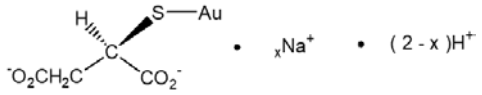
System performance: Proceed with 10 μL of the standard solution according to the above operating conditions; the number of theoretical plates and symmetry factor of the major peak from the standard solution are NLT 1500 and NMT 1.5, respectively.

System repeatability: Repeat the test 5 times with 10 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area of sodium alendronate is NMT 2.0%.

Buffer solution—Dissolve 14.7 g of sodium citrate dihydrate and 7.05 g of anhydrous sodium dihydrogen phosphate in water to make 1000 mL. To this solution, add phosphoric acid to adjust pH to 8.

Packaging and storage Preserve in well-closed containers at 15 ℃ to 30 ℃.

Sodium Aurothiomalate
금티오말산나트륨



and enantiomer

Mixture of $C_{15}H_3N_2O_4S$: 390.08 and $C_4H_4AuNaO_4S$: 368.10

Disodium; gold(1+); 2-sulfidobutanedioate [*12244-57-4*]

Sodium Aurothiomalate contains NLT 49.0% and NMT 52.5% of gold (Au: 196.97), calculated on the anhydrous basis.

Description Sodium Aurothiomalate occurs as a white to pale yellow powder or grain.
It is very soluble in water and practically insoluble in ethanol(95).
It is hygroscopic.
It is colored by light to greenish pale yellow.

Identification (1) Add 1 mL of calcium nitrate tetrahydrate solution (1 in 10) to 2 mL of the aqueous solution of Sodium Aurothiomalate (1 in 10); a white precipitate is produced and it dissolves in dilute nitric acid. It reappears with the addition of ammonium acetate TS.

(2) Add 3 mL of silver nitrate TS to 2 mL of the aqueous solution of Sodium Aurothiomalate (1 in 10); a yellow precipitate is produced and it dissolves in an excess of ammonia TS.

(3) Pipet 2 mL of the aqueous solution of Sodium Aurothiomalate (1 in 10) in a porcelain crucible, add 1 mL of ammonia TS and 1 mL of hydrogen peroxide water (30), evaporate to dryness, and ignite. Add 20 mL of water to the residue and filter; the residue on the filter paper occurs as a yellow or dark yellow powder or grain.

(4) The filtrate obtained in (3) responds to the Qualitative Analysis for sodium salt.

(5) The filtrate obtained in (3) responds to the Qualitative Analysis for sulfate.

pH Dissolve 1.0 g of Sodium Aurothiomalate in 10 mL of water; the pH of this solution is between 5.8 and 6.5.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Sodium Aurothiomalate in 10 mL of water; the resulting solution is clear and pale yellow.

(2) ***Heavy metals***—Proceed with 1.0 g of Sodium Aurothiomalate as directed under Method 2 and perform the test. Prepare the control solution with 3.0 mL of lead standard solution (NMT 30 ppm).

(3) ***Arsenic*—**Proceed with 1.0 g of Sodium Aurothiomalate as directed under Method 3 and perform the test (NMT 2 ppm).

(4) ***Ethanol*—**Weigh accurately about 0.125 g of Sodium Aurothiomalate, add exactly 5 mL of the internal standard solution, and put water again to make exactly 25 mL. Use this solution as the test solution. Separately, pipet 2 mL of ethanol(99.5), add water to make exactly 100 mL, and use this solution as the standard stock solution. Pipet 0.25 mL of the standard stock solution, add exactly 5 mL of the internal standard solution, and put water again to make exactly 25 mL. Use this solution as the standard solution. Perform the test with 1 μL each of the test and standard solutions as directed under the Gas Chromatography according to the following conditions, and calculate the peak area ratios, Q_T and Q_S of ethanol to internal standard (NMT 3.0%).

$$\text{Amount (mg) of ethanol} = Q_T / Q_S \times 5 \times 0.79$$

0.79: Density (g/mL) of ethanol at 20 °C.

Internal standard solution—A solution of 1− propanol (1 in 1000).

Operating conditions

Detector: A flame ionization detector

Column: A fused silica column 0.53 mm in internal diameter and 30 m in length, packed with 6% cyanopropylphenyl-94% dimethylpolysiloxane for gas chromatography (3 μm in particle diameter).

Column temperature: Maintain at 50 °C for 5 minutes, then raise the temperature at a rate of 50 °C per minute until it reaches 200 °C, and maintain at 200 °C for 4 minutes.

Injection port temperature: 210 ℃

Detector temperature: 280 °C

Carrier gas: Nitrogen

Flow rate: 5 mL/min

Split ratio: 1 : 5

System suitability

System performance: Proceed with 1 μL of the standard solution under the above conditions; ethanol and internal standard solution are eluted in this order.

System repeatability: Repeat the test 5 times with

1 μL each of the standard solutions under the conditions above; the relative standard deviation of the peak area is NMT 2.0%.

(5) ***Glycerin*** This procedure is based on the absorption characteristics of a complex of sodium, copper and glycerin. For the stability of the complex compound, all measurements should be taken within 1 hour, and all glassware used in this procedure should be thoroughly rinsed with water to avoid the blank test errors.
Weigh accurately about 400 mg of Sodium Aurothiomalate, transfer to a 10-mL volumetric flask, dissolve in 5.0 mL of water, and use this solution as the test solution. Separately, pipet a certain amount of glycerin and dissolve in water to make exactly the concentration of the solution 8 mg/mL. Take 1.0 mL, 2.0 mL and 3.0 mL each of this solution, transfer to a 10-mL volumetric flask respectively, add 4.0 mL, 3.0 mL and 2.0 mL of water to each flask and use these solutions as the standard solution (1), (2) and (3) of glycerin. Put 5.0 mL of water to a 10-mL volumetric flask, and use this solution as the blank test solution. Add 1.0 mL of sodium hydroxide solution to each of the standard solution of glycerin, blank test solution and test solution, and mix. Put 0.1 mL of copper chloride solution to each solution by shaking well, while observing the turbidity upon every addition. Add copper chloride solution until the solution becomes slightly turbid, and put more 0.1 mL additionally. With the stopper closed, shake for 1 minute. Fill up to the mark with water, and mix. Centrifuge this solution using a conical centrifuge tube with a 15-mL graduation line. A 1 mm to 4 mm precipitate of copper hydroxide is observed. Determine the absorption spectrum of the clear supernatant as directed under the Ultraviolet-visible Spectroscopy in a 1 cm cell at 635 nm wavelength, using water as a control, and subtract the absorbance of the blank test solution (NMT 0.040) from the determined value to calculate the absorbances of the test solution and the standard solutions, respectively. Create a calibration curve using the absorbance of each of the standard solution, determine the amount of glycerin in the test solution by calculating from the calibration curve, and calculate the amount of glycerin in the sample (NMT 5.5%).

Sodium hydroxide solution—Dissolve 23.6 g of sodium hydroxide in water to make 100 mL.

Copper chloride solution—Dissolve 3.8 g of copper chloride in water to make 100 mL.

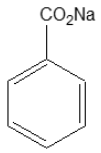
Water NMT 5.0% (0.1 g, coulometric titration). Use a water vaporizer (heating temperature: 105 ℃; heating time: 30 minutes).

Assay Weigh accurately 25 mg of Sodium Aurothiomalate, dissolve in 2 mL of aqua regia by heating, cool it down, and add water to make exactly 100 mL. Pipet 2 mL of this solution, add water to make exactly 25 mL, and use this solution as the test solution. Separately, pipet 5 mL, 10 mL and 15 mL each of the standard solution of gold for the atomic absorption spectroscopy, add water to make exactly 25 mL, and use these solutions as the standard solutions. Perform the test with the test and standard solutions as directed under the Atomic Absorption Spectroscopy under the following conditions, and determine the amount of gold in the test solution using the calibration curve obtained from the absorbances of the standard solutions.

Gas: Air–acetylene
Lamp: Gold hollow-cathode lamp
Wavelength: 242.8 nm

Packaging and storage Preserve in light-resistant, tight containers.

Sodium Benzoate
벤조산나트륨



$C_7H_5NaO_2$: 144.10
Sodium benzoate [*532-32-1*]

Sodium Benzoate, when dried, contains NLT 99.0% and NMT 101.0% of sodium benzoate ($C_7H_5NaO_2$).

Description Sodium Benzoate occurs as white grains, crystals or a crystalline powder. It is odorless and has a sweet and saline taste.
It is freely soluble in water, slightly soluble in ethanol(95) and practically insoluble in ether.

Identification An aqueous solution of Sodium Benzoate (1 in 100) responds to the Qualitative Analysis (1) and (2) for benzoate and sodium salt.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Sodium Benzoate in 5 mL of water; the solution is colorless and clear.

(2) ***Acid or alkali***—Dissolve 2.0 g of Sodium Benzoate in 20 mL of freshly boiled and cooled water and add 2 drops of phenolphthalein TS and 0.20 mL of 0.05 mol/L sulfuric acid; the resulting solution is colorless. To this solution, add 0.40 mL of 0.1 mol/L sodium hydroxide TS; the resulting solution turns red.

(3) ***Sulfate***—Dissolve 0.40 g of Sodium Benzoate in 40 mL of water, add 3.5 mL of dilute hydrochloric acid slowly while stirring thoroughly to mix, allow to stand for 5 minutes, and filter. Discard the first 5 mL of the filtrate, take the subsequent 20 mL of the filtrate, and add water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 0.40 mL of 0.005 mol/L sulfuric acid (NMT 0.120%).

(4) ***Heavy metals***—Dissolve 1.0 g of Sodium Benzoate in 44 mL of water, add 6 mL of dilute hydrochloric acid slowly while stirring thoroughly to mix, and filter. Discard the first 5 mL of the filtrate, take the subsequent 25 mL of the filtrate, neutralize with ammonia TS, and add 2 mL of dilute acetic acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution by adding 2 mL of dilute acetic acid and water to 1.0 mL of lead standard solution to make 50 mL (NMT 10 ppm).

(5) ***Arsenic***—Mix 1.0 g of Sodium Benzoate well with 0.40 g of calcium hydroxide, ignite, and dissolve the residue in 10 mL of dilute hydrochloric acid. Use this solution as the test solution and perform the test (NMT 2 ppm).

(6) ***Chlorinated compounds***—Dissolve 1.0 g of Sodium Benzoate in 10 mL of water, add 10 mL of dilute sulfuric acid, and extract twice each time with 20 mL of ether. Combine the ether extracts and evaporate the ether on a steam bath. Place 0.5 g of the residue and 0.7 g of calcium carbonate in a crucible, mix with a small amount of water, and dry. Next, ignite the resulting residue at about 600 ℃, dissolve in 20 mL of dilute nitric acid, and filter. Wash the residue with 15 mL of water, combine the filtrate and the washings, and add water to make 50 mL. To this solution, add 0.5 mL of silver nitrate TS; the resulting solution is not more turbid than the following control solution.

Control solution—Dissolve 0.7 g of calcium carbonate in 20 mL of dilute nitric acid and filter. Wash the residue with 15 mL of water, combine the filtrate and the washings, thereto add 1.2 mL of 0.01 mol/L hydrochloric acid and water to make 50 mL, and add 0.5 mL of silver nitrate TS.

(7) ***Phthalic acid***—Weigh accurately about 100 mg of Sodium Benzoate, dissolve it in 1 mL of water, add 1 mL of resorcinol-sulfuric acid TS, and evaporate the water by heating in an oil bath at between 120 and 125 ℃, and heat again for 90 minutes. After cooling, dissolve the resulting residue in 5 mL of water. Take 1 mL of this solution, add 10 mL of a solution of sodium hydroxide (43 in 500) and use this solution as the test solution. Separately, take exactly 61 mg of potassium hydrogen phthalate and dissolve it in 1000 mL of water. Take 1 mL of this solution and proceed in the same manner as in the preparation of the test solution, and use this solution as the standard solution. Perform the test with the test solution and the standard solution as directed under Ultraviolet-visible Spectroscopy, and determine the absorbances of these solutions at the wavelength of 495 nm; the absorbance of the test solution is NMT that of the standard solution.

Loss on drying NMT 1.5% (2 g, 110 ℃, 4 hours).

Assay Weigh accurately about 1.5 g of Sodium Benzoate, previously dried, and transfer it to a 300-mL glass-stoppered flask, dissolve in 25 mL of water, add 75 mL of ether and 10 drops of bromophenol blue TS, and titrate with 0.5 mol/L hydrochloric acid VS. Mix the water and ether layers by vigorous shaking during the titration. The endpoint of the titration is when the water layer turns a persistent and pale green color.

Each mL of 0.5 mol/L hydrochloric acid VS
= 72.05 mg of $C_7H_5NaO_2$

Packaging and storage Preserve in well-closed containers.

Sodium Bicarbonate
탄산수소나트륨

$NaHCO_3$: 84.01

Sodium hydrogen carbonate [*144-55-8*]

Sodium Bicarbonate contains NLT 99.0% and NMT 101.0% of sodium bicarbonate ($NaHCO_3$).

Description Sodium Bicarbonate occurs as white crystals or a crystalline powder. It is odorless and has a characteristic salty taste.
It is soluble in water and practically insoluble in ethanol(95) or ether.
It slowly decomposes in humid air.

Identification An aqueous solution of Sodium Bicarbonate (1 in 30) responds to the Qualitative Analysis for sodium salt and hydrogen carbonate.

pH Dissolve 1.0 g of Sodium Bicarbonate in 20 mL of water; the pH of this solution is between 7.9 and 8.4.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Sodium Bicarbonate in 20 mL of water; the resulting solution is clear and colorless.

(2) ***Chloride***—To 0.40 g of Sodium Bicarbonate, add 4 mL of dilute nitric acid, and heat to boiling. After cooling, add 6 mL of dilute nitric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 0.45 mL of 0.01 mol/L hydrochloric acid VS (NMT 0.040%).

(3) ***Sulfide***—Weigh accurately 0.2 g of Sodium Bicarbonate, dissolve in 20 mL of water, boil to make 5 mL, and add 1 mL of bromine TS. Evaporate to dryness and cool. Dissolve the residue in 10 mL of 3 mol/L hydrochloric acid VS, evaporate to dryness, and cool. Dissolve this residue in 5 mL of 3 mol/L hydrochloric acid VS, evaporate to dryness, and cool. To this residue, add 10 mL of water, and adjust the pH to 2 with 3 mol/L hydrochloric acid TS or ammonia TS. To obtain the clear solution, filter this solution, and wash the filtrate twice each with 2 mL of water. Combine these solutions, add water to make 20 mL, and use this solution as the test solution. Separately, to 0.30 mL of 0.01 mol/L sulfuric acid TS, add 1 mL of 0.06 mol/L hydrochloric acid TS, add water to make 20 mL, and use this solution as the

standard solution. To each of the test solution and the standard solution, add 1 mL of barium chloride TS, mix, and allow to stand for 30 minutes; the turbidity of the test solution is not more intense than the standard solution (NMT 0.015%).

(4) ***Carbonate***—To 1.0 g of Sodium Bicarbonate, add 20 mL of freshly boiled and cooled water, dissolve by gently shaking at NMT 15 ℃, and add 2.0 mL of 0.1 mol/L hydrochloric acid VS and 2 drops of phenolphthalein TS; the resulting solution does not immediately exhibit a red color.

(5) ***Ammonium***—Heat 1.0 g of Sodium Bicarbonate; the gas evolved does not change the color of a moistened red litmus paper to blue.

(6) ***Heavy metals***—Dissolve 4.0 g of Sodium Bicarbonate in 5 mL of water and 4.5 mL of hydrochloric acid, and evaporate to dryness on a steam bath, dissolve the residue in 2 mL of dilute acetic acid, 35 mL of water, and 1 drop of ammonia TS, and add water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution by evaporating 4.5 mL of hydrochloric acid to dryness and adding 2 mL of dilute acetic acid, 2.0 mL of lead standard solution, and water to make 50 mL (NMT 5 ppm).

(7) ***Copper***—Weigh 5.0 g of Sodium Bicarbonate, transfer into a 100 mL plastic volumetric flask, add 4 mL of nitric acid, and shake to mix. Sonicate for 30 minutes, add water to make 100 mL, and use this solution as the test solution. Separately, dissolve 1.0 g of copper RS in 20 mL of nitric acid, and add 0.2 mol/L nitric acid VS to make 1000 mL. Take 10 mL of this solution, add 0.2 mol/L nitric acid to make 1000 mL, and use this solution as the standard stock solution. Preserve the standard stock solution in a polyethylene bottle. Take an appropriate amount of the standard stock solution, dilute with 0.2 mol/L nitric acid VS to make solutions containing 0.1 μg/mL, 0.05 μg/mL, and 0.01 μg/mL, respectively, and use these solutions as the standard solution (1), the standard solution (2), and the standard solution (3). Perform the test with the test solution, the standard solution (1), the standard solution (2), and the standard solution (3) according to the following conditions, as directed under the Atomic Absorption Spectroscopy, and calculate the content of copper using the calibration curve obtained from the standard solution (NMT 1 ppm). Perform a blank test with the nitric acid solution (40 in 1000) and make any necessary correction.

Gas: Air–acetylene
Lamp: Copper hollow cathode lamp
Wavelength: 324.7 nm

(8) ***Iron***—Perform the test when used for the manufacturing of hemodialysis preparations. Weigh accurately 2.0 g of Sodium Bicarbonate, neutralize with hydrochloric acid, and record the consumed amount. Transfer this solution into a 25 mL volumetric flask using a small amount of water, and use this solution as the test solution. Separately, transfer 1.0 mL of iron standard solution into a 25 mL volumetric flask, add an equivalent amount of hydrochloric acid as the test solution, and use this solution as the standard solution. Also, take separately an amount of hydrochloric acid used to prepare the test solution, transfer into a 25 mL volumetric flask, and use this solution as the blank test solution. To each of the test solution, the standard solution, and the blank test solution, add 50 mg of ammonium peroxydisulfate and 30% ammonium thiocyanate solution, and add water to make 25 mL. Determine the absorbances at the absorption maximum wavelength of about 480 nm of the test solution and the standard solution as directed under the Ultraviolet-visible Spectroscopy using the blank test solution as the blank test solution; the absorbance of the test solution is not greater than that of the standard solution (NMT 5 ppm).

(9) ***Calcium***—Perform the test when used for the manufacturing of hemodialysis preparations. Weigh accurately 3.0 g of Sodium Bicarbonate, add 6 mL of 6 mol/L hydrochloric acid TS, 1 g of potassium chloride, and water, mix, and make 100 mL. Use this solution as the test solution. Separately, weigh 0.25 g of calcium carbonate, previously dried at 300 ℃ for 3 hours and cooled in a desiccator for 2 hours, dissolve in 6 mL of 6 mol/L hydrochloric acid TS, and add 1 g of calcium carbonate and water to make 100 mL. Pipet 10.0 mL of this solution, and add potassium chloride solution to make 100 mL so that the solution contains 100 μg of calcium per mL. To 2.0 mL, 3.0 mL, 4.0 mL, and 5.0 mL of this solution, add 6 mL of hydrochloric acid TS, add potassium chloride solution to make each solution 100 mL, and use these solutions as 2.0, 3.0, 4.0, and 5.0 μg/mL calcium standard solution. Perform the test with the test solution and the standard solutions as directed under the Atomic Absorption Spectroscopy according to the following conditions, and calculate the content of calcium in the test solution using the calibration curve obtained from the standard solution absorbance; it is NMT 0.01%.

Potassium chloride solution—Dissolve 10 g of potassium chloride in 1000 mL of 0.36 mol/L hydrochloric acid VS.

Gas: Nitrous oxide-acetylene
Lamp: Calcium hollow cathode lamp
Blank test solution: Potassium chloride TS
Wavelength: 422.7 nm

(10) ***Arsenic***—Dissolve 1.0 g of Sodium Bicarbonate in 3 mL of water and 2 mL of hydrochloric acid, use this solution as the test solution, and perform the test (NMT 2 ppm).

Assay Weigh accurately about 2 g of Sodium Bicarbonate, dissolve in 100 mL of water, and titrate with 1 mol/L hydrochloric acid VS. Add slowly 1 mol/L hydrochloric acid until the solution exhibits a pale purple color, and boil by heating. After cooling, titrate with 1 mol/L hydrochloric acid VS until the purple color no longer disappears (indicator: 2 drops of methyl red TS).

Each mL of 1 mol/L hydrochloric acid VS
= 84.01 mg of $NaHCO_3$

Packaging and storage Preserve in tight containers.

Sodium Bicarbonate Injection
탄산수소나트륨 주사액

Sodium Bicarbonate Injection is an aqueous solution for injection and contains NLT 95.0% and NMT 105.0% of the labeled amount of sodium bicarbonate ($NaHCO_3$: 84.01).

Method of preparation Prepare as directed under Injections, with Sodium Bicarbonate.

Description Sodium Bicarbonate Injection occurs as a clear, colorless liquid.

Identification Weigh a volume of Sodium Bicarbonate Injection, equivalent to 1 g of sodium bicarbonate, according to the labeled amount, and add water to make 30 mL; the solution responds to the Qualitative Analysis for sodium salt and bicarbonate.

Purity ***Carbonate***—Weigh a volume of Sodium Bicarbonate Injection, equivalent to 0.10 g of sodium bicarbonate according to the labeled amount, add water, freshly boiled and cooled to 10 °C, to make a 1.0 w/v% solution and determine the pH immediately; the pH of the solution is between 7.9 and 8.6.

Sterility Meets the requirements.

Bacterial endotoxins Less than 5.0 EU per mEq of Sodium Bicarbonate Injection.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Extractable volume of injections Meets the requirements.

Assay Take exactly a volume of Sodium Bicarbonate Injection, equivalent to about 2 g of sodium bicarbonate ($NaHCO_3$), titrate with 1 mol/L hydrochloric acid VS, and proceed as directed under the Assay under Sodium Bicarbonate.

Each mL of 1 mol/L hydrochloric acid VS
= 84.01 mg of $NaHCO_3$

Packaging and storage Preserve in hermetic containers. Plastic containers for aqueous injections may be used.

Sodium Bicarbonate Tablets
탄산수소나트륨 정

Sodium Bicarbonate Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of sodium bicarbonate ($NaHCO_3$: 84.01).

Method of preparation Prepare as directed under Tablets, with Sodium Bicarbonate.

Identification Perform the test according to the Identification under Sodium Bicarbonate.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately NLT 20 Sodium Bicarbonate Tablets and powder them. Weigh accurately an amount, equivalent to about 2 g of sodium bicarbonate (NaHCO3), dissolve in 100 mL of water, and titrate with 1 mol/L hydrochloric acid VS. Heat to boiling while adding slowly 1 mol/L hydrochloric acid until the solution exhibits a pale violet, cool, and titrate with 1 mol/L hydrochloric acid VS until the violet color does not disappear (indicator: 2 drops of methyl red TS).

Each mL of 1 mol/L hydrochloric acid
= 84.01 mg of $NaHCO_3$

Packaging and storage Preserve in well-closed containers.

Sodium Borate
붕사

$Na_2B_4O_7 \cdot 10H_2O$: 381.37
Disodium [oxido(oxoboranyloxy)boranyl]oxy-oxoboranyloxyborinate decahydrate [*1303-96-4*]

Sodium Borate, when dried, contains NLT 99.0% and NMT 103.0% of sodium borate ($Na_2B_4O_7 \cdot 10H_2O$).

Description Sodium Borate is colorless or white crystals or a white, crystalline powder. It is odorless and has a slightly distinctive, salty taste.
It is freely soluble in glycerin, soluble in water, and practically insoluble in ethanol(95), dehydrated ethanol(99.5) or ether.
When allowed to stand in dry air, it effloresces is weathered, and thus coated with a white powder.

Identification An aqueous solution of Sodium Borate (1 in 20) responds to the Qualitative Analysis for sodium salt and borate.

pH Dissolve 1.0 g of Sodium Borate in 20 mL of water;

the pH of this solution is between 9.1 and 9.6.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Sodium Borate in 20 mL of water by warming slightly; the solution is clear and colorless.

(2) ***Carbonate or bicarbonate***—Dissolve 1.0 g of powdered Sodium Borate in 20 mL of freshly boiled and cooled water and add 3 mL of dilute hydrochloric acid; the solution does not effervesce.

(3) ***Heavy metals***—Dissolve 1.5 g of Sodium Borate in 25 mL of water and 7 mL of 1 mol/L hydrochloric acid TS, add 1 drop of phenolphthalein TS, and add ammonia TS until a pale red color develops. Then add 1 drop of dilute acetic acid at a time until it becomes colorless and add 2 mL of diluted acetic acid and water to this solution to make 50 mL. Use this as the test solution and perform the test. Prepare the control solution by adding 2 mL of dilute acetic acid and water to 3.0 mL of lead standard solution to make 50 mL (NMT 20 ppm).

(4) ***Arsenic***—Proceed with 0.40 g of Sodium Borate according to Method 1 and perform the test (NMT 5 ppm).

Assay Weigh accurately about 2 g of Sodium Borate, dissolve it in 50 mL of water, and titrate with 0.5 mol/L hydrochloric acid VS (Indicator: 3 drops of Methyl red TS).

Each mL of 0.5 mol/L hydrochloric acid VS
= 95.34 mg of $Na_2B_4O_7 \cdot 10H_2O$

Packaging and storage Preserve in tight containers.

Sodium Bromide
브롬화나트륨

NaBr : 102.89

Sodium bromide [*7647-15-6*]

Sodium Bromide, when dried, contains NLT 99.0% and not more 101.0% of sodium bromide (NaBr).

Description Sodium Bromide occurs as colorless or white crystals or a crystalline powder. It is odorless.
It is freely soluble in water and soluble in ethanol(95).
It is hygroscopic but is not deliquescent.

Identification An aqueous solution of Sodium Bromide (1 in 10) responds to the Qualitative Analysis for sodium salt and bromide.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Sodium Bromide in 3 mL of water; the resulting solution is clear and colorless.

(2) ***Alkalinity***—Dissolve 1.0 g of Sodium Bromide in 10 mL of water, add 0.10 mL of 0.005 mol/L sulfuric acid and 1 drop of phenolphthalein TS, heat to boiling, and cool it down; the resulting solution is colorless.

(3) ***Chloride***—Perform the test as directed under the Assay; the amount of 0.1 mol/L silver nitrate solution equivalent to 1 g of Sodium Bromide is NMT 97.9 mL.

(4) ***Sulfate***—Perform the test with 2.0 g of Sodium Bromide. Prepare the control solution with 1.0 mL of 0.005 mol/L sulfuric acid (NMT 0.024%).

(5) ***Iodide***—Dissolve 0.5 g of Sodium Bromide in 10 mL of water, add between 2 and 3 drops of iron(III) chloride TS and 1 mL of chloroform, and shake well to mix; the chloroform layer does not exhibit a purple to violet color.

(6) ***Bromate***—Dissolve 1.0 g of Sodium Bromide in 10 mL of newly boiled and cooled water, add 2 drops of potassium iodide TS, 1 mL of starch TS and 3 drops of dilute sulfuric acid, shake gently to mix, and allow to stand for 5 minutes; the resulting solution does not exhibit a blue color.

(7) ***Heavy metals***—Proceed with 2.0 g of Sodium Bromide according to Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(8) ***Magnesium and alkaline earth metals***—To 200 mL of water, add 0.1 g of hydroxylamine hydrochloride, 10 mL of ammonium chloride buffer solution, pH 10, 1 mL of 0.1 mol/L zinc sulfate solution and 0.2 g of eryochrome black T-sodium chloride indicator, and warm at 40℃. To this solution, drop 0.01 mol/L ethylenediaminetetraacetic acid disodium salt until the purple color of the solution turns to bluish purple. To this solution, add a solution of 10.0 g of Sodium Bromide dissolved in 100 mL of water. If the color of the solution changes to purple, titrate with 0.01 mol/L ethylenediaminetetraacetic acid disodium salt until the color of the solution exhibits a bluish purple color; the consumed volume is NMT 5.0 mL (NMT 0.02%, calculated as calcium).

(9) **B*arium***—Dissolve 0.5 g of Sodium Bromide in 10 mL of water, add 0.5 mL of dilute hydrochloric acid and 1 mL of potassium sulfate TS, and allow to stand for 10 minutes; the resulting solution is not turbid.

(10) ***Iron***—Dissolve 0.5 g of Sodium Bromide in water to make 10 mL and use this solution as the test solution. To 1 mL of the iron standard solution, add water to make 10 mL, and use this solution as the standard solution. To the test solution and the standard solution, add 2.0 mL of citric acid (1 in 5) and 0.1 mL of thioglycolic acid, add ammonia water(28) until this solution makes the litmus paper alkaline, and add water to make 20 mL. The color obtained from the test solution after 5 minutes is not more intense than the color from the standard solution (NMT 20 ppm).

(11) ***Arsenic***—Proceed with 1.0 g of Sodium Bromide according to Method 1 and perform the test (NMT 2 ppm).

Loss on drying NMT 5.0% (1 g, 110 °C, 4 hours).

Assay Weigh accurately about 0.4 g of Sodium Bromide, previously dried, dissolve in 50 mL of water, add 10 mL of dilute nitric acid, add exactly 50 mL of 0.1 mol/L silver nitrate solution, and titrate the excess silver nitrate with 0.1 mol/L ammonium thiocyanate VS (indicator: 2

mL of ammonium iron(III) sulfate TS). Perform a blank test in the same manner.

Each mL of 0.1 mol/L silver nitrate VS
= 10.289 mg of NaBr

Packaging and storage Preserve in tight containers.

Sodium Chloride
염화나트륨

NaCl : 58.44

Sodium Chloride [*7647-14-5*]

Sodium Chloride contains NLT 98.0% and NMT 100.5% of sodium chloride (NaCl), calculated on the dried basis.

Description Sodium Chloride occurs as a white or almost white powder, colorless crystal, or white or almost white crystalline powder.
It is freely soluble in water and practically insoluble in ethanol(99.5).

Identification (1) An aqueous solution of Sodium Chloride (1 in 20) responds to the Qualitative Analysis for sodium salt.

(2) An aqueous solution of Sodium Chloride (1 in 20) responds to the Qualitative Analysis for chloride.

Purity (1) ***Clarity and color of solution***—Dissolve about 20.0 g of Sodium Chloride in 100.0 mL of freshly boiled and cooled water; the resulting solution is clear and colorless.

(2) ***Acidity or alkalinity***—To 20 mL of the solution obtained in (1), add 0.1 mL of bromothymol blue solution and 0.5 mL of 0.01 mol/L hydrochloric acid TS; the color of the solution is yellow. To 20 mL of the solution obtained in (1), add 0.1 mL of bromothymol blue solution and 0.5 mL of 0.01 mol/L sodium hydroxide TS; the color of the solution is blue.

Bromothymol blue solution—Dissolve 50 mg of bromothymol blue in a mixture of 20 mL of 0.02 mol/L diluted sodium hydroxide TS (1 in 10) and ethanol(95), and add water to make 100 mL.

(3) ***Bromide***—To 0.50 mL of the solution obtained in (1), add 4.0 mL of water, 2.0 mL of dilute phenol red TS and 1.0 mL of sodium toluenesulfonchloramide solution (1 in 10000), and mix immediately. After allowing to stand for 2 minutes, add 0.15 mL of 0.1 mol/L sodium thiosulfate solution, mix well, add water to make exactly 10 mL, and use this solution as the test solution. Separately, take 5.0 mL of potassium bromide solution (3 in 1000000), add 2.0 mL of dilute phenol red TS and 1.0 mL of sodium toluenesulfonchloramide solution (1 in 10000), and mix immediately. Proceed in the same manner as in the preparation of the test solution, and use it as the standard solution. Determine the absorbances of these solutions as directed under the Ultraviolet-visible Spectroscopy, using water as the blank; the absorbance of the test solution at 590 nm is not larger than that of the standard solution (NMT 100 ppm).

(4) ***Nitrites***—Take 10 mL of the solution obtained in (1), add 10 mL of water, and determine the absorbance as directed under the Ultraviolet-visible Spectroscopy; the absorbance at the wavelength of 354 nm is NMT 0.01.

(5) ***Iodides***—Wet about 5 g of Sodium Chloride by adding dropwise a freshly prepared mixture of soluble starch TS, 0.5 mol/L sulfuric acid TS and sodium nitrite TS (1000 : 40 : 3), allow to stand for 5 minutes, and examine under the direct sunlight; the solution does not exhibit a blue color.

(6) ***Phosphates***—To 2.0 mL of the solution obtained in (1), add water to make 100.0 mL, and then add 4 mL of ammonium molybdate-sulfuric acid TS and 0.1 mL of tin(II) chloride-hydrochloric acid TS, and allow to stand for 10 minutes; the color of the solution is not more intense than the following control solution (NMT 25 ppm).

Control solution—To 1.0 mL of standard phosphoric acid solution, add 12.5 mL of 2 mol/L sulfuric acid TS and water to make exactly 250 mL. To 100 mL of this solution, add 4 mL of ammonium molybdate-sulfuric acid TS and 0.1 mL of tin(II) chloride-hydrochloric acid TS, and proceed in the same manner as above.

(7) ***Sulfates***—To 7.5 mL of the solution obtained in (1), add water to make 30 mL, and use this solution as the test solution. Separately, dissolve 0.181 g of potassium sulfate in diluted ethanol(99.5) (3 in 10) to make exactly 500 mL. Pipet 5 mL of this solution, and add diluted ethanol(99.5) (3 in 10) to make exactly 100 mL. To 4.5 mL of this solution, add 3 mL of barium chloride solution (1 in 4), shake to mix, and allow to stand for 1 minute. To 2.5 mL of this solution, add 15 mL of the test solution and 0.5 mL of acetic acid(31), and allow to stand for 5 minutes; the solution is not more turbid than the following control solution (NMT 0.02%).

Control solution—Dissolve 0.181 g of potassium sulfate in water to make exactly 500 mL. Pipet 5 mL of this solution, and add water to make exactly 100 mL. Proceed in the same manner using this solution instead of the test solution.

(8) ***Ferrocyanides***—Dissolve about 2.0 g of Sodium Chloride in 6 mL of water, and add 0.5 mL of a mixture of iron(II) sulfate heptahydrate solution (1 in 100) and a solution of ammonium iron(III) sulfate dodecahydrate in diluted sulfuric acid (1 in 400) (1 in 100) (19 : 1); the resulting solution does not develop a blue color within 10 minutes.

(9) ***Magnesium and alkaline-earth metals***—To 200 mL of water, add 0.1 g of hydroxylamine hydrochloride, 10 mL of ammonium chloride buffer solution, pH 10, 1

mL of 0.1 mol/L zinc sulfate solution and 0.15 g of Eryochrome black T-sodium chloride indicator, and warm at 40 °C. Add 0.01 mol/L ethylenediaminetetraacetic acid disodium salt solution dropwise until the purple color of the solution turns blue. To this solution, add a solution prepared by dissolving 10.0 g of Sodium Chloride in 100 mL of water. If the resulting solution turns purple, add 0.01 mol/L ethylenediaminetetraacetic acid disodium salt solution until the color of the solution turns blue. The amount of 0.01 mol/L ethylenediaminetetraacetic acid disodium salt solution used in the second titration is NMT 2.5 mL (NMT 100 ppm).

(10) ***Barium***—To 5.0 mL of the solution obtained in (1), add 5.0 mL of water and 2.0 mL of dilute sulfuric acid, and allow to stand for 2 hours; the solution is not more turbid than the following control solution.

Control solution—To 5.0 mL of the solution obtained in (1), add 7.0 mL of water and allow to stand for 2 hours.

(11) ***Aluminum***—Perform the test when used in the manufacturing of hemodialysis preparations. Weigh accurately about 20 g of Sodium Chloride, dissolve in 100 mL of water, add 10 mL of acetic acid-ammonium acetate buffer solution, pH 6.0, and extract with 20 mL, 20 mL and 10 mL of 0.5% solutions of 8-hydroxyquinoline in chloroform. Collect in a 50-mL volumetric flask, add chloroform to make 50 mL, and use this solution as the test solution. Separately, weigh 0.352 g of aluminum potassium sulfate, dissolve in small amount of water, add 20 mL of dilute sulfuric acid, and then add water to make 100 mL. Pipet 1.0 mL of this solution immediately before use and add water to make 100 mL. Again, take 2.0 mL of this solution, add 10 mL of acetic acid-ammonium acetate buffer solution, pH 6.0, and then add 98 mL of water, and extract in the same manner as the test solution. Collect in a 50-mL volumetric flask, add chloroform to make 50 mL, and use this solution as the standard solution. To 10 mL of acetic acid-ammonium acetate buffer solution, pH 6.0, add 100 mL water, extract with chloroform in the same manner as the test solution, and use this solution as the blank test solution. Perform the test with the test solution and the standard solution as directed under the Fluorescence Spectroscopy with the blank test solution as the blank, and determine the fluorescence intensity at the excitation wavelength of 392 nm and the fluorescence wavelength of 518 nm; the fluorescence intensity obtained from the test solution is not greater than that from the standard solution (NMT 0.2 ppm).

(12) ***Iron***—To 10 mL of the solution obtained in (1), add 2 mL of citric acid monohydrate solution (1 in 5) and 0.1 mL of mercaptoacetic acid, alkalize with ammonia TS, then add water to make exactly 20 mL. Allow to stand for 5 minutes; the color of the solution is not more intense than that of the following control solution (NMT 5 ppm).

Control solution—Pipet 1 mL of iron standard solution, and add water to make exactly 25 mL. To 10 mL of this solution, add 2 mL of citric acid monohydrate solution (1 in 5) and 0.1 mL of mercaptoacetic acid, and proceed in the same manner as above.

(13) ***Potassium***—When used in the manufacturing of injections or preparations for peritoneal dialysis, hemodialysis or blood filtration, perform this test. Weigh accurately about 1 g of Sodium Chloride, add water, dissolve by mixing well to make 100 mL, and use this solution as the test solution. Separately, weigh accurately 1.144 g of potassium chloride, previously dried at 105 °C for 3 hours, dissolve in water to make 1000 mL to obtain a solution having known concentration of 600 μg of potassium per mL and use this solution as the standard stock solution. Dilute the standard stock solution to make three standard solutions at different concentrations to the extent the potassium content in the test solution is detectable. Perform the test with the test solution and each standard solution as directed under the Atomic Absorption Spectroscopy according to the following conditions at least three times.
Measure the potassium content using the calibration curve derived from the absorbance of the standard solution; it is NMT 500 ppm.

Gas: Air–acetylene
Wavelength: 766.5 nm

(14) ***Arsenic***—Proceed with 2.0 g of Sodium Chloride according to Method 1, and perform the test (NMT 1 ppm).

Bacterial endotoxins Less than 5 EU per g of Sodium Chloride when used in the manufacturing of injections. However, it is excluded in cases where there is an appropriate additional procedure for the removal of bacterial endotoxins in manufacturing of injections.

Loss on drying NMT 0.5% (1 g, 105 °C, 2 hours).

Assay Weigh accurately about 50 mg of Sodium Chloride, dissolve in 50 mL of water, and titrate with 0.1 mol/L silver nitrate VS (potentiometric titration under the Titrimetry).

Each mL of 0.1 mol/L silver nitrate VS
= 5.844 mg of NaCl

Packaging and storage Preserve in tight containers.

10% Sodium Chloride Injection
10% 염화나트륨 주사액

10% Sodium Chloride Injection is an aqueous solution for injection and contains NLT 9.5 w/v% and NMT 10.5 w/v% of sodium chloride (NaCl: 58.44).

Method of preparation

Sodium chloride	100 g
Water for injection	A sufficient amount
Total amount	1000 mL

Prepare as directed under Injections, with the above.

Description 10% Sodium Chloride Injection occurs as a clear, colorless liquid and has a saline taste.
It is neutral.

Identification 10% Sodium Chloride Injection responds to the Qualitative Tests for sodium salt and for chloride.

Sterility Meets the requirements.

Bacterial endotoxins Less than 3.6 EU/mL of Glucose Injection.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Extractable volume of injections Meets the requirements.

Assay Pipet 10 mL of 10% Sodium Chloride Injection and add water to make exactly 100 mL. Pipet 20 mL of this solution, add 30 mL of water and titrate with 0.1 mol/L silver nitrate VS while shaking vigorously (indicator: 3 drops of fluorescein sodium TS).

Each mL of 0.1 mol/L silver nitrate VS
= 5.844 mg of NaCl

Pipet 20 mL of this solution, add 30 mL of water and shake vigorously to mix, and titrate with 0.1 mol/L silver nitrate solution VS (indicator: 3 drops of fluorescein sodium TS).

Each mL of 0.1 mol/L silver nitrate VS
= 5.844 mg of NaCl

Packaging and storage Preserve in hermetic containers. Plastic containers for aqueous injections may be used for 10% Sodium Chloride Injection.

Sodium Chloride, Sodium Acetate, Potassium Chloride, Calcium Chloride, Magnesium Chloride and Dextrose Dialysis Solution

염화나트륨·아세트산나트륨수화물·염화칼륨·염화칼슘·염화마그네슘·포도당 투석액

Sodium Chloride, Sodium Acetate, Potassium Chloride, Calcium Chloride, Magnesium Chloride and Dextrose Dialysis Solution contains NLT 90.0% and NMT 110.0% of the labeled amounts of glucose ($C_6H_{12}O_6$: 180.16), total sodium (Na: 22.99) [sodium chloride (NaCl: 58.44) and sodium acetate hydrate ($CH_3COONa \cdot 3H_2O$: 136.08)], calcium (Ca: 40.08)[calcium chloride hydrate ($CaCl_2 \cdot 2H_2O$: 147.02)], magnesium (Mg: 24.31) [magnesium chloride hydrate ($MgCl_2 \cdot 6H_2O$: 203.30)], potassium (K: 39.10) [potassium chloride (KCl: 74.55)], sodium acetate hydrate ($CH_3COONa \cdot 3H_2O$: 136.08) and total chlorine (Cl: 35.45).

Method of preparation Prepare as directed under Dialysis Solutions, with Glucose, Sodium Chloride, Sodium Acetate Hydrate, Potassium Chloride, Calcium Chloride Hydrate and Magnesium Chloride Hydrate.

Identification (1) Take 20 mL of Sodium Chloride, Sodium Acetate, Potassium Chloride, Calcium Chloride, Magnesium Chloride and Dextrose Dialysis Solution, add 5 mL of hot Fehling's TS; a red precipitate is produced (glucose).

(2) Sodium Chloride, Sodium Acetate, Potassium Chloride, Calcium Chloride, Magnesium Chloride and Dextrose Dialysis Solution responds to the Qualitative Analysis for potassium salt, magnesium salt, chloride, sodium salt, calcium salt and acetate.

pH Between 6.0 and 8.0.

Purity (1) ***Heavy metals***—Proceed with 5.0 mL of Sodium Chloride, Sodium Acetate, Potassium Chloride, Calcium Chloride, Magnesium Chloride and Dextrose Dialysis Solution according to Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 4 ppm).

(2) ***Arsenic***—Take 2.0 mL of Sodium Chloride, Sodium Acetate, Potassium Chloride, Calcium Chloride, Magnesium Chloride and Dextrose Dialysis Solution, add water to make 5 mL, add 5 mL of dilute sulfuric acid and 1 mL of bromine TS, and heat on a steam bath for 5 minutes. Concentrate again to make 5 mL, cool, and perform the test using this solution as the test solution (NMT 1 ppm).

(3) ***5-hydroxymethylfurural***—Take 15 mL of Sodium Chloride, Sodium Acetate, Potassium Chloride, Calcium Chloride, Magnesium Chloride and Dextrose Dialysis Solution, and add water to make 100 mL. Perform the test with this solution as directed under the Ultraviolet-visible Spectroscopy; the absorbance at a wavelength 284 nm is NMT 0.1.

Sterility It meets the requirements when used in manufacturing of sterile preparations.

Bacterial endotoxins Less than 0.5 EU per mL of Sodium Chloride, Sodium Acetate, Potassium Chloride, Calcium Chloride, Magnesium Chloride and Dextrose Dialysis Solution.

Pyrogen It meets the requirements when the bacterial

endotoxins is unavailable.

Assay (1) ***Total sodium***—Take an amount of Sodium Chloride, Sodium Acetate, Potassium Chloride, Calcium Chloride, Magnesium Chloride and Dextrose Dialysis Solution, equivalent to 1.1 g of sodium (Na), according to the labeled amount, and add water to make 1000 mL. Take 5.0 mL of this solution, add water to make 200 mL, take 5.0 mL of the resulting solution, and add water to make 100 mL. Use this solution as the test solution. Separately, weigh accurately about 254.2 mg (equivalent to about 100 mg of sodium) of sodium chloride standard reagent, previously dried at 105 °C for 2 hours, dissolve in water to make 1000 mL, and use this solution as the standard stock solution (about 100 μg/mL of sodium). Make a solution at a concentration of 0 to 20 μg Na/mL with the standard stock solution, and use this solution as the standard solution. Perform the test using the test solution and the standard solution as directed under the Atomic Absorption Spectroscopy according to the following conditions. Determine the amount of sodium (Na) in the test solution using the calibration curve obtained from the absorbance of the standard solution.

Gas: Air–acetylene
Lamp: Sodium hollow cathode lamp
Wavelength: 589 nm

(2) ***Potassium***—Pipet an amount of Sodium Chloride, Sodium Acetate, Potassium Chloride, Calcium Chloride, Magnesium Chloride and Dextrose Dialysis Solution, equivalent to 30 mg of potassium (K), according to the labeled amount, and add water to make exactly 200 mL. Pipet 10 mL of this solution, add water to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 190 mg of potassium chloride standard reagent, previously dried at 105 °C for 2 hours, add water to make 1000 mL, and use this solution as the standard stock solution (about 100 μg/mL of potassium). Weigh accurately 1.689 g of sodium chloride standard reagent, dissolve in water to make 100 mL, add the standard stock solution to 10.0 mL of this solution to make a solution of potassium at concentration of 0 to 20 μg/mL, and use this solution as the standard solution. Perform the test using the test solution and standard solution as directed under the Atomic Absorption Spectroscopy according to the following conditions. Determine the amount of potassium (K) in the test solution using the calibration curve obtained from the absorbance of the standard solution.

Gas: Air–acetylene
Lamp: Potassium hollow cathode lamp
Wavelength: 766 nm

(3) ***Calcium***—Pipet an amount of Sodium Chloride, Sodium Acetate, Potassium Chloride, Calcium Chloride, Magnesium Chloride and Dextrose Dialysis Solution, equivalent to 20 mg of calcium (Ca), according to the labeled amount, and add water to make exactly 100 mL. Pipet 20 mL of this solution again, add 20.0 mL of lanthanum oxide TS and water to make exactly 100 mL and use this solution as the test solution. Separately, weigh accurately about 1.249 g of calcium chloride standard reagent, dissolve in 50 mL of water and 10 mL of hydrochloric acid, add water to make exactly 1000 mL, and use this solution as the standard stock solution (about 500 μg/mL of calcium). Make a solution of calcium at a concentration of 0 to 16 μg/mL with the standard stock solution, and use this solution as the standard solution. Perform the test using the test solution and standard solution as directed under the Atomic Absorption Spectroscopy according to the following conditions. Determine the amount of calcium (Ca) in the test solution using the calibration curve obtained from the absorbance of the standard solution.

Gas: Air–acetylene
Lamp: Calcium hollow cathode lamp
Wavelength: 422.7 nm

(4) ***Magnesium***—Pipet an amount of Sodium Chloride, Sodium Acetate, Potassium Chloride, Calcium Chloride, Magnesium Chloride and Dextrose Dialysis Solution, equivalent to 4 mg of magnesium (Mg), according to the labeled amount, and add water to make 200 mL. Take 10.0 mL of this solution and add water to make 100 mL. Again, take 20.0 mL of this solution, add water to make 200 mL, and use this solution as the test solution. Separately, weigh accurately about 1.0 g of metal magnesium standard reagent, dissolve in a small amount of hydrochloric acid (1 in 2), add 1% hydrochloric acid TS to make 1000 mL, and use this solution as the standard stock solution (about 1000 μg/mL of magnesium). Make a solution of magnesium at a concentration of 0 to 10 μg/mL with the standard stock solution, and use this solution as the standard solution. Perform the test using the test solution and standard solution as directed under the Atomic Absorption Spectroscopy according to the following conditions. Determine the amount of magnesium (Mg) in the test solution using the calibration curve obtained from the standard solution.

Gas: Air–acetylene
Lamp: Magnesium hollow cathode lamp
Wavelength: 285 nm

(5) ***Sodium acetate hydrate***—Pipet an amount of Sodium Chloride, Sodium Acetate, Potassium Chloride, Calcium Chloride, Magnesium Chloride and Dextrose Dialysis Solution, equivalent to 0.25 g of sodium acetate hydrate ($CH_3COONa \cdot 3H_2O$), according to the labeled amount, and evaporate to dryness on a steam bath. Dissolve in 50 mL of acetic acid(100) for non-aqueous titration and 10 mL of acetic acid(100), and titrate with 0.1 mol/L perchloric acid VS. However, the endpoint of the titration is when the purple color of the solution turns blue (indicator: 1 mL of methylrosaniline chloride TS). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 13.610 mg of $CH_3COONa \cdot 3H_2O$

(6) ***Total chlorine***—Pipet an amount of Sodium Chloride, Sodium Acetate, Potassium Chloride, Calcium Chloride, Magnesium Chloride and Dextrose Dialysis Solution, equivalent to 70 mg of total chlorine (Cl), according to the labeled amount, add 50 mL of water, shake well to mix, and titrate with 0.1 mol/L silver nitrate VS (indicator: 1 mL of potassium chromate TS). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L silver nitrate VS
= 3.545 mg of Cl

(7) ***Glucose***—Pipet an amount of Sodium Chloride, Sodium Acetate, Potassium Chloride, Calcium Chloride, Magnesium Chloride and Dextrose Dialysis Solution, equivalent to 4g of glucose ($C_6H_{12}O_6$), according to the labeled amount, add 0.2 mL of ammonia TS and water to make 100 mL, and allow to stand for 30 minutes. Determine the optical rotation α_D at 25 °C with a layer length of 100 mm.

Amount (mg) of glucose ($C_6H_{12}O_6$)
= $\alpha_D \times 1985.4$

Packaging and storage Preserve in hermetic containers.

Sodium Chloride, Sodium Lactate Solution, Calcium Chloride, Magnesium Chloride and Dextrose Irrigation
염화나트륨·락트산나트륨액·염화칼슘·염화마그네슘·포도당 관류액

Sodium Chloride, Sodium Lactate Solution, Calcium Chloride, Magnesium Chloride and Dextrose Irrigation contains NLT 90.0% and NMT 110.0% of the labeled amounts of total sodium (Na: 22.99), calcium (Ca: 40.08), magnesium (Mg: 24.31), total chlorine (Cl: 35.45), lactate ($C_3H_5O_3$: 89.07) and glucose ($C_6H_{12}O_6$: 180.16).

Method of preparation Prepare as directed under Irrigations, with Sodium Chloride, Sodium Lactate Solution, Calcium Chloride, Magnesium Chloride and Glucose.

Identification (1) ***Glucose***—Take an amount of Sodium Chloride, Sodium Lactate Solution, Calcium Chloride, Magnesium Chloride and Dextrose Irrigation, equivalent to 0.1 g of glucose, according to the labeled amount, add water or concentrate on a steam bath, if necessary, to make 2 mL. Add 2 to 3 drops of this solution to 5 mL of boiling Fehling's TS; a red precipitate is produced.

(2) Sodium Chloride, Sodium Lactate Solution, Calcium Chloride, Magnesium Chloride and Dextrose Irrigation responds to the Qualitative Analysis for sodium salt, calcium salt, magnesium salt, lactate and chloride.

pH Between 4.5 and 6.5.

Purity (1) ***5-hydroxymethylfurural***—Add water to Sodium Chloride, Sodium Lactate Solution, Calcium Chloride, Magnesium Chloride and Dextrose Irrigation so that the glucose content becomes about 0.4% according to the labeled amount, and perform the test as directed under the Ultraviolet-visible Spectroscopy; the absorbance at the wavelength of 284 nm is NMT 0.25.

Bacterial endotoxins Less than 0.5 EU per mL of Sodium Chloride, Sodium Lactate Solution, Calcium Chloride, Magnesium Chloride and Dextrose Irrigation.

Sterility Meets the requirements.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Extractable volume of injections Meets the requirements.

Assay (1) ***Total sodium***—Pipet an amount of Sodium Chloride, Sodium Lactate Solution, Calcium Chloride, Magnesium Chloride and Dextrose Irrigation, equivalent to 1.1 g of sodium (Na), according to the labeled amount, and add water to make 1000 mL. Take 5.0 mL of this solution and add water to make 200 mL. Take 5.0 mL of this solution and add 100 mL of water. Use this solution as the test solution. Separately, weigh accurately about 0.25 g (equivalent to about 100 mg of sodium) of sodium chloride standard reagent, previously dried at 105 °C for 2 hours, add water to make 1000 mL, and use this solution as the standard stock solution (about 100 μg/mL of sodium). Make a solution of sodium at a concentration 0 to 20 μg/mL with the standard stock solution, and use this solution as the standard solution. Perform the test using the test solution and the standard solution as directed under the Atomic Absorption Spectroscopy according to the following conditions. Determine the content of sodium (Na) in the test solution by using the calibration curve obtained from the absorbance of the standard solution.

Gas: Air–acetylene
Lamp: Sodium hollow cathode lamp
Wavelength: 589 nm

(2) ***Calcium***—Pipet an amount of Sodium Chloride, Sodium Lactate Solution, Calcium Chloride, Magnesium Chloride and Dextrose Irrigation, equivalent to 20 mg of calcium (Ca), according to the labeled amount, and add water to make 100 mL. Again, take 20 mL of this solution, add 20 mL of lanthanum oxide TS to make 100 mL,

and use this solution as the test solution. Separately, weigh accurately about 1.25 g of calcium chloride standard reagent, dissolve in 50 mL of water and 10 mL of hydrochloric acid, add water to make 100 mL, and use this solution as the standard stock solution (about 500 μg/mL of calcium). Prepare a solution of calcium at a concentration of 0 to 16 μg/mL with the standard stock solution, and use this solution as the standard solution. Perform the test using the test solution and standard solution as directed under the Atomic Absorption Spectroscopy according to the following conditions. Using the calibration curve obtained by the absorbance of the standard solution, determine the calcium (Ca) content in the test solution.

Gas: Air–acetylene
Lamp: Calcium hollow cathode lamp
Wavelength: 422.7 nm

(3) ***Magnesium***—Pipet an amount of Sodium Chloride, Sodium Lactate Solution, Calcium Chloride, Magnesium Chloride and Dextrose Irrigation, equivalent to 4 mg of magnesium (Mg), according to the labeled amount, and add water to make 200 mL. Take 10.0 mL of this solution and add water to make 100 mL. Again, take 20.0 mL of this solution, add water to make 200 mL, and use this solution as the test solution. Separately, weigh accurately about 1.0 g of metal magnesium standard reagent, dissolve in a small amount of hydrochloric acid (1 in 2), add 1% hydrochloric acid TS to make 1000 mL, and use this solution as the standard stock solution (about 1000 μg/mL of magnesium). Make a solution of magnesium at a concentration 0 to 10 μg/mL with the standard stock solution, and use this solution as the standard solution. Perform the test using the test solution and the standard solution as directed under the Atomic Absorption Spectroscopy according to the following conditions. Using the calibration curve obtained by the absorbance of the standard solution, determine the magnesium (Mg) content in the test solution.

Gas: Air–acetylene
Lamp: Magnesium hollow cathode lamp
Wavelength: 285 nm

(4) ***Glucose***—Pipet an amount of Sodium Chloride, Sodium Lactate Solution, Calcium Chloride, Magnesium Chloride and Dextrose Irrigation, equivalent to 4g of glucose ($C_6H_{12}O_6$), according to the labeled amount, add 0.2 mL of ammonia TS and water to make 100 mL, and allow to stand for 30 minutes. Determine the optical rotation α_D at 25 °C using a cell with a length of 200 mm.

Amount (mg) of glucose ($C_6H_{12}O_6$)
$= \alpha_D \times 947.7$

(5) ***Total chlorine***—Pipet an amount of Sodium Chloride, Sodium Lactate Solution, Calcium Chloride, Magnesium Chloride and Dextrose Irrigation, equivalent to 70 mg of total chlorine (Cl), according to the labeled amount, add 50 mL of water, shake well to mix, and titrate with 0.1 mol/L silver nitrate VS (indicator: 1 mL of potassium chromate TS). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L silver nitrate VS
= 3.545 mg of Cl

(6) ***Lactate***—Take an appropriate amount of Sodium Chloride, Sodium Lactate Solution, Calcium Chloride, Magnesium Chloride and Dextrose Irrigation, equivalent to a certain amount of lactate ($C_3H_5O_3$), according to the labeled amount, and use it as the test solution. Separately, dissolve sodium lactate RS in water to make 3 mg/mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak area of sodium lactate, A_T and A_S, in each solution.

Amount (mg) of sodium lactate ($C_3H_5O_3$)
= Concentration (mg/mL) of sodium lactate RS
$\times \frac{A_T}{A_S} \times \frac{89.07}{112.06}$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelengths: 210 nm).

Column: A stainless steel column, about 4.6 mm in internal diameter and 10 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (about drug 5 μm to 10 μm in particle diameter).

Mobile phase: A solution obtained by adding 1 mL of formic acid and 1 mL of dicyclohexylamine to 800 mL of water, and adding water to make 1000 mL.

Flow rate: 1.0 mL/min

System suitability

Inject a solution containing 3 mg of anhydrous sodium acetate RS and 3 mg of sodium lactate RS; the resolution is NLT 2. Repeat the test 5 times with 20 μL of the standard solution according to the above operating conditions; the relative standard deviation of the ratios of the peak areas is NMT 2.0%, and the symmetry factor is NMT 2.0.

Packaging and storage Preserve in hermetic containers.

Sodium Chondroitin Sulfate
콘드로이틴설페이트나트륨

Sodium Chondroitin Sulfate is a mucopolysaccharide that is the sodium salt of glycosaminoglycan sulfate, which is obtained from the cartilage tissue or trachea of healthy cattle, pigs, fish, or birds used for food by humans. Sodium Chondroitin Sulfate consists of the sodium salt of the sulfate ester of *N*-acetylcondrosamine (2-acetamino-2-deoxy-β-*D*-galactopyranose) and *D*-

glucuronic acid copolymer. These hexoses are alternatively linked β-1,4 and β-1,3 bonds in the polymer.

Sodium Chondroitin Sulfate, when dried, contains NLT 90.0% and NMT 105.0% of sodium chondroitin sulfate

Description Sodium Chondroitin Sulfate occurs as a white to pale yellowish white powder and has no odor or a slight characteristic odor.
It is freely soluble in water and practically insoluble in ethanol, acetone or ether.
It is hygroscopic.

Identification (1) Add 6 mL of sulfuric acid to 1 mL of an aqueous solution of Sodium Chondroitin Sulfate (1 in 1000), heat for 10 minutes on a steam bath, cool, add 0.2 mL of ethanolic solution of 0.125% carbazole and allow to stand at room temperature; the test solution exhibits a red to reddish purple color. Determine the absorption spectra as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum at about 530 nm.

(2) Determine the spectra of Sodium Chondroitin Sulfate and sodium chondroitin sulfate RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both exhibit similar intensities of absorption at the same wavenumbers.

(3) An aqueous solution of Sodium Chondroitin Sulfate (1 in 100) responds to the Qualitative Analysis (1) for sodium salt.

Optical rotation $[\alpha]_D^{20}$: Between -20.0° and -30.0° (0.3 g, previously dried, water, 10 mL, 100 mm).

pH Between 5.5 and 7.5 (1% aqueous solution).

Purity (1) ***Clarity and color of solution***—Dissolve 2.5 g of Sodium Chondroitin Sulfate in 50 mL of water, and perform the test as directed under the Ultraviolet-visible Spectroscopy using water as the control; the absorbance at 420 nm is NMT 0.35.

(2) ***Chloride***—Perform the test with 0.10 g of Sodium Chondroitin Sulfate. Prepare the control solution with 0.7 mL of 0.02 mol/L hydrochloric acid (NMT 0.50%).

(3) ***Sulfate***—Dissolve 0.2 g of Sodium Chondroitin Sulfate in 40 mL of water, add 10 mL of 4.0% cetylpyridinium chloride solution, shake to mix, and filter. Use 25 mL of the filtrate as the test solution, and perform the test as directed under the Sulfate. Prepare the control solution with 0.25 mL of 0.02 mol/L sulfuric acid instead of Sodium Chondroitin Sulfate (NMT 0.24%).

(4) ***Heavy metals***—Proceed with 1.0 g of Sodium Chondroitin Sulfate according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(5) ***Arsenic***—Weigh about 1.0 g of Sodium Chondroitin Sulfate according to Method 2 and perform the test (NMT 2 ppm).

(6) ***Protein***—Weigh accurately about 0.1 g of Sodium Chondroitin Sulfate, previously dried, dissolve in 10 mL of water, and use this solution as the test solution. Pipet 100 μL of this solution and dissolve in 700 μL of water, add 200 μL of colorimetric protein reagent and shake to mix. Determine the absorbance at 595 nm as directed under the Ultraviolet-visible Spectroscopy. Separately, serially dilute bovine serum albumin with water to concentrations of 5, 10, 15 and 20 μg/mL, proceed in the same manner as for the test solution and construct the calibration curve. Apply the absorbance of the test solution and determine the protein content of sodium chondroitin sulfate (NMT 3.5%).

Loss on drying NMT 10.0% (1 g, 105 ℃, 4 hours).

Residue on ignition Between 20.0% and 30.0% (1 g, calculated on the dried basis).

Assay Weight accurately about 0.1 g of Sodium Chondroitin Sulfate, previously dried, dissolve in water to make exactly 10 mL, filter with a membrane filter (0.45 μm), and use this solution as the test solution. Pipet 100 μL of the test solution and mix with 800 μL of 50 mM tris buffer solution (pH 8.0), add 100 μL of chondroitinase ABC enzyme solution and react for 1 hour at 37 ℃. Heat the solution for 5 minutes at 100 ℃ to stop the enzyme reaction, cool, centrifuge, filter the clear supernatant with a membrane filter (0.45 μm), and use the filtrate as the test solution. Separately, weigh accurately about 0.1 g of sodium chondroitin sulfate RS, proceed in the same manner as the test solution, and use this solution as the standard solution. Perform the test with 100 μL each of the test solution and standard solution [the column is pre-stabilized with water (pH 3.5).] as directed under the Liquid Chromatography, and measure the sum of peak areas for sodium chondroitin sulfate, A_T and A_S, of each solution.

$$\text{Amount (mg) of sodium chondroitin sulfate} = \text{Amount (mg) of sodium chondroitin sulfate RS} \times \frac{A_T}{A_S}$$

Sum of peak areas—Sum of peak areas of disaccharides (Di-0S, Di-6S, Di-4S) that appear in this order in the test solution and standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 232 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with silica gel coated with strong basic quaternary ammonium exchange resin for liquid chromatography.

Mobile phase: Control the step or gradient elution by mixing mobile phase A and mobile phase B as directed under the following table.

Mobile phase A: Water (pH 3.5)

Mobile phase B: 2 mol/L sodium chloride solution (pH 3.5)

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)

0 - 4	100	0
4 - 45	100 → 50	0 → 50
45 - 50	50	50

Flow rate: 1.0 mL/min

Packaging and storage Preserve in light-resistant, tight containers.

Sodium Chondroitin Sulfate Capsules
콘드로이틴설페이트나트륨 캡슐

Sodium Chondroitin Sulfate Capsules contain NLT 90.0% and NMT 110.0% of the labeled amounts of sodium chondroitin sulfate.

Method of preparation Prepared as directed under Capsules, with Sodium Chondroitin Sulfate.

Identification The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of the content NLT 20 Sodium Chondroitin Sulfate Capsules. Weigh an amount of Sodium Chondroitin Sulfate Capsules, equivalent to about 50 mg of sodium chondroitin sulfate, transfer into a 50-mL volumetric flask, add water to the volume, and transfer to a separatory funnel on the basis of quantity. Add 50 mL of n-hexane, shake well to mix, and allow to stand at room temperature. Pipet 200 μL of the water layer, and dilute with 800 μL of water. Add 1 mL of a mixture of phenol, chloroform and isoamyl alcohol (25 : 24 : 1), and shake well for 20 minutes to mix. Centrifuge at 15000 × g for 20 minutes, transfer 100 μL of the clear supernatant to a 1.5 mL test tube, dry completely (for example, use a speedvac at 60 ℃, etc.), and add 900 μL of 50 mM Tris buffer solution (pH 8.0). Mix for 10 minutes, add 100 μL of chondroitinase ABC enzyme solution, and react at 37 ℃ for 1 hour. Heat this solution at 100 ℃ for 5 minutes to stop the enzyme reaction, cool, centrifuge, and filter the clear supernatant with a membrane filter (0.45 μm). Inject 100 μL of the filtrate into the column, previously conditioned with water (pH 3.5). Separately, weigh accurately about 50 mg of sodium chondroitin sulfate RS, add 30 mL of water, shake to mix, and then add water to make 50 mL. Filter with a membrane filter (0.45 μm), transfer 100 μL of the filtrate to a 1.5-mL test tube, dry completely (for example, use a speedvac at 60 ℃, etc.), degrade by enzymes in the same manner as the test solution, and use this solution as the standard solution. Perform the test with 100 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions [However, use a column previously conditioned with water (pH 3.5)], and determine the sum of the peak areas, A_T and A_S, of sodium chondroitin sulfate in each solution.

$$\text{Amount (mg) of sodium chondroitin sulfate} = \text{Amount (mg) of sodium chondroitin sulfate RS} \times \frac{A_T}{A_S}$$

Sum of peak areas—Sum of peak areas of disaccharide (Di-0S, Di-6S, Di-4S) sequentially detected in the test solution and the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 232 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with silica gel coated with the strong basic quaternary ammonium anion exchange resin for liquid chromatography.

Mobile phase: Control the gradient by mixing the mobile phase A and mobile phase B as directed under the following table.

Mobile phase A: Water (pH 3.5)

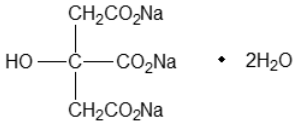
Mobile phase B: 2 mol/L sodium chloride solution (pH 3.5)

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 - 4	100	0
4 - 45	100 → 50	0 → 50
45 - 50	50	50

Flow rate: 1.0 mL/min

Packaging and storage Preserve in light-resistant, tight containers.

Sodium Citrate Hydrate
시트르산나트륨수화물



Sodium Citrate

$C_6H_5Na_3O_7 \cdot 2H_2O$: 294.10

Trisodium 2-hydroxypropane-1,2,3-tricarboxylate dihydrate [*6132-04-3*]

Sodium Citrate Hydrate, when dried, contains NLT 99.0% and NMT 101.0% of sodium citrate ($C_6H_5Na_3O_7$: 258.07).

Description Sodium Citrate Hydrate occurs as colorless crystals or a white crystalline powder. It is odorless and has a cool salty taste.

It is freely soluble in water and practically insoluble in ethanol(95) or ether.

Identification An aqueous solution of Sodium Citrate Hydrate (1 in 20) responds to the Qualitative Analysis for citrate and sodium salt.

pH Dissolve 1.0 g of Sodium Citrate Hydrate in 20 mL of water; the pH of this solution is between 7.5 and 8.5.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Sodium Citrate Hydrate in 10 mL of water; the solution is clear and colorless.

(2) ***Chloride***—Perform the test with 0.6 g of Sodium Citrate Hydrate. Prepare the control solution with 0.25 mL of 0.01 mol/L hydrochloric acid (NMT 0.015%).

(3) ***Sulfate***—Dissolve 0.5 g of 33.3% Sodium Citrate Hydrate in water to make 40 mL. Add 3.0 mL of dilute nitric acid and water to make 50 mL, and use this solution as the test solution. Prepare the control solution with 0.50 mL of 0.005 mol/L sulfuric acid (NMT 0.048%).

(4) ***Heavy metals***—Proceed with 2.5 g of Sodium Citrate Hydrate according to Method 2 and perform the test. Prepare the control solution with 2.5 mL of lead standard solution (NMT 10 ppm).

(5) ***Arsenic***—Prepare the test solution with 1.0 g of Sodium Citrate Hydrate, according to Method 1 and perform the test (NMT 2 ppm).

(6) ***Tartrate***—Add 2 mL of water, 1 mL of potassium acetate TS and 1 mL of acetic acid(31) to 1.0 g of Sodium Citrate Hydrate; a crystalline precipitate is not formed when scratching the inner wall with a glass rod.

(3) ***Oxylate***—Dissolve 1.0 g of Sodium Citrate Hydrate in 1 mL of water and 3 mL of dilute hydrochloric acid, add 4 mL of ethanol(95) and 0.2 mL of calcium chloride TS, and allow it to stand for 1 hour; the solution is clear.

(8) ***Readily carbonizable substances***—Proceed with 0.5 g of Sodium Citrate Hydrate and perform the test. Heat at 90 ℃ for 1 hour. The color of the solution is not more intense than that of the matching fluid K.

Loss on drying Between 10.0 and 13.0% (1 g, 180 °C, 2 hours).

Assay Weigh accurately about 0.1 g of Sodium Citrate Hydrate, previously dried, dissolve in water, put exactly 10 mL of internal standard solution and add water to make exactly 100 mL. Use this solution as the test solution. Weigh accurately about 0.1 g of sodium citrate hydrate RS, previously dried, dissolve in water, put 10 mL of internal standard solution and add water to make exactly 100 mL; use this solution as the test solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the peak area ratios, Q_T and Q_S, of sodium citrate to that of internal standard, respectively.

Amount (mg) of sodium citrate ($C_6H_5Na_3O_7$)
= Amount (mg) of sodium citrate in sodium citrate hydrate RS $\times \frac{Q_T}{Q_S}$

Internal standard solution—A solution of acetic acid (1 in 100).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 214 nm).

Column: A stainless steel column, about 4 mm in internal diameter and 15 cm to 30 cm in length is filled with octadecylsilanized silica gel for liquid chromatography.

Mobile phase: Dissolve 2.64 g of dibasic ammonium phosphate and 2 mL of triethylamine in 1000 mL of water, and adjust the pH to 2.5 with phosphoric acid.

Flow rate: Adjust the flow rate so that the retention time of sodium citrate is about 5 minutes.

Selection of column: When the procedure is run with 20 μL each of the standard solution according to the above conditions, internal standard and sodium citrate are eluted in this order with the resolution between their peaks being NLT 2.0.

Packaging and storage Preserve in tight containers.

Sodium Citrate Injection for Transfusion
수혈용 시트르산나트륨 주사액

Sodium Citrate Injection for Transfusion is an aqueous solution for injection, which contains NLT 9.5 w/v% and NMT 10.5 w/v% of sodium citrate hydrate ($C_6H_5Na_3O_7 \cdot 2H_2O$: 294.10).

Method of preparation

Sodium citrate hydrate	100 g
Water for injection	An appropriate amount
Total volume	1000 mL

Prepare as directed under Injections, with the above.
No preservative is added.

Description Diagnostic Sodium Citrate Solution occurs as a clear, colorless liquid.

Identification Sodium Citrate Injection for Transfusion responds to the Qualitative Analysis for sodium salt and citrate.

pH Between 7.0 and 8.5.

Sterility Meets the requirements.

Bacterial endotoxins Less than 5.6 EU per mL.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Extractable volume of injections Meets the requirements.

Assay Pipet 5 mL of Sodium Citrate Injection for Transfusion, and add water to make exactly 25 mL. Pipet 10 mL of this solution and evaporate to dryness on a steam bath. Dry the residue at 180 ℃ for 2 hours, add 30 mL of acetic acid(100), and dissolve by warming. After cooling, titrate with 0.1 mol/L perchloric acid VS (indicator: 3 drops of methylrosaniline chloride TS). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 9.803 mg of $C_6H_5Na_3O_7 \cdot 2H_2O$

Packaging and storage Preserve in hermetic containers.

Diagnostic Sodium Citrate Solution
진단용 시트르산나트륨 액

Diagnostic Sodium Citrate Solution contains NLT 3.3 w/v% and NMT 4.3 w/v% of sodium citrate hydrate ($C_6H_5Na_3O_7 \cdot 2H_2O$: 294.10).

The requirements as described for aqueous injections under Injections are applicable.

Method of preparation

Sodium Citrate Hydrate	38 g
Water for injection	An appropriate amount
Total volume	1000 mL

Prepare as directed under Injections with the above.
No preservative is added.

Description Diagnostic Sodium Citrate Solution occurs as a clear, colorless liquid.

Identification Diagnostic Sodium Citrate Solution responds to the Qualitative Analysis for sodium salt and for citrate.

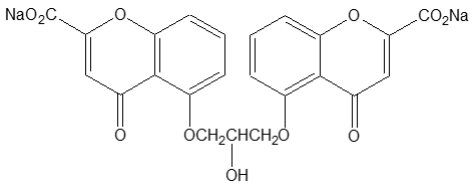
pH Between 7.0 and 8.5.

Assay Pipet 5.0 mL of Diagnostic Sodium Citrate Solution and evaporate on a steam bath to dryness. Dry the residue at 180 °C for 2 hours and dissolve in 30 mL of acetic acid(100) by warming. After cooling, titrate with 0.1 mol/L perchloric acid VS (indicator: 3 drops of methylrosaniline chloride TS). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 9.803 mg of $C_6H_5Na_3O_7 \cdot 2H_2O$

Packaging and storage Preserve in hermetic containers.

Sodium Cromoglicate
크로모글리크산나트륨



$C_{23}H_{14}Na_2O_{11}$: 512.33
Disodium 5-[3-(2-carboxylato-4-oxochromen-5-yl)oxy-2-hydroxypropoxy]-4-oxochromene-2-carboxylate [*15826-37-6*]

Sodium Cromoglicate contains NLT 98.0% and NMT 101.0% of sodium cromoglicate ($C_{23}H_{14}Na_2O_{11}$), calculated on the dried basis.

Description Sodium Cromoglicate occurs as a white, crystalline powder. It is odorless and initially tasteless but later has a slightly bitter taste.
It is freely soluble in water, sparingly soluble in propylene glycol, very slightly soluble in ethanol(95) and practically insoluble in 2-propanol or ether.
It is hygroscopic.
It is gradually changed to yellow by light.

Identification (1) Dissolve 0.1 g of Sodium Cromoglicate in 2 mL of water, add 2 mL of sodium hydroxide TS and boil for 1 minute; the solution exhibits a yellow color. Cool the solution and add 0.5 mL of concentrated diazobenzenesulfonic acid TS; the solution exhibits a dark red color.

(2) Determine the absorption spectra of solutions of Sodium Cromoglicate and sodium cromoglicate RS in the phosphate buffer solution, pH 7.4 (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Sodium Cromoglicate responds to the Qualitative Analysis for sodium salt.

Purity (1) ***Clarity and color of solution***—Dissolve 0.50 g of Sodium Cromoglicate in 10 mL of water; the solution is clear and colorless to pale yellow.

(2) ***Acid or alkali***—Dissolve 2.0 g of Sodium Cromoglicate in 40 mL of freshly boiled and cooled water, add 6 drops of bromothymol blue TS and use this solution as the test solution. To 20 mL of the test solution, add 0.25 mL of 0.1 mol/L sodium hydroxide; the color of the solution is blue. To 20 mL of the test solution, add 0.25 mL of 0.1 mol/L hydrochloric acid; the

color of the solution is yellow.

(3) ***Heavy metals***—Proceed with 1.0 g of Ceftazidime Hydrate according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(4) ***Oxalate***—Weigh 0.25 g of Sodium Cromoglicate, dissolve in water to make exactly 50 mL, and use this solution as the test solution. Separately, weigh accurately 49 mg of oxalate and dissolve in water to make exactly 100 mL. Pipet 5 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Pipet 20 mL each of the test solution and the standard solution, add exactly 5 mL of iron salicylate TS, and add water to make exactly 50 mL. Perform the test with the test solution and the standard solution as directed under the Ultraviolet-visible Spectroscopy, using water as the control; the absorbance of the solution obtained from the test solution at 480 nm is NLT that from the standard solution.

(5) ***Related substances***—Dissolve 0.20 g of Sodium Cromoglicate in 10 mL of water, and use this solution as the test solution. Pipet 1 mL of this solution and add water to make exactly 10 mL. Pipet 1 mL of this solution, add water to make exactly 20 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of methanol, chloroform and acetic acid(100) (9 : 9 : 2) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot obtained from the test solution are not more intense than the spot from the standard solution.

Loss on drying NMT 10.0% (1 g, in vacuum, 105 ℃, 4 hours).

Assay Weigh accurately about 0.18 g of Sodium Cromoglicate, add 25 mL of propylene glycol and 5 mL of 2-propanol, heat to dissolve and cool, and add 30 mL of 1,4-dioxane and titrate with 0.1 mol/L perchloric acid-1,4-dioxane VS (potentiometric titration under Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid-1,4-dioxane solution VS
= 25.62 mg of $C_{23}H_{14}Na_2O_{11}$

Packaging and storage Preserve in light-resistant, tight containers.

Sodium Ferric Gluconate Complex
글루콘산제이철나트륨착염

$[[Fe(OH)_3]_2 \cdot C_6H_{11}O_7Na]_n$

Sodium Ferric Gluconate Complex contains NLT 320 mg and NMT 380 mg of iron (Fe: 55.85) in each g of Sodium Ferric Gluconate Complex, calculated on the anhydrous basis. Sodium Ferric Gluconate Complex is a double salt obtained by reacting ferric hydroxide and sodium gluconate, and the equivalence ratio of iron and gluconic acid is 2 : 1.

Description Sodium Ferric Gluconate Complex occurs as a dark brown crystalline powder.

Identification (1) Add 2 mL of 25.0% hydrochloric acid to 1 mL of the aqueous solution of Sodium Ferric Gluconate Complex, heat it, and add 1 mL of 7.6% potassium thiocyanate TS; it turns red (iron).

(2) Weigh an appropriate amount of Sodium Ferric Gluconate Complex equivalent to 50 mg of iron, add water to make exactly 10 mL, and use this solution as the test solution. Separately, weigh an appropriate amount of sodium ferric gluconate complex RS equivalent to 50 mg of iron, add water to make exactly 10 mL, and use this solution as the standard solution. Put a cellulose acetate strip in Tris buffer solution, pH 9.0 for 10 minutes in advance, dry by sandwiching it between two sheets of paper, and put it in an electrophoresis chamber with Tris buffer solution, pH 9.0. Spot each of the test solution and the standard solution on the anode side of the strip, close the electrophoresis chamber, and perform an electrophoresis at 200 V for 30 minutes. Take out the strip and soak it in 1 mol/L hydrochloric acid for 3 minutes and then in 0.5% potassium ferrocyanide solution for 10 minutes. Soak the strip in a fixative (a solution in which methanol was added to 50 mL of a mixture of acetic acid, phenol, and water (800 : 90 : 110) to make 250 mL) for 1 minute, place it on a glass plate to air-dry; the standard solution and the test solution show a single blue band at the same R_f value.

(3) Dissolve 0.1 g of Sodium Ferric Gluconate Complex in water to make 100 mL. Take 10 mL of this solution, apply it in the strong acid ion exchange resin (H type) for column chromatography, flow it with water until the eluate becomes neutral, and use this solution as the test solution. Separately, weigh 0.1 g of sodium gluconate and add water to make 100 mL. Use this solution as the standard solution. Perform the test with these solutions as directed under the Thin Layer Chromatography. Spot each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. and then air dry the plate. Next, develop the plate with a mixture of ethanol, water, ammonia and ethyl acetate (50 : 30 : 10 : 10) as a developing solvent to a distance of about 10 cm, and air-dry the plate. Spray the coloring agent to the dried plate, and heat at 110 ℃ for 10 minutes; the R_f values of the spots obtained from the test and standard solutions are the same (gluconic acid).

(4) Determine the infrared spectra of Sodium Ferric Gluconate Complex and sodium ferric gluconate complex RS as directed in the potassium bromide disk method

under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(5) Weigh 0.1 g of Sodium Ferric Gluconate Complex, dissolve it in water to make exactly 50 mL, and use this solution as the test solution. Separately, weigh 100 mg of sodium ferric gluconate complex RS, dissolve it in water to make exactly 50 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating; the test solution shows a peak at the same retention time as the standard solution.

Operating conditions

Detector: An ultraviolet absorption spectrophotometer (wavelength: 254 nm).

Column: A stainless steel column about 7.8 mm in internal diameter and about 15 cm in length, packed with silica gel for liquid chromatography stabilized at a pH that can separate dextran with a molecular weight of 1000 to 30,000 Da (5 μm in particle diameter).

Mobile phase: A solution containing 0.05 mol/L, 0.15 mol/L, and 50 ppm of potassium monohydrogen phosphate, sodium chloride, and sodium azide (NaN_3), respectively, in 1000 mL of water, adjusted to pH 7.2 with 80.0% phosphoric acid, and filtered.

Flow rate: 0.6 mL/min

Dissolved state Dissolve 1.0 g of Sodium Ferric Gluconate Complex in 20 mL of water; the resulting solution is brown and clear.

pH Dissolve 5.0 g of Sodium Ferric Gluconate Complex in 40 mL of water; the pH of this solution is between 7.7 and 9.7.

Purity (1) ***Free Iron***—Weigh accurately about 0.25 g of Sodium Ferric Gluconate Complex, dissolve in water to make 10 mL, and use this solution as the test solution. Separately, dissolve about 172.5 mg of ammonium ferric sulfate dodecahydrate (an amount equivalent to about 20 mg as iron) in water to make 100 mL. Use this solution as the standard solution. Weigh 1 g of 80 - 100 mesh styrene-divinylbenzene copolymer (sodium type) (or its equivalent), suspend it in about 20 mL of distilled water for several minutes, pack it in a glass column (1 cm in diameter and 15 cm in height), and wash with water until it is decolorized. Next, elute subsequently with 5 mL of 1 mol/L hydrochloric acid, 7.5 mL of water and 5 mL of 1 mol/L sodium hydroxide, put it in a 50-mL volumetric flask, add 5 mL of 20.0% potassium thiocyanate aqueous solution, and make exactly 50 mL with 1 mol/L hydrochloric acid. Take 0.5 mL of the standard solution, proceed in the same way as the test solution, perform the test with each solution obtained from the standard solution and the test solution as directed under the Ultraviolet-visible Spectroscopy using 1 mol/L hydrochloric acid as the control solution, and determine the absorbance A_S and A_T at the wavelength of 470 nm. When calculated according to the following equation, free iron is NMT 2.0% of the total amount of iron.

$$\text{Content (\%) of free iron} = \frac{\text{Amount (mg) of iron in RS}}{\text{Amount (mg) of iron in sample}} \times \frac{A_T}{A_S} \times 5$$

(2) ***Free sodium gluconate***—Dissolve 5.0 g of Sodium Ferric Gluconate Complex in water to make 100 mL, and use this solution as the test solution. Separately, weigh 0.1 g of sodium gluconate, add water to make 100 mL, and use this solution as the standard solution. Spot each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography, and then air-dry the plate. Next, develop the plate with a mixture of ethanol, water, ammonia and ethyl acetate (50 : 30 : 10 : 10) as a developing solvent to a distance of about 10 cm, and air-dry the plate. Spray a coloring agent on the dried plate and heat it at 110 ℃ for 10 minutes; the spots other than the principal spot from the test solution are not more intense than the spot from the standard solution (NMT 2.0%).

(3) ***Gluconic acid***—Weigh accurately about 200 mg of Sodium Ferric Gluconate Complex, add 18 mL of acetic anhydride, stir for 10 minutes, add 5 mL of distilled water, and stir for 10 minutes. To this solution, add 25 mL of acetic acid, stir for 10 minutes, and titrate with 0.1 mol/L perchloric acid VS. Perform a blank test in the same manner and make any necessary correction. The amount of total gluconic acid in Sodium Ferric Gluconate Complex is between 39.0 & and 62.0%, calculated on the anhydrous basis.

$$\text{Each mL of 1 mol/L perchloric acid VS} = 19.616 \text{ mg of } C_6H_{12}O_7$$

Water NMT 10.0%.

Assay Weigh accurately about 0.1 g of Sodium Ferric Gluconate Complex, add water to make 200 mL, and use this solution as the test solution. Separately, weigh accurately about 172.5 mg of ammonium ferric sulfate dodecahydrate (an amount equivalent to about 20 mg as iron) and dissolve in water to make 200 mL. Use this solution as the standard solution. Take 1 mL each of the test and standard solutions, transfer each to a 100-mL volumetric flask filled with 40 mL of water, add 10 mL of 20.0% sulfuric acid and 1 mL of nitric acid, and boil for 10 minutes. After cooling, add 10 mL of 20.0% potassium thiocyanate solution, add water to make exactly 100 mL, and filter. Perform the test with the test solution and the standard solution as directed under the Ultraviolet-visible Spectroscopy using water as the control solution, and determine the absorbance A_S and A_T at the wavelength of 470 nm.

$$\text{Amount (mg) of iron (Fe)} = \text{Amount (mg) of the reference standard taken}$$

$$\times \frac{A_T}{A_s} \times 0.1158 \times \frac{100}{100 - \text{water}(\%)}$$

0.1158: Atomic weight of iron (55.85) / Molecular weight of ferric sulfate dodecahydrate (482.25).

Coloring agent—Add 2.5 g of ammonium molybdate to a 100-mL volumetric flask containing 50 mL of 1 mol/L sulfuric acid, add 1.0 g of cerium sulfate, dissolve completely, and add 1 mol/L sulfuric acid to make exactly 100 mL.

Packaging and storage Preserve in tight containers.

Sodium Fluoride
플루오르화나트륨

NaF: 41.99

[*7681-49-4*]

Sodium Fluoride contains NLT 98.0% and NMT 102.0% of sodium fluoride (NaF), calculated on the dried basis.

Description Sodium Fluoride occurs as a white powder, which is odorless.
It is soluble in water and practically insoluble in ethanol(95).

Identification (1) Put 1 g of Sodium Fluoride into a platinum crucible, add 15 mL of sulfuric acid, cover with a plate, heat for 1 hour on a steam bath, then wash the glass plate with water, and dry; the surface of the glass plate is corroded.

(2) An aqueous solution of Sodium Fluoride (1 in 25) responds to the Qualitative Analysis for sodium salt.

Purity (1) ***Acidity or alkalinity***—Weigh 2.0 g of Sodium Fluoride, put in a platinum dish, and dissolve in 40 mL of water. Add 10 mL of saturated potassium nitrate solution, cool to 0 °C, then add 3 drops of phenolphthalein TS. If no color appears at this time, add 0.10 mol/L sodium hydroxide solution until a pale red color appears, which lasts for 15 seconds; the consumed amount is NMT 2.0 mL. If a pale red color appears immediately after adding phenolphthalein TS dropwise, add 0.05 mol/L sulfuric acid until the color fades; the consumed amount is NMT 0.50 mL. This neutral solution is used in the fluorosilicate test.

(2) ***Fluorosilicate***—Heat the neutral solution obtained in (1) until it boils, and titrate with 0.01 mol/L sodium hydroxide solution VS while hot until a persistent pale red color appears; the consumed amount is NMT 1.5 mL.

(3) ***Chloride***—Dissolve 0.3 g of Sodium Fluoride in 20 mL of water, add 0.2 mg of boric acid, 1 mL of nitric acid and 1 mL of 0.1 mol/L silver nitrate solution; the color of the resulting solution is not more intense than that of the control solution (NMT 0.012%).

Control solution—To 1 mL of 0.0010 mol/L hydrochloric acid, add 0.2 mg of boric acid, 1 mL of nitric acid and 1 mL of 0.1 mol/L silver nitrate solution.

(4) ***Heavy metals***—Weigh 1.0 g of Sodium Fluoride, put in a platinum crucible, add 1 mL of water and 3 mL of sulfuric acid, then heat at as low a temperature as possible until all the sulfuric acid is evaporated to dryness. Dissolve the residue in 20 mL of water, neutralize with ammonia water(28) with phenolphthalein TS as the indicator, add 1 mL of acetic acid(100) and water to make 45 mL, and filter. Use 30 mL of filtrate as the test solution and perform the test. Prepare the control solution with 3.0 mL of lead standard solution (NMT 30 ppm).

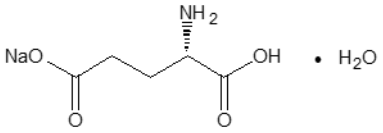
Loss on drying NMT 1.0% (1 g, 150 °C, 4 hours).

Assay Weigh accurately about 80 mg of Sodium Fluoride, dissolve in 25 mL of a mixture of acetic anhydride and acetic acid(100) (1 : 4), and titrate with 0.1 mol/L perchloric acid VS (indicator: methylrosaniline chloride TS). However, the endpoint of the titration is when the color turns green. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 4.199 mg of NaF

Packaging and storage Preserve in well-closed containers.

Sodium L-Glutamate Hydrate
L-글루탐산나트륨수화물



$C_5H_8O_4NNa \cdot H_2O$: 187.13

L-Glutamic acid monosodium salt hydrate; Sodium(2S)-2-amino-5-hydroxy-5-oxopentanoate hydrate, [142-47-2, anhydrous]

Sodium L-Glutamate Hydrate, when dried, contains NLT 90.0% and NMT 101.0% of sodium L-glutamate ($C_5H_8O_4NNa$).

Description Sodium L-Glutamate Hydrate occurs as colorless or white columnar crystals or white crystalline powder.

Identification (1) Sodium L-Glutamate Hydrate responds to the Qualitative Analysis for sodium salt.

(2) Add 1 mL of ninhydrin TS to 5 mL of the aqueous solution (1 in 1000) of Sodium L-Glutamate Hydrate and heat for 3 minutes; the solution appears purple.

(3) Dry Sodium L-Glutamate Hydrate and sodium

L-glutamate hydrate RS, and determine the absorption spectra as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Purity (1) ***Clarity and color of solution***—Dissolve 1 g of Sodium L-Glutamate Hydrate in 10 mL of water; the solution is clear and colorless.

(2) ***Chloride***—Proceed with 0.5 g of Sodium L-Glutamate Hydrate according to the Chloride and perform the test. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid VS (NMT 0.021%).

(3) ***Sulfate***—Proceed with 0.6 g of Sodium L-Glutamate Hydrate according to the sulfate limit test and perform the test. Prepare the control solution with 0.35 mL of 0.005 mol/L sulfuric acid VS (NMT 0.028%).

(4) ***Ammonium***—Proceed with 0.25 g of Sodium L-Glutamate Hydrate according to the Ammonium and perform the test. Prepare the control solution with 5.0 mL of ammonium standard solution (NMT 0.020%).

(5) ***Heavy metals***—Proceed with 2 g of Sodium L-Glutamate Hydrate according to the Heavy Metals and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(6) ***Iron***—Place 1.0 g of Sodium L-Glutamate Hydrate in a separatory funnel, dissolve in 10 mL of diluted hydrochloric acid, add 10 mL of methyl isobutyl ketone, and shake for 3 minutes to mix. Repeat the above procedure 3 times. Take the organic solvent layer, add 10 mL of water to it and shake for 3 minutes. It meets the requirement, when the Iron is performed with the water layer (NMT 10 ppm).

(7) ***Arsenic***—Proceed with 2.0 g of Sodium L-Glutamate Hydrate according to Method 1 under the Arsenic and perform the test (NMT 1 ppm).

(8) ***Other amino acids***—Weigh 0.50 g of Sodium L-Glutamate Hydrate, dissolve in 50 mL of water, and use this solution as the test solution. Perform the test with the solution as directed under the Paper Chromatography. Spot 5 mL of the test solution onto the filter paper, develop the filter paper with a mixture of n-butanol, water and acetic acid(100) (2 : 1 : 1) to the distance of about 30 cm and air-dry the filter paper. Spray the ninhydrin-acetone solution (1 in 50) evenly onto this and heat at 90 ℃ for 10 minutes; no spots other than a single purple spot appear.

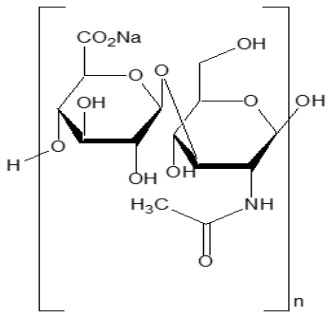
Loss on drying NMT 0.20% (1 g, 98 ± 1 °C, 5 hours).

Assay Weigh accurately 0.15 g of sodium L-glutamate hydrate, previously dried, dissolve it in 3 mL of formic acid, add 50 mL of acetic acid(100) for mixing, and titrate with 0.1 mol/L perchloric acid VS (indicator: 0.5 mL of α-naphthol benzene TS) until the solution turns from brown to green. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 8.456 mg of $C_5H_8O_4NNa$

Packaging and storage Preserve in tight containers.

Sodium Hyaluronate
히알루론산나트륨



Sodium Hyaluronate $(C_{14}H_{20}NNaO_{11})n$
Sodium (2*S*,3*S*,4*R*,5*R*,6*R*)-3-{[(2*S*,3*R*,5*S*,6*R*)-3-(acetylamino)-5-hydroxy-6-(hydroxymethyl)tetra-hydro-2*H*-pyran-2-yl]oxy}-4,5,6-trihydroxytetrahydro-2*H*-pyran-2-carboxylate [*9067-32-7*]

Sodium Hyaluronate is prepared by extracting from the comb of the rooster or by fermenting *Streptococcus* Lancefield Groups A and C, through minimizing or removing infectious agents. When prepared by fermenting Gram-positive bacteria, indicate the process to reduce or remove cell wall components causing heating or inflammation.

Sodium Hyaluronate is the sodium salt of hyaluronic acid, glycosaminoglycans, composed of D-Glucuronic acid and N-acetyl-D-glucosamine disaccharide units.

Sodium Hyaluronate contains NLT 95.0% and NMT 105.0% of sodium hyaluronate $(C_{14}H_{20}NNaO_{11})n$, calculated on the dried basis. Sodium Hyaluronate has the intrinsic viscosity of between 90% and 120% of the labeled amount.

Description Sodium Hyaluronate occurs as a white powder, granules or fibrous masses.
It is sparingly soluble in water and practically insoluble in ethanol(95).
It is hygroscopic.

Identification (1) Determine the infrared spectra of Sodium Hyaluronate and sodium hyaluronate RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) Dissolve 0.1 g of Sodium Hyaluronate in 2 mL of water; it responds to the Qualitative Analysis for sodium.

pH Dissolve 50 mg of Sodium Hyaluronate, calculated on the dried basis, in 10 mL of water; the pH of this solution is between 5.0 and 8.5.

Intrinsic viscosity Since Sodium Hyaluronate is extremely hygroscopic, avoid the humidity during weighing. Weigh accurately 0.200 g (m_{0p}) of Sodium Hyaluronate (this value is only a labeled value and should be adjusted after measuring the initial viscosity of the test solution (1)), add 50.0 g (m_{0s}) of the buffer solution at 4 ℃, and shake to mix. Weigh accurately 5.00 g (m_{1p}) of this solution, add 100.0 g (m_{1s}) of the buffer solution at 25 ℃, shake to mix for 20 minutes, and filter with a glass filter. Discard the first 10 mL of the filtrate, and use the subsequent filtrate for the test solution (1) with concentration, C_1. Weigh accurately 30.0 g (m_{2p}) of the test solution (1), add 10.0 g (m_{2s}) of the buffer solution at 25 ℃, shake to mix for 20 minutes, and filter with a glass filter. Discard the first 10 mL of the filtrate, and use the subsequent filtrate for the test solution (2) with concentration, C_2. Take 20.0 g (m_{3p}) of the test solution (1), add 20.0 g (m_{3s}) of the buffer solution at 25 ℃, shake to mix for 20 minutes, and filter with a glass filter. Discard the first 10 mL of the filtrate, and use the subsequent filtrate for the test solution (3) with concentration, C_3. Take 10.0 g (m_{4p}) of the test solution (1), add 30.0 g (m_{4s}) of the buffer solution at 25 ℃, shake to mix for 20 minutes, and filter with a glass filter. Discard the first 10 mL of the filtrate, and use the subsequent filtrate for the test solution (4) with concentration, C_4. Measure the flow times at 25.00 ± 0.03℃ of the test solution (1), (2), (3) and (4), and the buffer solution, and take as t_1, t_2, t_3, t_4 and t_0, respectively. Measure the time of each solution until it flows from the upper capillary B mark to the lower mark 3 times applying the same capillary viscometer (viscometer constant: 0.005 mm^2/s^2, dynamic viscosity range: 1 - 5 mm^2/s^2, internal diameter of capillary below sphere C: 0.53 mm, volume of sphere B: 5.6 mL, internal diameter of capillary 2: 2.8 - 3.2 mm). The test is invalid if any of the measured values deviate by more than 0.35% from the mean value, and if the flow time t_1 is NMT 1.6 times or NLT 1.8 times t_0. In this case, repeat the test with adjusting the value m_{0p}.

Calculation of relative viscosity: As the density of sodium hyaluronate and the solvent are similar, the relative viscosities (η_{ri})(η_{r1}, η_{r2}, η_{r3} and η_{r4}) are calculated from the ratio of the flow time t_i (t_1, t_2, t_3, t_4) of each test solution to the flow time t_0 of the solvent.

$$n_{r1} = \frac{t_1 - \frac{B}{t_1^2}}{t_0 - \frac{B}{t_0^2}}$$

B: Correction factor for dynamic energy of the capillary (30800 s3).

Calculation of concentration: the concentration of sodium hyaluronate of the test solution (1)

Calculation of C_1 (kg/m3)

$$C_1 = m_{0\rho} \times \frac{x}{100} \times \frac{100-h}{100} \times \frac{1}{m_{0\rho}+m_{0s}} \times \frac{m_{1\rho}}{m_{1\rho}+m_{1s}} \times \rho_{25}$$

χ: Sodium hyaluronate content (%) obtained from the test solution of Assay

h: Loss on drying (%)

ρ_{25}: 1005 kg/m^3 (density of the test solution at 25℃).

Calculation of other concentrations

$$C_2 = C_1 \times \frac{m_{2\rho}}{m_{2\rho}+m_{2s}}$$

$$C_3 = C_1 \times \frac{m_{3\rho}}{m_{3\rho}+m_{3s}}$$

$$C_4 = C_1 \times \frac{m_{4\rho}}{m_{4\rho}+m_{4s}}$$

Calculation of intrinsic viscosity: the intrinsic viscosity [η] (m^3/kg) is determined from Least Squares Regression (PLSR) following Martin equation, and obtained from the antilog of the intercept value.

$$\log \{(\eta_r - 1)/C\} = \log [\eta] + k[\eta]c$$

Buffer solution—Prepare the solution A by dissolving 0.78 g of sodium dihydrogen phosphate dihydrate and 4.50 g of sodium chloride in 500.0 mL of water, and the solution B by dissolving 1.79 g of sodium hydrogen phosphate docahydrate and 4.50 g of sodium chloride in 500.0 mL of water. Add the solution B to the solution A, adjust the pH to 7.0 and filter using a glass filter.

Purity (1) ***Clarity and color of solution***—Take Sodium Hyaluronate, equivalent to 0.1 g, calculated on the dried basis, add 30 mL of 0.9 w/v% sodium chloride solution, and shake it gently for 12 hours; the solution is clear. Perform the test with this solution as directed under the Ultraviolet-visible Spectroscopy; the absorbance at 600 nm is NMT 0.01.

(2) ***Chloride***—Dissolve 67 mg of Sodium Hyaluronate in 100 mL of water, and to 15 mL of this solution, add 1 mL of dilute nitric acid and 1 mL of silver nitrate TS. Prepare the control solution with 10 mL of chloride standard solution and 5 mL of water, and add 1 mL of dilute nitric acid and 1 mL of silver nitrate TS.

Chloride standard solution—Weigh accurately 0.824 g of sodium chloride, add water to make exactly 1000 mL, and to 1 mL of this solution, add water to make exactly 100-mL before use.

(3) ***Heavy metals***—Prepare 1.0 g of Sodium Hyaluronate in a combustion flask of 100mL, add a mixture of nitric acid and sulfuric acid (5 : 4) until the sample is moistened enough, and heat gently. Repeat this operation until using 18 mL of the mixture of nitric acid and sulfuric acid (5 : 4). Boil until the solution turns black. After cooling, add 2 mL of nitric acid, and heat again until the solution turns black. Repeat the operation until the solution no longer turns black, and heat vigorously until dense white fumes appear. After cooling, add 5 mL of water, boil gently until dense white fumes appear, and heat until the volume of the solution becomes between 2

and 3 mL. After cooling, add 5 mL of water; if the solution still exhibits a yellow color, add 1 mL of concentrated hydrogen peroxide, and heat until the volume of the solution becomes between 2 and 3 mL. After cooling, add 2 - 3 mL of water to dilute, transfer to a Nessler tube, add water to make 25 mL, and use this solution as the test solution. Separately, take 2.0 mL of lead standard solution in a combustion flask of 100 mL, add 18 mL of a mixture of nitric acid-sulfuric acid (5 : 4) and the same amount of nitric acid as in the preparation of the test solution, and heat until dense white fumes appear. After cooling, add 10 mL of water; if concentrated hydrogen peroxide is used in the preparation of the test solution, add the same volume of concentrated hydrogen peroxide, proceed in the same manner as the test solution, and use this solution as the standard solution. Add ammonia water(28) to the test solution and the control solution to adjust the pH of the solutions between 3.0 and 4.0, and add water to make 40 mL. To each solution, add 1.2 mL of thioacetamide TS, 2 mL of acetate buffer solution, pH 3.5 and water to make 50 mL, allow to stand for 5 minutes, and compare the color of the solutions using a white paper. The color of the test solution is not more intense than that of the control solution (NMT 20 ppm). However, when used in the manufacturing of parenteral preparations, NMT 10 ppm. In this case, perform the test in the same manner specified above with 1.0 g of Sodium Hyaluronate and 1.0 mL of the lead standard solution for the test solution.

(4) ***Iron***—Weigh accurately Sodium Hyaluronate, equivalent to 0.25 g, calculated on the dried basis, add 1 mL of nitric acid, heat on a steam bath to dissolve, cool, add water to make exactly 10 mL, and use this solution as the test solution. Prepare another 2 solutions in the same manner as the test solution, previously cooled, add 1.0 mL and 2.0 mL of the iron standard solution, and use these solutions as the standard solution (1) and (2) respectively. Perform the test using the test solution and the standard solution (1) and (2) according to the Atomic Absorption Spectroscopy under the following conditions.

Gas: Air–acetylene
Lamp: Iron hollow cathode lamp
Wavelength: 248.3 nm

(5) ***Sulfated glycosaminoglycans***—Sodium Hyaluronate, when extracted from the comb of roosters, is suitable for the following test. Weigh Sodium Hyaluronate, equivalent to 50.0 mg, calculated on the dried basis, put in a test tube with a length of 150 mm and an internal diameter of 16 mm, add 1.0 mL of perchloric acid, and use this solution as the test solution. Dissolve 0.149 g of sodium sulfate decahydrate in water to make100.0 mL, take 10.0 mL of this solution, and add water to make 100.0 mL. Pipet 1.0 mL of this solution into a test tube, evaporate to dryness at between 90 and 95 ℃, dissolve the residue in 1.0 mL of perchloric acid, and use this solution as the standard solution. Seal each test tube of solution with glass wool, heat at 180 ℃ for 12 hours to make clear and transparent solution, and cool to room temperature. Add 3.0 mL of 3.33 w/v% barium chloride solution in each test tube, close the lid, shake vigorously, and allow to stand for 30 minutes. Perform the test with all solutions, using water as the control solution, as directed under the Ultraviolet-visible Spectroscopy and determine the absorbance of these solutions at 660 nm; the absorbance of the test solution is not greater than that of the control solution.

(6) ***Nucleic acid***—Weigh Sodium Hyaluronate, equivalent to 0.10 g, calculated on the dried basis, add 30 mL of 0.9 w/v% sodium chloride solution, shake gently for 12 hours until the solution becomes transparent and clear liquid, perform the test with this solution as directed under the Ultraviolet-visible Spectroscopy; the absorbance at 260 nm is NMT 0.5.

(7) ***Protein***—Weigh accurately an amount of Sodium Hyaluronate equivalent to 0.1 g, calculated on the dried basis, dissolve in water to make exactly 10 mL, and use this solution as the test solution (1). Mix the test solution (1) and water in the same volume ratio to prepare the test solution (2). Weigh accurately 50 mg of bovine serum albumin, dissolve in water to make exactly 100 mL, take 1.0, 3.0, 5.0, 7.0 and 10.0 mL of this solution, add water to make each 100 mL, and use these solutions as the standard solutions. Select an appropriate test solution considering the permitted limit and the calibration curve. Pipet 2.5 mL each of water (blank test solution), the test solution (1), and (2), and standard solutions into a test tube, add 2.5 mL of newly prepared Copper(II) tartrate TS in each tube, mix for 10 minutes, add each 0.5 mL of a mixture of water-phosphomolybdic acid TS (1 : 1), previously prepared, and allow to stand for 30 minutes. Determine the absorbances of these solutions at 750 nm as directed under the Ultraviolet-visible Spectroscopy, using the blank test solution as the control solution, and determine the protein content of the test solution from the calibration curve prepared with the absorbance of the standard solution (NMT 0.3%, and NMT 0.1% for injection).

Loss on drying NMT 20.0% (0.50 g, 105 ℃, 6 hours, phosphorus pentoxide(V)).

Sterility Meets the requirements (when prepared under aseptic conditions).

Bacterial endotoxins It is NMT 0.5 EU for each mg (when used for the manufacturing of parenteral preparations without any process to remove endotoxin). It is NMT 0.05 EU for each mg (when used for the manufacturing of intraocular or intra-articular preparations without any process to remove endotoxin).

Microbiological examination of non-sterile products The total aerobic microbial count is NMT 100 CFU per g of Sodium Hyaluronate.

Determination Determine the glucuronic acid content by reacting with carbazole. Weigh accurately about 0.170 g of Sodium Hyaluronate, dissolve in water to make ex-

actly 100 g, weigh accurately 10 g of this solution, add water to make exactly 200 g, and use this solution as the test solution. Repeat the same operation to prepare 3 test solutions. Weigh accurately about 0.1 g of D-Glucuronic acid, previously dried in vacuum to a constant mass, add water to make exactly 100 g, take a certain amount of this solution, add water to make 5 solutions containing between 6.5 μg and 65 μg per g, and use these solutions as the standard solutions. Prepare 25 test tubes, label from 1 to 25, and place in an ice bath. Take 1.0 mL of each of the 5 standard solutions 3 times for each concentration, place into test tubes and indicate as the standard solution tubes (1 - 15). Then, take 1.0 mL of each of the 3 test solutions 3 times, place into 9 test tubes, and indicate as the test solution tubes (16 - 24). Put water into the last tube, and indicate as the blank test solution tube (25). To each test tube, add 5 mL of sulfuric acid solution of 0.95 w/v% sodium tetraborate decahydrate, newly prepared, seal tightly with plastic caps, shake to mix, allow to stand on a steam bath for 15 minutes, and cool in an ice bath. To each test tube, add 0.2 mL of ethanol(95) solution of 0.125 w/v% carbazole, seal tightly with caps, shake to mix, allow to stand on a steam bath for 15 minutes, and cool to room temperature. Determine the absorbance of these solutions at the wavelength of 530 nm as directed under the Ultraviolet-visible Spectrophotometry, using the blank test solution as the control solution. Determine the mean concentration of D-Glucuronic acid in the test solutions with the calibration curve created from the mean absorbance of the standard solution.

$$\text{Amount (mg) of sodium hyaluronate } [(C_{14}H_{20}NNaO_{11})n] = \frac{C_g}{C_S} \times Z \times \frac{100}{100 - h} \times \frac{401.3}{194.1}$$

C_g: The mean concentration (mg/g) of D-Glucuronic acid in the test solutions

C_S: Concentration (mg/g) of Sodium Hyaluronate in the test solutions

Z: Content (%) of D-Glucuronic acid

h: Loss on drying (%)

401.3: Relative molecular weight of disaccharides

194.1: Relative molecular weight of glucuronic acid

Packaging and storage Preserve in light-resistant, tight containers.

Sodium Hyaluronate Ocular Injection
히알루론산나트륨 안과용주사액

Sodium Hyaluronate Ocular Injection, as used for ophthalmological surgery, contains NLT 90.0% and NMT 110.0% of the labeled amount of sodium hyaluronate $[(C_{14}H_{20}O_{11}NNa)_n]$.

Method of preparation Prepare as directed under Injections, with Sodium Hyaluronate.

Identification (1) ***Glucuronic acid*—**To 0.3 g of Sodium Hyaluronate Ocular Injection, add 50 mL of isotonic sodium chloride injection, and dissolve by shaking to mix. Carefully place 1 mL of this solution in a stoppered test tube containing previously cooled 5 mL of borax-sulfuric acid TS (0.95 in 100), and cool with care to maintain the temperature of the solution at not higher than the room temperature. While cooling, slowly shake initially and shake hard afterwards to mix. Heat in a boiling water bath for 10 minutes, immediately cool to the room temperature with iced water, add 0.2 mL of carbazole-ethanol TS (0.125 in 100), and shake enough to mix. Heat in a boiling water bath for 15 minutes, and immediately cool to the room temperature with iced water; the solution exhibits a red color.

(2) ***N-acetylglucosamine*—**Transfer 4 mg of Sodium Hyaluronate Ocular Injection to a test tube, dissolve in 0.4 mL of isotonic sodium chloride injection, add 0.1 mL of hyaluronidase solution, shake to mix, and warm on a steam bath for 30 minutes. To this solution, add 0.1 mL of boric acid solution, stopper the tube with a glass stopper, and heat in a boiling water bath for 3 minutes. Immediately cool with iced water, add 3 mL of 4-dimethylaminobenzaldehyde TS, shake enough to mix, and warm in a 37 ℃ water bath for 20 minutes; the solution exhibits a reddish purple color.

(3) An aqueous solution of Sodium Hyaluronate Ocular Injection (1 in 100) responds to the Qualitative Analysis (1) for sodium salt. Additionally, an aqueous solution of Sodium Hyaluronate Ocular Injection (1 in 10000) responds to the Qualitative Analysis (2) for sodium salt.

pH Between 6.3 and 8.3.

Purity (1) ***Protein*—**Use Sodium Hyaluronate Ocular Injection as the test solution. Separately, weigh accurately 0.10 g of bovine serum albumin, as the standard protein, and add it to isotonic sodium chloride injection to make 100 mL. To 2.5 mL of this solution, add isotonic sodium chloride injection to make 50 mL, and use this solution as the standard solution. Take 0.5 mL of the test solution and 0.5 mL of the standard solution, add 2.5 mL of alkaline copper solution to each, shake enough to mix, and allow each to stand for 10 minutes. To each, add 0.25 mL of 1 mol/L Folin solution, shake enough to mix, and allow each to stand for 30 minutes. Determine the absorbances, A_T and A_S, of the solutions, respectively, using a solution obtained by proceeding with 0.5 mL of isotonic sodium chloride injection in the same manner, as a control solution, at the wavelength of 750 nm as directed under the Ultraviolet-visible Spectroscopy, and determine the amount of protein in the test solution according to the following formula; it is NMT 25 μg/g.

$$\text{Amount (μg /g) of protein in the test solution} = 50 \times \frac{A_T}{A_S}$$

(2) ***Other acidic mucopolysaccharide***—To Sodium Hyaluronate Ocular Injection in the amount equivalent to about 10 mg of sodium hyaluronate according to the labeled amount, add 10 mL of barbital buffer solution, pH 8.6, dissolve by shaking to mix, and use this solution as the test solution. Perform the test with this solution as directed under the Electrophoresis. Apply 2 μL of this solution to a cellulose acetate membrane, in about 1/6 of the entire length and in the width of 1 cm, starting from the left end of the membrane. Next, electrify both ends at the current of 0.5 mA per cm of the membrane with barbital buffer solution, pH 8.6, for 20 minutes for electrophoresis. Immediately after electrophoresis is finished, dry the membrane with hot air, immerse it in 0.5% toluidine blue O solution, previously filtered with a filter paper, to stain the membrane for 1 minute, and wash with water. Dry the membrane with hot air and spread it by placing it on the filter paper to remove wrinkles; no spots other than the principal spot appear.

Bacterial endotoxins Less than 0.5 EU per mL.

Intrinsic viscosity Weigh accurately about 0.22 g of Sodium Hyaluronate Ocular Injection, add it to 10 mL of 0.15 mol/L sodium chloride solution, shake enough for 1 hour to mix, and add 0.15 mol/L sodium chloride solution to make 20 mL. Dilute this solution with 0.15 mol/L sodium chloride solution to make solutions diluted exactly 1.5-, 2.0-, 3.0- and 6.0-fold, and use these solutions as the test solutions. Perform the test with these solutions as directed under the Intrinsic viscosity of sodium hyaluronate; the intrinsic viscosity (dL/g) is 30 to 55 (dL/g).

Sterility Meets the requirements.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Extractable volume of injections Meets the requirements.

Assay Pipet Sodium Hyaluronate Ocular Injection in the amount equivalent to 3 mg of sodium hyaluronate $[(C_{14}H_{20}O_{11}NNa)_n]$, add isotonic sodium chloride injection to make 50 mL, and use this solution as the test solution. Separately, weigh accurately about 0.1 g of glucuronolactone and dissolve in benzoic acid saturated solution to make 100 mL. Add 3.0 mL of this solution to 100 mL of isotonic sodium chloride injection and use this solution as the standard glucuronolactone solution. Place exactly 1 mL each of the test solution and the standard glucuronolactone solution in a respective stoppered test tube containing previously cooled 5 mL of borax-sulfuric acid TS (0.95 in 100), and cool with care to maintain the temperature of each solution at not higher than the room temperature. While cooling, slowly shake initially and shake hard afterwards to mix. Heat each in a boiling water bath for 10 minutes, immediately cool to the room temperature with iced water, add 0.2 mL of carbazole-ethanol TS (0.125 in 100) to each, and shake enough to mix. Heat each in a boiling water bath for 15 minutes and immediately cool to the room temperature with iced water. Determine the absorbances, A_T and A_S, of these solutions, respectively, using a solution obtained by proceeding with 1 mL of isotonic sodium chloride injection in the same manner, as a control solution, at the wavelength of 530 nm, and determine the amount of sodium hyaluronate, calculated on the dried basis, in Sodium Hyaluronate Ocular Injection according to the following formula.

$$\text{Amount (mg) of sodium hyaluronate } [(C_{14}H_{20}O_{11}NNa)_n] = \text{Amount (mg) of glucuronolactone RS} \times \frac{A_T}{A_S} \times \frac{3}{200} \times 2.28$$

$\frac{3}{200}$: *dilution factor*

$$2.28: \frac{\left|\text{Molar mass of 1 unit of sodium hyaluronate } [(C_{14}H_{20}O_{11}NNa)n]\right|}{\text{Molar mass of glucuronolactone } (C_6H_8O_6)} = \frac{[(C_{14}H_{20}O_{11}NNa)_n]}{(C_6H_8O_6)} = \frac{401.30}{176.12}$$

Packaging and storage Preserve in hermetic containers.

Sodium Iodide
요오드화나트륨

NaI: 149.89

Sodium iodide [*7681-82-5*]

Sodium Iodide, when dried, contains NLT 99.0% and NMT 101.0% of sodium iodide (NaI).

Description Sodium Iodide occurs as colorless crystals or a white crystalline powder, and is odorless.
It is very soluble in water and freely soluble in glycerin or ethanol(95).
It is deliquescent in humid air.

Identification An aqueous solution of Sodium Iodide (1 in 20) responds to the Qualitative Analysis for sodium and iodide.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Sodium Iodide in 2 mL of water; the solution is clear and colorless.

(2) ***Alkalinity***—Dissolve 1.0 g of Sodium Iodide in 10 mL of freshly boiled and cooled water, add 1.0 mL of 0.005 mol/L sulfuric acid and 1 drop of phenolphthalein TS; the solution is colorless.

(3) ***Chloride, bromide and thiosulfate***—Dissolve 0.20 g of Sodium Iodide in 5 mL of ammonia TS, add 15.0 mL of 0.1 mol/L silver nitrate shake to mix for 2 to 3 minutes, and filter. To 10 mL of the filtrate, add 15 mL

of dilute nitric acid; the solution does not turn brown. Also, the turbidity of the solution is not more intense than that of the following control solution.

Control solution—To 0.30 mL of 0.01 mol/L hydrochloric acid, add 2.5 mL of ammonia TS, 7.5 mL of 0.1 mol/L silver nitrate solution, and 15 mL of dilute nitric acid.

(4) ***Nitrate, nitrite or ammonium***—Take 1.0 g of Sodium Iodide in a 40 mL test tube, add 5 mL of water, 5 mL of sodium hydroxide TS and 0.2 g of aluminum, and cover with absorbent cotton and carefully heat for 15 minutes on a steam bath; the gas produced does not change a moistened red litmus paper to blue.

(5) ***Cyanide***—Dissolve 0.5 of Sodium Iodide in 10 mL of water, add 1 drop of iron(II) sulfate TS and 2 mL of sodium hydroxide TS to 5 mL of this solution, warm, and add 4 mL of hydrochloric acid; the solution does not turn green.

(6) ***Iodate***—Dissolve 0.5 g of Sodium Iodide in 10 mL of freshly boiled and cooled water, and add 2 drops of dilute sulfuric acid and 1 drop of starch TS; the solution does not turn blue immediately.

(7) ***Heavy metals***—Proceed with 2.0 g of Sodium Iodide as directed under Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(8) ***Barium***—Dissolve 0.5 g of Sodium Iodide in 10 mL of water, add 1 mL of dilute sulfuric acid and allow to stand for 5 minutes; no turbidity is produced.

(9) ***Potassium***—Dissolve 1.0 g of Sodium Iodide in water to make 100 mL. To 4.0 mL of this solution, add 1.0 mL of dilute acetic acid and shake to mix. Add 5.0 mL of sodium tetraphenylborate solution (1 in 30), shake to mix and allow to stand for 10 minutes; the turbidity of the solution is not more intense than that of the following control solution.

Control solution—Dissolve 9.5 mg of potassium chloride in water to make 1000 mL. Add 1.0 mL of dilute acetic acid to 4.0 mL of this solution, shake to mix, and proceed in the same manner as the following.

(10) ***Arsenic***—Proceed with 0.40 g of Sodium Iodide as directed under Method 1 and perform the test (NMT 5 ppm).

Loss on drying NMT 5.0% (2 g, 120 ℃, 2 hours).

Assay Weigh accurately about 0.4 g of Sodium Iodide, previously dried, place in an iodine bottle and add 10 mL of water to dissolve. Add 35 mL of hydrochloric acid and 5 mL of chloroform and shake vigorously to mix; titrate with 0.05 mol/L potassium iodate VS until the purple color of the chloroform layer disappears. The endpoint is when the purple color of the chloroform layer does not reappear within 5 minutes after it is decolorized.

Each mL of 0.05 mol/L potassium iodate VS

= 14.989 mg of NaI

Packaging and storage Preserve in light-resistant, tight containers.

Sodium Iodide (^{123}I) Injection
요오드화나트륨(^{123}I) 주사액

Sodium Iodide (^{123}I) Injection contains iodine-123 in sodium iodide form.

Sodium Iodide (^{123}I) Injection contains, on the test date, NLT 90.0% and NMT 110.0% of the labeled amount of radioactivity of iodine-123.

Method of preparation (1) Isolate the iodine-123 created by bombarding telerium-124 with protons, prepare in the form of sodium iodide (^{123}I), purify, and prepare as directed under Injections.

(2) Isolate iodine-123 obtained from the decay of cesium-123 and xenon-123 created by bombarding xenon-124 with protons, prepare in the form of sodium iodide (^{123}I), purify, and prepare as directed under Injections.

Description Sodium Iodide (123I) Injection occurs as a clear, colorless and odorless liquid.

Identification (1) Place ^{123}I standard gamma ray radioactive source at a certain distance from the gamma-ray detector, and measure the gamma-ray spectrum. Find the relationship between the spectrum peak due to the photoelectric effect and gamma-ray energy from low energy to high energy at appropriate intervals to prepare the energy calibration curve for the spectrometer. Measure the gamma-ray spectrum for an appropriate amount of Sodium Iodide (123I) Injection; the test solution exhibits a maximum at 0.159 MeV.

(2) Test as directed under the Purity (1); a radioactivity maximum is exhibited at the iodide spot.

pH Between 7.0 and 9.0.

Purity (1) ***Radiochemical impurity***—Develop an appropriate amount of Sodium Iodide (123I) Injection as directed under the Thin Layer Chromatography to a distance of about 1 cm using 75% methanol as the developing solvent; radioactivity other than that of the spot for sodium iodide (^{123}I) Injection must be NMT 5% of total radioactivity.

(2) ***Radionuclide***—Test Sodium Iodide (^{123}I) Injection as directed under the Identification (1), and find the radioactivity of the 0.159 MeV maximum of iodine-123 and the 0.603 MeV maximum of iodide-124; the radioactivity of iodine-123 to the sum of the radioactivity as of the test date and time is NLT 95%.

Sterility Meets the requirements.

Bacterial endotoxins NMT 175/V EU per mL of Sodium Iodide (^{123}I) Injection. Provided, the V is the maximum recommended amount per mL in the effective time.

Assay Measure and compare the ionization current or converted indication value (hereinafter referred to as "ionization current") by using an ionization chamber in γ-ray emitted from the sample and the reference standard under the same conditions. Weigh accurately the sample and the reference standard of which radioactivity is known, add a solvent, if necessary, and dilute them to make the test and standard solutions. Put the same amount of the test and standard solutions in a measuring container made of the same material and shape. Place the container at a certain position in an ionization chamber and measure each ionization current to calculate radioactivity in a certain amount of the sample according to the following equation:

$$\text{Radioactivity in a certain amount of sample} = S \times \frac{I}{I'} \times \frac{D}{D'} \times G$$

S: Radioactivity in a certain amount of reference standard

I: Ionization current of the test solution

I': Ionization current of the standard solution

D: Dilution factor of sample

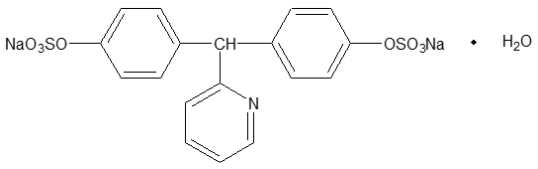
D': Dilution factor of reference standard

G: Correction terms such as geometric conditions of the position of test and standard solutions, etc.

However, use G = 1 as much as possible.

Expiration date Within 48 days of the test date.

Sodium Picosulfate Hydrate
피코설페이트나트륨수화물



Sodium Picosulfate $C_{18}H_{13}NNa_2O_8S_2 \cdot H_2O$: 499.42
Sodium 4,4'-(pyridin-2-ylmethylene)*bis*(4,1-phenylene) disulfate [*10040-45-6*, anhydride]

Sodium Picosulfate Hydrate contains NLT 98.5% and NMT 101.0% of sodium picosulfate ($C_{18}H_{13}N_2O_2S_2$), calculated on the anhydrous basis.

Description Sodium Picosulfate Hydrate occurs as a white, crystalline powder. It is odorless and tasteless.
It is very soluble in water, soluble in methanol, slightly soluble in ethanol(99.5) and practically insoluble in ether.
It is gradually colored by light.

Dissolve 1.0 g of Sodium Picosulfate Hydrate in 20 mL of water; the pH of the solution is between 7.4 and 9.4.

Identification (1) Add 10 mg of 1-chloro-2,4-dinitrobenzene to 5 mg of Sodium Picosulfate Hydrate to mix, and heat gently for 5 to 6 seconds to melt. After cooling, add 4 mL of potassium hydroxide-ethanol TS; the resulting solution exhibits an orange color.

(2) Add 5 mL of dilute hydrochloric acid to 0.2 g of Sodium Picosulfate Hydrate and boil the solution for 5 minutes. After cooling, add 1 mL of barium chloride; a white precipitate is produced.

(3) Determine the absorption spectra of aqueous solutions of Sodium Picosulfate Hydrate and sodium picosulfate hydrate RS (1 in 25000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(4) Determine the infrared spectra of Sodium Picosulfate Hydrate and sodium picosulfate hydrate RS, previously dried at 105 °C for 4 hours, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(5) An aqueous solution of Sodium Picosulfate Hydrate (1 in 10) responds to the Qualitative Analysis for sodium salt.

Absorbance $E_{1cm}^{1\%}$ (263 nm): Between 120 and 130 (4 mg calculated on the anhydrous basis, water, 100 mL).

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Sodium Picosulfate Hydrate in 10 mL of water; the resulting solution is clear and colorless to pale yellow.

(2) ***Chloride***—Perform the test with 0.5 g of Sodium Picosulfate Hydrate. Prepare the control solution with 0.40 mL of 0.01 mol/L hydrochloric acid (NMT 0.028%).

(3) ***Sulfate***—Perform the test with 0.40 g of Sodium Picosulfate Hydrate. Prepare the control solution with 0.35 mL of 0.005 mol/L (NMT 0.042%).

(4) ***Heavy metals***—Proceed with 2.0 g of Sodium Picosulfate Hydrate according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(5) ***Arsenic***—Proceed with 2.0 g of Sodium Picosulfate Hydrate according to Method 3 and perform the test (NMT 1 ppm).

(6) ***Related substances***—Dissolve 0.25 g of Sodium Picosulfate Hydrate in 5 mL of methanol, and use this solution as the test solution. Pipet 1 mL of this solution, add methanol to make exactly 500 mL, and use it as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on a plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of n-butanol, water and acetic acid(100) (74 : 20 : 19) as a developing solvent to a distance of about 10 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 366 nm); any spot other than the principal spot obtained from the test solution is

not more intense than the spot from the standard solution.

Water Between 3.0% and 4.5% (0.5 g, volumetric titration, direct titration).

Assay Weigh accurately about 0.4 g of Sodium Picosulfate Hydrate, dissolve in 50 mL of methanol, add 7 mL of acetic acid(100), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 1 mol/L perchloric acid VS
= 48.14 mg of $C_{18}H_{13}NNa_2O_8S_2$

Packaging and storage Preserve in light-resistant, tight containers.

Sodium Polystyrene Sulfonate
폴리스티렌설폰산나트륨

Sodium poly (2-ethenylbenzenesulfonate) [*178955-71-0*]

Sodium Polystyrene Sulfonate is a sodium-type cation exchange resin produced by combining a sulfonic acid group with a copolymer of styrene and divinylbenzene.

Sodium Polystyrene Sulfonate contains 9.4% to 11.0% sodium (Na: 22.99), calculated on the anhydrous basis.

Each g of Sodium Polystyrene Sulfonatee, calculated on the anhydrous basis, exchanges with 0.110 to 0.135 g of potassium (K: 39.10).

Description Sodium Polystyrene Sulfonate occurs as a yellowish-brown powder. It is odorless and tasteless.
It is practically insoluble in water, ethanol(95), acetone or ether.

Identification (1) Determine the infrared spectra of Sodium Polystyrene Sulfonate and sodium polystyrene sulfonate RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) Add 10 mL of dilute hydrochloric acid to 1 g of Sodium Polystyrene Sulfonate, stir and mix, filter, and add ammonia TS to the filtrate to make it neutral. The solution responds to the Chemical identification reaction for sodium salt.

Purity (1) ***Ammonium***—Take 1.0 g of Sodium Polystyrene Sulfonate in a flask, add 5 mL of sodium hydroxide TS, cover the bottom with a watch glass with a wet red litmus test paper attached, and heat for 15 minutes; the gas produced does not change the red litmus test paper to blue.

(2) ***Heavy metals***—Proceed with 2.0 g of Sodium Polystyrene Sulfonate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Arsenic***—Prepare the test solution with 2.0 g of Sodium Polystyrene Sulfonate according to Method 2, and perform the test (NMT 1 ppm).

(4) ***Styrene***—Weigh 10.0 g of Sodium Polystyrene Sulfonate, add 10 mL of acetone, shake to mix for 30 minutes, and centrifuge. Use the clear supernatant as the test solution. Separately, weigh 10 mg of styrene and dissolve in acetone to make exactly 100 mL. Pipet 1 mL of this solution, add acetone to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak area A_T and A_S of styrene in each liquid; A_T is not greater than A_S.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of water and acetonitrile (1 : 1).

Flow rate: Adjust the retention time so that the retention time of styrene is 7 to 8 minutes.

System suitability

System performance: Dissolve 20 mg each of styrene and butyl p-hydroxybenzoate in 100 mL of acetone. To 5 mL of this solution, add acetone to make 100 mL. Proceed with 20 mL of this solution according to the above operating conditions; butyl p-hydroxybenzoate and styrene are eluted in this order with the resolution being NLT 5.

System repeatability: Repeat the test 6 times with 20 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area of styrene is NMT 2.0%.

Water NMT 10.0% (0.2 g, volumetric titration, direct titration).

Assay (1) ***Sodium***—Weigh accurately about 1 g of Sodium Polystyrene Sulfonate, calculated on the anhydrous basis in a stoppered glass container, add exactly 50 mL of 3 mol/L hydrochloric acid TS, shake to mix for 60 minutes, and then filter. Discard the first 20 mL of the filtrate, pipet 5 mL of the subsequent filtrate, and add water to make 100 mL. Pipet 20 mL of this solution, add water to make exactly 1000 mL, and use this solution as the test solution. Separately, pipet an appropriate amount of sodium chloride standard stock solution, add water to dilute the solution so that each mL contains 1 to 3 μg of sodium (Na: 22.99), and use this solution as the standard solution. With the test and standard solutions, perform the test as directed under the Atomic Absorption Spectroscopy according to the following conditions, and determine

the sodium content in the test solution using the calibration curve obtained from the standard solution.

Gas: Air–acetylene
Lamp: Potassium hollow cathode lamp
Wavelength: 589.0 nm

(2) ***Potassium exchange capacity***—Weigh accurately about 1.5 g of Sodium Polystyrene Sulfonate, calculated on the anhydrous basis. in a stoppered glass container, add exactly 100 mL of potassium standard stock solution, shake to mix for 15 minutes, and then filter. Discard the first 20 mL of the filtrate, pipet 10 mL of the subsequent filtrate, and add water to make exactly 100 mL. Pipet 10 mL of this solution, add water to make exactly 1000 mL, and use this solution as the test solution. Separately, take exactly an appropriate amount of potassium standard stock solution, add water to dilute the solution so that each mL contains 1 to 5 μg of potassium (K: 39.10), and use this solution as the standard solution. With the test and standard solutions, perform the test as directed under the Atomic Absorption Spectroscopy according to the following conditions, and determine the potassium content *Y* (mg) in 1000 mL of the test solution using the calibration curve obtained from the standard solution. Determine the potassium exchange amount per gram of Sodium Polystyrene Sulfonate, calculated on the anhydrous basis, using the following formula.

$$\text{Potassium (K) exchange rate (mg) per gram of Sodium Polystyrene Sulfonate, calculated on the anhydrous basis} = \frac{X - 100Y}{W}$$

X: Amount (mg) of potassium in 100 mL of potassium standard stock solution before exchange
W: Amount (mg) of Sodium Polystyrene Sulfonate taken, calculated on the anhydrous basis

Gas: Air–acetylene
Lamp: Potassium hollow cathode lamp
Wavelength: 766.5 nm

Packaging and storage Preserve in tight containers.

Sodium Pyrosulfite
피로아황산나트륨

Potassium Metabisulfite $Na_2S_2O_5$: 190.11
Disodiumpyrosulfite [*7681-57-4*]

Sodium Pyrosulfite contains NLT 95.0% and NMT 101.0% of sodium pyrosulfite ($Na_2S_2O_5$).

Description Sodium Pyrosulfite occurs as a white or almost white, crystalline power and has a sulfur dioxide-like odor.
It is freely soluble in water, very slightly solution in ethanol(95), and practically insoluble in ether.
An aqueous solution of Sodium Pyrosulfite (1 in 20) is acidity.
It is hygroscopic.
It gradually decomposes in air.

Identification An aqueous solution of Sodium Pyrosulfite (1 in 20) responds to the Qualitative Analysis for sodium salt and bisulfite.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Sodium Pyrosulfite in 10 mL of water; the solution is clear and colorless.

(2) ***Thiosulfate***—Dissolve 1.0 g of Sodium Pyrosulfite in 15 mL of water, add gradually 5 mL of dilute hydrochloric acid, shake and mix the solution, allow to stand for 5 minutes; the solution does not become turbid.

(3) ***Heavy metals***—Dissolve Sodium Pyrosulfite in 10 mL of water, add 5 mL of hydrochloric acid, and evaporate to dryness on a steam bath. Dissolve the residue in 10 mL of water, add 1 drop of phenolphthalein TS, add ammonia TS until the solution turn slightly red, and add 2 mL of dilute acetic acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution by evaporating to dryness 5 mL of hydrochloric acid on a steam bath, adding 2 mL of dilute acetic acid, 2.9 mL of the lead standard solution and water to make 50 mL (NMT 20 ppm).

(4) ***Iron***—Prepare the test solution with 1.0 g of Sodium Pyrosulfite according to Method 1 and perform the test according to Method A. Prepare the control solution with 2.0 mL of the iron standard solution (NMT 20 ppm).

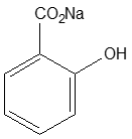
(5) ***Arsenic***—Dissolve Sodium Pyrosulfite in 10 mL of water, add 1 mL of sulfuric acid, heat in a sand bath until white fumes evolve, and add water to make 5 mL. Use this solution as the test solution and perform the test (NMT 4 ppm).

Assay Weigh accurately about 1.5 g of Sodium Pyrosulfite, and put in an iodine flask containing exactly 50 mL of 0.05 mol/L Iodine solution. Close the stopper of the flask, shake to mix, and allow to stand in a dark place for 5 minutes. Next, add 1 mL of hydrochloric acid, and titrate excess iodine with 0.1 mol/L sodium thiosulfate VS (indicator: 1 mL of starch TS). Perform a blank test in the same manner.

Each mL of 0.05 mol/L iodine VS
= 4.753 mg of $Na_2S_2O_5$

Packaging and storage Fill in a light-resistant, tight containers as full as possible, and preserve it at below 30 ℃.

Sodium Salicylate
살리실산나트륨



$C_7H_5NaO_3$: 160.10
Sodium 2-hydroxybenzoate [*54-21-7*]

Sodium Salicylate, when dried, contains NLT 98.0% and NMT 102.0% of sodium salicylate ($C_7H_5NaO_3$).

Description Sodium Salicylate occurs as white crystals or a crystalline powder.
It is very soluble in water, freely soluble in acetic acid(100) and soluble in ethanol(95).
It is gradually colored by light.

Identification (1) Determine the infrared spectra of Sodium Salicylate and sodium salicylate RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) An aqueous solution of Sodium Salicylate (1 in 20) responds to the Qualitative Analysis for sodium salt.

pH Dissolve 2.0 g of Sodium Salicylate in 20 mL of water; the pH of this solution is between 6.0 and 8.0.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Sodium Salicylate in 10 mL of water; the solution is clear. Perform the test with this solution as directed under the Ultraviolet-visible Spectroscopy; the absorbance at 420 nm is NMT 0.02.

(2) ***Chloride***—Dissolve 0.5 g of Sodium Salicylate in 15 mL of water and add 6 mL of dilute nitric acid and ethanol(95) to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution by adding 0.30 mL of 0.01 mol/L hydrochloric acid, 28 mL of ethanol(95), 6 mL of dilute nitric acid and water to make 50 mL (NMT 0.021%).

(3) ***Sulfate***—Dissolve 0.25 g of Sodium Salicylate in 5 mL of water, add 0.5 mL of barium chloride TS; the solution shows no change.

(4) ***Sulfite and thiosulfate***—Dissolve 1.0 g of Sodium Salicylate in 20 mL of water, add 1 mL of hydrochloric acid and filter it. Add 0.15 mL of 0.05 mol/L iodine solution to the filtrate; the color of the solution is yellow.

(5) ***Heavy metals***—Proceed with 1.0 g of Sodium Salicylate as directed under Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(6) ***Arsenic***—Put 1.0 g of Sodium Salicylate into a decomposition flask, add 5 mL of nitric acid and 2 mL of sulfuric acid, and heat carefully until white fumes are produced. After cooling, add 2 mL of nitric acid, heat, and cool it again. Then, add 2 mL of hydrogen peroxide water (30) and heat again until the solution becomes colorless to pale yellow. Repeat the procedure of adding nitric acid and hydrogen peroxide water (30) and heating, if necessary. After cooling, add 2 mL of saturated ammonium oxalate solution and heat again until white fumes are produced. After cooling, add water to make 5 mL and perform the test with this solution using as the test solution (NMT 2 ppm).

Loss on drying NMT 0.5% (1 g, 105 ℃, 2 hours).

Assay Weigh accurately about 0.2 g each of Sodium Salicylate and sodium salicylate RS, previously dried, and dissolve by adding water to make exactly 100 mL. Pipet 10.0 mL each of these solutions, add 10.0 mL of the internal standard solution and water to make exactly 100 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 20 μL each of these solutions as directed under the Liquid Chromatography according to the following conditions and calculate the peak area ratios, Q_T and Q_S, of sodium salicylate to that of internal standard, respectively.

$$\text{Amount (mg) of sodium salicylate } (C_7H_5NaO_3) = \text{Amount (mg) of sodium salicylate RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—Weigh 20 mg of anhydrous caffeine RS and dissolve in water to make 100 mL.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and 15 cm to 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm to 10 μm in particle diameter).

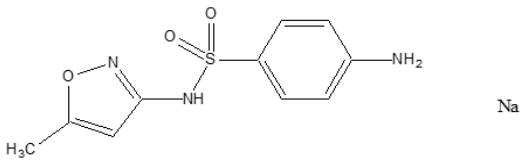
Mobile phase: A mixture of water, methanol and acetic acid(31) (50 : 50 : 1).

Flow rate: Adjust the flow rate so that the retention time of sodium salicylate is about 8.5 minutes.

Selection of column: Proceed with 10 μL of the standard solution according to the above conditions; internal standard and sodium salicylate are eluted in this order with the resolution between their peaks being NLT 4.0.

Packaging and storage Preserve in light-resistant, tight containers.

Sodium Sulfamethoxazole
설파메톡사졸나트륨



$C_{10}H_{11}N_3O_3S \cdot Na$: 275.26
4-Amino-*N*-(5-methyl-3-isoxazolyl)-benzenesulfonamide sodium salt (1:1), [*4563-84-2*]

Sodium Sulfamethoxazole, when dried, contains NLT 98.0% and NMT 101.0% of sodium sulfamethoxazole ($C_{10}H_{10}N_3NaO_3S$).

Description Sodium Sulfamethoxazole occurs as white crystals or a crystalline powder. It is odorless and has a bitter taste.
It is very soluble in water, slightly soluble in ethanol, and practically insoluble in ether.

Identification (1) Dissolve 0.4 g of Sodium Sulfamethoxazole in 10 mL of water, and add 1 mL of 1 mol/L hydrochloric acid TS to mix and separate crystals. Filter the precipitate, wash with a small amount of water, and dry at 105 ℃ for 2 hours. Dissolve 10 mg of the crystals in 1 mL of dilute hydrochloric acid and 4 mL of water; the solution responds to the Qualitative Analysis for primary aromatic amine.

(2) Dissolve 20 mg of the crystals obtained from (1) in 5 mL of water and 1 mL of *n*-butylamine, add 2 to 3 drops of copper sulfate TS, and shake well to mix. To this, add 5 mL of chloroform, shake to mix, and allow to stand; the chloroform layer exhibits a bluish green color.

(3) Determine the melting point of the crystals obtained from (1); the melting point is between 169 and 172 ℃.

(4) Determine the infrared spectrum of Sodium Sulfamethoxazole as directed in the paste method under the Mid-infrared Spectroscopy; it exhibits absorption at the wavenumbers of about 3505 cm^{-1}, 3400 cm^{-1}, 3220 cm^{-1}, 1625 cm^{-1}, 1595 cm^{-1}, 1315 cm^{-1} and 1170 cm^{-1}.

(5) An aqueous solution of Sodium Sulfamethoxazole (1 in 10) responds to the Qualitative Analysis for sodium salt.

pH Dissolve 2.0 g of Sodium Sulfamethoxazole in 20 mL of water; the pH of this solution is between 9.2 and 10.4.

Purity (1) ***Clarity and color of solution*—**Dissolve 1.0 g of Sodium Sulfamethoxazole in 10 mL of water; the resulting solution is clear and colorless.

(2) ***Heavy metals*—**Proceed with 1.0 g of Sodium Sulfamethoxazole as directed under Method 3 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Related substances*—**Weigh accurately 0.1 g of Sodium Sulfamethoxazole, dissolve in 5 mL of water, and use this solution as the test solution. Pipet 1 mL of this solution and add water to make exactly 20 mL. Pipet 1 mL of this solution, add water to make exactly 20 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of tetrahydrofuran, acetonitrile, water and strong ammonia water (150 : 150 : 20 : 1) as the developing solvent to a distance of about 15 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot obtained from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 0.5% (1 g, 105 ℃, 2 hours).

Assay Weigh accurately about 0.4 g of Sodium Sulfamethoxazole, previously dried, add 100 mL of water to dissolve, and titrate with 0.1 mol/L hydrochloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L hydrochloric acid VS
= 27.53 mg of $C_{10}H_{10}N_3NaO_3S$

Packaging and storage Preserve in tight containers.

Sodium Thiosulfate Hydrate
티오황산나트륨수화물

Sodium Thiosulfate $Na_2S_2O_3 \cdot 5H_2O$: 248.18
Sodium thiosulfate hydrate [*7772-98-7*, anhydrous]

Sodium Thiosulfate Hydrate, when dried, contains NLT 99.0% and NMT 101.0% of sodium thiosulfate ($Na_2S_2O_3$: 158.11).

Description Sodium Thiosulfate Hydrate occurs as colorless crystals or a crystalline powder and is odorless.
It is very soluble in water, very slightly soluble in ethanol(95) and practically insoluble in ether.
It effloresces in dry air and deliquesces in humid air.

Identification An aqueous solution of Sodium Thiosulfate Hydrate (1 in 10) responds to the Qualitative Analysis for sodium salt and thiosulfate.

pH Dissolve 1.0 g of Sodium Thiosulfate Hydrate in 10 mL of water; the pH of this solution is between 6.0 and 8.0.

Purity (1) ***Clarity and color of solution*—**Dissolve 1.0 g of Sodium Thiosulfate Hydrate in 10 mL of water; the resulting solution is clear and colorless.

(2) ***Heavy metals***—Dissolve 1.0 g of Sodium Thiosulfate Hydrate in 10 mL of water, evaporate to dryness on a steam bath by slowly adding 5 mL of dilute hydrochloric acid. To the residue, add 15 mL of water, boil gently for 2 minutes, and then filter. Heat the filtrate to boiling, add bromine TS while it is hot, and when the solution becomes clear and there is a slight excess of bromine, boil it again to remove bromine. After cooling, add 1 drop of phenolphthalein TS and add sodium hydroxide TS one drop at a time until the solution exhibits a slight red color. Add 2 mL of dilute acetic acid, and add water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution by adding 2 mL of dilute acetic acid and water to 2.0 mL of lead standard solution to make 50 mL (NMT 20 ppm).

(3) ***Calcium***—Dissolve 1.0 g of Sodium Thiosulfate Hydrate in 10 mL of water, add 2 mL of ammonium oxalate TS, and allow to stand for 4 minutes; the solution does not become turbid.

(4) ***Arsenic***—To 0.40 g of Sodium Thiosulfate Hydrate, add 3 mL of nitric acid and 5 mL of water, evaporate it to dryness on a steam bath. Proceed with the residue according to Method 2 and perform the test (NMT 5 ppm).

Loss on drying Between 32.0% and 37.0% (1 g, in vacuum, 40 ℃ to 45 ℃, 16 hours).

Assay Weigh accurately 0.4 g of Sodium Thiosulfate Hydrate, previously dried, dissolve in 30 mL of water, and titrate with 0.05 mol/L iodine VS (indicator: 1 mL of starch TS).

Each mL of 0.05 mol/L iodine VS
= 15.811 mg of $Na_2S_2O_3$

Packaging and storage Preserve in tight containers.

Sodium Thiosulfate Injection
티오황산나트륨 주사액

Sodium Thiosulfate Injection is an aqueous solution for injection. Sodium Thiosulfate Injection contains not less that 95.0% and NMT 105.0% of the labeled amount of sodium thiosulfate ($Na_2S_2O_3 \cdot 5H_2O$: 248.18).

Method of preparation Prepare as directed under Injections, with Sodium Thiosulfate Hydrate.

Description Sodium Thiosulfate Injection occurs as a clear, colorless liquid.

Identification Sodium Thiosulfate Injection responds to the Qualitative Analysis for sodium salt and thiosulfate.

Sterility Meets the requirements.

Bacterial endotoxins Less than 0.01 EU per mg of sodium thiosulfate.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

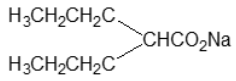
Extractable volume of injections Meets the requirements.

Assay Pipet an amount of Sodium Thiosulfate Injection equivalent to 0.5 g of sodium thiosulfate ($Na_2S_2O_3 \cdot 5H_2O$), add water to make 30 mL, and titrate with 0.05 mol/L iodine VS (indicator : 1 mL of starch TS).

Each mL of 0.05 mol/L iodine VS
= 24.818 mg of $Na_2S_2O_3 \cdot 5H_2O$

Packaging and storage Preserve in hermetic containers.

Sodium Valproate
발프로산나트륨



$C_8H_{15}NaO_2$: 166.19
Sodium 2-propylpentanoate [*1069-66-5*]

Sodium Valproate, when dried, contains NLT 98.5% and NMT 101.0% of sodium valproate ($C_8H_{15}NaO_2$).

Description Sodium Valproate occurs as a white crystalline powder. It has a characteristic odor and a bitter taste.
It is very soluble in water, freely soluble in formic acid, ethanol(95), ethanol(99.5) or acetic acid(100) and practically insoluble in ether.
It is hygroscopic.

Identification (1) Add 4 mL of hydroxylamine perchlorate-ethanol (99.5) TS and 1 mL of *N,N'*-dicyclohexylcarbodiimide-ethanol (99.5) TS in 1 mL of a solution of Sodium Valproate in ethanol(99.5) (1 in 200), shake well to mix, and allow it to stand in lukewarm water for 20 minutes. After cooling, add 1 mL of iron(III) perchlorate hexahydrate-ethanol (99.5) TS, and shake well to mix; the resulting solution exhibits a violet color.

(2) Take 5 mL of an aqueous solution of Sodium Valproate (1 in 20), add 1 mL of cobalt nitrate solution (1 in 20), and warm on a steam bath; a violet precipitate is formed.

(3) Weigh 0.5 g each of Sodium Valproate and sodium valproate RS, dissolve in 5 mL of water, respectively, add 5 mL of chloroform and 1 mL of 2 mol/L hydrochloric acid TS, and shake strongly to mix. Allow it to stand, take the chloroform layer separately, dehydrate

with anhydrous sodium sulfate, and filter. Determine the infrared spectra of the residues as directed under the liquid membrane method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(4) An aqueous solution of Sodium Valproate (1 in 10) responds to the Qualitative Analysis for sodium salt.

pH Dissolve 1.0 g of Sodium Valproate in 20 mL of water; the pH of this solution is between 7.0 and 8.5.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Sodium Valproate in 10 mL of water; the resulting solution is clear and colorless.

(2) ***Chloride***—Dissolve 0.5 g of Sodium Valproate in 25 mL of ethanol(95), and add 6 mL of dilute nitric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution by adding 0.70 mL of 0.01 mol/L hydrochloric acid, 25 mL of ethanol(95) and 6 mL of dilute nitric acid to make 50 mL (NMT 0.050%).

(3) ***Sulfate***—Dissolve 0.5 g of Sodium Valproate in 25 mL of ethanol(95), and add 1 mL of dilute hydrochloric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution by adding 0.50 mL of 0.005 mol/L sulfuric acid, 25 mL of ethanol(95), 1 mL of dilute hydrochloric acid and water to make 50 mL (NMT 0.048%).

(4) ***Heavy metals***—Dissolve 2.0 g of Sodium Valproate in 44 mL of water, add 6 mL of dilute hydrochloric acid, shake well to mix, and allow it to stand for 5 minutes. Filter, discard 5 mL of the first filtrate, take 25 mL of the subsequent filtrate, neutralize with ammonia TS, and add 2 mL of dilute acetic acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution by adding 2 mL of lead standard solution and 2 mL of dilute acetic acid and water to make 50 mL (NMT 20 ppm).

(5) ***Arsenic***—Dissolve 2.0 g of Sodium Valproate in 10 mL of water, add 10 mL of dilute hydrochloric acid, shake well to mix, and allow it to stand for 5 minutes. Filter, discard 5 mL of the first filtrate, and take 10 mL of the subsequent filtrate. Use this solution as the test solution and perform the test (NMT 2 ppm).

(6) ***Related substances***—Dissolve 0.10 g of Sodium Valproate in 10 mL of a mixture of formic acid and chloroform (1 : 1), and use this solution as the test solution. Pipet 1 mL of this solution, add a mixture of formic acid and chloroform (1 : 1) to make exactly 200 mL, and use this solution as the standard solution. Perform the test with 2 μL each of the test solution and standard solution as directed under the Gas Chromatography according to the following conditions. Determine the peak area of each solution as directed in the automatic integration method; the sum of peak areas other than the peak of valproic acid from the test solution is not greater than the peak area of valproic acid from the standard solution.

Operating conditions

Detector: A flame ionization detector.

Column: A column about 3 mm in internal diameter and about 2 m in length, packed with diethylene glycol adipic acid ester for gas chromatography and phosphoric acid covered with diatomaceous earth for gas chromatography with 5% and 1% ratio (between 150 and 180 μm in particle diameter).

Column temperature: A constant temperature of about 145 °C.

Carrier gas: Nitrogen

Flow rate: Adjust the flow rate so that the retention time of valproic acid is between 6 and 10 minutes.

System suitability

Detection sensitivity: Adjust the sensitivity so that the peak height of valproic acid obtained from 2 μL of the standard solution is between 4 and 10 mm.

System performance: Mix 1 mL of the test solution and 4 mL of a mixture of formic acid and chloroform (1 : 1) of *n*-valeric acid. Proceed with 2 μL of this solution according to the above conditions; *n*-valeric acid and valproic acid are eluted in this order with a resolution being NLT 3.

Time span of measurement: About 2 times the retention time of valproic acid after the solvent peak.

Loss on drying NMT 1.0% (1 g, 105 ℃, 3 hours).

Assay Weigh accurately about 0.2 g of Sodium Valproate, previously dried, dissolve in 80 mL of acetic acid(100), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 16.619 mg of $C_8H_{15}NaO_2$

Packaging and storage Preserve in tight containers.

Sodium Valproate for Injection
주사용 발프로산나트륨

Sodium Valproate for Injection is an injection, which is dissolved before use, and contains NLT 95.0% and NMT 105.0% of the labeled amount of sodium valproate ($C_8H_{15}NaO_2$: 166.19).

Method of preparation Prepare as directed under Injections, with Sodium Valproate.

Identification (1) An aqueous solution of Sodium Valproate for Injection (1 in 10) responds to the Qualitative Analysis for sodium salt.

(2) To 1 mL of a solution of Sodium Valproate for Injection in ethanol(99.5) (1 in 200), add 4 mL of hydroxylamine perchlorate-anhydrous ethanol TS and 1 mL of *N*,*N*'-dicyclohexylcarbodiimide-ethanol (99.5) TS, shake well to mix, and allow it to stand in warm water for 20 minutes. After cooling, add 1 mL of iron(III) perchlo-

rate-ethanol (99.5) TS, and shake well to mix; the resulting solution exhibits a violet color.

(3) To 5 mL of an aqueous solution of Sodium Valproate for Injection (1 in 20), add 1 mL of cobalt nitrate solution (1 in 20), and warm on a steam bath; a violet precipitate is formed.

(4) Dissolve 0.5 g of Sodium Valproate for Injection in 5 mL of water, add 5 mL of chloroform and 1 mL of 2 mol/L hydrochloric acid TS, and shake strongly to mix for 1 minute. Allow it to stand, separately take the chloroform layer, dehydrate with anhydrous sodium sulfate, and filter. Remove the solvent from the filtrate, and determine the infrared spectrum of the residue as directed under the liquid film method under the Mid-infrared Spectroscopy; it exhibits absorption at the wavenumbers of about 1707 cm^{-1}, 1466 cm^{-1}, 1415 cm^{-1}, 1252 cm^{-1}, 1241 cm^{-1} and 938 cm^{-1}.

pH Between 6.8 and 8.5 (10% aqueous solution).

Sterility Meets the requirements.

Bacterial endotoxins Less than 0.125 EU per mg of sodium valproate.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Uniformity of dosage units Meets the requirements.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Sodium Valproate for Injection in 10 mL of water; the resulting solution is clear and colorless.

(2) ***Related substances***—Dissolve 0.10 g of Sodium Valproate for Injection in 10 mL of a mixture of formic acid and chloroform (1 : 1), and use this solution as the test solution. Pipet 1.0 mL of the resulting solution, add a mixture of formic acid and chloroform (1 : 1) to make 200 mL, and use this solution as the standard solution. Perform the test with 2 μL each of the test solution and standard solution as directed under the Gas Chromatography according to the following conditions. Determine the peak area of each solution by the automatic integration method; the sum of peak areas other than the peak of valproic acid from the test solution is not greater than the peak area of valproic acid from the standard solution (NMT 0.5%).

Operating conditions

Detector: A flame ionization detector.

Column: A column about 0.25 mm of internal diameter and 30.0 m of length, coated with polyethylene glycol nitroterephthalate in a thickness of 0.25 μm.

Column temperature: Maintain at 120 ℃ for the first 5 minutes, increase at a rate of 10 ℃ per minute up to 135 ℃, and maintain it for 5 minutes. Next, increase the temperature to 160 ℃ at a rate of 10 ℃ per minute, maintain it for 5 minutes, then increase the temperature to 180 ℃ at a rate of 10 ℃ per minute, and maintain it for 5 minutes. Then, increase the temperature to 230 ℃ at a rate of 50 ℃ per minute.

Sample injection port temperature: 240 ℃

Detector temperature: 250 ℃

Carrier gas: Nitrogen

Flow rate: 2.0 mL/min

System suitability

System performance: Mix 1 mL of the test solution and 4 mL of a solution of *n*-valeric acid in a mixture of formic acid and chloroform (1 : 1) (1 in 1000). Proceed with 2 μL of this solution according to the above conditions; *n*-valeric acid and valproic acid are eluted in this order with a resolution being NLT 3.

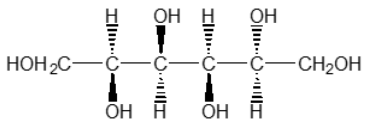
Loss on drying NMT 2.0% (2 g, 105 °C, 2 hours).

Assay Weigh accurately the mass of NLT 20 containers of Sodium Valproate for Injection. Weigh accurately an amount of Sodium Valproate for Injection, equivalent to about 0.2 g of sodium valproate ($C_8H_{15}NaO_2$), dissolve in 80 mL of acetic acid(100), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 16.62 mg of $C_8H_{15}NaO_2$

Packaging and storage Preserve in hermetic containers.

D-Sorbitol
D-소르비톨



D-Sorbit

$C_6H_{14}O_6$: 182.17

(2*R*,3*R*,4*R*,5*S*)-Hexane-1,2,3,4,5,6-hexol [*50-70-4*]

D-Sorbitol, when dried, contains NLT 97.0% and NMT 101.0% of D-Sorbitol ($C_6H_{14}O_6$).

Description D-Sorbitol occurs as a white powder or grain or crystalline mass, is odorless and has a sweet taste with a cold sensation.
It is very soluble in water, sparingly soluble in ethanol(95) and practically insoluble in ether.
It is hygroscopic.

Identification (1) Add 2 mL iron(II) sulfate TS and 1 mL sodium hydroxide solution (1 in 5) to 1 mL of the aqueous solution of D-Sorbitol (7 in 10); the resulting solution exhibits a bluish green color but does not become cloudy.

(2) Add 1 mL of freshly prepared catechol solution (1 in 10) to 1mL of the aqueous solution of D-Sorbitol (1 in 20), shake well to mix, put quickly 2 mL of sulfuric acid, and shake to mix; the resulting solution soon exhibits a reddish purple to violet color.

(3) Add 10 mL acetic anhydride and 1 mL pyridine to 0.5 g of D-Sorbitol, attach a reflux condenser, and boil for 10 minutes. Cool, add 25 mL of water, shake to mix, and then allow to stand in a cold place. Transfer the resulting solution into a separatory funnel, add 30 mL of chloroform, and extract. Evaporate the extract on a steam bath, add 80 mL of water to the oily residue, heat on a steam bath for 10 minutes, and then filter when hot. Take the precipitate that forms after cooling by filtering through a glass filter (G3), wash with water, then recrystallize once with ethanol(95), and dry for 4 hours in a desiccator (in vacuum, silica gel) for 4 hours; the melting point is between 97 and 101 ℃.

Purity (1) ***Clarity and color of solution and acidity or alkalinity***—Dissolve 5 g of D-Sorbitol in 20 mL of water by shaking to mix while warming; the solution is colorless, clear and neutral.

(2) ***Chloride***—Perform the test with 2.0 g of D-Sorbitol. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid (NMT 0.005%).

(3) ***Sulfate***—Perform the test with 4.0 g of D-Sorbitol. Prepare the control solution with 0.50 mL of 0.005 mol/L sulfuric acid (NMT 0.006%).

(4) ***Heavy metals***—Proceed with 5.0 g of D-Sorbitol according to Method 1 and perform the test. Prepare the control solution with 2.5 mL of lead standard solution (NMT 5 ppm).

(5) ***Nickel***—Dissolve 0.5 g of D-Sorbitol in 5 mL of water, add 3 drops of dimethylglyoxime TS and 3 drops of ammonia TS, and allow to stand for 5 minutes; no red color is observed.

(6) ***Arsenic***—Proceed with 1.5 g of D-Sorbitol according to Method 1 and perform the test (NMT 1.3 ppm).

(7) ***Glucose***—Dissolve 20.0 g of D-Sorbitol in 25 mL of water, add 40 mL of Fehling's TS, and boil gently for 3 minutes. After cooling, filter the clear supernatant using a glass filter (G4), while taking cautions to ensure that the precipitate leaves in the flask. Wash the precipitate in the flask with warm water until the washings do not exhibit alkalinity, then filter the washings with the glass filter described above. Dissolve the precipitate in the flask in 20 mL of iron(III) sulfate TS, filter using the glass filter described above, wash with water, and combine the washings and the filtrate. Heat at 80 ℃ and titrate with 0.02 mol/L potassium permanganate VS; the consumed volume is NMT 6.3 mL.

(8) ***Sugars***—Dissolve 20.0 g of D-Sorbitol in 25 mL water, add 8 mL of dilute hydrochloric acid, and heat under a reflux condenser on a steam bath for 3 hours. Cool, then add 2 drops methyl orange TS, put sodium hydroxide TS until the resulting solution exhibits orange, and add water to make 100 mL. Take 10 mL of the resulting solution, add 10 mL of water and 40 mL of Fehling's TS, and then boil for 3 minutes over low heat. Proceed as directed in (7).

Loss on drying NMT 2.0% (0.5 g, in vacuum, phosphorus pentoxide, 80 ℃, 3 hours).

Residue on ignition NMT 0.02% (5 g).

Microbiological examination of non-sterile products The total aerobic microbial count is NMT 1000 CFU, and the total combined yeasts/molds count is NMT 100 CFU per g of D-Sorbitol. Also, *Escherichia coli* and *Salmonella* are not detected.

Assay Weight accurately about 0.2 g of D-Sorbitol, previously dried, and dissolve in water to make exactly 100 mL. Pipet 10 mL of the solution, put into an iodine bottle, add exactly 50 mL of potassium periodate TS, and heat for 15 minutes on a steam bath. After cooling, add 2.5 g of potassium iodide, immediately stopper tightly, and shake well to mix. Allow to stand for 5 minutes in a dark place and titrate the liberated iodine with 0.1 mol/L sodium thiosulfate VS (indicator: 3 mL of starch TS). Perform a blank test in the same manner.

Each mL of 0.1 mol/L sodium thiosulfate VS
= 1.8217 mg of $C_6H_{14}O_6$

Packaging and storage Preserve in tight containers.

D-Sorbitol Solution
D-소르비톨 액

D-Sorbit Solution

D-Sorbitol Solution contains NLT 97.0% and NMT 103.0% of the labeled amount of D-Sorbitol ($C_6H_{14}O_6$: 182.17).

Description D-Sorbitol Solution occurs as a clear, colorless liquid, is odorless, and have a sweet taste.
It is miscible with water, ethanol(95), glycerin or propylene glycol.
In some cases, it may precipitate crystalline masses.

Identification (1) Take an amount of D-Sorbitol Solution, equivalent to 0.7g of D-Sorbitol according to the labeled amount, and perform the test according to the Identification (1) of D-Sorbitol.

(2) Take an amount of D-Sorbitol Solution, equivalent to 1g of D-Sorbitol according to the labeled amount, add water to make 20 mL. Perform the test with 1 mL of the resulting solution according to the Identification (2) of D-Sorbitol.

Purity (1) ***Acidity or alkalinity***—D-Sorbitol Solution is neutral.

(2) ***Chloride***—Take an amount of D-Sorbitol Solution, equivalent to 2.0g of D-Sorbitol according to the

labeled amount, and perform the test according to the Purity (2) of D-Sorbitol (NMT 0.005%).

(3) ***Sulfate***—Take an amount of D-Sorbitol Solution, equivalent to 4.0g of D-Sorbitol according to the labeled amount, and perform the test according to the Purity (3) of D-Sorbitol (NMT 0.006%).

(4) ***Heavy metals***—Take an amount of D-Sorbitol Solution, equivalent to 5.0g of D-Sorbitol according to the labeled amount, and perform the test according to the Purity (4) of D-Sorbitol (NMT 5 ppm).

(5) ***Nickel***—Take an amount of D-Sorbitol Solution, equivalent to 0.5g of D-Sorbitol according to the labeled amount, and perform the test according to the Purity (5) of D-Sorbitol

(6) ***Arsenic***—Take an amount of D-Sorbitol Solution, equivalent to 1.5g of D-Sorbitol according to the labeled amount, dilute with water or concentrate on a steam bath as needed to make 5 mL, cool, and use this solution as the test solution (NMT 1.3 ppm).

(7) ***Glucose***—Take an amount of D-Sorbitol Solution, equivalent to 20.0 g of D-Sorbitol according to the labeled amount, dilute by adding water or concentrate on a steam bath as needed to make 40 mL, add 40 mL of Fehling's TS, and perform the test according to the Purity (7) of D-Sorbitol.

(8) ***Sugars***—Take an amount of D-Sorbitol Solution, equivalent to 20.0 g of D-Sorbitol according to the labeled amount, dilute by adding water or concentrate on a steam bath as needed to make 40 mL, add 8 mL of dilute hydrochloric acid, and perform the test according to the Purity (8) of D-Sorbitol.

(9) ***Ethylene glycol and diethylene glycol***—Weigh accurately about 2.0g of Cellulase II, transfer to a 25 mL volumetric flask, add 1 mL of diluent, and shake to mix for about 3 minutes. Add the remaining diluent in three portions while shaking to mix for about 3 minutes each time, and bring to the gauge line. Take the clear supernatant, filter through a membrane filter with pore diameter NMT 0.45 μm, discard the initial 2 mL of filtrate, take the remaining filtrate, and use this as the test solution. Separately, weigh an appropriate amount of diethylene glycol RS and ethylene glycol RS, dissolve in the diluent to make a solution containing 0.08 mg of each per mL, and use this solution as the standard solution. Perform the test with 1.0 μL each of the test solution and the standard solution as directed under the Gas Chromatography according to the following conditions. Determine the peak areas for each solution by the automatic integration method; the peak area of diethylene glycol obtained from the test solution is not greater than the peak area of diethylene glycol from the standard solution (NMT 0.10%), and the peak area of ethylene glycol from the test solution is not greater than the peak area of ethylene glycol from the standard solution (NMT 0.10%).

Operating conditions

Detector: A flame ionization detector

Column: A quartz glass column 0.32 mm in internal diameter and about 15 m in length, coated the inside with cyanopropylphenyl dimethylpolysiloxane for gas chromatography (6:94) in a 0.25 μm thickness.

Column temperature: Maintain at 70 ℃ for 2 minutes, then heat at a rate of 50 ℃ per min to 300 ℃, and hold for 5 minutes.

Sample injection port temperature: A constant temperature of about 240 ℃.

Detector temperature: A constant temperature of about 300 ℃.

Carrier gas: Helium

Flow rate: 3.0 mL/min

Split ratio: About 1 : 10.

System suitability

System performance: Proceed with 1 μL of the standard solution according to the above conditions; ethylene glycol and diethylene glycol are eluted in this order with the resolution being NLT 30.

Diluent—A mixture of acetone and· water (96 : 4).

Residue on ignition Accurately take an amount of D-Sorbitol Solution, equivalent to 5 g of D-Sorbitol according to the labeled amount, add 3 - 4 drops of sulfuric acid, evaporate by heating gently. Ignite and burn, cool, and perform the test with the residue; the resulting residue is NMT 1.0 mg.

Assay Take an amount of D-Sorbitol Solution, equivalent to about 5 g of D-Sorbitol ($C_6H_{14}O_6$), and add water to make exactly 250 mL. Pipet 10 mL of this solution and add water to make exactly 100 mL. Pipet 10 mL of this solution and place in an iodine bottle, and perform the test as directed under the Assay of D-Sorbitol.

Each mL of 0.1 mol/L sodium thiosulfate VS
= 1.8217 mg of $C_6H_{14}O_6$

Packaging and storage Preserve in tight containers.

D-Sorbitol and D-Mannitol Irrigation
D-소르비톨·D-만니톨 관류액

D-Sorbitol and D-Mannitol Irrigation contains NLT 90.0% and NMT 110.0% of the labeled amounts of D-Sorbitol ($C_6H_{14}O_6$: 182.17) and D-Mannitol ($C_6H_{14}O_6$: 182.17).

Method of preparation Prepared as directed under Irrigation, with D-Sorbitol and D-Mannitol.

Identification Perform the test as directed under the Assay; the retention times of D-Sorbitol and D-Mannitol peaks obtained from the test solution and the reference standard are the same.

pH Between 4.5 and 7.5.

Sterility Meets the requirements.

Pyrogen It meets the requirements when tested as directed under the Pyrogen.

Assay Weigh accurately an amount of D-Sorbitol and D-Mannitol Irrigation, equivalent to 0.135 g of D-Sorbitol ($C_6H_{14}O_6$) (27 mg of D-Mannitol) according to the labeled amount, add 4.0 mL of internal standard solution, and add water to make 25 mL. Filter, if necessary, and use the filtrate as the test solution. Separately, weigh accurately about 0.135 g of D-Sorbitol RS and about 27 mg of D-Mannitol RS, add 4.0 mL of internal standard solution, add water to make exactly 25 mL, and use this solution as the standard solution. Pipet 15 μL each of the test solution and the standard solution and perform the test as directed under the Liquid Chromatography. Determine the ratios Q_{T1}, Q_{S1}, Q_{T2} and Q_{S2} of the peak area of D-Sorbitol and D-Mannitol to the peak area of the internal standard from these solutions.

$$\text{Amount (g) of D-sorbitol } (C_6H_{14}O_6) = \text{Amount (mg) of D-sorbitol RS} \times \frac{Q_{T1}}{Q_{S1}}$$

$$\text{Amount (g) of D-mannitol } (C_6H_{14}O_6) = \text{Amount (mg) of D-mannitol RS} \times \frac{Q_{T2}}{Q_{S2}}$$

Internal standard solution—Weigh about 1.0 g of purified sucrose and dissolve in water to make 100.0 mL.

Operating conditions

Detector: A differential refractometer

Column: Sugar Pak I or equivalent column

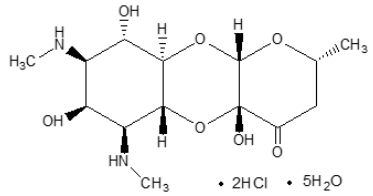
Column temperature: A constant temperature of about 90 °C.

Mobile phase: water

Flow rate: 0.6 mL/min

Packaging and storage Preserve in hermetic containers.

Spectinomycin Hydrochloride Hydrate
스펙티노마이신염산염수화물



Spectinomycin Hydrochloride

$C_{14}H_{24}N_2O_7 \cdot 2HCl \cdot 5H_2O$: 495.35

(1*R*,3*S*,5*R*,8*R*,10*R*,11*S*,12*S*,13*R*,14*S*)-8,12,14-trihydroxy-5-methyl-11,13-bis(methylamino)-2,4,9-trioxatricyclo[8.4.0.03,8]tetradecan-7-one hydrochloride pentahydrate [*22189-32-8*]

Spectinomycin Hydrochloride Hydrate is the hydrochloride of a compound having antibacterial activity produced by cultivating *Streptomyces spectabilis*.

Spectinomycin Hydrochloride Hydrate contains NLT 603 μg and NMT 713 μg (potency) of spectinomycin ($C_{14}H_{24}N_2O_7$: 332.35) per mg.

Description Spectinomycin Hydrochloride Hydrate occurs as a white to pale yellowish white crystalline powder.

It is freely soluble in water and practically insoluble in ethanol(95).

Identification (1) To 5 mL of an aqueous solution of Spectinomycin Hydrochloride Hydrate (1 in 100), add slowly anthrone TS; a blue to bluish green color is produced at the boundary layer.

(2) Determine the infrared spectra of Spectinomycin Hydrochloride Hydrate and spectinomycin hydrochloride RS as directed in the paste method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) To 3 mL of an aqueous solution of Spectinomycin Hydrochloride Hydrate (1 in 150), add 1 drop of silver nitrate TS; a white turbidity is produced.

Crystallinity Meets the requirements.

Optical rotation $[\alpha]_D^{20}$: Between +15° and +21° (2.1 g calculated on the anhydrous basis, water, 25 mL, 200 mm).

pH Dissolve about 0.1 g of Spectinomycin Hydrochloride Hydrate in 10 mL of water; the pH is between 4.0 and 5.6.

Water Between 16.0% and 20.0% (0.3 g, volumetric titration, direct titration).

Residue on ignition NMT 1.0% (1 g).

Sterility It meets the requirements when used in a sterile preparation. However, it is excluded when there is a terminal sterilization process in the manufacturing of a sterile preparation.

Bacterial endotoxins Less than 0.09 EU/mg (potency) of spectinomycin, when used in a sterile preparation.

Histamine It meets the requirements when used in a sterile preparation. Weigh an appropriate amount of Spectinomycin Hydrochloride Hydrate, dissolve it in isotonic sodium chloride injection to prepare a solution containing 15 mg (potency) per mL, and use this solution as the test solution.

Assay Weigh accurately about 30 mg (potency) each of Spectinomycin Hydrochloride Hydrate and spectinomycin hydrochloride RS, and add 10.0 mL of the internal standard solution and 1.0 mL of hexamethyldisilazane. Allow to react for 1 hour, shaking occasionally. Use them as the test solution and the standard solution, respectively. Perform the test with 0.5 μL each of these solutions as

directed under the Gas Chromatography according to the following conditions, and determine the ratios, Q_T and Q_S, of the peak area of spectinomycin hydrochloride to that of the internal standard.

$$\text{Potency (μg) of spectinomycin hydrochloride } (C_{14}H_{24}N_2O_7) = \text{Potency (μg) of spectinomycin hydrochloride RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—Weigh 50 mg of triphenylantimony, add dimethylamide to dissolve, and make 25 mL.

Operating conditions

Detector: A flame ionization detector

Column: A glass column about 3 mm in internal diameter and about 60 cm in length, packed with column gas-chrom Q (80/100 mesh) coated with SE-52, equivalent to 5% of its mass.

Column temperature: A constant temperature of about 90 °C.

Carrier gas: Helium

Flow rate: 45 mL/min

Packaging and storage Preserve in tight containers.

Spectinomycin Hydrochloride for Injection
주사용 스펙티노마이신염산염

Spectinomycin Hydrochloride for Injection is a preparation, which is dissolved before use. Spectinomycin Hydrochloride for Injection contains NLT 90.0% and NMT 120.0% of the labeled amount of spectinomycin ($C_{14}H_{24}N_2O_7$: 332.35).

Method of preparation Prepare as directed under Injections, with Spectinomycin Hydrochloride Hydrate.

Description Spectinomycin Hydrochloride for Injection occurs as a white powder.

Identification (1) Determine the infrared spectra of Spectinomycin Hydrochloride for Injection and spectinomycin hydrochloride RS as directed in the paste method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) The relative retention time of the major peak to the internal standard from the test solution and the standard solution obtained under the Assay are the same.

Water Between 16.0% and 20.0% (0.1 g, volumetric titration, direct titration).

pH Dissolve Spectinomycin Hydrochloride for Injection according to the label; the pH of the resulting solution is between 4.0 and 7.0.

Sterility Meets the requirements.

Bacterial endotoxins Less than 0.09 EU per mg (potency) of spectinomycin.

Histamine Meets the requirements. Weigh an appropriate amount of Spectinomycin Hydrochloride for Injection, dissolve in isotonic sodium chloride injection to obtain a solution having known concentration of 15 mg of Spectinomycin Hydrochloride for Injection per mL, and use the solution as the test solution.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately an amount of Spectinomycin Hydrochloride for Injection, equivalent to 20 mg (potency) of spectinomycin according to the labeled potency, and dissolve in water to make exactly 100 mL. Pipet 1 mL of the solution, add 15 mL of acetone and evaporate to dryness under a stream of air. To the residue, add exactly 10 mL of the internal standard solution and 1 mL of hexamethyldisilazane, allow to react by shaking occasionally, and use this solution as the test solution. Separately, weigh accurately about 22 mg (potency) of spectinomycin hydrochloride RS and add water to make exactly 100 mL. Pipet 1 mL of the solution, add 15 mL of acetone, and evaporate to dryness under a stream of air. Add 10.0 mL of the internal standard solution and 1.0 mL of hexamethyldisilazane, allow to react by shaking occasionally, and use this solution as the standard solution. Perform the test with each 0.5 μL of the test solution and the standard solution as directed under the Gas Chromatography according to the following operating conditions and determine the ratios, Q_T and Q_S, of the peak area of spectinomycin to that of the internal standard.

$$\text{Potency (μg) of spectinomycin } (C_{14}H_{24}N_2O_7) = \text{Potency (μg) of spectinomycin RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—Weigh 50 mg of triphenylantimony and dissolve in dimethylamide to make 25 mL.

Operating conditions

Detector: A hydrogen flame ionization detector

Column: A column, about 3 mm in internal diameter and about 60 cm in length, packed with 80 to 100 mesh diatomaceous earth for gas chromatography coated with methyl silicone polymer for gas chromatography at a rate of 5%.

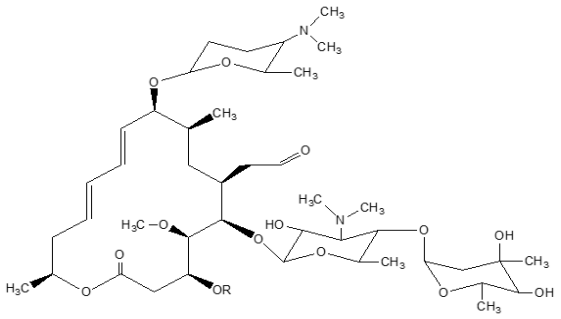
Column temperature: A constant temperature of about 90 °C.

Carrier gas: Helium

Flow rate: 45 mL/min

Packaging and storage Preserve in hermetic containers.

Spiramycin
스피라마이신



Spiramycin I : R = H $C_{43}H_{74}N_2O_{14}$: 843.06

Spiramycin is a mixture of spiramycin I, spiramycin II and spiramycin III. Spiramycin contains NLT 3200 units (potency) of spiramycin I ($C_{43}H_{74}N_2O_{14}$: 843.06) per mg, calculated on a dried basis.

Description Spiramycin occurs as a white to pale yellowish white powder and has a bitter taste.
It is very soluble in methanol, in ethanol(95) or in acetone, sparingly soluble in ether and very slightly soluble in water.

Identification (1) Dissolve 0.5 g (potency) of Spiramycin in 10 mL of 0.1 mol/L sulfuric acid TS, add 25 mL of water and mix. Adjust the pH to 8.0 with 0.1 mol/L sodium hydroxide TS and add water to make 50 mL. To 5 mL of this solution, add 2 mL of a mixture of sulfuric acid and water (2 : 1); the resulting solution exhibits a brown color.

(2) Dissolve 0.1 g (potency) of Spiramycin in methanol to make 100 mL. Pipet 1 mL of this solution, add methanol to make 100 mL and determine the absorption spectrum of this solution at between 220 nm and 350 nm as directed under the Ultraviolet-visible Spectroscopy; it exhibits maxima at around 232 nm and at around 340 nm.

(3) Proceed with Spiramycin as directed under the Purity (2); the Rf values and the color of the principal spot obtained from the test solution are the same as those from the standard solution S1, and the spots other than the principal spot obtained from the test solution are similar to the spots other than the principal spot from the standard solution S1, but different from the principal spot from the standard solution S5.

Optical rotation $[\alpha]_D^{20}$: Between -80° and -85° (1.0 g, calculated on the anhydrous basis, 10% acetic acid, 50 mL).

pH Dissolve about 0.5 g (potency) of Spiramycin in 5 mL of methanol and add water to make 100 mL; the pH of this solution is between 8.5 and 10.5.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Spiramycin according to Method 4 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Related substances***—Weigh accurately about 40 mg of Spiramycin, dissolve in methanol to make exactly 10 mL, and use this solution as the test solution. Separately, weigh accurately about 40 mg of spiramycin RS and dissolve in methanol to make exactly 10 mL (S1). To 1 mL of this solution, add methanol to make exactly 10 mL (S2). To 5 mL and 2 mL each of the standard solution S2, dilute with methanol and make 10 mL each (S3 and S4, respectively). Dissolve 40 mg (potency) of erythromycin RS in methanol to make exactly 10 mL (S5). Perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solutions and the standard solutions S1, S2, S3, S4 and S5 on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with the clear supernatant of a mixture of 2-propanol, 15% ammonium acetate (adjust the pH to 9.6 with 1 mol/L sodium hydroxide TS) and ethyl acetate (4 : 8 : 9) as the developing solution to a distance of about 15 cm. Air-dry the plate, and to 10 mL of anisaldehyde, add 90 mL of ethanol(95) and mix well. Add 10 mL of sulfuric acid, mix well, and spray evenly this solution on the air-dried plate and heat at 110 ℃ for 5 minutes; the standard solution S1 shows the principal spot, and the spots of spiramycin II and spiramycin III appear slightly above and slightly further above the principal spot, respectively. The spots of spiramycin II obtained from the test solution are not more intense than the spots from the standard solution S2, and the spots of spiramycin III obtained from the test solution are not more intense than the spots from the standard solution S3. Any spot other than the principal spot obtained from the test solution is not more intense than the

spots from the standard solution S4.

Loss on drying NMT 3.5% (0.5 g, in vacuum, phosphorus pentoxide, 80 ℃, 6 hours).

Residue on ignition NMT 0.1% (1 g).

Assay ***The cylinder-plate method***—(1) Agar media for seed and base layer: Use the culture medium (A) (2) (a) ① ⓐ under the Microbial Assays for Antibiotics. Adjust the pH of the medium to between 7.8 and 8.0.

(2) Test organism: Use *Bacillus subtilis* ATCC 6633 as the test microorganism.

(3) Weigh accurately about 75000 units (potency) of Spiramycin, dissolve in 5 mL of methanol, dilute with 0.1 mol/L phosphate buffer solution (pH 8.0) to obtain solutions having known concentrations of 120 units (potency) and 30 units (potency) per mL, and use these solutions as the high concentration test solution and the low concentration test solution, respectively. Separately, weigh accurately about 75000 units (potency) of spiramycin RS, dissolve in 5 mL of methanol, add 0.1 mol/L phosphate buffer solution (pH 8.0) to obtain a solution having a known concentration of 7500 units (potency) per mL, and use this solution as the standard stock solution. Keep the standard stock solution at a temperature not exceeding 5 ℃ and use it within 7 days. Pipet an appropriate amount of the standard stock solution, add 0.1 mol/L phosphate buffer solution (pH 8.0) to obtain solutions having known concentrations of 120 units (potency) and 30 units (potency) per mL, and use these solutions as the high concentration standard solution and the low concentration standard solution, respectively. Perform the test as directed in (A) (8) under the Microbial Assays for Antibiotics.

Packaging and storage Preserve in tight containers.

Spiramycin Tablets
스피라마이신 정

Spiramycin Tablets contain NLT 90.0% and NMT 120.0% of the labeled amount of spiramycin.

Method of preparation Prepare as directed under Tablets, with Spiramycin.

Identification Dissolve 0.1 g (potency) of Spiramycin Tablets in methanol to make 100 mL. To 1 mL of this solution, add methanol to make 100 mL and determine the absorption spectrum of this solution at the wavelength of between 220 nm and 350 nm as directed under the Ultraviolet-visible Spectroscopy; it exhibits maxima at around 232 nm and at around 340 nm.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Loss on drying NMT 5.0% (0.1 g, 0.7 kPa, 60 ºC, 3 hours).

Assay ***Cylinder plate method***—(1) Culture medium: Agar media for seed and base layer Use the culture medium A) (2) (A) ③ (a) under the Microbial Assays for Antibiotics. Adjust the pH to 7.8 to 8.0.

(2) Test organism: Use *Bacillus subtilis* ATCC 6633 as the test organism.

(3) Weigh accurately NLT 20 tablets of Spiramycin Tablets and powder. Weigh accurately about 750000 units (potency) of the powder according to the labeled potency, dissolve in methanol, shake vigorously to make exactly 50 mL. Filtrate or centrifuge, if necessary. Pipet an appropriate amount of this solution, dilute with 0.1 mol/L phosphate buffer solution (pH 8.0) to make solutions know concentrations of 120 and 30 units (potency) per mL, and use these solutions as the high concentration test solution and the low concentration test solution, respectively. Separately, weigh accurately about 75000 units (potency) of spiramycin RS, dissolve in 5 mL of methanol, add 0.1 mol/L phosphate buffer solution (pH 8.0) to obtain a solution having known concentration of 7500 units (potency) per mL, and use this solution as the standard stock solution. Keep the standard stock solution at a temperature not exceeding 5 ℃ and use it within 7 days. Pipet an appropriate amount of the standard stock solution, dilute with 0.1 mol/L phosphate buffer solution (pH 8.0) to obtain solutions having known concentrations of 120 and 30 units (potency) per mL, and use these solutions as the high concentration standard solution and the low concentration standard solution, respectively. With these solutions, perform the test according to A) (8) under the Microbial Assays for Antibiotics.

Packaging and storage Preserve in tight containers.

Spiramycin and Metronidazole Tablets
스피라마이신·메트로니다졸 정

Spiramycin and Metronidazole Tablets contain NLT 90.0% and NMT 120.0% of the labeled amount of spiramycin ($C_{43}H_{74}N_2O_{14}$: 843.06) and NLT 90.0% and NMT 110.0% of the labeled amount of metronidazole ($C_6H_9N_3O_3$: 171.15).

Method of preparation Prepare as directed under Tablets, with Spiramycin and Metronidazole.

Identification Weigh an amount, equivalent to about 250 mg of spiramycin and 125 mg of metronidazole according to the labeled amount, add 25 mL of water, filter, and use the filtrate as the test solution. Weigh 250 mg of spiramycin RS and 125 mg of metronidazole RS, dissolve in 25 mL of methanol, and use these solutions, respectively as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chroma-

tography. Spot each of the test solution and the standard solution on a thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of ether, diethylamine and methanol (97 : 2 : 1) as the developing solvent, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the color and R_f values of the spots obtained from the test solution and the standard solution are the same. Spray the titanium chloride solution on the plate, dry at 130 °C for several minutes, cool to room temperature, and spray 1% fast blue B salt solution; the metronidazole test solution and the standard solution exhibit pink spots at the same R_f value.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay (1) ***Spiramycin***—(i) Cylinder plate method

(a) Medium Agar media for seed and base layer Use the culture medium in (i) (2) (a) ③ ⓐ under the Microbial Assays for Antibiotics. Adjust the pH to 7.8 to 8.0.

(b) Test organism: Use Bacillus subtilis ATCC 6633 as the test organism.

(c) Weigh accurately about 75000 units (potency) of Spiramycin and Metronidazole Tablets, dissolve in 5 mL of methanol, dilute with 0.1 mol/L phosphate buffer solution (pH 8.0) to obtain solutions having known concentrations of 120 units (potency) and 30 units (potency) per mL, and use these solutions as the high concentration test solution and the low concentration test solution, respectively. Separately, weigh accurately about 75000 units (potency) of spiramycin RS, dissolve in 5 mL of methanol, add 0.1 mol/L phosphate buffer solution (pH 8.0) to obtain a solution having known concentration of 7500 units (potency) per mL, and use this solution as the standard stock solution. Keep the standard stock solution below 5 °C and use it within 7 days. Pipet an appropriate amount of the standard stock solution, add 0.1 mol/L phosphate buffer solution (pH 8.0) to obtain solutions having known concentrations of 120 units (potency) and 30 units (potency) per mL, and use these solutions as the high concentration standard solution and the low concentration standard solution, respectively. Perform the test as directed under the Microbial Assays for Antibiotics (i) with the test solution standard solution.

(ii) Turbidimetric assay (a) Culture medium: Use the culture medium described in (iii) (b) (ii) under the Microbial Assays for Antibiotics.

(b) Test organism: Use *Staphylococcus aureus* ATCC 6538P as the test organism.

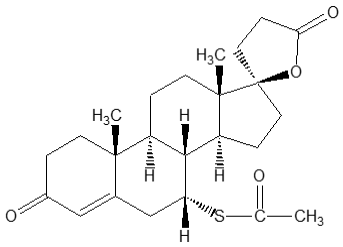
(c) Weigh accurately about 75000 units (potency) of Spiramycin and Metronidazole Tablets, dissolve in 5 mL of methanol, dilute with 0.05 mol/L phosphate buffer solution (pH 7.0) to obtain a solution having known concentration of 11.7 units (potency) per mL, and use this solution as the test solution. Separately, weigh accurately about 75000 units (potency) of spiramycin RS, dissolve in 5 mL of methanol, add 0.05 mol/L phosphate buffer solution (pH 7.0) to obtain a solution having known concentration of 7500 units (potency) per mL, and use per solution as the standard stock solution. Keep the standard stock solution at below 5 °C and use it within 7 days. Pipet an appropriate amount of the standard stock solution, dilute with 0.05 mol/L phosphate buffer solution (pH 7.0) to obtain solutions having known concentrations of 17.5, 14.3, 11.7, 9.59 and 7.86 units (potency) per mL, and use these solutions as the test solutions. With these solutions, perform the test according to C) under the Microbial Assays for Antibiotics.

(2) ***Metronidazole***—Weigh accurately the mass of NLT 20 tablets of Spiramycin and Metronidazole Tablets, and powder. Weigh accurately an amount, equivalent to about 100 mg of metronidazole ($C_6H_9N_3O_3$) and add 20 mL of 1 mol/L hydrochloric acid, shake to mix, allow to stand for 5 minutes, add water to make exactly 200 mL, and then filter. Pipet 2 mL of this solution, add 1 mol/L hydrochloric acid to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 100 mg of metronidazole RS, dissolve in 20 mL of 1 mol/L hydrochloric acid, and add water to make exactly 200 mL. To 2 mL of this solution, add 0.1 mol/L hydrochloric acid to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution at the wavelength of 276 nm as directed under the Ultraviolet-visible Spectroscopy, using 0.1 mol/L hydrochloric acid as a control solution.

$$\text{Amount (mg) of metronidazole } (C_6H_9N_3O_3) = \text{Amount (mg) of metronidazole RS} \times (A_T / A_S)$$

Packaging and storage Preserve in tight containers.

Spironolactone
스피로노락톤



$C_{24}H_{32}O_4S$: 416.57

7α-Acetylthio-3-oxo-17α-pregn-4-ene-21,17-carbolactone [*52-01-7*]

Spironolactone, when dried, contains NLT 97.0% and NMT 103.0% of spironolactone ($C_{24}H_{32}O_4S$).

Description Spironolactone occurs as a white to pale yellowish brown, very fine powder.

It is freely soluble in chloroform, soluble in ethanol(95), slightly soluble in methanol and practically insoluble in

water.

Melting point—Between 198 and 207 ℃. Continue heating on a steam bath at about 125 ℃ so that the temperature rises at a rate of about 10 ℃ per minute in the range between 140 and 185 ℃, and then, when the temperature is not within the above melting range, adjust the heating so that the temperature rises at a rate of about 3 ℃ per minute.

Identification (1) Determine the absorption spectra of solutions of Spironolactone and spironolactone RS in methanol (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Spironolactone and spironolactone RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers. If there is any difference between the spectra, dissolve each of Spironolactone and spironolactone RS in methanol, then evaporate methanol to dryness, and repeat the test on the residues.

Optical rotation $[\alpha]_D^{20}$: Between -33° and -37° (0.25 g, after drying, chloroform, 25 mL, 200 mm).

Purity (1) ***Mercapto compounds***—To 2.0 g of Spironolactone, add 20 mL of water, shake to mix, and filter. To 10 mL of the filtrate, add 1 mL of starch TS and 0.05 mL of 0.01 mol/L iodine VS and mix; the resulting solution exhibits a blue color.

(2) ***Related substances***—Dissolve 0.20 g of Spironolactone in 10 mL of ethanol(95) and use this solution as the test solution. Pipet 1 mL of this solution, add ethanol(95) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate using n-butyl acetate as the developing solvent to a distance of about 15 cm, and air-dry the plate. Spray evenly a solution of sulfuric acid in methanol (1 in 10) on the plate and heat the plate at 105 ℃ for 10 minutes; the spots other than the principal spot obtained from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 0.5% (1 g, 105 ℃, 2 hours).

Residue on ignition NMT 0.1%. (1 g).

Assay Weigh accurately about 50 mg each of Spironolactone and spironolactone RS, previously dried for 2 hours at 105 ℃, and dissolve each in ethanol to make exactly 250 mL. Pipet 5 mL each of these solutions, add methanol to make exactly 100 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with these solutions as directed under the Ultraviolet-visible Spectroscopy, and determine the absorbances, A_T and A_S, at 238 nm.

$$\text{Amount (mg) of spironolactone } (C_{24}H_{32}O_4S) = \text{Amount (mg) of spironolactone RS} \times \frac{A_T}{A_S}$$

Packaging and storage Preserve in light-resistant, tight containers.

Stannous Fluoride

SnF_2 : 156.71

Difluorotin [*7783-47-3*]

Stannous Fluoride contains NLT 71.2% of tin(II) (Sn^{2+}: 118.71) and NLT 22.3% and NMT 25.5% of fluorine (F: 19.00), calculated on the dried basis.

Description Stannous Fluoride occurs as a white crystalline powder, which has bitter and salty taste.
It is freely soluble in water and practically insoluble in ethanol(95), ether or chloroform.

Melting point—About 213 °C.

Identification (1) To 5 mL of an aqueous solution of Stannous Fluoride (1 in 100), add 2 mL of calcium chloride TS; a white crystalline precipitate of calcium fluoride is formed.

(2) Put 2 drops of the aqueous solution (1 in 100) of Stannous Fluoride on a white drip plate and add 2 drops of silver nitrate TS; a dark brown precipitate is formed.

(3) To 2 mL of an aqueous solution of Stannous Fluoride (0.8 in 100), add 5 mL of acidic potassium permanganate TS; a violet solution turns colorless.

pH Dissolve 0.1 g of Stannous Fluoride in freshly boiled and cooled water to make 25 mL. The pH of this solution is between 2.8 and 3.5.

Purity (1) ***Water insoluble matter*—**Weigh accurately about 10 g of Stannous Fluoride, put in a plastic beaker, add 200 mL of water, and stir with a plastic rod for 3 minutes or until the solid is not disintegrated anymore. Filter the resulting solution by a Gooch crucible, weighed previously and filled with asbestos, wash with ammonium fluoride solution (1 in 100) first, and then wash with water thoroughly. Dry the residue at 105 °C for 4 hour; the amount is NMT 0.2%.

(2) ***Antimony***—(i) Rhodamine B solution: Dissolve about 0.5 g of rhodamine B in 200 mL of 0.5 mol/L hydrochloric acid.

(ii) Standard solution: Weigh accurately about 55.0 mg of antimony potassium tartrate, dissolve in water to make exactly 200 mL, pipet 5 mL of the resulting solution, and add 6 mol/L hydrochloric acid to make exactly 500 mL. Use this solution as the standard solution.

(iii) Test solution: Weigh accurately about 1.0 g of Stannous Flouride, and add 6 mol/L hydrochloric acid

to make 50 mL. Use this solution as the test solution.

(iv) Procedure: Pipet 5 mL each of the test solution and standard solution, put them in the separatory funnel, add 15 mL of hydrochloric acid and 1 g of cerium sulfate, shake from time to time for mixing, and allow to stand for 5 minutes. To this solution, add 0.5 g of hydroxylamine hydrochloride, shake for 1 minute, add 15 mL of isopropyl ether, shake for 30 seconds, then add 7 mL of water to shake for mixing. After cooling for 10 minutes at room temperature, shake for 30 seconds, allow it stand to separate into two layers, and discard the aqueous layer. To the resulting solution, add 20 mL of rhodamine B solution, shake to mix for 30 minutes, and discard the aqueous layer again. Tilt the separatory funnel to take the isopropyl ether layer from the top, and centrifuge, if necessary, to make it a transparent solution. Determine the absorption spectra of the isopropyl ether layers obtained from test solution and standard solution as directed under Ultraviolet-visible Spectroscopy at the absorbance maximum wavelength (λmax) of around 550 nm with water as a control; the absorbance of the test solution is not greater than that of the standard solution (NMT 0.005%).

Loss on drying NMT 0.5% (1 g, 105 °C, 4 hours).

Assay (1) ***Tin***—Weigh accurately about 0.25 g of Stannous Fluoride, put in the Erlenmeyer flask, and add 300 ml of 3 mol/L hydrochloric acid which has been heated and started boiling. Shake the flask while passing oxygen-free inert gas to the surface of the solution to dissolve stannous fluoride, then cool to room temperature. Add 5 mL of potassium iodide TS, pass through the inert gas, and titrate with 0.05 mol/L potassium iodate VS. To the resulting solution, add 3 mL of starch TS around the endpoint.

Each mL of 0.05 mol/L potassium iodate
= 5.935 mg of Sn^{2+}

(2) ***Fluorine***—Weigh accurately about 0.1 g of Stannous Fluoride, add 50 mL of water to dissolve, shake vigorously for 5 minute to mix, and add water to make exactly 250 mL. Pipet 5 mL of this solution, add water to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately an appropriate amount of stannous fluoride RS, dissolve in water to make a solution containing about 10 μg of fluorine per mL, and use this solution as the standard solution. Take 1.0 mL, 2.0 mL, 3.0 mL and 4.0 mL each of the standard solution, put them in the 100-mL volumetric flasks, respectively, add 10.0 mL of the solution D to each flask, add water up to the gauge line of each flask, and mix well. Determine the absorption spectra of the respective solutions and solution E as directed under Ultraviolet-visible Spectroscopy at the absorbance maximum wavelength (λmax) of around 590 nm with the solution C as a control solution. Subtract the absorbance of each solution from the absorbance of the solution E to obtain absorbance differences, based on which the standard curve of the fluorine content (μg) is drawn. Separately, take 5.0 mL of the test solution, proceed with it in the same manner stated above, and obtain the amount (μg) of fluorine (F) contained in 5 mL of the test solution from the standard curve.

Solution A—Dissolve 3.16 g of 4,5-dihydroxy-3-(p-sulfophenylazo)-2,7-naphthalenedisulfonic acid trisodium salt in 550 mL of water.

Solution B—Dissolve 0.113 g of oxychlorzirconium in 50 mL of water, then add 350 mL of hydrochloric acid and water to make exactly 500 mL.

Solution C—Dilute 50 mL of the solution A by adding 500 mL of water and 35 mL of hydrochloric acid.

Solution D—Mix equal amounts of the solution A and solution B in a brown bottle.

Solution E—Add water to 10.0 mL of the solution D to make exactly 100 mL.

Packaging and storage Preserve in well-closed containers.

Streptokinase and Streptodornase
스트렙토키나제·스트렙토도르나제

Streptokinase and Streptodornase is an enzyme, obtained by purifying the culture products of *Enterococcus hemolyticus* H 46 A strain.

Streptokinase and Streptodornase contains NLT 1000 units of streptokinase and NLT 250 units of streptodornase.

Description Streptokinase and Streptodornase occurs as a white or pale brown powder and is odorless.

Dissolve Streptokinase and Streptodornase in 20 mL of physiological saline solution containing 50,000 units of streptokinase; the solution becomes clear or slightly turbid in 5 hours.

Identification Dissolve 50 mg of Streptokinase and Streptodornase in 20 mL of physiological saline solution. Add dilute gelatin TS to 1 mL of this solution so that the resulting solution contains 10 units of streptokinase per mL, and use this solution as the test solution. Transfer 0.2 mL each of the test solution and dilute gelatin TS (control solution) to separate test tubes, put into a water bath at 25 ± 0.1 ℃, add 0.2 mL of plasminogen TS to each test tube, and shake to mix. Add 0.4 mL of fibrinogen TS after 4 minutes, add again plasminogen TS, put 0.1 mL of thrombin TS after 5 minutes, and shake to mix; the test solution coagulates but do not dissolve in 15 minutes. The control solution also coagulates and do not dissolve within 1 hour.

pH Dissolve about 0.25 g of Streptokinase and Strep-

todornase in 100 mL of isotonic sodium chloride injection; the pH of the solution is between 6.5 and 8.5.

Loss on drying 6.0% (0.1 g in vacuum, phosphorus oxide (V), constant mass)

Assay (1) ***Streptokinase***—Weigh accurately about 0.5 g of Streptokinase and Streptodornase, add physiological saline solution to dissolve by gently shaking, and make exactly 200 mL. To the resulting solution, add dilute gelatin TS, make solutions with a concentration of 1 in 500, 1 in 750, 1 in 1000, 1 in 1500, 1 in 2000, and 1 in 3000, respectively, and use them as the test solutions. Separately, put an appropriate amount of streptokinase RS into the physiological saline solution to gently shake to mix so that 1 mL of the solution contains 10,000 units of streptokinase. Add dilute gelatin TS to achieve equivalent concentrations to those of the test solutions and use these solutions as the standard solutions. Transfer 0.2 mL each of the six test and standard solutions to separate test tubes (100 mm in length x 10 mm in diameter), put them into a water bath maintained at 25 ± 0.1 ℃, add 0.2 mL of plasminogen TS to each test tube, and shake to mix. Add 0.4 mL of fibrinogen TS after 4 minutes. Add 0.1 mL of thrombin TS in 5 minutes after putting plasminogen TS, and record the time (second) required for the thrombin-induced coagulates to dissolve. Tilt the test tube; if the surface of the solution in the test tube is horizontal and little residue is observed, the coagulates are considered to be dissolved. Plot the dissolution time for the standard and test solutions on the vertical axis and the dilution factor on the horizontal axis of a log-log graph to construct two straight lines. Determine the dilution factor for the test solution and the standard solution at the point where the respective straight line intersects with the horizontal line representing the dissolution time of 10 minutes.

Unit of Streptokinase per mg =
Unit of standard solution (10,000) × (dilution factor of sample / dilution factor of the standard solution) × [200 / amount of sample taken (mg)]

(2) ***Streptodornase***—Weigh accurately about 0.1 g of Streptokinase and Streptodornase and dissolve in the physiological saline solution to make exactly 100 mL. To the solution, add mixed peptone so that 1 mL of the resulting solution contains 10 units of streptodornase, and use this solution as the test solution. Separately, dissolve an appropriate amount of streptodornase RS in the physiological saline solution so that 1 mL of the solution contains 5,000 units of streptodornase. Add mixed peptone TS to achieve equivalent concentrations to those of the test solution and use this solution as the standard solution. Immerse a viscometer in the upright position on a steam bath at 30 ± 0.1 ℃ up to about 10 mm above the gauge line. Remove the stopper with a platinum electrode, add 3.5 mL of deoxyribonucleic acid TS into the upper room, install the stopper with a platinum electrode, and allow to stand. Wait for 30 minutes until the deoxyribonucleic acid TS reaches thermal equilibrium with the water bath. Connect the viscometer with a vacuum pump, suck the deoxyribonucleic acid TS traveled down to the lower room up to the gauge line indicated on the upper room. Measure travel time 2 to 3 times; travel time is defined as the time required for the liquid level to drop from the short needle to the long needle of the platinum electrode. In consecutive measurements, gradually decreasing travel time indicates potential contamination of deoxyribonucleic acid TS; repeat the procedure. Once the travel time of the deoxyribonucleic acid TS becomes constant, accurately add 0.1 mL of the test solution to the upper room and shake well to mix. Measure the travel time B (second). Measure travel time 5, 10, 15, 20, 25, and 30 minutes after adding the test solution to the upper room. Assign the respective measurements to B_1, B_2, B_3, B_4, B_5, and B_6. Determine the viscometer constant, A (second), in advance by measuring the time required for the liquid level to drop from the short needle to the long needle of the platinum electrode with 3 mL of mixed peptone TS. Divide A by B_1, B_2, B_3, B_4, B_5 and B_6, resulting in X_1, X_2, X_3, X_4, X_5 and X_6, respectively. Plot X values versus time (5, 10, 15, 20, 25, and 30 minutes) to construct a straight line. From the straight line, determine the values at 0 minute (C) and 25 minutes (D), subtract the value C from the value D, and the resulting value becomes K_{25} of the test solution. Separately, repeat the above procedure for the standard solution to determine K_{25} of the standard solution.

Unit of streptodornase per mg =
Unit of the standard solution (10) × (K_{25} test solution / K_{25} standard solution) × [1 / amount of sample taken (mg)]

Packaging and storage Preserve in tight containers (at 2 to 10 ℃).

Streptokinase and Streptodornase Tablets
스트렙토키나제·스트렙토도르나제 정

Streptokinase and Streptodornase Tablets contain NLT 90.0% and NMT 150.0% of the labeled amount (potency) of streptokinase and NLT 100.0% of the labeled amount (potency) of streptodornase.

Method of preparation Prepare as directed under Tablets, with Streptokinase and Streptodornase.

Identification (1) Weigh an amount of Streptokinase and Streptodornase Tablets, equivalent to 50 mg of streptokinase, dissolve in 20 mL of normal saline solution, and add dilute gelatin TS to 1 mL of this solution so that the resulting solution contains 10 units of streptokinase per mL. Use this solution as the test solution. Transfer 2 mL of the test solution and 0.2 mL of dilute gelatin TS (control solution) to test tubes, respectively, put into a water bath at 25 ± 0.1 ℃, add 0.2 mL of plasminogen TS to

each test tube, and shake to mix. Add 0.2 mL of fibrinogen TS after 4 minutes, add again plasminogen TS, add 0.1 mL of thrombin TS after 5 minutes, and shake to mix; the test solution coagulates but dissolves in 15 minutes. The control solution also coagulates but do not dissolve within 1 hour.

(2) ***Streptodornase***—Dissolve Streptokinase and Streptodornase Tablets in normal saline solution so that the resulting solution contains 5000 units of streptodornase per mL. To this solution, add mixed peptone TS so that the resulting solution contains 10 units of streptodornase per mL, and use this solution as the test solution. When tested as directed under the Assay, the velocity of substrate increases over time.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay (1) ***Streptokinase***—Weigh accurately the mass of NLT 20 tablets of Streptokinase and Streptodornase Tablets, and powder. Weigh accurately an amount, equivalent to 0.125 g of streptokinase, dissolve in normal saline solution by shaking gently to make 50 mL. To the resulting solution, add dilute gelatin solution to obtain a concentration of 1 in 500, 1 in 750, 1 in 1000, 1 in 1500, 1 in 2000, and 1 in 3000, respectively, and use these solutions as the test solutions. Separately, add the physiological saline solution to an appropriate amount of streptokinase RS, shake gently to mix so that the solution contains 10000 units of streptokinase per mL, add dilute gelatin TS to obtain the same concentrations as those of the test solutions and use these solutions as the standard solutions. Perform the test as directed under the Assay of streptokinase in Streptokinase and Streptodornase.

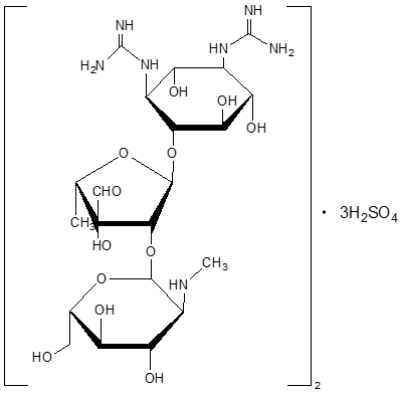
$$\begin{aligned}&\text{Streptokinase unit in 1 tablet}\\&= \text{Unit (10,000) of standard solution}\\&\times \frac{Dilution\ factor\ of\ sample}{Dilution\ factor\ of\ standard\ solution}\\&\times \frac{50}{Amount\ (mg)\ of\ sample\ taken}\\&\times Average\ mass\ (mg)\ of\ 1\ tablet\end{aligned}$$

(2) ***Streptodornase***—Weigh accurately the mass of NLT 20 tablets of Streptokinase and Streptodornase Tablets, and powder. Weigh accurately an amount, equivalent to 0.1 g of streptodornase, and dissolve in normal saline solution to make 100 mL. To the solution, add mixed peptone so that 1 mL of the resulting solution contains 10 units of streptodornase, and use this solution as the test solution. Separately, dissolve an appropriate amount of streptodornase RS in the physiological saline solution so that the solution contains 5000 units of streptodornase per mL. Add mixed peptone TS to obtain the same concentrations as those of the test solution and use this solution as the standard solution. Perform the test as directed under Assay of streptodornase in Streptokinase and Streptodornase.

$$\begin{aligned}&\text{Streptodornase unit in 1 tablet}\\&= \text{Unit (10) of standard solution}\\&\times \frac{K_{25}\ test\ solution}{K_{25}\ standard\ solution}\\&\times \frac{Average\ mass\ (mg) of\ 1\ tablet}{Amount\ (mg)\ of\ sample\ taken}\\&\times Dilution\ factor\ of\ test\ solution\end{aligned}$$

Packaging and storage Preserve in tight containers (at 2 to 10 °C).

Streptomycin Sulfate
스트렙토마이신황산염



$(C_{21}H_{39}N_7O_{12})_2 \cdot 3H_2SO_4$: 1457.38

2-[(1*S*,2*S*,3*R*,4*S*,5*S*,6*R*)-3-(Diaminomethylideneamino)-4-[(2*R*,3*R*,4*R*,5*S*)-3-[(2*S*,3*S*,4*S*,5*R*,6*S*)-4,5-dihydroxy-6-(hydroxymethyl)-3-(methylamino) oxan-2-yl]oxy-4-formyl-4-hydroxy-5-methyloxolan-2-yl]oxy-2,5,6-trihydroxycyclohexyl]guanidine sulfate [*3810-74-0*]

Streptomycin Sulfate is the sulfate of an aminoglycoside substance having antibacterial activity and obtained from *Streptomyces griseus* culture.

Streptomycin Sulfate contains NLT 740 μg (potency) and NMT 820 μg (potency) of streptomycin ($C_{21}H_{39}N_7O_{12}$: 581.57) per mg, calculated on the dried basis.

Description Streptomycin Sulfate occurs as a white to pale yellowish white powder.
It is freely soluble in water and very slightly soluble in ethanol(95).

Identification (1) Dissolve 50 mg of Streptomycin Sulfate in 5 mL of water, add 1 mL of ninhydrin TS and 0.5 mL of pyridine, and heat for 10 minutes; a purple color develops.

(2) Dissolve 10 mg each of Streptomycin Sulfate and streptomycin sulfate RS in 10 mL of water, and use these solutions as the test solution and standard solution. Perform the test directed under the Thin Layer Chromatography. Spot 10 μL each of these solutions on a thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Develop the plate with a solution

of potassium dihydrogen phosphate (7 in 100) as the developing solvent to a distance of about 12 cm, and air-dry the plate. Spray evenly a mixture of a solution of 1,3-dihydroxynaphthalene in ethanol(95) (1 in 500) and diluted sulfuric acid (1 in 5) (1 : 1) on the plate, and heat at about 150 °C for about 5 minutes; the principal spots obtained from the test solution and standard solution show the same color and R_f value.

(3) A solution of Streptomycin Sulfate (1 in 5) responds to the Qualitative Analysis for sulfate.

Optical rotation $[\alpha]_D^{20}$: Between -79° and -88° (0.5 g calculated on the dried basis, water, 50 mL, 100 mm).

pH Dissolve about 2 g of Streptomycin Sulfate in 10 mL of water; the pH of the solution ranges between 4.5 and 7.0.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Streptomycin Sulfate in 5 mL of water; the resulting solution is colorless to pale yellow and clear.

(2) ***Heavy metals***—Proceed with 2.0 g of Streptomycin Sulfate according to Method 4 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Arsenic***—Prepare the test solution with 2.0 g of Streptomycin Sulfate according to Method 3 and perform the test (NMT 1 ppm).

(4) ***Related substances***—Weigh accurately 0.20 g of Streptomycin Sulfate, dissolve in a mixture of methanol and sulfuric acid (97 : 3) to make 5 mL, and heat under a reflux condenser for 1 hour. Cool, wash the inside of the condenser with an appropriate amount of a mixture of methanol and sulfuric acid (97 : 3), add a mixture of methanol and sulfuric acid (97 : 3) to make exactly 20 mL, and use this solution as the test solution. Separately, weigh accurately 36 mg of D(+)-mannose, dissolve in a mixture of methanol and sulfuric acid (97 : 3) to make 5 mL, and heat with a reflux condenser for 1 hour. After cooling, wash the inside of the condenser with an appropriate amount of a mixture of methanol and sulfuric acid (97 : 3), and add a mixture of methanol and sulfuric acid (97 : 3) to make exactly 50 mL. Pipet 5 mL of this solution and mix with a mixture of methanol and sulfuric acid (97 : 3) to make exactly 50 mL and use this solution as the standard solution. Perform the test directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on a thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Develop the plate with a mixture of toluene, methanol and acetic acid(100) (2 : 1 : 1) to a distance of 13 to 15 cm, and air-dry the plate. Spray evenly a mixture of 1,3-dihydroxynaphthalene in ethanol(95) (1 in 500) and diluted sulfuric acid (1 in 5) (1 : 1) on the plate, and heat at 110 °C for 5 minutes; the spot from the test solution corresponding to the spot from the standard solution is not more intense than the spot from the standard solution.

Loss on drying NMT 5.0% (0.5 g, not exceeding 0.67 kPa, 60 °C, 3 hours).

Residue on ignition NMT 1.0% (1 g).

Sterility It meets the requirements when used in a sterile preparation. However, it is excluded in cases where there is a terminal sterilization process in the manufacturing of a sterile preparation.

Bacterial endotoxins Less than 0.10 Eu/mg (potency) of streptomycin, when used in a sterile preparation.

Abnormal toxicity Dissolve 1 mg of Streptomycin Sulfate in 0.5 mL of water for injection, and inject intravenously for 15 to 30 seconds to each of 5 healthy mice weighing 17 to 24 g. Use the animals without any sign of abnormality for at least 5 days before the test. No animals die for the first 24 hours after injection. If 1 animal dies, repeat the test with 5 animals, and make sure that no animal dies for the first 24 hours.

Histamine It meets the requirements when used in a sterile preparation. Weigh an appropriate amount of Streptomycin Sulfate, dissolve it in isotonic sodium chloride injection so that the solution contains 3.0 mg (potency) of the Streptomycin sulfate per mL, and use the solution as the test solution.

Assay ***Cylinder plate method*** (1) Agar media for seed and base layer: Use the medium in (A) (2) (a) ① ⓐ under the Microbial Assays for Antibiotics.

(2) Test organism: *Bacillus subtilis* ATCC 6633

(3) Weigh accurately about 20 mg (potency) of Streptomycin Sulfate, dissolve in water to make exactly 50 mL, and use this solution as the test stock solution. Pipet an appropriate amount of the test stock solution, add 0.1 mol/L phosphate buffer solution (pH 8.0) to dilute so that the resulting solutions contain 8.0 μg (potency) and 2.0 μg (potency) per mg, and use these solutions as the high-concentration test solution and low-concentration test solution, respectively. Separately, weigh accurately about 20 mg (potency) of streptomycin sulfate RS, previously dried, dissolve in diluted pH 6.0 phosphate buffer solution (1 in 2) to make exactly 50 mL, and use this solution as the standard stock solution. Keep the standard stock solution between 5 and 15 °C and use within 30 days. Pipet an appropriate amount of the standard stock solution, dilute with 0.1 mol/L phosphate buffer solution (pH 8.0) so that the resulting solutions contain 8.0 μg (potency) and 2.0 μg (potency) per mL, and use these solutions as the high-concentration standard solution and low-concentration standard solution, respectively. Perform the test with these solutions as directed in (A) (8) under the Microbial Assays for Antibiotics.

Packaging and storage Preserve in tight containers.

Streptomycin Sulfate for Injection
주사용 스트렙토마이신황산염

Streptomycin Sulfate for Injection is a preparation for injection, which is dissolved before use. Streptomycin Sulfate for Injection contains NLT 90.0% and NMT 110.0% of the labeled amount of streptomycin ($C_{21}H_{39}N_7O_{12}$: 581.57).

Method of preparation Prepare as directed under Injections, with Streptomycin Sulfate.

Description Streptomycin Sulfate for Injection occurs as a white to pale yellow mass or a powder.

Identification Perform the test as directed under the Identification (2) under Streptomycin Sulfate.

pH Dissolve an amount of Streptomycin Sulfate for Injection, equivalent to 2.0 g (potency) of streptomycin, in water; the pH of the solution is between 5.0 and 7.0.

Purity ***Clarity and color of solution***—Dissolve an amount of Streptomycin Sulfate for Injection, equivalent to 1.0 g (potency) of streptomycin sulfate according to the labeled amount, in 3 mL of water; the resulting solution is clear. Perform the test with this solution as directed under the Ultraviolet-visible Spectroscopy; the absorbance at a wavelength of 400 nm is NMT 0.50.

Loss on drying NMT 4.0% (0.5 g, not exceeding 0.67 kPa, 60 ℃, 3 hours)

Sterility Meets the requirements.

Bacterial endotoxins Less than 0.10 EU per mg (potency) of streptomycin.

Particulate contamination: Visible particles Meets the requirements.

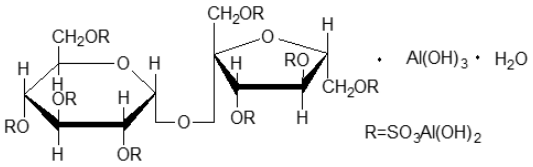
Insoluble particulate matter in injections Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Proceed as directed under the Assay under Streptomycin Sulfate. Weigh accurately an amount of Streptomycin Sulfate for Injection, equivalent to about 1.0 g (potency) according to the labeled potency, and add water to make exactly 200 mL. Pipet an appropriate amount of this solution, add 0.1 mol/L phosphate buffer solution (pH 8.0) to obtain a solution having known concentration of 8.0 μg and 2.0 μg (potency) per mL, and use them as the high-concentration test solution and low-concentration test solution, respectively.

Packaging and storage Preserve in hermetic containers.

Sucralfate Hydrate
수크랄페이트수화물



Sucrose Sulfate Aluminum Salt

Sucralfate $C_{12}H_{30}Al_8O_{51}S_8 \cdot x\mathrm{Al(OH)_3} \cdot yH_2O$

Aluminum;[(2*R*,3*R*,4*S*,5*R*,6*R*)-2-[(2*R*,3*R*,4*S*,5*S*)-3,4-*bis*(λ1-alumanyloxysulfonyloxy)-2,5-*bis*(λ1-alumanyloxysulfonyloxymethyl)oxolan-2-yl]oxy-3,5-bis(λ1-alumanyloxysulfonyloxy)-6-(λ1-alumanyloxysulfonyloxymethyl)oxan-4-yl]oxysulfonyloxyaluminum;tetracontahydrate [*54182-58-0*]

Sucralfate Hydrate contains NLT 17.0% and NMT 21.0% of aluminum (Al: 26.98) and NLT 34.0% and NMT 43.0% of sucrose octasulfate ($C_{12}H_{22}O_{35}S_8$: 982.80), calculated on the dried basis.

Description Sucralfate Hydrate occurs as a white powder and is odorless and tasteless.
It is practically insoluble in water, hot water, ethanol(95) or ether.
It dissolves in dilute hydrochloric acid or sulfuric acid-sodium hydroxide TS.

Identification (1) Transfer 50 mg of Sucralfate Hydrate to a small test tube, add 50 mg of freshly cut pieces of sodium metal, and melt by careful heating. Immerse the test tube immediately in 100 mL of water, break the test tube, shake well to mix, and filter. To 5 mL of the filtrate, add 1 drop of sodium pentacyanonitrosylferrate(III) TS; the solution exhibits a purple color.

(2) Dissolve 40 mg of Sucralfate Hydrate in 2 mL of dilute sulfuric acid, and add gently 2 mL of anthrone TS to make 2 layers; the boundary layer exhibits a blue color, and gradually changes to bluish green.

(3) Dissolve 0.5 g of Sucralfate Hydrate in 10 mL of dilute hydrochloric acid; the solution responds to the Qualitative Analysis for aluminum salt.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Sucralfate Hydrate in 10 mL of dilute sulfuric acid; the resulting solution is clear and colorless.

(2) ***Chloride***—Dissolve 0.5 g of Sucralfate Hydrate in 30 mL of dilute nitric acid, and heat gently to boiling. After cooling, add water to make 100 mL, and to 10 mL of this solution, add 3 mL of dilute nitric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 0.70 mL of 0.01 mol/L hydrochloric acid (NMT 0.50%).

(3) ***Heavy metals***—Dissolve 1.0 g of Sucralfate Hydrate in 20 mL of sodium chloride solution (1 in 5) and 1 mL of dilute hydrochloric acid, and to this solution,

add 2 mL of dilute acetic acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution by evaporating 1 mL of dilute hydrochloric acid on a steam bath to dryness, and adding 20 mL of sodium chloride solution (1 in 5), 2 mL of dilute acetic acid, 2.0 mL of lead standard solution and water to make 50 mL (NMT 10 ppm).

(4) ***Free aluminum***—To 3.0 g of Sucralfate Hydrate, add 50 mL of water, heat on a steam bath for 5 minutes, cool, and filter. Wash the residue with four 5-mL portions of water, combine the filtrate with the washings, add 2 mL of dilute hydrochloric acid, and heat on a steam bath for 30 minutes. After cooling, neutralize with sodium hydroxide TS, add water to make exactly 100 mL, and use this solution as the test solution. Pipet 50 mL of the test solution, add exactly 25 mL of 0.05 mol/L ethylenediaminetetraacetic acid disodium salt and 20 mL of acetic acid-ammonium acetate buffer solution, pH 4.5, and boil for 5 minutes. After cooling, add 50 mL of ethanol(95) and titrate the excess ethylenediaminetetraacetic acid disodium salt with 0.05 mol/L zinc acetate VS (indicator: 3 mL of dithizone TS). The endpoint of the titration is when this solution changes from greenish purple through violet to red. Perform a blank test in the same manner (NMT 0.2%).

Each mL of 0.05 mol/L ethylenediaminetetraacetic acid disodium salt
= 1.3491 mg of Al

(5) ***Arsenic***—Dissolve 1.0 g of Sucralfate Hydrate in 5 mL of dilute hydrochloric acid, use this solution as the test solution, and perform the test (NMT 2ppm).

(6) ***Related substances***—With 50 μL of the test solution obtained in the Assay (2) Sucrose octasulfate ester, perform the test as directed under the Liquid Chromatography according to the Assay (2) Sucrose octasulfate ester. Determine the peak area of sucrose octasulfate and the peak area of related substances having the relative retention time to the peak of sucrose octasulfate of about 0.7 from the test solution by the automatic integration method, and determine the ratio of the peak area of the related substances to that of sucrose octasulfate; it is NMT 0.1.

Detection sensitivity: Adjust the detection sensitivity so that the peak height of sucrose octasulfate ester obtained from 50 μL of the standard solution in the Assay (2) Sucrose octasulfate ester is between 60% and 100% of the full scale.

Loss on drying NMT 14.0% (1 g, 105 °C, 3 hours).

Acid-neutralizing capacity Weigh accurately about 0.25 g of Sucralfate Hydrate, previously dried, and perform the test; the amount of 0.1 mol/L hydrochloric acid VS consumed per g of Sucralfate Hydrate is NLT 130 mL.

Assay (1) ***Aluminum***—Weight accurately about 1 g of Sucralfate Hydrate, dissolve in 10 mL of dilute hydrochloric acid by warming, cool, and add water to make exactly 250 mL. Pipet 25 mL of this solution, add exactly 25 mL of 0.05 mol/L ethylenediaminetetraacetic acid disodium salt and 20 mL of acetic acid-ammonium acetate buffer solution, pH 4.5, and boil for 5 minutes. After cooling, add 50 mL of ethanol(95), and titrate the excess ethylenediaminetetraacetic acid disodium salt with 0.05 mol/L zinc acetate VS (indicator: 3 mL of dithizone TS). The endpoint of the titration is when this solution changes from greenish purple through violet to red. Perform a blank test in the same manner.

Each mL of 0.05 mol/L ethylenediaminetetraacetic acid disodium salt
= 1.3491 mg of Al

(2) ***Sucrose octasulfate ester***—Weigh accurately about 0.55 g of Sucralfate Hydrate, add exactly 10 mL of sulfuric acid-sodium hydroxide TS, shake vigorously to mix, and dissolve by sonicating at below 30 °C for 5 minutes. Add 0.1 mol/L sodium hydroxide to make exactly 25 mL, and use this solution as the test solution. Separately, weigh accurately about 0.25 g of potassium sucrose octasulfate RS, add the mobile phase to make exactly 25 mL, and use this solution as the standard solution. Prepare rapidly the test solution and the standard solution, and perform the test immediately. Pipet 50 μL each of the test solution and the standard solution, and perform the test as directed under the Liquid Chromatography according to the following conditions. Determine the peak areas, A_T and A_S, of sucrose octasulfate ester from these solutions.

Amount (mg) of sucrose octasulfate ester ($C_{12}H_{22}O_{35}S_8$)
= Amount (mg) of potassium sucrose octasulfate RS, calculated on the dried basis $\times \frac{A_T}{A_S} \times 0.7633$

Operating conditions

Detector: A differential refractometer

Column: A stainless steel column about 4 mm in internal diameter and about 30 cm in length, packed with aminopropylsilyl silica gel for liquid chromatography (about 8 μm in particle diameter).

Mobile phase: Dissolve an appropriate amount (26 g to 132 g) of ammonium sulfate in 1000 mL. of water, and adjust the pH to 3.5 with phosphoric acid. Allow a solution of potassium sucrose sctasulfate RS in dilute hydrochloric acid (1 in 100) to stand at 60 °C for 10 minutes, cool, and perform the test immediately. Adjust the amount of ammonium sulfate so that the peak of a related substance, having the relative retention time to that of sucrose octasulfate ester of about 0.7, almost returns to the base line, and the peak of sucrose octasulfate ester elutes most rapidly.

Flow rate: Adjust the flow rate so that the retention time of sucrose octasulfate ester is between 6 and 11 minutes.

System suitability

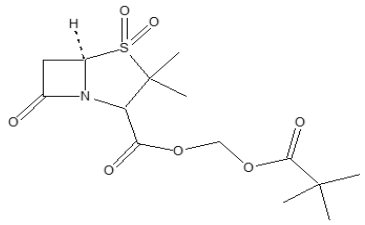
System performance: Allow a solution of potassi-

um sucrose octasulfate RS in dilute hydrochloric acid (1 in 100) to stand at 60 °C for 10 minutes, cool, and proceed immediately with 50 μL of this solution according to the above operating conditions; the resolution between sucrose octasulfate ester and the related substance with the relative retention time being about 0.7 to sucrose octasulfate ester is NLT 1.5.

System repeatability: Repeat the test 6 times with 50 μL each of the standard solution according to the above operating conditions; the relative standard deviation of the peak areas for sucrose octasulfate ester is NMT 2.0%.

Packaging and storage Preserve in tight containers.

Sulbactam Pivoxil
설박탐피복실



$C_{14}H_{21}NO_7S$:347.38
(2,2-Dimethyl-1-oxopropoxy) methyl (2*S*-*cis*)-3,3-dimethyl-7-oxo-4,4-dioxide4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid ester, [*69388-79-0*]

Sulbactam Pivoxil contains NLT 620 μg and NMT 680 μg (potency) of sulbactam ($C_8H_{11}NO_5S$: 233.24) per mg, calculated on the anhydrous basis.

Description Sulbactam Pivoxil occurs as a milky white crystalline powder.
It is sparingly soluble in water and soluble in methanol, chloroform, and acetone.

Identification (1) Determine the infrared spectra of Sulbactam Pivoxil and sulbactam pivoxil RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) Weigh about 100 mg (potency) of Sulbactam Pivoxil and sulbactam pivoxil RS, dissolve in 10 mL of methanol, and use these solutions as the test solution and standard solution, respectively. With the test and standard solutions, perform the test as directed under the Thin Layer Chromatography. Spot 1 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography, develop the plate with a mixture of diethyl ether-methanol-acetic acid (50:50:1), and air-dry the plate. Put the thin-layer chromatographic plate into a suitable container containing 2 to 4 g of iodine crystals, cover it with a lid, and allow to stand for 3 to 5 minutes; the R*f* values obtained from the test solution and the standard solution are the same.

Optical rotation $[\alpha]_D^{20}$: Between +162 ° and +170 ° (0.1 g, Methanol, 10 mL, 100 mm).

Melting point Between 103 and 106 ℃.

Purity ***Heavy metals***—Proceed with 1.0 g of Sulbactam Pivoxil according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

Water NMT 1.0%.

Assay Weigh accurately about 75 mg each of Sulbactam Pivoxil and sulbactam pivoxil RS, add a mixture of water and methanol (1:1) to make exactly 100 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions and determine the peak areas, A_T and A_S, of sulbactam in each solution.

$$\text{Potency (μg) of sulbactam } (C_8H_{11}NO_5S) = \text{Potency (μg) of sulbactam in sulbactam pivoxil RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 235 nm).

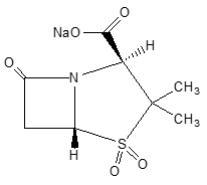
Column: A stainless steel column about 4 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 μm in particle diameter).

Mobile phase: A mixture of methanol and 1% acetic acid (65 : 35).

Flow rate: 1.0 mL/min

Packaging and storage Preserve in tight containers.

Sulbactam Sodium
설박탐나트륨



$C_8H_{10}NNaO_5S$: 255.22
Sodium (3*S*)-2,2-dimethyl-1,1-dioxo-1λ6-penam-3-carboxylate [*69388-84-7*]

Sulbactam Sodium contains NLT 875 μg and NMT 941 μg (potency) per mg of sulbactam ($C_8H_{11}NO_5S$: 233.24), calculated on the anhydrous basis.

Description Sulbactam Sodium occurs as a white to yellowish white crystalline powder.
It is freely soluble in water, sparingly soluble in methanol, very slightly soluble in ethanol(99.5), and practically insoluble in acetonitrile.

Identification (1) Determine the infrared spectra of Sulbactam Sodium and sulbactam sodium RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both exhibit similar intensities of absorption at the same wavenumbers.

(2) Sulbactam Sodium responds to the Qualitative Analysis for sodium salt.

Crystallinity Meets the requirements.

Optical rotation $[\alpha]_D^{20}$: Between +219° and +233° (1.0 g, water, 100 mL, 100 mm).

pH Dissolve 1.0 g of Sulbactam Sodium in 20 mL of water. The pH of this solution is between 5.2 and 7.2.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Sulbactam Sodium in 20 mL of water; the solution is colorless to pale yellow color and is clear.

(2) ***Heavy metals***—Proceed with 1.0 g of Sulbactam Sodium and perform the test as directed under Method 2. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Arsenic***—Proceed with 1.0 g of Sulbactam Sodium according to Method 3 and perform the test (NMT 2 ppm).

(4) ***Sulbactam penicillamine***—Weigh accurately about 0.2 g of Sulbactam Sodium, dissolve in the mobile phase to make exactly 50 mL, and use this solution as the test solution. Separately, dissolve 40 mg of sulbactam sodium for sulbactam penicillamine, accurately weighed, in 2 mL of water, add 0.5 mL of sodium hydroxide TS, and allow it to stand for 10 minutes at room temperature. Then, add 0.5 mL of 1 mol/L hydrochloric acid TS, and add the mobile phase to make exactly 100 mL. Pipet 5 mL of the resulting solution, add the mobile phase to make exactly 50 mL, and use this solution as the standard solution. Take exactly 10 μL each of the test solution and the standard solution, perform the test as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas A_T and A_S of sulbactam penicillamine for each solution; the amount of sulbactam penicillamine is NMT 1.0%.

$$\text{Content (\%) of sulbactam penicillamine} = \frac{W_S}{W_T} \times \frac{A_T}{A_S} \times 5$$

W_S: Amount (mg) taken of sulbactam sodium for sulbactam penicillamine

W_T: Amount (mg) taken of Sulbactam Sodium

Operating conditions

For the column, column temperature, mobile phase and flow rate, comply with the operating conditions as directed under the Assay.

Detector: An ultraviolet absorption photometer (wavelength: 230 nm).

System suitability

System performance: Proceed as directed under the system suitability under the Assay.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solutions according to the above conditions; the relative standard deviation of the peak area of sulbactam penicillamine is NMT 2.0%.

Water NMT 1.0% (0.5 g, volumetric titration, direct titration)

Sterility It meets the requirements when Sulbactam Sodium is used in a sterile preparation. However, it is excluded in cases where there is a final sterilization process in the manufacturing of a sterile preparation.

Bacterial endotoxins Less than 0.17 EU/mg (potency) when Sulbactam Sodium is used in a sterile preparation.

Assay Weigh accurately about 0.1 g (potency) each of Sulbactam Sodium and sulbactam sodium RS, dissolve each in the mobile phase, and add 10.0 mL of the internal standard solution. Add the mobile phase to make exactly 100 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 10 μL each of these solutions as directed under the Liquid Chromatography according to the following conditions and calculate the peak area ratios, Q_T and Q_S, of sulbactam to internal standard, respectively.

$$\text{Potency (μg) of sulbactam } (C_8H_{11}NO_5S) = \text{Potency (μg) of sulbactam RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of ethyl p-hydroxybenzoate in the mobile phase (7 in 1000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

Column: A stainless steel column about 3.9 mm in internal diameter and 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 μm in particle diameter).

Column temperature: A constant temperature of about 35 ℃.

Mobile phase: Add 0.005 mol/L tetrabutylammonium hydroxide TS to 250 mL of acetonitrile to make exactly 1000 mL.

Flow rate: Adjust the flow rate so that the retention time of sulbactam is about 6 minutes.

System suitability

System performance: Proceed with 10 μL of the standard solution according to the above conditions; sulbactam and internal standard are eluted in this order with resolution between their peaks being NLT 1.5.

System repeatability: Repeat the test 6 times with

10 μL each of the standard solutions according to the above conditions; the relative standard deviation of the peak area of sulbactam is NMT 1.0%.

0.005 mol/L Tetrabutylammonium hydroxide TS— To 10 mL of tetrabutylammonium hydroxide TS, add phosphoric acid diluted with 700 mL of water (1 in 10) to adjust pH to 4.0. Add water to make 1000 mL.

Packaging and storage Preserve in tight containers.

Sulbactam Sodium·Amoxicillin Sodium for Injection
주사용 설박탐나트륨·아목시실린나트륨

Sulbactam Sodium·Amoxicillin Sodium for Injection, as an injection that is dissolved upon use, contains NLT 90.0% and NMT 120.0% of the labeled amount of sulbactam ($C_8H_{11}NO_5S$: 233.24) and amoxicillin ($C_{16}H_{19}N_3O_5S$: 365.41), respectively.

Method of preparation Prepare as directed under Injections, with Sulbactam Sodium and Amoxicillin Sodium.

Description Sulbactam Sodium·Amoxicillin Sodium for Injection occurs as a white to yellowish white powder.

Identification The major peaks obtained from the test solution and the standard solution under the Assay are the same in the retention time.

pH Dissolve Sulbactam Sodium·Amoxicillin Sodium for Injection in water to make a concentration of 0.1 g (potency)/mL as amoxicillin; the pH of this solution is between 7.0 and 9.0.

Sterility Meets the requirements.

Pyrogen Perform the test by injecting a solution, prepared by adding isotonic sodium chloride injection to make a known concentration of 40 mg (potency) of Sulbactam Sodium·Amoxicillin Sodium for Injection per mL, into a rabbit (1 mL of the solution per kg of the rabbit weight); it meets the requirements.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Uniformity of dosage units Meets the requirements.

Water NMT 3.0% (0.2 g, volumetric titration, direct titration).

Assay Weigh accurately an amount of Sulbactam Sodium·Amoxicillin Sodium for Injection equivalent to about 0.14 g (potency) of amoxicillin, add the mobile phase to make exactly 200 mL, and use this solution as the test solution. Separately, weigh accurately each about 35 mg (potency) of sulbactam RS and about 70 mg (potency) of amoxicillin RS, add water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions and determine the peak areas of sulbactam and amoxicillin, A_{T1}, A_{S1}, A_{T2} and A_{S2}, in each solution.

$$\text{Potency (μg) of sulbactam } (C_8H_{11}NO_5S) = \text{Potency (μg) of sulbactam RS} \times \frac{A_{T1}}{A_{S1}}$$

$$\text{Potency (μg) of amoxicillin } (C_{16}H_{19}N_3O_5S) = \text{Potency (μg) of amoxicillin RS} \times \frac{A_{T2}}{A_{S2}}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 225 nm).

Column: A stainless steel column about 4 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of 0.01 mol/L phosphate buffer solution (pH 3.0) and methanol (95 : 5).

Packaging and storage Preserve in hermetic containers.

Sulbactam Sodium·Ampicillin Sodium
설박탐나트륨·암피실린나트륨

Sulbactam Sodium·Ampicillin Sodium is a mixture of Sulbactam Sodium and Ampicillin Sodium at a ratio of 1 to 2. It contains NLT 280 μg and NMT 340 μg (potency) of sulbactam ($C_8H_{11}NO_5S$: 233.24), and NLT 560 μg and NMT 680 μg (potency) of ampicillin ($C_{16}H_{19}N_3O_4S$: 349.41) per mg, calculated on the anhydrous basis.

Description Sulbactam Sodium·Ampicillin Sodium occurs as a white or milky white powder.
It is very soluble in water, sparingly soluble in methanol, and very slightly soluble in ethanol(95).

Identification (1) ***Sulbactam sodium***—The retention time of the major peak obtained from the test solution corresponds to that from the standard solution, as obtained in the Assay (1).

(2) ***Ampicillin sodium***—The retention time of the major peak obtained from the test solution corresponds to that from the standard solution, as obtained in the Assay (2).

pH Dissolve Sulbactam Sodium·Ampicillin Sodium in water to make 5 mg (potency)/mL as sulbactam ($C_8H_{11}NO_5S$); the pH of this solution is between 8.0 and

10.0.

Sterility It meets the requirements when Sulbactam Sodium·Ampicillin Sodium is used in sterile preparations. However, it is excluded in cases where there is a final sterilization process in the manufacturing of sterile preparations.

Bacterial endotoxins It meets the requirements when Sulbactam Sodium·Ampicillin Sodium is used in sterile preparations. However, Sulbactam Sodium·Ampicillin Sodium is less than 0.51 EU per mg (potency) as sulbactam ($C_8H_{11}NO_5S$).

Water NMT 2.0% (0.5 g, volumetric titration, direct titration)

Assay (1) ***Sulbactam sodium***—Weigh accurately an amount equivalent to about 0.1 g (potency) as sulbactam ($C_8H_{11}NO_5S$) according to the labeled potency of Sulbactam Sodium·Ampicillin Sodium, and dissolve by putting the mobile phase. Add 10.0 mL of the internal standard solution, put the mobile phase to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 0.1 g (potency) of sulbactam RS, proceed in the same manner as in the test solution, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the peak area ratios, Q_T and Q_S, of sulbactam to the internal standard.

$$\text{Potency (μg) of sulbactam } (C_8H_{11}NO_5S) = \text{Potency (μg) of sulbactam RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of ethyl *p*-hydroxybenzoate in the mobile phase (7 in 1000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 μm in particle diameter).

Mobile phase: Add 0.005 mol/L tetra-n-butylammonium hydroxide to 250 mL of acetonitrile to make exactly 1000 mL.

Flow rate: Adjust the flow rate so that the retention time of sulbactam is about 6 minutes.

System suitability

System performance: Perform the test with 10 μL of the standard solution; sulbactam and the internal standard are eluted in this order with the resolution between these peaks being NLT 1.5.

(2) ***Ampicillin sodium***—Weigh accurately an amount equivalent to about 60 mg (potency) as ampicillin ($C_{16}H_{19}N_3O_4S$) according to the labeled potency of Sulbactam Sodium·Ampicillin Sodium and about 60 mg (potency) of ampicillin sodium RS, and add the mobile phase to make exactly 25 mL. Pipet 5 mL each of these solutions, add the mobile phase to make exactly 25 mL, and use these solutions as the test and standard solutions. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of ampicillin for each solution.

$$\text{Potency (μg) of ampicillin } (C_{16}H_{19}N_3O_4S) = \text{Potency (μg) of ampicillin sodium RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 230 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 μm in particle diameter).

Mobile phase: Add 0.005 mol/L tetrabutylammonium hydroxide TS to 175 mL of acetonitrile to make exactly 1000 mL.

Flow rate: 2.0 mL/min

Packaging and storage Preserve in tight containers.

Sulbactam Sodium-Ampicillin Sodium for Injection
주사용 설박탐나트륨·암피실린나트륨

Sulbactam Sodium-Ampicillin Sodium for Injection, as an injection that is dissolved upon use, contains NLT 90.0% and NMT 120.0% of the labeled amount of sulbactam ($C_8H_{11}NO_5S$: 233.24) and ampicillin ($C_{16}H_{19}N_3O_4S$: 349.41), respectively.

Method of preparation Prepare as directed under Injections, with Sulbactam Sodium and Ampicillin Sodium at a ratio of 1 : 2 (potency).

Description Sulbactam Sodium-Ampicillin Sodium for Injection occurs as a white to grayish white crystalline powder.

Identification (1) ***Sulbactam sodium***—The retention time of the major peak of sulbactam obtained from the test solution is the same as that from the standard solution, as obtained in the Assay (1).

(2) ***Ampicillin sodium***—The retention time of the major peak of ampicillin obtained from the test solution is the same as that from the standard solution, as obtained in the Assay (2).

pH Dissolve an amount of Sulbactam Sodium·Ampicillin Sodium for Injection, equivalent to 1.0 g (potency) of ampicillin sodium, in 100 mL of water; the

pH of this solution is between 8.0 and 10.0.

Water NMT 2.0% (0.5 g, volumetric titration, direct titration).

Sterility Meets the requirements.

Bacterial endotoxins Less than 0.20 EU per mg (potency) of ampicillin.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Dissolve an appropriate amount of Sulbactam Sodium and Ampicillin Sodium for Injection according to the labeled amount in water, pipet an appropriate amount of the resulting solution, dilute with the mobile phase to make a solution having a known concentration of 0.25 mg (potency) of sulbactam and 0.5 mg (potency) of ampicillin per mL, and use this solution as the test solution. Separately, weight accurately appropriate amounts of ampicillin RS and sulbactam RS, dissolve in the mobile phase to make a solution having a known concentration of 0.25 mg (potency) of sulbactam and 0.5 mg (potency) of ampicillin per mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions and determine the peak areas of sulbactam and ampicillin, A_{T_1}, A_{S_1}, A_{T_2} and A_{S_2}, in the test solution and the standard solution, respectively.

Potency (μg) of sulbactam ($C_8H_{11}NO_5S$)
= Concentration [potency (μg)/mL] of sulbactam in the standard solution × $\frac{A_{T1}}{A_{S1}}$ × dilution factor of the test solution

Potency (μg) of ampicillin ($C_{16}H_{19}N_3O_4$)
= Concentration [potency (μg)/mL] of ampicillin in the standard solution × $\frac{A_{T2}}{A_{S2}}$ × dilution factor of the test solution

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 230 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (1.5 μm to 10 μm in particle diameter).

Mobile phase: A mixture of 0.005 mol/L tetrabutylammonium hydroxide TS and acetonitrile (1650 : 350).

Flow rate: 2.0 mL/min

0.005 mol/L Tetrabutylammonium hydroxide TS—To 6.6 mL of 40% tetrabutylammonium hydroxide solution, add water to make 1800 mL, adjust the pH to 5.0 ± 1 with 1 mol/L phosphoric acid, and then add water to make 2000 mL.

System suitability

System performance: Proceed with 10 μL of the system suitability solution under the above operating conditions; the relative retention time of ampicillin with respect to the alkaline degradation product of sulbactam is about 0.7, with the resolution between these peaks being NLT 4.0. Proceed with 10 μL of the standard solution according to the above operating conditions; the relative retention time of ampicillin with respect to sulbactam is about 0.35. The number of theoretical plates and the symmetry factor of sulbactam are NLT 3500 and NMT 1.5, respectively.

System repeatability: Repeat the test 5 times with 10 μL of the standard solution according to the above operating conditions; the relative standard deviation of the areas of sulbactam peaks is NMT 2.0%.

System suitability solution—Weigh about 30 mg of sulbactam RS and dissolve in 0.01 mol/L sodium hydroxide solution to make 100 mL, allow to stand for 30 minutes, and then adjust the pH to 5.0 ± 1 with 1 mol/L phosphoric acid. To 5 mL of this solution, add 4.25 mL of acetonitrile, and dilute with 0.005 mol/L tetrabutylammonium hydroxide TS to make 25 mL. To 1 mL of this solution, add 15 mg of ampicillin RS, and dilute with the mobile phase to make 25 mL.

Packaging and storage Preserve in hermetic containers.

Sulbactam Sodium·Cefoperazone Sodium for Injection
주사용 설박탐나트륨·세포페라존나트륨

Sulbactam Sodium·Cefoperazone Sodium for Injection, as an injection that is dissolved upon use, contains sulbactam sodium and cefoperazone sodium at a ratio of 1 : 1 (potency), and contains NLT 90.0% and NMT 120.0% of the labeled amount of sulbactam ($C_8H_{11}NO_5S$: 233.24) and cefoperazone ($C_{25}H_{27}N_9O_8S_2$: 645.67), respectively.

Method of preparation Prepare as directed under Injections, with Sulbactam Sodium and Cefoperazone Sodium.

Description Sulbactam Sodium·Cefoperazone Sodium for Injection occurs as a white to grayish white crystalline powder or a powder.

Identification (1) Dissolve 10 mg of Sulbactam Sodium·Cefoperazone Sodium for Injection with 2 mL of water, add 3 mL of hydroxylamine hydrochloride TS, allow it to stand for 5 minutes, add 1 mL of acidic am-

monium iron(III) sulfate TS, and shake well to mix; the resulting solution exhibits a reddish brown color.

(2) Dissolve 20 mg of Sulbactam Sodium·Cefoperazone Sodium for Injection with 1 mL of a mixture of water and methanol (1 : 1), spot 1 drop of the resulting solution on a filter paper, dry, spray hydroiodic acid TS, and dry at room temperature for 15 minutes in vacuum while protected from light; a brown color develop in the spot. Spay 5% starch TS on this brown spot; it turns purple.

(3) Dissolve 20 mg of Sulbactam Sodium·Cefoperazone Sodium for Injection in 20 mL of water, take 4 mL of the resulting solution, add 1 mL of sodium carbonate solution (1 in 100) and 1 mL of diazobenzenesulfonic acid TS, and shake well to mix; the resulting solution exhibits an orange color.

(4) Dissolve 20 mg of Sulbactam Sodium·Cefoperazone Sodium for Injection with 4 mL of 1 mol/L sodium hydroxide TS, heat on a steam bath for 20 minutes, cool it, neutralize with 6 mol/L hydrochloric acid TS, heat on a steam bath for 2 to 3 minutes, add 1 mL of potassium chloride TS, and then allow to stand for 30 minutes. Filter the produced precipitate using a glass filter (G_4), wash the precipitate with 5 mL of water 4 times, dissolve with 1 mL of 1 mol/L sulfuric acid TS, add about 10 mg of magnesium, and dissolve. Take 3 drops of the resulting solution, add 2 mL of 2,7-dihydroxynaphthalene TS, and heat on a steam bath for 10 minutes; the solution exhibits a magenta color.

pH Dissolve Sulbactam Sodium·Cefoperazone Sodium for Injection in water to make a concentration of 50 mg (potency)/mL as sulbactam; the pH of this solution is between 4.5 and 6.5.

Sterility Meets the requirements.

Bacterial endotoxins Less than 0.9 EU per mg (potency) of Sulbactam Sodium·Cefoperazone Sodium for Injection.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Uniformity of dosage units Meets the requirements.

Water NMT 4.0% for crystalline powder (0.2 g, volumetric titration, direct titration), and NMT 1.0% for freeze-dried powder (1.0 g, volumetric titration, direct titration).

Assay Weigh accurately an amount of Sulbactam Sodium·Cefoperazone Sodium for Injection equivalent to about 500 mg of sulbactam ($C_8H_{10}NN_5S$) and about 500 mg of cefoperazone sodium ($C_{25}H_{26}N_9NaO_8SS$), dissolve in water to make 500 mL, and filter through a membrane filter with a pore size of 0.45 μm, and use this filtrate as the test solution. Separately, weigh accurately about 100 mg of sulbactam sodium RS and about 100 mg of cefoperazone sodium RS, add water to make 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions and determine the peak areas of sulbactam sodium and cefoperazone sodium, A_{T1}, A_{S1}, A_{T2} and A_{S2}, in each solution.

$$\text{Amount (mg) of sulbactam sodium } (C_8H_{11}NO_5S) = \text{Amount (mg) of sulbactam sodium RS} \times \frac{A_{T1}}{A_{S1}} \times 5$$

$$\text{Amount (mg) of cefoperazone sodium } (C_{25}H_{27}N_9O_8S_2) = \text{Amount (mg) of cefoperazone sodium RS} \times \frac{A_{T1}}{A_{S1}} \times 5$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 215 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 30 °C.

Mobile phase: Add 0.005 mol/L tetra n-butylammonium bromide solution containing 0.1% acetic acid to 350 mL of methanol to make exactly 1000 mL.

Flow rate: 1.0 mL/min

System suitability

System performance: Proceed with 10 μL of the standard solution according to the above operating conditions; sulbactam sodium and cefoperazone sodium are eluted in this order with the resolution between these peaks being NLT 9.0.

System repeatability: Repeat the test 6 times with 10 μL of the standard solution under the above operating conditions; the relative standard deviation of the peak areas of sulbactam sodium and cefoperazone sodium is NMT 1.0%.

Packaging and storage Preserve in hermetic containers.

Sulbactam Sodium·Piperacillin Sodium for Injection
주사용 설박탐나트륨·피페라실린나트륨

Sulbactam Sodium·Piperacillin Sodium for Injection, as an injection that is dissolved upon use, contains NLT 90.0% and NMT 120.0% of the labeled amount of sulbactam ($C_8H_{11}NO_5S$: 233.24) and piperacillin ($C_{23}H_{27}N_5O_7S$: 517.56), respectively.

Method of preparation Prepare as directed under Injections, with Sulbactam Sodium and Piperacillin Sodium.

Description Sulbactam Sodium·Piperacillin Sodium for

Injection occurs as a white to pale yellow powder or a mass.

Identification (1) *Sulbactam sodium*—The retention time of major peak of the test solution and the standard solution for Assay (1) is the same.

(2) ***Piperacillin sodium***—The retention time of major peak of the test solution and the standard solution for Assay (2) is the same.

pH Dissolve Sulbactam Sodium·Piperacillin Sodium for Injection in water to make 0.1 g (potency)/mL as piperacillin; the pH of the solution is between 7.0 and 9.0.

Sterility Meets the requirements.

Bacterial endotoxins Less than 6.67 EU per 100 mg of sulbactam sodium·piperacillin sodium.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Uniformity of dosage units Meets requirements.

Water NMT 1.0% (1.0 g, volumetric titration, direct titration)

Assay (1) *Sulbactam sodium*—Weigh accurately an amount of Sulbactam Sodium·Piperacillin Sodium for Injection equivalent to about 25 mg (potency) of sulbactam ($C_8H_{11}NO_5S$: 233.24) and about 25 mg (potency) of sulbactam RS, add the mobile phase to make exactly 100 mL, respectively, and use these solutions as the test solution and the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions and determine the peak areas of sulbactam, A_T and A_S, in each solution.

$$\text{Potency (μg) of sulbactam } (C_8H_{11}NO_5S) = \text{Potency (μg) of sulbactam RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 230 nm).

Column: A stainless steel column about 4 mm in internal diameter and 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 μm in particle diameter).

Mobile phase: A mixture of methanol, water, 0.2 mol/L sodium dihydrogen phosphate solution and 0.4 mol/L tetrabutylammonium hydroxide solution (450: 447 : 100 : 3).

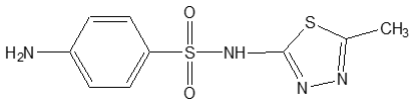
Flow rate: About 1.0 mL/min

(2) ***Piperacillin sodium***—Weigh accurately an amount of Sulbactam Sodium·Piperacillin Sodium for Injection equivalent to about 50 mg (potency) of piperacillin sodium ($C_{23}H_{27}N_5O_7S$) and about 50 mg (potency) of piperacillin sodium RS, add the mobile phase to make exactly 100 mL, respectively, and use these solutions as the test solution and the standard solution. Proceed with 10 μL each of the test solution and the standard solution, and perform the test according to the operating conditions as in the Assay (1), and determine the peak areas of piperacillin, A_T and A_S, in the test solution and the standard solution.

$$\text{Potency (μg) of piperacillin } (C_{23}H_{27}N_5O_7S) = \text{Potency (μg) of piperacillin RS} \times \frac{A_T}{A_S}$$

Packaging and storage Preserve in hermetic containers.

Sulfamethizole
설파메티졸



$C_9H_{10}N_4O_2S_2$: 270.33

4-Amino-*N*-(5-methyl-1,3,4-thiadiazol-2-yl) benzenesulfonamide [*144-82-1*]

Sulfamethizole, when dried, contains NLT 99.0% and NMT 101.0% of sulfamethizole ($C_9H_{10}N_4O_2S_2$).

Description Sulfamethizole occurs as white to pale yellowish white crystals or a crystalline powder, and is odorless.
It is slightly soluble in acetic acid(100) or ethanol(95) and practically insoluble in water or ether.
It dissolves in dilute hydrochloric acid or sodium hydroxide TS.
It is gradually colored by light.

Identification Determine the infrared spectra of Sulfamethizole and sulfamethizole RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Melting point Between 208 and 211 ℃.

Purity (1) ***Clarity and color of solution*—**Dissolve 0.5 g of Sulfamethizole in 3 mL of sodium hydroxide TS and 20 mL of water; the solution is colorless and clear.

(2) ***Acid*—**Dissolve 1.0 g of Sulfamethizole in 50 mL of water, warm at 70 ℃ for 5 minutes, allow to stand for 1 hour in iced water, and filter. To 25 mL of the filtrate, add 2 drops of methyl red TS and 0.60 mL of 0.1 mol/L sodium hydroxide; the solution exhibits a yellow color.

(3) ***Heavy metals*—**Proceed with 1.0 g of Sulfamethizole as directed under Method 2 and perform the test.

Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(4) ***Arsenic***—Prepare the test solution with 1.0 g of Sulfamethizole according to Method 3 and perform the test (NMT 2 ppm).

(5) ***Related substances***—Dissolve 0.10 g of Sulfamethizole in 10 mL of acetone and use this solution as the test solution. Pipet 1 mL of this solution and add acetone to make exactly 50 mL. Pipet 5 mL of this solution, add acetone to make exactly 20 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate and acetic acid(100) (20 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot obtained from the test solution are not more intense than the principal spot from the standard solution.

Loss on drying NMT 0.5% (1 g, 105 ℃, 4 hours).

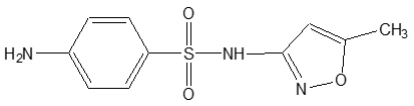
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.4 g of Sulfamethizole, previously dried, dissolve in 5 mL of hydrochloric acid and 50 mL of water to dissolve, add 10 mL of potassium bromide solution (3 in 10), and cool at NMT 15 ℃. Then, titrate with 0.1 mol/L sodium nitrite VS as directed in the potentiometric titration or amperometric titration under the Titrimetry.

Each mL of 0.1 mol/L sodium nitrite VS
= 27.033 mg of $C_9H_{10}N_4O_2S_2$

Packaging and storage Preserve in light-resistant, well-closed containers.

Sulfamethoxazole
설파메톡사졸



Sulfisomezole $C_{10}H_{11}N_3O_3S$: 253.28
4-Amino-*N*-(5-methyl-1,2-oxazol-3-yl)benzene-sulfonamide [*723-46-6*]

Sulfamethoxazole, when dried, contains NLT 99.0% and NMT 101.0% of sulfamethoxazole ($C_{10}H_{11}N_3O_3S$).

Description Sulfamethoxazole occurs as white crystals or a crystalline powder. It is odorless and has a slightly bitter taste.
It is very soluble in *N*,*N*-dimethylformamide, sparingly soluble in ethanol(95), slightly soluble in ether, and very slightly soluble in water.
It is soluble in sodium hydroxide TS.
It is gradually colored by light.

Identification Determine the infrared spectra of Sulfamethoxazole and sulfamethoxazole RS, when dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Melting point Between 169 and 172 ℃.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Sulfamethoxazole in 5 mL of sodium hydroxide TS and 20 mL of water; the solution is clear and colorless.

(2) ***Acidity***—Add 50 mL of water in 1.0 g of Sulfamethoxazole, heat at 70 ℃ for 5 minutes, let it stand in iced water for 1 hour, and filter. Add 2 drops of methyl red TS and 0.60 mL of 0.1 mol/L sodium hydroxide to 25 mL of the filtrate; the resulting solution exhibits a yellow color.

(3) ***Heavy metals***—Proceed with 1.0 g of Sulfamethoxazole according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(4) ***Arsenic***—Proceed with 1.0 g of Sulfamethoxazole according to Method 3 and perform the test (NMT 2 ppm).

(5) ***Selenium***—Weigh about 0.2 g of Sulfamethoxazole and combust as directed under the Oxygen Flask Combustion, using 25 mL of diluted nitric acid (1 in 30) as an absorbent. Use a combustion flask with a volume of 1000 mL, combust, wash the stopper and the inner wall of the flask with 10 mL of water, and use about 20 mL of water to move the solution in the combustion flask into a 150-mL beaker. Heat lightly until it boils, boil for 10 minutes, allow it to cool down at room temperature, and use this solution as the test solution. Separately, pipet 6.0 mL of standard selenium stock solution, add 25 mL of diluted nitric acid (1 in 30) and 25 mL of water, and use this solution as the standard solution. Add diluted ammonia water(28) (1 in 2) to each of the test and standard solutions, adjust the pH to 0.2, add water to dilute to 60 mL, and use 10 mL of water to move the solution to a separatory funnel. Then, wash the separatory funnel with 10 mL of water. Add 0.2 g of hydroxylamine hydrochloride, dissolve by stirring, add 5.0 mL of 2,3-diaminonaphthalene TS, and stopper. Mix by stirring and allow to stand at room temperature for 100 minutes. To the resulting mixture, add 5.0 mL of cyclohexane, shake hard for two minutes, and allow to stand. If the layer is separated, remove the water layer, centrifuge cyclohexane extracts, remove water, and take the cyclohexane layer. With these solutions, proceed in the same manner with a solution prepared by adding 25 mL of water to 25 mL of diluted nitric acid (1 in 30), and perform the test as directed under the Ultraviolet-visible Spectroscopy, using the resulting solution as the control solution. Determine

the absorbance at the absorbance maximum wavelength around 380 nm; the absorbance of the solution obtained from the test solution is not greater than that from the standard solution (NMT 30 ppm).

(6) ***Related substances***—Weigh 0.20 g of Sulfamethoxazole, dissolve in 10 mL of a mixture of ammonia water(28) and methanol (1 in 50), and use this solution as the test solution. Pipet 1 mL of this solution and use a mixture of ammonia water(28) and methanol (1 in 50) to make exactly 10 mL. Pipet 1 mL of this solution, use a mixture of ammonia water(28) and methanol (1 in 50) to make exactly 20 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of ethyl acetate, acetonitrile, and diluted ammonia water (7 in 100) (10:8:1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot obtained from the test solution are not more intense than the principal spots from the standard solution.

Loss on drying NMT 0.5% (1 g, 105 °C, 4 hours).

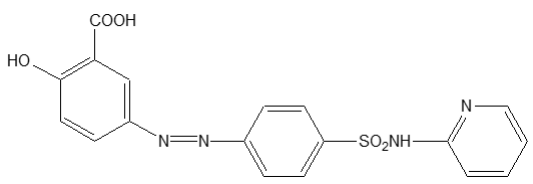
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.4 g of Sulfamethoxazole, previously dried, dissolve in 30 mL of *N*,*N*-dimethylformamide, add 10 mL of water, and titrate with 0.1 mol/L sodium hydroxide VS until the solution exhibits a pale blue color (indicator: 0.5 mL of thymolphthalein TS). Perform a blank test with a solution prepared by adding 26 mL of water to 30 mL of *N*,*N*-dimethylformamide in the same manner and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS
= 25.328 mg of $C_{10}H_{11}N_3O_3S$

Packaging and storage Preserve in light-resistant, well-closed containers.

Sulfasalazine
설파살라진



Salazosulfapyridine $C_{18}H_{14}N_4O_5S$: 398.39
6-Oxo-3-[[4-(pyridin-2-ylsulfamoyl)phenyl] hydrazinylidene]cyclohexa-1,4-diene-1-carboxylic acid [*599-79-1*]

Sulfasalazine, when dried, contains NLT 96.0% and NMT 101.0% of sulfasalazine ($C_{18}H_{14}N_4O_5S$).

Description Sulfasalazine occurs as a yellow to yellowish brown file powder. It is odorless and tasteless.
It is sparingly soluble in pyridine, slightly soluble in ethanol(95), and practically insoluble in water, chloroform or ether.
It dissolves in sodium hydroxide TS.

Melting point—Between 240 and 249 ℃ (with decomposition).

Identification (1) Dissolve 0.1 g of Sulfasalazine in 20 mL of dilute sodium hydroxide TS. The solution exhibits a reddish brown color. To this, slowly add 0.5 g of sodium hydrosulfite with shaking to mix. The reddish brown color of the solution slowly disappears. Use this solution for the test in (2) through (4) below.

(2) To 1 mL of the solution obtained under (1), add 40 mL of water, neutralize with 0.1 mol/L hydrochloric acid TS, and add water to make 50 mL. To 5 mL of this solution, add 2 to 3 drops of dilute iron(III) chloride TS; the solution exhibits a red color. To this, drop dilute hydrochloric acid; the solution initially exhibits a violet color which disappears later.

(3) The solution obtained under (1) responds to the Qualitative Analysis for primary aromatic amine.

(4) To 1 mL of the solution obtained under (1), add 1 mL of pyridine and 2 drops of copper(II) sulfate TS, and shake to mix. To this, add 3 mL of water and 5 mL of chloroform, shake to mix, and allow to stand; the chloroform layer exhibits a green color.

(5) Determine the absorption spectra of respective solutions of Sulfasalazine and sulfasalazine RS in dilute sodium hydroxide TS (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

Purity (1) ***Chloride***—Dissolve 2.0 g of Sulfasalazine in 12 mL of sodium hydroxide TS and 36 mL of water, add 2 mL of nitric acid, shake to mix, and filter. To 25 mL of the filtrate, add 6 mL of dilute nitric acid, and add water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 0.40 mL of 0.01 mol/L hydrochloric acid (NMT 0.014%).

(2) ***Sulfate***—Dissolve 2.0 g of Sulfasalazine in 12 mL of sodium hydroxide TS and 36 mL of water, add 2 mL of hydrochloric acid, shake to mix, and filter. To 25 mL of the filtrate, add 1 mL of dilute hydrochloric acid, and then water to make 50 mL. Perform the test, using this solution as the test solution. Prepare the control solution with 1.0 mL of 0.005 mol/L sulfuric acid (NMT 0.048%).

(3) ***Heavy metals***—Proceed with 1.0 g of Sulfasalazine as directed under Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(4) ***Arsenic***—Put 1.0 g of Sulfasalazine into a decomposition flask, add 20 mL of nitric acid, and heat at a low temperature until it becomes fluidized. After cooling,

add 5 mL of sulfuric acid and heat until white fumes appear. If necessary, after cooling, add 5 mL of nitric acid and heat again. Repeat this procedure until the solution becomes a colorless to pale yellow. After cooling, add 15 mL of saturated ammonium oxalate solution and heat again until white fumes appear. After cooling, add water to make 25 mL. Use 5 mL of this solution as the test solution and perform the test; it is not more intense than the following standard solution (NMT 10 ppm).

Standard solution—Proceed in the same manner without using Sulfasalazine. Put 5 mL of the solution in a generator bottle, add exactly 2 mL of arsenic standard solution, and proceed in the same manner as in the preparation of the test solution.

(5) ***Related substances***—Dissolve 0.20 g of Sulfasalazine in 20 mL of pyridine and use this solution as the test solution. Pipet 1 mL of this solution, add pyridine to make exactly 100 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of methanol and water (9 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot obtained from the test solution are not more intense than the spots from the standard solution.

(6) ***Salicylic acid***—To 0.10 g of Sulfasalazine, add 15 mL of ether, and shake hard to mix. To this, add 5 mL of dilute hydrochloric acid, and shake hard for 3 minutes to mix. Separate the ether layer, and filter it. To the water layer, add 15 mL of ether, and shake hard for 3 minutes to mix. Separate the ether layer, and filter it. Combine the filtrate with the previously obtained filtrate. Wash the residue on the filter paper with a small amount of ether, combine the filtrate and washings, and evaporate ether with the aid of a current of air at the room temperature. To the residue, add dilute ammonium iron(III) sulfate TS, shake to mix, and if necessary, filter. Wash the residue on the filter paper with a small amount of dilute ammonium iron(III) sulfate TS, and combine the filtrate and washings. To this, add dilute ammonium iron(III) sulfate TS to make exactly 20 mL, and use this solution as the test solution. Separately, weigh accurately about 10 mg of salicylic acid RS, previously dried for 3 hours in a desiccator (silica gel), dissolve in dilute ammonium iron(III) sulfate TS to make exactly 400 mL, and use this solution as the standard solution. With the test solution and the standard solution, perform the test as directed under the Ultraviolet-visible Spectroscopy and determine the absorbances of the test solution and the standard solution, A_T and A_S, at the wavelength 535 nm, using dilute ammonium iron(III) sulfate TS as the control solution; the amount of salicylic acid is NMT 0.5%.

Amount (mg) of salicylic acid ($C_7H_6O_3$)
= Amount (mg) of salicylic acid RS × $\frac{A_T}{A_S}$ × 0.05

Loss on drying NMT 1.0% (1 g, 105 ℃, 2 hours).

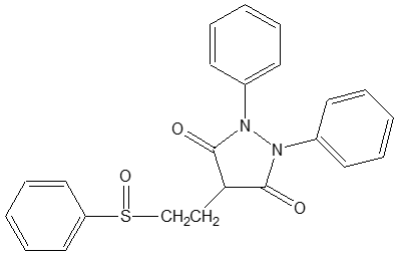
Residue on ignition NMT 0.2% (1 g).

Assay Weigh accurately about 20 mg of Sulfasalazine, previously dried, and perform the test with it as directed under the sulfur determination under the Oxygen Flask Combustion, using 10 mL of diluted hydrogen peroxide(30) solution (1 in 40) as the absorbent.

Each mL of 0.005 mol/L barium perchlorate VS
= 1.9920 mg of $C_{18}H_{14}N_4O_5S$

Packaging and storage Preserve in light-resistant, tight containers.

Sulfinpyrazone
설핀피라존



$C_{23}H_{20}N_2O_3S$: 404.48
4-[2-(Benzenesulfinyl)ethyl]-1,2-diphenylpyrazolidine-3,5-dione [*57-96-5*]

Sulfinpyrazone, when dried, contains NLT 98.5% and NMT 101.0% of sulfinpyrazone ($C_{23}H_{20}N_2O_3S$).

Description Sulfinpyrazone occurs as a white to pale yellowish white powder, is odorless, and has a bitter taste.
It is freely soluble in acetic acid(100) or acetone, soluble in ethanol(95), slightly soluble in ether, and practically insoluble in water.
It dissolves in sodium hydroxide TS.

Melting point—About 138 ℃ (with decomposition)

Identification (1) Dissolve 2 mg of Sulfinpyrazone in 1 mL of acetic acid(100), add 1 mL of palladium(II) chloride TS and 2 mL of chloroform, and shake to mix; the chloroform layer exhibits a yellow color.

(2) Determine the absorption spectra of solutions of Sulfinpyrazone and sulfinpyrazone RS in 0.01 mol/L sodium hydroxide TS (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared spectra of Sulfinpyrazone

and sulfinpyrazone RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Purity (1) ***Clarity and color of solution*—**Dissolve 0.5 g of Sulfinpyrazone in 10 mL of acetone; the solution is colorless and clear. Also, dissolve 0.5 g of Sulfinpyrazone in 10 mL of sodium hydroxide TS; the solution is colorless and clear.

(2) ***Heavy metals*—**Proceed with 2.0 g of Sulfinpyrazone as directed under Method 4 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Arsenic*—**Proceed with 1.0 g of Sulfinpyrazone as directed under Method 3 and perform the test (NMT 2 ppm).

(4) ***Related substances***—Dissolve 0.10 g of Sulfinpyrazone in 5 mL of acetone and use this solution as the test solution. Pipet 1 mL of this solution, add acetone to make exactly 100 mL, and use this solution as the standard solution (1). Separately, pipet 1 mL of the test solution, add acetone to make exactly 200 mL, and use this solution as the standard solution (2). With these solutions, perform the test as directed under the Thin Layer Chromatography. Quickly drop 5 μL each of the test solution, the standard solution (1) and the standard solution (2) on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography under the nitrogen gas flow. Develop the plate with a mixture of chloroform and acetic acid(100) (4 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the most intense spot other than the principal spot obtained from the test solution is not more intense than the spot from the standard solution (1). Also, the spots other than the principal spot and above spot obtained from the test solution are not more intense than the spots from the standard solution (2).

Loss on drying NMT 0.5% (1 g, 105 ℃, 2 hours).

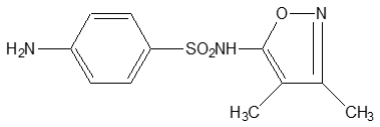
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.5 g of Sulfinpyrazone, previously dried, dissolve in 40 mL of acetone, add 40 mL of water, and titrate with 0.1 mol/L sodium hydroxide VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS
= 40.448 mg of $C_{23}H_{20}N_2O_3S$

Packaging and storage Preserve in well-closed containers.

Sulfisoxazole
설피속사졸



Sulfafurazole $C_{11}H_{13}N_3O_3S$: 267.30
4-Amino-*N*-(3,4-dimethylisoxazol-5-yl) benzenesulfonamide [*127-69-5*]

Sulfisoxazole, when dried, contains NLT 99.0% and NMT 101.0% of sulfisoxazole ($C_{11}H_{13}N_3O_3S$).

Description Sulfisoxazole occurs as white crystals or a crystalline powder. It is odorless and has a slightly bitter taste.
It is freely soluble in pyridine or *n*-butylamine, soluble in methanol, sparingly soluble in ethanol(95), slightly soluble in acetic acid(100), and very slightly soluble in water or ether.
It dissolves in dilute hydrochloric acid, sodium hydroxide TS or ammonia TS.
It is gradually colored by light.

Identification (1) Dissolve 0.01 g of Sulfisoxazole in 1 mL of dilute hydrochloric acid and 4 mL of water. The solution responds to the Qualitative Analysis for primary aromatic amine.

(2) Dissolve 0.02 g of the Sulfisoxazole in 5 mL of water and 1 mL of n-butylamine, add 2 to 3 drops of copper sulfate TS, and shake well to mix. To this solution, add 5 mL of chloroform, shake to mix, and allow to stand; the chloroform layer exhibits a bluish green color.

(3) Dissolve 0.01 g of Sulfisoxazole in 1 mL of pyridine, add 2 drops of copper sulfate TS, and shake well to mix. To this, add 3 mL of water and 5 mL of chloroform, shake to mix, and allow to stand; the chloroform layer exhibits a pale yellowish brown color.

(4) To 0.5 g of Sulfisoxazole, add 2 mL of acetic acid, and heat with a reflux condenser attached to dissolve. To this solution, add 1 mL of acetic anhydride, and boil for 10 minutes. Add 10 mL of water to cool, add about 7 mL of sodium hydroxide solution (3 in 10) to alkalize this solution, and if necessary, filter. To this solution, directly add acetic acid dropwise to acidify. Combine the formed precipitates, recrystallize with methanol, and dry at 105 ℃ for 1 hour; the melting point is between 208 and 210 ℃.

Melting point Between 192 and 196 ℃ (with decomposition).

Purity (1) ***Clarity and color of solution*—**Dissolve 1.0 g of Sulfisoxazole in 5 mL of sodium hydroxide TS and 20 mL of water; the solution is colorless and clear.

(2) ***Acid*—**Dissolve 1.0 g of Sulfisoxazole in 50 mL of water, warm at 70 ℃ for 5 minutes, allow to stand for 1 hour in iced water, and filter. To 25 mL of the filtrate,

add 2 drops of methyl red TS and 0.20 mL of 0.1 mol/L sodium hydroxide; the solution exhibits a yellow color.

(3) ***Heavy metals***—Proceed with 1.0 g of Sulfisoxazole as directed under Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(4) ***Selenium***—Burn 0.2 g of Sulfisoxazole as directed under the Oxygen Flask Combustion, using 25 mL of diluted nitric acid (1 in 30) as the absorbent. Use a 1 L volumetric flask as the combustion flask. After burning, wash the stopper and the inner wall of the flask with 10 mL of water, and use about 20 mL of water to move the solution in the combustion flask into a 150-mL beaker. Heat lightly until it boils, boil for 10 minutes, allow it to cool down to the room temperature, and use this solution as the test solution. Separately, pipet 6.0 mL of standard selenium stock solution, add 25 mL of diluted nitric acid (1 in 30) and 25 mL of water, and use this solution as the standard solution. To each of the test solution and the standard solution, add diluted ammonia water(28) (1 in 2) to adjust the pH to 2.0, and add water to dilute to 60 mL. Use 10 mL of water to move each to a respective separatory funnel, and wash the separatory funnel with 10 mL of water. To each, add 0.2 g of hydroxylamine hydrochloride, and stir to dissolve. Then, immediately add 5.0 mL of 2,3-diaminonaphthalene TS, put a stopper, stir to mix, and allow to stand at the room temperature for 100 minutes. To each, add 5.0 mL of cyclohexane, shake hard for 2 minutes, and allow to stand. If layers are separated, remove the water layer, centrifuge the cyclohexane extract to remove water from it, and take the cyclohexane layer. With these solutions, perform the test as directed under the Ultraviolet-visible Spectroscopy, using a control solution that is prepared by proceeding in the same manner using a solution of 25 mL of water in 25 mL of diluted nitric acid (1 in 30). Determine the absorbance at the absorption maximum wavelength about 380 nm; the absorbance of the test solution is not greater than the absorbance of the standard solution (NMT 30 ppm).

(5) ***Related substances***—Dissolve 10 mg of Sulfisoxazole in 1 mL of ethyl acetate and use this solution as the test solution. Separately, dissolve 1 mg of sulfisoxazole RS in 5 mL of ethyl acetate and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 20 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography, develop the plate with a mixture of acetone, cyclohexane and acetic acid(100) (5 : 4 : 1) as the developing solvent to a distance of about 15 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm and 365 nm); the spots other than the principal spot obtained from the test solution are not larger or not more intense than the spots from the standard solution (NMT 2.0%).

Loss on drying NMT 0.5% (2 g, 105 ℃, 4 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 1 g of Sulfisoxazole, previously dried, add 50 mL of methanol, and warm to dissolve. After cooling, titrate with 0.2 mol/L sodium hydroxide VS (indicator: 3 drops of phenolphthalein TS). Separately, perform a blank test in the same manner using a solution prepared by adding 18 mL of water to 50 mL of methanol and make any necessary correction.

Each mL of 0.2 mol/L sodium hydroxide VS
= 53.46 mg of $C_{11}H_{13}N_3O_3S$

Packaging and storage Preserve in light-resistant, well-closed containers.

Sulfisoxazole Tablets
설피속사졸 정

Sulfisoxazole Tablets contain NMT 95.0% and NLT 105.0% of the labeled amount of sulfisoxazole ($C_{11}H_{13}N_3O_3S$: 267.30).

Method of preparation Prepare as directed under Tablets, with Sulfisoxazole.

Identification Powder Sulfisoxazole Tablets, weigh an amount equivalent to about 1.0 g of sulfisoxazole, and add 50 mL of ethanol(95). Boil on a steam bath for 3 minutes to extract, and immediately filter into a beaker. Allow to stand until needle-like crystals are produced. After cooling, collect the crystals, recrystallize with a small amount of ethanol(95), and dry at 105 ℃. Determine the infrared spectra of the crystals and sulfisoxazole RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Dissolution Perform the test with 1 tablet of Sulfisoxazole Tablets at 100 revolutions per minute according to Method 1, using 900 mL of diluted hydrochloric acid (1 in 12.5) as the dissolution medium. Take NLT 20 mL of the dissolved solution 30 minutes after starting the test and filter through a membrane filter. Discard the first 10 mL of the filtrate, pipet 2 mL of the subsequent filtrate, add water to make exactly make 100 mL, and use this solution as the test solution. Separately, weigh accurately about 50 mg of sulfisoxazole RS and dissolve in diluted hydrochloric acid (1 in 12.5) to make exactly 100 mL. Pipet 2 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at the wavelength of 267 nm as directed under the Ultraviolet-visible Spectroscopy.

It meets the requirements if the dissolution rate of Sulfoi-

soxazole Tablets in 30 minutes is NLT 70%.

Dissolution rate (%) with respect to the labeled amount of sulfisoxazole ($C_{11}H_{13}N_3O_3S$)

$$= W_S \times \frac{A_T}{A_S} \times \frac{1}{C} \times 900$$

*W*s: Amount (mg) of sulfisoxazole RS

C: Labeled amount (mg) of sulfisoxazole ($C_{11}H_{13}N_3O_3S$) in 1 tablet

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 Sulfisoxazole Tablets and powder. Weigh accurately an amount, equivalent to about 20 mg of sulfisoxazole ($C_{11}H_{13}N_3O_3S$), shake for 15 minutes in methanol, extract to make exactly 50 mL, and filter. Discard the first 10 mL of the filtrate, pipet 5 mL of the subsequent filtrate and 8 mL of the internal standard solution, add methanol to make exactly 50 mL, and use this solution as the test solution. Separately, weigh accurately about 20 mg of sulfisoxazole RS, previously dried at 105 ℃ for 4 hours, and dissolve in methanol to make exactly 50 mL. Take exactly 5 mL of this solution and 8 mL of the internal standard solution, add methanol to make exactly 50 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak area ratios, Q_T and Q_S, of sulfisoxazole to the peak area of the internal standard.

Amount (mg) of sulfisoxazole ($C_{11}H_{13}N_3O_3S$)

$$= \text{Amount (mg) of sulfisoxazole RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—Dissolve about 20 mg of anhydrous caffeine RS in methanol to make 50 mL.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 15 cm to 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm to 10 μm in particle diameter).

Mobile phase: A mixture of water, methanol and acetic acid(95) (70 : 30 : 1).

Flow rate: Adjust the flow rate so that the retention time of sulfisoxazole is about 8 minutes.

System suitability

System performance: Proceed with 20 μL of the standard solution according to the above conditions; the internal standard and sulfisoxazole are eluted in this order with the resolution being NLT 2.0.

Packaging and storage Preserve in light-resistant, well-closed containers.

Sulfur
황

S: 32.07

[*7704-34-9*]

Sulfur, when dried, contains NLT 99.5% and NMT 101.0% of sulfur (S).

Description Sulfur occurs as a pale yellow to yellow powder. It is odorless and tasteless.
It is freely soluble in water and practically insoluble in water, ethanol(95), or ether.

Identification (1) Ignite Sulfur; it exhibits a blue flame and has an irritating odor of sulfur dioxide.

(2) To 5 mg of Sulfur, add 5 mL of sodium hydroxide TS, and dissolve on a steam bath by heating. After cooling, add 1 drop of sodium pentacyanonitrosylferrate(III) TS; the resulting solution exhibits a bluish purple color.

(3) To 1 mg of Sulfur, add 2 mL of pyridine and 0.2 mL of sodium bicarbonate TS, and boil; the resulting solution exhibits a blue color.

Purity (1) ***Clarity and color of solution***—To 1.0 g of Sulfur, add a mixture of 20 mL of sodium hydroxide solution (1 in 6) and 2 mL of ethanol(95), dissolve by boiling; the resulting solution is clear. Also, dissolve 2.0 g of Sulfur in 10 mL of carbon disulfide; most of it dissolves, or it is slightly turbid.

(2) ***Acid or alkali***—To 2.0 g of Sulfur, add 50 mL of freshly boiled and cooled water, shake to mix, and add 2 drops of phenolphthalein TS; the resulting solution does not exhibit a red color. To this solution, add 1.0 mL of 0.1 mol/L sodium hydroxide TS; the resulting solution exhibits a red color.

(3) ***Arsenic***—Prepare the test solution with 0.20 g of Sulfur, according to Method 3, and perform the test (NMT 10 ppm).

Loss on drying NMT 1.0% (1 g, NMT 0.67 kPa, silica gel, 4 hours).

Residue on ignition NMT 0.2% (1 g).

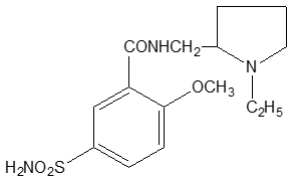
Assay Weigh accurately 0.4 g of Sulfur, previously dried, add 20 mL of potassium hydroxide-ethanol TS and 10 mL of water, dissolve by boiling, and add water to make exactly 100 mL. Pipet 25 mL of this solution, transfer into a 400-mL beaker, add 50 mL of hydrogen peroxide TS, and heat on a steam bath for 1 hour. Next, add dilute hydrochloric acid to make it acidic, add 200 mL of water, heat to boiling, and add barium chloride TS dropwise until a precipitate does not form; again, heat on a steam bath for 1 hour. Filter and collect the precipitate, and wash with water until the washings does not become turbid when silver nitrate TS is added, dry, and strongly heat to a constant mass. Weigh the amount and use it as barium sulfate ($BaSO_4$:

233.39). Perform a blank test in the same manner and make any necessary correction.

Amount (mg) of sulfur (S)
= Amount (mg) barium sulfate (BaSO4) × 0.13739

Packaging and storage Preserve in well-closed containers.

Sulpiride
설피리드



$C_{15}H_{23}N_3O_4S$: 341.43
N-[(1-ethylpyrrolidin-2-yl)methyl]-2-methoxy-5-sulfamoylbenzamide [*15676-16-1*]

Sulpiride, when dried, contains NLT 98.5% and NMT 101.0% of sulpiride ($C_{15}H_{23}N_3O_4S$).

Description Sulpiride occurs as a white crystalline powder and is odorless.
It is freely soluble in acetic acid(100) or dilute acetic acid, sparingly soluble in methanol, slightly soluble in ethanol(95) or acetone, and practically insoluble in water, chloroform or ether.
It dissolves in dilute hydrochloric acid or 0.05 mol/L sulfuric acid TS.

Melting point—Between 175 and 182 ℃ (with decomposition).

Identification (1) Dissolve 0.1 g each of Sulpiride and sulpiride RS in 0.05 mol/L sulfuric acid TS to make 100 mL each. To 5 mL each of the respective solutions, add water to make 100 mL. Determine the absorption spectra of the respective resulting solutions as directed under the Ultraviolet-visible Spectroscopy, using water as the control solution; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Sulpiride and sulpiride RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Purity (1) ***Clarity and color of solution***—Dissolve 2.0 g of Sulpiride in 7 mL of dilute acetic acid and add water to make 20 mL; the solution is clear. Also, determine the absorbance of this solution at the wavelength 450 nm, as directed under the Ultraviolet-visible Spectroscopy, using water as the control solution; the absorbance is NMT 0.020.

(2) ***Heavy metals***—Proceed with 2.0 g of Sulpiride as directed under Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Related substances***—Dissolve 50 mg of Sulpiride in 10 mL of methanol and use this solution as the test solution. Pipet 1 mL of the test solution and add methanol to make exactly 100 mL. Pipet 5 mL of this solution, add methanol to make exactly 10 mL, and use it as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 20 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of 1-butanol, water and acetic acid(100) (4 : 2 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot obtained from the test solution are not more intense than the spots from the standard solution. Also, allow the plate to stand for 30 minutes in iodine vapor; the spots other than the principal spot from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 0.5% (1 g, 105 ℃, 3 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.4 g of Sulpiride, previously dried, dissolve in 80 mL of acetic acid(100), and titrate with 0.1 mol/L perchloric acid VS (indicator: 2 drops of methylosaniline chloride TS). However, the endpoint of the titration is when the violet color of this solution turns to the blue color and then finally to the bluish green color. Perform a blank test in the same manner and make any necessary correction.

Each mL of perchloric acid VS
= 34.143 mg of $C_{15}H_{23}N_3O_4S$

Packaging and storage Preserve in well-closed containers.

Sulpiride Capsules
설피리드 캡슐

Sulpiride Capsules contain NLT 95.0% and NMT 105.0% of the labeled amount of sulpiride ($C_{15}H_{23}N_3O_4S$: 341.43).

Method of preparation Prepared as directed under Capsules, with Sulpiride.

Identification Weigh an amount of Sulpiride Capsules, equivalent to 0.5 g of sulpiride according to the labeled amount, add methanol to make 50 mL, filter, and use the filtrate as the test solution. Separately, weigh about 0.5 g

of sulpiride RS, add methanol to make 50 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with methanol as the developing solvent, and air-dry the plate. Examine the plate under ultraviolet light; the R_f values of the spots obtained from the test solution and the standard solution are the same.

Dissolution Perform the test with 1 capsule of Sulpiride Capsules at 50 revolutions per minute according to Method 2, using 900 mL of 0.05 mol/L sodium acetate buffer solution, pH 4.0, as the dissolution medium. Take the dissolved solution 45 minutes after starting the dissolution test and filter it. Discard the first 10 mL of the filtrate, pipet *V* mL of the subsequent filtrate, add the dissolution medium to make exactly *V'* mL of a solution containing about 50 μg of sulpiride per mL according to the labeled amount, and use this solution as the test solution. Separately, weigh accurately 25 mg of sulpiride RS, and dissolve in the dissolution medium to make 100 mL. Take exactly 10 mL of this solution, add the dissolution medium to make exactly 50 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions, and determine the peak areas, A_T and A_S, of sulpiride in each solution. Meets the requirements if the dissolution rate of Sulpiride Capsules in 45 minutes is NLT 70%.

$$\text{Dissolution rate (\%) of the labeled amount of sulpiride } (C_{15}H_{23}N_3O_4) = W_S \times \frac{V'}{V} \times \frac{A_T}{A_S} \times \frac{1}{C} \times \frac{900}{5}$$

*W*s: Amount (mg) of sulpiride RS

C: Labeled amount (mg) of sulpiride ($C_{15}H_{23}N_3O_4S$) in 1 capsule

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 240 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 30 °C.

Mobile phase: Dissolve 6.8 g of potassium dihydrogen phosphate in 1000 mL of water. Separately, dissolve 1 g of sodium 1-octanesulfonate in 1000 mL of water, and combine these two solutions to make 2000 mL. To this solution, add phosphoric acid to adjust the pH to 3.3. To 800 mL of this solution, add 100 mL of methanol and 100 mL of acetonitrile.

Flow rate: 1.5 mL/min

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of the contents of NLT 20 capsules of Sulpiride Capsules. Weigh accurately an amount of the contents, equivalent to about 100 mg of sulpiride ($C_{15}H_{23}N_3O_4S$), and add the mobile phase to make 100 mL. After filtering this solution, take 10 mL of the filtrate, add the mobile phase to make exactly 200 mL, and use this solution as the test solution. Separately, weigh accurately 100 mg of sulpiride RS, and add the mobile phase to make 100 mL. Pipet 10 mL of this solution, add the mobile phase to make exactly 200 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions, and determine the peak areas, A_T and A_S, of sulpiride in each solution.

$$\text{Amount (mg) of sulpiride } (C_{15}H_{23}N_3O_4S) = \text{Amount (mg) of sulpiride RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 240 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 30 °C.

Mobile phase: A mixture of sodium octanesulfonate-phosphoric acid solution, methanol and acetonitrile (80 : 10 : 10).

Flow rate: 1.5 mL/min

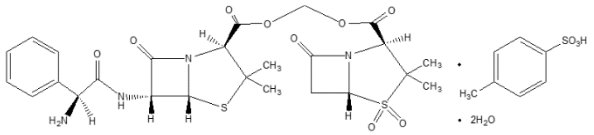
System suitability

System repeatability: Repeat the test 6 times with 10 mL of the standard solution according to the above conditions; the relative standard deviation of the peak areas of sulpiride is NMT 2.0%.

Sodium octanesulfonate-phosphoric acid solution—Add 6.8 g of potassium dihydrogen phosphate to water to make 1000 mL, and mix with a solution of 1 g of sodium 1-octanesulfonate dissolved in 1000 mL of water to make 2000 mL. To this solution, add phosphoric acid to adjust the pH to 3.3.

Packaging and storage Preserve in tight containers.

Sultamicillin Tosilate Hydrate
설타미실린토실산염수화물



$C_{25}H_{30}N_4O_9S_2 \cdot C_7H_8O_3S \cdot 2H_2O$: 802.89
(3*S*)-2,2-dimethyl-1,1-dioxo-1λ^6-penam-3-carbonyloxymethyl (3*S*)-2,2-dimethyl-6b-[(2*R*)-2-amimo-2-phenylactamido]penam-3-carboxylate [*83105-70-8*, anhydride]

Sultamicillin Tosilate Hydrate contains NLT 698 μg and NMT 800 μg (potency) per mg of sultamicillin ($C_{25}H_{30}N_4O_9S_2$: 594.66), calculated on the anhydrous basis and corrected by the amount of solvent.

Method of preparation If there is any possibility of alkyl toluenesulfonate esters (methyl, ethyl, isopropyl, etc.) to be inserted as the potential impurities according to the manufacturing process of Sultamicillin Tosilate Hydrate, take caution with starting material, manufacturing process, and intermediate material control to minimize the residue of impurities in consideration of risk assessment results. If needed, the manufacturing process can be justified by the test data proving that there is no quality risk in final drug substances.

Description Sultamicillin Tosilate Hydrate occurs as a white to yellow crystalline powder.
It is freely soluble in acetonitrile, methanol or ethanol(99.5), and very slightly soluble in water.

Identification Determine the infrared spectra of Sultamicillin Tosilate Hydrate and sultamicillin tosilate hydrate RS as directed in the paste method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Optical rotation $[\alpha]_D^{20}$: Between +173° and +187° (0.5 g, calculated on the anhydrous basis, a mixture of water and acetonitrile (3:2), 25 mL, 100 mm).

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Sultamicillin Tosilate Hydrate according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Arsenic***—Proceed with 1.0 g of Sultamicillin Tosilate Hydrate according to Method 3 and perform the test (NMT 2 ppm).

(3) ***Ampicillin***—Perform this procedure quickly. Weigh accurately about 20 mg of Sultamicillin Tosilate Hydrate, dissolve in the mobile phase to make exactly 50 mL, and use this solution as the test solution. Separately, weigh accurately an amount equivalent to about 20 mg (potency) of sultamicillin tosilate hydrate RS and dissolve in the mobile phase to make exactly 100 mL. Pipet 6 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 25 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak area of ampicillin in each solution by the automatic integration method; the peak area of the test solution is not greater than that of the standard solution.

Operating conditions

For the detector, column, and column temperature, perform the test as directed under the operating conditions under the Assay.

Mobile phase: Dissolve by adding 3.12 g of sodium dihydrogen phosphate dihydrate to about 750 mL of water, adjust the pH to 3.0 by using diluted phosphoric acid (1 in 10), and add water to make 1000 mL. Add this solution to 80 mL of acetonitrile for liquid chromatography to make 1000 mL.

Flow rate: Adjust the flow rate so that the retention time of ampicillin is about 14 minutes.

System suitability

System performance: Dissolve 12 mg of ampicillin RS, 4 mg of sulbactam RS, and 4 mg of *p*-toluenesulfonic acid monohydrate in 1000 mL of the mobile phase. Proceed with 25 μL of this solution according to the above conditions; sulbactam, *p*-toluenesulfonic acid, and ampicillin are eluted in this order with each resolution being NLT 2.0.

System repeatability: Repeat the test 6 times with 25 μL each of the standard solutions according to the above conditions; the relative standard deviation of peak areas of ampicillin is NMT 2.0%.

(4) ***Sulbactam***—Perform this procedure quickly. Weigh accurately about 20 mg of Sultamicillin Tosilate Hydrate, dissolve in the mobile phase to make exactly 50 mL, and use this solution as the test solution. Separately, weigh accurately an amount equivalent to about 20 mg (potency) of sulbactam RS and dissolve in the mobile phase to make exactly 100 mL. Pipet 2 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 25 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak area of sulbactam in each solution according to the automatic integration method; the peak area of the test solution is not greater than that of the standard solution.

Operating conditions

Perform the test as directed under the operating conditions under the Purity (3).

System suitability

Perform the test as directed under the system suitability under the Purity (3).

(5) ***Penicillic acid***—Weigh accurately about 25 mg of Sultamicillin Tosilate Hydrate, transfer to a 100-mL flask with a stopper, dissolve in 1 mL of acetonitrile, and

add 25 mL of 0.02 mol/L phosphate buffer (pH 3.0). Add exactly 5 mL of 0.005 mol/L iodine to this solution, cover the flask with the stopper tightly, let it stand for 5 minutes, and titrate with 0.005 mol/L sodium thiosulfate VS (indicator: 1.0 mL of starch TS). Perform a blank test in the same manner, and make any necessary correction; the amount of penicillic acid ($C_{25}H_{34}N_4O_{11}S_2$: 630.69) is NMT 3.0%.

Each mL of 0.005 mol/L sodium thiosulfate VS
= 0.2585 mg of $C_{25}H_{34}N_4O_{11}S_2$

(6) ***Residual solvent***—Weigh accurately about 0.1 g of Sultamicillin Tosilate Hydrate, dissolve in 2 mL of methanol, add water to make exactly 20 mL, and use this solution as the test solution. Separately, weigh accurately about 1 g of ethyl acetate and mix it evenly with water to make exactly 200 mL. Pipet 2 mL of this solution, add 10 mL of methanol, add water again to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 5 μL each of the test solution and the standard solution as directed under the Gas Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of ethyl acetate. Calculate the amount of ethyl acetate according to the following equation; it is NMT 2.0%.

$$\text{Content (\%) of ethyl acetate} = \frac{Potency\ (mg)\ of\ ethyl\ acetate}{W_T} \times \frac{A_T}{A_S} \times \frac{1}{5}$$

W_T: Amount (mg) of Sultamicillin Tosilate Hydrate taken

Operating conditions

Detector: A hydrogen flame ionization detector.

Column: Column: A column of about 3 mm in internal diameter and about 3 m in length, packed with porous styrene–divinylbenzene copolymer for gas chromatography of 150 μm to 180 μm in particle diameter (average pore size: 8.5 nm; specific surface area: 300 to 400 m^2/g).

Column temperature: A constant temperature of about 155 °C.

Carrier gas: Nitrogen

Flow rate: Adjust the flow rate so that the retention time of ethyl acetate is about 6 minutes.

System suitability

System performance: Proceed with 5 μL of the standard solution according to the above conditions; the number of theoretical plates of the ethyl acetate peak is NLT 500, and the symmetry factor is NMT 1.5.

System repeatability: Repeat the test 6 times with 5 μL each of standard solutions according to the above conditions; the relative standard deviation of the peak area of ethyl acetate is NMT 5%.

Water Between 4.0% and 6.0% (0.5 g, volumetric titration, direct titration).

Residue on ignition NMT 0.2% (1 g).

Assay Perform this procedure quickly. Weigh accurately about 50 mg (potency) of Sultamicillin Tosilate Hydrate and sultamicillin tosilate hydrate RS, and dissolve each in the mobile phase to make exactly 50 mL. With 5 mL each of these solutions, add exactly 5 mL of the internal standard solution to each, put the mobile phase to make 25 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 10 μL each of these solutions as directed under the Liquid Chromatography according to the following conditions and calculate the peak area ratios, Q_T and Q_S, of sultamicillin to the internal standard, respectively.

Potency (mg) of sultamicillin ($C_{25}H_{30}N_4O_9S_2$)
= Potency (mg) of sultamicillin tosilate hydrate RS× $\frac{Q_T}{Q_S}$

Internal standard solution—A solution of isopropyl 4-aminobenzoate in the mobile phase (1 in 2500).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 215 nm).

Column: A stainless steel column about 3.9 mm in internal diameter and about 30 cm in length, packed with octadecylsilanized silical gel for liquid chromatography (10 μm in particle diameter).

Column temperature: A constant temperature of about 35 °C.

Mobile phase: Dissolve 3.12 g of sodium dihydrogen phosphate dihydrate in about 750 mL of water, adjust the pH to 3.0 with diluted phosphoric acid (1 in 10), and add water to make 1000 mL. Add this solution to 400 mL of acetonitrile for liquid chromatography to make 1000 mL.

Flow rate: Adjust the flow rate so that the retention time of sultamicillin is about 4 minutes.

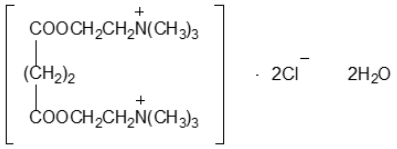
System suitability

System performance: Proceed with 10 μL of the standard solution according to the above conditions; *p*-toluenesulfonic acid, sultamicillin, and the internal standard are eluted in this order with each resolution being NLT 2.0.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solutions according to the above conditions; the relative standard deviation of the peak area of sultamicillin is NMT 2.0%.

Packaging and storage Preserve in tight containers.

Suxamethonium Chloride Hydrate
숙사메토늄염화물수화물



Suxamethonium Chloride

$C_{14}H_{30}Cl_2N_2O_4 \cdot 2H_2O$: 397.34

N,*N*,*N*,*N'*,*N'*,*N'*-Hexamethyl-3,8-dioxa-4,7-dioxodecane-1,10-diaminium dichloride dihydrate [*6101-15-1*]

Suxamethonium Chloride Hydrate contains NLT 98.0% and NMT 101.0% of suxamethonium chloride ($C_{14}H_{30}Cl_2N_2O_4$: 361.31), calculated on the anhydrous basis.

Description Suxamethonium Chloride Hydrate occurs as a white crystalline powder.
It is freely soluble water, methanol and acetic acid(100), slightly soluble in ethanol(95), very slightly soluble in acetic anhydride, and practically insoluble in ether.

Identification (1) Determine the infrared spectra of Suxamethonium Chloride Hydrate and suxamethonium chloride RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) An aqueous solution of Dilazep Hydrochloride Hydrate (1 in 20) responds to the Qualitative Analysis for chloride.

Melting point Between 159 and 164 °C (hydrate form).

pH Dissolve 1.0 g of Suxamethonium Chloride Hydrate in 10 mL of water; the pH of this solution is between 4.0 and 5.0.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Suxamethonium Chloride Hydrate in 10 mL of water; the solution is clear and colorless.

(2) ***Related substances***—Dissolve 0.25 g of Suxamethonium Chloride Hydrate in 5 mL of water, and use this solution as the test solution. Pipet 1 mL of the test solution, add water to make exactly 200 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 1 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of cellulose for thin-layer chromatography. Develop the plate with a mixture of ammonium acetate (1 in 100), acetone, n-butanol and formic acid (20 : 20 : 20 : 1) to a distance of about 10 cm, and dry the plate at 105 °C for 15 minutes. Spray evenly hexachloroplatinic(IV) acid-potassium iodide TS on the plate, and allow to stand for 15 minutes; the spots other than the principal spot obtained from the test solution are not more intense than the spots from the standard solution.

Water Between 8.0% and 10.0% (0.4 g, volumetric titration, direct titration).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.4 g of Suxamethonium Chloride Hydrate, dissolve in 80 mL of a mixture of acetic anhydride and acetic acid(100) (7 : 3), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 18.065 mg of $C_{14}H_{30}Cl_2N_2O_4$

Packaging and storage Preserve in tight containers.

Suxamethonium Chloride Injection
숙사메토늄염화물 주사액

Suxamethonium Chloride Injection is an aqueous solution for injection. Suxamethonium Chloride Injection contains NLT 93.0% and NMT 107.0% of the labeled amount of suxamethonium chloride ($C_{14}H_{30}Cl_2N_2O_4$: 361.31).

The concentration of Suxamethonium Chloride Injection is indicated as the amount of suxamethonium chloride ($C_{14}H_{30}Cl_2N_2O_4$).

Method of preparation Prepare as directed under Injections, with Suxamethonium Chloride Hydrate.

Description Suxamethonium Chloride Injection occurs as a colorless and clear liquid.

Identification Weigh an amount of Suxamethonium Chloride Injection, equivalent to 50 mg of Suxamethonium Chloride Hydrate according to the labeled amount, dissolve in water to make 10 mL, and use this solution as the test solution. Separately, dissolve 50 mg of suxamethonium chloride hydrate RS in 10 mL of water and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 1 μL each of the test solution and the standard solution on a plate of cellulose for thin-layer chromatography. Develop the plate with a mixture of ammonium acetate (1 in 100), acetone, n-butanol and formic acid (20 : 20 : 20 : 1) as the developing solvent to a distance of about 10 cm, and dry the plate at 105 °C for 15 minutes. Spray evenly hexachloroplatinic (IV) acid-potassium iodide TS on the plate; the spots from the test solution and the standard solution are bluish purple and have the same R_f values.

pH Between 3.0 and 5.0.

Purity ***Related substances***—Perform the test as directed under the Assay; the amount of 0.1 mol/L sodium hydroxide VS required for the initial neutralization is NMT 0.7 mL per 0.2 g of suxamethonium chloride

($C_{14}H_{30}Cl_2N_2O_4$).

Sterility Meets the requirements.

Bacterial endotoxins Less than 2.0 EU per mg of suxamethonium chloride.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Extractable volume of injections Meets the requirements.

Assay Pipet an amount of Suxamethonium Chloride Injection, equivalent to about 0.2 g of suxamethonium chloride ($C_{14}H_{30}Cl_2N_2O_4$), transfer to a separatory funnel, add 30 mL of freshly boiled and cooled water, and wash 5 times with each 20 mL of ether. Combine the ether washings and extract the combined ether layer with two 10 mL volumes of freshly boiled and cooled water. Combine these extracts and wash twice with each 10 mL of ether. Combine the resulting aqueous layer with the aqueous solution obtained above, add 2 drops of bromothymol blue TS, and neutralize with 0.1 mol/L sodium hydroxide. Add exactly 25 mL of 0.1 mol/L sodium hydroxide and boil under a reflux condenser for 40 minutes. After cooling, titrate the excess sodium hydroxide with 0.1 mol/L hydrochloric acid VS. Add 50 mL of freshly boiled and cooled water to a flask, add 2 drops of bromothymol blue TS, and neutralize with 0.1 mol/L sodium hydroxide. Perform a blank test in the same manner.

Each mL of 0.1 mol/L sodium hydroxide VS
= 18.065 mg of $C_{14}H_{30}Cl_2N_2O_4$

Packaging and storage Preserve in well-closed containers. Avoid freezing and keep at a temperature not exceeding 5 ℃.

Expiration date 12 months from the date of manufacture.

Suxamethonium Chloride for Injection
주사용 숙사메토늄염화물

Suxamethonium Chloride for Injection

Suxamethonium Chloride for Injection contains NLT 93.0% and NMT 107.0% of labeled amount of suxamethonium chloride ($C_{14}H_{30}Cl_2N_2O_4$: 361.31).

The concentration of Suxamethonium Chloride for Injection is expressed as the amount of suxamethonium chloride ($C_{14}H_{30}Cl_2N_2O_4$).

Method of preparation Prepare as directed under Injections, with Suxamethonium Chloride Hydrate.

Description Suxamethonium Chloride for Injection occurs as a white, crystalline powder or a mass.

Identification Weigh an amount of Suxamethonium Chloride for Injection, equivalent to 50 mg of suxamethonium chloride hydrate, according to the labeled amount, dissolve in water to make 10 mL, and use this solution as the test solution. Separately, dissolve 50 mg of suxamethonium chloride hydrate RS in 10 mL of water, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 1 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of cellulose for thin-layer chromatography, develop the plate with a mixture of ammonium acetate (1 in 100), acetone, 1-butanol and formic acid (20 : 20 : 20 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate at 105 ℃ for 15 minutes. Spray evenly hexachloroplatinic(IV) acid-potassium iodide TS on the plate; the colors of the spots from the test solution and the standard solution exhibit a bluish purple color, and their R_f values are the same.

pH Dissolve 0.1 g of Suxamethonium Chloride for Injection in 10 mL of water; the pH of this solution is 4.0 to 5.0.

Purity ***Related substances***—Weigh an amount of Suxamethonium Chloride for Injection, equivalent to 0.25 g of Suxamethonium Chloride Hydrate, according to the labeled amount, and perform the test as directed under the Purity (2) of Suxamethonium Chloride Hydrate.

Sterility Meets the requirements.

Bacterial endotoxins Less than 1.5 EU per mg of suxamethonium chloride.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

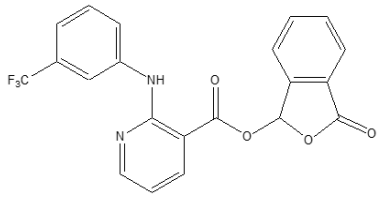
Uniformity of dosage units Meets the requirements.

Assay Take NLT 10 samples of Suxamethonium Chloride for Injection, weigh accurately about 0.5 g of the mass, and perform the test as directed under the Assay of Suxamethonium Chloride Hydrate.

Each mL of 0.1 mol/L perchloric acid VS
= 18.065 mg of $C_{14}H_{30}Cl_2N_2O_4$

Packaging and storage Preserve in hermetic containers.

Talniflumate
탈니플루메이트



$C_{21}H_{13}F_3N_2O_4$: 414.33

(3-Oxo-1*H*-2-benzofuran-1-yl)2-[3-(trifluoromethyl)anilino]pyridine-3-carboxylate, [*66898-62-2*]

Talniflumate contains NLT 98.0% and NMT 102.0% of talniflumate ($C_{21}H_{13}F_3N_2O_4$), calculated on the anhydrous basis.

Description Talniflumate occurs as a white to pale yellow crystalline powder. It is odorless and tasteless.

Identification (1) Determine the infrared spectra of Talniflumate and talniflumate RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) Dissolve about 20 mg of Talniflumate in 5 mL of ethyl acetate, and add methanol to make 100 mL. Take 10.0 mL of this solution, and add methanol to make 100 mL. Determine the absorption spectrum of this solution as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum at the wavelength of about 285 nm.

(3) To 10 mg of Talniflumate, add 1 to 2 drops of 4.5% sodium hydroxide solution, mix with acetone, and add 1 drop of 10% copper sulfate solution; a yellowish green precipitate is formed.

(4) Dissolve 0.1 g of Talniflumate in methanol to make 100 mL, and use this solution as the test solution. Weigh 0.1 g of talniflumate RS, add methanol to make 100 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of heptane and ethanol (100 : 1.5) as the developing solvent, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 365 nm); the R_f value and the color of the spots obtained from the test solution and the standard solution are identical.

Melting point Between 165 and 167 ℃.

Purity Weigh accurately about 0.2 g of Talniflumate, add acetonitrile to make 100 mL, and use this solution as the test solution. Separately, weigh accurately about 20 mg of 2-(3-trifluoromethyl)anilino nicotinic acid RS, dissolve in methanol to make 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions; the amount of 2-(3-trifluoromethyl)anilino nicotinic acid is NMT 1%.

$$\text{Content (\%) of related substances} = 100 \times \frac{C_S}{C_T} \times \frac{A_i}{A_S}$$

C_S: Concentration (mg/mL) of 2-(3-trifluoromethyl)anilino nicotinic acid in the standard solution

C_T: Concentration (mg/mL) of Talniflumate in the test solution

A_i: Peak area of related substances obtained from the test solution

A_s: Peak area of 2-(3-trifluoromethyl)anilino nicotinic acid obtained from the standard solution

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 280 nm).

Column: A stainless steel column 4 mm in internal diameter and about 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm to 10 μm in particle diameter).

Mobile phase: A mixture of acetonitrile, 0.1% phosphoric acid, and methanol (76 : 19 : 5).

Flow rate: 1 mL/min

Water NMT 1.0% (0.2 g, volumetric titration, direct titration).

Assay Weigh accurately about 0.5 g of Talniflumate, dissolve in 50 mL of acetic acid(100) by gently heating, and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 41.43 mg of $C_{21}H_{13}F_3N_2O_4$

Packaging and storage Preserve in well-closed containers.

Talniflumate Tablets
탈니플루메이트 정

Talniflumate Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of talniflumate ($C_{21}H_{13}F_3N_2O_4$: 414.33).

Method of preparation Prepare as directed under Tablets, with Talniflumate.

Identification The retention times of the major peaks obtained from the test solution and the standard solution

under the Assay are the same.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 tablets of Talniflumate Tablets and powder them. Weigh accurately an amount of the powder, equivalent to about 35 mg of talniflumate ($C_{21}H_{13}F_3N_2O_4$), and add acetonitrile to make 100 mL. Take 5 mL of this solution, add acetonitrile to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 35 mg of talniflumate RS, proceed in the same manner as in the preparation of the test solution, and use the resulting solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas for talniflumate, A_T and A_S, in the test solution and the standard solution, respectively.

$$\text{Amount (mg) talniflumate } (C_{21}H_{13}F_3N_2O_4) = \text{Amount (mg) of talniflumate RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 287 nm).

Column: A stainless steel column about 4 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of acetonitrile and 0.1% phosphoric acid (80 : 20).

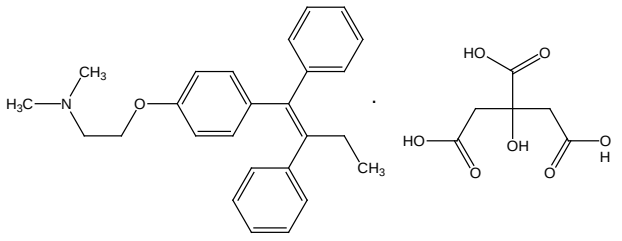
Flow rate: 1.0 mL/min

System suitability

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution according to the above conditions; the relative standard deviation is NMT 2.0%.

Packaging and storage Preserve in well-closed containers.

Tamoxifen Citrate
타목시펜시트르산염



$C_{26}H_{29}NO \cdot C_6H_8O_7$: 563.64

2-[4-[(*Z*)-1,2-Diphenylbut-1-enyl]phenoxy]-*N*,*N*-dimethylethanamine;2-hydroxypropane-1,2,3-tricarboxylic acid [*54965-24-1*]

Tamoxifen Citrate, when dried, contains NLT 99.0% and NMT 101.0% of tamoxifen citrate ($C_{26}H_{29}NO \cdot C_6H_8O_7$).

Description Tamoxifen Citrate occurs as a white fine crystalline powder.

It is freely soluble in acetic acid(100), sparingly soluble in methanol, and very slightly soluble in water or ethanol(95).

Melting point—About 142 ℃ (with decomposition).

Identification (1) Determine the absorption spectra of solutions of Tamoxifen Citrate and tamoxifen citrate RS in methanol (1 in 50000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Tamoxifen Citrate and tamoxifen citrate RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) An aqueous solution of Tamoxifen Citrate (1 in 100) responds to the Qualitative Analysis for citrate.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Tamoxifen Citrate as directed under Method 2 and perform the test. Prepare the control solution with 1.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Iron***—Proceed with 1.0 g of Tamoxifen Citrate as directed under Method 3 and use this solution as the test solution. Separately, pipet 5.0 mL of iron standard solution, proceed in the same manner as the test solution, and use this solution as the control solution. Proceed with the test solution and the control solution according to Method A; the test solution is not more intense than the control solution (NMT 50 ppm).

(3) ***E-isomer***—Weigh accurately about 30 mg of Tamoxifen Citrate, dissolve in the mobile phase to make exactly 50 mL, and use this solution as the test solution. Separately, weigh accurately about 30 mg of tamoxifen citrate RS, dissolve in the mobile phase to make exactly 50 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak area, A_T and A_S, of citrate ($C_{26}H_{29}NO \cdot C_6H_8O_7$) of the E-isomer of each solution (NMT 0.3%)

$$\text{Amount (mg) of E-isomer } (C_{26}H_{29}NO \cdot C_6H_8O_7) = 0.05 \times C \times \frac{A_T}{A_S}$$

C: The concentration (μg/mL) of the E-isomer of citrate ($C_{26}H_{29}NO \cdot C_6H_8O_7$) as indicated on the standard solution for tamoxifen citrate RS

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.0 mm in internal diameter and about 30 cm in length, packed with phenyl silica gel for liquid chromatography (5 μm to 10 μm in particle diameter).

Mobile phase: Dissolve 2 mL of acetic acid(100) and 1.08 g of sodium 1-octanesulfonate in 320 mL of water, and add methanol to make 1000 mL.

Flow rate: 0.7 mL/min

System suitability

System performance: Proceed with 20 μL of the standard solution according to the above conditions; the relative retention time of the E-isomer peak to the Z-isomer peak is NMT 0.93.

System repeatability: Repeat the test 5 times with 20 μL of the standard solution according to the above conditions; the relative standard deviation of the peak area of tamoxifen is NMT 3.0%.

(4) ***Related substances***—Perform the test quickly using a light-resistant container. Weigh accurately about 15 mg of Tamoxifen Citrate, dissolve in the mobile phase to make 10 mL, and use this solution as the test solution. Pipet 1 mL of this solution, add the mobile phase to make 100 mL, and use this solution as the standard solution. Pipet 10 μL each of the test solution and the standard solution and perform the test as directed under the Liquid Chromatography according to the following conditions. Determine the peak area from each of the solutions according to the automatic integration method; the peak area other than the tamoxifen peak from the test solution is not greater than 3/10 the peak area of tamoxifen from the standard solution. Also, the total area of the peaks other than tamoxifen from the test solution is not greater than 4/ 5 of the peak area of tamoxifen from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 240 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 ℃.

Mobile phase: Dissolve 4.8 g of *N,N*-dimethyl-n-octylamine in 1000 mL of water, and dissolve 0.9 g of sodium dihydrogen phosphate dihydrate in 1000 mL of water. Mix these solutions, add phosphoric acid to adjust the pH to 3.0, take 600 mL of this solution, and add 400 mL of acetonitrile.

Flow rate: Adjust the flow rate so that the retention time of tamoxifen is about 21 minutes.

System suitability

Test for required detectability: Pipet 1 mL of the standard solution, and add the mobile phase to make 10 mL. Confirm that the peak area of tamoxifen obtained from 10 μL of this solution is equivalent to 8% to 12% of the peak area of tamoxifen from the standard solution.

System performance: Proceed with 10 μL of the standard solution under the above conditions; the number of theoretical plates and symmetry factor of the peak of tamoxifen are NLT 5000 and NMT 1.5, respectively.

System repeatability: Repeat the test 6 times with 10 μL of the standard solution according to the above conditions; the relative standard deviation of the peak area of tamoxifen is NMT 1.5%.

Time span of measurement: About 2.5 times the retention time of tamoxifen after the solvent peak.

Loss on drying NMT 0.5% (1 g, 105 ℃, 4 hours).

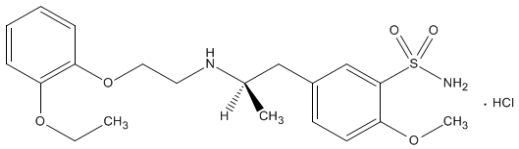
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 1.0 g of Tamoxifen Citrate, previously dried, dissolve in 150 mL of acetic acid(100), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 1 mol/L perchloric acid VS
= 56.36 mg of $C_{26}H_{29}NO \cdot C_6H_8O_7$

Packaging and storage Preserve in light-resistant, well-closed containers.

Tamsulosin Hydrochloride
탐스로신염산염



$C_{20}H_{28}N_2O_5S \cdot HCl$: 444.97

5-[(2*R*)-2-[2-(2-Ethoxyphenoxy)ethylamino]propyl]-2-methoxybenzenesulfonamidehydrochloride [*106463-17-6*]

Tamsulosin Hydrochloride, when dried, contains NLT 98.5% and NMT 101.0% of tamsulosin hydrochloride ($C_{20}H_{28}N_2O_5S \cdot HCl$).

Description Tamsulosin Hydrochloride occurs as white crystals. It is freely soluble in formic acid, sparingly soluble in water, slightly soluble in acetic acid(100), and very slightly soluble in ethanol(99.5).

Melting point—About 230 ℃ (with decomposition).

Identification (1) Determine the absorption spectra of solutions of Tamsulosin Hydrochloride and tamsulosin hydrochloride RS (3 in 160000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Tamsulosin

Hydrochloride and tamsulosin hydrochloride RS as directed in the potassium chloride disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) Cool 5 mL of an aqueous solution of Tamsulosin Hydrochloride (3 in 400) with ice, add 3 mL of dilute nitric acid, shake well, and allow to stand for 30 minutes. Filter the solution, and the filtrate responds to the Qualitative Analysis for chloride.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Tamsulosin Hydrochloride according to Method 4 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Related substances***—(i) Dissolve 50 mg of Tamsulosin Hydrochloride in 10 mL of mobile phase, and use this solution as the test solution. Pipet 2 mL of the test solution and add the mobile phase to make exactly 50 mL. Pipet 2.5 mL of this resulting solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine each peak area obtained from the test solution and the standard solution by the automatic integration method; the total area of peaks other than the peak of tamsulosin from the test solution is not greater than that of tamsulosin from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 225 nm).

Column: A stainless steel column about 4.0 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 ℃.

Mobile phase: Dissolve 4.4 mL of perchloric acid and 1.5 g of sodium hydroxide in 950 mL of water, use sodium hydroxide TS to adjust the pH to 2.0, and add water to make 1000 mL. To 700 mL of this solution, add 300 mL of acetonitrile.

Flow rate: Adjust the flow rate so that the retention time of tamsulosin is about 6 minutes.

System suitability

Test for required detectability: Take exactly 1 mL of the standard solution, and add the mobile phase to make exactly 50 mL. Confirm that the peak area of tamsulosin obtained from 10 μL of this solution is equivalent to 1.4% to 2.6% of the peak area of tamsulosin obtained from the standard solution.

System performance: Dissolve 5 mg of tamsulosin hydrochloride and 10 mg of propyl p-hydroxybenzoate in 20 mL of mobile phase. To 2 mL of this solution, add the mobile phase to make 20 mL, and proceed with 10 μL of this solution according to the above conditions; tamsulosin and propyl p-hydroxybenzoate are eluted in this order with the resolution between these peaks being NLT 12.0.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area of tamsulosin is NMT 4.0%.

Time span of measurement: The range until the termination of the tamsulosin peak (except for the solvent peak)

(ii) Perform the test with 10 μL each of the test solution and the standard solution obtained from the Related substances (A) as directed under the Liquid Chromatography according to the following conditions. Determine the peak areas of each solution as directed in the automatic integration method; the total area of peaks other than the tamsulosin peak from the test solution is not greater than the area of the tamsulosin peak from the standard solution.

Operating conditions

Detector, column, and column temperature: Perform the test according to the operating conditions of the Related substances (i).

Mobile phase: Dissolve 4.4 mL of perchloric acid and 1.5 g of sodium hydroxide in 950 mL of water, use sodium hydroxide TS to adjust the pH to 2.0, and add water to make 1000 mL. To this solution, add 1000 mL of acetonitrile.

Flow rate: Adjust the flow rate so that the retention time of tamsulosin is about 2.5 minutes.

System suitability

Test for required detectability: Pipet 1 mL of the standard solution and add the mobile phase of related substance (i) to make exactly 50 mL. Confirm that the peak area of tamsulosin obtained from 10 μL of this solution is equivalent to 1.4% to 2.6% of the peak area of tamsulosin obtained from the standard solution.

System performance: Perform the test according to the system performance of related substances (A).

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area of tamsulosin is NMT 4.0%.

Time span of measurement: About 5 times the retention time of tamsulosin beginning after the tamsulosin peak.

Isomer Weigh exactly 50 mg of Tamsulosin Hydrochloride, add 25 mL of methanol, and use this solution as the test solution. Pipet 1 mL of this solution and add methanol to make 100 mL. Take 1 mL of this solution, add the mobile phase to make 10 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the amount of tamsulosin hydrochloride enantiomer; the amount is NMT 0.3%.

$$\text{Content (\%) of tamsulosin hydrochloride enantiomer} = (C_S/C_T) \times (A_i/A_S) \times 100$$

C_S: Concentration of the standard solution (mg/mL)

C_T: Concentration of the test solution (mg/mL)

A_i: Peak area of tamsulosin hydrochloride enantiomer obtained from the test solution

A_S: Peak area of tamsulosin hydrochloride enantiomer obtained from the standard solution

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 225 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with silica gel for liquid chromatography (5 μm in particle diameter, amylose tris(3,5-dimethylphenylcarbamate)).

Column temperature: A constant temperature of about 35℃.

Mobile phase: A mixture of hexane, anhydrous alcohol, methanol, and diethylamine (650 : 200 : 150 : 1).

Flow rate: 0.5 mL/min

System suitability

System performance: Dissolve racemic tamsulosin hydrochloride RS in methanol to make the concentration 40 μg/mL, and use this solution as the system suitability solution. Proceed with the system suitability solution according to the above conditions; the resolution between tamsulosin hydrochloride and tamsulosin hydrochloride enantiomer is NLT 2.0.

Loss on drying NMT 0.5% (1 g, 105 ℃, 2 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.7 g of Tamsulosin Hydrochloride, previously dried, dissolve in 5 mL of formic acid, add 75 mL of a mixture of acetic acid(100) and acetic anhydride (3 : 2), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 44.50 mg of $C_{20}H_{28}N_2O_5S \cdot HCl$

Packaging and storage Preserve in well-closed containers.

Tannic Acid
탄닌산

Tannin [*1401-55-4*]

Tannic Acid is a tannin obtained mainly from Galla Rhois or Galla Halepensis.

Description Tannic Acid occurs as a yellowish white to pale brown amorphous powder, shiny small plate, or spongy particle. It is odorless or has a slightly characteristic odor and a very bitter taste.

It is very soluble in water or ethanol(95) and practically insoluble in ether.

Identification (1) To 5 mL of an aqueous solution of Tannic Acid (1 in 400), add 2 drops of iron(III) chloride TS; the resulting solution exhibits a bluish black color and a bluish black precipitate is formed when allowed to stand.

(2) To each of 5 mL of an aqueous solution of Tannic Acid (1 in 20), add 1 drop of albumin TS, 1 drop of gelatin TS, or 1 mL of starch TS, respectively; each solution forms a precipitate.

Purity (1) ***Rubber, dextrin, or sugar***—Dissolve 3.0 g of Tannic Acid in 15 mL of hot water; the solution is only slightly turbid. Filter this solution after cooling. To 5 mL of the filtrate add 5 mL of ethanol(95); the solution is not turbid. Again, add 3 mL of ether; the solution is not turbid.

(2) ***Resinous substances***—To 5 mL of the filtrate of (1), add 10 mL of water; the solution is not turbid.

(3) ***Heavy metals***—Proceed with 0.5 g of Tannic Acid according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 40 ppm).

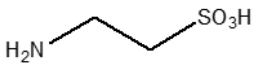
(4) ***Arsenic***—Proceed with 0.67 g of Tannic Acid according to Method 2 and perform the test (NMT 3 ppm).

Loss on drying NMT 12.0% (1 g, 105 ℃, 2 hours).

Residue on ignition NMT 1.0% (0.5 g).

Packaging and storage Preserve in light-resistant, tight containers.

Taurine
타우린



$C_2H_7NO_3S$: 125.15

2-Aminoethanesulfonic acid, [*107-35-7*]

Taurine, when dried, contains NLT 98.5% and NMT 101.0% of taurine ($C_2H_7NO_3S$).

Description Taurine occurs as a white crystalline powder with colorless or white crystals. It is odorless.
An aqueous solution of Taurine (1 in 20) is weakly acidic.

Identification (1) To 5 mL of the aqueous solution of Taurine (1 in 20), add 5 drops of dilute hydrochloric acid and 5 drops of sodium nitrite TS; the gas generated is colorless.

(2) To 0.5 g of Taurine, add 7.5 mL of sodium hydroxide TS, heat gently, evaporate to dryness, and

decompose by ignition at 500 ℃ for 2 hours. To the residue, add 5 mL of water, and shake to mix. After filtering, add 1 mL of sodium nitroprusside TS; the resulting solution is reddish purple and clear.

Purity (1) ***Clarity and color of solution***—Dissolve 0.5 g of Taurine in 20 mL of water; the solution is colorless and clear.

(2) ***Chloride***—Perform the test with 1.0 g of Taurine. Prepare the control solution with 0.3 mL of 0.01 mol/L hydrochloric acid VS (NMT 0.011%).

(3) ***Sulfate***—Perform the test with 1.5 g of Taurine. Prepare the control solution with 0.45 mL of 0.005 mol/L sulfuric acid VS (NMT 0.014%).

(4) ***Ammonium***—Transfer 0.1 g of Taurine into the flask, dissolve in 70 mL of water, add 1 g of magnesium oxide, and attach the distillation apparatus. Add 2 mL of 0.01 mol/L hydrochloric acid VS into a Nessler tube, and use this as a collector. Immerse the end of the condenser in the solution in the collector, and distill until the distillate becomes 40 mL. To the distillate, add 5 mL of sodium hydroxide TS and water to make 50 mL, and add 0.5 mL of Nessler's TS; the color of the solution is not more intense than the following control solution.

Control solution—Transfer 2.0 mL of ammonium standard solution into the Nessler tube, add 5 mL of sodium hydroxide TS and water to make 50 mL, and add 0.5 mL of Nessler's TS.

(5) ***Heavy metals***—Proceed with 2.0 g of Taurine according to Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(6) ***Iron***—Weigh accurately about 2.0 g of Taurine, proceed according to Method 1, and use this solution as the test solution. Separately, pipet 2.0 mL of iron standard solution, proceed in the same manner as the test solution, and use this solution as the control solution. Proceed with the test solution and the control solution as directed under Method A; the test solution is not more intense than the control solution (NMT 10 ppm).

(7) ***Arsenic***—Dissolve 1.0 g of Taurine in 5 mL of water and 1 mL of nitric acid, add 5 mL of water and 1 mL of sulfuric acid, and perform the test with this solution (NMT 2 ppm).

(8) ***Related substances***—Dissolve 1.0 g of Taurine in 50 mL of water, and use this solution as the test solution. Pipet 1 mL of this solution and add water to make exactly 50 mL. Pipet 1 mL of this solution, add water to make exactly 10 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography, develop the plate with a mixture of water, anhydrous ethanol, 1-butanol, and acetic acid(100) (150 : 150 : 100 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Spray evenly ninhydrin-butanol TS on the plate, and heat at 105 ℃ for 5 minutes; the number of spots other than the principal spot obtained from the test solution is NMT 1 and those spots are not more intense than the spots from the standard solution.

(9) ***Readily carbonizable substances***—Weigh 0.1 g of Taurine, and dissolve in 1mL of sulfuric acid for readily carbonizable substances; the resulting solution is colorless.

Loss on drying NMT 0.2% (1.0 g, 105 ℃, 2 hours).

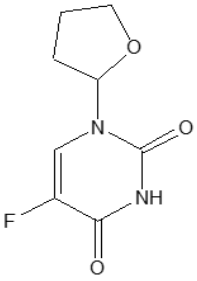
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.2 g of Taurine, previously dried, dissolve in 50 mL of water, add 5 mL of formalin, and titrate with 0.1 mol/L sodium hydroxide VS (indicator: 3 drops of phenolphthalein TS). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS
= 12.515 mg of $C_2H_7NO_3S$

Packaging and storage Preserve in well-closed containers.

Tegafur
테가푸르



and enantiomer

$C_8H_9FN_2O_3$: 200.17

(*RS*)-5-Fluoro-1-(tetrahydrofuran-2-yl)pyrimidine-2,4(1*H*,3*H*)-dione [*17902-23-7*]

Tegafur, when dried, contains NLT 98.0% and NMT 101.0% of tegafur ($C_8H_9FN_2O_3$).

Description Tegafur occurs as a white crystalline powder.
It is soluble in methanol or acetone and sparingly soluble in water or ethanol(95).
It is soluble in dilute sodium hydroxide TS.
A solution of Tegafur in methanol (1 in 50) exhibits no optical rotation.

Identification (1) Determine the absorption spectra of Tegafur and a solution of tegafur RS in 0.01 mol/L sodium hydroxide TS (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit

similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Tegafur and tegafur RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) Proceed with 10 mg of Tegafur as directed under the Oxygen Flask Combustion, using a mixture of 0.5 mL of 0.01 mol/L sodium hydroxide TS and 20 mL of water as the absorbent; the obtained test solution responds to the Qualitative Analysis (2) for fluoride.

Melting point Between 166 and 171 ℃.

pH Dissolve 0.5 g of Tegafur in 50 mL of water; the pH of this solution is between 4.2 and 5.2.

Purity (1) ***Clarity and color of solution***—Dissolve 0.2 g of Tegafur in 10 mL of dilute sodium hydroxide TS; the resulting solution is colorless and clear.

(2) ***Chloride***—Dissolve 0.8 g of Tegafur in 40 mL of water by warming. After cooling, filter if necessary, and add 6 mL of dilute nitric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 0.25 mL of 0.01 mol/L hydrochloric acid (NMT 0.011%).

(3) ***Heavy Metals***—Dissolve 1.0 g of Tegafur in 40 mL of water by warming. After cooling, filter if necessary, and add 2 mL of dilute acetic acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 1.0 mL of lead standard solution (NMT 10 ppm).

(4) ***Arsenic***—Transfer 1.0 g of Tegafur into a crucible, and add 10 mL of a solution of magnesium nitrate in ethanol(95) (1 in 10). After burning the ethanol by firing, ignite at 750 ℃ to 850 ℃ to incinerate. If there is a residual carbide, wet it with a small amount of nitric acid and ignite again to incinerate. After cooling, dissolve the residue in 10 mL of dilute hydrochloric acid by warming on a steam bath, use this solution as the test solution, and perform the test (NMT 2 ppm).

(5) ***Related substances***—Dissolve 0.1 g of Tegafur in 10 mL of methanol, and use this solution as the test solution. Pipet 1 mL of this solution, add methanol to make exactly 200 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of chloroform and ethanol(95) (5 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot obtained from the test solution are not more intense than the spot obtained from the standard solutions.

Losson drying NMT 0.5% (1 g, 105 °C, 4 hours).

Residue on ignition NMT 0.1% (1 g, platinum crucible).

Assay Weigh accurately about 0.15 g of Tegafur, previously dried, transfer into the iodine bottle, dissolve in 75 mL of water, and add exactly 25 mL of 1/60 mol/L potassium bromate. Next, add quickly 1.0 g of potassium bromide and 12 mL of hydrochloric acid, immediately close the stopper, mix by occasional shaking, and allow to stand for 30 minutes. Add 1.6 g of potassium iodide, mix by gently shaking, allow to stand for exactly 5 minutes, and titrate free iodine with 0.1 mol/L sodium thiosulfate VS (indicator: 2 mL of starch TS). Perform a blank test in the same manner.

Each mL of 1/60 mol/L potassium bromate VS
= 10.008 mg of $C_8H_9FN_2O_3$

Packaging and storage Preserve in tight containers.

Tegafur and Uracil Capsules
테가푸르·우라실 캡슐

Tegafur and Uracil Capsules contain NLT 90.0% and NMT 110.0% of the labeled amounts of tegafur ($C_8H_9FN_2O_3$: 200.17) and uracil ($C_4H_4N_2O_2$: 112.09).

Method of preparation Prepare as directed under Capsules, with Tegafur and Uracil.

Identification Weigh an amount of Tegafur and Uracil Capsules equivalent to 50 mg of tegafur (an amount equivalent to 0.1 g of uracil) according to the labeled amount, add 20 mL of methanol (4 in 5), shake to dissolve, and filter. Use the filtrate as the test solution. Separately, weigh about 25 mg of tegafur RS and 50 mg of uracil RS each, add 10 mL of methanol to each, and use these solutions as the standard solutions. Perform the test with these solutions as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with the mixture of butanol and acetic acid(100) (5 : 1) as the developing solvent, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm), and the R_f values of the spots from the test solution and the standard solution are the same.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the contents in NLT 20 capsules of Tegafur and Uracil Capsules. Weigh accurately an amount equivalent to about 0.1 g of tegafur ($C_8H_9FN_2O_3$) [about 0.2 g as uracil ($C_4H_4N_2O_2$)] add water, and sonicate and dissolve to make 200 mL. Pass through a filter and use the filtrate as the test solution. Separately, weigh

accurately about 0.1 g of tegafur RS and about 0.2 g of uracil RS, add water to make 200 mL, and use this solution as the standard solution. Perform the test with 5 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas of tegafur and uracil, $_{T1}$, A_{T2}, A_{S1} and A_{S2}, in each solution.

$$\text{Amount (mg) of tegafur } (C_8H_9FN_2O_3) = \text{Amount (mg) of tegafur RS} \times \frac{A_{T1}}{A_{S1}}$$

$$\text{Amount (mg) of uracil } (C_4H_4N_2O_2) = \text{Amount (mg) of uracil RS} \times \frac{A_{T2}}{A_{S2}}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 280 nm).

Column: A stainless steel column about 4.0 mm in internal diameter and about 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 to 10 μm in particle diameter).

Mobile phase: 20% methanol

Flow rate: 1.0 mL/min

Packaging and storage Preserve in well-closed containers.

[*61036-62-2*, Teicoplanin]

Teicoplanin is a mixture of glycopeptide substances having antibacterial activity produced by culturing *Actinoplanes teichomyceticus*. Teicoplanin contains NLT 900 μg (potency) of teicoplanin ($C_{72\sim89}H_{68\sim99}Cl_2N_{8\sim9}O_{28\sim33}$) per mg, calculated on the anhydrous, sodium chloride-free and solvent-free basis.

Description Teicoplanin occurs as a white to pale yellowish white powder.
It is freely soluble in water, sparingly soluble in *N*,*N*-dimethylformamide and practically insoluble in acetonitrile, methanol, ethanol(95), acetone, acetic acid(100) or ether.

Identification (1) To 1 mL of an aqueous solution of Teicoplanin (1 in 100), add 2 mL of ninhydrin TS, and warm for 5 minutes; the solution exhibits a bluish purple color.

(2) To 1 mL of an aqueous solution of Teicoplanin (3 in 100), add slowly 2 mL of anthrone TS, and shake gently to mix; the solution exhibits a dark brown color.

(3) Determine the infrared spectra of Teicoplanin and teicoplanin RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

pH Dissolve 0.5 g of Tecoplanin in 10 mL of water; the pH of this solution is between 6.3 and 7.7.

Content Ratio Dissolve about 20 mg of Teicoplanin in water to make 10 mL, and use this solution as the test solution. Perform the test with 20 μL of the test solution as directed under the Liquid Chromatography according to the following operating conditions. Calculate the sum of the peak areas of the teicoplanin A_2 group, S_a, the sum of the peak areas of the teicoplanin A_3 group, S_b, and the sum of the peak areas of other contents, S_c according to the automatic integration method. Determine the amount of each content by the following formula; the teicoplanin A_2 group is NLT 80.0%, the teicoplanin A_3 group is NMT 15.0%, and the other contents are NMT 5.0%. The order of elution of each teicoplanin content and the relative retention times with respect to teicoplanin A_{2-2} are as follows.

Name of content	Elution order	Relative retention time
Teicoplanin A_3 group		≤0.42
Teicoplanin A_{3-1}	1	0.29
Teicoplanin A_2 group		0.42<, ≤1.25
Teicoplanin A_{2-1}	2	0.91
Teicoplanin A_{2-2}	3	1.00
Teicoplanin A_{2-3}	4	1.04
Teicoplanin A_{2-4}	5	1.17
Teicoplanin A_{2-5}	6	1.20
Other contents		1.25<

$$\text{Content (\%) of the Teicoplanin } A_2 \text{ group} = \frac{S_a}{S_a + 0.83S_b + S_c} \times 100$$

$$\text{Content (\%) of the teicoplanin } A_3 \text{ group} = \frac{0.83S_b}{S_a + 0.83S_b + S_c} \times 100$$

$$\text{Content (\%) of other contents} = \frac{S_c}{S_a + 0.83S_b + S_c} \times 100$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: Control the mixing ratio of mobile phase A and mobile phase B stepwise or via the gradient elution as follows.

Mobile phase A: Dissolve 7.80 g of sodium dihydrogen phosphate dihydrate in 1650 mL of water, add 300 mL of acetonitrile, adjust the pH to 6.0 with sodium hydroxide TS, and add water to make 2000 mL.

Mobile phase B: Dissolve 7.80 g of sodium dihydrogen phosphate dihydrate in 550 mL of water, add 1400 mL of acetonitrile, adjust the pH to 6.0 with sodium hydroxide TS, and add water to make 2000 mL.

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 - 32	100 → 70	0 → 30
32 - 40	70 → 50	30 → 50
40 - 42	50 → 100	50 → 0

Flow rate: 1.8 mL/min

Time span of measurement: About 1.7 times the retention time of Teicoplanin $A_{2\text{-}2}$ after solvent peak.

System suitability

Test for required detectability: Ensure that the peak height of Teicoplanin $A_{2\text{–}2}$ obtained from the test solution is about 90% of the full scale.

System performance: Proceed with 20 μL of the test solution and perform the test under the above operating conditions; the symmetry factor of the Teicoplanin $A_{3\text{–}1}$ peak is NMT 2.2.

System repeatability: Proceed with each 20 μL of the test solution and perform the test 3 times under the above operating conditions; the relative standard deviation of the peak area of Teicoplanin $A_{2\text{–}2}$ is NMT 2.0%.

Purity (1) ***Sodium chloride***—Weigh accurately about 0.5 g of Teicoplanin, dissolve in 50 mL of water, titrate with 0.1 mol/L silver nitrate VS (indicator: 1 mL of potassium chromate TS), and calculate the amount of sodium chloride; the content of sodium chloride is NMT 5.0%.

Each mL of 0.1 mol/L silver nitrate VS
= 5.844 mg of NaCl

(2) ***Heavy metals***—Proceed with 1.0 g of Teicoplanin according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

Water NMT 15.0% (0.2 g, volumetric titration, direct titration).

Sterility It meets the requirements when used in the manufacturing of sterile preparations. However, it is exempt from the requirements when there is a terminal sterilization process in the manufacturing process of sterile preparations.

Bacterial endotoxins Less than 0.75 EU/mg (potency) of teicoplanin when used in the manufacturing of sterile preparations.

Assay ***Cylinder plate method***—(1) Test organism: Use *Bacillus subtilis* ATCC 6633 as the test bacterium.

(2) Medium: Agar media for seed and base layer Use the culture medium in (A) (2) (a) ① ⓐ under the Microbial Assays for Antibiotics.

(3) Standard solution: Weigh accurately about 50 mg (potency) of teicoplanin RS, dissolve in phosphate buffer solution (pH 6.0) to make exactly 50 mL, and use this solution as the standard stock solution. Keep the standard stock solution at below 5 °C and use it within 14 days. Pipet an appropriate amount of the standard stock solution, dilute with phosphate buffer solution (pH 6.0) so that each mL contains 160 μg (potency) and 40 μg (potency) of teicoplanin RS, respectively, and use these solutions as the high-concentration standard solution and the low-concentration standard solution.

(4) Test solutions: Weigh accurately about 50 mg (potency) of Teicoplanin and dissolve in phosphate buffer solution (pH 6.0) to make exactly 50 mL. Pipet an appropriate amount of this solution, dilute with phosphate buffer solution (pH 6.0) so that each mL contains 160 μg (potency) and 40 μg (potency) of teicoplanin, respectively, and use these solutions as the high-concentration test solution and the low-concentration test solution. Perform the test with these solutions as directed in (A) (8) under the Microbial Assays for Antibiotics.

Packaging and storage Preserve in light-resistant, tight containers (at below 5 °C).

Teicoplanin for Injection
주사용 테이코플라닌

Teicoplanin for Injection is an injection dissolved before use. Teicoplanin for Injection contains NLT 90.0% and NMT 120.0% of the labeled amount of teicoplanin.

Method of preparation Prepare as directed under Injections, with Teicoplanin.

Description Teicoplanin for Injection occurs as a white or pale yellow powder.

Identification Weigh about 25 mg (potency) each of Teicoplanin for Injection and teicoplanin RS, dissolve in 1% methanol solution to make exactly 25 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions; the retention times of the major peaks obtained from the test solution and the standard solution are the same.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and 15 to 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (8 to 10 μm in particle diameter).

Mobile phase: Control the mixing ratio of mobile phase A and mobile phase B stepwise or via the gradient elution as follows.

Mobile phase A: Dissolve 1.95 g of sodium dihy-

drogen phosphate in a mixture of acetonitrile and water (1 : 9), and add 1 mol/L sodium hydroxide TS to adjust the pH to exactly 6.0 and make 500 mL.

Mobile phase B: Dissolve 1.95 g of sodium dihydrogen phosphate in a mixture of acetonitrile and water (7 : 3), and add 1 mol/L sodium hydroxide TS to adjust the pH to exactly 6.0 and make 500 mL.

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0	100	0
48	60	40
51	0	100

Flow rate: 2 mL/min

pH Dissolve Teicoplanin for Injection in water to make 0.1 g/mL; the pH of the solution is between 7.2 and 7.8.

Water NMT 2.5% (0.5 g, volumetric titration, direct titration)

Sterility Meets the requirements.

Bacterial endotoxins Less than 0.32 EU per mg (potency) of teicoplanin.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Uniformity of dosage units Meets the requirements.

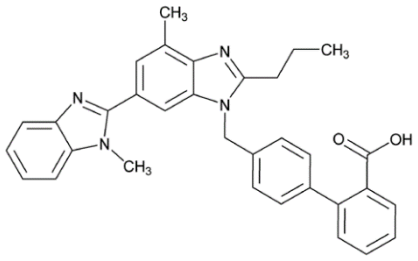
Assay ***Cylinder plate method***—(1) Medium: Agar media for seed and base layer Use the medium in (A) (2) (a) ① ⓐ under the Microbial Assays for Antibiotics.

(2) Test organism: Use *Bacillus subtilis* ATCC 6633 as the test organism.

(3) Weigh accurately about 20 mg (potency) of Teicoplanin for Injection according to the labeled potency, and dissolve in phosphate buffer solution, pH 7.4 to obtain a solution with a suitable concentration. Pipet an appropriate amount of this solution, dilute with phosphate buffer solution, pH 7.4 to obtain solutions having known concentrations of 20.0 μg and 5.0 μg (potency) per mL, and use these solutions as the high-concentration test solution and the low-concentration test solution, respectively. Separately, weigh accurately about 20 mg (potency) of teicoplanin RS, dissolve in phosphate buffer solution, pH 7.4 to prepare the standard stock solution with a suitable concentration. Pipet an appropriate of the standard stock solution, dilute with phosphate buffer solution, pH 7.4 to obtain solutions with known concentrations of 20.0 μg and 5.0 μg (potency) per mL, respectively, and use these solutions as the high-concentration standard solution and the low-concentration standard solution, respectively. With these solutions, perform the test as directed in (A) (8) under the Microbial Assays for Antibiotics.

Packaging and storage Preserve in hermetic containers.

Telmisartan
텔미사르탄



$C_{33}H_{30}N_4O_2$: 514.62

2-(4-{[4-Methyl-6-(1-methyl-1*H*-1,3-benzodiazol-2-yl)-2-propyl-1*H*-1,3-benzodiazol-1-yl]methyl}phenyl)benzoic acid [*144701-48-4*]

Riboflavin, when dried, contains NLT 98.0% and NMT 101.0% of riboflavin ($C_{33}H_{30}N_4O_2$).

Description Telmisartan occurs as a white to pale yellow crystalline powder.
It is sparingly soluble in dichloromethane, slightly soluble in methanol, and practically insoluble in water.
It dissolves in 1 mol/L sodium hydroxide.

Identification (1) Determine the infrared spectra of Telmisartan and telmisartan RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers. If the two spectra are different, dissolve Telmisartan and telmisartan RS in ethanol(95) and heat it if necessary. Cool this solution with iced water and filter the precipitate. Dry the precipitate obtained through this process at 105 °C and then measure again.

(2) The retention time of the major peak obtained from the test solution corresponds to that from the standard solution in the related substances.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Telmisartan according to Method 2 and perform the test. Prepare the control solution with 1.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Related substances***—Dissolve about100 mg of Telmisartan, weighed accurately, in 20 mL of methanol and 100 μL of sodium hydroxide TS, 1 mol/L, and sonicate it, and then add methanol to make 40 mL, and use this solution as the test solution. After preparation, protect the test solution from light and use it immediately. Separately, dissolve 100 mg of telmisartan RS, weighed accurately, in 20 mL of methanol and 100 μL of 1 mol/L sodium hydroxide, and then sonicate it, and add methanol

to make 40 mL. Pipet 1 mL of Telmisartan, add methanol to make 100 mL, and use this solution as the standard solution. Perform the test with each 2 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine each peak area of each solution by the automatic integration and calculate the amount of related substances in the test solution; the relative retention time with respect to telmisartan is NMT 0.1% for telmisartan-related substance I {1,7′-dimethyl-2′-propyl-1H,3′H-2,5′-bibenzo[d]imidazole} of about 0.3, Telmisartan amide of about 0.7, telmisartan-related substance II {4′-[(1,7′-dimethyl-2propyll-1′H,1H-2,5′-bibenzo[d] imidazol-1'-yl)methyl]biphenyl-2-carboxylic acid} of about 0.9, and telmisartan diecid of about 1.1 and the relative retention time with respect to telmisartan t-butyl ester of about 1.7 and telmisartan-unknown related substances of about 1.8 is NMT 0.2%. Other each related substances are NMT 0.1%, and the sum of total related substances is NMT 1.0%. However, related substances containing NMT 0.05% are excluded.

$$\text{Content (\%) of each related substance} = \frac{A_T}{A_S} \times \frac{C_S}{C_T} \times 100$$

A_i: Peak area of each related substance in the test solution

A_S: Peak area of each related substance in the test solution

C_S: Concentration of telmisartan RS in the standard solution

C_U: Concentration of telmisartan in the test solution

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 230 nm).

Column: A stainless steel column about 4.0 mm in internal diameter and about 12.5 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: Control the step or gradient elution by mixing the mobile phases A and B as directed following.

Mobile phase A: Dissolve 2.0 g of potassium dihydrogen phosphate and 3.8 g of sodium 1-pentanesulfonate in 1000 mL of water and add phosphoric acid to adjust the pH to 3.0.

Mobile phase B: A mixture of acetonitrile and methanol (4 : 1).

Column temperature: A constant temperature of about 40 °C.

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 - 2	70	30
2 - 27	70 → 20	30 → 80
27 - 32	20	80
32 - 32.1	70	30
32.1 - 37	70	30

Flow rate: 1 mL/min

System suitability

System performance: Dissolve 100 mg of telmisartan RS and 100 mg of telmisartan-related substance II RS, weighed accurately, in 20 mL of methanol and 100 μL of 1 mol/L sodium hydroxide, sonicate it, then add methanol to make 40 mL, and use this solution as the system suitability solution. Proceed with 2 μL of the system suitability solution according to the above operating conditions; the resolution between the peaks of telmisartan and telmisartan-related substance II is NLT 3.0, and the symmetry factor of telmisartan-related substance II is between 0.9 and 1.5.

System repeatability: Repeat the test 6 times with 2 μL of the standard solution according to the above operating conditions; the relative standard deviation of the peak area for Telmisartan is NMT 5.0%.

Loss on drying NMT 1.5% (1 g, 105 ℃).

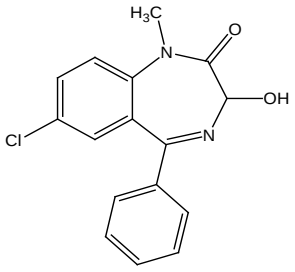
Residue on ignition NMT 0.1% (1 g).

Assay Dissolve about 190 mg of Telmisartan, weighed accurately, in 5 mL of anhydrous formic acid, add 75 mL of acetic anhydride and titrate it with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 25.73 mg of $C_{33}H_{30}N_4O_2$

Packaging and storage Preserve in light-resistant, tight containers.

Temazepam
테마제팜



$C_{16}H_{13}O_2N_2Cl$: 300.74

7-Chloro-3-hydroxy-1-methyl-5-phenyl-2,3-dihydro-1*H*-1,4-benzodiazepin-2-one [*846-50-4*]

Temazepam contains NLT 98.0% and NMT 102.0% of temazepam ($C_{16}H_{13}O_2N_2Cl$), calculated on the dried basis.

Description Temazepam occurs as a white crystalline powder.

It is sparingly soluble in ethanol(95) and very slightly

soluble in water.

Melting point—157 ℃ to 163 ℃.

Identification (1) Determine the absorption spectra of solutions of Temazepam and temazepam RS in methanol (1 in 80000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Temazepam and temazepam RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) The retention time of the major peak obtained from the test solution under the Assay is the same as that of the major peak from the standard solution.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Temazepam according to Method 2 and perform the test. Prepare the control solution with 2 mL of lead standard solution (NMT 20 ppm).

(2) ***Related substances***—Weigh exactly 0.1 g of Temazepam, dissolve in chloroform to make exactly 10 mL, and use this solution as the test solution. Weigh exactly 0.1 g of temazepam RS, and dissolve in chloroform to make exactly 10 mL. To 1.0 mL of this solution, add chloroform to make 100 mL and 200 mL, respectively, and use these solutions as the standard solution (1) and the standard solution (2). With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution, standard solution (1), and standard solution (2) on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of cyclohexane, chloroform, methanol, and ammonia water(28) (50 : 40 : 12 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot obtained from the test solution are not more intense than the principal spots obtained from the standard solution (1) (1.0%), and the total intensity of the spots other than the principal spot obtained from the test solution is not greater than 4 times the spots obtained from the standard solution (2) (2.0%).

Loss on drying NMT 0.5% (1 g, 105 ℃, 2 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 40 mg each of Temazepam and temazepam RS, dissolve in the diluent to make exactly 200 mL, and use these solutions as the test solution and the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions and determine the peak areas, A_T and A_S, of temazepam in each solution.

Content (%) of the temazepam ($C_{16}H_{13}O_2N_2Cl$)

$$= \frac{A_T}{A_S} \times \frac{C_S}{C_T} \times 100$$

C_S: Concentration [mg/mL] of the standard solution
C_T: Concentration [mg/mL] of the test solution

Diluent—A mixture of methanol and water (90 : 10).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless-steel column about 4 mm in internal diameter and about 25 cm in length, packed with dimethylsilyl silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of phosphate buffer solution and acetonitrile (53 : 47).

Flow rate: 2.0 mL/min

System suitability

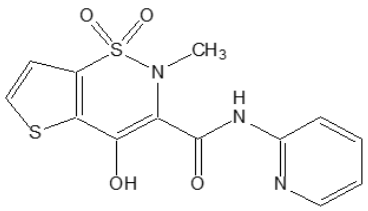
System performance: Proceed with 10 μL of the standard solution according to the above conditions; the number of theoretical plates and the symmetry factor are NLT 800 and NMT 2, respectively.

System repeatability: Repeat the test 5 times with 10 μL of the standard solution according to the above conditions; the relative standard deviation of the peak area of temazepam is NMT 2.0%.

Phosphate buffer solution—Dissolve 2.7 g of potassium dihydrogen phosphate in water to make 1000 mL, and adjust the pH to 3.0 with phosphoric acid.

Packaging and storage Preserve in light-resistant, well-closed containers.

Tenoxicam
테녹시캄



$C_{13}H_{11}N_3O_4S_2$: 337.37

(3*Z*)-3-{Hydroxy[(pyridin-2-yl)amino]methylidene}-2-methyl-2*H*,3*H*,4*H*-1$l^{6},5,2-thieno[2,3-e][1$l^{6},2]thiazine-1,1,4-trione [*59804-37-4*]

Tenoxicam contains NLT 99.0% and NMT 101.0% of tenoxicam ($C_{13}H_{11}N_3O_4S_2$), calculated on the anhydrous basis.

Description Tenoxicam occurs as a yellow crystalline powder.

It is sparingly soluble in dichloromethane, very slightly soluble in ethanol(95), and practically insoluble in water.

It is soluble in acid or alkali solution.
It exhibits polymorphism.

Identification Determine the infrared spectra of Tenoxicam and tenoxicam RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers. If there is any difference between the two spectra, dissolve Tenoxicam and tenoxicam RS in a small amount of dichloromethane, respectively, evaporate on a steam bath to dryness, and repeat the test with the residues.

Purity (1) ***Clarity and color of solution***—Dissolve 0.10 g of Tenoxicam in 20 mL of dichloromethane; the solution is clear.

(2) ***Heavy metals***—Proceed with 1.0 g of Tenoxicam according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Related substances***—Weigh exactly 0.40 g of Tenoxicam, dissolve in a mixture of methanol and ammonia water(28) (96 : 4) to make exactly 5 mL, and use this solution as the test solution. Take 1.0 mL of this solution, and add a mixture of methanol and ammonia water(28) (96 : 4) to make exactly 20 mL. Then again, take 1.0 mL of this solution, add a mixture of methanol and ammonia water(28) (96 : 4) to make exactly 20 mL, and use this solution as the standard solution (1). Separately, weigh exactly 20 mg of tenoxicam RS and 20 mg of salicylic acid RS, dissolve in a mixture of methanol and ammonia water(28) (96 : 4) to make 5 mL, and use this solution as the standard solution (2). Weigh exactly 20 mg of pyridin-2-amine, and dissolve in a mixture of methanol and ammonia water(28) (96 : 4) to make exactly 5 mL. To 2.0 mL of this solution, add a mixture of methanol and ammonia water(28) (96 : 4) to make exactly 50 mL, and use this solution as the standard solution (3). With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of dichloromethane, acetone, methanol, and formic acid (70 : 20 : 5 : 5) as the developing solvent to a distance of about 15 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spot corresponding to pyridin-2-amine obtained from the test solution is not more intense than the spot obtained from standard solution (3), and the spots other than the principal spot obtained from the test solution pyridin-2-amine are not more intense than the spot obtained from standard solution (1).

Water NMT 0.5% (1 g, volumetric titration, direct titration).

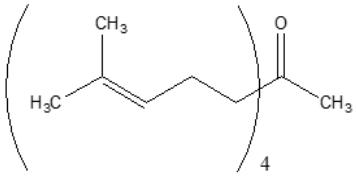
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.25 g of Tenoxicam, dissolve in 5 mL of formic acid, add 70 mL of acetic acid(100), and mix. Titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 1 mol/L perchloric acid VS
= 33.738 mg of $C_{13}H_{11}N_3O_4S_2$

Packaging and storage Preserve in light-resistant, well-closed containers.

Teprenone
테프레논



$C_{23}H_{38}O$: 330.54
(5*E*,9*E*,13*E*)-6,10,14,18-Tetramethylnonadeca-5,9,13,17-tetraen-2-one, [*6809-52-5*]

Teprenone is composed of mono-cis isomer and trans isomer, and the ratio is about 2 : 3. Teprenone contains NLT 97.0% and NMT 101.0% of teprenone ($C_{23}H_{38}O$), calculated on the anhydrous basis.

Teprenone occurs as a colorless to light yellow clear oily liquid. It has a slightly peculiar odor and no taste.

Teprenone is sparingly soluble in methanol, ethanol, acetone, chloroform, or hexane, and practically insoluble in water.

Teprenone is affected by air.

Identification (1) Add 1 mL of phosphomolybdic acid and acetic acid(100) solution (1 in 100) to 2 mL of dehydrated ethanol solution (1 in 100) of Teprenone, and heat it on a steam bath for 5 minutes, then add 5 to 6 drops of sulfuric acid, and heat it; the solution exhibits blue to bluish green.

(2) Add 2 mL of 2, 4-dinitrophenylhydrazine solution to 2 mL of Teprenone in anhydrous ethanol (1 in 100) and shake to mix; a yellow to orange-yellow precipitate is formed.

(3) Weigh 10 mg of Teprenone, dissolve in 2 mL of hexane, and use this solution as the test solution. Perform the test with 2 μL to 4 μL of the test solution as directed under the Gas Chromatography according to the following conditions. Calculate the two adjacent major peak areas S_{C1} and S_T; the ratio of S_{C1} and S_T is about 2:3. However, the area of the one with a small retention time (mono-cis isomer) of two adjacent major peaks is S_{C1}, and the area of the other one with a large retention time (all-trans isomer) is S_T.

Operating conditions

Detector: A flame ionization detector

Column: A glass column about 3 to 4 mm in internal diameter and about 1.5 to 2 m in length, packed with 149 μm to 177 μm diatomaceous earth for gas chromatography coated with 5% polyethylene glycol-2-nitrotelephthalate, or packed with equivalent or greater.

Column temperature: A constant temperature of about 210 °C.

Carrier gas: Nitrogen or helium

Flow rate: Adjust flow rate so that the retention time of trans sieve is 15 to 20 minutes.

Refractive index n_D^{20}: Between 1.485 and 1.491.
Specific gravity d_{20}^{20}: Between 0.882 and 0.890.

Purity (1) ***Clarity and color of solution***—Dissolve about 1 g of Teprenone in 10 mL of dehydrated ethanol; the solution is colorless to light yellow in color and clear.

(2) ***Heavy metals***—Proceed with 1.0 g of Teprenone according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Arsenic***—Proceed with 1.0 g of Teprenone according to Method 3 and perform the test (NMT 2 ppm).

(4) ***Others Cis-isomer***—Perform the test according to the Identification (3), and determine the peak areas Sc_2 and Sc_3 corresponding to the di-cis isomer and tri-cis isomer; the sum of the peak areas of Sc_2 and Sc_3 with respect to the total peak area is NMT 1%.

(5) ***Other related substance***—Perform the test as directed under the Gas Chromatography according to the Identification (3); the peak area ratio of other related substances (excluding solvent peaks, S_T, S_{C1}, S_{C2} and S_{C3}) with respect to the total peak area is NMT 1%.

Water NMT 0.5% (0.3 g, volumetric titration, direct titration).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.1 g each of Teprenone and teprenone RS, add 10.0 mL of the internal standard solution, add ethyl acetate to make 100.0 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 2 μL to 4 μL each of the test solution and the standard solution as directed under the Gas Chromatography according to the following conditions. Circulate the ratio Q_T and Q_S of the peak areas of the mono cis isomer and all-cis isomer forms with respect to the peak areas of the internal standards of the test solution and the standard solution.

$$\text{Amount (mg) of teprenone } (C_{23}H_{38}O) = \text{Amount (mg) of teprenone RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—Weigh about 0.5 g of di-en-butyl phthalate and dissolve in ethyl acetate to make 100 mL.

Operating conditions

Detector: A flame ionization detector

Column: A glass column about 3 mm to 4 mm in internal diameter and about 1.5 m to 2 m in length, packed with 149 μm to 177 μm diatomaceous earth for gas chromatography coated with 5% of polyethylene glycol-2-nitrotelephthalate, or packed with equivalent or greater.

Column temperature: A constant temperature of about 210 °C.

Carrier gas: Nitrogen or helium

Flow rate: 40 mL/min

Packaging and storage Preserve in tight containers.

Teprenone Capsules
테프레논 캡슐

Teprenone Capsules contain NLT 93.0% and NMT 107.0% of the labeled amount of teprenone ($C_{23}H_{38}O$: 330.54).

Method of preparation Prepare as directed under Capsules, with Teprenone.

Identification (1) Weigh an amount of Teprenone Capsules, equivalent to 0.1 g of teprenone according to the labeled amount, add 10 mL of ethanol(99.5), shake to dissolve, and centrifuge. Pipet 2 mL of the clear supernatant, add 1 mL of a solution of molybdic acid in acetic acid(100) (1 in 100), and heat on a steam bath for 5 minutes. Add 5 to 6 drops of sulfuric acid and continue heating; the solution exhibits a color of blue to bluish green.

(2) Weigh a portion of the contents of Teprenone Capsules, equivalent to 0.1 g of teprenone according to the labeled amount, add 10 mL of ethanol(99.5), shake to dissolve, and centrifuge. Pipet 2 mL of the clear supernatant, add 2 mL of 2,4-dinitrophenylhydrazine TS, and shake to mix; a yellow to orange precipitate is produced.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of the contents of NLT 20 capsules of Teprenone Capsules. Weigh accurately an amount equivalent to about 50 mg of teprenone ($C_{23}H_{38}O$) and dissolve in methanol to make exactly 100 mL. Pipet 2 mL of this solution, transfer to a 10-mL volumetric flask, add 1 mL of the internal standard solution and hexane to make exactly 10 mL. Use this solution as the test solution. Separately, weigh accurately about 50 mg of teprenone RS and prepare a solution in the same manner as the test solution, and use this solution as the standard solution. Perform the test with each 2 μL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the ratios, Q_T and Q_S, for the

sum of the peak areas of mono-cis and all-trans isomers to those of the internal standard.

$$\text{Amount (mg) of teprenone } (C_{23}H_{38}O) = \text{Amount (mg) of teprenone RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of phthalic acid-di-n-butyl in hexane (1 in 10000).

Operating conditions

Detector: A hydrogen flame ionization detector

Column: A column about 0.32 mm in internal diameter and 30.0 m in length, coated with 5% phenyl - 95% methyl polysiloxane to 0.25 μm.

Column temperature: Maintain the initial temperature to 200 °C, raise the temperature to 240 °C at the rate of 10 °C per minute and further to 245 °C at the rate of 2 °C per minute, and maintain this temperature for 3,5 minutes.

Sample injection port temperature: 250 °C

Detector temperature: 250 °C

Carrier gas: Nitrogen

Flow rate: 2 mL/min

Total flow: About 60 mL.

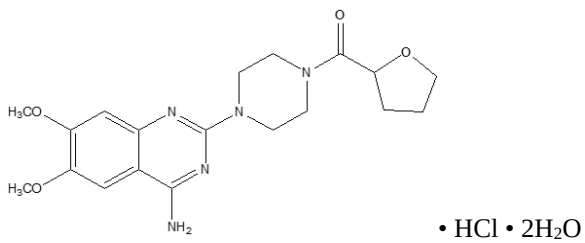
System suitability

System performance: Proceed with 2 μL of the standard solution according to the above conditions; the internal standard and mono-cis and all-trans isomers of teprenone are eluted in this order with the resolution between the peaks of mono-cis and all-trans isomers of teprenone being NLT 3.

System repeatability: Repeat the test 6 times with 2 μL each of the standard solution according to the above conditions; the relative standard deviation of the ratios for the sum of the peak areas of teprenone (mono-cis and all-trans isomers) to the peak area of the internal standard is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Terazosin Hydrochloride Hydrate
테라조신염산염수화물



• HCl • $2H_2O$

$C_{19}H_{25}N_5O_4 \cdot HCl \cdot 2H_2O$: 459.92

6,7-Dimethoxy-2-{4-[(oxolan-2-yl)carbonyl]piperazin-1-yl}quinazolin-4-amine dihydrate hydrochloride [*70024-40-7*]

Terazosin Hydrochloride Hydrate, when dried, contains NLT 98.0% and NMT 102.0% of terazosin hydrochloride ($C_{19}H_{25}N_5O_4 \cdot HCl$).

Description Terazosin Hydrochloride Hydrate occurs as a white to pale yellow crystalline powder.

It is sparingly soluble in water, slightly soluble in methanol, very slightly soluble in ethanol(95), and practically insoluble in acetone.

Identification (1) Determine the infrared spectra of Terazosin Hydrochloride Hydrate and terazosin hydrochloride RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

(3) Dissolve 0.1 g of Terazosin Hydrochloride Hydrate in 10 mL of a mixture of methanol and water (9 : 1); the solution responds to the Qualitative Analysis for chloride.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Terazosin Hydrochloride Hydrate as directed under Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Related substances***—(i) Tetrahydro-2-furan carboxylic acid: Weigh accurately about 0.1 g of Terazosin Hydrochloride Hydrate, transfer into a 50-mL centrifuge tube, add 5.0 mL of acetone and 5.0 mL of internal standard solution, and shake for 30 minutes. After centrifuging for approximately 10 minutes, filter the solution using a nylon membrane filter with a pore size of NMT 0.45 μm (previously washed with acetone). Discard the first 1 mL of the filtrate, and use the subsequent filtrate as the test solution. Separately, weigh accurately tetrahydro-2-furan carboxylic acid RS, and dissolve in acetone to make exactly 1.0 mg/mL. Dissolve this solution in acetone to make exactly 100 μg/mL, and use this solution as the standard stock solution. Transfer 5.0 mL of standard stock solution and 5.0 mL of internal standard solution into a 50-mL centrifuge tube, mix, and filter the solution using a nylon membrane filter with a pore size of NMT 0.45 μm (previously washed with acetone). Discard the first 1 mL of the filtrate and use the subsequent filtrate as the standard solution. Separately, pipet 2.0 mL of acetic acid(100), and add acetone to make exactly 100 mL. Mix 5.0 mL of this solution and 5.0 mL of acetone, and filter the solution using a nylon membrane filter with a pore size of NMT 0.45 μm (previously washed with acetone). Discard the first 1 mL of the filtrate and use the subsequent filtrate as the blank test solution. Perform the test with 0.2 μL each of the test solution and the standard solution as directed under the Gas Chromatography according to the following conditions, and calculate the ratios, Q_T and Q_S, of the peak area of tetrahydro-2-furan carboxylic acid to that of the internal standard, respectively (NMT 0.1%). However, perform the test with about 0.2 μL of the blank test solution as directed under

the Gas Chromatography according to the following conditions; confirm the absence of any additional peaks.

$$\text{Content (\%) of tetrahydro-2-furan carboxylic acid} = \frac{C}{W} \times \frac{Q_T}{Q_S}$$

C: Concentration (μg/mL) of tetrahydro-2-furan carboxylic acid in the standard solution

W: Amount (mg) of terazosin hydrochloride in the test solution

Internal standard solution—Weigh accurately about 0.1 g of capric acid, transfer into a 100-mL volumetric flask, dissolve in acetone, fill up to the gauge line, and mix. Mix 10.0 mL of this solution and 2.0 mL of acetic acid(100) in a 100-mL volumetric flask, add acetone to dilute, fill up to the gauge line, and mix.

Operating conditions

Detector: A flame ionization detector

Column: A fused silica column about 0.53 mm in internal diameter and about 10 m in length, of which the inner surface is coated with polyethylene glycol compound TPA for gas chromatography (1.2 μm in thickness).

Column temperature: A constant temperature of about 170 °C.

Inlet temperature: A constant temperature of about 230 °C.

Detector temperature: A constant temperature of about 240 °C.

Carrier gas: Helium

Flow rate: 9 mL/min

System suitability

System performance: Proceed with the standard solution under the above conditions; the relative retention time of tetrahydro-2-furan carboxylic acid and capric acid is 1.0 and 1.2, respectively, and the resolution between the resolution between these peaks is NLT 2.3.

System repeatability: When repeating the test 6 times with the standard solution under the above conditions, the relative standard deviation of the ratio of peak area of the tetrahydro-2-furan carboxylic acid is NMT 6.5%.

(ii) 1-[(Tetrahydro-2-furanyl)piperazine]: Weigh accurately about 125 mg of Terazosin Hydrochloride Hydrate, dissolve in a mixture of acetonitrile and water (1 : 1) to make exactly 25 mL, and use this solution as the test solution. Separately, weigh accurately 1-[(tetrahydro-2-furanyl)piperazine] RS, and dissolve in acetonitrile to make exactly 1.0 mg/mL. Dissolve this solution in acetonitrile to make exactly 5 μg/mL, and use this solution as the standard solution. Use acetonitrile as the blank test solution. Separately, dissolve about 2.0 g of 3,5-dinitrobenzoyl chloride in 250 mL of acetonitrile, and use this solution as the derivatization solution. Add 5 mL each of the blank test solution, the standard solution, and the test solution to the separate 100-mL volumetric flask, mix with 5.0 mL of phosphate buffer solution, add 10.0 mL of the derivatization solution, and allow to stand at room temperature for 20 minutes. Add a mixture of acetonitrile and water (1 : 1) to dilute, fill up to the gauge line, and mix. Perform the test with 50 μL each of the blank test solution, the standard solution, and the test solution, which are derivatized, as directed under the Liquid Chromatography according to the following conditions, and determine the area of each peak obtained from each solution by the automatic integration method. The content of 1-[(tetrahydro-2-furanyl)piperazine] is NMT 0.1% by using the following formula:

$$\text{Content (\%) of 1-[(tetrahydro-2-furanyl)piperazine]} = \frac{C}{W} \times \frac{A_T}{A_S} \times 2500$$

C: Concentration (mg/mL) of 1-[(tetrahydro-2-furanyl)piperazine] in the standard solution

W: Amount (mg) of terazosin hydrochloride in the test solution

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in internal diameter and 25 cm in length, packed with octylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: Control the step or gradient elution by mixing the mobile phases A and B as followings.

Mobile phase A: Water

Mobile phase B: Acetonitrile

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 - 35	82	18
35 - 40	82 → 10	18 → 90
40 - 75	10	90
75 - 80	10 → 82	90 → 18
80 - 100	82	18

Flow rate: 1.5 mL/min. However, between 40 and 80 minutes, change the flow rate to 2.0 mL/min.

System suitability

System performance: The retention time for 1-[(tetrahydro-2-furanyl)piperazine] appears after 22 minutes, and the number of theoretical plate is NLT 3500.

System repeatability: Repeat the test 6 times with 50 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak areas of 1-[(tetrahydro-2-furanyl)piperazine] is NMT 3.0%.

Phosphate buffer solution—Weigh accurately about 96.3 g of dibasic potassium phosphate and 3.85 g of potassium dihydrogen phosphate, transfer into a 500-mL volumetric flask, and add water to dilute to the gauge

line. Use the diluted phosphoric acid solution (10 in 100) or sodium hydroxide solution (10 in 100), and adjust the pH to 8.0 ± 0.1. Transfer 25.0 mL of this solution into a 100-mL volumetric flask, and add water to dilute to the gauge line. Use the diluted phosphoric acid solution (10 in 100) or sodium hydroxide solution (10 in 100), and adjust the pH to 8.0 ± 0.1.

(iii) *Other related substances*—Weigh accurately about 200 mg of Terazosin Hydrochloride Hydrate, dissolve in the mobile phase to make exactly 100 mL, and use this solution as the test solution. Pipet 1 mL of this solution, and add the mobile phase to make exactly 100 mL. Pipet 1 mL of this solution, add the mobile phase to make exactly 10 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak area of each solution according to the automatic integration method, and calculate the amount of each related substance; terazosin related substance I with relative retention time of 0.4 to the terazosin hydrochloride obtained from the test solution is NMT 0.3%, terazosin related substance III with relative retention time of 1.8 is NMT 0.4%, any individual related substances eluting before the terazosin peak is NMT 0.3%, terazosin hydrochloride related substance II with a relative retention time of 1.2, as well as any other individual related substances, is NMT 0.1%, and the total related substances is NMT 0.6%. However, exclude any peaks smaller than 0.05%.

$$\text{Content (\%) of related substances} = \frac{A_T}{A_S} \times rf \times \frac{1}{10}$$

A_T: Peak area of each related substance obtained from the test solution

A_S: Peak area of terazosin hydrochloride obtained from the standard solution

rf: The correction factor for each related substance for terazosin hydrochloride peak

Terazosin related substance I: 1.03
Terazosin related substance II: 1.41
Terazosin related substance III: 0.69
Other related substances: 1.00

Operating conditions

For the detector, mobile phase, flow rate, etc., perform the test as directed under the operating conditions under the Assay.

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Time span of measurement: For 40 minutes after injecting the samples.

System suitability

Test for required detectability: Pipet 5 mL of the standard solution, and add the mobile phase to make exactly 10 mL. Proceed with 20 μL of this solution according to the above conditions; confirm that the signal-to-noise ratio of the terazosin hydrochloride peak is NLT 10.

System performance: Proceed with 20 μL of the standard solution according to the above operating conditions; the number of theoretical plates and the symmetry factor of the peak of terazosin hydrochloride are NLT 10000 and 0.8 - 2.0, respectively.

System repeatability: Repeat the test 6 times with 20 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area of terazosin is NMT 2.0%.

Loss on drying NMT 9.0% (1 g, in vacuum, 105 ℃, 3 hours).

Residue on ignition NMT 0.2% (1 g).

Assay Weigh accurately about 0.1 g of Terazosin Hydrochloride Hydrate, add the mobile phase to make exactly 200 mL, and use this solution as the test stock solution. Pipet 10.0 mL of the test stock solution, and add the mobile phase to make exactly 50 mL. Pipet 10.0 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately terazosin hydrochloride RS, dissolve in the mobile phase to make 0.5 mg/mL, and use this solution as the standard stock solution. Pipet 10.0 mL of the standard stock solution and add the mobile phase to make exactly 50 mL. Pipet 10.0 mL of this solution, add the mobile phase to it make exactly 100 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test standard solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak area of terazosin hydrochloride, A_T and A_S, from each of the solutions.

$$\text{Amount (mg) of terazosin hydrochloride } (C_{19}H_{25}N_5O_4 \cdot HCl) = C \times \frac{A_T}{A_S} \times 10000$$

C: Concentration (mg/mL) of terazosin hydrochloride RS in the standard solution

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 30 °C.

Mobile phase: A mixture of pH 3.2 citric acid buffer solution and acetonitrile (1685 : 315).

Flow rate: 1.0 mL/min

System suitability

System performance: Proceed with 20 μL of the

standard solution according to the above conditions; the number of theoretical plates and the symmetry factor are NLT 12000 and 0.9 to 1.3, respectively.

System repeatability: Repeat the test 6 times according to the above conditions with 20 μL of the standard solution each time; the relative standard deviation of the peak area is NMT 0.9%.

pH 3.2 citric acid buffer solution—Dissolve 12.0 g of sodium citrate dihydrate and 28.5 g of citric acid (100) in 1950 mL of water. Adjust pH to 3.2 ± 0.1 with citric acid (100) or sodium citrate, and add water to make 2000 mL.

Packaging and storage Preserve in tight containers at a temperature between 20 and 25 °C.

Terazosin Hydrochloride Tablets
테라조신염산염 정

Terazosin Hydrochloride Tablets contain NLT 90.0% and NMT 110.0% of labeled amount of terazosin ($C_{19}H_{25}N_5O_4$: 387.43).

Method of preparation Prepare as directed under Tablets, with Terazosin Hydrochloride.

Identification (1) Weigh a portion of powdered Terazosin Hydrochloride Tablets, equivalent to 10 mg of terazosin hydrochloride according to the labeled amount, place in a 100-mL volumetric flask, dilute with 0.1 mol/L hydrochloric acid filled up to 50% of the volumetric flask's volume, sonicate for 10 minutes, allow to stand to cool to room temperature, and fill with 0.1 mol/L hydrochloric acid up to the gauge line. Take 5 mL of this solution, dilute with 0.1 mol/L hydrochloric acid to make 100 mL, shake to mix, and filter 20 mL of this solution through a membrane filter with 0.45 μm of pore diameter, discarding the first 5 mL of the filtrate. Use this subsequent filtrate as the test solution. Separately, dissolve terazosin hydrochloride RS in 0.1 mol/L hydrochloric acid to make a concentration of 0.005 mg/mL, sonicate for 10 minutes to dissolve completely, and filter through a nylon filter with 0.45 μm of pore diameter, discarding the first 5 mL of the filtrate. Use this subsequent filtrate as the standard solution. Determine the absorption spectra of the test solution and the standard solution as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit absorption maxima and minima at the same wavelengths.

(2) Perform the test as directed under the Assay; the retention times of the major peaks obtained from the test solution and the standard solution are the same.

Purity ***Related substances***—Weigh accurately the mass of NLT 20 tablets of Terazosin Hydrochloride Tablets and powder. Weigh accurately an amount of the powder, equivalent to about 15 mg of terazosin hydrochloride, put in in a 50-mL volumetric flask, dilute with 25 mL of the mobile phase, sonicate for NLT 10 minutes, and shake to mix for NLT 20 minutes. To this solution, add the mobile phase to make 50 mL. Filter this solution through a nylon or Teflon filter with 0.45 μm of pore diameter, discard the first 5 mL of the filtrate, and use the remaining filtrate as the test solution. Separately, dissolve terazosin hydrochloride RS in the mobile phase to make a concentration of 0.003 mg/mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions to determine the peak area of each solution by the automatic integration method, and calculate the amount of related substances in the test solution; terazosin hydrochloride related substances I {N-(4-amino-6,7-dimethoxy-2-quinazolinyl)piperazine} having the relative retention time to terazosin hydrochloride of about 0.52, terazosin hydrochloride related substances II {2-chloro-4-amino-6,7-dimethoxy-2-quinazoline} having that of about 1.37 and terazosin hydrochloride related substances III {*N*,*N*-bis-(4-amino-6,7-dimethoxy-2-quinazolinyl)piperazine} having that of about 3.85 are NMT 0.4% respectively, other individual related substances are NMT 0.2%, and the sum of total related substances is NMT 1.2%. However, the correction factors for the peak areas of terazosin related substances I and terazosin related substances II are 1.1 and 1.2, respectively.

$$\text{Amounts (\%) of related substances} = \frac{A_T}{A_S} \times \frac{C_S}{C_T} \times \frac{1}{F} \times \frac{387.43}{423.89} \times 100$$

C_S: Concentration (mg/mL) of terazosin hydrochloride in the standard solution

C_T: Concentration (mg/mL) of terazosin in the test solution

A_T: Peak areas of the individual related substances in the test solution

A_S: Peak area of terazosin hydrochloride in the standard solution

F: Correction factor

387.43: Molecular weight of terazosin

423.89: Molecular weight of terazosin hydrochloride

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 246 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of buffer solution and acetonitrile (19 : 6).

Flow rate: 1 mL/min

System suitability

System performance: Dissolve terazosin hydrochloride RS in the mobile phase to make 0.15 μg/mL, and

use this solution as the system suitability solution. Perform the test with 10 μL each of the standard solution and the system suitability solution according to the operating conditions above; the capacity factor (retention factor) of the terazosin peak from the standard solution is NLT 1.0, its symmetry factor is NMT 2.0, and the signal-to-noise ratio of the terazosin peak from the system suitability solution is NLT 10.

System repeatability: Repeat the test 6 times with 10 μL of the standard solution according to the above conditions; the relative standard deviation of the peak areas of terazosin is NMT 2.0%.

Time span of measurement: About 4.5 times the retention time of terazosin after the solvent peak.

Buffer solution—Dissolve 4.1 g of potassium dihydrogen phosphate and 1.1 g of sodium 1-heptanesulfonate monohydrate in 950 mL of water, adjust with phosphoric acid to pH 3.0 ± 0.10, dilute with water to make 1000 mL, filter the solution through a nylon filter with 0.45 μm of pore diameter, and use this solution as the buffer solution.

Dissolution Perform the test with 1 tablet of Terazosin Hydrochloride Tablets at 50 revolutions per minute according to Method 2 under the Dissolution, using 900 mL of water as the dissolution medium. Take 20 mL of the dissolved solution 30 minutes after starting the test and filter through a membrane filter with a pore size of 0.45 μm. Discard the first 10 mL of the filtrate, add water to the subsequent filtrate so that each mL contains about 5 μg of terazosin ($C_{19}H_{25}N_5O_4$), and use this solution as the test solution. Separately, dissolve terazosin hydrochloride RS in water to make a concentration of terazosin hydrochloride 0.1 mg/mL. Take 5.0 mL of this solution, add water to make 100.0 mL, and use this solution as the standard solution. Perform the test with the test solution and the standard solution as directed under the Ultraviolet-visible Spectroscopy, and determine the absorbance at the absorbance maximum wavelength of around 245 nm. The dissolution rate of Terazosin Hydrochloride Tablets in 30 minutes is NLT 75%.

$$\text{Dissolution rate (\%) of terazosin } (C_{19}H_{25}N_5O_4) = \frac{A_T}{A_S} \times \frac{C_S}{L} \times \frac{387.43}{423.89} \times V \times 100$$

A_T: Absorbance of the test solution

A_S: Absorbance of the standard solution

C_S: Concentration (mg/mL) of terazosin hydrochloride in the standard solution

L: Labeled amount (mg/tablet) of terazosin in 1 tablet

387.43: Molecular weight of terazosin

423.89: Molecular weight of terazosin hydrochloride

V: Volume of the dissolution medium, 900mL

Uniformity of dosage units Perform the test with 1 tablet of Terazosin Hydrochloride Tablets as directed under the Assay; it meets the requirements of the Procedure for content uniformity.

Assay Weigh accurately the mass of NLT 20 tablets of Terazosin Hydrochloride Tablets and powder them. Weigh accurately an amount of the powder, equivalent to about 10 mg of terazosin hydrochloride ($C_{19}H_{25}N_5O_4 \cdot HCl$), place in a 200-mL volumetric flask, add 100 mL of the diluent, sonicate for NLT 10 minutes, and shake for NLT 10 minutes. Repeat this process until the sample is uniformly dispersed. Allow the solution to stand at room temperature until cooled, and add the diluent to make 200 mL. Filter through a membrane filter with 0.45 μm of pore diameter, discarding the first 5 mL of the filtrate, and use the remaining filtrate as the test solution. Separately, dissolve terazosin hydrochloride RS in the diluent to have a concentration of 0.55 mg/mL for terazosin hydrochloride, sonicate for 5 minutes to dissolve completely, and use this solution as the standard stock solution. Add the diluent to the standard stock solution and make the concentration of terazosin hydrochloride 0.055 mg/mL. Filter through a membrane filter with 0.45 μm of pore diameter, discarding the first 5 mL of the filtrate, and use the remaining filtrate as the standard solution. Perform the test with 25 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions, and determine the area of the peak of terazosin hydrochloride in the test solution, A_T, and in the standard solution, A_S.

$$\text{Content (\%) of terazosin } (C_{19}H_{25}N_5O_4) = \frac{A_T}{A_S} \times \frac{C_S}{C_T} \times \frac{387.43}{423.89} \times 100$$

C_S: Concentration (mg/mL) of terazosin hydrochloride in the standard solution

C_T: Concentration (mg/mL) of terazosin in the test solution

387.43: Molecular weight of terazosin

423.89: Molecular weight of terazosin hydrochloride

Diluent—Add 0.85 mL of hydrochloric acid to 1000 mL methanol to make 0.01 mol/L hydrochloric acid-methanol solution. Use a mixture of the 0.01 mol/L hydrochloric acid-methanol solution and water (2 : 3) as the diluent.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm)

Column: A stainless steel column about 4.6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter)

Mobile phase: Add acetic acid(100) to a mixture of acetonitrile and water (7 : 3) to make a concentration of 10.00 mL/L, degas, filter through a nylon filter with 0.45 μm of pore diameter, add 0.20 mL of diethylamine to the

filtrate and mix.

Flow rate: 1 mL/min

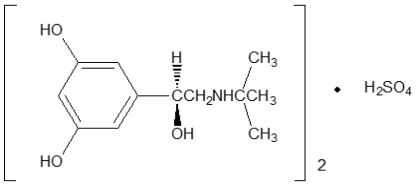
System suitability

System performance: Place 50 mg of naproxen RS in a 100-mL volumetric flask, add 25 mL of acetonitrile, sonicate to dissolve, add water to make 100 mL, and use this solution as the naproxen standard solution. Add the diluent to the naproxen standard solution and the standard stock solution for assay to prepare a mixture containing 0.05 mg/mL of naproxen and 0.055 mg/mL of terazosin, filter through a membrane filter with 0.45 μm of pore diameter, discard the first 5 mL of the filtrate, and use the remaining filtrate as the system suitability solution. Perform the test with 25 μL of the system suitability solution according to the above conditions; the resolution between the naproxen and terazosin peaks is NLT 2.0, and the symmetry factor of the terazosin peak is NMT 1.8.

System repeatability: Repeat the test 6 times with 25 μL of the standard solution according to the above conditions; the relative standard deviation of the peak areas of terazosin is NMT 2.0%.

Packaging and storage Preserve in tight containers.

Terbutaline Sulfate
테르부탈린황산염



and enantiomer

$(C_{12}H_{19}NO_3)_2 \cdot H_2SO_4$: 548.65

5-[2-(*tert*-Butylamino)-1-hydroxyethyl]benzene-1,3-diol; sulfuric acid [*23031-32-5*]

Terbutaline Sulfate contains NLT 98.5% and NMT 101.0% of terbutaline sulfate [$(C_{12}H_{19}NO_3)_2 \cdot H_2SO_4$], calculated on the anhydrous basis.

Description Terbutaline Sulfate occurs as white to brownish white crystals or a crystalline powder. It is odorless or has a slight odor of acetic acid.

It is freely soluble in water and practically insoluble in acetonitrile, acetic acid(100), ethanol(95), ether, or chloroform.

It is gradually colored by light or air.

Melting point—About 255 °C (with decomposition).

Identification (1) Dissolve 1 mg of Terbutaline Sulfate in 1 mL of water, and add 5 mL of pH 9.5 tris buffer solution, 0.5 mL of 4-aminoantipyrine solution (1 in 50), and 2 drops of potassium hexacyanoferrate(III) solution (2 in 25); the resulting solution exhibits a purple color.

(2) Determine the absorption spectra of solutions of Terbutaline Sulfate and terbutaline sulfate RS in 0.01 mol/L hydrochloric acid TS (1 in 10000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths. A maximum sometimes splits into two.

(3) An aqueous solution of Terbutaline Sulfate (1 in 50) responds to the Qualitative Analysis for sulfate.

pH Dissolve 0.10 g of Terbutaline Sulfate in 10 mL of water; the pH of this solution is between 4.0 and 4.8.

Purity (1) ***Clarity and color of solution***—Dissolve 0.10 g of Terbutaline Sulfate in 10 mL of water; the resulting solution is colorless to pale yellow and clear.

(2) ***Chloride***—Perform the test with 2.0 g of Terbutaline Sulfate. Prepare the control solution with 0.25 mL of 0.01 mol/L hydrochloric acid (NMT 0.004%).

(3) ***Heavy metals***—Proceed with 2.0 g of Terbutaline Sulfate according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(4) ***Arsenic***—Prepare the test solution with 1.0 g of Terbutaline Sulfate according to Method 3 and perform the test (NMT 2 ppm).

(5) ***Related substances***—Weigh accurately 50 mg of Terbutaline Sulfate, add the mobile phase to make exactly 50 mL, and use this solution as the test solution. Separately, weigh accurately 30 mg of terbutaline sulfate RS, dissolve in the mobile phase to make 100 mL, pipet 1.0 mL of this solution, and add the mobile phase to make 100 mL of a solution containing 3 μg of terbutaline sulfate per mL. Use this solution as the standard solution. Perform the test with 20 μL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak area of each solution as directed in the automatic integration method; the amount of total related substances is NMT 1.0%.

$$\text{Content (\%) of related substances} = 5000 \times \frac{C}{W} \times \frac{A_T}{A_S}$$

C: Concentration (mg/mL) of terbutaline sulfate in the standard solution

W: Sampling amount (mg)

A_T: Peak area of each related substance obtained from the test solution

A_S: Peak area of terbutaline obtained from the standard solution

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 276 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: Dissolve 3.15 g of ammonium formate in 900 mL of water, adjust the pH to 3.0 with

formic acid, add 5.49 g of sodium 1-hexanesulfonate, and add water to make 1000 mL. To 770 mL of this solution, add 230 mL of methanol.

Flow rate: 1 mL/min

System suitability

System performance: Weigh accurately 25 mg of terbutaline sulfate RS and 10 mg of related substance I {3,5-dihydroxy-ω-t-butylaminoacetophenone sulfate}, dissolve in mobile phase to make 25 mL of solutions, each containing 1.0 mg and 0.4 mg per mL, and use these solutions as the system suitability solution. Proceed with 20 μL of these solutions according to the above conditions; the relative retention time for terbutaline related substance I to terbutaline is 0.9 with the resolution being NLT 2.0. The number of theoretical plates and the symmetry factor of the peak of terbutaline are NLT 1500 and NMT 2.0, respectively.

System repeatability: Repeat the test 5 times with 20 μL each of the system suitability solution according to the above conditions; the relative standard deviation of the peak areas of terbutaline is NMT 2.0%.

(6) ***3,5-Dihydroxy-ω-t-butylaminoacetophenone sulfate***—Dissolve 0.50 g of Terbutaline Sulfate in 0.01 mol/L hydrochloric acid TS to make exactly 25 mL, and perform the test with this solution as directed under Ultraviolet-visible Spectroscopy; the absorbance at the wavelength of 330 nm is NMT 0.47.

(7) ***Related substances***—Dissolve about 0.50 g of Terbutaline Sulfate in phosphoric acid solution (59 in 1000) to make exactly 10 mL, and use this solution as the test solution. Separately, dissolve 1.50 g of acetic acid(100) in phosphoric acid (59 in 1000) to make exactly 100 mL. Pipet 2 mL of this solution, add phosphoric acid (59 in 1000) to make exactly 200 mL, and use this solution as the standard solution. Perform the test with 2 μL each of the test solution and standard solution as directed under the Gas Chromatography according to the following conditions. Determine the peak area of acetic acid, A_T and A_S, of each solution; A_T is not greater than A_S.

Operating conditions

Detector: A flame ionization detector

Column: A column, about 3 mm in internal diameter and about 1 m in length, packed with polyethylene glycol 6000 coated in 180 μm to 250 μm terephthalic acid for gas chromatography at a rate of 10%.

Column temperature: A constant temperature of about 120 °C.

Carrier gas: Nitrogen

Flow rate: Adjust the flow rate so that the retention time of acetic acid is about 5 minutes.

System suitability

System performance: Dissolve 50 mg each of acetic acid(100) and propionic acid in 100 mL of phosphoric acid solution (59 in 1000). Proceed with 2 μL of this solution according to the above conditions; acetic acid and propionic acid are eluted in this order with the resolution being NLT 2.0.

System repeatability: Repeat the test 6 times with 2 μL each of the standard solutions according to the above conditions; the relative standard deviation of the peak area of acetic acid is NMT 3.0%.

Water NMT 0.5% (1 g, volumetric titration, direct titration).

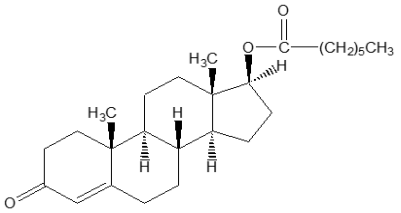
Residue on ignition NMT 0.2% (1 g).

Assay Weigh accurately about 0.5 g of Terbutaline Sulfate, add 50 mL of a mixture of acetic acid(100) and acetonitrile (1 : 1), and dissolve by warming while stirring. After cooling, titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry; however, use a saturated methanol solution of potassium chloride as the internal solution).

Each mL of 1 mol/L perchloric acid VS
= 54.87 mg of $(C_{12}H_{19}NO_3)_2 \cdot H_2SO_4$

Packaging and storage Preserve in light-resistant, tight containers.

Testosterone Enanthate
테스토스테론에난테이트



$C_{26}H_{40}O_3$: 400.59

[(8*R*,9*S*,10*R*,13*S*,14*S*,17*S*)-10,13-Dimethyl-3-oxo-1,2,6,7,8,9,11,12,14,15,16,17-dodecahydrocyclopenta[a]phenanthren-17-yl]heptanoate [*315-37-7*]

Testosterone Enanthate, when dried, contains NLT 95.0% and NMT 105.0% of testosterone enanthate ($C_{26}H_{40}O_3$).

Description Testosterone Enanthate occurs as a white to pale yellow crystal, crystalline powder, or pale yellowish brown viscous liquid. It is odorless or has a slightly characteristic odor.

It is very soluble in ethanol(95), 1,4-dioxane, or ether and practically insoluble in water.

Melting point—About 36 °C.

Identification To 25 mg of Testosterone Enanthate, add 2 mL of potassium hydroxide in methanol solution (1 in 100), and heat on a steam bath under a reflux condenser for 1 hour. After cooling, add 10 mL of water, filter the precipitate by suction, wash the residue until the washings become neutral, and dry the residue in a desiccator (in vacuum, phosphorus pentoxide) for 4 hours; the melt-

ing point is between 151 and 157 ℃.

Optical rotation $[\alpha]_D^{20}$: Between +81° and +86° (0.1 g after drying, ethanol(99.5), 10 mL, 100 mm).

Purity (1) ***Acid***—Dissolve 0.5 g of Testosterone Enanthate in 10 mL of a neutralized solution of bromothymol blue TS in ethanol, and add 2 drops of bromothymol blue TS and 0.50 mL of 0.01 mol/L sodium hydroxide VS; the resulting solution exhibits a pale blue color.

(2) ***Free heptanoic acid***—Weigh accurately 0.5 g of Testosterone Enanthate, dissolve in 10 mL of neutralized ethanol, previously prepared by adding 2 to 3 drops of bromothymol blue TS in ethanol until the color of the solution turns pale blue, and titrate with 0.01 mol/L sodium hydroxide VS; the consumed amount is NMT 0.6 mL (NMT 0.16% of heptanoic acid).

(3) ***Related substances***—Weigh accurately 0.1 g of Testosterone Enanthate, dissolve in methanol to make exactly 10 mL of a solution containing about 10 mg per mL, and use this solution as the test solution. Separately, weigh accurately an appropriate amount of testosterone enanthate RS, dissolve in methanol to make solutions each containing about 0.01 mg, 0.05 mg, 0.1 mg, and 0.2 mg per mL, and use these solutions as the standard solution (1), the standard solution (2), the standard solution (3), and the standard solution (4), respectively. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 20 μL each of the test solution, the standard solution (1), the standard solution (2), the standard solution (3), and the standard solution (4) on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography, develop the plate with a mixture of cyclohexane and ethyl acetate (2 : 1) as the developing solvent to a distance of about three-fourths of the length of the plate, and air-dry the plate. Spray a solution of 20g of p-toluenesulfonic acid monohydrate in 100 mL of alcohol on the plate, dry at 110 ℃ for 15 minutes, and examine the plate under ultraviolet light (main wavelength: 366 nm); any spot in the test solution is not larger or more intense than the principal spot of the standard solution (3) (NMT 1.0%). The sum of all the spots other than the principal spot from the test solution is NMT 2.0%.

Loss on drying NMT 0.5% (0.5 g, in vacuum, phosphorus pentoxide, 4 hours).

Residue on ignition NMT 0.1% (0.5 g).

Assay Weigh accurately about 0.1 g of Testosterone Enanthate, previously dried, and dissolve in ethanol(95) to make exactly 100 mL. Pipet 10 mL of this solution, and add ethanol(95) to make exactly 100 mL. Again, pipet 10 mL of this solution, and add ethanol(95) to make exactly 100 mL. Perform the test with this solution as directed under the Ultraviolet-visible Spectroscopy, and determine the absorbance of this solution, *A*, at the absorbance maximum wavelength at about 241 nm.

$$\text{Amount (mg) of testosterone enanthate } (C_{26}H_{40}O_3) = \frac{A}{426} \times 100000$$

Packaging and storage Preserve in light-resistant, tight containers at below 30 ℃.

Testosterone Enanthate Injection
테스토스테론에난테이트 주사액

Testosterone Enanthate Injection is an oily solution of injection, which contains NLT 90.0% and NMT 110.0% of the labeled amount of testosterone enanthate ($C_{26}H_{40}O_3$: 400.59).

Method of preparation Prepare as directed under Injections, with Testosterone Enanthate.

Description Testosterone Enanthate occurs as a clear, colorless to pale yellow oily liquid.

Identification Weigh an amount of Testosterone Enanthate Injection, equivalent to 50 mg of testosterone enanthate, according to the labeled amount, add 8 mL of petroleum ether, and extract three times with 10 mL each of diluted acetic acid (7 in 10). Combine the extracts, wash with 10 mL of petroleum ether, add 0.5 mL of diluted sulfuric acid (7 in 10) to 0.1 mL of the extract and heat on a steam bath for 5 minutes. After cooling, add 0.5 mL of iron(III) chloride-acetic acid TS; the color of the solution is blue.

Sterility Meets the requirements.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Extractable volume of injections Meets the requirements.

Assay Take exactly a volume of Testosterone Enanthate Injection, equivalent to about 50 mg of testosterone enanthate ($C_{26}H_{40}O_3$), and add chloroform to make exactly 100 mL. Pipet 15 mL of this solution, add 5 mL of the internal standard solution and methanol to make 50 mL, and use this solution as the test solution. Separately, weigh accurately about 50 mg of testosterone enanthate RS, previously dried for 4 hours in a desiccator (in vacuum, phosphorus pentoxide), proceed in the same manner as the test solution, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak area ratios, Q_T and Q_S, of testosterone enanthate to the peak area of the internal

standard.

$$\text{Amount (mg) of testosterone enanthate } (C_{26}H_{40}O_3) = \text{Amount (mg) of testosterone enanthate RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of phenanthrene in methanol (1 in 2000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm to 10 μm in particle diameter).

Column temperature: An ordinary temperature

Mobile phase: A mixture of acetonitrile and water (85 : 15).

Flow Rate: Adjust the flow rate so that the retention time of testosterone enanthate is about 10 minutes.

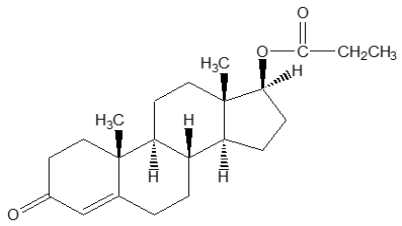
System suitability

System performance: Proceed with 20 μL of the standard solution according to the above conditions; the internal standard and testosterone enanthate are eluted in this order with the resolution being NLT 2.5.

System repeatability: Repeat the test 6 times with 20 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area ratios of testosterone enanthate RS to that of the internal standard is NMT 2.0%.

Packaging and storage Preserve in light-resistant, hermetic containers.

Testosterone Propionate
테스토스테론프로피오네이트



$C_{22}H_{32}O_3$: 344.49

[(8*R*,9*S*,10*R*,13*S*,14*S*,17*S*)-10,13-Dimethyl-3-oxo-1,2,6,7,8,9,11,12,14,15,16,17-dodecahydrocyclopenta[a]phenanthren-17-yl]propanoate [*57-85-2*]

Testosterone Propionate, when dried, contains NLT 97.0% and NMT 103.0% of testosterone propionate ($C_{22}H_{32}O_3$).

Description Testosterone Propionate occurs as white to pale yellow crystals or a crystalline powder and is odorless. It is freely soluble in methanol or in ethanol(95) and practically insoluble in water.

Identification (1) Determine the absorption spectra of solutions of Testosterone Propionate and testosterone propionate RS in ethanol(95) (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Testosterone Propionate and testosterone propionate RS, previously dried, as directed under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Optical rotation $[\alpha]_D^{20}$: Between +83° and +90° (0.1 g after drying, ethanol(95), 10 mL, 100 mm).

Melting point Between 118 and 123 ℃.

Purity ***Related substances***—Dissolve about 40 mg of Testosterone Propionate in ethanol(95) and use the solution as the test solution. Pipet 1 mL of the test solution, add ethanol(95) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under the Thin Layer Chromatography. Spot each 10 μL of the test and standard solution on a plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of chloroform and diethylamine (19 : 1) to a distance of about 15 cm and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 366 nm); any spot other than the principal spot obtained from the test solution is not more intense than the spot from the standard solution.

Loss on drying NMT 0.5% (0.5 g, in vacuum, phosphorus pentoxide, 4 hours).

Residue on ignition NMT 0.1% (0.5 g).

Assay Weigh accurately each about 10 mg of Testosterone Propionate and testosterone propionate RS, previously dried, and dissolve in methanol to make exactly 100 mL, respectively. Pipet 5.0 mL of these solutions, add exactly 5 mL of the internal standard solution and then methanol to make exactly 20 mL, and use these solutions as the test solution and the standard solution. Perform the test with 5 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions. Determine the ratios of the peak area, Q_T and Q_S of tetosterone propionate to the peak area of the internal standard of each solution.

$$\text{Amount (mg) of testosterone propionate } (C_{22}H_{32}O_3) = \text{Amount (mg) of testosterone propionate RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of progesterone in methanol (9 in 100000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 241 nm).

Column: A stainless steel column 4.6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 35 °C.

Mobile phase: A mixture of acetonitrile and water (7: 3).

Flow rate: Adjust the flow rate so that the retention time of Testosterone Propionate is about 10 minutes.

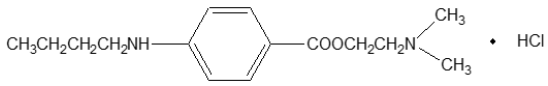
System suitability

System performance: Proceed with 5 μL of the standard solution under the above operating conditions; the internal standard and testosterone propionate are eluted in this order with the resolution being NLT 9.

System repeatability: Repeat the test six times with 5 μL of the standard solution under the above operating conditions; the relative standard deviation of the peak area ratio of testosterone propionate to that of the internal standard is NMT 1.0%.

Packaging and storage Preserve in light-resistant, tight containers.

Tetracaine Hydrochloride
테트라카인염산염



$C_{15}H_{24}N_2O_2 \cdot HCl$: 300.82

2-(Dimethylamino)ethyl 4-(butylamino)benzoate hydrochloride [*136-47-0*]

Tetracaine Hydrochloride, when dried, contains NLT 98.5% and NMT 101.0% of tetracaine hydrochloride ($C_{15}H_{24}N_2O_2 \cdot HCl$).

Description Tetracaine Hydrochloride occurs as white crystals or a crystalline powder. It is odorless, has a slightly bitter taste, and paralyzes the tongue.

It is very soluble in formic acid, freely soluble in water, soluble in ethanol(95), sparingly soluble in ethanol(99.5), slightly soluble in acetic anhydride, and practically insoluble in ether.

An aqueous solution of Tetracaine Hydrochloride (1 in 10) is neutral.

Melting point—About 148 °C.

Identification (1) Dissolve 0.5 g of Tetracaine Hydrochloride in 50 mL of water, add 5 mL of ammonia TS, shake to mix, allow to stand in a cold place, and filter the extracted crystals. Wash with water until the filtrate becomes neutral, and dry it in a desiccator (silica gel) for 24 hours; the melting point of the crystals so obtained is between 42 and 44 ℃.

(2) Dissolve about 0.1 g of Tetracaine Hydrochloride in 8 mL of water and add 3 mL of ammonium thiocyanate TS; a crystalline precipitate is formed. Filter the precipitate formed. Dry the precipitate at 80 ℃ for 2 hour; the precipitate melts between 130 and 132 ℃.

(3) Determine the absorption spectra of solutions of Tetracaine Hydrochloride and tetracaine hydrochloride RS in ethanol(99.5) (1 in 200000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(4) A solution of Tetracaine Hydrochloride (1 in 10) responds to the Qualitative Analysis for chloride.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Tetracaine Hydrochloride as directed under Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Related substances—***Weigh 0.5 g of Tetracaine Hydrochloride, dissolve in water to make 10mL, prepare a solution containing 50 mg per mL, and use this solution as the test solution. Separately, weigh 20 mg of 4-(butylamino)benzoic acid, dissolve in methanol to make exactly 100 mL, make a solution containing 0.2 mg per mL, and use this solution as the standard solution. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Develop the plate with a mixture of chloroform, methanol and isopropylamine (98 : 7 : 2) to a distance of about three-fourths of the length of the plate, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot obtained from the test solution are not larger or more intense than the spot from the standard solution. The sum of all the spots other than the principal spot from the test solution is NMT 0.8%.

Loss on drying NMT 1.0% (1 g, 105 ℃, 4 hours).

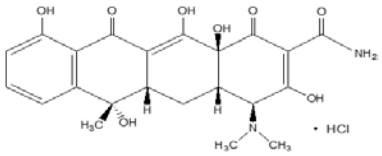
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.5 g of Tetracaine Hydrochloride, previously dried, dissolve in 2 mL of formic acid, add 80 mL of acetic anhydride, allow to stand on a steam bath at 30 ℃ for 15 minutes, and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 1 mol/L perchloric acid VS
= 30.082 mg of $C_{15}H_{24}N_2O_2 \cdot HCl$

Packaging and storage Preserve in tight containers.

Tetracycline Hydrochloride
테트라사이클린염산염



$C_{22}H_{24}N_2O_8 \cdot HCl$: 480.90
(4*S*,4a*R*,5*S*,5a*R*,6*R*,12aS)-4-(Dimethylamino)-3,6,10,12,12a-pentahydroxy-6-methyl-1,11-dioxo-1,4,4a,5,5a,6,11,12a-octahydrotetracene-2-carboxamide hydrate [*64-75-5*]

Tetracycline Hydrochloride is the hydrochloride of a kind of tetracycline substance having antibacterial activity produced by the growth of *Streptomyces aureofaciens.*

Tetracycline Hydrochloride contains NLT 950 μg and NMT 1010 μg (potency) of tetracycline hydrochloride ($C_{22}H_{24}N_2O_8$: 475.58) per mg, calculated on the dried basis.

Description Tetracycline Hydrochloride occurs as a yellow to pale brown crystalline powder.
It is freely soluble in water and sparingly soluble in ethanol(95).

Identification (1) Determine the absorption spectra of Tetracycline Hydrochloride and tetracycline hydrochloride RS (1 in 62500) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Tetracycline Hydrochloride and tetracycline hydrochloride RS as directed in the potassium chloride disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) An aqueous of Tetracycline Hydrochloride (1 in 100) responds to the Qualitative Analysis (2) for chloride.

pH Dissolve 1.0 g of Tetracycline Hydrochloride in 100 mL of water; the pH of this solution is between 1.8 and 2.8.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Tetracycline Hydrochloride according to Method 2 and perform the test. Prepare the control solution with 1.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Arsenic***—Proceed with 1.0 g of Tetracycline Hydrochloride according to Method 4 and perform the test (NMT 2 ppm).

(3) ***Related substances***—Weigh accurately about 25 mg of Tetracycline Hydrochloride, dissolve exactly in 50 mL of 0.01 mol/L hydrochloric acid TS, and use this solution as the test solution. Pipet 3 mL of Tetracycline Hydrochloride, add 0.01 mol/L hydrochloric acid TS to make exactly 100 mL, and use this solution as the standard solution. Take exactly 20 μL each of the test solution and the standard solution, perform the test as directed under the Liquid Chromatography according to the following conditions, and determine the peak area of each solution by the automatic integration method; each peak area other than Tetracycline from the test solution is not larger than the peak area of Tetracycline from the standard solution. The sum of peak areas other than Tetracycline from the test solution is not greater than 3 times the peak area of Tetracycline from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with spherical styrene-divinylbenzene copolymer for liquid chromatography (0.01 nm in pore diameter).

Column temperature: 60 °C

Mobile phase: Dissolve 3.5 g of dibasic potassium phosphate, 2.0 g of tetrabutylammonium hydrogen sulfate and 0.4 g of disodium dihydrogen ethylenediaminetetraacetate dihydrate in 300 mL of water, and adjust the pH to pH 9.0 with sodium hydroxide TS. To this solution, add 90 g of t-butyl alcohol, and add water to make 1000 mL.

Flow rate: Adjust the flow rate so that the retention time of Tetracycline is about 5 minutes.

System suitability

Test for required detectability: Pipet 3 mL of the standard solution and add 0.1 mol/L hydrochloric acid TS to make exactly 100 mL. Confirm that the peak area of tetracycline obtained from 20 μL of this solution is 1 to 5% of the peak area of tetracycline obtained from the standard solution.

System performance: Weigh about 0.05 g of tetracycline hydrochloride RS and dissolve in 25 mL of the water. Heat 5 mL of this solution on a steam bath for 60 minutes and add water to make 25 mL. Proceed with 20 μL of this solution according to the above conditions; the retention time of 4-epoxytetracycline is about 3 minutes; 4-eptetracycline and tetracycline are eluted in this order with the resolution being NLT 2.5.

System repeatability: Repeat the test 6 times with 20 μL each of the standard solutions; the relative standard deviation of the peak area of tetracycline is NMT 1.0%.

Time span of measurement: About 7 times the retention time of tetracycline after the solvent peak.

Loss on drying NMT 2.0% (1.0 g, in vacuum, 60 °C, 3 hours).

Residue on ignition NMT 0.3% (1.0 g).

Sterility It meets the requirements when used in the manufacturing of a sterile preparation. However, it is excluded when there is a terminal sterilization process in the manufacturing process of sterile preparations.

Bacterial endotoxins Less than 0.5 EU per mg (potency) of tetracycline hydrochloride when used in the manufacturing of sterile preparations.

Histamine It meets the requirements when used in the manufacturing of a sterile preparation. Proceed with an

appropriate amount of Tetracycline Hydrochloride to prepare a solution containing 5.0 mg (potency) per mL in Isotonic Sodium Chloride Injection, and use the solution as the test solution. Use 0.6 mL of the solution for the test.

Assay Weigh accurately about 50 mg (potency) each of Tetracycline Hydrochloride and tetracycline hydrochloride RS, dissolve in the mobile phase A to make exactly 100 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions, and determine the peak areas, A_T and A_S, of tetracycline hydrochloride in the test solution and the standard solution.

Potency (μg) of tetracycline hydrochloride ($C_{22}H_{24}N_2O_8$)
= Potency (μg) of tetracycline hydrochloride RS× $\frac{A_T}{A_S}$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 280 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: Adjust a mixture of mobile phase A and mobile phase B (950 : 50) to pH 7.6 to 7.7 with ammonium hydroxide and phosphoric acid.

Mobile phase A: A mixture of 0.1 mol/L ammonium oxalate and dimethylformamide (680 : 270).

Mobile phase: 0.2 mol/L ammonium monohydrogen phosphate

Flow rate: 2.0 mL/min

Packaging and storage Preserve in light-resistant, tight containers.

Tetracycline Hydrochloride Capsules
테트라사이클린염산염 캡슐

Tetracycline Hydrochloride Capsules contain NLT 90.0% and NMT 120.0% of the labeled amount of tetracycline hydrochloride ($C_{22}H_{24}N_2O_8$·HCl : 480.90).

Method of preparation Prepare as directed under Capsules, with Tetracycline Hydrochloride.

Identification (1) Take the contents of Tetracycline Hydrochloride Capsules, weigh an amount equivalent to 2 to 3 mg of tetracycline, and add 2 mL of sulfuric acid; the resulting solution exhibits purple.

(2) The retention times of the major peaks from the test solution and the standard solution obtained under the Assay are the same.

Purity ***4-epianhydrotetracycline hydrochloride***—Weigh accurately the contents of NLT 20 capsules of Tetracycline Hydrochloride Capsules, weigh accurately the amount equivalent to about 50 mg (potency) according to the labeled potency, dissolve in the mobile A to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 10 mg of 4-epianhydrotetracycline hydrochloride RS, dissolve in the mobile phase A to make exactly 1000 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas of 4-epianhydrotetracycline RS, A_T and A_S, in each solution (NMT 3.0%).

Content (%) of 4-epianhydrotetracycline hydrochloride

$$= 10 \times \frac{C_s}{T} \times \frac{A_i}{A_S}$$

C_s: Concentration [μg(potency)/mL] of 4-epianhydrotetracycline hydrochloride in the standard solution

T: Amount [μg(potency)/mL] of 4-epianhydrotetracycline hydrochloride in the test solution

A_i: Peak area of 4-epianhydrotetracycline hydrochloride in the test solution

A_S: Peak area of 4-epianhydrotetracycline hydrochloride in the standard solution

Operating conditions

For the detector, column, column temperature, mobile phase and flow rate, perform the test according to the conditions as directed under the Assay.

Loss on drying NMT 4.0% (0.1 g, 0.7 kPa, 60 ℃, 3 hours).

Dissolution Take 1 capsule of Tetracycline Hydrochloride Capsule and perform the test at 75 revolutions per minute according to Method 2, using 900 mL of water as the test solution, with the distance between the bottom edge of the stirring blade and the inside bottom of the flask fixed at 45 ± 5 mm during the test. For 0.5 g of capsules, take the dissolved solution after 60 minutes from the start of the test and filter. Discard the first 10 mL of the filtrate, pipet V mL of the subsequent filtrate, add the dissolution medium to make exactly V' mL, and use this solution as the test solution. Separately, weigh accurately an appropriate amount of tetracycline hydrochloride RS, dissolve in the dissolution medium to obtain a solution having the same concentration as the test solution, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at the absorbance maximum wavelength of about 276 nm as directed under the Ultraviolet-visible Spectroscopy, using the dissolution medium as a control solution. It meets the requirements when the dissolution rate for 60 minutes is NLT 80% (Q). However, 0.5 g of the capsules meet the requirement when the dissolution rate for 90 minutes is NLT 80% (Q).

Dissolution rate (%) with respect to the labeled amount of tetracycline hydrochloride ($C_{22}H_{24}N_2O_8 \cdot HCl$)

$$= C_S \times \frac{A_T}{A_S} \times \frac{V'}{V} \times \frac{1}{C} \times 90000$$

Cs: Concentration [mg (potency)/mL] of the standard solution

C: Labeled amount [mg (potency)] of tetracycline hydrochloride ($C_{22}H_{24}N_2O_8.HCl$) in 1 capsule

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the contents of 20 capsules of Tetracycline Hydrochloride Capsules, weigh the amount equivalent to about 50 mg (potency) according to the labeled potency, dissolve in the mobile phase A to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 50 mg (potency) of tetracycline hydrochloride RS, dissolve in the mobile phase A to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas of tetracycline hydrochloride, A_T and A_S, in each solution.

Potency (μg) of tetracycline hydrochloride ($C_{22}H_{24}N_2O_8 \cdot HCl$) = Potency (μg) of tetracycline hydrochloride RS× $\frac{A_T}{A_S}$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 280 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 250 mm in length, packed with octylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: Adjust a mixture of the mobile phase A and the mobile phase B (950 : 50) to pH 7.6 to 7.7 with 3 mol/L ammonium hydroxide solution and phosphoric acid.

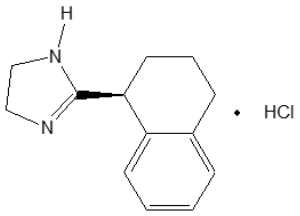
Mobile phase A: A mixture of 0.1 mol/L ammonium oxalate TS and dimethylformamide (680 : 270).

Mobile phase B: 0.2 mol/L ammonium monohydrogen phosphate

Flow rate: 2.0 mL/min

Packaging and storage Preserve in tight containers.

Tetrahydrozoline Hydrochloride
테트라히드로졸린염산염



and enantiomer

$C_{13}H_{16}N_2 \cdot HCl$: 236.74

2-(1,2,3,4-Tetrahydronaphthalen-1-yl)-4,5-dihydro-1*H*-imidazolehydrochloride [*522-48-5*]

Tetrahydrozoline Hydrochloride contains NLT 98.0% and NMT 100.5% of tetrahydrozoline hydrochloride ($C_{13}H_{16}N_2 \cdot HCl$), calculated on the dried basis.

Description Tetrahydrozoline Hydrochloride occurs as a white solid and is odorless.

It is freely soluble in water or ethanol(95), slightly soluble in chloroform, and practically insoluble in ether.

Melting point—About 256 °C (with decomposition).

Identification (1) Determine the absorption spectra of aqueous solutions of Tetrahydrozoline Hydrochloride and tetrahydrozoline hydrochloride RS (1 in 4000) as directed under the Ultraviolet-visible Spectroscopy; both exhibit an absorption maximum and minimum at the same wavelengths. The difference in absorbances of the solutions, calculated on the dried basis, at the absorption maximum wavelength of around 241 nm and 271 nm is NMT 4.0%.

(2) Determine the infrared spectra of Tetrahydrozoline Hydrochloride and tetrahydrozoline hydrochloride RS, previously dried at 105 °C for 2 hours, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit maxima at the same wavenumbers.

(3) A solution of Nortriptyline Hydrochloride (1 in 200) responds to the Qualitative Analysis for chloride.

Purity (1) ***Heavy metals***—Proceed with 0.40 g of Tetrahydrozoline Hydrochloride, dissolve in 23 mL of water, add 2 mL of 1 mol/L acetic acid as directed under Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 50 ppm).

(2) ***Related substances***—Weigh 0.1 g of Tetrahydrozoline Hydrochloride, dissolve in 10 mL of methanol, and use this solution as the test solution. Separately, weigh 10 mg of tetrahydrozolin hydrochloride RS (previously dried at 105℃ for 2 hours), and dissolve in methanol to make 10 mL. Pipet 0.1 mL, 0.5 mL, 1.0 mL and 2.0 mL each of the test solution, add methanol to make 10 mL, and use these solutions as the standard solutions (1), (2), (3) and (4), respectively. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 20 μL each of the test solution and the standard solutions (1), (2), (3) and (4) on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Develop the plate with a mixture of methanol, acetic acid(100) and water (8 : 1 : 1) as the developing solvent to a distance of about 15 cm, and air-

dry the plate. Spray evenly hexachloroplatinic(IV) acid-potassium iodide TS on the plate, and examine the plate under ultraviolet light (254 nm and 366 nm); the intensities of all spots other than the principal spot obtained from the test solution are NMT 2.0% of the total spots, as compared to those obtained from the standard solution.

Loss on drying NMT 1.0% (1 g, 105 ℃, 2 hours).

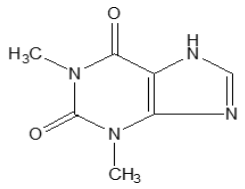
Residue on ignition NMT 0.1% (1 g).

Assay Weigh exactly about 0.2 g of Tetrahydrozoline Hydrochloride, previously dried, dissolve in 100 mL of a mixture of acetic anhydride and acetic acid(100) (7 : 3), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 1 mol/L perchloric acid VS
= 23.674 mg of $C_{14}H_{14}N_2 \cdot HCl$

Packaging and storage Preserve in tight containers.

Theophylline
테오필린



$C_7H_8N_4O_2$: 180.16
1,3-Dimethyl-2,3,6,7-tetrahydro-1H-purine-2,6-dione
[*58-55-9*]

Theophylline, when dried, contains NLT 99.0% and NMT 101.0% of theophylline ($C_7H_8N_4O_2$).

Description Theophylline occurs as white crystals or a crystalline powder.
It is soluble in *N*,*N*-dimethylformamide and slightly soluble in water or ethanol(99.5).
It dissolves in 0.1 mol/L hydrochloric acid TS.

Identification (1) Determine the absorption spectra of Theophylline and theophylline RS in hydrochloric acid TS (1 in 200000) as directed Under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Theophylline and theophylline RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy, respectively; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Melting point Between 271 and 275 ℃.

Purity (1) ***Acid***—To 0.5 g of Theophylline, add 75 mL of water, 2.0 mL of 0.01 mol/L sodium hydroxide TS and 1 drop of methyl red TS; the solution is yellow.

(2) ***Heavy metals***—Proceed with 1.0 g of Theophylline according to Method 4 and perform the test. Prepare the control solution with 2.0 mL of the lead standard solution (NMT 20 ppm).

(3) ***Arsenic***—Proceed with 1.0 g of Theophylline according to Method 3 and perform the test (NMT 2 ppm).

(4) ***Related substances***—Dissolve 0.10 g of Theophylline in 3 mL of *N*,*N*-dimethylformamide, add 10 mL of methanol, and use this solution as the test solution. Pipet 1 mL of this solution, add methanol to make exactly 200 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot each 10 μL of the test solution and the standard solution on a plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of acetone-chloroform-methanol-1-butanol-ammonia water(28) (3 : 3 : 2 : 2 : 1) to a distance of about 10 cm and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); any spot other than the principal spot obtained from the test solution is not more intense than the spot from the standard solution.

Loss on drying NMT 0.5% (1 g, 105 °C, 4 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.25 g of Theophylline, previously dried, dissolve in 100 mL of water, add exactly 20 mL of 0.1 mol/L silver nitrate solution, and shake to mix. Titrate with 0.1 mol/L sodium hydroxide VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS
= 18.016 mg of $C_7H_8N_4O_2$

Packaging and storage Preserve in well-closed containers.

Theophylline Tablets
테오필린 정

Theophylline Tablets contain NLT 94.0% and NMT 106.0% of the labeled amount of theophylline ($C_7H_8N_4O_2$: 180.17).

Method of preparation Prepare as directed under Tablets, with Theophylline.

Identification (1) Take Theophylline Tablets, previously powdered, in the amount equivalent to 0.5 g of theophylline according to the labeled amount, soften it with 10

mL and 5 mL of hexane separately, and discard the hexane from each. Soften each residue twice with 10 mL of a mixture of ammonia TS and water (1 : 1) each time, and filter. Combine the filtrates, evaporate to concentration to about 15 mL, neutralize with 6 mol/L acetic acid TS using a litmus paper, if necessary, and cool to about 15 ℃ with shaking. Filter it, wash the residue with cold water, and dry the washed residue at 105 ℃ for 2 hours; the melting point is between 270 and 274 ℃.

(2) Determine the infrared spectra of the dried residue obtained in (1) and theophylline RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) The retention times of the major peaks obtained from the test solution and the standard solution in the Assay are the same.

Dissolution Perform the test with 1 tablet of Theophylline Tablets at 50 revolutions per minute according to Method 2 under the Dissolution, using 900 mL of water as the dissolution medium. Take the dissolution medium 45 minutes after starting the test, filter, dilute with the dissolution medium if necessary, and use this solution as the test solution. Separately, weigh accurately a suitable quantity of theophylline RS, previously dried at 105 ℃ for 4 hours, use it to make a solution of a certain concentration, and use this solution as the standard solution. Perform the test with the test solution and the standard solution as directed under the Ultraviolet-visible Spectroscopy, using the dissolution medium as the control solution, and determine the absorbance at the absorbance maximum wavelength (λmax) of about 272 nm.

It meets the requirements when the dissolution rate of Theophylline Tablets in 45 minutes is NLT 80%.

Uniformity of dosage units Meets the requirements.

Assay To 10 tablets of Theophylline Tablets, add 50 mL of water and 50 mL of ammonia TS, shake well to mix for complete disintegration. To this, add water to make exactly 500 mL, and filter with suction using a dry filter paper. Discard the first 20 mL of the filtrate. From the remaining filtrate, pipet the amount (V mL) equivalent to about 10 mg of theophylline ($C_7H_8N_4O_2$) according to the labeled amount, add 20.0 mL of the internal standard solution, and add the mobile phase to make exactly 100 mL. Use this solution as the test solution. Separately, weigh accurately a suitable quantity of theophylline RS, previously dried at 105 ℃ for 4 hours, and dissolve in the mobile phase to obtain a solution having known concentration of 1 mg per mL. Pipet 10 mL of this solution, add 20.0 mL of the internal standard solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the peak area ratios, Q_T and Q_S, of theophylline to the internal standard, respectively.

$$\text{Amount (mg) of theophylline } (C_7H_8N_4O_2) = 5000 \times \frac{C}{V} \times \frac{Q_T}{Q_S}$$

C: Concentration (mg/mL) of the standard solution

Internal standard solution—Weigh accurately about 50 mg of theobromine, dissolve in 10.0 mL of ammonia TS, and add the mobile phase to make exactly 100 mL.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 280 nm).

Column: A stainless steel column, about 4 mm in internal diameter and about 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography.

Mobile phase: To 70 mL of acetonitrile, add the buffer solution to make 1000 mL.

Flow rate: 1 mL/min

System suitability

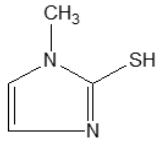
System performance: Proceed with 20 μL of the standard solution according to the above conditions; the resolution is NLT 1.5.

System repeatability: Repeat the test 6 times with 20 μL each of the standard solution according to the above conditions; the relative standard deviation of the ratios of the peak area of theophylline to that of the internal standard is NMT 1.5%.

Buffer solution—Dissolve 2.72 g of sodium acetate trihydrate in 200 mL of water, and add 20.0 mL of acetic acid(100) and then water to make 2 L.

Packaging and storage Preserve in well-closed containers.

Thiamazole
티아마졸



Methimazole $C_4H_6N_2S$: 114.17

3-Methyl-1*H*-imidazole-2-thione [*60-56-0*]

Thiamazole, when dried, contains NLT 98.0% and NMT 101.0% of thiamazole ($C_4H_6N_2S$).

Description Thiamazole occurs as white to pale yellowish crystals or a crystalline powder. It has a slight, characteristic odor and a bitter taste.

It is freely soluble in water or ethanol(95) and slightly soluble in ether.

Dissolve 1.0 g of Thiamazole in 50 mL of water; the pH of the solution is between 5.0 and 7.0.

Identification (1) Dissolve 5 mg of Thiamazole in 1 mL of water, add 1 mL of sodium hydroxide TS, shake to mix, and add 3 drops of sodium pentacyanonitrosylferrate(III) TS; the color of the solution gradually changes from yellow through yellowish green to green. To this solution, add 1 mL of acetic acid(31); the color of the solution changes to blue.

(2) To 2 mL of an aqueous solution of Thiamazole (1 in 200), add 1 mL of sodium carbonate TS and 1 mL of diluted Folin TS (1 in 5); the solution exhibits a deep blue color.

Melting point Between 144 and 147 °C.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Thiamazole according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Selenium***—Weigh 0.10 g of Thiamazole and prepare the test solution as directed under the Oxygen Flask Combustion with 25 mL of diluted nitric acid (1 in 30) as the absorbent. Apply a small amount of water to the upper part of apparatus A, open C carefully and transfer the test solution to a beaker. Wash C, B and the inner wall of A with 25 mL of water and combine the washings with the test solution. Boil this solution gently for 10 minutes, cool to room temperature, add water to make exactly 50 mL, and use this solution as the test solution. Separately, pipet 2 mL of selenium standard stock solution, add diluted nitric acid (1 in 60) to make exactly 50 mL and use this solution as the standard solution. Pipet 40 mL each of the test solution and the standard solution into separate beakers and adjust the pH of each solution to 1.8 - 2.2 with ammonia water(28). To each solution, add 0.2 g of hydroxylamine hydrochloride, shake gently to mix and dissolve, then add 5 mL of 2,3-diaminonaphthalene TS, shake and allow to stand for 100 minutes. Transfer each solution to a separatory funnel, wash the beakers with 10 mL of water, combine the washings, add 5.0 mL of cyclohexane, shake well for 2 minutes and extract. Take the cyclohexane layer and centrifuge to remove water. Perform the test with these solutions as directed under the Ultraviolet-visible Spectroscopy, using a solution prepared with 40 mL of diluted nitric acid (1 in 60) in the same manner as the control solution. The absorbance of the solution obtained from the test solution at the absorbance maximum wavelength around 378 nm is not greater than the absorbance of the solution obtained from the standard solution.

(3) ***Arsenic***—Proceed with 1.0 g of Thiamazole according to Method 1 and perform the test (NMT 2 ppm).

Loss on drying NMT 0.5% (1 g, 105 °C, 2 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.25 g of Thiamazole, previously dried, dissolve in 75 mL of water, add 15 mL of 0.1 mol/L sodium hydroxide VS with a burette and add 30 mL of silver nitrate TS while stirring. Add 1 mL of bromothymol blue TS and titrate with 0.1 mol/L sodium hydroxide VS, until the solution exhibits a persistent bluish green color. Sum up the amount of 0.1 mol/L sodium hydroxide VS consumed.

Each mL of 0.1 mol/L sodium hydroxide VS
= 11.417 mg of $C_4H_6N_2S$

Packaging and storage Preserve in light-resistant, well-closed containers.

Thiamazole Tablets
티아마졸 정

Thiamazole Tablets contain NLT 94.0% and NMT 106.0% of the labeled amount of thiamazole ($C_4H_6N_2S$: 114.17).

Method of preparation Prepare as directed under Tablets, with Thiamazole.

Identification (1) Weigh an amount of Thiamazole Tablets, previously powdered, equivalent to 50 mg of thiamazole according to the labeled amount, add 20 mL of hot ethanol, shake for 15 minutes to mix, filter, and evaporate the filtrate to dryness on a steam bath. Dissolve the residue in 10 mL of water, filter, if necessary, and use the filtrate as the test solution. To 1 mL of the test solution, add 1 mL of sodium hydroxide TS, shake to mix, and add 3 drops of sodium nitroprusside TS; the solution slowly turns from yellow to yellowish green to green color. To this solution, add 1 mL of acetic acid(31); the solution turns to blue.

(2) Perform the test with 2 mL of the test solution obtained in (1), as directed under the Identification (2) under Thiamazole.

Dissolution Perform the test with 1 tablet of Thiamazole Tablets at 100 revolutions per minute according to Method 1, using 500 mL of water as the dissolution medium. Take the dissolved solution after 30 minutes from the start of the test and filter. Discard the first 10 mL of the filtrate, pipet V mL of the subsequent filtrate, add the dissolution medium to make exactly V' mL, and use this solution as the test solution. Separately, weigh accurately a suitable amount of thiamazole RS, dissolve in the dissolution medium to obtain a solution having the same concentration as the test solution, and use this solution as the standard solution. Perform the test with the test solution and the standard solution as directed under the Ultraviolet-visible Spectroscopy, using methanol as the control solution, and determine the absorbances, A_T and A_S, at the absorbance maximum wavelength of about 252 nm. It meets the requirements when the dissolution rate in 30 minutes is NLT 80% (Q).

Dissolution rate (%) of the labeled amount of thiamazole

$$(C_4H_6N_2S) = C_S \times \frac{A_T}{A_S} \times \frac{V'}{V} \times \frac{1}{C} \times 50000$$

C_S: Concentration (mg/mL) of the standard solution

C: Amount (mg) of the labeled amount of thiamazole ($C_4H_6N_2S$) in 1 tablet

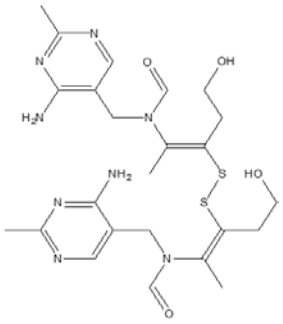
Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 tablets of Thiamazole Tablets, and powder. Weigh accurately an amount, equivalent to about 0.15 g of thiamazole ($C_4H_6N_2S$), add 80 mL of water, and shake for 15 minutes to mix. To this, add water to make exactly 100 mL, centrifuge, and filter. Discard the first 20 mL of the filtrate, pipet 50 mL of the subsequent filtrate, and add 1 mL of bromothymol blue TS. If the solution exhibits a blue color, neutralize it with 0.1 mol/L hydrochloric acid until it exhibits a green color. To this solution, add 4.5 mL of 0.1 mol/L sodium hydroxide solution with a burette, and mix by stirring. While stirring, add 15 mL of 0.1 mol/L silver nitrate solution and titrate with 0.1 mol/L sodium hydroxide VS until the resulting solution exhibits a persistent bluish green color. Combine the consumed amount of 0.1 mol/L sodium hydroxide solutions used throughout this process.

Each mL of 0.1 mol/L sodium hydroxide VS
= 11.417 mg of $C_4H_6N_2S$

Packaging and storage Preserve in light-resistant, well-closed containers.

Thiamine Disulfide
티아민디설피드



$C_{24}H_{34}N_8O_4S_2$: 562.71

N,*N*′-[Dithiobis[2-(2-hydroxyethyl)-1-methyl-2,1-ethenediyl]]bis[*N*-[(4-amino-2-methyl-5-pyrimidinyl)methyl] formamide], [*67-16-3*]

Thiamine Disulfide contains NLT 98.0% and NMT 102.0% of thiamine disulfide ($C_{24}H_{34}N_8O_4S_2$), calculated on the anhydrous basis.

Description Thiamine Disulfide occurs as white crystals or a crystalline powder and is odorless or has a slight, characteristic odor.

It is slightly soluble in ethanol, and practically insoluble in water or ether.

It dissolves in dilute hydrochloric acid or dilute nitric acid.

The pH of a saturated solution of Thiamine Disulfide is almost neutral.

Identification (1) Dissolve 50 mg each of Thiamine Disulfide and thiamine disulfide RS in 50 mL of ethyl acetate and use these solutions as the test solution and the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on a plate made of silica gel with fluorescent indicator for thin-layer chromatography. Then, develop the plate with a mixture of water and methanol (1 : 1) as the developing solvent to a distance of about 15 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm); the colors and R_f values of the spots from the test solution and the standard solution are the same.

(2) To 5 mg of Thiamine Disulfide, add 1 mL of lead acetate TS and 1 mL of sodium hydroxide solution (1 in 10) and warm the mixture; the color of the resulting solution changes to blackish brown, and when the solution is left to stand, blackish brown precipitates are formed.

(3) To 2 mL of a solution of Thiamine Disulfide in 0.1 mol/L hydrochloric acid TS (1 in 200), add 2 mL of picric acid TS; yellow precipitates are formed.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Thiamine Disulfide in 20 mL of water; the resulting solution is clear.

(2) ***Chloride***—Dissolve 0.20 g of Thiamine Disulfide in 6 mL of dilute nitric acid, add water to make 50 mL, and use this solution as the test solution to perform the test. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid (NMT 0.053%).

(3) ***Sulfate***—Dissolve 1.5 g of Thiamine Disulfide in 6 mL of dilute hydrochloric acid, and add water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 0.35 mL of 0.005 mol/L sulfuric acid and 6 mL of dilute hydrochloric acid and add water to make 50 mL (NMT 0.011%).

(4) ***Nitrate***—Dissolve 0.5 g of Thiamine Disulfide in 2 mL of dilute hydrochloric acid and water to make 25 mL. To 2 mL of this solution, carefully add 2 mL of sulfuric acid while cooling in iced water, shake to mix, and superimpose iron(II) sulfate TS; no dark brown ring is formed at the interface.

(5) ***Heavy metals***—Proceed with 1.0 g of Thiamine Disulfide according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(6) ***Arsenic***—Proceed with 1.0 g of Thiamine Disulfide according to Method 3 and perform the test (NMT 2

ppm).

(7) ***Thiochrome reaction-positive substance***— Weigh accurately about 0.1 g of Thiamine Hydrochloride, dissolve in 10 ml of 0.1 mol/L hydrochloric acid, add water to make exactly 100 mL, and use this solution as the test solution. Transfer exactly 2 mL each of the test solutions to glass-stoppered centrifuge tubes T and T′ and add 3 mL each of acidic potassium chloride TS. Put 3 mL of cyanogen bromide TS for thiamine assay into T, shake to mix, rapidly add 2 mL of sodium hydroxide solution (3 in 10), shake to mix, add exactly 15 mL of isobutanol, stopper the tube, and shake vigorously to mix for 2 minutes. Put 2 mL of sodium hydroxide solution (3 in 10) into T′, shake to mix, rapidly add 3 mL of sodium hydroxide solution (3 in 10), shake to mix, add 3 mL of cyanogen bromide TS for thiamine assay, shake to mix, add exactly 15 mL of isobutanol, stopper the tube, and shake vigorously to mix for 2 minutes. Separately, weigh accurately about 0.1 g of thiamine hydrochloride RS (water is determined previously) and add 10 mL of 0.1 mol/L hydrochloric acid TS and water to make exactly 200 mL. Pipet 2 mL of this solution, add 0.01 mol/L hydrochloric acid TS to make exactly 100 mL, and use this solution as the standard solution. Transfer exactly 2 mL each of the standard solutions to glass-stoppered centrifuge tubes S and S′ and proceed in the same manner as the test solution. Centrifuge each centrifuge tube at a slow rate for 2 minutes, take and transfer each isobutanol layer to another test tube. If necessary, add 1 to 2 g of anhydrous sodium sulfate, mix with gentle shaking, allow to stand and take the clear layer of isobutanol. With these solutions, perform the test as directed under the Fluorescence Spectroscopy. Determine fluorescence intensities F_T & F_T' and F_S & F_S' at maximum excitation wavelength about 370 nm and maximum fluorescence wavelength about 440 nm and convert into percentage (%) for anhydride corresponding to values obtained from the following equation and the values obtained from water; the content (%) of thiochrome reaction-positive substance is NMT 0.5%.

Amount (mg) of thiochrome reaction-positive substance
= Amount (mg) of thiamine disulfide RS, calculated on the anhydrous basis × $(F_T - F_T') / (F_S - F_S') \times 0.78 \times (1 / 500)$

0.78: Conversion factor from thiamine disulfide ($C_{12}H_{17}ClN_4OS \cdot HCl$) to thiamine ($C_{12}H_{17}N_4OS^+$)

Water NMT 10.0% (0.2 g, volumetric titration, direct titration).

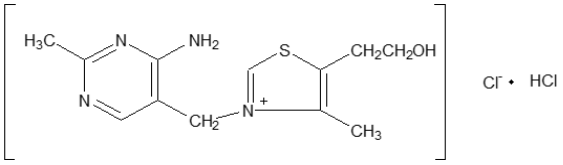
Residue on ignition NMT 0.5% (1 g).

Assay Weigh accurately about 0.4 g each of Thiamine Disulfide, dissolve in 50 mL of acetic acid(100) and titrate with 0.1 mol/L perchloric acid VS (indicator: 2 drops of methylrosaniline chloride TS). the endpoint of the titration is when the color of the solution changes from violet to blue. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 28.135 mg of $C_{24}H_{34}N_8O_4S_2$

Packaging and storage Preserve in light-resistant, tight containers.

Thiamine Hydrochloride
티아민염산염



Vitamin B1 Hydrochloride $C_{12}H_{17}ClN_4OS \cdot HCl$: 337.27
3-[(4-Amino-2-methylpyrimidin-5-yl)methyl]-5-(2-hydroxyethyl)-4-methyl-1,3-thiazol-3-ium chloride hydrochloride [*67-03-8*]

Thiamine Hydrochloride contains NLT 98.5% and NMT 101.0% of thiamine hydrochloride ($C_{12}H_{17}ClN_4OS \cdot HCl$), calculated on the anhydrous basis.

Description Thiamine Hydrochloride occurs as white crystals or a crystalline powder and is odorless or has a slight, characteristic odor.
It is freely soluble in water, sparingly soluble in methanol, slightly soluble in ethanol(95), and practically insoluble in ether.

Melting point—About 245 °C (with decomposition).

Identification (1) To 5 mL of an aqueous solution of Thiamine Hydrochloride (1 in 500), add 2.5 mL of sodium hydroxide TS and 0.5 mL of potassium hexacyanoferrate(III) TS. Then, add 5 mL of 2-methyl-1-propanol, shake the mixture vigorously for 2 minutes, allow to stand and examine it under ultraviolet light (main wavelength: 365 nm); the 2-methyl-1-propanol layer exhibits a bluish purple fluorescence. This fluorescence disappears when the mixture is acidified and reappears when alkalified.

(2) Determine the absorption spectra of aqueous solutions of Timolol Maleate and timolol maleate RS as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared spectra of Timolol Maleate and timolol maleate RS, previously dried at 105 °C for 2 hours, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers. If there is a difference between the two spectra, dissolve each in water, evaporate water to dryness, dry the residue at 105 °C for 2 hours and repeat the test in the same manner.

(4) An aqueous solution of Thiamine Hydrochloride

(1 in 500) responds to the Qualitative Analysis for chloride.

pH Dissolve 1.0 g of Thiamine Hydrochloride in 100 mL of water; the pH of this solution is between 2.7 and 3.4.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Thiamine Hydrochloride in 10 mL of water; the solution is clear and the color is not more intense than that of the following control solution.

Control solution—To 1.5 mL of $\frac{1}{60}$ mol/L potassium bichromate solution, add water to make 1000 mL.

(2) ***Sulfate***—Perform the test with 1.5 g of Thiamine Hydrochloride. Prepare the control solution with 0.35 mL of 0.005 mol/L sulfuric acid (NMT 0.011%).

(3) ***Nitrate***—Dissolve 0.5 g of Thiamine Hydrochloride in 25 mL of water. Add 2 mL of sulfuric acid to 2 mL of this solution, shake to mix, cool and superimpose iron(II) sulfate TS; no dark brown ring is formed at the interface.

(4) ***Heavy metals***—Proceed with 1.0 g of Thiamine Hydrochloride according to Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(5) ***Related substances***—Dissolve 0.1 g of Thiamine Hydrochloride in 100 mL of the mobile phase and use this solution as the test solution. Pipet 1 mL of this solution, add the mobile phase to it make exactly 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak area of each solution by the automatic integration method; the total area of the peaks other than the major peak is not greater than the area of the major peak from the standard solution.

Operating conditions

For the detector, column, column temperature, mobile phase and flow rate, proceed as directed in the operating conditions under the Assay.

System suitability

For system performance, proceed as directed under the system suitability under the Assay.

Test for required detectability: Pipet 5 mL of the standard solution and add water to make exactly 50 mL. Confirm that the peak area of thiamine obtained from 10 μL of this solution is equivalent to 7% to 13% of that from the standard solution.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak areas of thiamine is NMT 1.0%.

Time span of measurement: About 3 times the retention time of thiamine.

Water NMT 5.0% (30 mg, coulometric titration).

Residue on ignition NMT 0.2% (1 g).

Assay Weigh accurately about 0.1 g each of Thiamine Hydrochloride and thiamine hydrochloride RS (water is determined previously) and dissolve in the mobile phase to make exactly 50 mL. Pipet 10 mL each of the solutions, add exactly 5 mL of the internal standard solution, then add the mobile phase to make exactly 50 mL and use these solutions as the test solution and the standard solution, respectively. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions and calculate the ratios, Q_T and Q_S, of the peak area of thiamine to that of the internal standard.

Amount (mg) of thiamine hydrochloride ($C_{12}H_{17}ClN_4OS \cdot HCl$) = Amount (mg) of thiamine hydrochloride RS, calculated on the anhydrous basis $\times \frac{Q_T}{Q_S}$

Internal standard solution—A solution of methyl benzoate in methanol (1 in 50).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 15 cm to 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: Dissolve 1.1 g of sodium 1-octanesulfonate in 1000 mL of diluted acetic acid(100) (1 in 100). To 600 mL of this solution, add 400 mL of a mixture of methanol and acetonitrile (3 : 2).

Flow rate: Adjust the flow rate so that the retention time of thiamine is about 12 minutes.

System suitability

System performance: Proceed with 10 μL of the standard solution according to the above operating conditions; thiamine and the internal standard are eluted in this order with the resolution being NLT 6.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak areas of thiamine is NMT 1.0%.

Packaging and storage Preserve in light-resistant, tight containers.

Thiamine Hydrochloride Injection
티아민염산염 주사액

Vitamin B1 Hydrochloride Injection

Thiamine Hydrochloride Injection is an aqueous

injection and contains NLT 95.0% and NMT 115.0% of the labeled amount of thiamine hydrochloride ($C_{12}H_{17}ClN_4OS \cdot HCl$: 337.27).

Method of preparation Prepare as directed under Injections, with Thiamine Hydrochloride.

Description Thiamine Hydrochloride Injection occurs as a clear, colorless liquid.

pH—Between 2.5 and 4.5.

Identification To an amount of Thiamine Hydrochloride Injection equivalent to 50 mg of Thiamine Hydrochloride according to the labeled amount, add water to make 25 mL. Perform the test with 5 mL of this solution as directed under the Identification (1) of Thiamine Hydrochloride.

Sterility Meets the requirements.

Bacterial endotoxins Less than 6.0 EU per mg of thiamine hydrochloride

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Extractable volume of injections Meets the requirements.

Assay Pipet an amount of Thiamine Hydrochloride Injection equivalent to about 20 mg of thiamine hydrochloride ($C_{12}H_{17}ClN_4OS \cdot HCl$), diluted with 0.001 mol/L hydrochloric acid TS, if necessary, add 20 mL of methanol, and add 0.001 mol/L hydrochloric acid TS to make exactly 100 mL. Pipet 25 mL of this solution, add 5 mL of the internal standard solution, and 0.001 mol/L hydrochloric acid TS to make 50 mL, and use the resulting solution as the test solution. Separately, weigh accurately about 0.1 g of thiamine hydrochloride RS (previously determined the water) and dissolve 0.001 mol/L hydrochloric acid TS to make exactly 50 mL. Pipet 10 mL of this solution, add 20 mL of methanol, and add 0.001 mol/L hydrochloric acid TS to make exactly 100 mL. Pipet 25 mL of this solution, add exactly 5 mL of the internal standard solution, add 0.001 mol/L hydrochloric acid TS to make exactly 50 mL, and use the resulting solution as the standard solution. Perform the test as directed under the Assay under Thiamine Hydrochloride.

Amount (mg) of thiamine hydrochloride ($C_{12}H_{17}ClN_4OS \cdot HCl$)
= Amount (mg) of thiamine hydrochloride RS (calculated on the anhydrous basis) $\times \frac{Q_T}{Q_S} \times \frac{1}{5}$

Internal standard solution—A solution of methyl benzoate in methanol (1 in 200).

Packaging and storage Preserve in light-resistant, tight containers.

Thiamine Hydrochloride Tablets
티아민염산염 정

Vitamin B1 Hydrochloride Tablets

Thiamine Hydrochloride Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of thiamine hydrochloride ($C_{12}H_{17}ClN_4OS \cdot HCl$: 337.27).

Method of preparation Prepare as directed under Tablets, with Thiamine Hydrochloride.

Identification (1) Weigh an amount of Hydrochloride Tablets, previously powdered, equivalent to 10 mg of thiamine hydrochloride according to the labeled amount, add 10 mL of 0.5 mol/L sodium hydroxide TS, and filter. Perform the test with 5 mL of the filtrate as directed under the Identification (2) under Thiamine Hydrochloride.

(2) Weigh an amount of Thiamine Hydrochloride Tablets, previously powdered, equivalent to 10 mg of thiamine hydrochloride according to the labeled amount, add 10 mL of water, and filter. To 2 mL of the filtrate, add iodine TS and silver nitrate TS (1 in 20); a reddish brown precipitate and a black precipitate are formed, respectively.

(3) To the filtrate obtained in (2), add 1 mL of lead acetate TS and 1 mL of 2.5 mol/L sodium hydroxide solution; the resulting solution exhibits a yellow color. Heat it on a steam bath for several minutes; the resulting solution turns to a brown color and a lead sulfide precipitate is separated.

(4) The filtrate obtained in (2) responds to the Qualitative Analysis for chloride.

Dissolution Perform the test with 1 tablet of Thiamine Hydrochloride Tablets at 50 revolutions per minute according to Method 2 under the Dissolution, using 900 mL of water as the dissolution medium. Take the dissolution medium 45 minutes after starting the test, filter, use it as the test solution, and perform the test as directed under the Assay. If necessary, weigh accurately a suitable amount of thiamine hydrochloride RS, proceed in the same manner as in the preparation of the test solution, use the resulting solution as the standard solution, and perform the test.

It meets the requirements when the dissolution rate of Thiamine Hydrochloride Tablets in 45 minutes is NLT 75%.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 tablets of Thiamine Hydrochloride Tablets and powder. Weigh accurately an amount, equivalent to about 20 mg of thiamine hydrochloride ($C_{12}H_{17}ClN_4OS \cdot HCl$), add 60 mL of 0.01 mol/L hydrochloric acid TS, heat on a steam bath for

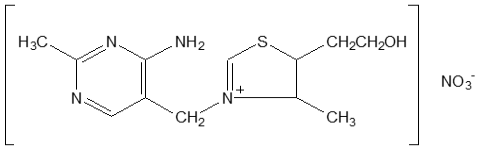
30 minutes, and shake vigorously for 10 minutes to mix. After cooling, add methanol to make exactly 100 mL, and centrifuge. Pipet 25 mL of the clear supernatant, add exactly 5 mL of the internal standard solution, then add water to make 50 mL, and use this solution as the test solution. Separately, weigh accurately about 0.1 g of thiamine hydrochloride RS (previously measured the water content in the same manner as in Thiamine Hydrochloride), and dissolve in 0.01 mol/L hydrochloric acid TS to make exactly 50 mL. Pipet 10 mL of this solution, add 50 mL of 0.01 mol/L hydrochloric acid TS, and add methanol to make exactly 100 mL. Pipet 25 mL of this solution, add exactly 5 mL of the internal standard solution, add water to make 50 mL, and use this solution as the standard solution. Perform the test as directed under the Assay under Thiamine Hydrochloride.

Amount (mg) of thiamine hydrochloride ($C_{12}H_{17}ClN_4OS \cdot HCl$)
= Amount (mg) of thiamine hydrochloride RS, calculated on the anhydrous basis $\times \frac{Q_T}{Q_S} \times \frac{1}{5}$

Internal standard solution—A solution of methyl benzoate in methanol (1 in 200).

Packaging and storage Preserve in light-resistant, tight containers.

Thiamine Nitrate
티아민질산염



Vitamin B1 Nitrate $C_{12}H_{17}N_5O_4S$: 327.36
3-[(4-Amino-2-methylpyrimidin-5-yl)methyl]-5-(2-hydroxyethyl)-4-methyl-1,3-thiazol-3-ium chloride nitrate [*532-43-4*]

Thiamine Nitrate, when dried, contains NLT 98.0% and NMT 102.0% of thiamine nitrate ($C_{12}H_{17}N_5O_4S$).

Description Thiamine Nitrate occurs as white crystals or a crystalline powder. It is odorless or has a slight, characteristic odor.
It is sparingly soluble in water, very slightly soluble in ethanol(95) and practically insoluble in ether.

Melting point—About 193 °C (with decomposition).

Identification (1) Determine the infrared spectra of Thiamine Nitrate and thiamine nitrate RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) An aqueous solution of Thiamine Nitrate (1 in 50) responds to the Qualitative Analysis (1) and (2) for nitrate.

pH Dissolve 1.0 g of Thiamine Nitrate in 100 mL of water; the pH of this solution is between 6.5 and 8.0.

Purity (1) ***Chloride***—Perform the test with 0.20 g of Thiamine Nitrate. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid solution (NMT 0.053%).

(2) ***Sulfate***—Dissolve 1.5 g of Thiamine Nitrate in 30 mL of water and 2 mL of dilute hydrochloric acid, and add water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 0.35 mL of 0.005 mol/L sulfuric acid and 2 mL of dilute hydrochloric acid and add water to make 50 mL (NMT 0.011%).

(3) ***Heavy metals***—Dissolve about 1.0 g of Thiamine Nitrate in 30 mL of water by warming, cool, and add 12 mL of 6 mol/L acetic acid TS and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(4) ***Related substances***—Weigh accurately 0.1 g of Thiamine Nitrate, dissolve in the mobile phase to make exactly 100 mL, and use this solution as the test solution. With 10 μL of the test solution, perform the test as directed under the Liquid Chromatography according to the following conditions. Determine the peak area of this solution by the automatic integration method; the total area of the peaks other than the major peak from the test solution is NMT 1.0% of the area of all peaks from the test solution.

Operating conditions

For the detector, column temperature, and mobile phase, proceed as directed in the operating conditions under the Assay.

Column: A stainless steel column about 4 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Flow rate: 0.75 mL/min

Time span of measurement: About 3 times the peak retention time of thiamine.

Loss on drying NMT 1.0% (0.5 g, 105 °C, 2 hours).

Residue on ignition NMT 0.2% (1 g).

Assay Weigh accurately about 0.1 g each of Thiamine Nitrate, previously dried, and thiamine hydrochloride RS (previously determined the water) and dissolve each of them in the mobile phase to make exactly 50 mL. Pipet 10 mL each of these solutions, add exactly 5 mL each of the internal standard solution, add the mobile phase to make exactly 50 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions and calcu-

late the peak area ratios, Q_T and Q_S, of thiamine to that of the internal standard.

Amount (mg) of thiamine nitrate ($C_{12}H_{17}N_5O_4S$)
= Amount of thiamine hydrochloride RS calculated on the anhydrous basis (mg)$\times \frac{Q_T}{Q_S} \times 0.9706$

Internal standard solution—A solution of methyl benzoate in methanol (1 in 50).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 30 °C.

Mobile phase: Dissolve 1.1 g of sodium 1-octanesulfonate in 1000 mL of diluted acetic acid(100) (1 in 100). To 600 mL of this solution, add 400 mL of a mixture of methanol and acetonitrile (3 : 2).

Flow rate: Adjust the flow rate so that the retention time of thiamine is about 12 minutes.

System suitability

System performance: Proceed with 10 μL of the standard solution according to the above conditions; thiamine and the internal standard are eluted in this order with the resolution being NLT 6.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution under the above conditions; the relative standard deviation of the ratios of the peak area of thiamine to that of the internal standard is NMT 1.0%.

Packaging and storage Preserve in light-resistant, tight containers.

33.3% Thiamine Nitrate Powder
티아민질산염 3배산

33.3% Thiamine Nitrate Powder contains NLT 32.6% of thiamine nitrate ($C_{12}H_{17}N_5O_4S$: 327.36).

Method of preparation Prepare by finely dispersing Thiamine Nitrate in edible fatty acid. 33.3% Thiamine Nitrate Powder is a drug substance.

Description 33.3% Thiamine Nitrate Powder occurs as a white to pale yellow powder.

Identification (1) Take 2 mL each of aqueous solution of 33.3% Thiamine Nitrate Powder (1 in 500) and add 2 to 3 drops of iodine TS; a reddish brown precipitate or turbidity is formed. Add 1mL of picric acid TS; a yellow precipitate or turbidity is formed.

(2) Add 1 mL of lead acetate TS and 1 mL of sodium hydroxide solution (1 in 10) to 5 mL of aqueous solution of 33.3% Thiamine Nitrate Powder (1 in 500) and warm; the solution turns yellow and then brown. Allow to stand; a blackish brown precipitate is formed.

(3) Weigh accurately an amount of 33.3% Thiamine Nitrate Powder, equivalent to 10 mg of thiamine nitrate, dissolve in 5 mL of methanol, filter, and use the filtrate as the test solution. Separately, weigh accurately about 10 mg of thiamine nitrate RS, dissolve in methanol to make 5 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 20 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescence indicator for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, acetic acid(100) and acetone (9 : 4 : 1) as the developing solvent, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the R_f value and the color of the spots obtained from the test solution and the standard solutions are the same.

(4) An aqueous solution of 33.3% Thiamine Nitrate Powder (1 in 50) responds to the Qualitative Analysis (1) and (2) for nitrate.

Water NMT 1.0% (0.5 g, volumetric titration, direct titration).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh 0.1 g of 33.3% Thiamine Nitrate Powder, previously dried, and about 30 mg of thiamine nitrate RS (previously determined the water), and add the mobile phase to make 50 mL, respectively. Take 10.0 mL each of these solutions, add exactly 5.0 mL of the internal standard solution, then add the mobile phase to make 50 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak area ratios, Q_T and Q_S of thiamine to that of the internal standard.

Amount (mg) of thiamine nitrate ($C_{12}H_{17}N_5O_4S$)
= Amount (mg) of thiamine nitrate RS, calculated on the anhydrous basis (mg)$\times \frac{Q_T}{Q_S}$

Internal standard solution—A solution of methyl benzoate in methanol (1 in 50).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 15 cm to 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm to 10 μm in particle diameter).

Mobile phase: Dissolve 1.1 g of sodium 1-octanesulfonate in 1000 mL of diluted acetic acid(100) (1

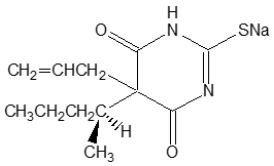
in 100). To 600 mL of this solution, add 400 mL of a mixture of methanol and acetonitrile (3 : 2).

Flow rate: Adjust the flow rate so that the retention time of thiamine is about 12 minutes.

Selection of column: Proceed with 10 μL of the standard solution under the above conditions; thiamine and the internal standard are eluted in this order with the resolution being NLT 5.

Packaging and storage Preserve in light-resistant, tight containers.

Thiamylal Sodium
티아밀랄나트륨



and enantiomer

$C_{12}H_{17}N_2NaO_2S$: 276.33

Sodium 5-allyl-6-oxo-5-(2-pentanyl)-2-thioxo-1,2,5,6-tetrahydro-4-pyrimidinolate [*337-47-3*]

Thiamylal Sodium, when dried, contains NLT 98.0% and NMT 102.0% of thiamylal sodium ($C_{12}H_{17}N_2NaO_2S$).

Description Thiamylal Sodium occurs as pale yellow crystals or a powder.
It is very soluble in water, and freely soluble in ethanol(95).
Dissolve 1.0 g of Thiamylal Sodium in 10 mL of water; the pH of the solution is between 10.0 and 11.0.
It is hygroscopic.
It is gradually decomposed by light.
Its solution in ethanol(95) (1 in 10) shows no optical rotation.

Identification (1) Determine the absorption spectra of solutions of Thiamylal Sodium and thiamylal sodium RS in ethanol (7 in 1000000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Thiamylal Sodium and thiamylal sodium RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) An aqueous solution of Thiamylal Sodium (1 in 10) responds to the Qualitative Analysis for sodium salt.

Purity (1) ***Clarity and color of solution***—To 1.0 g of Thiamylal Sodium in a 11- to 13-mL glass-stoppered test tube, add 10 mL of freshly boiled and cooled water, stopper the test tube, allow to stand and dissolve by gently shaking; the resulting solution is clear and pale yellow.

(2) ***Heavy metals***—Proceed with 1.0 g of Thiamylal Sodium according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Related substances***—Dissolve about 1 g of Thiamylal Sodium in 10 mL of ethanol(95) and use this solution as the test solution. Pipet 1 mL and 3 mL of the test solution, respectively, add ethanol(95) to make exactly 200 mL, and use these solutions as the standard solution (1) and the standard solution (2). With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solutions (1) and (2) on a plate of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of toluene, methanol and ethyl acetate (40 : 7 : 3) as the developing solvent to a distance of about 12 cm, and air-dry the plate. Allow the plate to stand in iodine vapor overnight; the spots with a R_f value of about 0.1 obtained from the test solution are not more intense than the spots obtained from the standard solution (2). Also, the spots other than the principal spot of the test solution, the spot at origin and the spot mentioned above are not more intense than the spots obtained from the standard solution (1).

Loss on drying NMT 2.0% (1 g, 105 ℃, 1 hour).

Assay Weigh accurately about 0.25 g of Thiamylal Sodium, dissolve in 50 mL of methanol and 5 mL of dilute hydrochloric acid, and add methanol to make exactly 100 mL. Pipet 10 mL of this solution and add methanol to make exactly 100 mL. Pipet 5 mL of this solution, add exactly 10 mL of the internal standard solution and the mobile phase to make exactly 200 mL, and use this solution as the test solution. Separately, weigh accurately about 23 mg of thiamylal RS, previously dried at 105 ℃ for 1 hour, dissolve in 50 mL of methanol and 0.5 mL of dilute hydrochloric acid, and add methanol to make exactly 100 mL. Pipet 5 mL of this solution, add exactly 10 mL of the internal standard solution and the mobile phase to make exactly 200 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak area ratios, Q_T and Q_S, of thiamylal to that of the internal standard.

$$\text{Amount (mg) of thiamylal sodium } (C_{12}H_{17}N_2NaO_2S) = \text{Amount (mg) of thiamylal RS} \times \frac{Q_T}{Q_S} \times 10 \times 1.0864$$

Internal standard solution—A solution of phenyl benzoate in methanol (3 in 500).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 289 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 15 cm in length, packed with octadecylsilanised silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: A mixture of methanol, 0.05 mol/L acetic acid of pH 4.6, and sodium acetate buffer solution (13 : 7).

Flow rate: Adjust the flow rate so that the retention time of thiamylal is about 6 minutes.

System suitability

System performance: Proceed with 20 μL of the standard solution according to the above conditions; thiamylal and the internal standard are eluted in this order with the resolution being NLT 12.

System repeatability: Repeat the test 6 times with 20 μL each of the standard solution according to the above conditions; the relative standard deviation of the ratios of the peak area of thiamylal to that of the internal standard is NMT 1.0%.

Packaging and storage Preserve in light-resistant, tight containers.

Thiamylal Sodium for Injection
주사용 티아밀랄나트륨

Thiamylal Sodium for Injection is an injection dissolved before use. Thiamylal Sodium for Injection contains NLT 93.0% and NMT 107.0% of the labeled amount of thiamylal sodium ($C_{12}H_{17}N_2NaO_2S$).

Method of preparation Prepare as directed under Injections, with a mixture of Thiamylal Sodium and Dried Sodium Carbonate at the mass ratio of 100 : 7.

Description Thiamylal Sodium for Injection occurs as a pale yellow crystal, powder or a mass.
It is hygroscopic.
It is slowly decomposed by light.

Identification (1) Proceed with 1.0 g of Thiamylal Sodium for Injection, add 20 mL of ethanol(95), shake vigorously to mix, and filter. Dissolve the residue in 1 mL of water and add 1 mL of barium chloride TS; a white precipitate is formed. Also, centrifuge the solution, gently remove the clear supernatant, and add dilute hydrochloric acid dropwise to the precipitate; the precipitate is dissolved while forming bubbles.

(2) Proceed with 50 mg of Thiamylal Sodium for Injection, add 100 mL of ethanol(95), shake vigorously to mix, and filter. To 3 mL of the filtrate, add ethanol(95) to make 200 mL. Determine the absorption spectrum of this solution as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum between 236 nm and 240 nm and between 287 nm and 291 nm.

pH Dissolve 1.0 g of Thiamylal Sodium for Injection in 40 mL of water; the pH of this solution is between 10.5 and 11.5.

Purity ***Related substances***—Proceed with 1.0 g of Thiamylal Sodium for Injection, add 10 mL of ethanol(95), shake vigorously to mix, and filter. Use the resulting solution as the test solution. Perform the test as directed under the Purity (3) under Thiamylal Sodium.

Sterility Meets the requirements.

Bacterial endotoxins Less than 1.0 EU per mg of Thiamylal Sodium for Injection

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Uniformity of dosage units Meets the requirements.

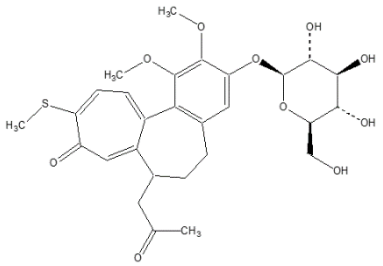
Assay Carefully open 10 units of Thiamylal Sodium for Injection, dissolve the content in water, wash each container with water, and combine the washings with the previously dissolved solution. To this, add water to make exactly *V* mL having a known concentration of about 5 mg of thiamylal sodium ($C_{12}H_{17}N_2NaO_2S$) per mL. Pipet 5 mL of this solution, add 0.5 mL of dilute hydrochloric acid, and add methanol to make exactly 100 mL. Pipet 5 mL of this solution, add exactly 10 mL of the internal standard solution, add the mobile phase to make 200 mL, and use the resulting solution as the test solution. Perform the test as directed under the Assay under Thiamylal Sodium.

Amount (mg) of thiamylal sodium ($C_{12}H_{17}N_2NaO_2S$) in 1 unit of Thiamylal Sodium for Injection
= Amount (mg) of thiamylal sodium RS
$\times \frac{Q_T}{Q_S} \times \frac{V}{50} \times 1.0864$

Internal standard solution—A solution of phenyl benzoate in methanol (3 in 500).

Packaging and storage Preserve in light-resistant, hermetic containers.

Thiocolchicoside
티오콜키코시드



$C_{27}H_{33}NO_{10}S$: 563.62
N-[(7*S*)-3-(β-*D*-Glucopyranosyloxy)-5,6,7,9-tetrahydro-1,2-dimethoxy-10-(methylthio)-9-oxobenzo[a]heptalen-7-yl]-acetamide, [*602-41-5*]

Thiocolchicoside contains NLT 98.5% and NMT 101.0% of thiocolchicoside ($C_{27}H_{33}NO_{10}S$) and NLT 5.5% and NMT 5.9% of sulfur (S), calculated on the dried basis.

Description Thiocolchicoside occurs as a yellow crystalline powder.
It is soluble in water and methanol, and practically insoluble in ethanol and chloroform.

Identification Dissolve 50 mg of Thiocolchicoside and thiocolchicoside RS in 10 mL of methanol, and use these solutions as the test solution and the standard solution, respectively. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of 1-butanol, water and acetic acid (4 : 1 : 1) as the developing solvent and air-dry the plate. Spray evenly with a mixture of chlorosulfuric acid and acetic acid (1 : 1); the R_f values of spots obtained from the test solution and the standard solution are the same.

Optical rotation $[\alpha]_D^{20}$: Between -580° and -610° (after drying, 10 mg, water, 100 mL).

Absorbance $E_{1cm}^{1\%}$ (260 nm): Between 380 and 400 (after drying, 10 mg, water, 1000 mL).
$E_{1cm}^{1\%}$ (372 nm): Between 322 and 338 (after drying, 10 mg, water, 1000 mL).

Purity ***Colchicoside and other impurities***—Dissolve 0.25 g of Thiocolchicoside in anhydrous ethanol to make 10 mL and use this solution as the test solution. Separately, weigh accurately about 0.125 g of colchicoside RS and add methanol to make 20 mL. Take 1,2,4 and 8 mL each of this solution, add methanol to make 100 mL, and use these solutions as the standard solutions a,b,c and d. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of 1-butanol, water and acetic acid (4 : 1 : 1) as the developing solvent and air-dry the plate. Spray evenly with a mixture of chlorosulfuric acid and acetic acid (1 : 1) and examine the plate under ultraviolet light: the spot of the test solution appearing at the same R_f value (R_f value: about 0.35) as that of the standard solution is not greater or more intense than the spots from the standard solution c. The number of spots of impurities other than the principal spot from the test solution and the spot of colchicoside is 2 to 3, and these spots are not greater or more intense than the spots from the standard solution a.

Loss on drying NMT 3.0% (1 g, 105 °C, 3 hours).

Residue on ignition NMT 0.1% (1 g).

Assay (1) ***Thiocolchicoside***—Weigh accurately about 0.35 g of Thiocolchicoside, dissolve in 5 mL of acetic acid(100), add 50 mL of acetic anhydride, and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 56.36 mg of $C_{27}H_{33}NO_{10}S$

(2) ***Sulfur***—Weigh accurately about 0.1 g of Thiocolchicoside and perform the test as directed under the sulfur assay under the Oxygen Flask Combustion. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.005 mol/L barium perchlorate VS
= 0.1603 mg of S

Packaging and storage Preserve in tight containers.

Thiocolchicoside Capsules
티오콜키코시드 캡슐

Thiocolchicoside Capsules contain NLT 95.0% and NMT 105.0% of the labeled amount of thiocolchicoside ($C_{27}H_{33}NO_{10}S$: 563.62).

Method of preparation Prepare as directed under Capsules, with Thiocolchicoside.

Identification The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

Purity ***Colchicoside***—Weigh accurately the mass of the contents of about 10 Thiocolchicoside Capsules. Weigh accurately an amount equivalent to about 4 mg of thiocolchicoside ($C_{27}H_{33}NO_{10}S$) and add water to make exactly 100 mL. Filter this solution through a 0.45 μm membrane filter and use the filtrate as the test solution.

Separately, weigh accurately about 40 mg of colchicoside RS and add water to make 100 mL. To 10.0 mL of this solution, add water to make 100 mL, filter through a 0.45 μm membrane filter, and use the filtrate as the test solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions, and calculate the peak areas, A_T and A_S, of colchicoside for each solution; the amount of colchicoside is NMT 1.0% for the labeled amount of thiocolchicoside.

$$\text{Amount (mg) of colchicoside} = \text{Amount (mg) of colchicoside RS} \times \frac{A_T}{A_S} \times \frac{1}{1000}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 μm in particle diameter).

Mobile phase: 16% acetonitrile

Flow rate: 2 mL/min

Dissolution Perform the test with 1 capsule of Thiocolchicoside Capsules at 100 revolutions per minute according to Method 2, using 500 mL of water as the dissolution medium. Take the dissolved solution after 45 minutes from the start of the test and filter. Discard the first 10 mL of the filtrate, pipet *V* mL of the subsequent filtrate, add water to obtain a solution having known concentration of about 4 μg of thiocolchicoside per mL according to the labeled amount and to make exactly *V' mL*, and use this solution as the test solution. Separately, weigh accurately about 40 mg of thiocolchicoside RS and add water to make 100 mL. Pipet 2 mL of this solution, add water to make 200 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak area of thiocolchicoside, A_T and A_S, in each solution. The acceptable dissolution criterion is NLT 75% of Thiocolchicoside Capsules dissolved in 30 minutes.

$$\text{Dissolution rate (\%) with respect to the labeled amount of thiocolchicoside } (C_{27}H_{33}NO_{10}S) = W_S \times \frac{V'}{V} \times \frac{A_T}{A_S} \times \frac{1}{C}$$

Ws: Amount (mg) of thiocolchicoside RS

C: Labeled amount (mg) of thiocolchicoside ($C_{27}H_{33}NO_{10}$) in 1 capsule

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 370 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: A mixture of water and acetonitrile (84 : 16).

Flow rate: 1.5 mL/min

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of the contents of 20 capsules of Thiocolchicoside Capsules. Weigh accurately about 4 mg of thiocolchicoside ($C_{27}H_{33}NO_{10}$), add water to make 100 mL, filter through a 0.45 μm membrane filter, and use the filtrate as the test solution. Separately, weigh accurately about 40 mg of thiocolchicoside RS and add water to make 100 mL. Pipet 10.0 mL of this solution, add water to make 100 mL, filter through 0.45 μm filters, and use the filtrate as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions, and determine the peak areas, A_T and A_S, of thiocolchicoside, respectively.

$$\text{Amount (mg) of thiocolchicoside } (C_{27}H_{33}NO_{10}S) = \text{Amount (mg) of thiocolchicoside RS} \times \frac{A_T}{A_S} \times \frac{1}{10}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 370 nm).

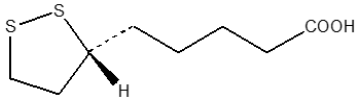
Column: A stainless steel column about 4 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 μm in particle diameter).

Mobile phase: 16% acetonitrile

Flow rate: 2 mL/min

Packaging and storage Preserve in tight containers.

Thioctic Acid
티옥트산



and enantiomer

$C_8H_{14}O_2S_2$: 206.33

1,2-Dithiolane-3-pentanoic acid, [1077-28-7]

Thioctic Acid, when dried, contains NLT 97.0% and NMT 101.0% of thioctic acid ($C_8H_{14}O_2S_2$).

Description Thioctic Acid occurs as pale yellow or yellow crystals or a crystalline powder and is odorless.

It is freely soluble in dimethylformamide or chloroform, soluble in ethanol, acetone or ether and insoluble in wa-

ter.

Identification (1) Weigh 5 mg of Thioctic Acid, dissolve in 1 mL of ethanol, and use this solution as the test solution. Separately, dissolve 5 mg of thioctic acid RS in 1 mL of ethanol, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography, develop the plate with a mixture of 1-butanol, ammonia and ethanol (8 : 3 : 2) as the developing solvent, and air-dry the plate. Examine the plate under ultraviolet light; the R_f values of the spots obtained from the test solution and standard solution are the same.

(2) To 5 mL of ethanol solution of Thioctic Acid (1 in 100), add 10 mL of dilute hydrochloric acid and 1 g of zinc powder. Shake vigorously for 20 minutes, and then filter. Continue adding 10% ammonia water until the white precipitates formed in this filtrate are dissolved, and then add 2 to 3 drops of sodium nitroprusside TS. It will soon exhibits a magenta color and then fade.

Melting point Between 59 and 63 °C.

Purity (1) ***Chloride***—Dissolve 0.2 g of Thioctic Acid in 100 mL of ethanol (6 in 10) mixture. Perform the test with 50 mL of this solution. Prepare the control solution with 0.2 mL of 0.01 mol/L hydrochloric acid solution (NMT 0.071%).

(2) ***Sulfate***—Take 50 mL of the solution from (1) and perform the test. Prepare the control solution with 0.4 mL of 0.005 mol/L sulfuric acid (NMT 0.192%).

(3) ***Heavy metals***—Weigh 1.0 g of Thioctic Acid, put in a crucible, heat it slowly below 500℃, add 5 mL of dilute hydrochloric acid to the residue, and evaporate to dryness on a steam bath. Dissolve the residue in 2 mL of dilute acetic acid. If necessary, filter and add water to make 50 mL, and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

Loss on drying NMT 1.0% (1.0 g, phosphorus pentoxide, 2 kPa, 18 hours).

Residue on ignition NMT 0.1% (0.5 g).

Assay Weigh accurately about 5 mg of Thioctic Acid, previously dried, add chloroform to make 100.0 mL, and use this solution as the test solution. Separately, weigh accurately about 50 mg of thioctic acid RS dried in a sulfuric acid desiccator for 4 hours, and dissolve in chloroform to make 100.0 mL. Take accurately 10.0 mL of this solution, add chloroform to make 100.0 mL, and use this solution as the standard solution. Take 2.0 mL each of the test solution, standard solution, and chloroform, slowly evaporate to dryness on a steam bath at 70 °C, and cool. To the residue, add 2 mL of the solution prepared by 0.4 g of 2,6-dibromoquinonechlorimide dissolved in 95% ethanol to make 100 mL. After stoppering, allow to stand for 15 minutes, add 10 mL of potassium chloride and hydrochloric acid buffer at pH 2.2, and add 95% ethanol to make 25.0 mL. Determine the absorbances of A_S and A_T at 440 nm as directed under the Ultraviolet-visible Spectroscopy using the blank test solution as the control solution.

$$\text{Amount (mg) of thioctic acid } (C_8H_{14}O_2S_2) = \text{amount (mg) of thioctic acid RS} \times \frac{A_T}{A_S} \times \frac{1}{10}$$

Packaging and storage Preserve in well-closed containers.

Thioctic Acid Injection
티옥트산 주사액

Thioctic Acid Tablets contain NLT 90.0% and NMT 130.0% of the labeled amount of thioctic acid ($C_8H_{14}O_2S_2$: 206.33).

Method of preparation Prepare as directed under Injections, with Thioctic Acid.

Identification The retention times of the major peaks obtained from the test solution and standard solution under the Assay are the same.

pH Between 7.5 and 9.5.

Sterility Meets the requirements.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets requirements.

Extractable volume of injections Meets the requirements.

Assay Pipet an amount of Thioctic Acid Injection, equivalent to 50 mg of thioctic acid ($C_8H_{14}O_2S_2$) according to the labeled amount, add methanol to make 100 mL, and use this solution as the test solution. Separately, weigh accurately about 50 mg of thioctic acid RS, proceed in the same manner as the test solution, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of thioctic acid in each solution.

$$\text{Amount (mg) of thioctic acid } (C_8H_{14}O_2S_2) = \text{Amount (mg) of thioctic acid RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 210 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of 0.1% phosphoric acid and acetonitrile (60 : 40).

Flow rate: 1.0 mL/min

Packaging and storage Preserve in light-resistant, hermetic containers (in a cold place).

Thioctic Acid Tablets
티옥트산 정

Thioctic Acid Tablets contain NLT 90.0% and NMT 130.0% of the labeled amount of thioctic acid ($C_8H_{14}O_2S_2$: 206.33).

Method of preparation Prepare as directed under Tablets, with Thioctic Acid.

Identification The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

Dissolution Perform the test with 1 tablet of Thioctic Acid Tablets at 100 revolutions per minute according to Method 2, using 500 mL of pH 6.8 phosphate buffer solution as the dissolution medium. Take the dissolved solution after 45 minutes from the start of the test and filter. Discard the first 10 mL of the filtrate, pipet *V* mL of the subsequent filtrate, add water to make *V'* mL of a solution containing about 0.4 mg of thioctic acid per mL according to the labeled amount, and use this solution as the test solution. Separately, weigh accurately about 40 mg of thioctic acid RS, dissolve in 10 mL of methanol, add the dissolution medium to make 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of thioctic acid in each solution. Meets the requirements if the dissolution rate of Thioctic Acid Tablets in 45 minutes is NLT 75%.

Dissolution rate (%) of the labeled amount of thioctic acid ($C_8H_{14}O_2S_2$)

$$= W_S \times \frac{V'}{V} \times \frac{A_T}{A_S} \times \frac{1}{C} \times 500$$

W_S: Amount (mg) of thioctic acid RS

C: Labeled amount (mg) of thioctic acid ($C_8H_{14}O_2S_2$) in 1 tablet

pH 6.8 phosphate buffer solution—Dissolve 137.6 g of sodium dihydrogen phosphate monohydrate and 23.9 g of citric acid hydrate in water to make 5000 mL, and adjust the pH to 6.8.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 215 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 12.5 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (about 5 μm in particle diameter).

Mobile phase: Adjust the pH of a mixture of methanol, 0.005 mol/L potassium dihydrogen phosphate solution and acetonitrile (117 : 91 : 18) with phosphoric acid (8.3 in 100) to between 3.0 and 3.1.

Flow rate: 1.3 mL/min

System suitability

System performance: Proceed with 50 μL of the standard solution according to the above conditions; the symmetry factor is NMT 2.0.

System repeatability: Repeat the test 5 times with 50 μL of the standard solution according to the above conditions; the relative standard deviation of the peak area of thioctic acid is NMT 2.0%.

0.005 mol/L potassium dihydrogen phosphate solution—Dissolve 1.36 g of potassium dihydrogen phosphate in water to make 2000 mL.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 Thioctic Acid Tablets, and powder. Weigh accurately an amount of Thioctic Acid Tablets, equivalent to about 0.5 mg of thioctic acid ($C_8H_{14}O_2S_2$), according to the labeled amount, add methanol to make 100 mL, and use this solution as the test solution. Separately, weigh accurately about 50 mg of thioctic acid RS, proceed in the same manner as in the preparation of the test solution, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of thioctic acid in each solution.

Amount (mg) of thioctic acid ($C_8H_{14}O_2S_2$)

$$= \text{Amount (mg) of thioctic acid RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 210 nm).

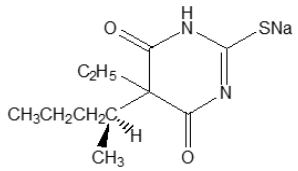
Column: A stainless steel column about 4 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of 0.1% phosphoric acid and acetonitrile (60 : 40).

Flow rate: 1.0 mL/min

Packaging and storage Preserve in tight containers.

Thiopental Sodium
티오펜탈나트륨



and enantiomer

$C_{11}H_{17}N_2NaO_2S$: 264.32
Sodium 5-ethyl-4,6-dioxo-5-pentan-2-yl-1*H*-pyrimidine-2-thiolate [*71-73-8*]

Thiopental Sodium, when dried, contains NLT 97.0% and NMT 101.0% of thiopental sodium ($C_{11}H_{17}N_2NaO_2S$).

Description Thiopental Sodium occurs as a pale yellow powder and has a faint, characteristic odor.
It is very soluble in water, freely soluble in ethanol(95) and practically insoluble in ether.
A solution of Thiopental Sodium in 10 mL of water is alkaline.
It is hygroscopic.
Allow to stand an aqueous solution of Thiopental Sodium; it is gradually decomposed.

Identification (1) Dissolve 0.2 g of Thiopental Sodium in 5 mL of sodium hydroxide TS and add 2 mL of lead acetate TS; a white precipitate is formed. The precipitate dissolves when heated, while a black precipitate is gradually formed when re-boiled. Also, the precipitate responds to the Qualitative Analysis for sulfide.

(2) Dissolve 0.5 g of Thiopental Sodium in 15 mL of water, add 10 mL of dilute hydrochloric acid; a white precipitate is formed. Extract this four times with each 25 mL of chloroform. Combine the chloroform extracts, evaporate on a steam bath and dry at 105 °C for 2 hours; the melting point of the residue is between 157 and 162 °C.

(3) An aqueous solution of Thiopental Sodium (1 in 10) responds to the Qualitative Analysis (1) and (2) for sodium salt.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Thiopental Sodium in 10 mL of freshly boiled and cooled water; the resulting solution is clear and pale yellow.

(2) ***Heavy metals***—Dissolve 2.0 g of Thiopental Sodium in 76 mL of water, add 4 mL of dilute hydrochloric acid, shake to mix and filter through a glass filter (G4). To 40 mL of the filtrate, add 2 mL of ammonium acetate TS, and add water to make 50 mL. Use this solution as the test solution and perform the test. Prepare a control solution by adding 2 mL of dilute acetic acid, 2 mL of ammonium acetate TS and water to 2.0 mL of lead standard solution to make 50 mL (NMT 20 ppm).

(3) ***Neutral and basic substances***—Weigh accurately about 1.0 g of Thiopental Sodium, dissolve in 10 mL of water and 5 mL of sodium hydroxide TS, add 40 mL of chloroform and shake to mix well. Separate the chloroform layer, wash the layer twice with 5 mL each of water, filter and evaporate the filtrate on a steam bath to dryness. Dry the residue at 105 °C for 1 hour; the amount of the residue is NMT 0.50%.

(4) ***Related substances***—Dissolve 50 mg of Thiopental Sodium in 50 mL of the mobile phase and use this solution as the test solution. Pipet 1 mL of this solution, add the mobile phase to it make exactly 200 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak area of each solution by the automatic integration method; the total area of the peaks of thiopental from the test solution is not greater than the peak area of thiopental from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: Dissolve 1 g of potassium dihydrogen phosphate in 1000 mL of water and adjust the pH to 3.0 with phosphoric acid. To 700 mL of this solution, add 300 mL of acetonitrile.

Flow rate: Adjust the flow rate so that the retention time of thiopental is about 15 minutes.

System suitability

Test for required detectability: Take exactly 2 mL of the standard solution, and add the mobile phase to make exactly 10 mL. Confirm that the peak area of thiopental obtained from 20 μL of this solution is equivalent to 15% to 25% of that of thiopental obtained from the standard solution.

System performance: Dissolve 5 mg each of isopropyl p-hydroxybenzoate and propyl p-hydroxybenzoate in 50 mL of acetonitrile and add water to make 100 mL. Proceed with 20 μL of this solution under the above operating conditions; isopropyl p-hydroxybenzoate and propyl p-hydroxybenzoate are eluted in this order with the resolution being NLT 1.9.

Time span of measurement: About 1.5 times the retention time of thiopental.

Loss on drying NMT 2.0% (1 g, in vacuum, 80 °C, 4 hours).

Assay Weigh accurately about 0.5 g of Thiopental Sodium, previously dried, put into a separatory funnel, dissolve in 20 mL of water, add 5 mL of ethanol(95) and 10 mL of dilute hydrochloric acid, and extract with 50 mL of chloroform, Then, extract three times with 25 mL each of

chloroform. Combine the chloroform extracts, wash twice with 5 mL each of water and extract the washings twice with 10 mL each of chloroform. Combine the chloroform extracts and filter into an Erlenmeyer flask. Wash the filter paper three times with 5 mL each of chloroform. Combine the filtrate and the washings and add 10 mL of ethanol(95). Titrate with 0.1 mol/L potassium hydroxide-ethanol VS (indicator: 2 mL of alizarin yellow GG-thymolphthalein TS). However, the endpoint of the titration is when the color of the solution changes from yellow through pale blue to violet. Perform a blank test in the same manner with a solution of 30 mL of ethanol(95) in 160 mL of chloroform and make any necessary correction.

Each mL of 0.1 mol/L potassium hydroxide VS
= 26.43 mg of $C_{11}H_{17}N_2NaO_2S$

Packaging and storage Preserve in light-resistant, tight containers.

Thiopental Sodium for Injection
주사용 티오펜탈나트륨

Thiopental Sodium for Injection is a preparation for injection which is dissolved before use. Thiopental Sodium for Injection contains NLT 93.0% and NMT 107.0% of the labeled amount of thiopental sodium ($C_{11}H_{17}N_2NaO_2S$: 264.32).

Method of preparation Prepare as directed under Injections with Thiopental Sodium and dried sodium carbonate mixed at a mass ratio of 100 : 6.

Description Thiopental Sodium for Injection occurs as a pale yellow powder or a mass with a slightly characteristic odor.
It is very soluble in water and practically insoluble in dehydrated ether.
It is hygroscopic.

Identification (1) Dissolve 0.1 g of Thiopental Sodium for Injection in 10 mL of water, then add 0.5 mL of barium chloride TS; a white precipitate is formed. Collect the precipitate and add dilute hydrochloric acid dropwise: the precipitate dissolves with effervescence.

(2) Perform the test as directed under the Identification of Thiopental sodium.

pH Dissolve 1.0 g of Thiopental Sodium for Injection in 40 mL of water; the pH of this solution is between 10.2 and 11.2.

Purity Perform the test as directed under Purity for Thiopental sodium.

Loss on drying NMT 2.0% (1 g, in vacuum, 80 ℃, 4 hours)

Sterility Meets the requirements.

Bacterial endotoxins Less than 0.3 EU per mg of thiopental sodium

Uniformity of dosage units Meets the requirements.

Particulate contamination: Visible particles Meets the requirements.

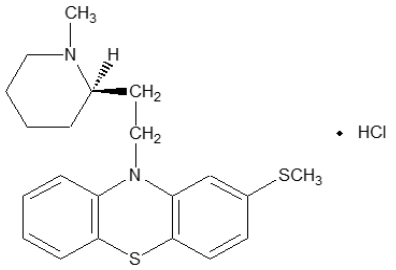
Insoluble particulate matter in injections Meets the requirements.

Assay Take 10 units of thiopental sodium for injection and carefully open each. Dissolve each content with water, wash each container with water, combine the washings with the former solution and add water to make exactly 1000 mL. Pipet 10 mL of this solution and add water to make exactly 100 mL. Pipet an amount (*V* mL) of this solution equivalent to about 15 mg of thiopental sodium ($C_{11}H_{17}N_2NaO_2S$), and add water to make exactly 1000 mL. Pipet 10 mL of this solution and add 15 mL of diluted dilute sodium hydroxide TS (1 in 100), then add water to make exactly 30 mL and use this solution as the test solution. Separately, weigh accurately about 46 mg of Thiopental RS, previously dried at 105 ℃ for 3 hours, dissolve in 50 mL of dilute sodium hydroxide TS and add water to make exactly 200 mL. Pipet 2 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at the wavelength of 304 nm as directed under Ultraviolet-visible Spectroscopy.

Amount (mg) of thiopental sodium ($C_{11}H_{17}N_2NaO_2S$) in 1 unit of thiopental sodium for injection
$= \text{Amount (mg) of thiopental RS} \times \frac{A_T}{A_S} \times \frac{300}{V} \times 1.0904$

Packaging and storage Preserve in light-resistant, hermetic containers.

Thioridazine Hydrochloride
티오리다진염산염



and enantiomer

$C_{21}H_{26}N_2S_2 \cdot HCl$: 407.04
10-[2-(1-Methylpiperidin-2-yl)ethyl]-2-

methylsulfanylphenothiazinehydrochloride [*130-61-0*]

Thioridazine Hydrochloride, when dried, contains NLT 99.0% and NMT 101.0% of thioridazine hydrochloride ($C_{21}H_{26}N_2S_2 \cdot HCl$).

Description Thioridazine Hydrochloride occurs as a white to pale yellow, crystalline powder. It is odorless and has a bitter taste.
It is freely soluble in water, in methanol, acetic acid(100) or ethanol(95), sparingly soluble in acetic anhydride and practically insoluble in ether.
Dissolve 1.0 g of Its in 100 mL of water; the pH of the solution is between 4.2 and 5.2.
It is gradually colored by light.

Identification (1) Dissolve 10 mg of Thioridazine Hydrochloride in 2 mL of sulfuric acid; the resulting solution exhibits a deep blue color.

(2) Dissolve 10 mg of Thioridazine Hydrochloride in 2 mL of water and add 1 drop of tetraammonium cerium (IV) sulfate TS; the solution exhibits a blue color, and the color disappears the excess test solution is added.

(3) Determine the infrared spectra of Thioridazine Hydrochloride and thioridazine hydrochloride RS, previously dried, as directed in the potassium chloride disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers

(4) To 5 mL of an aqueous solution of Thioridazine Hydrochloride (1 in 100), add 2 mL of ammonia TS, heat on a steam bath for 5 minutes, cool, and filter. Acidify the filtrate with dilute nitric acid: the solution responds to the Qualitative Analysis (2) for chloride.

Melting point Between 159 and 164 °C.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Thioridazine Hydrochloride according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Selenium***—Weigh 0.1 g of Thioridazine Hydrochloride, add 0.1 g of magnesium oxide, mix, transfer to a combustion flask, and proceed as directed under the Oxygen Flask Combustion, using 25 mL of diluted nitric acid (1 in 30) as the absorbent. Use a 1 L volumetric flask as the combustion flask. After combustion, wash the stopper and the inner wall of the flask with 10 mL of water. Transfer the liquid from the flask to a 150-mL beaker, using 20 mL of water. Heat gently to boil, boil for 10 minutes, cool to room temperature, and use this solution as the test solution. Separately, pipet 3.0 mL of standard selenium stock solution, add 25 mL of diluted nitric acid (1 in 30) and 25 mL of water, and use this solution as the standard solution. Adjust the pH of the test solution and the standard solution to 2.0 ± 0.2 with diluted ammonia water(28) (1 in 2), add water to make exactly 60 mL, transfer it to a separatory funnel using 10 mL of water, and wash the separatory funnel with 10 mL of water. To each, add 0.2 g of hydroxylamine hydrochloride and stir to dissolve. Then, immediately add 5.0 mL of 2,3-diaminonaphthalene TS, put a stopper, stir to mix, and allow to stand at the room temperature for 100 minutes. To this, add 5.0 mL of cyclohexane, shake vigorously for 2 minutes, and allow to stand. When the layer is separated, remove the water layer, centrifuge cyclohexane extracts, remove water, and take the cyclohexane layer. With these solutions and a control solution prepared with water added to 25 mL of diluted nitric acid (1 in 30) in the same manner, perform the test as directed under the Ultraviolet-visible Spectroscopy. Determine the absorbance at the absorption maximum wavelength around 380 nm; the absorbance of the solution from the test solution is not greater than the absorbance from the standard solution (NMT 30 ppm).

(3) ***Arsenic***—Proceed with 1.0 g of Thioridazine Hydrochloride according to Method 3 and perform the test (NMT 2 ppm).

(4) ***Related substances***—Dissolve 0.10 g of Thioridazine Hydrochloride in 10 mL of methanol and use this solution as the test solution. Pipet 1 mL of this solution, add methanol to make exactly 20 mL, pipet 2 mL of this solution, add methanol to make exactly 10 mL and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on a plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of chloroform, 2-propanol and ammonia water(28) (74 : 25 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 366 nm); the spots other than the principal spot obtained from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 0.5% (1 g, 105 °C, 4 hours)

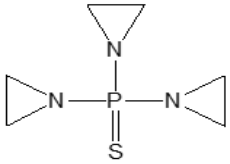
Residue on ignition NMT 0.1% (1 g)

Assay Weigh accurately about 0.35 g of Thioridazine Hydrochloride, previously dried, dissolve in 80 mL of a mixture of acetic anhydride and acetic acid(100) (1 : 1), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 1 mol/L perchloric acid VS
= 40.704 mg of $C_{21}H_{26}N_2S_2 \cdot HCl$

Packaging and storage Preserve in light-resistant, tight containers.

Thiotepa
티오테파



$C_6H_{12}N_3PS$: 189.22

tris(Aziridin-1-yl)-sulfanylidene-λ*5*-phosphane [*52-24-4*]

Thiotepa, when dried, contains NLT 98.0% and NMT 101.0% of thiotepa ($C_6H_{12}N_3PS$).

Description Thiotepa occurs as colorless or white crystals or a crystalline powder and is odorless.
It is freely soluble in water, ethanol(95) or ether.
Dissolve 1.0 g of Its in 10 mL of water; the solution is neutral.

Identification (1) To 5 mL of an aqueous solution of Thiotepa (1 in 100), add 1 mL of ammonium molybdate TS and allow to stand; the resulting solution exhibits a dark blue color slowly when the solution is cold, or quickly when warm.

(2) To 5 mL of an aqueous solution of Thiotepa (1 in 100), add 1 mL of nitric acid; the resulting solution responds to the Qualitative Analysis (2) for phosphate.

(3) Dissolve 0.1 g of Thiotepa in a mixture of 1 mL of lead acetate TS and 10 mL of sodium hydroxide TS and boil; the gas evolved changes moistened red litmus paper to blue and the solution exhibits a grayish red color.

Melting point Between 52 and 57 °C.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Thiotepa in 20 mL of water; the solution is clear and colorless.

(2) ***Heavy metals***—Proceed with 1.0 g of Thiotepa in a platinum crucible according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Arsenic***—Dissolve 0.20 g of Thiotepa in 5 mL of water and add 1 mL of nitric acid and 1 mL of sulfuric acid. Proceed with this solution according to Method 2 and perform the test (NMT 10 ppm).

Loss on drying NMT 0.2% (1 g, in vacuum, silica gel, 4 hours).

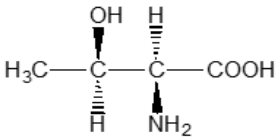
Residue on ignition NMT 0.1% (1 g, platinum crucible).

Assay Weigh accurately about 0.1 g of Thiotepa, previously dried, dissolve in 50 mL of a potassium thiocyanate solution (3 in 20), add exactly 25 mL of 0.05 mol/L sulfuric acid VS, and allow to stand for 20 minutes with occasional shaking. Titrate the excess sulfuric acid with 0.1 mol/L sodium hydroxide VS (indicator: 3 drops of methyl red TS). However, the endpoint of the titration is when the color of the solution changes from red to pale yellow. Perform a blank test in the same manner.

Each mL of 0.05 mol/L sulfuric acid VS
= 6.307 mg of $C_6H_{12}N_3PS$

Packaging and storage Preserve in a cold place, light-resistant, tight containers.

L-Threonine
L-트레오닌



$C_4H_9NO_3$: 119.12

(2*S*,3*R*)-2-Amino-3-hydroxybutanoic acid [*72-19-5*]

L-Threonine, when dried, contains NLT 98.5% and NMT 101.0% of L-threonine ($C_4H_9NO_3$).

Description L-Threonine occurs as crystals or a crystalline powder, which is odorless or has a slight characteristic odor and a slightly sweet taste.
It is freely soluble in formic acid, soluble in water, and practically insoluble in ethanol(95) or ether.

Identification Determine the infrared spectra of L-Threonine and L-threonine RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Optical rotation $[\alpha]_D^{20}$: Between -26.0° and -29.0° (1.5 g after drying, water, 25 mL, 100 mm).

pH Dissolve 0.20 g of L-Threonine in 20 mL of water; the pH of this solution is between 5.2 and 6.2.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of L-Threonine in 20 mL of water; the resulting solution is clear and colorless.

(2) ***Chloride***—Perform the test with 0.5 g of L-Threonine. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid (NMT 0.021%).

(3) ***Sulfate***—Perform the test with 0.6 g of L-Threonine. Prepare the control solution with 0.35 mL of 0.005 mol/L sulfuric acid (NMT 0.028%).

(4) ***Ammonium***—Perform the test with 0.25 g of L-Threonine. Prepare the control solution with 5.0 mL of ammonium standard solution (NMT 0.02%).

(5) ***Heavy metals***—Proceed with 1.0 g of L-Threonine according to Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(6) ***Iron***—Dissolve 0.333 g of L-Threonine in water to make 45 mL, add 2 mL of hydrochloric acid, and use this solution as the test solution. Add water to 1.0 mL of iron standard solution to make 45 mL, add 2 mL of hy-

drochloric acid, and use this solution as the standard solution. Add 50 mg of ammonium peroxydisulfate and 3 mL of 30% ammonium thiocyanate solution to each of the test solution and the standard solution and mix; the color obtained from the test solution is not more intense than that from the standard solution (NMT 30 ppm).

(7) ***Arsenic***—Dissolve 1.0 g of L-Threonine in 5 mL of dilute hydrochloric acid and use this solution as the test solution (NMT 2 ppm).

(8) ***Related substances***—Dissolve 0.30 g of L-Threonine in water to make exactly 50 mL and use this solution as the test solution. Pipet 1 mL of this solution and add water to make exactly 50 mL. Pipet 5 mL of this solution, add water to make exactly 20 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on a thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of 1-butanol, water and acetic acid(100) (3 : 1 : 1) (as the developing solvent) to a distance of about 10 cm, and dry the plate at 80 ℃ for 30 minutes. Spray evenly a solution of ninhydrin in acetone (1 in 50) on the plate, heat at 80 ℃ for 5 minutes; the spots other than the principal spot are not more intense than the spots from the standard solution.

Loss on drying NMT 0.2% (1 g, 105 ℃, 3 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.12 g of L-Threonine, previously dried, and dissolve in 3 mL of formic acid, add 50 mL of acetic acid(100), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 11.912 mg of $C_4H_9NO_3$

Packaging and storage Preserve in tight containers.

Thrombin
트롬빈

Thrombin is prepared by treating prothrombin derived from human or bovine blood with thromboplastin in the presence of calcium ions, sterilizing, and lyophilizing.

Thrombin contains NLT 80.0% and NMT 150.0% of the labeled units of Thrombin.

Each mg of Thrombine contains NLT 10 units of Thrombin.

Description Thrombin occurs as a white to pale yellow powder.
Dissolve an amount, equivalent to 500 units Thrombin, in isotonic sodium chloride injection; the resulting solution is clear within 1 minute or slight turbid while dissolving.

Loss on drying NMT 3.0% (50 mg, in vacuum, phosphorus pentoxide, 4 hours)

Sterility Meets the requirements.

Assay (1) ***Fibrinogen solution***—Weigh accurately about 30 mg of fibrinogen and dissolve in 3 mL of isotonic sodium chloride injection. Add about 3 units of Thrombin and frequently shake to mix until clots are sufficiently produced. Separately, take the precipitated clots and wash thoroughly with water until the washings yield no turbidity when silver nitrate TS is added. Dry at 105 ℃ for 3 hours, weigh the residue, and determine the percentage (%) of the clots. Based on the percentage (%) of the clots, dissolve separately fibrinogen in isotonic sodium chloride injection so that the amount of fibrinogen in the solution is 0.20% of the clots and adjust the pH of the solution between 7.0 and 7.4 by adding 0.05 mol/L sodium monohydrogen phosphate TS (if necessary, use 0.5 mol/L sodium monohydrogen phosphate TS), and add isotonic sodium chloride injection to make a 0.1% solution.

(2) ***Procedure***—Dissolve thrombin RS in isotonic sodium chloride injection to prepare 4 standard solutions, which contain 4.0, 5.0, 6.2 and 7.5 units of thrombin RS per mL, respectively. Pipet 0.10 mL of the standard solution, previously kept at between 20 and 30 ℃ (± 1 ℃), transfer into a small test tube, 10 mm in internal diameter and 100 mm in length. To the test tube, pipet 0.9 mL of the fibrinogen solution, previously kept at the same temperature as the standard solution. Start a stopwatch simultaneously, shake the tube gently to mix, and measure the time for the first appearance of clot. Repeat the procedure 5 times with each of the 4 standard solutions and determine the average values. If the difference between the maximum and the minimum values from the 5 measurements is NLT 10%, repeat the procedure. The concentration of the standard solution may be varied appropriately withing the range of 14 to 60 seconds of the clotting time. The measurement is performed at the same temperature described above. Next, weigh accurately the mass of the entire contents of a single container of Thrombin and dissolve in isotonic sodium chloride injection to obtain a solution containing about 5 units of Thrombin per mL. Take 0.10 mL of the solution, repeat the above procedure 5 times, measure the clotting time, and determine the average value. Plot the average value of the clotting times of the 4 standard solutions (vertical axis) against units of thrombin RS (horizontal axis), using units as the abscissa and clotting times as the ordinate on a logarithmic graph to create a calibration curve. Using the calibration curve, read the unit *U*, corresponding to the average clotting time of the test solution.

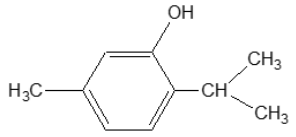
Units of a single container of Thrombin
$= U \times 10 \times V$

V: Number of mL of the volume in which the contents of a single container of Thrombin is dissolved

Separately, determine the units per mg of the contents.

Packaging and storage Preserve in hermetic containers below 10 ℃.

Thymol
티몰



$C_{10}H_{14}O$: 150.22

5-Methyl-2-propan-2-ylphenol [*89-83-8*]

Thymol contains NLT 98.0% and NMT 101.0% of thymol ($C_{10}H_{14}O$).

Description Thymol occurs as colorless crystals or a white crystalline mass. It has an aromatic odor and a burning taste.
It is very soluble in acetic acid(100), freely soluble in ethanol(95) or ether, and slightly soluble in water.
It sinks in water, but when warmed, it melts and rises to the surface of water.

Identification (1) To 1 mL of a solution of Thymol in acetic acid(100) (1 in 300), add 6 drops of sulfuric acid and 1 drop of nitric acid; the solution exhibits a bluish green color by reflected light and a purple color by transmitted light.

(2) To 1 g of Thymol, add 5 mL of sodium hydroxide solution (1 in 10), dissolve by heating on a steam bath, and continue heating for several minutes: the solution gradually exhibits a pale yellowish red color. Allow this solution to stand at room temperature; the color changes to dark yellowish brown. To this solution, add 2 to 3 drops of chloroform and shake to mix; the solution immediately exhibits a purple color.

(3) Triturate Thymol with an equal amount of camphor or menthol: the mixture liquefies.

Melting point Between 49 and 51 °C.

Purity (1) ***Non-volatile residue***—Volatilize 2.0 g of Thymol by heating on a steam bath and dry the residue at 105 °C for 2 hours: the mass is NMT 1.0 mg.

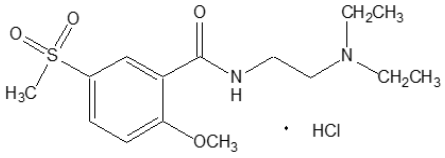
(2) ***Other phenols***—To 1.0 g of Thymol, add 20 mL of warm water, shake vigorously for 1 minute, and filter. To 5 mL of the filtrate, add 1 drop of iron(III) chloride TS; the solution exhibits a green color but no blue to violet color.

Assay Weigh accurately about 0.5 g of Thymol, dissolve in 10 mL of sodium hydroxide TS and add water to make exactly 100 mL. Pipet 10 mL of this solution, put it into an iodine bottle, add 50 mL of water and 20 mL of dilute sulfuric acid, and cool in iced water for 30 minutes. Then, add exactly 20 mL of 0.05 mol/L bromine solution, stopper immediately, allow to stand for 30 minutes in iced water with occasional shaking in the dark, add 14 mL of potassium iodide TS and 5 mL of chloroform, stopper, shake vigorously, and titrate the liberated iodine with 0.1 mol/L sodium thiosulfate VS (indicator: 3 mL of starch TS). However, near the endpoint of titration, stopper and shake vigorously. The endpoint is when the blue color in the chloroform layer disappears. Perform a blank test in the same manner.

Each mL of 0.05 mol/L bromine VS
= 3.756 mg of $C_{10}H_{14}O$

Packaging and storage Preserve in light-resistant, tight containers.

Tiapride Hydrochloride
티아프리드염산염



$C_{15}H_{24}N_2O_4S \cdot HCl$: 364.89

N-[2-(Diethylamino)ethyl]-2-methoxy-5-methylsulfonylbenzamidehydrochloride [*51012-33-0*]

Tiapride Hydrochloride contains NLT 98.5% and NMT 101.0% of tiapride hydrochloride ($C_{15}H_{24}N_2O_4S \cdot HCl$), calculated on the dried basis.

Description Tiapride Hydrochloride occurs as a white to pale yellowish white crystalline powder.
It is freely soluble in water, soluble in methanol and slightly soluble in ethanol(95).

Identification (1) Determine the infrared spectra of Tiapride Hydrochloride and tiapride hydrochloride RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) An aqueous solution of Tiapride Hydrochloride (2.5 in 50) responds to the Qualitative Analysis for chloride.

pH Dissolve 2.5 g of Tiapride Hydrochloride in 50 mL of water; the pH of this solution is between 4.0 and 6.0.

Purity (1) ***Clarity and color of solution***—Dissolve 2.5 g of Tiapride Hydrochloride in 50 mL of water; the solution is clear. Perform the test with this solution as directed under the Ultraviolet-visible Spectroscopy; the absorbance at the wavelength of 450 nm is NMT 0.030.

(2) ***Heavy metals***—Proceed with 1.0 g of Tiapride

Hydrochloride according to Method 1, and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (20 ppm).

(3) ***Related substance I***—Dissolve 0.40 g of Tiapride Hydrochloride, accurately weighed, in methanol to make exactly 10 mL and use this solution as the test solution. Separately, dissolve 20.0 mg of tiapride related substance I RS {*N*,*N*-diethylethylen-1,2-diamine} in methanol to make exactly 50 mL. To 2.0 mL of this solution, add methanol to make exactly 20 mL and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on a plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of methyl-t-butyl ether, ethanol(99.5), and ammonia water(28) (40 : 10 : 2) as the developing solvent to a distance of about 12 cm, and air-dry the plate. Spray evenly with 0.2 w/v% ninhydrin 1-butanol solution and heat at 100 °C for 15 minutes; the spots of the related substance I from the test solution are not more intense than the spots from the standard solution (NMT 0.1%).

(4) ***Related substances***—Dissolve 0.1 g of Tiapride Hydrochloride, accurately weighed, in the mobile phase to make exactly 100 mL and use this solution as the test solution. To 1.0 mL of the test solution, add the mobile phase to make exactly 10 mL. To 1.0 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions and calculate the areas of peaks; the area of peaks other than the major peak obtained from the test solution is not greater than the area of the major peak from the standard solution (0.1%), and the sum of the areas of these peaks is not greater than 3 times the area of the major peak from the standard solution (0.3%). However, disregard any peak with an area smaller than 0.5 times the area of the major peak from the standard solution (NMT 0.05%).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 240 nm).

Column: A stainless steel column 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: Dissolve 5.44 g of potassium dihydrogen phosphate and 80 mg of sodium ocatanesulphonate in 780 mL of water, adjust the pH to 2.7 with phosphoric acid, and add water to make 800 mL. To this solution, add 150 mL of methanol and 50 mL of acetonitrile.

Flow rate: 1.5 mL/min

System suitability

Dissolve 5.0 mg of tiapride hydrochloride RS and 5.0 mg of tiapride N-oxide RS in the mobile phase to make 100 mL. Proceed with 10 μL of this solution according to the above conditions; the resolution between the peaks of tiapride (the retention time is about 9 minutes) and tiapride N-oxide (the retention time is about 13 minutes) is NLT 4.0.

Loss on drying NMT 0.5% (1 g, 105 °C, constant mass).

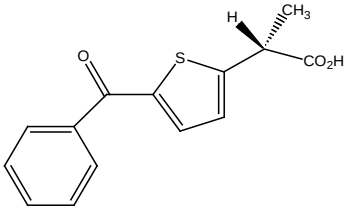
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.3 g of Tiapride Hydrochloride, dissolve in 20 mL of acetic acid(100) and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Separately, perform a blank test, and make any necessary correction.

Each mL of 1 mol/L perchloric acid VS
= 36.489 mg of $C_{15}H_{24}N_2O_4S \cdot HCl$

Packaging and storage Preserve in well-closed containers.

Tiaprofenic Acid
티아프로펜산



and enantiomer

$C_{14}H_{12}O_3S$: 260.31

2-(5-Benzoylthiophen-2-yl)propanoic acid [*33005-95-7*]

Tiaprofenic Acid contains NLT 99.0% and NMT 101.0% of tiaprofenic acid ($C_{14}H_{12}O_3S$), calculated on the dried basis.

Description Tiaprofenic Acid occurs as a white crystalline powder.
It is very soluble in acetone, ethanol(95) or dichloromethane, and practically insoluble in water.

Identification Determine the infrared spectra of Tiaprofenic Acid and tiaprofenic acid RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Melting point Between 95 and 99 °C.

Optical rotation $[\alpha]_D^{20}$: Between -0.10° and +0.10° (0.5 g, ethyl acetate, 10 mL, 100 mm).

Purity (1) ***Clarity and color of solution***—Dissolve 2.0 g of Tiaprofenic Acid in ethanol(95) to make 20 mL; the

resulting solution is clear and not more intense than a mixture of 5 mL of Matching fluids for color F and 95 mL of 1 w/v% hydrochloric acid.

(2) ***Heavy metals***—Proceed with 2.0 g of Tiaprofenic Acid according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Related substances***—Dissolve 20.0 mg of Tiaprofenic Acid in the mobile phase to make exactly 20 mL, and use this solution as the test solution. Add the mobile phase to 1.0 mL of the test solution to make exactly 50 mL, and add the mobile phase to 1.0 mL of this solution to make exactly 10 mL. Use this solution as the standard solution (1). To 5.0 mL of the standard solution (1), add the mobile phase to make exactly 10 mL, and use this solution as the standard solution (2). Dissolve 10.0 mg of tiaprofenic acid related substance I RS [(2RS)-2-(5-benzoyl-thiopene-3-yl)propanosan] in the mobile phase to make 100 mL. Add the mobile phase to 1.0 mL of this solution to make exactly 50 mL, and use this solution as the standard solution (3). Add the standard solution (3) to 1.0 mL of the standard solution (1) to make exactly 2 mL, and use this solution as the standard solution (4). Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. The peak area of the related substance I obtained from the test solution is not greater than the corresponding peak area from the standard solution (3) (NMT 0.2%). The area of the peaks other than the major peak from the test solution and the peak area of the related substance It is not greater than the area of the major peak obtained from the standard solution (2) (0.1%), and the sum of the areas of peaks other than the major peak from the test solution and the peak of the related substance I, is not greater than 1.5 times the area of the major peak obtained from the standard solution (1) (0.3%). However, disregard the peaks smaller than 0.5 times the area of the major peak obtained from the standard solution (2).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 250 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of dichloromethane, hexane, acetic acid(100) and water (500 : 500 : 20 : 1). Add the water to acetic acid(100), mix, then add hexane and dichloromethane. Sonicate the mixture for 2 minutes. Do not degas with helium during analysis.

Flow rate: 1.0 mL/min

System suitability

System performance: Proceed with 20 μL each of the test solution and standard solution (4) according to the above conditions; the relative retention times of related substance II, III and I to the retention time of tiaprofenic acid are 0.19, 0.48 and 0.86, respectively, and the resolution of the peaks between tiaprofenic acid and related substance I is NLT 3.0 Adjust the detection sensitivity so that the height of the major peak from the standard solution (4) is NLT 50% of the full scale.

Loss on drying NMT 0.5% (1.0 g, 60℃, NMT 0.9 kPa, 3 hours).

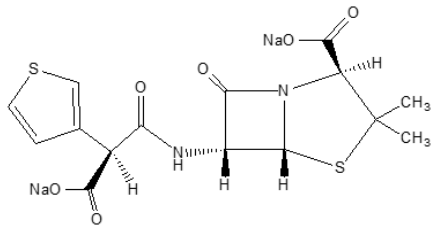
Residue on ignition NMT 0.1% (1.0 g).

Assay Weigh accurately about 0.25 g of Tiaprofenic Acid, dissolve in 25 mL of ethanol(95), add 25 mL of water, and titrate with 0.1 mol/L sodium hydroxide VS (indicator: 0.5 mL of phenolphthalein TS). Perform a blank test in the same manner and make any necessary correction.

Each mL of 1 mL of 0.1 mol/L sodium hydroxide VS
= 26.031 mg of $C_{14}H_{12}O_3S$

Packaging and storage Preserve in light-resistant, well-closed containers.

Ticarcillin Sodium
티카르실린나트륨



$C_{15}H_{14}N_2Na_2O_6S_2$: 428.40

Disodium(2*S*,5*R*,6*R*)-6-[[(2*R*)-2-carboxylato-2-thiophen-3-ylacetyl]amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylate [*4697-14-7*]

Ticarcillin Sodium contains NLT 800 μg (potency) of ticarcillin ($C_{15}H_{16}N_2O_6S_2$: 384.43) per mg, calculated on the anhydrous basis.

Description Ticarcillin Sodium occurs as a white to pale yellowish white powder and has a characteristic odor.
It is very soluble in water, freely soluble in methanol, sparingly soluble in ethanol(95), and practically insoluble in ether.

Identification (1) Weigh accurately 40 mg of Ticarcillin Sodium and ticarcillin sodium RS, respectively, and dissolve in water to make exactly 100 mL. Add 0.1 mol/L methanol hydrochloric acid TS to 5 mL of each these solutions to make exactly 100 mL, and use these solutions as the test solution and the standard solution, respectively. Determine the absorption spectra of the test solution and the standard solution at 200 nm to 300 nm as directed under the Ultraviolet-visible Spectroscopy, using 0.1 mol/L methanol hydrochloric acid TS as the control solution; it exhibits a maximum at the wavelength of

around 230 nm, and the absorption spectrum of each wavelength is the same as that of the reference standards.

(2) An aqueous solution of Ticarcillin Sodium (1 in 20) responds to the Qualitative Analysis for sodium.

Optical rotation $[\alpha]_D^{25}$: Between +172° and +187° (1 g, calculated on the anhydrous basis, water, 100 mL, 100 mm).

pH Dissolve 0.1 g of Ticarcillin Sodium in 10 mL of water; the pH of this solution is between 6.0 and 8.0.

Purity (1) ***Dimethylaniline***—Weigh accurately about 1.0 g of Ticarcillin Sodium, add 5 mL of 1 mol/L sodium hydroxide TS and 1 mL of the internal standard solution, centrifuge, if necessary, and use the clear supernatant as the test solution. Separately, weigh accurately about 50 mg of dimethylaniline, add 2.0 mL of hydrochloric acid, and add water to make 50 mL. Pipet 5.0 mL of this solution and add water to make exactly 250 mL. Pipet 1.0 mL of this solution, add 5.0 mL of 1 mol/L sodium hydroxide TS and 1.0 mL of the internal standard solution, centrifuge if necessary, and use the clear supernatant as the standard solution. Perform the test with 1 μL each of the test solution and the standard solution as directed under the Gas Chromatography according to the following conditions, and calculate the peak area ratios, Q_T and Q_S, of dimethylaniline to the internal standard from the test solution and the standard solution, respectively (NMT 20 ppm).

$$\text{Content (ppm) of dimethylaniline} = \text{Amount (mg) of dimethylaniline taken} \times \frac{Q_T}{Q_S} \times \frac{Purity\ (\%)\ of\ dimethylaniline}{Amount\ (mg)\ of\ \text{Ticarcillin Sodium}} \times 4$$

Internal standard solution—Dissolve 50.0 mg of naphthalene in cyclohexane to make 50 mL. Take 5.0 mL of this solution, add cyclohexane to make 100 mL, and use this solution as the internal standard solution.

Operating conditions

Detector: A flame ionization detector

Column: A column about 2 mm in internal diameter and about 2 m in length, packed with diatomaceous earth for gas chromatography, which is coated with 50% phenyl-50% methylpolysiloxane for gas chromatography equivalent to 3% of the mass of the diatomaceous earth for gas chromatography.

Column temperature: 120 °C

Temperatures of the sample injection port and the detector: 150 °C.

Carrier gas: Nitrogen

Flow rate: 30 mL/min

(2) ***Ticarcillin content***—Weigh accurately about 40 mg each of Ticarcillin Sodium and ticarcillin sodium RS and dissolve each in water to make exactly 100 mL. Pipet 5.0 mL each of these solutions, add 0.1 mol/L methanol hydrochloric acid TS to make exactly 100 mL, and use these solutions as the test solution and the standard solution, respectively. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at 230 nm as directed under Ultraviolet-visible Spectroscopy, using the blank test solution as the control solution (NLT 80.0% and NMT 94.0%, calculated on the anhydrous basis).

$$\text{Content (\%) of ticarcillin} = \text{Concentration (\%) of ticarcillin in ticarcillin sodium RS} \times \frac{Amount\ (mg)\ of\ ticarcillin\ sodium\ RS}{Amount\ (mg)\ of\ sample} \times \frac{A_T}{A_S}$$

0.1 mol/L Hydrochloric acid-methanol TS—Add methanol to 0.8 mL of hydrochloric acid to make 100 mL.

Water NMT 6.0% (0.2 g, volumetric titration, direct titration).

Sterility It meets the requirements when used in the manufacturing of sterile preparations. However, the manufacturing process of sterile preparations which includes the terminal sterile process is exceptional.

Bacterial endotoxins Less than 0.05 EU per mg (potency) of ticarcillin when used in the manufacturing of sterile preparations.

Assay Weigh about 50 mg (potency) each of Ticarcillin Sodium and ticarcillin sodium RS, dissolve each in a phosphate buffer solution (pH 6.4) to make exactly 50 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions and determine the peak areas, A_T and A_S, of the test solution and the standard solution, respectively.

$$\text{Potency (μg) of ticarcillin } (C_{15}H_{16}N_2O_6S_2) = \text{Potency (μg) of ticarcillin RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

Column: A stainless steel column with an internal diameter of about 4 mm and a length of about 30 cm, packed with octadecylsilanized silica gel for liquid chromatography (3 to 10 μm in particle diameter).

Mobile phase: A mixture of phosphate buffer solution (pH 4.3) and acetonitrile (95 : 5).

Flow rate: 2 mL/min

System suitability

System performance: Proceed with the resolution test solution under the above operating conditions; the relative retention time of clavulanic acid and ticarcillin are 0.2 and 1.0, respectively, the resolutions are NLT 5.0; the number of theoretical plates and the symmetric factor are NLT 1000 and NMT 2.0, respectively.

System repeatability: Repeat the test 5 times with 20 μL each of the standard solutions according to the above operating conditions; the relative standard deviation of the peak area of ticarcillin is NMT 2.0%.

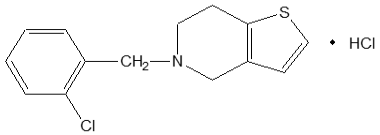
Phosphate buffer solution (pH 6.4)—Dissolve 6.9 g of sodium dihydrogen phosphate monohydrate in 900 mL of water, adjust with 10 mol/L sodium hydroxide to a pH of 6.4 ± 0.1, and add water to make 1000 mL.

Phosphate buffer solution (pH 4.3)—Dissolve 13.8 g of sodium dihydrogen phosphate monohydrate in 900 mL of water, adjust with 10 mol/L sodium hydroxide to a pH of 4.3 ± 0.1, and add water to make 1000 mL.

Resolution test solution—Weigh accurately about 25 mg (potency) of ticarcillin sodium RS, add 5 mL of phosphate buffer solution (pH 6.4) solution of clavulanic acid RS containing 0.15 mg per mL, and then add phosphate buffer solution (pH 6.4) to make exactly 25 mL.

Packaging and storage Preserve in tight containers (at 2 to 8 ℃).

Ticlopidine Hydrochloride
티클로피딘염산염



$C_{14}H_{14}ClNS \cdot HCl$: 300.25

5-[(2-Chlorophenyl)methyl]-4*H*,5*H*,6*H*,7*H*-thieno[3,2-c]pyridine hydrochloride [*53885-35-1*]

Ticlopidine Hydrochloride contains NLT 99.0% and NMT 101.0% of ticlopidine hydrochloride ($C_{14}H_{14}ClNS \cdot HCl$), calculated on the anhydrous basis.

Description Ticlopidine Hydrochloride occurs as a white to pale yellowish crystalline powder.
It is freely soluble in acetic acid(100), soluble in water or methanol, sparingly soluble in ethanol(99) and practically insoluble in ether.

Identification (1) Determine the absorption spectra of Ticlopidine Hydrochloride and ticlopidine hydrochloride RS according to the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) A solution of Ticlopidine Hydrochloride (1 in 20) responds to the Qualitative Analysis (2) for chloride.

Purity (1) ***Heavy metals***—Proceed with 2.0 g of Ticlopidine Hydrochloride according to Method 3, and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Arsenic***—Proceed with 1.0 g of Ticlopidine Hydrochloride according to Method 4, and perform the test (NMT 2 ppm).

(3) ***Related substances***—Dissolve 0.5 g of Ticlopidine Hydrochloride in 20 mL of methanol (1 in 20000) of hydrochloric acid, and use this solution as the test solution. Pipet 5 mL of this solution, add methanol (1 in 20000) of hydrochloric acid to make exactly 200 mL, and use this solution as the standard solution (1). Separately, pipet 1 mL of test solution, add methanol (1 in 20000) of hydrochloric acid to make exactly 50 mL, and use this solution as the standard solution (2). With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL of the test solution and standard solution (1) on a plate (1) made of silica gel with fluorescent indicator for thin-layer chromatography, and spot 10 μL of each test solution and standard solution (2) on a plate (2) made of silica gel for thin-layer chromatography. Next, develop the plate with the upper layer of a mixture of water, 1-butanol and acetic acid(100) (5 : 4 : 1) as the developing solvent to a distance of about 15 cm, and air-dry the plate. Spray evenly a solution of ninhydrin in acetone (1 in 50) on the plate (1) and heat at 100 °C for 20 minutes; spots other than the principal spot from the test solution are not more intense than the spots from the standard solution (1). Allow the plate (2) to stand for 30 minutes in iodine steam; the spots other than the principal spot from the test solution are not more intense than those from the standard solution (2).

(4) ***Formaldehyde***—Dissolve 0.8 g of Ticlopidine Hydrochloride in 19.0 mL of water, add 1.0 mL of 4 mol/L sodium hydroxide TS, and shake well to mix. Centrifuge this solution and filter the upper layer. To 5.0 mL of the filtrate, add 5.0 mL of acetylacetone TS, mix, and warm at 40℃ for 5 minutes; the color of the resulting solution is not more intense than that of the following control solution.

Control solution—Weigh exactly 0.54g of formaldehyde solution, and add water to make exactly 1000 mL. Pipet 10 mL of this solution and add water to make exactly 1000 mL. Prepare before use. Add water to 8.0 mL of this solution to make 20.0 mL, and filter. Take 5.0 mL of the filtrate, add 5.0 mL of acetylacetone TS, and proceed in the same manner as below.

Water NMT 1.0% (0.3 g, volumetric titration, direct titration).

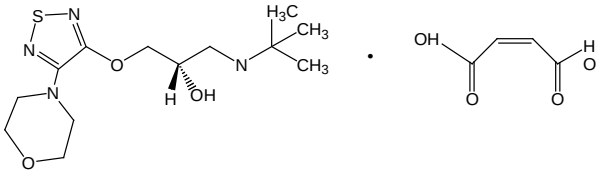
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.4 g of Ticlopidine Hydrochloride, dissolve in 20 mL of acetic acid(100), add 40 mL of acetic anhydride, and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

1 mL of 0.1 mol/L perchloric acid VS
= 30.025 mg of $C_{14}H_{14}ClNS \cdot HCl$

Packaging and storage Preserve in well-closed containers.

Timolol Maleate
티몰롤말레산염



$C_{13}H_{24}N_4O_3S \cdot C_4H_4O_4$: 432.49
(*Z*)-But-2-Enedioic acid;(2*S*)-1-(*tert*-butylamino)-3-[(4-morpholin-4-yl-1,2,5-thiadiazol-3-yl)oxy]propan-2-ol
[*26921-17-5*]

Timolol Maleate, when dried, contains NLT 98.0% and NMT 101.0% of timolol maleate ($C_{13}H_{24}N_4O_3S \cdot C_4H_4O_4$).

Description Timolol Maleate occurs as a white to pale yellowish white powder.
It is freely soluble in acetic acid(100), and soluble in water or ethanol(99.5).
It dissolves in 0.1 mol/L hydrochloric acid TS.

Melting point—About 197 °C (with decomposition).

Identification (1) Determine the absorption spectra of solutions of Timolol Maleate and timolol maleate RS in 0.1 mol/L hydrochloric acid TS (3 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Timolol Maleate and timolol maleate RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) Add 1 drop of potassium permanganate TS to 5 mL of an aqueous solution of Timolol Maleate (1 in 500); the red color of the test solution disappears immediately.

pH Dissolve 1.0 g of Timolol Maleate in 20 mL of water; the pH of this solution is between 3.8 and 4.3.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Timolol Maleate in 20 mL of water; the resulting solution is clear. Also, perform the test with this solution as directed under the Ultraviolet-visible Spectroscopy; the absorbance at 440 nm is NMT 0.05.

(2) ***Heavy metals***—Proceed with 2.0 g of Timolol Maleate according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Related substances***—Dissolve about 30 mg of Timolol Maleate in 20 mL of the mobile phase and use this solution as the test solution. Pipet 1 mL of this solution, add the mobile phase to it make exactly 100 mL, and use this solution as the standard solution. Perform the test with 25 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions, and determine each peak area by the automatic integration method; the peak area other than that of timolol and maleic acid from the test solution is not greater than 0.2 times the peak area of timolol from the standard solution. The total area of the peaks other than the peak of timolol and maleic acid from the test solution is not greater than 0.5 times the peak area of timolol from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 280 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: Dissolve 1.9 g of sodium 1-hexanesulfonate in 1800 mL of water, add 6.0 mL of triethylamine and 8.0 mL of formic acid, adjust the pH to 3.0 with formic acid, and add water to make 2000 mL. To 1400 mL of this solution, add 500 mL of methanol and 100 mL of acetonitrile.

Flow rate: Adjust the flow rate so that the retention time of timolol is about 18 minutes.

System suitability

Test for required detectability: Take exactly 1 mL of the standard solution, and add the mobile phase to make exactly 10 mL. Confirm that the peak area of timolol obtained from 25 μL of this solution is equivalent to 7% to 13% of that from the standard solution.

System performance: Proceed with 25 μL of the standard solution according to the above conditions; the number of theoretical plates and the symmetry factor of the peak of timolol are NLT 1500 and NMT 2.5, respectively.

System repeatability: Repeat the test 6 times with 25 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak areas of timolol is NMT 2.0%.

Time span of measurement: About 2 times the retention time of timolol after the solvent peak.

Isomer Perform the test using light-resistant containers. Weigh exactly 30 mg of Timolol Maleate, dissolve in 10 mL of a mixture of methylene chloride and isopropanol (10 : 30), and use this solution as the test solution. Dissolve 30 mg of timolol maleate RS in 10 mL of a solvent and use this solution as the standard solution (a). Dissolve 3 mg of timolol maleate enantiomer RS ({(2R)-1-[(1,1-dimethylethyl)amino}-3-{[4-(morpholin-4-yl)-1,2,5-thiadiazol-3-yl]oxy} propane-2-) in 10 mL of the solvent, take 1.0 mL of this solution, add the solvent to make exactly 10mL, and use this solution as the standard solution (b). Take 1 mL of the standard solution (a) and add the

solvent to make 100 mL. Mix 1 mL of this solution and 1 mL of the standard solution (b) and use this solution as the standard solution (c). Add 100 mL of the solvent to 1.0 mL of the test solution and use this solution as the standard solution (d). Perform the test with 5 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions; the amount of timolol maleate enantiomer is not greater than that corresponding to the area of the major peak of the standard solution (d) (1.0%).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 297 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with silica gel for liquid chromatography (cellulose tris (3,5-dimethylphenylcarbamate)) (5 μm in particle diameter).

Mobile phase: A mixture of diethylamine, 2-propanol and hexane (2 : 40 : 960).

Flow rate: 1 mL/min

Injection volume: 5 μL

Order of elution: Timolol maleate enantiomer is eluted the first in the order of elution.

System suitability

System performance: The peak retention times of the major peak of the test solution and the standard solution (a) are the same, and the resolution between the major peak of the standard solution (c) and the peak of timolol maleate enantiomer is NLT 4.

Loss on drying NMT 0.5% (1 g, in vacuum, 100 ℃, 3 hours).

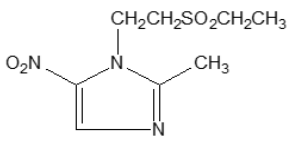
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.8 g of Timolol Maleate, previously dried, dissolve in 90 mL of acetic acid(100), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 1 mol/L perchloric acid VS
= 43.25 mg of $C_{13}H_{24}N_4O_3S \cdot C_4H_4O_4$

Packaging and storage Preserve in tight containers.

Tinidazole
티니다졸



$C_8H_{13}N_3O_4S$: 247.27

1-(2-Ethylsulfonylethyl)-2-methyl-5-nitroimidazole

[*19387-91-8*]

Tinidazole, when dried, contains NLT 98.5% and NMT 101.0% of tinidazole ($C_8H_{13}N_3O_4S$).

Description Tinidazole occurs as a pale yellow crystalline powder.

It is soluble in acetic anhydride or acetone, sparingly solution in methanol, slightly soluble in ethanol(95) and practically insoluble in water.

Identification (1) Determine the absorption spectra of Tinidazole and tinidazole RS in methanol (1 in 50000) as directed Under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) Determine the infrared spectra of Tinidazole and tinidazole RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Melting point Between 125 and 129 ℃.

Purity (1) ***Sulfate***—To 2.0 g of Tinidazole, add 100 mL of water, boil for 5 minutes, and cool. Then, add water to make 100 mL and filter. Take 25 mL of the filtrate, add 1 mL of dilute hydrochloric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 0.45 mL of 0.005 mol/L sulfuric acid (NMT 0.043%).

(2) ***Heavy metals***—Proceed with 1.0 g of Tinidazole according to Method 4 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Arsenic***—Proceed with 2.0 g of Tinidazole according to Method 3 and perform the test (NMT 1 ppm).

(4) ***Related substances***—Dissolve 50 mg of Tinidazole in 2 mL of acetone and use this solution as the test solution. Pipet 1 mL of this solution, add acetone to make exactly 200 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot each 10 μL of the test solution and the standard solution on a plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate and diethylamine (19 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Heat the plate at 100 ℃ for 5 minutes, cool, and examine under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 1.0% (1 g, 105 ℃, 2 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.35 g of Tinidazole, previously dried, dissolve in 50 mL of acetic anhydride, and titrate with 0.1 mol/L perchloric acid VS (potentiometric

titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 24.73 mg of $C_8H_{13}N_3O_4S$

Packaging and storage Preserve in light-resistant, tight containers.

Tinidazole Tablets
티니다졸 정

Tinidazole Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of tinidazole ($C_8H_{13}N_3O_4S$: 247.27).

Method of preparation Prepare as directed under Tablets, with Tinidazole.

Identification (1) Determine the absorption spectra of solutions of Tinidazole Tablets and tinidazole RS in 0.001% methanol as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Extract Tinidazole Tablets, previously powdered, with methanol to obtain a solution containing 5 mg of tinidazole per mL, and use this solution as the test solution. Separately, add methanol to tinidazole RS to obtain a solution containing 5 mg per mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Paper Chromatography. Spot 50 μL each of the test solution and the standard solution on the Whatman paper, develop the paper with a mixture of water, acetic acid(100), 1-butanol and ethyl acetate (1 : 1 : 1 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 366 nm); the color and R_f value of the spots obtained from the test solution and the standard solution are the same.

Disintegration Meets the requirements.

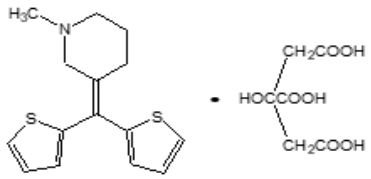
Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 tablets of Tinidazole Tablets, and powder. Weigh accurately an amount, equivalent to about 0.1 g of tinidazole ($C_8H_{13}N_3O_4S$), add about 70 mL of methanol, and shake for 10 minutes to mix. To this, add methanol to make 100 mL, and filter it. To 10.0 mL of the filtrate, add methanol to make 100 mL. Take 10.0 mL of this solution, add methanol to make 100 mL, and use this solution as the test solution. Separately, dry tinidazole RS in a desiccator (in vacuum, silica gel) for 4 hours. Weigh accurately 0.1 g of the dried matter, proceed in the same manner as in the preparation of the test solution, and use this solution as the standard solution. Perform the test with the test solution and the standard solution as directed under the Ultraviolet-visible Spectroscopy, using methanol as the control solution, and determine the absorbances, A_T and A_S, at the wavelength of 310 nm.

Amount (mg) of tinidazole ($C_8H_{13}N_3O_4S$)
= Amount (mg) of tinidazole RS× $\frac{A_T}{A_S}$

Packaging and storage Preserve in tight containers.

Tipepidine Citrate
티페피딘시트르산염



$C_{15}H_{17}NS_2 \cdot C_6H_8O_7$: 467.56
3(Di-2-thienylmethylene)-1-methyl-piperidine 2-hydroxy-1,2,3-propanetricarboxylate (1:1), [*14698-07-8*]

Tipepidine Citrate, when dried, contains NLT 99.0% and NMT 101.0% of tipepidine citrate ($C_{15}H_{17}NS_2 \cdot C_6H_8O_7$).

Description Tipepidine Citrate occurs as white to light yellow crystals or a crystalline powder, and has no or a slight odor and a bitter taste.
It is freely soluble in acetic acid(100), sparingly soluble in water or methanol, slightly soluble in anhydrous ethanol, very slightly soluble in acetone and practically insoluble in anhydrous ether.

Identification (1) Add 10 mL of water to 0.1 g of Tipepidine Citrate, and heat to dissolve. After cooling, add sodium hydroxide TS until precipitate forms. Add chloroform to this solution, shake to mix, take the aqueous layer, and add ammonia TS to neutralize it; the resulting solution responds to the Qualitative Analysis (2) and (3) for citrate.

(2) Dissolve 1 mg of Tipepidine Citrate with 3 mL of acetic acid(100), and add 5 mL of ninhydrin-sulfuric acid (1 in 1000); the solution exhibits bluish-purple.

(3) To 0.1 g of Tipepidine Citrate, add 5 mL of water, dissolve by heating on a steam bath, and cool. Use this solution as the test solution. Add 1 to 2 drops of bromine TS to 2 mL of the test solution; the color of the test solution disappears immediately.

(4) To 2 mL of the test solution obtained from (3), add 5 mL of chloramine TS; yellow color appears or yellow precipitates are formed.

(5) Add 500 mL of water to 10 mg of Tipepidine Citrate, heat to dissolve, and cool. Determine the absorption spectrum of this solution as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum at a wavelength between 245 nm and 249 nm.

Melting point Between 138 and 142 ℃.

Purity (1) ***Heavy metals***—Prepare the test solution with 2.0 g of Tipepidine Citrate according to Method 2 under the Heavy Metals, and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Arsenic***—Prepare the test solution with 1.0 g of Tipepidine Citrate according to Method 3 under the Arsenic, and perform the test (NMT 2 ppm).

(3) ***Related substances***—Weigh about 10 mg of Tipepidine Citrate, add the mobile phase to make exactly 20.0 mL, and use this solution as the test solution. Take 1.0 mL of the test solution, add the mobile phase to make 50.0 mL, and use this solution as the standard solution. Test using 20 μL of test solution and standard solution as directed under the Liquid Chromatography according to the following conditions. The total peak areas other than tipepidine from the test solution is not larger than peak area of tipepidine from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column, 4 mm to 4.6 mm in internal diameter and 15 cm to 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm to 10 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: A mixture of methanol and ammonium acetate solution (1 in 500) (4 : 1).

Flow rate: Adjust the flow rate so that the retention time of tipepidine is about 5 to 7 minutes.

Time span of measurement: About 2 times the retention time of tipepidine.

System suitability

System performance: Weigh 12 mg of Tipepidine Citrate and 4 mg of *o*-delphenyl, and dissolve in the mobile phase to make 50 mL. Proceed with 10 μL of this solution under the above operating conditions, using the resolution being NLT 2.

Detection sensitivity: Adjust the detection sensitivity so that the peak height of the tipepidine in the chromatogram obtained from the standard solution is about 5% of the full scale of the recording paper.

Loss on drying NMT 1.0% (1 g, sulfuric acid, 24 hours).

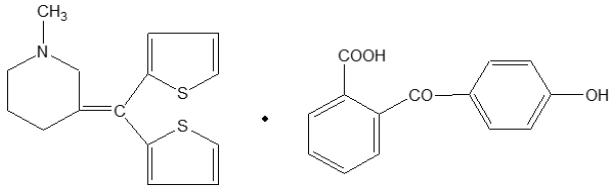
Residue on ignition NMT 0.10% (1 g).

Assay Weigh accurately about 0.9 g of Tipepidine Citrate, previously dried, dissolve in 40 mL of acetic acid(100) for non-aqueous titration, and titrate with 0.1 mol/L perchloric acid VS (indicator: 2 drops of methylrosanilinium chloride TS). the endpoint of the titration is when the purple color of this solution turns to blue and then finally to green. Perform a blank test in the same manner and make any necessary correction.

Each mL of 1 mol/L perchloric acid VS
= 46.76 mg of C15H17NS2·C6H8O7

Packaging and storage Preserve in tight containers.

Tipepidine Hibenzate
티페피딘히벤즈산염



$C_{15}H_{17}NS_2 \cdot C_{14}H_{10}O_4$: 517.66

4-(2-Carboxybenzoyl)phenolate;3-(dithiophen-2-yl methylidene)-1-methylpiperidin-1-ium [*31139-87-4*]

Tipepidine Hibenzate, when dried, contains NLT 98.5% and NMT 101.0% of tipepidine hibenzate($C_{15}H_{17}NS_2 \cdot C_{14}H_{10}O_4$).

Description Tipepidine Hibenzate occurs as a white to pale yellow crystalline powder, and is odorless and tasteless.

It is freely soluble in acetic acid(100), slightly soluble in methanol or ethanol(95), very slightly soluble in water and practically insoluble in ether.

Identification (1) Dissolve 10 mg of Tipepidine Hibenzate in 5 mL of sulfuric acid; the resulting solution exhibits an orange color.

(2) Dissolve 0.3 g of Tipepidine Hibenzate in 10 mL of sodium hydroxide TS and 5 mL of water, and extract 2 times with 20 mL of chloroform. Wash the chloroform extract with 10 mL of water, and filter the chloroform layer. Evaporate the filtrate to dryness on a steam bath, and dissolve the residue by adding 0.5 mL of 1 mol/L hydrochloric acid TS and 5 mL of water. To 2 mL of this solution, add 5 mL of tin reinecke salt TS; a pale red precipitate is produced.

(3) Determine the absorption spectra of ethanol(99.5) solutions of Tipepidine Hibenzate and tipepidine hibenzate RS (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(4) Determine the infrared spectra of Tipepidine Hibenzate and tipepidine hibenzate RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Melting point Between 189 and 193 ℃.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Tipepidine Hibenzate in 10 mL of acetic acid(100); the

resulting solution is clear. Perform the test with this solution as directed under the Ultraviolet-visible Spectroscopy; the absorbance at 400 nm is NMT 0.16.

(2) ***Heavy metals***—Proceed with 2.0 g of Tipepidine Hibenzate according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Arsenic***—Proceed with 1.0 g of Tipepidine Hibenzate according to Method 3 and perform the test (NMT 2 ppm).

(4) ***Related substances***—(i) Dissolve 10 mg of Tipepidine Hibenzate in 20 mL of mobile phase, and use this solution as the test solution. Pipet 1 mL of this solution, add the mobile phase to it make exactly 100 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine each peak area according to the automatic integration method; the total peak areas other than the peaks of hibenzic acid and tipepidine from the test solution is not greater than the peak area of tipepidine from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column, about 4 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 - 10 μm in particle diameter).

Column temperature: A constant temperature of about 50 °C.

Mobile phase: A mixture of ammonium acetate solution (1 in 100) and tetrahydrofuran (32 : 13).

Flow rate: Adjust the flow rate so that the retention time of tipepidine is about 10 to 14 minutes.

System suitability

Detection sensitivity: Weigh accurately 2 mL of the standard solution and add the mobile phase to make exactly 20 mL. Verify that the peak area of tipepidine obtained from 20 μL of this solution is equivalent to 7% to 13% of the peak area of tipepidine obtained from the standard solution.

System performance: Dissolve 10 mg of Tipepidine Hibenzate and 3 mg of propyl *p*-hydroxybenzoate in 100 mL of the mobile phase. Proceed with 20 μL of this solution according to the above operating conditions; hibenzic acid, propyl *p*-hydroxybenzoate and tipepidine are eluted in this order with the resolution between peaks of tipepidine and propyl *p*-hydroxybenzoate being NLT 3.

System repeatability: Repeat the test 6 times with 20 μL each of the standard solution according to the above operating conditions; the relative standard deviation of the peak area of tipepidine is NMT 1.5%.

Time span of measurement: Range from after solvent peak until the tipepidine efflux.

(ii) Dissolve 10 mg of Tipepidine Hibenzate in 20 mL of the mobile phase and use this solution as the test solution. Pipet 1 mL of this solution, add the mobile phase to it make exactly 100 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak area of each solution by the automatic integration method; the total peak areas other than hibenzic acid and tipepidine from the test solution is not larger than half the peak area of tipepidinee from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm to 10 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: A mixture of methanol and ammonium acetate solution (1 in 500) (13 : 7).

Flow rate: Adjust the flow rate so that the retention time of tipepidine is about 10 minutes.

System suitability

Detection sensitivity: Weigh accurately 2 mL of the standard solution and add the mobile phase to make exactly 20 mL. Confirm that the peak area of tipepidine obtained from 20 μL of this solution is equivalent to 7% to 13% of the peak area of tipepidine obtained from the standard solution.

System performance: Dissolve 10 mg of Tipepidine Hibenzate and 3 mg of propyl p-hydroxybenzoate in 100 mL of the mobile phase. Proceed with 20 μL of this solution according to the above operating conditions, elute hibenzic acid, propyl *p*-hydroxybenzoate and tipepidine in this order with the resolution between tipepidine and propyl p-hydroxybenzoate being NLT 3.

System repeatability: Repeat the test 6 times with 20 μL each of the standard solution according to the above operating conditions; the relative standard deviation of the peak area of tipepidine is NMT 3.0%.

Time span of measurement: Range from after solvent peak until the tipepidine efflux.

Loss on drying NMT 0.5% (1 g, 60 ℃, in vacuum, phosphorus pentoxide, 3 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 1 g of Tipepidine Hibenzate, previously dried, dissolve in 40 mL of acetic acid(100), and titrate with 0.1 mol/L perchloric acid VS (indicator: 3 drops of methylrosanilinium chloride TS). However, the endpoint of the titration is when the violet color of this solution turns to the blue color and then finally to the green color. Perform a blank test in the same manner and make any necessary correction.

Each mL of 1 mol/L perchloric acid VS

= 51.766 mg of $C_{15}H_{17}NS_2 \cdot C_{14}H_{10}O_4$

Packaging and storage Preserve in light-resistant, well-closed containers.

Tipepidine Hibenzate Tablets
티페피딘히벤즈산염 정

Tipepidine Hibenzate Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of tipepidine hibenzate ($C_{15}H_{17}NS_2 \cdot C_{14}H_{10}O_4$: 517.66).

Method of preparation Prepare as directed under Tablets, with Tipepidine Hibenzate.

Identification (1) Weigh an amount of Tipepidine Hibenzate Tablets, previously powdered, equivalent to 44 mg of tipepidine hibenzate according to the labeled amount, add 5 mL of water, shake for 1 minute to mix, and add 10 mL of sodium hydroxide TS. Extract 2 times each with 20 mL of chloroform. Combine all extracts, wash with 10 mL of water, and then filter the chloroform layer. Evaporate the filtrate to dryness on a steam bath. To the residue, dissolve in 0.2 mL of 1 mol/L hydrochloric acid TS and 2 mL of water, and add 5 mL of Reinecke salt TS; a pale red precipitate is formed.

(2) Weigh an amount of Tipepidine Hibenzate Tablets, previously powdered, equivalent to 11 mg of tipepidine hibenzate according to the labeled amount, add 30 mL of ethanol(99.5), and warm for 10 minutes while occasionally shaking to mix. After cooling, add ethanol(99.5) to make 50 mL, and filter. To 1 mL of the filtrate, add ethanol(99.5) to make 20 mL. Determine the absorption spectrum of this solution as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum absorption between 282 nm and 286 nm.

Dissolution Perform the test with 1 tablet of Tipepidine Hibenzate Tablets at 50 revolutions per minute according to Method 2, using 900 mL of water as the dissolution medium. Use the dissolved solution after 30 minutes from starting of the test as the test solution. Separately, weigh accurately about 0.11 g of tipepidine hibenzate RS, previously dried in a phosphorus pentoxide desiccator in vacuum at 60 ℃ for 3 hours, add diluted ethanol (3 in 4), and dissolve by occasionally warming. After cooling, add diluted ethanol (3 in 4) to make exactly 100 mL. Pipet 20 mL of this solution, add water to make 900 mL, and use this solution as the standard solution. Determine the absorbances, A_{T1} and A_{S1}, at 286 nm and A_{T2} and A_{S2}, at 360 nm of the test solution and the standard solution, respectively, as directed under Ultraviolet-visible Spectrophotometry.
Meets the requirements if the dissolution rate of Tipepidine Hibenzate Tablets in 30 minutes is NLT 80%.

Dissolution rate (%) of the labeled amount of tipepidine hibenzate ($C_{18}H_{17}NS_2 \cdot C_{14}H_{10}O_4$)

$$= W_S \times \frac{A_{T1} - A_{T2}}{A_{S1} - A_{S2}} \times \frac{20}{C}$$

W_S: Amount (mg) of the reference standards
C: Labeled amount (mg) of tipepidine hibenzate ($C_{15}H_{17}NS_2 \cdot C_{14}H_{10}O_4$) in 1 tablet

Uniformity of dosage units It meets the requirements when the procedure for content uniformity is performed according to the following procedure.
Take 1 table of Tipepidine Hibenzate Tablets, add 5 mL of diluted acetic acid(100) (1 in 2) and 15 mL of methanol per 11 mg of tipepidine hibenzate, and warm for 15 minutes by shaking occasionally to mix. After cooling, add diluted methanol (1 in 2) to make V mL of a solution containing about 0.44 mg of tipepidine hibenzate per mL, then filter, discard 10 mL of the first filtrate, and pipet 5 mL of the subsequent filtrate. Add 5 mL of the internal standard solution, add diluted methanol (1 in 2) to make exactly 25 mL, and use this solution as the test solution. Perform the test as directed under the Assay below.

Amount (mg) of tipepidine hibenzate ($C_{15}H_{17}NS_2 \cdot C_{14}H_{10}O_4$)
$$= \text{Amount (mg) of tipepidine hibenzate RS} \times \frac{Q_T}{Q_S} \times \frac{V}{50}$$

Internal standard solution—A solution of dibucaine hydrochloride in methanol (1 in 2000).

Assay Weigh accurately the mass of NLT 20 Tipepidine Hibenzate Tablets, and powder. Weigh accurately an amount equivalent to about 22 mg of tipepidine hibenzate ($C_{15}H_{17}NS_2 \cdot C_{14}H_{10}O_4$), add 10 mL of diluted acetic acid(100) (1 in 2) and 30 mL of methanol, and warm for 10 minutes by shaking occasionally to mix. After cooling, add diluted methanol (1 in 2) to make exactly 50 mL, and filter. Discard the first 10 mL of the filtrate, and pipet 5 mL of the subsequent filtrate, add 5 mL of the internal standard solution, and then add diluted methanol (1 in 10) to make exactly 25 mL. Use this solution as the test solution. Separately, weigh accurately about 22 mg of tipepidine hibenzate RS, previously dried in a phosphorus pentoxide desiccator in vacuum at 60 ℃ for 3 hours, dissolve in 10 mL of diluted acetic acid(100) (1 in 2) and 30 mL of methanol, and add diluted methanol (1 in 2) to make exactly 50 mL. Pipet 5 mL of this solution, add exactly 5 mL of the internal standard solution, then add diluted methanol (1 in 5) to make 25 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the peak area ratios, Q_T and Q_S, of tipepidine to the peak area of the internal standard, respectively.

Amount (mg) of tipepidine hibenzate ($C_{18}H_{17}NS_2 \cdot C_{14}H_{10}O_4$)
$$= \text{Amount (mg) of tipepidine hibenzate RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of dibucaine hydrochloride in methanol (1 in 2000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column, about 4 to 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 to 10 μm in particle diameter).

Column temperature: A constant temperature of about 40 ℃.

Mobile phase: A mixture of a solution of sodium lauryl sulfate in diluted phosphoric acid (1 in 1000) (1 in 500), acetonitrile and 2-propanol (3 : 2 : 1).

Flow rate: Adjust the flow rate so that the retention time of tipepidine is about 7 minutes.

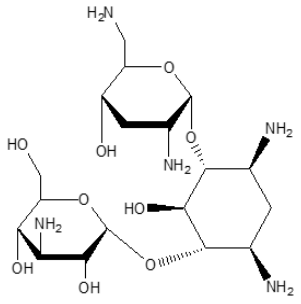
System suitability

System performance: Proceed with 20 μL of the standard solution under the above operating conditions; tipepidine and the internal standard are eluted in this order with the resolution being NLT 10.0.

System repeatability: Repeat the test 6 times with 20 μL each of the standard solution according to the above conditions; the relative standard deviation of the ratios of the peak area of tipepidine to the peak area of the internal standard is NMT 1.0%.

Packaging and storage Preserve in light-resistant, tight containers.

Tobramycin
토브라마이신



$C_{18}H_{37}N_5O_9$: 467.51

(2*S*,3*R*,4*S*,5*S*,6*R*)-4-Amino-2-[(1*S*,2*S*,3*R*,4*S*,6*R*)-4,6-diamino-3-[(2*R*,3*R*,5*S*,6*R*)-3-amino-6-(aminomethyl)-5-hydroxyoxan-2-yl]oxy-2-hydroxycyclohexyl]oxy-6-(hydroxymethyl)oxane-3,5-diol [*32986-56-4*]

Tobramycin is an aminoglycoside substance having antibacterial activity produced by cultivating *Streptomyces tenebrarius.*

Tobramycin contains NLT 900 μg and NMT 1060 μg (potency) of tobramycin ($C_{18}H_{37}N_5O_9$) per mg, calculated on the anhydrous basis.

Description Tobramycin occurs as a white to pale yellowish white crystalline powder.

It is very soluble in water, freely soluble in formamide, very slightly soluble in methanol, and very slightly soluble in ethanol(95).

It is hygroscopic.

Identification (1) Dissolve 10 mg each of Tobramycin and tobramycin RS in 1 mL of water and use each solution as the test solution and the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 4 μL each of the test solution and the standard solution on a plate of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of ammonia water, 1-butanol, and methanol (5 : 5 : 2) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Spray ninhydrin TS evenly on the plate, and heat it at 100 ℃ for 5 minutes; the R_f values of the spots obtained from the test and the standard solutions are the same.

(2) Determine ^1H as directed under the nuclear magnetic resonance spectrum using the heavy aqueous solution (1 in 125) of Tobramycin for nuclear magnetic resonance spectrum and sodium 3-trimethylsilylpropanesulfonate for nuclear magnetic resonance spectrum as an internal standard; it exhibits single-line signals A, C around δ 5.1 ppm, δ 2.6 to 4.0 ppm, and δ 1.0 to 7.0 ppm, respectively, and the area intensity ratio A : B : C of each signal is about 1 : 8 : 2.

Optical rotation $[\alpha]_D^{20}$: Between +138 and +148° (1 g, calculated on the anhydrous basis, water, 25 mL, 100 mm).

pH Dissolve 0.10 g of Tobramycin in 10 mL of water; the pH of this solution is between 9.5 and 11.5

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Tobramycin in 10 mL of water; the solution is clear, and colorless to pale yellow.

(2) ***Heavy metals***—Proceed with 1.0 g of Tobramycin according to Method 2 and perform the test. Prepare the control solution with 3.0 mL of the lead standard solution (NMT 30 ppm).

(3) ***Related substances***—Dissolve 80 mg of Tobramycin in 10 mL of diluted ammonia water(28) (1 in 250) and use this solution as the test solution. Pipet 1 mL of this solution, add diluted ammonia water(28) (1 in 250) to make exactly 100 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on a plate of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of ammonia water(28), ethanol(95) and 2-butanone (1 : 1 : 1) as the developing solvent to a distance of about 10 cm, air-dry the plate, and heat it at 110 ℃ for 10 minutes. Immediately, spray a mixture of water and sodium hypochlorite TS (4 : 1) on the plate, air dry it, and then spray the potassium iodide starch TS again; the spots other than the principal spots obtained from the test solution are not intense than the spots obtained from the standard solution.

Water NMT 11.0% (0.1 g, volumetric titration, direct titration). However, use a mixture of formamide for water determination and methanol for water determination (3 : 1) instead of methanol for water determination.

Residue on ignition NMT 1.0% (0.5 g).

Sterility It meets the requirements when used in the manufacturing of sterile preparations. However, it is excluded in cases where there is a terminal sterilization process in the manufacturing of sterile preparations.

Bacterial endotoxin Less than 2.0 EU per mg of tobramycin (potency) when used in the manufacturing of sterile preparations.

Assay Dissolve about 50 mg (potency) each of Tobramycin and tobramycin RS, weighed accurately, in water to make exactly 250 mL, and use these solutions as the test solution and the standard solution. Take exactly 4.0 mL each of the test solution and standard solution and put them in each 50-mL volumetric flask, and add 10 mL of 2,4-dinitrofluorobenzene solution and 10 mL of 2-amino-2-hydroxymethyl-1,3-propanediol solution, and shake to mix, and leave on a steam bath at 60 ± 2 ℃ for 50 ± 5 minutes, and allow to stand at room temperature for 10 minutes. Add about 20 mL of acetonitrile, cool at room temperature, make exactly 50 mL with acetonitrile, filter it through a membrane filter with a pore diameter of NMT 0.5 μm, and use the solutions as the test solution, standard solution, and derivative solution, respectively. Take exactly 20 μL each of the test solution, standard solution, and derivative solution, and perform the test as directed under the Liquid Chromatography under the following conditions, and determine the peak areas A_T and A_S of tobramycin in each solution.

$$\text{Potency (μg) of Tobramycin } (C_{18}H_{37}N_5O_9) = \text{Potency (μg) of tobramycin RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 365 nm).

Column: A stainless steel column about 4 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 μm in particle diameter).

Mobile phase: Dissolve 2.0 g of 2-amino-2-hydroxymethyl-1,3-propanediol in 800 mL of water. Add 20 mL of sulfuric acid solution, 0.5 mol/L, into this solution, and add acetonitrile to make exactly 2000 mL.

Flow rate: 1.2 mL/min

System suitability

System performance: Weigh accurately 5 mg of *p*-naphtholbenzein to make exactly 20 mL with acetonitrile. Then, take 2 mL of this solution, add the standard solution and the derivative solution to make 10 mL, and use this solution as the system suitability solution. Inject the system suitability solution; the relative retention time of *p*-naphtholbenzein with respect to tobramycin is about 0.6, and the resolution is NLT 4.0.

Packaging and storage Preserve in tight containers.

Tobramycin Injection
토브라마이신 주사액

Tobramycin Injection contains NLT 90.0% and NMT 110.0% of the labeled amount of tobramycin ($C_{18}H_{37}N_5O_9$: 467.52).

Method of preparation Prepare as directed under Injections, with Tobramycin.

Description Tobramycin Injection occurs as a colorless to a pale yellow, clear liquid.

Identification Weigh accurately about 10 mg (potency) of Tobramycin Injection, add water to make exactly 1 mL, and use this solution as the test solution. Separately, weigh accurately 10 mg (potency) of tobramycin RS, add water to make exactly 1 mL, and use this solution as the standard solution. Perform the test with the test solution and the standard solution as directed under the Thin Layer Chromatography. Spot 4 μL each of the test solution and the standard solution on a thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of ammonia water, 1-butanol and methanol (5 : 5 : 2) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Spray evenly ninhydrin TS on the plate and heat the plate at 100 ℃ for 5 minutes; the R_f values of the spots obtained from the test solution and the standard solution are the same.

pH Between 5.0 and 7.0.

Sterility Meets the requirements.

Bacterial endotoxins Less than 0.50 EU per mg (potency) of tobramycin.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Extractable volume of injections Meets the requirements.

Assay Perform the test as directed in the Assay under Tobramycin. Prepare the test solution by taking an amount of Tobramycin Injection equivalent to about 50 mg (potency) according to the labeled potency and dissolving in water to make exactly 250 mL.

Packaging and storage Preserve in hermetic containers.

Tobramycin Ophthalmic Ointment
토브라마이신 안연고

Tobramycin Ophthalmic Ointment contains NLT 90.0% and NMT 120.0% of the labeled amount of tobramycin ($C_{18}H_{37}N_5O_9$: 467.52).

Method of preparation Prepare as directed under Ophthalmic Solutions, with Tobramycin.

Identification Perform the test according to the Identification (1) of Tobramycin. Weigh an appropriate amount of Tobramycin Ophthalmic Ointment, put in a separatory funnel, and dissolve in 10 mL of chloroform. Add water, shake to mix, and allow to stand until the two liquid layers are completely separated. Take the water layer, and dilute it with water to obtain a solution containing 3 mg (potency) per mL, and use this solution as the test solution. Separately, weigh an appropriate amount of tobramycin RS, dissolve in water to obtain a solution containing 3 mg (potency) per mL, and use this solution as the standard solution. The drop volume of the test solution and the standard solution is 5 μL.

Water NMT 1.0% (1.0 g, volumetric titration, direct titration).

Sterility Meets the requirements.

Foreign metallic matter Meets the requirements.

Assay Proceed as directed under the Assay under Tobramycin. However, weigh accurately an appropriate amount of Tobramycin Ophthalmic Ointment to place in a separatory funnel, and add 50 mL of ether. Extract 3 times with 25 mL of sterile purified water, combine the extracts, and add sterile purified water to make exactly 100 mL. Take an appropriate amount of this solution and dilute with sterile purified water to obtain a solution containing 0.2 mg (potency) per mL, and use this solution as the test solution.

Packaging and storage Preserve in tight containers.

Tobramycin Ophthalmic Solution
토브라마이신 점안액

Tobramycin Ophthalmic Solution contains NLT 90.0% and NMT 120.0% of the labeled amount of tobramycin ($C_{18}H_{37}N_5O_9$: 467.52).

Method of preparation Prepare as directed under Ophthalmic Solutions, with Tobramycin.

Identification Perform the test according to the Identification (1) of Tobramycin. However, weigh an appropriate amount of Tobramycin Ophthalmic Solution and tobramycin RS, dissolve in water to make a solution containing 3 mg (potency) per mL, and use this solution as the test solution and standard solution, respectively.

pH Between 7.0 and 8.0.

Sterility Meets the requirements.

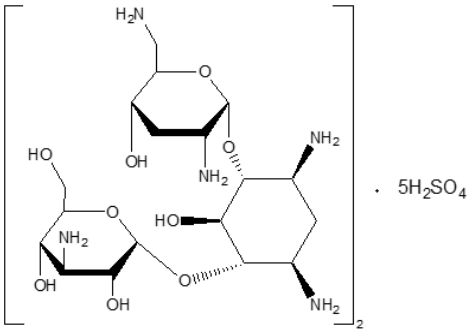
Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in ophthalmic solutions Meets the requirements.

Assay Proceed as directed under the Assay under Tobramycin. However, take an amount of Tobramycin Ophthalmic Solution, equivalent to about 50 mg (potency), according to the labeled potency, dissolve it in water to make exactly 250 mL, and use this solution as the test solution.

Packaging and storage Preserve in tight containers.

Tobramycin Sulfate
토브라마이신황산염



$(C_{18}H_{37}N_5O_9)_2.5H_2SO_4$: 1425.43

(2*S*,3*R*,4*S*,5*S*,6*R*)-4-Amino-2-[(1*S*,2*S*,3*R*,4*S*,6*R*)-4,6-diamino-3-[(2*R*,3*R*,5*S*,6*R*)-3-amino-6-(aminomethyl)-5-hydroxyoxan-2-yl]oxy-2-hydroxycyclohexyl]oxy-6-(hydroxymethyl)oxane-3,5-diol;sulfuric acid [*49842-07-1*]

Tobramycin Sulfate contains NLT 634 μg and NMT 739 μg (potency) of tobramycin ($C_{18}H_{37}N_5O_9$: 467.52) per mg, calculated on the anhydrous basis.

Description Tobramycin Sulfate occurs as a white to pale yellowish powder.
It is freely soluble in water, slightly soluble in ethanol(95), and practically insoluble in chloroform or ether.
It is hygroscopic.

Identification (1) Perform the test according to the Iden-

tification for Tobramycin. However, Dissolve about 60 mg (potency) each of Tobramycin Sulfate and tobramycin RS, weighed respectively, in water to make a solution containing 6 mg (potency) per mL, and use these solutions as the test solution and the standard solution.

(2) The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

(3) Tobramycin Sulfate responds to the Qualitative Analysis for sulfate.

pH Dissolve 0.4 g of Tobramycin Sulfate (potency) in 10 mL of water; the pH is between 6.0 and 8.0.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Tobramycin Sulfate according to Method 2 and perform the test. Prepare the control solution with 3.0 mL of lead standard solution (NMT 30 ppm).

(2) ***Related substances***—Dissolve 50 mg of Tobramycin Sulfate, weighed accurately, in 7 mL of water, adjust the pH to 5.5 with 1 mol/L sulfuric acid, then add water to make 10 mL and use this solution as the test solution. Pipet 1 mL of the test solution, add water to make exactly 100 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 1 μL each of the test solution and the standard solution on a thin-layer chromatographic plate made of silica gel for thin-layer chromatography and develop the thin later plate with a mixture of sodium chloride solution (29.2 in 100), alcohol and water (50 : 30 : 20) as the developing solvent to a distance of about 15 cm, and dry the thin-layer chromatographic plate by using hot air, and then heat it at 110 ℃ for 10 minutes. Spray diluted sodium hypochlorite solution TS (1 in 5) on the hot thin-layer chromatographic plate and add a drop of potassium iodide starch TS to the lower part of the circular line of the thin-layer chromatographic plate and blow cold air until a very light blue color appears. Evenly spray potassium iodide starch solution on the thin-layer chromatographic plate; it exhibits bluish-purple spots. Spots other than the principal spot obtained from the test solution are not more intense than the spots obtained from the standard solution (NMT 1.0%).

Water NMT 2.0% (0.5 g, volumetric titration, direct titration).

Residue on ignition NMT 1.0% (1 g).

Sterility It meets the requirements when used in the manufacturing of sterile preparations. However, it is excluded in cases where there is a terminal sterilization process in the manufacturing of sterile preparations.

Bacterial endotoxins Less than 2.0 EU per mg of tobramycin (potency) when used in the manufacturing of sterile preparations.

Assay Weigh accurately 50 mg of Tobramycin Sulfate and tobramycin RS (potency), dissolve each in the water phase to make exactly 250 mL, and use these solutions as the test solution and the standard solution. Take exactly 4.0 mL each of the test solution and the standard solution, add them in each 50-mL volumetric flask, add 10 mL of 2,4-dinitrobenzene TS and 10 mL of 2-amino-2-hydroxymethyl-1,3-propanediol TS, and shake to mix for 60 minutes, and leave in a ±2 °C on a steam bath for 50±5 minutes and allow to stand at room temperature for 10 minutes. Add about 20 mL of acetonitrile, cool at room temperature, make exactly 50 mL with acetonitrile, filter it through a membrane filtration method with a pore diameter of NMT 0.5 μm, and use these solutions as the test solution, the standard solution, and the derivative solution, respectively. Take exactly 20 μL each of the test solution, the standard solution, and the derivative solution, and perform the test as directed under the Liquid Chromatography under the following conditions, and determine the peak areas, A_T and A_S, of Tobramycin in each solution.

$$\text{Potency (μg) of tobramycin } (C_{18}H_{37}N_5O_9) = \text{Potency (μg) of tobramycin RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 365 nm).

Column: A stainless steel column about 4 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 μm in particle diameter).

Mobile phase: Dissolve 2.0 g of 2-amino-2-hydroxymethyl-1,3-propanediol in 800 mL of water. Add 20 mL of 1 mol/L sulfuric acid solution into this solution, and add acetonitrile to make exactly 2000 mL.

Flow rate: 1.2 mL/min

System performance: Weigh accurately 5 mg of *p*-naphtholbenzein to make exactly 20 mL with acetonitrile, and then, take 2 mL of this solution, and add the standard solution and the derivative solution to make 10 mL, and use this solution as the system suitability solution. Inject the system suitability solution; the relative retention time of *p*-naphtholbenzein with respect to tobramycin is about 0.6, and the resolution is NLT 4.0.

Packaging and storage Preserve in tight containers.

Tobramycin Sulfate Injection
토브라마이신황산염 주사액

Tobramycin Sulfate Injection contains NLT 90.0% and NMT 120.0% of the labeled amount of tobramycin ($C_{18}H_{37}N_5O_9$: 467.52).

Method of preparation Prepare as directed under Injections, with Tobramycin Sulfate.

Description Tobramycin Sulfate Injection occurs as col-

orless to yellowish white, clear liquid.

Identification (1) Dissolve about 60 mg (potency) each of Tobramycin Sulfate Injection and tobramycin RS in water to obtain solutions having known concentrations of 6 mg (potency) per mL, and use these solutions as the test solution and the standard solution, respectively. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot an appropriate amount each of the test solution and the standard solution on a thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of methanol, strong ammonia water and chloroform (60 : 30 : 25) as the developing solvent, and air-dry the plate. Spray evenly a mixture of 100 mL of a solution of 1% ninhydrin in butanol and 1 mL of pyridine on the plate and heat the plate at 110 ℃ for 10 minutes; the R*f* values of the spots obtained from the test solution and the standard solution are the same.

(2) The retention times of the major peaks from the test solution and the standard solution obtained in the Assay are the same.

pH Between 3.0 and 6.5.

Sterility Meets the requirements.

Bacterial endotoxins Less than 2.0 EU per mg (potency) of tobramycin.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Extractable volume of injections Meets the requirements.

Assay Weigh accurately 50 mg (potency) of Tobramycin Sulfate Injection, add water to make 250 mL, and use this solution as the test solution. Separately, weigh accurately about 50 mg (potency) of tobramycin RS, add water to make exactly 250 mL, and use this solution as the standard solution. Pipet 4.0 mL each of the test solution and the standard solution, place in each 50 mL-volumetric flask, add 10 mL of 2,4-dinitrofluorobenzene TS and 10 mL of tris(hydroxymethyl)aminomethane TS, and shake to mix. Allow each to stand on a steam bath at 60 ± 2 ℃ for 50 ± 5 minutes and then at the room temperature for 10 minutes. Add about 20 mL of acetonitrile to each, cool to the room temperature, add acetonitrile to each to make exactly 50 mL, and filter through a membrane filter of 0.5 μm in pore diameter. Perform the test with 20 μL each of the resulting solutions as directed under the Liquid Chromatography according to the following conditions, and calculate peak areas, A_T and A_S, of tobramycin in the solutions, respectively.

Potency of (μg) tobramycin ($C_{18}H_{37}N_5O_9$)

$$= \text{Potency (μg) of tobramycin RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 365 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 μm in particle diameter).

Mobile phase: Dissolve 2.0 g of tris(hydroxymethyl)aminomethane in 800 mL of water. To this solution, add 20 mL of 1 mol/L sulfuric acid and add acetonitrile to make exactly 2000 mL.

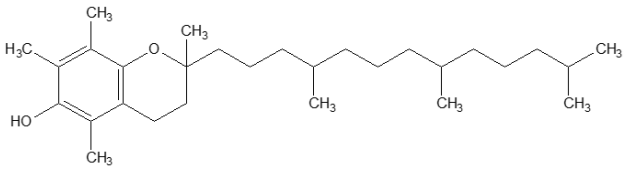
Flow rate: 1.2 mL/min

System suitability

System performance: Weigh accurately 5 mg of *p*-naphtholbenzein, add acetonitrile to make exactly 100 mL, and use this solution as the resolution measurement solution. Inject a mixture of the resolution measurement solution and the standard solution; the relative retention time of *p*-naphtholbenzein with respect to tobramycin is about 0.6 with the resolution between the two peaks being NLT 4.0.

Packaging and storage Preserve in hermetic containers.

Tocopherol
토코페롤



Vitamin E

dl-α-Tocopherol $C_{29}H_{50}O_2$: 430.71

(2*R*)-2,5,7,8-Tetramethyl-2-[(4*R*,8*R*)-4,8,12-trimethyltridecyl]-3,4-dihydrochromen-6-ol [*10191-41-0*]

Tocopherol contains NLT 96.0% and NMT 102.0% of *dl*-α-tocopherol ($C_{29}H_{50}O_2$).

Description Tocopherol occurs as a yellow to reddish brown, clear, viscous liquid, which is odorless.
It is miscible with ethanol(99.5), acetone, ether, chloroform or vegetable oil.
It is freely soluble in ethanol(95), and practically insoluble in water.
It has no optical rotation.
It is oxidized by the action of air and light, turning dark red.

Identification (1) Dissolve 10 mg of Tocopherol in 10 mL of ethanol(99.5), add 2 mL of nitric acid, and heat at 75 ℃ for 15 minutes; the resulting solution exhibits a red to orange color.

(2) Determine the infrared spectra of Tocopherol

and tocopherol RS as directed under the liquid film method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Refractive index n_D^{20}: Between 1.503 and 1.507.

Specific gravity d_{20}^{20}: Between 0.947 and 0.955.

Absorbance $E_{1cm}^{1\%}$ (292 nm): Between 71.0 and 76.0 (10 mg, ethanol(99.5), 200 mL).

Purity (1) ***Clarity and color of solution***—Dissolve 0.10 g of Tocopherol in 10 mL of ethanol(99.5); the solution is clear and the color is not more intense than the control solution C.

(2) ***Heavy metals***—Proceed with 1.0g of Tocopherol according to Method 4 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

Assay Weigh accurately about 50 mg each of Tocopherol and tocopherol RS, dissolve each in ethanol(99.5) to make them exactly 50 mL, and use these solutions as the test solution and the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak heights, H_T and H_S of tocopherol from each of the solutions.

$$\text{Amount (mg) of tocopherol } (C_{29}H_{50}O_2) = \text{amount (mg) of tocopherol RS} \times \frac{H_T}{H_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 292 nm).

Column: A stainless steel column about 4 mm in internal diameter and 15 cm to 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm to 10 μm in particle diameter).

Mobile phase: A mixture of methanol and water (49 : 1).

Flow rate: Adjust the flow rate so that the retention time of tocopherol is about 10 minutes.

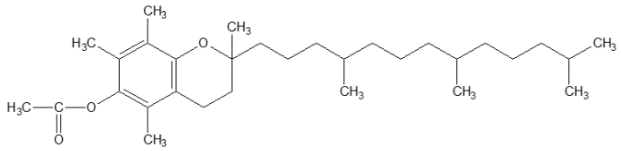
System suitability

System performance: Dissolve 50 mg each of Tocopherol and tocopherol acetate in 50 mL of ethanol(99.5). Proceed with 20 μL of this solution under the above operating conditions; tocopherol and tocopherol acetate are eluted in this order with the resolution being NLT 2.6.

System repeatability: Repeat the test 6 times with 20 μL each of the standard solution under the above operating conditions; the relative standard deviation of the peak height of tocopherol is NMT 0.8%.

Packaging and storage Preserved in light-resistant, tight containers, as well-filled or under the nitrogen atmosphere.

Tocopherol Acetate
토코페롤아세테이트



Vitamin E Acetate

dl-α-Tocopherol Acetate $C_{31}H_{52}O_3$: 472.74

[(2*R*)-2,5,7,8-Tetramethyl-2-[(4*R*,8*R*)-4,8,12-trimethyltridecyl]-3,4-dihydrochromen-6-yl]acetate [*7695-91-2*]

Tocopherol Acetate contains NLT 96.0% and NMT 102.0% of *dl*-α-tocopherol acetate ($C_{31}H_{52}O_3$).

Description Tocopherol Acetate occurs as a colorless to yellow, clear, viscous liquid, and is odorless.
It is miscible with ethanol(99.5), acetone, hexane, ether, chloroform or vegetable oil.
It is freely soluble in ethanol(95), and practically insoluble in water.
It shows no optical rotation.
It is affected by air and light.

Identification (1) Dissolve 50 mg of Tocopherol Acetate in 10 mL of ethanol(99.5) mL, add 2 mL of nitric acid, and heat at 75 ℃ for 15 minutes; the resulting solution exhibits a red to orange color.

(2) Determine the infrared spectra of Tocopherol Acetate and tocopherol acetate RS as directed under the liquid film method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Refractive index n_D^{20}: Between 1.494 and 1.499.

Specific gravity d_{20}^{20}: Between 0.952 and 0.966.

Absorbance $E_{1cm}^{1\%}$ (284 nm): Between 41.0 and 45.0 (10 mg, ethanol(99.5), 100 mL).

Purity (1) ***Clarity and color of solution***—Dissolve 0.10 g of Tocopherol Acetate in 10 mL of ethanol(99.5); the solution is clear and its color is not more intense than the following control solution.

Control solution—To 0.5 mL of the colorimetric stock solution of iron(III) chloride, add 0.5 mol/L hydrochloric acid TS to make 100 mL.

(2) ***Heavy metals***—Carbonize 1.0 g of Tocopherol Acetate by gentle heating. After cooling, add 10 mL of a solution of magnesium nitrate in ethanol(95) (1 in 10), and ignite the ethanol to burn. After cooling, add 1 mL of sulfuric acid, proceed according to Method 4 and perform

the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***α-tocopherol***—Dissolve 0.10 g of Tocopherol Acetatein exactly 10 mL of hexane, and use this solution as the test solution. Separately, weigh 50 mg of tocopherol RS and add hexane to make exactly 100 mL. Pipet 1 mL of this solution, add hexane to make exactly 10 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of toluene and acetic acid(100) (19 : 1) to a distance of about 10 cm, and air-dry the plate. Spray evenly a solution of iron(III) chloride ethanol(99.5) (1 in 500), again spray evenly a solution of 2,2'-dipyridyl ethanol(99.5) (1 in 200), and allow to stand for 2 - 3 minutes; the spot obtained from the test solution, of which location corresponds to that of the spot from the standard solution, is neither larger nor more intense than the spot from the standard solution.

Assay Weigh accurately about 50 mg each of Tocopherol Acetate and tocopherol acetate RS, dissolve in ethanol(99.5) respectively to make them exactly 50 mL, and use these solutions as the test solution and the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak heights, H_T and H_S of tocopherol acetate from each of the solutions.

$$\text{Amount (mg) of tocopherol acetate } (C_{31}H_{52}O_3) = \text{amount (mg) of tocopherol acetate RS} \times \frac{H_T}{H_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 284 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 35 °C.

Mobile phase: A mixture of methanol and water (49 : 1).

Flow rate: Adjust the flow rate so that the retention time of tocopherol acetate is about 12 minutes.

System suitability

System performance: Dissolve 50 mg each of Tocopherol Acetate and tocopherol RS in 50 mL of ethanol(99.5). Proceed with 20 μL of this solution under the above operating conditions; tocopherol and tocopherol acetate are eluted in this order with the resolution being NLT 2.6.

System repeatability: Repeat the test 5 times with 20 μL each of the standard solution under the above operating conditions; the relative standard deviation of the peak height of tocopherol acetate is NMT 0.8%.

Packaging and storage Preserve in light-resistant, tight containers.

50% Tocopherol Acetate Powder
토코페롤아세테이트 2배산

50% Tocopherol Acetate Powder, when dried, contains NLT 50.0% of tocopherol acetate ($C_{31}H_{52}O_3$: 472.74).

Method of preparation Prepare by finely dispersing Tocopherol Acetate in a diluent such as gelatin. 50% Tocopherol Acetate Powder is a drug substance.

Description 50% Tocopherol Acetate Powder occurs as a white to pale yellow powder.

Identification (1) Dissolve 0.1 g of 50% Tocopherol Acetate Powder in 10 mL of anhydrous ethanol(99.5), add 2 mL of nitric acid and heat for 15 minutes at 75 °C; the solution exhibits a red to orange color.

(2) Weigh accurately an amount equivalent to 50 mg of tocopherol acetate, add 5 mL of 0.01 mol/L hydrochloric acid, and mix by sonicating on a 60 °C water bath. To this solution, add 5 mL of anhydrous ethanol(99.5) and 10 mL of cyclohexane, shake for 1 minute, centrifuge for 5 minutes, and use the supernatant as the test solution. Separately, dissolve 50 mg of tocopherol acetate RS in 10 mL of cyclohexane and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of cyclohexane and diethyl ether (80 : 20) as the developing solvent to about 15 cm, air-dry the plate at room temperature, and expose it to ultraviolet light (main wavelength: 254 nm); the R_f value and the color of the spots obtained from the test solution and the standard solution are the same.

Loss on drying NMT 6.0% (1 g, 105 °C, 4 hours).

Assay Weigh accurately 0.1 g of 50% Tocopherol Acetate Powder, previously dried, place in a 50-mL volumetric flask and add 1 mL of water to suspend. Then add anhydrous ethanol(99.5) to make exactly 50 mL and use this solution as the test solution. Separately, weigh accurately about 0.1 g of tocopherol acetate RS, add anhydrous ethanol(99.5) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak area of tocopherol acetate, A_T and A_S, in each solution.

$$\text{Amount (mg) of tocopherol acetate } (C_{31}H_{52}O_3)$$

= Amount (mg) of tocopherol acetate RS × A_T / A_S

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 284 nm).

Column: A stainless steel column about 4 mm in internal diameter and 15 cm to 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm to 10 μm in particle diameter).

Mobile phase: Mixture of methanol and water (49 : 1).

Flow rate: 1.6 mL/min

System suitability

System performance: Dissolve 50.0 mg each of tocopherol acetate and tocopherol in 50 mL of anhydrous ethanol. Proceed with 20 μL of this solution according to the above conditions; tocopherol and tocopherol acetate are eluted in this order with the resolution being NLT 2.6.

System repeatability: Repeat the test 6 times with the standard solution according to the above conditions; the relative standard deviation of the peak area of tocopherol acetate is NMT 0.8%.

Packaging and storage Preserve in light-resistant, tight containers.

Tocopherol Acetate and Magnesium Oxide Capsules
토코페롤아세테이트·산화마그네슘 캡슐

Tocopherol Acetate and Magnesium Oxide Capsules contain NLT 90.0% and NMT 150.0% of the labeled amount of tocopherol acetate ($C_{31}H_{52}O_3$: 472.74) and NLT 90.0% and NMT 110.0% of the labeled amount of magnesium in the magnesium oxide (Mg : 24.31).

Method of preparation Prepare as directed under Capsules, with Tocopherol Acetate and Magnesium Oxide.

Identification (1) ***Tocopherol acetate***—Perform the test with Tocopherol Acetate and Magnesium Oxide Capsules as directed under the Analysis for Vitamins.

(2) ***Magnesium in the magnesium oxide***—Perform the test with Tocopherol Acetate and Magnesium Oxide Capsules as directed under the Analysis for Minerals.

Disintegration Meets the requirements.

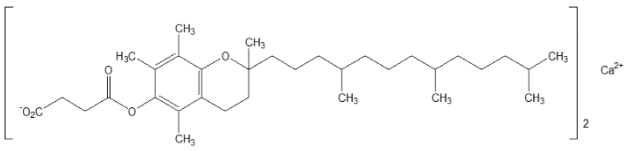
Uniformity of dosage units Meets the requirements.

Assay (1) ***Tocopherol acetate*—**Weigh accurately the mass of the contents of NLT 20 capsules of Tocopherol Acetate and Magnesium Oxide Capsules and perform the test as directed under the Analysis for Vitamins.

(2) ***Magnesium in the magnesium oxide*—**Weigh accurately the mass of the contents of NLT 20 capsules of Tocopherol Acetate and Magnesium Oxide Capsules and perform the test as directed under the Analysis for Minerals

Packaging and storage Preserve in tight containers.

Tocopherol Calcium Succinate
토코페롤숙시네이트칼슘



Vitamin E Calcium Succinate

$C_{66}H_{106}CaO_{10}$: 1099.62

Calcium 4-oxo-4-[[(2*R*)-2,5,7,8-tetramethyl-2-[(4*R*,8*R*)-4,8,12-trimethyltridecyl]-3,4-dihydro-chromen-6-yl]oxy]butanoate [*14638-18-7*]

Tocopherol Calcium Succinate, when dried, contains NLT 96.0% and NMT 102.0% of *dl*-α-tocopherol calcium succinate ($C_{66}H_{106}CaO_{10}$).

Description Tocopherol Calcium Succinate occurs as a white to yellowish white powder, which is odorless.
It is freely soluble in chloroform or carbon tetrachloride, and practically insoluble in water, ethanol(95) or acetone.
Add 7 mL of acetic acid(100) to 1 g of Tocopherol Calcium Succinate, and shake to mix; it dissolves, and produces a turbidity after being allowed to stand for a while.
It dissolves in acetic acid(100).
It has no optical rotation.

Identification (1) Dissolve to 50 mg of Tocopherol Calcium Succinate with 1 mL of acetic acid(100), add 9 mL of ethanol(99.5), and mix. Add 2 mL of fuming nitric acid, and heat at 75 ℃ for 15 minutes; the solution exhibits a red to orange color.

(2) Dissolve 80 mg each of Tocopherol Calcium Succinate and tocopherol calcium succinate RS, previously dried, in 0.2 mL of chloroform, and determine the infrared spectra of these solutions as directed under the liquid film method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) Dissolve 5 g of Tocopherol Calcium Succinate in 30 mL of chloroform, add 10 mL of hydrochloric acid, shake to mix for 20 minutes, take the water layer, and neutralize with ammonia TS; the solution responds to the Qualitative Analysis for calcium salt.

Absorption $E_{1cm}^{1\%}$ (286 nm): Between 36.0 and 40.0 (10 mg, chloroform 100 mL).

Purity (1) ***Clarity and color of solution***—Dissolve 0.10 g of Tocopherol Calcium Succinate in 10 mL of chloroform; the resulting solution is clear and it's color is not more intense than the following control solution.

Control solution—To 0.5 mL of the colorimetric stock solution of iron(III) chloride, and add 0.5 mol/L hydrochloric acid TS to make 100 mL.

(2) ***Alkali***—Add 10 mL of ether, 2 mL of water, 1 drop of phenolphthalein TS and 0.10 mL of 0.1 mol/L hydrochloric acid TS to 0.20 g of Tocopherol Calcium Succinate, and shake to mix; the water layer does not exhibit a red color.

(3) ***Chloride***—Dissolve 0.10 g of Tocopherol Calcium Succinate in 4 mL of acetic acid(100), add 20 mL of water and 50 mL of ether, shake well to mix, and collect the water layer. Add 10 mL of water into the ether layer, shake to mix, and collect the water layer. Combine the water layers, and add 6 mL of dilute nitric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution in the same manner as in the test solution using 0.60 mL of 0.01 mol/L of hydrochloric acid instead of Tocopherol Calcium Succinate (NMT 0.212%).

(4) ***Heavy metals***—Proceed with 1.0 g of Tocopherol Calcium Succinate according to Method 4 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(5) ***Arsenic***—Proceed with 1.0 g of Tocopherol Calcium Succinate according to Method 3 and perform the test (NMT 2 ppm).

(6) ***α-tocopherol***—Dissolve 0.10 g of Tocopherol Calcium Succinate with chloroform to make exactly 10 mL, and use this solution as the test solution. Separately, dissolve 50 mg of tocopherol RS with chloroform to make exactly 100 mL. Pipet 1 mL of this solution, add chloroform to make exactly 10 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of toluene and acetic acid(100) (19 : 1) to a distance of about 10 cm, and air-dry the plate. Spray evenly a solution of iron(III) chloride hexahydrate in ethanol(99.5) (1 in 500) on the plate, again spray evenly a solution of 2,2'-dipyridyl in ethanol(99.5) (1 in 200), and allow to stand for 2 - 3 minutes; the spot obtained from the test solution, of which location corresponds to that of the spot from the standard solution, is neither larger nor more intense than the spot from the standard solution.

Loss on drying NMT 2.0% (1 g, in vacuum, phosphorus pentoxide, 24 hours).

Assay Weigh accurately about 50 mg each of Tocopherol Calcium Succinate and tocopherol succinate RS, previously dried, disslove with a mixture of ethanol(99.5) and diluted acetic acid(100) (1 in 5) (9 : 1) to make exactly 50 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak heights, H_T and H_S, of tocopherol succinate from these solutions.

$$\text{Amount (mg) of tocopherol calcium succinate } (C_{66}H_{106}CaO_{10}) = \text{Amount (mg) of tocopherol succinate RS} \times \frac{H_T}{H_S} \times 1.0358$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 284 nm).

Column: A stainless steel column about 4 mm in internal diameter and 15 cm to 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm to 10 μm in particle diameter).

Mobile phase: A mixture of methanol, water and acetic acid(100) (97 : 2 : 1).

Flow rate: Adjust the flow rate so that the retention time of tocopherol succinate is about 8 minutes.

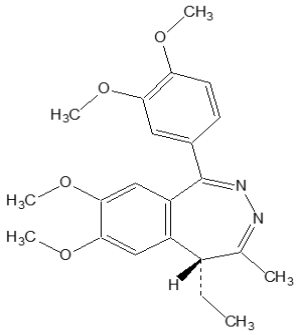
System suitability

System performance: Weigh 50 mg each of tocopherol succinate and tocopherol, and dissolve in a mixture of ethanol(99.5) and diluted acetic acid(100) (1 in 5) (9 : 1) to make 50 mL. Proceed with 20 μL of this solution according to the above operating conditions; tocopherol succinate and tocopherol are eluted in this order with a resolution being 2.0.

System repeatability: Repeat the test 6 times with 20 μL each of the standard solution under the above operating conditions; the relative standard deviation of the peak height of tocopherol succinate is NMT 0.8%.

Packaging and storage Preserve in light-resistant, tight containers.

Tofisopam
토피소팜



and enantiomer

$C_{22}H_{26}N_2O_4$: 382.45

1-(3,4-Dimethoxyphenyl)-5-ethyl-7,8-dimethoxy-4-methyl-5*H*-2,3-benzodiazepine [*22345-47-7*]

Tofisopam, when dried, contains NLT 98.0% and NMT 101.0% of tofisopam ($C_{22}H_{26}N_2O_4$).

Description Tofisopam occurs as a pale yellowish white crystalline powder.

It is freely soluble in acetic acid(100), soluble in acetone, sparingly soluble in ethanol(95), slightly soluble in ether, and practically insoluble in water.
A solution of Tofisopam in ethanol(95) (1 in 100) shows no optical rotation.

Identification (1) Determine the absorption spectra of solutions of Tofisopam and tofisopam RS in ethanol(95) (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit the same intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Tofisopam and tofisopam RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Melting point Between 155 and 159 ℃.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Tofisopam according to Method 2 and perform the test. Prepare the control solution with 1.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Arsenic***—Proceed with 1.0 g of Tofisopam according to Method 3 and perform the test (NMT 2 ppm).

(3) ***Related substances***—Dissolve 50 mg of Tofisopam in 10 mL of acetone and use this solution as the test solution. Add the acetone to 1.0 mL of this solution to make exactly 20 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of ethyl acetate, acetone, methanol and formic acid (24 : 12 : 2 : 1) (as the developing solvent) to a distance of about 10 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot obtained from the test solution are not more intense than the spot from the standard solution.

Loss on drying NMT 0.5% (1 g, in vacuum, silica gel, 60 ℃, 3 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.2 g of Tofisopam, previously dried, dissolve in 50 mL of acetic acid(100), and titrate with 0.1 mol/L hydrochloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 38.25 mg of $C_{22}H_{26}N_2O_4$

Packaging and storage Preserve in light-resistant, tight containers.

Tofisopam Tablets
토피소팜 정

Tofisopam Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of tofisopam ($C_{22}H_{26}N_2O_4$: 382.45).

Method of preparation Prepare as directed under Tablets, with Tofisopam.

Identification Weigh an amount, equivalent to 50 mg of tofisopam according to the labeled amount of Tofisopam Tablets, add 10 mL of acetone, shake to dissolve, and filter. Use the filtrate as the test solution. Separately, weigh 25 mg of tofisopam RS, dissolve in 5 mL of acetone, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on a thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography Next, develop the plate with a mixture of ether, acetic acid(100) and ethanol(95) (30 : 9 : 5) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the colors and R_f values of the spots obtained from the test solution and the standard solution are the same.

Purity ***Related substances*—**The test solution obtained in the Identification is used as the test solution. Dilute 0.2 mL of the test solution with 10 mL of ethanol(95) and use this solution as the standard solution. Perform the test with the test solution and the standard solution as directed under the above Identification. The spots other than the principal spot obtained from the test solution are not more intense than the spots from the standard solution (NMT 2%).

Disintegration Meets the requirements.

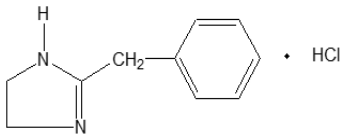
Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 tablets of Tofisopam Tablets and powder. Weigh accurately an amount, equivalent to about 50 mg of tofisopam ($C_{22}H_{26}N_2O_4$), add 50 mL of ethanol(95), shake to mix, and add ethanol(95) to make exactly 100 mL. Centrifuge a portion of this solution, pipet 1 mL of the supernatant, add ethanol(95) to make exactly 50 mL, and use this solution as the test solution. Separately, weigh accurately about 50 mg of tofisopam RS and add ethanol(95) to make exactly 100 mL. Pipet 1 mL of this solution, add ethanol(95) to make exactly 50 mL, and use this solution as the standard solution. Perform the test with the test solution and the standard solution as directed under the Ultraviolet-visible Spectroscopy, using ethanol as a control solution, and determine the absorbances, A_T and A_S, at the wavelength of 310 nm.

Amount (mg) of tofisopam ($C_{22}H_{26}N_2O_4$)
= Amount (mg) of tofisopam RS × (A_T / A_S)

Packaging and storage Preserve in well-closed containers.

Tolazoline Hydrochloride
톨라졸린염산염



$C_{10}H_{12}N_2$·HCl: 196.68
2-Benzyl-4,5-dihydro-1*H*-imidazolehydrochloride
[*59-97-2*]

Tolazoline Hydrochloride contains NLT 98.0% and NMT 101.0% of tolazoline hydrochloride ($C_{10}H_{12}N_2$·HCl), calculated on the dried basis.

Description Tolazoline Hydrochloride occurs as a white to grayish white crystalline powder.
It is freely soluble in water or ethanol(95).
An aqueous solution of Tolazoline Hydrochloride appears weekly acidic on the litmus paper.

Identification (1) Determine the infrared spectra of Tolazoline Hydrochloride and tolazoline hydrochloride RS as directed in the paste method under the Mid-infrared Spectroscopy; both spectra exhibit a maximum at the same wavenumbers.

(2) Proceed the test according to the Related substances; the R_f value of the principal spot from the identification solution is the same as the R_f value of the spot from the standard solution (1).

Melting point Between 172.0 and 176.0 ℃.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Tolazoline Hydrochloride according to Method 2 and perform the test. Prepare the control solution with 1.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Related substances***—Weigh accurately an appropriate amount of Tolazoline Hydrochloride, dissolve in methanol to make a solution containing 20 mg per mL, and use this solution as the test solution. Take an appropriate amount of the test solution, dissolve in methanol to make a solution containing 100 μg per mL, and use this solution as the identification test solution. Separately, weigh accurately an appropriate amount of tolazoline hydrochloride RS (previously dried in vacuum for 4 hours with silica gel), dissolve in methanol to make a solution containing 100 μg per mL, and use this solution as the standard solution (1). Pipet 4 mL, 3 mL, 2 mL and 1 mL each of this solution, add methanol to make 5 mL, respectively, and use these solutions as the standard solutions (2), (3), (4) and (5). With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution, the identification solution and the standard solutions (1) - (5) on a thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Develop the plate with a mixture of methanol and ammonia TS (95 : 5) (as a developing solvent) to a distance of about 15 cm, and dry the plate for at least 30 minutes. Expose the plate to chlorine gas for 5 minutes at most, and air-dry until the chlorine gas disappears. Spray the coloring agent, and determine the sum of the intensities by comparing the intensities of all spots other than the principal spot from the test solution with the intensities of the spots from each of the standard solutions; it is NMT 1.0%.

Coloring agent—Dissolve 0.5 g of potassium iodide in 50 mL of water, separately, dissolve 1.5 g of soluble starch in 50 mL of boiling water; mix each 10 mL of these solutions before use, and add 3 mL of ethanol(95).

Loss on drying NMT 0.2% (1 g, in vacuum, silica gel, 4 hours).

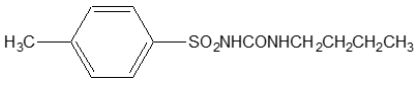
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.3 g of Tolazoline Hydrochloride, dissolve in 100 mL of acetic acid(100), add 25 mL of mercury(II) acetate TS, and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 19.668 mg of $C_{10}H_{12}N_2$·HCl

Packaging and storage Preserve in well-closed containers.

Tolbutamide
톨부타미드



$C_{12}H_{18}N_2O_3S$: 270.35
3-Butyl-1-[(4-methylbenzene)sulfonyl]urea [*64-77-7*]

Tolbutamide, when dried, contains NLT 99.0% and NMT 101.0% of tolbutamide ($C_{12}H_{18}N_2O_3S$).

Description Tolbutamide occurs as white crystals or a crystalline powder which is odorless or has a slight characteristic odor, and is tasteless.
It is soluble in ethanol(95), slightly soluble in ether, and practically insoluble in water.

Identification (1) Take 0.2 g of Tolbutamide, add 8 mL of diluted sulfuric acid (1 in 3), and boil under a reflux condenser for 30 minutes. Cool the solution in iced water,

collect the separated crystals by filtration, recrystallize from water, and dry at 105 ℃ for 3 hours; the melting point is between 135 and 139℃.

(2) Add 20 mL of sodium hydroxide solution (1 in 5) to the filtrate of (1) to make alkaline, and heat; it gives a ammonia-like odor.

Melting point Between 126 and 132 ℃.

Purity (1) ***Clarity and color of solution***—Dissolve 0.5 g of Tolbutamide in 10 mL of 0.5 mol/L ammonia water; the solution is clear than milky white color.

(2) ***Acidity***—To 3.0 g of Tolbutamide, add 150 mL of water, warm at 70 ℃ for 5 minutes, allow to stand in iced water for 1 hour, and filter. To 25 mL of the filtrate, add 2 drops of methyl red TS and 0.20 mL of 0.1 mol/L sodium hydroxide TS; the solution exhibits a yellow color.

(3) ***Chloride***—To 40 mL of the filtrate obtained in (1), add 6 mL of dilute nitric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.25 mL of 0.01 mol/L hydrochloric acid (NMT 0.011%).

(4) ***Sulfate***—To 40 mL of the filtrate obtained in (1), add 1 mL of dilute hydrochloric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.35 mL of 0.005 mol/L sulfuric acid (NMT 0.021%).

(5) ***Heavy metals***—Proceed with 2.0 g of Tolbutamide according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(6) ***Selenium***—Mix 0.1 g of Tolbutamide and 0.1 g of magnesium oxide, transfer the mixture to a combustion flask, and combust as directed under the Oxygen Flask Combustion, using 25 mL of diluted nitric acid (1 in 30) as an absorbent. Use a combustion flask with a volume of 1 L, combust, wash the stopper and the inner wall of the flask with 10 mL of water, and use 20 mL of water to move the solution in the combustion flask into a 150-mL beaker. Heat lightly until it boils, boil for 10 minutes, allow it to cool down at room temperature, and use this solution as the test solution. Separately, pipet 3.0 mL of standard selenium stock solution, add 25 mL of diluted nitric acid (1 in 30) and 25 mL of water, and use this solution as the standard solution. Adjust the pH of each of the test and standard solutions to 2.0 ± 0.2 with diluted ammonia water(28) (1 in 2), add water to dilute exactly to 60 mL, and transfer the solution to a separatory funnel with 10 mL of water. Then, wash the separatory funnel with 10 mL of water. To each, add 0.2 g of hydroxylamine hydrochloride, stir to dissolve, add immediately 5.0 mL of 2,3-diaminonaphthalene TS, put a stopper, stir to mix, and allow to stand at the room temperature for 100 minutes. Add 5.0 mL of cyclohexane, shake hard for 2 minutes, and allow to stand. If the layers are separated, remove the water layer, centrifuge cyclohexane extracts to remove water, and take the cyclohexane layer. With these solutions and a control solution prepared with 25 mL of water added to 25 mL of diluted nitric acid (1 in 30) in the same way, perform the test as directed under the Ultraviolet-visible Spectroscopy. Determine the absorbance at the absorbance maximum wavelength of about 380 nm; the absorption of the solution from the test solution is not larger than the absorption from the standard solution (NMT 30 ppm).

Loss on drying NMT 0.5% (1 g, 105 ℃, 3 hours).

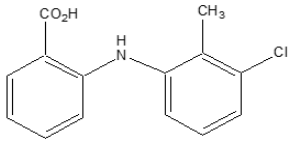
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.5 g of Tolbutamide, previously dried, dissolve in 30 mL of neutralized ethanol, add 20 mL of water, and titrate with 0.1 mol/L sodium hydroxide VS (indicator: 3 drops of phenolphthalein TS).

Each mL of 0.1 mol/L sodium hydroxide VS
= 27.035 mg of $C_{12}H_{18}N_2O_3S$

Packaging and storage Preserve in well-closed containers.

Tolfenamic Acid
톨페남산



$C_{14}H_{12}ClNO_2$: 261.70
2-(3-Chloro-2-methylanilino)benzoic acid [*13710-19-5*]

Tolfenamic Acid, when dried, contains NLT 99.0% and NMT 101.0% of tolfenamic acid ($C_{14}H_{12}ClNO_2$).

Description Tolfenamic Acid occurs as a white or pale yellow crystalline powder.
It is soluble in *N,N*-dmethylformamide, sparingly soluble in ethanol(95) or dichloromethane, and practically insoluble in water.
It is soluble in dilute sodium hydroxide TS.

Melting point—About 213 °C.

Identification (1) Dissolve 10 mg each of Tolfenamic Acid and tolfenamic acid RS in a mixture of methanol and 1 mol/L hydrochloric acid (99 : 1) to make 100 mL, and to 5.0 mL of this solution, add a mixture of methanol and 1 mol/L hydrochloric acid (99 : 1) to make exactly 50 mL. Determine the absorption spectra of these solutions as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Tolfenamic Acid and tolfenamic acid RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) Dissolve 25 mg each of Tolfenamic Acid and tolfenamic acid RS in methanol to make 10 mL, and use these solutions as the test solution and the standard solution, respectively. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on a thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of acetone, heptane and acetic acid(100) (70 : 30 : 1) (as the developing solvent) to a distance of about 15 cm, and air-dry the plate. Expose the plate under ultraviolet light (main wavelength: 254nm); the color and R_f values of the principal spots obtained from the test solution and the standard solution are the same.

Purity (1) ***Copper***—Put 1.0 g of Tolfenamic Acid into a porcelain crucible, moisten with sulfuric acid, and heat over a flame carefully for 30 minutes. Increase the temperature slowly to about 650 ℃, ignite until completely carbonized, cool, dissolve the residue in 0.1 mol/L hydrochloric acid TS to make 25.0 mL, and use this solution as the test solution. Prepare the standard solution by diluting the copper standard stock solution if necessary. Perform the test with the test solution and the standard solutions as directed under the Atomic Absorption Spectroscopy, and determine the copper concentration in the test solution and quantify (10 ppm).

Gas: Air–acetylene
Lamp: Copper hollow cathode lamp
Wavelength: 324.8 nm

(2) ***Related substances***—Dissolve 50.0 mg of Tolfenamic Acid in 5 mL of ethanol(95), add the mobile phase to make exactly 50 mL, and use this solution as the test solution. Separately, dissolve 25 mg each of tolfenamic acid related substances I (2-chlorobenzoic acid) and tolfenamic acid related substances II (3-chloro-2-methylaniline) in 5 mL of ethanol(95), add the mobile phase to make exactly 50 mL, and use this solution as the standard solution (1). Add the mobile phase to 1.0 mL of the test solution to make exactly 50 mL, and add the mobile phase to 1.0 mL of this solution to make exactly 10 mL. Use this solution as the standard solution (2). Perform the test with 20 μL each of the test solution and the standard solution (1) and (2) as directed under the Liquid Chromatography according to the following operating conditions. The peak area of the related substance I from the test solution is not greater than that from the standard solution (1) (0.1%), and the peak area of the related substance II is not greater than 0.5 times that from the standard solution (1) (0.05%). The area of any peak other than the major peak obtained from the test solution is not greater than the area of the major peak from the standard solution (2) (0.1%) and the sum of the peak areas other than the major peak obtained from the test solution is not greater than 5 times the area of the major peak from the standard solution (2) (0.5%). However, exclude any peak with an area less than 0.1 times the area of the major peak from the standard solution (2).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 232 nm).

Column: A stainless steel column 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of ethanol(95), water and acetic acid(100) (650 : 320 : 2).

Flow rate: 0.8 mL/min

System suitability

System performance: Proceed with each of the test solution and the standard solution (1) under the above conditions; the relative retention time of the related substance I and II to the retention time of tolfenamic acid (about 15 minutes) is 0.25 and 0.34, respectively, and the resolution between these two peaks are NLT 2.5.

Loss on drying NMT 0.5% (1 g, 105 ℃, constant mass).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.2 g of Tolfenamic Acid, previously dried, add 100 mL of ethanol(95), sonicate to dissolve, and titrate with 0.1 mol/L sodium hydroxide VS (indicator: 0.1 mL of phenol red TS). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS
= 26.171 mg of $C_{14}H_{12}ClNO_2$

Packaging and storage Preserve in light-resistant, well-closed containers.

Tolfenamic Acid Capsules
톨페남산 캡슐

Tolfenamic Acid Capsules contain NLT 95.0% and NMT 105.0% of tolfenamic acid ($C_{14}H_{12}ClNO_2$: 261.70).

Method of preparation Prepare as directed under Capsules, with Tolfenamic Acid.

Identification Take the contents of 1 capsule of Tolfenamic Acid Capsules and add 0.1 mol/L sodium hydroxide to make 100 mL. Agitate this solution for 30 minutes, take 1.0 mL of this solution, and add 0.1 mol/L sodium hydroxide to make 100 mL. Filter this solution and determine the absorption spectrum of the filtrate as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum at the wavelengths between 283 nm and 289 nm.

Disintegration Meets the requirements.

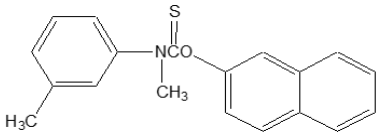
Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of the contents of NLT 20 capsules of Tolfenamic Acid Capsules. Weigh accurately about 0.3 g of tolfenamic acid ($C_{14}H_{12}ClNO_2$), dissolve in dimethylformamide, previously neutralized, and titrate with 0.1 mol/L of tetrabutylammonium hydroxide VS. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L of tetrabutylammonium hydroxide VS
= 26.170 mg of $C_{14}H_{12}ClNO_2$

Packaging and storage Preserve in well-closed containers.

Tolnaftate
톨나프테이트



$C_{19}H_{17}NOS$: 307.41

N-Methyl-*N*-(3-methylphenyl)-1-(naphthalen-2-yloxy)methanethioamide [*2398-96-1*]

Tolnaftate, when dried, contains NLT 98.0% and NMT 101.0% of tolnaftate ($C_{19}H_{17}NOS$).

Description Tolnaftate occurs as a white powder and is odorless.
It is freely soluble in chloroform, sparingly soluble in ether, slightly soluble in methanol or ethanol(95), and practically insoluble in water.

Identification (1) Take 0.2 g of Tolnaftate, add 20 mL of potassium hydroxide-ethanol TS and 5 mL of water, and heat under a reflux condenser for 3 hours. After cooling, take 10 mL of the solution, add 2 mL of acetic acid(100) and 1 mL of lead acetate TS in this order, and shake to mix; a black precipitate is formed.

(2) Determine the absorption spectra of solutions of Tolnaftate and tolnaftate RS in methanol (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared spectra of Tolnaftate and tolnaftate RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Melting point Between 111 and 114 ℃ (after drying).

Purity (1) ***Heavy metals***—Weigh 1.0 g of Tolnaftate, and heat gently to carbonize. After cooling, add 5 mL of nitric acid and 1 mL of sulfuric acid, and heat until white fumes appear. After cooling, add another 2 mL of nitric acid, heat until white fumes appear, cool, add 2 mL of nitric acid and 0.5 mL of perchloric acid, heat gently until white fumes appear, repeat this procedure 2 times, and heat until white fumes are no longer evolved. Ignite the residue at between 500 and 600 ℃ for 1 hour to incinerate. Proceed as directed in Method 2 to make 50 mL, use this solution as the test solution, and perform the test. Prepare the control solution in the same manner as in the test solution with 11 mL of nitric acid, 1 mL of sulfuric acid, 1 mL of perchloric acid and 2 mL of hydrochloric acid, and add 2.0 mL of lead standard solution and water to make 50 mL (NMT 20 ppm).

(2) ***Related substances***—Dissolve 0.50 g of Tolnaftate in 10 mL of chloroform, and use this solution as the test solution. Pipet 2 mL of this solution and add chloroform to make exactly 100 mL. Pipet 5 mL of this solution, add chloroform to make exactly 100 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Then, develop the plate with toluene (as the developing solvent) to a distance of about 10 cm, and air-dry the plate. Allow the plate to stand in iodine vapor for 5 minutes, examine under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot from the test solution are not more intense than the spot from the standard solution.

Loss on drying NMT 0.5% (1 g, 65 ℃, at the pressure not exceeding 0.67 kPa, 3 hours).

Residue on ignition Weigh accurately 2.0 g of Tolnaftate and heat gently to carbonize. Next, moisten with 1 mL of sulfuric acid, heat gently until white fumes are no longer evolved, and ignite at between 450 and 550 ℃ for about 2 hours to a constant mass; the residue is NMT 0.1%.

Assay Weigh accurately about 50 mg each of Tolnaftate and tolnaftate RS, previously dried, add each 200 mL of methanol, dissolve while warming on a steam bath, cool, and add methanol to make exactly 250 mL. Pipet 5 mL each of these solutions, add methanol to each to make exactly 100 mL, and use these solutions as the test solution and the standard solution. Determine the absorbance A_T and A_S, of the test solution and the standard solution, respectively, at 257 nm as directed under the Ultraviolet-visible Spectroscopy.

Amount (mg) of tolnaftate ($C_{19}H_{17}NOS$)
$= \text{amount (mg) of tolnaftate RS} \times \frac{A_T}{A_S}$

Packaging and storage Preserve in tight containers.

Tolnaftate Cream
톨나프테이트 크림

Tolnaftate cream contains NLT 90.0% and NMT 110.0% of the labeled amount of tolnaftate ($C_{19}H_{17}NOS$: 307.42).

Method of preparation Prepare as directed under Creams, with Tolnaftate.

Identification Take 10 mL of the chloroform solution immediately before the final solution obtained in the Assay under Tolnaftate Cream, evaporate to dryness on a steam bath, then dissolve in 1 mL of ethanol(95), and use this solution as the test solution. Separately, dissolve 10 mg of tolnaftate RS in 1 mL of ethanol(95), and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on a thin-layer chromatographic plate made of silica gel (with fluorescence indicator) for thin-layer chromatography. Next, develop the plate with toluene (as the developing solvent) to a distance of about 12 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the R_f values of the spots obtained from the test solution and the standard solution are the same.

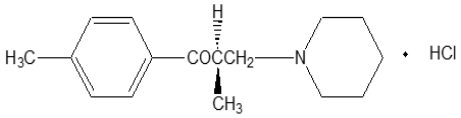
Assay Weigh accurately an amount of Tolnaftate Cream, equivalent to about 10 mg of tolnaftate ($C_{19}H_{17}NOS$), transfer to a separatory funnel, and extract with 75 mL of chloroform. Wash the chloroform layer with 25 mL of 0.1 mol/L sodium hydroxide TS twice, with 25 mL of 0.1 mol/L hydrochloric acid twice, and with 25 mL of water. Filter the chloroform layer using cotton washed with chloroform, then add chloroform to make exactly 100 mL. Pipet 5 mL of this solution, add chloroform to make exactly 50 mL, and use this solution as the test solution. Separately, weigh accurately an appropriate amount of tolnaftate RS (previously dried in vacuum at 65℃ for 3 hours), dissolve in chloroform to obtain a solution containing 10 μg per mL, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at 258 nm as directed under Ultraviolet-visible Spectroscopy, using chloroform as the control solution.

$$\text{Amount (mg) of tolnaftate } (C_{19}H_{17}NOS) = C \times \frac{A_T}{A_S}$$

C: Concentration (μg/mL) of the standard solution

Packaging and storage Preserve in tight containers.

Tolperisone Hydrochloride
톨페리손염산염



and enantiomer

$C_{16}H_{23}NO \cdot HCl$: 281.82

2-Methyl-1-(4-methylphenyl)-3-piperidin-1-ylpropan-1-one hydrochloride [*3644-61-9*]

Tolperisone Hydrochloride, when dried, contains NLT 98.5% and NMT 101.0% of tolperisone hydrochloride ($C_{16}H_{23}NO \cdot HCl$).

Description Tolperisone Hydrochloride occurs as a white crystalline powder and has a slight characteristic odor.

It is very soluble in acetic acid(100), freely soluble in water and ethanol(95), soluble in acetic anhydride, slightly soluble in acetone, and practically insoluble in ether.

It is hygroscopic.

Dissolve 1.0 g of Tolperisone Hydrochloride in 20 mL of water; the pH of the solution is between 4.5 and 5.5.

Melting point—Between 167 and 174 ℃.

Identification (1) Dissolve 0.2 g of Tolperisone Hydrochloride in 2 mL of ethanol(95) mL, add 2 mL of 1,3-dinitrobenzene TS and 2 mL of sodium hydroxide TS, and heat; the resulting solution exhibits a red color.

(2) To 5 mL of an aqueous solution of Tolperisone Hydrochloride (1 in 20), add 2 to 3 drops of iodine TS; a reddish brown precipitate is formed.

(3) Dissolve 0.5 g of Tolperisone Hydrochloride in 5 mL of water, add 2 mL of ammonia TS, and filter. Pipet 5 mL of the filtrate, add dilute nitric acid to make acid; the solution responds to the Qualitative Analysis for chloride.

Absorbance $E_{1cm}^{1\%}$ (257 nm): Between 555 and 585 (5 mg after drying, ethanol(95), 500 mL).

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Tolperisone Hydrochloride in 10 mL of water; the solution is clear and colorless.

(2) ***Sulfate*—**Perform the test with 4.0 g of Tolperisone Hydrochloride. Prepare the control solution with 0.40 mL of 0.005 mol/L sulfuric acid (NMT 0.005%).

(3) ***Heavy metals***—Proceed with 1.0 g of Tolperisone Hydrochloride according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(4) ***Piperidine hydrochloride***—Weigh 0.20 g of Tolperisone Hydrochloride, dissolve in water to make exactly 10 mL, and use this solution as the test solution. Separately, weigh 20 mg of piperidine hydrochloride RS, dissolve in water to make exactly 1000 mL, and use this solution as the standard solution. Take exactly 5.0 mL

each of the test solution and the standard solution into a separatory funnel, respectively, add 0.1 mL of copper sulfate solution (1 in 20), 0.1 mL of ammonia water(28) and exactly 10 mL of a mixture of isooctane and carbon disulfide (3 : 1) in each funnel, and shake vigorously for 30 minutes to mix. Allow to stand, separate immediately isooctane-carbon disulfide layer, and dehydrate with anhydrous sodium sulfate. Perform the test with these solutions as directed under the Ultraviolet-visible Spectroscopy; the absorbance of the test solution at 438 nm is not greater than that of the standard solution.

Loss on drying NMT 0.5% (1 g, in vacuum, silica gel, 3 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.5 g of Tolperisone Hydrochloride, previously dried, dissolve in 70 mL of a mixture of acetic anhydride and acetic acid(100) (7 : 3), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 28.182 mg of $C_{16}H_{23}NO \cdot HCl$

Packaging and storage Preserve in well-closed containers.

Tolperisone Hydrochloride Tablets
톨페리손염산염 정

Tolperisone Hydrochloride Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of tolperisone hydrochloride ($C_{16}H_{23}NO \cdot HCl$: 281.82).

Method of preparation Prepare as directed under Tablets, with Tolperisone Hydrochloride.

Identification (1) Weigh an amount, equivalent to 0.2 g of tolperisone hydrochloride according to the labeled amount of Tolperisone Hydrochloride Tablets, add 10 mL of water, shake well to mix, and filter. To this solution, add 2 mL of Nessler's TS; the solution turns to a yellowish white color and, when allowed to stand, it forms a yellowish white, oil-phase precipitate.

(2) Weigh an amount, equivalent to 0.2 g of tolperisone hydrochloride according to the labeled amount of Tolperisone Hydrochloride Tablets, add 10 mL of water, shake well to mix, and filter. Evaporate the filtrate to concentration in vacuum, add 2 mL of ethanol to the residue, and heat to filter the insolubles. To this solution, add 2 mL of 1,3-dinitrobenzene TS, add sodium hydroxide TS, and heat; the solution exhibits a red color.

(3) Weigh an amount, equivalent to 0.5 g of tolperisone hydrochloride according to the labeled amount of Tolperisone Hydrochloride Tablets, add 20 mL of water, and shake well to mix. To this, add 2 mL of ammonia TS and filter. Take 10 mL of this solution, add dilute nitric acid to acidify, and add silver nitrate TS; a white precipitate is formed.

Disintegration Meets the requirements.

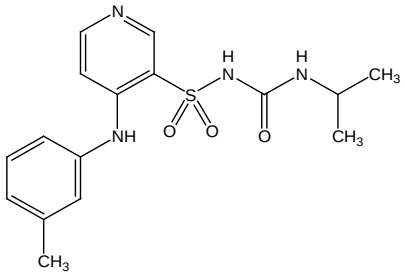
Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 tablets of Tolperisone Hydrochloride Tablets and powder it. Weigh accurately an amount, equivalent to about 30 mg of tolperisone hydrochloride ($C_{16}H_{23}NO \cdot HCl$), and put in a separatory funnel. Dissolve in 40 mL of 0.1 mol/L hydrochloric acid TS, add n-hexane, and shake to mix. Separate the n-hexane layer and wash it with 20 mL of 0.1 mol/L hydrochloric acid TS. Combine the washings with the previously separated 0.1 mol/L hydrochloric acid TS layer, and add 0.1 mol/L hydrochloric acid TS to make 100 mL. Filter this solution with a filter paper and discard the about 50 mL of the first filtrate, pipet 2.0 mL of the remaining filtrate, and add 0.1 mol/L hydrochloric acid TS to make exactly 50 mL. Use this solution as the test solution. Separately, weigh accurately about 0.15 g of tolperisone hydrochloride RS, previously dried (in vacuum, silica gel, for 3 hours), and add 0.1 mol/L hydrochloric acid TS to make exactly 50 mL. Pipet 10.0 mL of this solution, place in a separatory funnel, add 30 mL of 0.1 mol/L hydrochloric acid TS, and proceed in the same manner as the preparation of the test solution. Use the resulting solution as the standard solution. Perform the test with the test solution and the standard solution as directed under the Ultraviolet-visible Spectroscopy, using 0.1 mol/L hydrochloric acid TS as the control solution, and determine the absorbances, A_T and A_S, respectively, at the wavelength of 262 nm.

Amount (mg) of tolperisone hydrochloride ($C_{16}H_{23}NO \cdot HCl$)
= Amount (mg) of tolperisone hydrochloride RS $\times \frac{A_T}{A_S} \times \frac{1}{5}$

Packaging and storage Preserve in light-resistant, well-closed containers.

Torsemide
토르세미드



$C_{16}H_{20}N_4O_3S$: 348.42

1-[4-(3-Methylanilino)pyridin-3-yl]sulfonyl-3-propan-2-ylurea [*56211-40-6*]

Torsemide contains NLT 98.0% and NMT 102.0% of torsemide ($C_{16}H_{20}N_4O_3S$), calculated on the anhydrous basis.

Description Torsemide occurs as a white crystalline powder.
It is slightly soluble in ethanol(95) or methanol and very slightly soluble in acetone or chloroform and practically insoluble in water or ether.

Identification (1) Determine the infrared spectra of Torsemide and torsemide RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Torsemide according to Method 2 and perform the test. Prepare the control solution with 1.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Related substances***—Use the test solution in the Assay as the test solution. Pipet 1 mL of this solution, and add the mobile phase to make exactly 100 mL. Pipet 2 mL of this solution, add the mobile phase to it make exactly 10 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak area of each solution by the automatic integration and determine the amount of each related substances; torsemide-related substance I with a relative retention time of 0.4 with respect to Torsemide obtained from the test solution is NMT 0.5%, and torsemide-related substance II with a relative retention time of 1.9 is NMT 0.3%, and torsemide-related material III with a relative retention time of 0.5 is NMT 0.2%. Additionally, each unknown related substance is more than 0.1%, the total sum of each unknown related substance is NMT 0.2%, and total related substances are less than 1.0%. However, exclude any peaks smaller than 0.05%.

$$\text{Content (\%) of related substances} = \frac{A_T}{A_S} \times rf \times \frac{1}{5}$$

A_T: Peak area of each related substance obtained from the test solution

A_S: Peak area of torsemide obtained from the standard solution

rf: The correction factor of each related substance for Torsemide peak

Torsemide-related substances I: 0.80

Torsemide-related substances II: 1.16

Torsemide-related substances III and other related substances: 1.00

Operating conditions

For the test solution, detector, mobile phase, and flow rate, proceed as directed in the operating conditions under the Assay.

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 ℃.

System suitability

Test for required detectability: Pipet 5 mL of the standard solution, and add the mobile phase to make exactly 20 mL. Proceed with 20 μL of this solution according to the above conditions; confirm that the signal-to-noise ratio of torsemide peak is NLT 10.

System performance: Proceed with 20 μL of the standard solution according to the above conditions; the symmetry factor for torsemide peak is between 0.8 and 2.0.

System repeatability: Perform the test 6 times with 20 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area of torsemide is not more that 10.0%.

Water NMT 1.0% (1 g, volumetric titration, direct titration).

Residue on ignition NMT 0.1% (1 g).

Assay Dissolve about 38 mg of Torsemide, weighed accurately, in 30 mL of methanol, sonicate it for at least 8 minutes, then add 45 mL of 0.02 mol/L potassium dihydrogen phosphate buffer solution, and add the mobile phase to make exactly 100 mL, and use this solution as the test solution. Separately, dissolve about 19 mg of torsemide RS, weighed accurately, in 15 mL of methanol, sonicate it for NLT 8 minutes, add 22.5 mL of 0.02 mol/L potassium dihydrogen phosphate buffer solution, and add the mobile phase to make exactly 50 mL. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas of Torsemide from each solution, A_T and A_S,

respectively.

$$\text{Amount (mg) of torsemide } (C_{16}H_{20}N_4O_3S) = 100 \times C \times \frac{A_T}{A_S}$$

C: Concentration of torsemide in the standard solution (mg/mL)

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 288 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (7 μm in particle diameter).

Mobile phase: A mixture of 0.02 mol/L potassium dihydrogen phosphate buffer solution and methanol (3 : 2).

Flow rate: 1.5 mL/min

System suitability

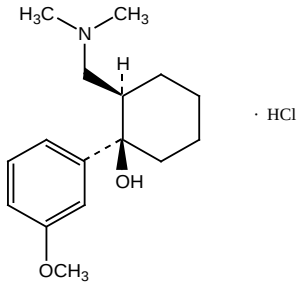
System performance: Proceed with 20 μL of the standard solution according to the above conditions; the symmetry factor of the peak of torsemide is NMT 2.0.

System repeatability: Perform the test 5 times with 20 μL each of the standard solution according to the above conditions; the relative standard deviation of peak areas of torsemide is NMT 2.0%.

Potassium dihydrogen phosphate buffer solution, 0.02 mol/L—Dissolve 2.7 g of potassium dihydrogen phosphate in 900 mL of water, add phosphoric acid to adjust the pH to 3.5, and add water to make 1000 mL.

Packaging and storage Preserve in well-closed containers.

Tramadol Hydrochloride
트라마돌염산염



and enantiomer

$C_{16}H_{25}NO_2 \cdot HCl$: 299.84

(1*R*,2*R*)-2-[(Dimethylamino)methyl]-1-(3-methoxyphenyl)cyclohexan-1-ol hydrochloride [*36282-47-0*]

Tramadol Hydrochloride contains NLT 99.0% and NMT 101.0% of tramadol hydrochloride ($C_{16}H_{25}NO_2 \cdot HCl$), calculated on an anhydrous basis.

Description Tramadol Hydrochloride occurs as a white crystalline powder.

It is freely soluble in water or methanol and very slightly soluble in acetone.

Identification (1) Determine the infrared spectra of Tramadol Hydrochloride and tramadol hydrochloride RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) Perform the test with related substances I under the Purity as directed under the Thin Layer Chromatography; the R_f value of the principal spots obtained from the test solution (2) and the standard solution (1) are the same.

(3) An aqueous of Tramadol Hydrochloride (1 in 50) responds to the Qualitative Analysis (2) for chloride.

Melting point Between 180 and 184 ℃.

Optical rotation $[\alpha]_D^{20}$: Between −10° and + 0.10° (1.0 g, water, 20 mL, 100 mm).

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Tramadol Hydrochloride in 20 mL of water; the resulting solution is clear and colorless.

(2) ***Acidity or alkalinity***—Dissolve 1.0 g of Tramadol Hydrochloride in 20 mL of water, take 10 mL of this solution, and add 0.1 mL of methyl red TS and 0.2 mL of 0.01 mol/L hydrochloric acid; the resulting solution exhibits a red color. Add 0.01 mol/L sodium hydroxide solution until the solution exhibits a yellow color; NMT 0.4 mL of 0.1 mol/L sodium hydroxide solution is consumed.

(3) ***Heavy metals***—Proceed with 1.0 g of Tramadol Hydrochloride according to Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(4) ***Related substances I***—Dissolve 0.10 g of Tramadol Hydrochloride in 2 mL of methanol, and use this solution as the test solution (1). Pipet 1 mL of this solution, add methanol to make exactly 10 mL, and use this solution as the test solution (2). Separately, dissolve 50 mg of tramadol hydrochloride RS in methanol to make 10 mL, and use this solution as the standard solution (1). Weigh 10 mg of tramadol related substances I RS {(2*RS*)-2-[(dimethylamino)methyl]cyclohexanone}, dissolve in 10 mL of methanol, pipet 1 mL of this solution, add methanol to make 10 mL, and use this solution as the standard solution (2). Weigh 5 mg of tramadol related substances II RS {(1*RS*,2*SR*)-2-[(dimethylamino)methyl]-1-(3-methoxyphenyl)cyclohexanol}, dissolve in 1 mL of the standard solution (1), and use this solution as the standard solution (3). With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution, the standard solutions (2) and (3) on a thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, put the thin layer into one side of the double developing chamber containing ammonia wa-

ter(28), saturate for 20 minutes to develop more than 2/3 of the thin layer. On the other side, develop the plate with a mixture of toluene, 2-propanol, strong ammonia water (80 : 19 : 1) (as a developing solvent) to a distance of about 10 cm and air-dry the plate. Expose the plate to the iodine vapor for 1 hour, and then to the ultraviolet light (254 nm); the spot of the related substances I from the test solution (1) is not more intense or greater than that of the standard solution (2) (0.2%). This test is valid when the two spots from the standard solution (3) are clearly separated.

(5) ***Related substances***— Weigh 0.15 g of Tramadol Hydrochloride, dissolve in the mobile phase to make exactly 100 mL, and use this solution as the test solution. To 2.0 mL of the test solution, and add the mobile phase to make 10 mL. To 1.0 mL of this solution, add the mobile phase to make 100 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak area of each solution according to the automatic integration method. The related substances II from the test solution are not greater than the major peak area from the standard solution (0.2%), the area of peaks other than the major peak is not greater than 0.5 times of the major peak area from the standard solution (0.1%), and the sum of the peak areas other than major peak is not greater than 2 times the peak area from the standard solution (0.4%). However, exclude any peak having an area smaller than 0.1 times the major peak area obtained from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 270 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for alkali inactivated liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of trifluoroacetic acid and water (0.2 : 100), and a mixture of acetonitrile (705 : 295).

Flow rate: 1.0 mL/min

System suitability

System performance: Dissolve 5 mg of tramadol related substances II RS in 4.0 mL of the test solution, and add the mobile phase to make 100 mL. Proceed with 20 μL of this solution according to the above conditions; the resolution between the peaks of related substances II and tramadol is NLT 2.0.

Water NMT 0.5% (1 g, volumetric titration, direct titration).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.18 g of Tramadol Hydrochloride, dissolve in 25 mL of acetic acid(100), add 10 mL of acetic anhydride to mix, and titrate 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 29.984 mg of $C_{16}H_{25}NO_2 \cdot HCl$

Packaging and storage Preserve in light-resistant, well-closed containers.

Tramadol Hydrochloride Capsules
트라마돌염산염 캡슐

Tramadol Hydrochloride Capsules contain NLT 95.0% and NMT 105.0% of the labeled amount of tramadol hydrochloride ($C_{16}H_{25}NO_2 \cdot HCl$: 299.84).

Method of preparation Prepare as directed under Capsules, with Tramadol Hydrochloride.

Identification With the contents of Tramadol Hydrochloride Capsules, weigh an amount equivalent to about 50 mg of tramadol hydrochloride according to the labeled amount. Add 10 mL of methanol, shake well to mix, filter, and use the filtrate as the test solution. Separately, dissolve about 50 mg of tramadol hydrochloride RS in 10 mL of methanol and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Develop the plate with a mixture of methanol, acetone and formic acid (50 : 50 : 1) as the developing solvent and air-dry the plate. Spray evenly Dragendorff's TS on the plate; the R_f values and the colors of the spots obtained from the test solution and the standard solution are the same.

Dissolution Perform the test with 1 capsule of Tramadol Hydrochloride Capsules at 50 revolutions per minute according to Method 2, using 900 mL of water as the dissolution medium. Take the medium 30 minutes after the start of the test and filter. Discard the first 10 mL of the filtrate and pipet V mL of the subsequent filtrate. Add water to make exactly V' mL so that the solution contains about 50 μg of tramadol hydrochloride per mL according to the labeled amount, and use this solution as the test solution. Separately, weigh accurately about 50 mg of tramadol hydrochloride RS and add water to make 100 mL. Pipet 10 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of tramadol hydrochloride in each solution. It meets the requirements when the dissolution rate of Tramadol Hydrochloride Capsules in 30 minutes is NLT 80%.

Dissolution rate (%) wiht respect to the labeled amount of tramadol hydrochloride ($C_{16}H_{25}NO_2 \cdot HCl$)

$$= W_S \times \frac{V'}{V} \times \frac{A_T}{A_S} \times \frac{1}{C} \times 90$$

W_S: Amount of tramadol hydrochloride RS (mg)

C: Labeled amount (mg) of tramadol hydrochloride ($C_{16}H_{25}NO_2 \cdot HCl$) in 1 capsule

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 270 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octylcylsilaniaed silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 30 °C.

Mobile phase: A mixture of trifluoroacetic acid TS (0.2) and acetonitrile (705 : 295).

Flow rate: 1.0 mL/min

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of the contents of NLT 20 capsules of Tramadol Hydrochloride Capsules. Weigh accurately about 10 mg of tramadol hydrochloride ($C_{16}H_{25}NO_2 \cdot HCl$), add water to make 100 mL, filter, and use the filtrate as the test solution. Separately, weigh accurately about 100 mg of tramadol hydrochloride RS, and add water to make exactly 100 mL. Pipet 10 mL of this solution, add water to make 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography, and determine the peak areas, A_T and A_S, of tramadol hydrochloride RS, respectively, in each solution.

Amount (mg) of tramadol hydrochloride ($C_{16}H_{25}NO_2 \cdot HCl$)

$$= \text{Amount (mg) of tramadol hydrochloride RS} \times \frac{A_T}{A_S} \times \frac{1}{10}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 270 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 30 °C.

Mobile phase: A mixture of 0.2% trifluoroacetic acid TS and acetonitrile (705 : 295).

Flow rate: 1.0 mL/min

System suitability

System repeatability: Repeat the test 6 times with 10 μL of the standard solution under the above operating conditions; the relative standard deviation of the peak area of tramadol hydrochloride is NMT 1.0%.

Packaging and storage Preserve in light-resistant, tight containers.

Tramadol Hydrochloride Injection
트라마돌염산염 주사액

Tramadol Hydrochloride Injection contains NLT 95.0% and NMT 105.0% of the labeled amount of tramadol hydrochloride ($C_{16}H_{25}NO_2 \cdot HCl$: 299.84).

Method of preparation Prepare as directed under Injections, with Tramadol Hydrochloride.

Identification Take an amount of Tramadol Hydrochloride Injection, equivalent to about 50 mg of tramadol hydrochloride according to the labeled amount, add 10 mL of methanol, shake to mix, and use this solution as the test solution. Separately, weigh accurately about 50 mg of tramadol hydrochloride RS, dissolve in 10 mL of methanol, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on a thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of methanol, acetone and formic acid (50 : 50 : 1) as the developing solvent to a distance of about 15 cm, and air-dry the plate. Spray evenly Dragendorff's TS onto the plate; the R_f values and colors of the spots obtained from the test solution and the standard solution are the same.

pH Between 5.3 and 7.3.

Sterility Meets the requirements.

Bacterial endotoxins Less than 3 EU per mg of tramadol hydrochloride.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Extractable volume of injections Meets the requirements.

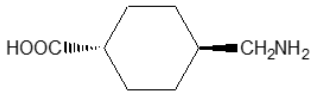
Assay Pipet Tramadol Hydrochloride Injection in the amount equivalent to 0.1 g of tramadol hydrochloride ($C_{16}H_{25}NO_2 \cdot HCl$) according to the labeled amount, and add water to make exactly 200 mL. Pipet 5 mL of this solution, add water to make exactly 50 mL, and use the resulting solution as the test solution. Separately, weigh accurately about 0.1 g of tramadol hydrochloride RS, add 830 μL of sodium acetate solution (0.4 in 100), and add water to make exactly 200 mL. Pipet 5 mL of this solution, add water to make exactly 50 mL, and use the resulting solution as the standard solution. Separately, to

830 μL of sodium acetate solution (0.4 in 100), add water to make exactly 200 mL, proceed with this solution in the same manner as the preparation of the test solution, and use the resulting solution as the blank test solution. Perform the test with the test solution and the standard solution as directed under the Ultraviolet-visible Spectroscopy, using the blank test solution as a control solution, and determine the absorbances, A_T and A_S, respectively, at the wavelength of 272 nm.

Amount (mg) of tramadol hydrochloride ($C_{16}H_{25}NO_2 \cdot HCl$)
= Amount (mg) of tramadol hydrochloride RS × (A_T / A_S)

Packaging and storage Preserve in hermetic containers.

Tranexamic Acid
트라넥삼산



$C_8H_{15}NO_2$: 157.21
4-(Aminomethyl)cyclohexane-1-carboxylic acid [*1197-18-8*]

Tranexamic Acid, when dried, contains NLT 98.0% and NMT 101.0% of tranexamic acid ($C_8H_{15}NO_2$).

Description Tranexamic Acid occurs as white crystals or a powder.
It is freely soluble in water and practically insoluble in ethanol(99.5).
It dissolves in sodium hydroxide TS.

Identification Determine the infrared spectra of Tranexamic Acid and tranexamic acid RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit the same intensities of absorption at the same wave numbers.

pH Dissolve 1.0 g of Tranexamic Acid in 20 mL of water; the pH of this solution is between 7.0 and 8.0.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Tranexamic Acid in 10 mL of water; the solution is clear and colorless.

(2) ***Chloride***—Perform the test with 1.0 g of Tranexamic Acid. Prepare the control solution with 0.40 mL of 0.01 mol/L hydrochloric acid (NMT 0.014%).

(3) ***Heavy metals***—Dissolve 2.0 g of Tranexamic Acid in water to make 20 mL, and use this solution as the test stock solution. Add 2 mL of hydrochloric acid-ammonium acetate buffer solution, pH 3.5, to 12 mL of the test stock solution and shake to mix. Add 1.2 mL of Thioacetamide TS, shake immediately to mix, and use this solution as the test solution. Separately, proceed in the same manner with a mixture of 1 mL of lead standard solution, 2 mL of the test stock solution and 9 mL of water and use this solution as the standard solution. Proceed in the same manner with a mixture of 10 mL of water and 2 mL of the test stock solution and use this solution as the control solution. Confirm that the color of the standard solution is slightly intense than that of the control solution. Compare the colors between the test solution and the standard solution 2 minutes after the preparation of the solutions; the color of the test solution is not more intense than that of the standard solution (NMT 10 ppm).

(4) ***Arsenic***—Dissolve 1.0 g of Tranexamic Acid in 10 mL of water and use this solution as the test solution to perform the test (NMT 2 ppm).

(5) ***Related substances***—Dissolve 0.20 g of Tranexamic Acid in 20 mL of water and use this solution as the test solution. Pipet 5 mL of this solution, add water to make exactly 100 mL, pipet 1 mL of this resulting solution, add water to make exactly 10 mL, and use this solution as the standard solution. With 20 μL each of the test solution and the standard solution, perform the test as directed under the Liquid Chromatography according to the following conditions and determine the peak areas from the respective solutions according to the automatic integration method; the area determine by multiply the peak area obtained from the test solution with the relative retention time of 1.5 by the correction factor of 1.2 is not greater than 2/5 of the peak area of the tranexamic acid from the standard solution, and the peak area obtained from the test solution with the relative retention time of 2.1 is not greater than 1/5 of the peak area of the tranexamic acid from the standard solution. In addition, each peak area other than tranexamic acid and the above peaks from the test solution are not greater than 1/5 times the peak area of tranexamic acid from the standard solution. However, multiply the correction factor of 0.005 for the peak area with the relative retention time of 1.1, and the correction factor of 0.006 for the peak area with the relative retention time of 1.3, respectively. The sum of peak areas other than tranexamic acid from the test solution is not greater than the peak area of tranexamic acid from the standard solution.

Operating conditions

For the detector, column, column temperature, mobile phase and flow rate, proceed as directed in the operating conditions under the Assay.

System suitability

System performance: Proceed as directed under the system suitability under the Assay.

Test for required detectability: Pipet 5 mL of the standard solution and add water to make exactly 25 mL. Verify that the peak area of tranexamic acid obtained from 20 μL of this solution is equivalent to between 14% and 26% of the peak area of tranexamic acid obtained from the standard solution.

System repeatability: Repeat the test 6 times with 20 μL each of the standard solution according to the above operating conditions; the relative standard deviation of the peak area of tranexamic acid is NMT 7%.

Time span of measurement: About 3 times the

retention time of tranexamic acid after the solvent peak.

Loss on drying NMT 0.5% (1 g, 105 ℃, 2 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 50 mg each of Tranexamic Acid and tranexamic acid RS, previously dried, dissolve each in water to make exactly 25 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak area, A_T and A_S of tranexamic acid from each of the solutions.

$$\text{Amount (mg) of tranexamic acid } (C_8H_{15}NO_2) = \text{amount (mg) of tranexamic acid RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

Column: A stainless steel column about 6.0 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 ℃.

Mobile phase: Dissolve 11.0 g of anhydrous sodium dihydrogen phosphate in 500 mL of water and add 5 mL of triethylamine and 1.4 g of sodium lauryl sulfate. Adjust the pH to 2.5 with phosphoric acid and phosphoric acid solution (1 in 10) and add water to make 600 mL. Add 400 mL of methanol to this solution.

Flow rate: Adjust the flow rate so that the retention time of tranexamic acid is about 20 minutes.

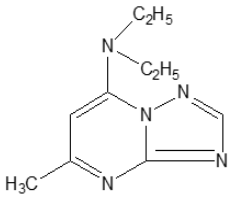
System suitability

System performance: Take 5 mL of the standard solution, add 1 mL of the solution prepared by dissolving 10 mg of 4-(aminomethyl)benzoic acid in water to make 100 mL, and add water to make 50 mL. Proceed with 20 μL of this solution according to the above conditions; tranexamic acid and 4-(aminomethyl)benzoic acid are eluted in this order with the resolution between the peaks being NLT 5.

System repeatability: Repeat the test 6 times with 20 μL each of the standard solution according to the above operating conditions; the relative standard deviation of the peak area of tranexamic acid is NMT 0.6%.

Packaging and storage Preserve in well-closed containers.

Trapidil
트라피딜



$C_{10}H_{15}N_5$: 205.26

N,*N*-Diethyl-5-methyl-[1,2,4]triazolo[1,5-a]pyrimidin-7-amine [*15421-84-8*]

Trapidil, when dried, contains NLT 98.5% and NMT 101.0% of trapidil ($C_{10}H_{15}N_5$).

Description Trapidil occurs as a white to pale yellowish white crystalline powder.
It is very soluble in water or methanol, and freely soluble in ethanol(95), acetic anhydride or acetic acid(100), and sparingly soluble in ether.
Dissolve 1.0 g of Trapidil in 100 mL of water; the pH of the solution is between 6.5 and 7.5.

Identification (1) Take 5 mL of an aqueous solution of Trapidil (1 in 50) and add 3 drops of Dragendorff's TS; the solution exhibits an orange color.

(2) Determine the absorption spectra of solutions of Trapidil and trapidil RS (1 in 125000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

Melting point Between 101 and 105 ℃.

Absorbance $E_{1cm}^{1\%}$ (307 nm): Between 860 and 892 (20 mg after drying, water, 2500 mL).

Purity (1) ***Clarity and color of solution***—Dissolve 2.5 g of Trapidil in 10 mL of water; the resulting solution is colorless to pale yellow and clear.

(2) ***Chloride***—Perform the test with 0.5 g of Trapidil. Prepare the control solution with 0.25 mL of 0.01 mol/L hydrochloric acid (NMT 0.018%).

(3) ***Ammonium***—Weigh 50 mg of Trapidil, put in a glass-stoppered Erlenmeyer flask, add 10 drops of sodium hydroxide TS to moisten, and put a stopper. Allow to stand at 37 ℃ for 15 minutes; the gas evolved does not change the color of a moistened red litmus paper to blue.

(4) ***Heavy metals***—Dissolve 1.0 g of Trapidil in 40 mL of water, and add 1.5 mL of dilute hydrochloric acid, 2 mL of dilute acetic acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution by adding 2 mL of dilute acetic acid and water to 1.0 mL of lead standard solution to make 50 mL (NMT 10 ppm).

(5) ***Arsenic***—Proceed with 1.0 g of Trapidil according to Method 1 and perform the test (NMT 2 ppm).

(6) ***Related substances***—Dissolve 0.10 g of Trapidil in 4 mL of methanol and use this solution as the test solution. Pipet 1.0 mL of this solution and add methanol to make exactly 20 mL, pipet 1 mL of this solution, add methanol to make exactly 100 mL, and use this solution as the standard solution. With these solutions, perform

the test as directed under the Thin Layer Chromatography. Spot 20 μL each of the test solution and the standard solution on a thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of chloroform, ethanol(95) and acetic acid(100) (85 : 13 : 2) (as the developing solvent) to a distance of about 10 cm, and air-dry the plate. Allow the plate to stand for 60 minutes in iodine steam; the spots other than the principal spot from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 0.5% (1 g, in vacuum, silica gel, 60 ℃, 3 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.2 g of Trapidil, previously dried, and dissolve in 20 mL of acetic acid(100), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 20.526 mg of $C_{10}H_{15}N_5$

Packaging and storage Preserve in tight containers.

Trazodone Hydrochloride Capsules
트라조돈염산염 캡슐

Trazodone Hydrochloride Capsules contain NLT 95.0% and NMT 105.0% of the labeled amount of trazodone hydrochloride ($C_{19}H_{22}ClN_5O$·HCl : 408.33).

Method of preparation Prepare as directed under Capsules, with Trazodone Hydrochloride.

Identification Weigh an amount equivalent to 25 mg of trazodone hydrochloride according to the labeled amount, add 5 mL of water, and shake to dissolve. To this solution, add 20 mL of ethanol, mix, filter and use the filtrate as the test solution. Separately, weigh 25 mg of trazodone hydrochloride RS, dissolve in 5 mL of water, add 20 mL of ethanol, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on a thin-layer chromatographic plate made of silica gel for thin-layer chromatography (with a fluorescent indicator). Develop the plate with a mixture of acetone, hexane, and ammonia water (10 : 10 : 1) as the developing solvent, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm), the colors and R_f values of the spots obtained from the test solution and the standard solution are the same.

Dissolution Perform the test with 1 capsule of Trazodone Hydrochloride Capsules at 50 revolutions per minute according to Method 2, using 900 mL of water as the dissolution medium. Take the dissolved solution after 30 minutes from the start of the test and filter. Discard the first 10 mL of the filtrate and pipet V mL of the subsequent filtrate. Add water to make exactly V' mL so that the solution contains about 20 μg of trazodone hydrochloride per mL according to the labeled amount, and use this solution as the test solution. Separately, weigh accurately about 20 mg of trazodone hydrochloride RS and add water to make 100 mL. Pipet 10 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions. Determine the peak areas, A_T and A_S, of trazodone hydrochloride in each solution. Meets the requirements if the dissolution rate of Trazodone Hydrochloride Capsules in 30 minutes is NLT 75%.

Dissolution rate (%) with respect to the labeled amount of trazodone hydrochloride ($C_{19}H_{22}ClN_5O$·HCl)

$$= W_S \times \frac{V'}{V} \times \frac{A_T}{A_S} \times \frac{1}{C} \times 90$$

Ws: Amount (mg) of trazodone hydrochloride RS
C: Labeled amount (mg) of trazodone hydrochloride ($C_{19}H_{22}ClN_5O$·HCl) in 1 capsule

Operating conditions

Detector: An ultraviolet absorption spectrophotometer (wavelength: 246 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 250 mm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: A mixture of methanol and 0.01 mol/L ammonium phosphate (pH 6.0) (75 : 25).

Flow rate: 1.0 mL/min

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of the contents of NLT 20 capsules of Trazodone Hydrochloride Capsules. Weigh accurately about 5 mg of trazodone hydrochloride ($C_{19}H_{22}ClN_5O$·HCl), add water to make 100 mL, filter, and use the filtrate as the test solution. Separately, weigh accurately about 50 mg of acetone, and add water to make exactly 100 mL. Pipet 10 mL of this solution, add water to make 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography, and calculate the peak areas, A_T and A_S, of trazodone in each solution.

Amount (mg) of trazodone hydrochloride ($C_{19}H_{22}ClN_5O$·HCl)

$$= \text{Amount (mg) of trazodone hydrochloride RS} \times \frac{A_T}{A_S} \times \frac{1}{10}$$

Operating conditions

Detector: An ultraviolet absorption spectrophotometer (wavelength: 246 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: A mixture of methanol and 0.01 mol/L ammonium phosphate dibasic buffer solution (pH 6.0) (75 : 25).

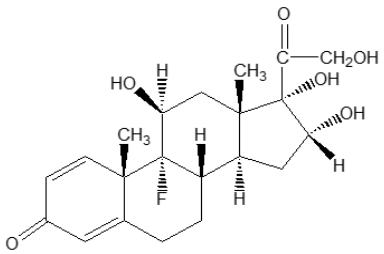
Flow rate: 1.0 mL/min

System suitability

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution under the above conditions; the relative standard deviation of the peak areas of trazodone is NMT 1.0%.

Packaging and storage Preserve in well-closed containers.

Triamcinolone
트리암시놀론



$C_{21}H_{27}FO_6$: 394.43

(1*R*,2*S*,10*S*,11*S*,13*R*,14*S*,15*S*,17*S*)-1-Fluoro-13,14,17-trihydroxy-14-(2-hydroxyacetyl)-2,15-dimethyltetracyclo[8.7.0.0^{2,7}.0^{11,15}]heptadeca-3,6-dien-5-one [*124-94-7*]

Triamcinolone, when dried, contains NLT 97.0% and NMT 103.0% of triamcinolone ($C_{21}H_{27}FO_6$).

Description Triamcinolone occurs as a white crystalline powder and is odorless.

It is freely soluble in *N*,*N*-dimethylformamide, slightly soluble in methanol, ethanol(95), or acetone and practically insoluble in water, 2-propanol, or ether.

Melting point—About 264 °C (with decomposition).

Identification (1) Dissolve 1 mg of Triamcinolone in 6 mL of ethanol(95), add 5 mL of 2,6-di-*t*-butylcresol TS and 5 mL of sodium hydroxide TS, and heat on a steam bath for 30 minutes under a reflux condenser; the solution exhibits a purple color.

(2) To 10 mL of Triamcinolone, add 5 mL of water and 1 mL of Fehling's TS and heat: a red precipitate is formed.

(3) Proceed with 10 mg of Triamcinolone as directed under the Oxygen Flask Combustion, using a mixture of 0.5 mL of 0.01 mol/L sodium hydroxide TS and 20 mL of water as the absorbent; the solution responds to the Qualitative Analysis for fluoride.

(4) Determine the infrared spectra of Triamcinolone and triamcinolone RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy, respectively; both spectra exhibit similar intensities of absorption at the same wavenumbers. If there exist any differences in the two spectra, dissolve each 0.1 g of Triamcinolone and triamcinolone RS in 7 mL of a mixture of 2-propanol and water (2 : 1) by warming. Cool the solutions with ice, filter the extracted crystals, wash with 10 mL of water 2 times, and dry. Repeat the test with residues in the same manner.

Optical rotation $[\alpha]_D^{20}$: Between +65° and +71° (0.1 g after drying, *N*,*N*-dimethylformamide, 10 mL, 100 mm).

Purity ***Heavy metals***—Proceed with 0.5 g of Triamcinolone according to Method 2 and perform the test. Prepare the control solution with 1.5 mL of lead standard solution (NMT 30 ppm).

Loss on drying NMT 2.0% (0.5 g, in vacuum, phosphorus pentoxide, 60 ℃, 3 hours).

Residue on ignition NMT 0.3% (0.5 g, platinum crucible).

Assay Weigh accurately about each 20 mg of Triamcinolone and triamcinolone RS, previously dried, and dissolve in a solution of L-ascorbic acid in methanol (1 in 1000) to make exactly 50 mL. Pipet each 5 mL of these solutions, add 5 mL of the internal standard solution, and add a solution of L-ascorbic acid in methanol (1 in 1000) to make exactly 20 mL each. Use these solutions as the test solution and the standard solution, respectively. Perform the test with 10 μL of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions and calculate the peak height ratios, Q_T and Q_S, of triamcinolone to that of the internal standard.

$$\text{Amount (mg) of triamcinolone } (C_{21}H_{27}FO_6) = \text{Amount (mg) of triamcinolone RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—Dissolve 15 mg of methyl *p*-hydroxybenzoate in a solution of L-ascorbic acid in methanol (1 in 1000) to make 100 mL.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and 15 to 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 to 10 μm in particle diameter).

Column temperature: A constant temperature of

about 25 °C.

Mobile phase: A mixture of water and acetonitrile (3 : 1).

Flow rate: Adjust the flow rate so that the retention time of triamcinolone is about 10 minutes.

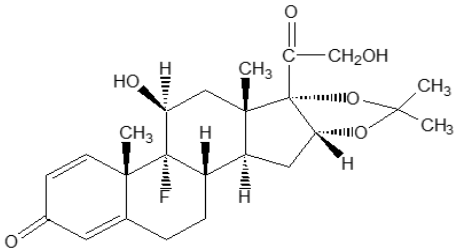
System suitability

System performance: Perform the test with 10 μL of the standard solution according to the above operating conditions; triamcinolone and the internal standard are eluted in this order with the resolution being NLT 2.0.

System repeatability: Proceed with 10 μL of the standard solution under the above operating conditions and repeat the test 6 times; the relative standard deviation of the peak height ratio of triamcinolone to that of the internal standard is NMT 1.5%.

Packaging and storage Preserve in light-resistant, tight containers.

Triamcinolone Acetonide
트리암시놀론아세토니드



$C_{24}H_{31}FO_6$: 434.50

(4a*S*,4b*R*,5*S*,6a*S*,6b*S*,9a*R*,10a*S*,10b*S*)-4b-Fluoro-6b-glycoloyl-5-hydroxy-4a,6a,8,8-tetramethyl-4a,4b,5,6,6a,6b,9a,10,10a,10b,11,12-dodecahydro-2*H*-naphtho[2',1':4,5]indeno[1,2-d][1,3]dioxol-2-one

[*76-25-5*]

Triamcinolone Acetonide, when dried, contains NLT 97.0% and NMT 103.0% of Triamcinolone Acetonide ($C_{24}H_{31}FO_6$).

Description Triamcinolone Acetonide occurs as a white, crystalline powder and is odorless.

It is sparingly soluble in ethanol(99.5), acetone or 1,4-dioxane, slightly soluble in methanol or ethanol(95), and practically insoluble in water or ether.

Melting point—About 290 °C (with decomposition).

Identification (1) Dissolve 2 mg of Triamcinolone Acetonide in 40 mL of ethanol(95), add 5 mL of 2,6-di-*t*-butylcresol TS and 5 mL of sodium hydroxide TS and heat on a steam bath for 20 minutes under a reflux condenser: the solution exhibits a green color.

(2) To 10 mg of Triamcinolone Acetonide, add 5 mL of water and 1 mL of Fehling's TS and heat: a red precipitate is formed.

(3) Proceed with 10 mg of Triamcinolone Acetonide as directed under the Oxygen Flask Combustion using a mixture of 0.5 mL of 0.01 mol/L sodium hydroxide TS and 20 mL of water as the absorbent; the solution responds to the Qualitative Analysis for fluoride.

(4) Determine the absorption spectra of Triamcinolone Acetonide and triamcinolone acetonide RS in ethanol(95) (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(5) Determine the infrared spectra of Triamcinolone Acetonide and triamcinolone acetonide RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy, respectively; both spectra exhibit similar intensities of absorption at the same wavenumbers. If there exist any differences in the two spectra, dissolve each 0.1 g of Triamcinolone Acetonide and triamcinolone acetonide RS in 20 mL of ethanol(95), evaporate to dryness, and repeat the test with the residues in the same manner.

Optical rotation $[\alpha]_D^{20}$: Between +118° and +130° (0.05 g calculated on the dried basis, *N*,*N*-dimethylformamide, 10 mL, 100 mm).

Purity (1) ***Heavy metals***—Proceed with 0.5 g of Triamcinolone Acetonide according to Method 2 and perform the test. Prepare the control solution with 1.5 mL of lead standard solution (NMT 30 ppm).

(2) ***Related substances***—Dissolve 40 mg of Triamcinolone Acetonide in 4 mL of acetone and use this solution as the test solution. Pipet 1 mL of this solution, add acetone to make exactly 100 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 20 μL each of the test solution and the standard solution on a thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of chloroform and methanol (93 : 7) (as the developing solvent) to a distance of about 10 cm and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); any spots other than the principal spot obtained from the test solution is not more intense than the spots from the standard solutions.

Loss on drying NMT 2.0% (0.5 g, in vacuum, phosphorus pentoxide, 60 ℃, 3 hours).

Residue on ignition NMT 0.2% (0.5 g, platinum crucible).

Assay Weigh accurately each 20 mg of Triamcinolone Acetonide and triamcinolone acetonide RS, previously dried, and dissolve in methanol to make exactly 50 mL, respectively. Pipet each 10 mL of these solutions, add exactly 10 mL of the internal standard solution and the mobile phase to make exactly 50 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with each 20 μL of the test solution and the standard solution as directed under the Liquid Chromatography according to the following con-

ditions and calculate the peak height ratios, Q_T and Q_S, of triamcinolone acetonide from the test solution to the peak height of the internal standard.

$$\text{Amount (mg) of triamcinolone acetonide } (C_{24}H_{31}FO_6) = \text{Amount (mg) of triamcinolone acetonide RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of Prednisolone in methanol (1 in 5000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 240 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 15 to 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 to 10 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: A mixture of water and acetonitrile (3 : 1).

Flow rate: Adjust the flow rate so that the retention time of Triamcinolone Acetonide is about 13 minutes.

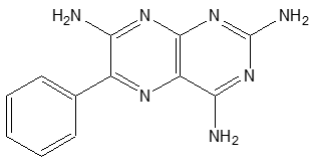
System suitability

System performance: Proceed with 10 μL of the standard solution under the above operating conditions; the internal standard and triamcinolone acetonide are eluted in this order with the resolution being NLT 6.

System repeatability: Perform the test 6 times with each 10 μL of the standard solution according to the above operating conditions; the relative standard deviation of the peak height ratio of triamcinolone acetonide to the peak height of the internal standard is NMT 1.0%.

Packaging and storage Preserve in light-resistant, tight containers.

Triamterene
트리암테렌



$C_{12}H_{11}N_7$: 253.26

6-Phenylpteridine-2,4,7-triamine [*396-01-0*]

Triamterene, when dried, contains NLT 98.5% and NMT 101.0% of Triamterene ($C_{12}H_{11}N_7$).

Description Triamterene occurs as a yellow crystalline powder. It is odorless and tasteless.

It is sparingly soluble in dimethylsulfoxide, very slightly soluble in acetic acid(100) and practically insoluble in water, ethanol(95) or ether.

It dissolves in nitric acid or sulfuric acid but does not dissolve in dilute nitric acid, dilute sulfuric acid or dilute hydrochloric acid.

Identification (1) To 10 mg of Triamterene, add 10 mL of water, heat, cool, and filter; the filtrate exhibits a purple fluorescence. To 2 mL of the filtrate, add 0.5 mL of hydrochloric acid; the fluorescence disappears.

(2) The filtrate obtained in (1) responds to the Qualitative Analysis for primary aromatic amines.

(3) Dissolve each 10 mg of Triamterene and triamterene RS in 100 mL of acetic acid(100). To each 10 mL of these solutions, add water to make 100 mL. Determine the absorption spectra of these solutions as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

Purity (1) ***Heavy metals*—**Proceed with 1.0 g of Triamterene according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Arsenic*—**Proceed with 1.0 g of Triamterene according to Method 3 and perform the test (NMT 2 ppm).

(3) ***Related substances*—**Dissolve 0.10 g of Triamterene in 20 mL of dimethylsulfoxide. Pipet 2 mL of this solution, add methanol to make exactly 50 mL, and use this solution as the test solution. Pipet 1 mL of this solution, add methanol to make exactly 200 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot each 5 μL of the test solution and the standard solution on a thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, ammonia TS and methanol (9 : 1: 1) (as the developing solvent) to a distance of about 10 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 365 nm); any spot other than the principal spot obtained from the test solution is not more intense than the spot from the standard solution.

Loss on drying NMT 0.5% (1 g, 105 ℃, 4 hours).

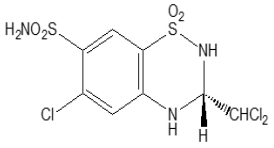
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.15 g of Triamterene, previously dried, dissolve in 100 mL of acetic acid(100) by warming, cool, and titrate with 0.05 mol/L perchloric acid VS (indicator: 2 drops of methylrosaniline chloride TS). Perform a blank test in the same manner and make any necessary correction.

$$\text{Each mL of 0.05 mol/L perchloric acid VS} = 12.663 \text{ mg of } C_{12}H_{11}N_7$$

Packaging and storage Preserve in well-closed containers.

Trichlormethiazide
트리클로르메티아지드



and enantiomer

$C_8H_8Cl_3N_3O_4S_2$: 380.66

6-Chloro-3-(dichloromethyl)-1,1-dioxo-3,4-dihydro-2*H*-1λ6,2,4-benzothiadiazine-7-sulfonamide [*133-67-5*]

Trichlormethiazide, when dried, contains NLT 97.5% and NMT 102.0% of Trichlormethiazide ($C_8H_8Cl_3N_3O_4S_2$).

Description Trichlormethiazide occurs as a white powder.

It is freely soluble in *N*,*N*-dimethylformamide or acetone, slightly soluble in acetonitrile or ethanol(95), and practically insoluble in water.

A Solution of Trichlormethiazide in acetone (1 in 50) shows no optical rotation.

Melting point—About 270 °C (with decomposition).

Identification (1) Determine the absorption spectra of solutions of Trichlormethiazide and trichlormethiazide RS in ethanol(95) (3 in 250000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Trichlormethiazide and trichlormethiazide RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) Perform the test with Trichiormethiazide as directed under the Flame Coloration (2); a green color appears.

Purify (1) ***Chloride***—Dissolve 1.0 g of Trichlormethiazide in 30 mL of acetone and add 6 mL of dilute nitric acid and water to make 50 mL. Use this solution as the test solution to perform the test. Prepare the control solution by adding 30 mL of acetone, 6 mL of dilute nitric acid and water to 1.0 mL of 0.01 mol/L hydrochloric acid to make 50 mL (NMT 0.036%).

(2) ***Sulfate***—Dissolve 1.0 g of Trichlormethiazide in 30 mL of acetone and add 1 mL of dilute hydrochloric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution by adding 30 mL of acetone, 1 mL of dilute hydrochloric acid and water to 1.0 mL of 0.005 mol/L sulfuric acid to make 50 mL (NMT 0.048%).

(3) ***Heavy metals***—Proceed with 1.0 g of Trichlormethiazide according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(4) ***Selenium***—Weigh 0.2 g of Trichlormethiazide and combust as directed under the Oxygen Flask Combustion with 25 mL of diluted nitric acid (1 in 30) as an absorbent. Use a 1 L combustion flask as the combustion flask. After combustion, wash the stopper and the inner wall of the flask with 10 mL of water, and transfer the liquid inside the flask to a 150-mL beaker using 20 mL of water. Then, heat gently to boil, boil for 10 minutes, cool to room temperature, and use this solution as the test solution. Separately, pipet 6.0 mL of the standard selenium stock solution, add 25 mL of diluted nitric acid (1 in 30) and 25 mL of water, and use this solution as the standard solution. Add diluted ammonia water(28) (1 in 2) to the test solution and standard solution, respectively, adjust the pH to 2.0 ± 0.2, and dilute by adding water to make exactly 60 mL. Transfer into a separatory funnel using 10 mL of water, and wash the separatory funnel with 10 mL of water. To each solution, add 0.2 g of hydroxylamine hydrochloride, stir to dissolve, then immediately add 5.0 mL of 2,3-diaminonaphthalene TS, and put a stopper. Stir to mix and allow to stand at room temperature for 100 minutes. To the resulting mixture, add 5.0 mL of cyclohexane, shake vigorously for 2 minutes, and allow to stand. If layers are separated, discard the water layer, centrifuge the cyclohexane extract to remove water, and take the cyclohexane layer. With these solutions and the control solution prepared in the same way with 25 mL of water added to 25 mL of diluted nitric acid (1 in 30), perform the test as directed under the Ultraviolet-visible Spectroscopy. Determine the absorbance at the absorption maximum wavelength of about 380 nm; the absorbance obtained from the test solution is not greater than that from the standard solution (NMT 30 ppm).

(5) ***Arsenic***—Proceed with 0.6 g of Trichlormethiazide according to Method 5 and perform the test. For this test, use 20 mL of *N*,*N*-dimethylformamide. (NMT 3.3 ppm).

(6) ***Related substances***—Dissolve 25 mg of Trichlormethiazide in 50 mL of acetonitrile and use this solution as the test solution. With 10 μL of the test solution, perform the test as directed under the Liquid Chromatography according to the following operating conditions. Determine each peak area by the automatic integration method and calculate the amount of related substances by the percentage peak area method; the amount of 4-amino-6-chlorobenzene-1,3-disulfonamide, having the relative retention time of about 0.3 with respect to trichlormethiazide, is NMT 2.0%, and the total amount of the related substances is NMT 2.5%.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 268 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 15 cm in length, packed with phenyl silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: Control the mixing ratio of mobile phase A and mobile phase B stepwise or via the gradient elution as follows.

Mobile phase A: A mixture of diluted phosphoric acid (1 in 1000) and acetonitrile (3 : 1).

Mobile phase B: A mixture of acetonitrile and diluted phosphoric acid (1 in 1000) (3 : 1).

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 - 10	100	0
10 - 20	100 → 0	0 → 100

Flow rate: 1.5 mL/min

System suitability

Test for required detectability: Pipet 1 mL of the test solution, add acetonitrile to make exactly 50 rnL, and use this solution as the system suitability solution. Pipet 1 mL of the system suitability solution and add acetonitrile to make exactly 20 mL. Confirm that the peak area of trichlormethiazide obtained from 10 μL of this solution is 3.5 to 6.5% of that of trichlormethiazide obtained from 10 mL of the system suitability solution.

System performance: To 5 mL of the system suitability solution, add 5 mL of water, warm on a steam bath at 60 °C for 30 minutes, cool, and proceed with 10 μL of this solution according to the above operating conditions; 4-amino-6-chlorobenzene-1,3-disulfonamide and trichlormethiazide are eluted in this order, the relative retention time of 4-amino-6-chlorobenzene-1,3-disulfonamide with respect to trichlormethiazide is about 0.3, and the number of theoretical plates and the symmetry factor of the trichlormethiazide peak are NLT 5000 and NMT 1.2, respectively.

System repeatability: Perform the test 3 times with 10 μL of the system suitability solution according to the above operating conditions; the relative standard deviation of the peak area of Trichlormethiazide is NMT 2.0%.

Time span of measurement: About 2.5 times the retention time of trichlormethiazide after the solvent peak.

Loss on drying NMT 0.5% (1 g, 105 °C, 3 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about each 25 mg of Trichlormethiazide and trichlormethiazide RS, previously dried, and dissolve in exactly 20 mL of the internal standard solution. Pipet each 1 mL of these solutions, add acetonitrile to make exactly 20 mL, and use these solutions as the test solution and the standard solution. Perform the test with 10 μL of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions and calculate the peak area ratio, Q_T and Q_S, of trichlormethiazide to that of the internal standard.

$$\text{Amount (mg) of trichlormethiazide } (C_8H_8Cl_3N_3O_4S_2) = \text{Amount (mg) of triamcinolone RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of 3-nitropheno in acetonitrile (1 in 800).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 268 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 15 cm in length, packed with phenyl silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: A mixture of diluted phosphoric acid (1 in 1000) and acetonitrile (3:1).

Flow rate: Adjust the flow rate so that the retention time of trichlormethiazide is about 8 minutes.

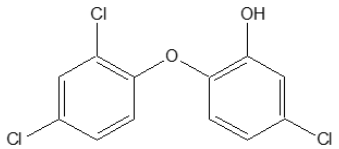
System suitability

System performance: Proceed with 10 μL of the standard solution according to the above operating conditions and perform the test; the internal standard and trichlormethiazide are eluted in this order with the resolution being NLT 2.0.

System repeatability: Perform the test 6 times with each 10 μL of the standard solution according to the above operating conditions; the relative standard deviation of the peak area ratio of trichlormethiazide to that of the internal standard is NMT 1.0%.

Packaging and storage Preserve in well-closed containers.

Triclosan
트리클로산



$C_{12}H_7Cl_3O_2$: 289.54

5-Chloro-2-(2,4-dichlorophenoxy)phenol [*3380-34-5*]

Triclosan contains NLT 97.0% and NMT 103.0% of triclosan ($C_{12}H_7Cl_3O_2$), calculated on the anhydrous basis.

Description Triclosan occurs as a white crystalline powder.

It is freely soluble in methanol, ethanol(95) or acetone, sparingly soluble in hexane and practically insoluble in water.

Melting point—About 57 °C.

Identification (1) Determine the infrared spectra of Triclosan and triclosan RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) The retention time of the major peak of the test

solution corresponds to that of the standard solution, as obtained in the Assay.

Purity (1) ***Clarity and color of solution***—Dissolve 1.40 g of Triclosan in 10 mL of acetone; the resulting solution is clear.

(2) ***Heavy metals***—Proceed with 1.0 g of Triclosan according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of the lead standard solution (NMT 20 ppm).

(3) ***Related substances*—**Perform the test with 0.5 μL of the test solution in the Assay as directed under the Gas Chromatography according to the following operating conditions. Inject the test solution, increase the column temperature to 140 °C at a rate of 20 °C per minute, and then increase to 240 °C at a rate of 4 °C per minute. Maintain this temperature for NLT 5 minutes, measure the peak area of chromatogram obtained from the above, and calculate the amount of each related substance by the percentage peak area method; each related substance is NMT 0.1% and the amount of total related substance is NMT 0.5%.

Operating conditions

For the detector, column, mobile phase, flow rate, and system compatibility solution, proceed as directed in the operating conditions under the Assay.

(4) ***Monochlorophenols and 2,4-dichlorophenol*—**Weigh accurately 0.25 g of Triclosan, dissolve in 20 mL of acetonitrile, add water to make exactly 25 mL, and use this solution as the test solution. Separately, weigh accurately 5 mg of 4-chlorophenol and 1 mg of 2,4-dichlorophenol, respectively, dissolve in 50 mL of acetonitrile, and add water to make exactly 100 mL. Pipet 1.0 mL of this solution, add a mixture of acetonitrile and water (1 : 1) to make 100 mL, and use this solution as the standard solution. Perform the test with each 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak area of each solution by the automatic integration method; the peak areas of 4-chlorophenol and 2,4-dichlorophenol obtained from the test solution are not larger than those from the standard solution.

Operating conditions

Detector: An electrochemical detector (electrode 1: −0.45 V, electrode 2: −0.75 V).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 to 10 μm in particle diameter).

Mobile phase: A mixture of acetonitrile and phosphate buffer solution (1: 1).

Flow rate: 1.0 mL/min

System suitability

System repeatability: Perform the test 5 times with 20 μL each of the standard solution according to the above operating conditions; the relative standard deviation of the peak area of 2,4-dichlorophenol is NMT 9.0%.

Phosphate buffer solution—Dissolve 1.38 g of anhydrous sodium dihydrogen phosphoric acid and 1.42 g of sodium monohydrogen phosphoric acid in water to make 1000 mL.

(5) ***1,3,7-trichlorodibenzo-p-dioxin, 2,8-dichlorodibenzo-p-dioxin, 2,8-dichlorodibenzofuran and 2,4,8-trichlorodibenzofuran*—**Weigh accurately 2.0 g of Triclosan, transfer into a stoppered centrifuge tube, add 5 mL of 2 mol/L potassium hydroxide TS, and shake for 10 minutes to dissolve. Add 3 mL of *n*-hexane, shake for 10 minutes, allow to stand, and transfer the organic solvent layer to a suitable container. Add 3 mL of *n*-hexane to the aqueous layer, shake for 10 minutes, and allow to stand for the organic layer to be separated. Combine the organic layer with the extract above, and discard the aqueous layer. Add 3 mL of 2 mol/L potassium hydroxide TS to the combined organic solvent, shake for 10 minutes, and allow to stand. Then, take the organic solvent layer and discard the aqueous layer. Again, add 3 mL of 2 mol/L potassium hydroxide TS to the organic solvent layer, shake for 10 minutes, and allow to stand. Transfer the organic solvent layer to a suitable container and evaporate to dryness under a stream of nitrogen. Dissolve the residue in 1.0 mL of methanol and use this solution as the test solution. Separately, weigh accurately 5 mg of 2,8-dichlorodibenzofuran and 10 mg of 2,4,8-trichlorodibenzofuran, put into a 100-mL volumetric flask, add accurately amounts, equivalent to 5 mg of 1,3,7-trichlorodibenzo-*p*-dioxin and 10 mg of 2,8-dichlorodibenzo-*p*-dioxin, and dissolve in methanol to make exactly 100 mL. Pipet 1.0 mL of this solution, add methanol to make exactly 100 mL, and use this solution as the standard solution. Perform the test with each 20 μL of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak areas from each solution; the peak areas of 2,8-dichlorodibenzofuran, 2,8-dichlorodibenzo-*p*-dioxin, 2,4,8-trichlorodibenzofuran, and 1,3,7-trichlorodibenzo-*p*-dioxin from the test solution are not larger than each corresponding peak area from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 μm to 10 μm in particle diameter).

Mobile phase: A mixture of acetonitrile, water and acetic acid(100) (70 : 30 : 0.1).

Flow rate: 1.5 mL/min

System suitability

System performance: Proceed with 20 μL of the standard solution according to the above operating conditions and perform the test; the relative retention times of 2,8-dichlorodibenzofuran, 2,8-dichlorodibenzo-*p*-dioxin,

2,4,8-trichlorobenzofuran, and 1,3,7-trichlorodibenzo-*p*-dioxin are about 0.59, 0.71, 0.88, and 1.0, respectively.

System repeatability: Perform the test 5 times with 20 μL each of the standard solution according to the above operating conditions; the relative standard deviation of the peak area of 2,8-dichloro-dibenzo-*p*-dioxin is NMT 15.0%.

(6) ***2,3,7,8-tetrachlorodibenzo-p-dioxin and 2,3,7,8-tetrachlorodibenzofuran (extremely toxic)***—Weigh accurately 30 g of Triclosan, transfer into a separatory funnel, add 30 μL of the internal standard solution, dissolve in 200 mL of 1 mol/L sodium hydroxide TS, and extract 4 times with each 30 mL of *n*-hexane. Combine all the extracts and wash with 20 mL of water. Extract the washings with 15 mL of *n*-hexane. Combine the extracts, add about 3 g of anhydrous sodium sulfate to the combined extracts, and allow to stand for 30 minutes. Quantitatively transfer into an appropriate round-bottom flask, and distill using a distillation apparatus until about 1 mL of distillate remains. Transfer the distillate to the top of chromatographic column A, and elute with 50 mL of n-hexane. Collect the eluate on top of chromatograph column B, elute with 30 mL of a mixture of n-hexane and dichloromethane (98 : 2), and discard the eluate. Again, elute with 40 mL of a mixture of n-hexane and dichloromethane (1 : 1), and collect the eluates in a round-bottom flask. Distill the combined eluates, using a distillation apparatus, until about 1 mL remains. Evaporate this solution to concentrate to the volume of 50 μL with a stream of nitrogen, evaporate to dryness at room temperature, dissolve 10 μL of 2,2,4-trimethylpentane, and use this solution as the test solution. Perform the test with 1 μL of the test solution as directed under the Gas Chromatography with a high-resolution mass spectrometer, and determine the peak areas at mass-to-charge ratios of 319.90, 321.89, 331.88, 333.93, 303.90, 305.90 and 317.94. The peak area for 2,3,7,8-tetrachlorodibenzo-*p*-dioxin at a mass-to-charge ratio of 319.90 is not larger than the peak area of the internal standard at a mass-to-charge ratio of 331.88; the peak area for 2,3,7,8-tetrachloro dibenzofuran at a mass-to-charge ratio of 303.90 is not larger than the peak area of the internal standard at a mass-to-charge ratio of 315.94.

Operating conditions

Detector: A high-resolution mass spectrometer (electron impact ionization).

Column: A capillary column, about 0.25 mm in internal diameter and about 60 m in length, coated with cyanopolysiloxane.

Mobile phase: helium

Column temperature: Maintain at 80 °C for 1 minute, raise the temperature to 220 °C at a rate of 20 °C per minute, raise the temperature to 270 °C at a rate of 2 °C per minute, and maintain at 270 °C for 20 minutes.

Signal-to-noise ratio: NLT 50 at a mass-to-charge ratio of 321.89.

Stationary phase A—Place about 10 g of silica gel in a suitable container and add about 3 mL of 1 mol/L sodium hydroxide TS.

Stationary phase B—Place about 60 g of silica gel in a suitable container and add about 74 mL of sulfuric acid.

Chromatography column A—Transfer 5.1 g of the stationary phase A, 0.5 g of silica gel, 6.2 g of the stationary phase B, 3.2 g of sodium sulfuric acid in a chromatography column with an internal diameter of 10 mm, wash by adding 50 mL of *n*-hexane, and discard the eluate.

Chromatography column B—Transfer 2.5 g of alumina and 2.5 g of sodium sulfate decahydrate in a chromatography column with an internal diameter of 6 mm, wash by adding 30 mL of *n*-hexane, and discard the eluate.

Internal standard solution—Weigh accurately a suitable amount of 2,3,7,8-tetrachlorodibenzo-*p*-dioxin, ^{13}C-labeled 2,3,7,8-tetrachlorodibenzofuran, ^{13}C-labeled nonane and dissolve in a suitable amount of 2,2,4-trimethylpentane to obtain a solution containing about 1.0 pg of each per μL.

Water NMT 0.1% (1 g, volumetric titration, direct titration).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately each 40 mg of Triclosan and triclosan RS, dissolve in dichloromethane to make exactly 10 mL, respectively, and use these solutions as the test solution and the standard solution, respectively. Perform the test with each 0.5 μL of test solution and standard solution as directed under the Gas Chromatography according to the following operating conditions; determine the peak areas, A_T and A_S, of Triclosan obtained from the solutions.

$$\text{Amount (mg) of Triclosan } (C_{12}H_7Cl_3O_2) = \text{Amount (mg) of triclosan RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: A flame ionization detector

Column: About 0.53 mm in internal diameter and and about 15 m in length, packed with 50% of phenyl and 50% methylpolysiloxan.

Injection port temperature: Maintain at 34 °C and raise rapidly to 200 °C immediately after the injection.

Column temperature: After the injection, increase the column temperature to 140 °C at a rate of 20 °C per minute, then increase the temperature to 240 °C at a rate of 4 °C per minute, and maintain at 270 °C for 5 minutes or longer.

Detector temperature: 260 °C

Carrier gas: Helium (6 psi)

System suitability

System repeatability: Perform the test 5 times with 0.5 μL of the standard solution according to the above operating conditions. The relative standard deviation of the area of the Triclosan peak is NMT 2.0%.

Packaging and storage Preserve in light-resistant, tight containers.

Trifluridine Ophthalmic Solution
트리플루리딘 점안액

Trifluridine Ophthalmic Solution contains NLT 90.0% and NMT 110.0% of the labeled amount of trifluridine ($C_{10}H_{11}O_5N_2F_3$: 296.20).

Method of preparation Prepare as directed under Ophthalmic Ointments, with Trifluridine.

Identification Use Trifluridine Ophthalmic Solution as the test solution. Weigh 0.1 g of trifluridine RS, add water to make 100 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 20 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescence indicator for thin-layer chromatography. Next, develop the plate with a mixture of chloroform and ethanol (8 : 2) as the developing solvent, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the R_f values of the spots from the test solution and the standard solution are the same.

Sterility Meets the requirements.

Particulate contamination: Visible particles Meets the requirements.

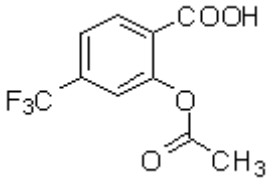
Insoluble particulate matter in ophthalmic solutions Meets requirements.

Assay Pipet an amount of Trifluridine Ophthalmic Solution, equivalent to about 50 mg of trifluridine ($C_{10}H_{11}O_5N_2F_3$), and add water to make exactly 50 mL. Take 5.0 mL of this solution, add 0.1 mol/L hydrochloric acid to make 50 mL, and use this solution as the test solution. Separately, weigh accurately about 50 mg of trifluridine RS, and add water to make 50 mL. Take 5.0 mL of this solution, add 0.1 mol/L hydrochloric acid to make 50 mL, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at 260 nm as directed under the Ultraviolet-visible Spectroscopy.

$$\text{Amount (mg) of trifluridine } (C_{10}H_{11}O_5N_2F_3) = \text{Amount (mg) of trifluridine RS} \times \frac{A_T}{A_S}$$

Packaging and storage Preserve in tight containers.

Triflusal
트리플루살



$C_{10}H_7F_3O_4$: 248.16
2-Acetyloxy-4-(trifluoromethyl)benzoic acid [*322-79-2*]

Triflusal contains NLT 98.5% and NMT 101.5% of triflusal ($C_{10}H_7F_3O_4$), calculated on the dried basis.

Description Triflusal occurs as a white powder.
It is very soluble in ethanol(95), freely soluble in dichloromethane and practically insoluble in water.

Melting point—About 118 ℃ (with decomposition).

Identification (1) Determine the infrared spectra of Triflusal and triflusal RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Purity (1) ***Clarity and color of solution*—**Dissolve 1.0 g of Triflusal in ethanol(95) to make 20 mL; the solution is clear.

(2) ***Heavy metals*—**Weigh 2.0 g of Triflusal, dissolve in 9 mL of ethanol(95) and add water to make 20 mL. To this solution, add 2 mL of dilute acetic acid and a mixture of ethanol(95) and water (9 : 6) to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution by adding 2.0 mL of dilute acetic acid and the mixture of ethanol(95) and water (9: 6) to 2.0 mL of the lead standard solution to make 50 mL (NMT 10 ppm).

(3) ***Triflusal related substance I*—**Weigh accurately 0.1 g of Triflusal, dissolve in the mobile phase to make exactly 25 mL, and use this solution as the test solution. Separately, weigh accurately 40 mg of triflusal related substance I (2-acetoxyterephthalic acid) RS and dissolve in the mobile phase to make exactly 100 mL. To this solution, add the mobile phase to make exactly 100 mL and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. The peak area of 2-acetoxyterephthalic acid obtained from the test solution is not greater than the area of the major peak obtained from the standard solution (NMT 0.1%).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 250 nm).

Column: A stainless steel column, 4.6 mm in inter-

nal diameter and 25 cm in length, packed with aminopropylsilyl silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of acetonitrile and 0.05 mol/L phosphate buffer (pH 4.5) (75 : 25).

Flow rate: 1.2 mL/min

System suitability

Perform the test with 20 μL of a mixture containing the same volume of the test solution and the standard solution according to the above operating conditions; the retention time of Triflusal and 2-acetoxyterephthalic acid is about 2.4 and 5 minutes, respectively.

(4) ***Triflusal related substance II***—Dissolve 0.1 g of Triflusal in 15 mL of ethanol(95), add 15 mL of cold water and 0.5 mL of 5 w/v% ammonium iron(III) sulfate, and allow to stand for 1 minute; the resulting solution is not more intense than the following control solution.

Control solution—Dissolve 10.0 mg of Triflusal related substance II [4-(trifluoromethylsalicylic acid)] in ethanol(95) to make exactly 100 mL. To 3 mL of the solution, add 0.1 mL of 0.5 w/v% ammonium iron(III) sulfate, 12 mL of ethanol(95) and 15 mL of water.

Loss on drying NMT 0.5% (1 g, in vacuum, phosphorus pentoxide).

Residue on ignition NMT 0.1% (1 g, platinum crucible).

Assay Weigh accurately about 0.2 g of Triflusal, dissolve in 50 mL of ethanol(95), and titrate with 0.1 mol/L sodium hydroxide VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS
= 24.82 mg of $C_{10}H_7F_3O_4$

Packaging and storage Preserve in tight containers below 25 ℃.

Triflusal Capsules
트리플루살 캡슐

Triflusal Capsules contain NLT 95.0% and NMT 105.0% of the labeled amount of triflusal ($C_{10}H_7F_3O_4$: 248.16).

Method of preparation Prepare as directed under Capsules, with Triflusal.

Identification Weigh an amount of Triflusal Capsules, equivalent to 0.1 g of triflusal, add acetonitrile to make 100 mL, and use this solution as the test solution. Separately, weigh 0.1 g of triflusal RS, add acetonitrile to make 100 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of hexane, acetone, and acetic acid(100) (10 : 4 : 1) as the developing solvent and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the R_f values of the spots obtained from the test solution and the standard solution are the same.

Uniformity of dosage units Meets the requirements.

Dissolution Take 1 capsule of Triflusal Capsules and perform the test at 100 revolutions per minute according to Method 1, using 900 mL of a mixture of 5 L of pH 4.5 acetic acid buffer solution and 2,500 mL of 1-propanol as the dissolution medium. Filter the dissolved solution 45 minutes after the start of the test. To 5.0 mL of the filtrate, add dissolution medium to make 20 mL, and use this solution as the test solution. Separately, weigh accurately about 33 mg of triflusal RS and add the dissolution medium to make 100 mL. Take 5.0 mL of this solution, add the dissolution medium to make 20 mL, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at the wavelength of 270 nm as directed under the Ultraviolet-visible Spectroscopy.
It meets the requirements if the dissolution rate of Triflusal Capsules in 45 minutes is NLT 70%.

Purity Weigh accurately the mass of the contents of NLT 20 capsules of Triflusal Capsules. Weigh accurately an amount equivalent to about 0.15 g (potency) of triflusal, add acetonitrile to make 100 mL, and use this solution as the test solution. Separately, weigh accurately about 25 mg of 4-(trifluoromethyl)salicylic acid RS and add acetonitrile to make 100 mL. Take 3.0 mL of this solution, add acetonitrile to make 25 mL, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at the wavelength of 324 nm as directed under the Ultraviolet-visible Spectroscopy with acetonitrile as a control solution.

$$\text{Content (\%) of 4-(trifluoromethyl)salicylic acid} = \frac{\text{Amount (mg) of the reference standard}}{\text{Amount (mg) of the sample}} \times \frac{A_T}{A_S} \times 12$$

Assay Weigh accurately the mass of the contents of NLT 20 capsules of Triflusal Capsules. Weigh accurately an amount equivalent to about 0.1 g of triflusal ($C_{10}H_7F_3O_4$), add the mobile phase to make exactly 25 mL, and use this solution as the test solution. Separately, weigh accurately about 0.1 g of triflusal RS, add the mobile phase to make 25 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and

determine the peak areas, A_T and A_S, of triflusal in each solution.

$$\text{Amount (mg) of triflusal } (C_{10}H_7F_3O_4) = \text{Amount (mg) of triflusal RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption spectrophotometer (wavelength: 250 nm).

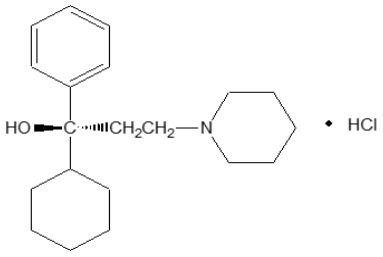
Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with aminopropylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of acetonitrile and 0.05 mol/L phosphate buffer solution (pH 4.5) (75 : 25).

Flow rate: 1.2 mL/min

Packaging and storage Preserve in tight containers.

Trihexyphenidyl Hydrochloride
트리헥시페니딜염산염



and enantiomer

$C_{20}H_{31}NO \cdot HCl$: 337.93

1-Cyclohexyl-1-phenyl-3-piperidin-1-ylpropan-1-ol hydrochloride [*52-49-3*]

Trihexyphenidyl Hydrochloride, when dried, contains NLT 98.5% and NMT 101.0% of trihexyphenidyl hydrochloride ($C_{20}H_{31}NO \cdot HCl$).

Description Trihexyphenidyl Hydrochloride ($C_{20}H_{31}NO \cdot HCl$) occurs as a white crystalline powder. It is odorless and has a bitter taste.

It is soluble in ethanol(95), sparingly soluble in acetic acid(100), slightly soluble in water, very slightly soluble in acetic anhydride and practically insoluble in ether.

Melting point—About 250 °C (with decomposition).

Identification (1) Determine the infrared spectra of Trihexyphenidyl Hydrochloride and trihexyphenidyl hydrochloride RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) To 1 g of Trihexyphenidyl Hydrochloride, add 100 mL of water, dissolve by warming, and cool. The solution responds to the Qualitative Analysis (2) for chloride.

pH Dissolve 1.0 g of Trihexyphenidyl Hydrochloride in 100 mL of water by warming; the pH of the solution is between 5.0 and 6.0.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Trihexyphenidyl Hydrochloride in 100 mL of water by warming; the solution is colorless and clear.

(2) ***Heavy metals***—Dissolve 1.5 g of Trihexyphenidyl Hydrochloride in 60 mL of water by warming on a steam bath at 80 °C, cool, and filter. To 40 mL of the filtrate, add 2 mL of dilute nitric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution by adding 2.0 mL of dilute acetic acid and water to 2.0 mL of the lead standard solution to make 50 mL (NMT 20 ppm).

(3) ***Related substances***—Weigh accurately 20 mg of Trihexyphenidyl Hydrochloride, dissolve in 10 mL of the mobile phase, and use this solution as the test solution. To 1.0 mL of the test solution, add the mobile phase to make 200 mL. Pipet 10 mL of this solution, add the mobile phase to make 50 mL, and use this solution as the standard solution (1). Separately, weigh accurately about 10 mg of trihexyphenidyl related substance I {1-phenyl-3-(pyperidin-1-yl)propan-1-one} RS, dissolve in 10 mL of the mobile phase, and use this solution as the standard solution (2). Pipet 1.0 mL of the standard solution (2), add the mobile phase to make 100 mL, and use this solution as the standard solution (3). Pipet 1 mL of the standard solution (2) and 1 mL of the test solution, add the mobile phase to make 100 mL, and use this solution as the standard solution (4). Perform the test with each 20 μL of the test solution and the standard solutions (1), (3), and (4) as directed under the Liquid Chromatography according to the following conditions. The peak area of trihexyphenidyl related substance I obtained from the test solution is not larger than the area of the major peak from the standard solution (3) (NMT 0.5%), and the peak area of any other related substance is not larger than the area of the major peak from the standard solution (1) (NMT 0.1%). The total area of related substances is NMT 0.5%. Exclude any peak of which the area is less than 0.2 times the area of the major peak from the standard solution (1) (0.02%).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 210 nm).

Column: A stainless steel column about 5 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 45 °C.

Mobile phase: Mix 200 mL of water with 0.2 mL of triethylamine and adjust the pH of the solution to 4.0 with phosphoric acid. To this solution, add 800 mL of acetonitrile.

Flow rate: 1.0 mL/min

System suitability

System performance: Proceed with 20 μL of the standard solution (4) according to the above operating conditions and perform the test; the resolution of the peaks of trihexyphenidyl and trihexyphenidyl related substance I is NLT 4.0.

Time span of measurement: About 3 times the retention time of trihexyphenidyl.

Loss on drying NMT 0.5% (1 g, 105 ℃, 3 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.5 g of Trihexyphenidyl Hydrochloride, previously dried, dissolve in 50 mL of ethanol and 5.0 mL of 0.01 mol/L hydrochloric acid TS, and titrate with 0.1 mol/L sodium hydroxide VS from 1st equivalent point and 2nd equivalent point (potentiometric titration under the Titrimetry).

Each mL of 0.1 mol/L sodium hydroxide VS
= 33.793 mg of $C_{20}H_{31}NO \cdot HCl$

Packaging and storage Preserve in tight containers.

Trihexyphenidyl Hydrochloride Tablets
트리헥시페니딜염산염 정

Trihexyphenidyl Hydrochloride Tablets contain NLT 93.0% and NMT 107.0% of the labeled amount of trihexyphenidyl hydrochloride ($C_{20}H_{31}NO \cdot HCl$: 337.93).

Method of preparation Prepare as directed under Tablets, with Trihexyphenidyl Hydrochloride.

Identification The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay., and the ultraviolet-visible absorption spectrum at 190 to 300 nm is the same.

Dissolution Take 1 tablet of Trihexyphenidyl Hydrochloride Tablets, add 900 mL of pH 6.8 phosphate buffer solution (1 in 2), previously diluted with the dissolution medium, and perform the test at 50 revolutions per minute according to Method 2. Take 30 mL of the dissolved solution 30 minutes after starting the test, and filter through a membrane filer with a pore size of NMT 0.8 μm. Discard the first 10 mL of the filtrate and use the subsequent filtrate as the test solution. Separately, weigh accurately about 10 mg of trihexyphenidyl hydrochloride RS, previously dried at 105 ℃ for 3 hours, and dissolve in diluted pH 6.8 phosphate buffer solution (1 in 2) to make exactly 100 mL. Pipet 2 mL of this solution, add diluted pH 6.8 phosphate buffer solution (1 in 2) to make exactly 100 mL, and use this solution as the standard solution. Pipet 20 mL each of the test solution, the standard solution and the diluted phosphate buffer solution, pH 6.8 (1 in 2), add exactly 1 mL of diluted acetic acid (1 in 10) and then immediately 5 mL of bromocresol green-sodium hydroxide-acetic acid-sodium acetate TS, respectively, and shake to mix. Add exactly 10 mL of dichloromethane, shake well to mix, and centrifuge. Using the dichloromethane layer as the control solution, perform the test as directed under the Ultraviolet-visible Spectroscopy. Determine the absorbances, A_T, A_S and A_B, at the wavelength of 415 nm.
It meets the requirements when the dissolution rate of Trihexyphenidyl Hydrochloride Tablets for 30 minutes is NLT 70%.

Dissolution rate (%) of the labeled amount of trihexyphenidyl hydrochloride ($C_{20}H_{31}NO \cdot HCl$)

$$= W_S \times \frac{A_T - A_B}{A_S - A_B} \times \frac{1}{C} \times 18$$

W_S: Amount (mg) of RS
C: Amount (mg) of the labeled amount of trihexyphenidyl hydrochloride ($C_{20}H_{31}NO \cdot HCl$) contained in 1 tablet

Uniformity of dosage units It meets the requirements when the Procedure for content uniformity is performed according to the following method.
Take 1 tablet of Trihexyphenidyl Hydrochloride Tablets, add 2 mL of dilute hydrochloric acid and 60 mL of water, shake vigorously for 10 minutes to disintegrate, and warm on a steam bath for 10 minutes with occasional shaking. After cooling, add 2 mL of methanol, and add water to obtain exactly V mL of a solution containing about 20 μg of trihexyphenidyl hydrochloride ($C_{20}H_{31}NO \cdot HCl$) per mL. If necessary, centrifuge, and use the clear supernatant as the test solution. Separately, weigh accurately about 20 mg of trihexyphenidyl hydrochloride RS (previously dried at 105 ℃ for 3 hours), and dissolve in methanol to make exactly 20 mL. Pipet 2 mL of this solution, add 2 mL of dilute hydrochloric acid, add water to make exactly 100 mL, and use this solution as the standard solution. Pipet 10 mL each of the test solution and the standard solution, transfer to glass-stoppered centrifuge tube, add 10 mL of bromocresol purple-dibasic potassium phosphate-citric acid TS and 15 mL of chloroform and stopper. Shake well to mix, and centrifuge. Pipet 10 mL of the chloroform layer from each tube, add chloroform to make exactly 50 mL. Perform the test with these solutions as directed under the Ultraviolet-visible Spectroscopy and determine the absorbances, A_T and A_S, at the wavelength of 408 nm.

Amount (mg) of trihexyphenidyl hydrochloride ($C_{20}H_{31}NO \cdot HCl$)
= Amount (mg) of trihexyphenidyl hydrochloride RS, calculated on the dried basis $\times \frac{A_T}{A_S} \times \frac{V}{1000}$

Assay Take 20 tablets of Trihexyphenidyl Hydrochloride Tablets, transfer to 0.1 mol/L hydrochloric acid, the amount equivalent to 10% of the entire solution, and sonicate for 10 minutes for complete disintegration. To this, add the mobile phase, the amount equivalent to 40% of

the entire solution, shake for 10 minutes, and cool at the ordinary temperature. To this, add 50% of the entire solution, mix, and filter to obtain a solution containing 0.2 mg of trihexyphenidyl hydrochloride ($C_{20}H_{31}NO \cdot HCl$) per mL according to the labeled amount. Use this solution as the test solution. Separately, weigh accurately about 20 mg of trihexyphenidyl hydrochloride RS, dissolve in the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the peak areas, A_T and A_S, of trihexyphenidyl hydrochloride in each solution.

Amount (mg) of trihexyphenidyl hydrochloride ($C_{20}H_{31}NO \cdot HCl$)
= Amount (mg) of trihexyphenidyl hydrochloride RS $\times \frac{A_T}{A_S}$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 210 nm). However, use a photo-diode array detector (190 to 300 nm) when the Identification is performed.

Column: A stainless steel column about 4.6 mm in internal diameter and about 8 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 μm in particle diameter).

Mobile phase: To a mixture of acetonitrile, water and triethylamine (920 : 80 : 0.2), add phosphoric acid to adjust the pH to 4.0.

Flow rate: 2.0 mL/min

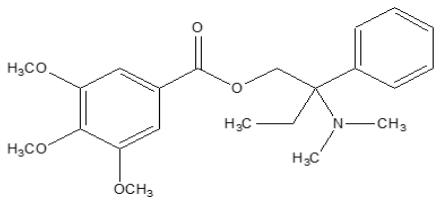
System suitability

System performance: Proceed with 10 μL of the standard solution according to the above conditions; the number of theoretical plate and the symmetry factor of the trihexyphenidyl hydrochloride peak is NLT 1300 and NMT 3.0, respectively.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area of trihexyphenidyl hydrochloride is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Trimebutine
트리메부틴



$C_{22}H_{29}NO_5$: 387.48

2-(Dimethylamino)-2-phenylbutyl 3,4,5-trimethoxybenzoic acid ester, [*39133-31-8*]

Trimebutine contains NLT 98.5% and NMT 101.0% of trimebutine ($C_{22}H_{29}NO_5$: 387.48), calculated on the anhydrous basis.

Description Trimebutine occurs as a white, crystalline powder and is odorless.
It is very soluble in chloroform, freely soluble in ethanol, slightly soluble in hexane and practically insoluble in water.

Identification (1) Dissolve 2 mg of Trimebutine in 100 mL of 0.1 mol/L hydrochloric acid and determine the absorption spectrum of the solution as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum at around 267 nm.

(2) Determine the infrared spectra of Trimebutine and trimebutine RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Melting point Between 78 and 84 ℃.

Purity ***Heavy metals***—Perform the test with 1.0 g of Trimebutine according to Method 1. Prepare the control solution with 2.0 mL of the lead standard solution (NMT 20 ppm).

Water NMT 0.5% (0.5 g, volumetric titration, direct titration).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.3 g of Trimebutine, dissolve in 50 mL of acetic acid(100) for non-aqueous titration, and titrate with 0.1 mol/L perchloric acid VS (indicator: methylrosaniline chloride TS). However, the endpoint is when the solution changes from violet to dark green. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 38.748 mg of $C_{22}H_{29}NO_5$

Packaging and storage Preserve in tight containers.

Trimebutine Syrup
트리메부틴 시럽

Trimebutine syrup is a syrup to be dissolved before use, and contains NLT 95.0% and NMT 105.0% of the labeled amount of trimebutine ($C_{22}H_{29}NO_5$: 387.47).

Method of preparation Prepare as directed under Syrups, with Trimebutine.

Identification The retention time of the major peak of

the test solution corresponds to that of the standard solution, as obtained in the Assay.

Uniformity of dosage units (distribution) Meets the requirements.

pH Dissolve Trimebutine Syrup in water according to the directions for use; the pH of this solution is between 7.2 and 8.2.

Assay Pipet an amount of Trimebutine Syrup, equivalent to about 20 mg of trimebutine ($C_{22}H_{29}NO$), according to the labeled amount, add a mixture of 0.01 mol/L hydrochloric acid TS and acetonitrile (13 : 7) to make exactly 100 mL, filter, and use the filtrate as the test solution. Separately, weigh accurately about 20 mg of trimebutine RS, dissolve in a mixture of 0.01 mol/L hydrochloric acid TS and acetonitrile (13 : 7) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions, and determine the peak areas, A_T and A_S, of trimebutine, respectively.

$$\text{Amount (mg) of trimebutine } (C_{22}H_{29}NO) = \text{Amount (mg) of trimebutine RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption spectrophotometer (wavelength: 254 nm).

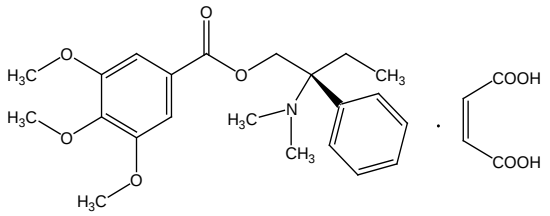
Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: Dissolve 1 g of sodium 1-pentanesulfonate in 650 mL of a solution prepared by adjusting the pH of a dilute perchloric acid solution (17 in 20000) to 3.0 with an ammonium acetate solution (1 in 1000), filter with a membrane filter, and add 350 mL of acetonitrile to the filtrate.

Flow rate: 1.0 mL/min

Packaging and storage Preserve in tight containers.

Trimebutine Maleate
트리메부틴말레산염



and enantiomer

$C_{22}H_{29}NO_5 \cdot C_4H_4O_4$:503.54

(*Z*)-but-2-Enedioicacid;[2-(Dimethylamino)-2-phenylbutyl]3,4,5-trimethoxybenzoate [*34140-59-5*]

Trimebutine Maleate, when dried, contains NLT 98.5% and NMT 101.0% of Trimebutine Maleate ($C_{22}H_{29}NO_5 \cdot C_4H_4O_4$).

Description Trimebutine Maleate occurs as white crystals or a crystalline powder.

It is freely soluble in *N*,*N*-dimethylformamide or acetic acid(100), soluble in acetonitrile and slightly soluble in water or ethanol(99.5).

It dissolves in 0.01 mol/L hydrochloric acid TS.

A solution of Trimebutine Maleate in *N*,*N*-dimethylformamide (1 in 20) exhibits no optical rotation.

Identification (1) Determine the absorption spectra of solutions of Trimebutine Maleate and trimebutine maleate RS in 0.01 mol/L hydrochloric acid TS (1 in 50000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Trimebutine Maleate and trimebutine maleate RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Melting point Between 131 and 135 ℃.

Purity (1) ***Heavy metals*—**Proceed with 2.0 g of Trimebutine Maleate according to Method 2 under the Heavy Metals and perform the test. Prepare the control solution with 2.0 mL of the lead standard solution (NMT 10 ppm).

(2) ***Arsenic*—**Proceed with 2.0 g of Trimebutine Maleate according to Method 3 and perform the test (NMT 1 ppm).

(3) ***Related substances***—Dissolve 0.10 g of Trimebutine Maleate in 100 mL of a mixture of hydrochloric acid TS and acetonitrile (13 : 7), and use this solution as the test solution. Pipet 1.0 mL of this solution, add a mixture of 0.01 mol/L hydrochloric acid TS and acetonitrile (13 : 7) to make exactly 250 mL, and use this solution as the standard solution. Perform the test with each 20 μL of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak areas of each solution

by the automatic integration method; the area of each peak other than trimebutine and maleic acid from the test solution is not larger than 0.5 times the peak area of trimebutine from the standard solution. The total area of the peaks other than trimebutine and maleic acid from the test solution is not larger than the peak area of trimebutine from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: Add ammonium acetate solution (1 in 1000) to diluted perchloric acid (17 in 20000) and adjust the pH to 3.0. Dissolve 650 mL of this solution in 1 g of sodium 1-pentanesulfonate. To 650 mL of this solution, add 350 mL of acetonitrile.

Flow rate: Adjust the flow rate so that the retention time of trimebutine is about 9 minutes.

System suitability

Test for required detectability: Pipet 5 mL of the standard solution, add a mixture of 0.01 mol/L Hydrochloric acid TS and acetonitrile (13 : 7) to make 20 mL. Confirm that the peak area of trimebutine obtained from 20 μL of this solution is equivalent to between 20 and 30% of that of trimebutine from the standard solution.

System performance: Dissolve 40 mg of Trimebutine Maleate and 20 mg of Imipramine Hydrochloride in 100 mL of a mixture of 0.01 mol/L hydrochloric acid TS and acetonitrile (13 : 7). Proceed with 20 μL of this solution according to the above operating conditions; trimebutine and imipramine are eluted in this order with the resolution being NLT 2.5.

System repeatability: Perform the test 6 times with each 20 μL of the standard solution according to the above operating conditions; the relative standard deviation of the peak area of trimebutine is NMT 5.0%.

Time span of measurement: About 2 times the retention time of trimebutine after the maleic acid peak.

Loss on drying NMT 0.5% (1 g, 105 °C, 3 hours).

Residue on Ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.8 g of Trimebutine Maleate, previously dried, dissolve in 70 mL of acetic acid(100), and titrate with 0.1 mol/L perchloric acid VS (indicator: 3 drops of methylrosaniline chloride TS). The endpoint of the titration is when the color of the solution changes from violet through blue to bluish green. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 50.35 mg of $C_{22}H_{29}NO_5 \cdot C_4H_4O_4$

Packaging and storage Preserve in well-closed containers.

Trimebutine Maleate Tablets
트리메부틴말레산염 정

Trimebutine Maleate Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of trimebutine maleate ($C_{22}H_{29}NO_5\,C_4H_4O_4$: 503.55).

Method of preparation Prepare as directed under Tablets, with Trimebutine Maleate.

Identification The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

Purity ***Related substances*—**Weigh accurately the mass of NLT 20 tablets of Trimebutine Maleate Tablets and powder them. Weigh accurately an amount, equivalent to about 0.1 g of trimebutine maleate ($C_{22}H_{29}NO_5 \cdot C_4H_4O_4$), add 60 mL of 0.01 mol/L hydrochloric acid TS, warm on a steam bath for 5 minutes, and shake for 15 minutes to mix. After cooling, add 35 mL of acetonitrile and then 0.01 mol/L hydrochloric acid TS to make exactly 100 mL, and centrifuge. Filter the clear supernatant, discard the first 20 mL of the filtrate, pipet 10 mL of the subsequent filtrate, and add 5 mL of acetonitrile and then water to make exactly 25 mL. Use the resulting solution as the test solution. Separately, weigh accurately 0.1 g of trimebutine maleate RS, add 60 mL of 0.01 mol/L hydrochloric acid TS, and warm on a steam bath to dissolve. After cooling, add 0.01 mol/L hydrochloric acid TS to make exactly 100 mL. Pipet 1 mL of this solution, add 35 mL of acetonitrile, add 0.01 mol/L hydrochloric acid TS to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak areas in each solution according to the automatic integration method; the sum of peak areas other than trimebutine from the test solution is not larger than the peak area of trimebutine from the standard solution.

Operating conditions

For the detector, column, column temperature, mobile phase, flow rate and selection of column, proceed as directed under the operating conditions in the Assay.

Detection sensitivity: Adjust the sensitivity so that the peak height of trimebutine obtained from 20 μL of the standard solution is 3 to 10 mm.

Time span of area measurement: About twice the retention time of trimebutine after the peak of maleic acid.

Dissolution Perform the test with 1 tablet of Theophyl-

line Tablets at 50 revolutions per minute according to Method 2 under the Dissolution, using 900 mL of Solution 1 in the Dissolution as the dissolution medium. Take the dissolved solution 45 minutes after starting the test and filter it. Discard the first 10 mL of the filtrate, pipet *V* mL of the subsequent filtrate, and add Solution 1 under the Dissolution to obtain exactly *V′* mL of a solution containing 100 μg of trimebutine maleate per mL according to the labeled amount. Separately, weigh accurately about 100 mg of trimebutine maleate RS and dissolve in Solution 1 in the Dissolution to make exactly 100 mL. Pipet 10 mL of this solution, add Solution 1 in the Dissolution to make 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and measure the peak areas, A_T and A_S, of trimebutine maleate ($C_{22}H_{29}NO_5 \cdot C_4H_4O_4$) in each solution. The dissolution rate of Trimebutine Maleate Tablets is NLT 75% in 45 minutes.

Dissolution rate (%) of the labeled amount of trimebutine maleate ($C_{22}H_{29}NO_5 \cdot C_4H_4O_4$)

$$= W_S \times \frac{V'}{V} \times \frac{A_T}{A_S} \times \frac{1}{C}$$

*W*s: Amount (mg) of trimebutine maleate RS

C: Labeled amount (mg) of trimebutine maleate ($C_{22}H_{29}NO_5 \cdot C_4H_4O_4$) contained in 1 tablet

Operating conditions

Detector: An ultraviolet absorption spectrophotometer (wavelength: 269 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 35 ℃.

Mobile phase: A mixture of Solution A and acetonitrile (65 : 35).

Flow rate: 1.0 mL/min

Solution A—A solution obtained by dissolving 1 g of sodium 1-pentanesulfonate in 650 mL of a solution of dilute perchloric acid (17 in 20,000) adjusted the pH to 3.0 with the ammonium acetate solution.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 tablets of Trimebutine Maleate Tablets and powder them. Weigh accurately an amount, equivalent to about 100 mg of trimebutine maleate ($C_{22}H_{29}NO_5 \cdot C_4H_4O_4$), and dissolve in 50% methanol to make exactly 100 mL. Filter this solution, take 10 mL of the filtrate, add the mobile phase to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately 100 mg of trimebutine maleate RS and dissolve in 50% methanol to make exactly 100 mL. Pipet 10 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and measure the peak areas, A_T and A_S, in each solution.

Amount (mg) of trimebutine maleate ($C_{22}H_{29}NO_5 \cdot C_4H_4O_4$)

$$= \text{Amount (mg) of trimebutine maleate RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption spectrophotometer (wavelength: 269 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 35 ℃.

Mobile phase: A mixture of Solution A and acetonitrile (65 : 35).

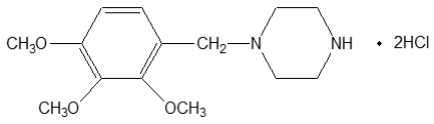
Flow rate: 1.0 mL/min

System suitability

System repeatability: Repeat the test 6 times with 20 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area of trimebutine maleate is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Trimetazidine Hydrochloride
트리메타지딘염산염



$C_{14}H_{22}N_2O_3 \cdot 2HCl$: 339.26

1-[(2,3,4-Trimethoxyphenyl)methyl]piperazine dihydrochloride [*13171-25-0*]

Trimetazidine Hydrochloride contains NLT 98.0% and NMT 101.0% of trimetazidine hydrochloride ($C_{14}H_{22}N_2O_3 \cdot 2HCl$), calculated on the anhydrous basis.

Description Trimetazidine Hydrochloride occurs as a white crystalline powder.

It is very soluble in water or formic acid, soluble in methanol, and practically insoluble in ether.

Dissolve 1.0 g of Trimetazidine Hydrochloride in 20 mL of water; the pH of the solution is between 2.3 and 3.3.

Melting point—About 227 °C (with decomposition).

Identification (1) Determine the absorption spectra of solutions of Trimetazidine Hydrochloride and trimetazidine hydrochloride RS in 0.1 mol/L hydrochloric acid TS (1 in 6250) as directed under the Ultraviolet-visible

Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Trimetazidine Hydrochloride and trimetazidine hydrochloride RS as directed in the potassium chloride disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) An aqueous solution of Trimetazidine Hydrochloride (1 in 50) responds to the Qualitative Analysis for chloride.

Purity (1) ***Heavy metals***—Proceed with about 2.0 g of Trimetazidine Hydrochloride according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of the lead standard solution (NMT 10 ppm).

(2) ***Related substances***—Dissolve 0.2 g of Trimetazidine Hydrochloride in 50 mL of water and use this solution as the test solution. Pipet 2 mL of the test solution and add water to make exactly 20 mL. Pipet 2 mL of the resulting solution, add water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with each 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak areas of the test solution and standard solution by the automatic integration method; the area of any peak other than trimetazidine from the test solution is not larger than 1.5 times the peak area of Trimetazidine from the standard solution. The total area of the peaks other than trimetazidine from the test solution is not larger than 2.5 times the peak area of trimetazidine from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 240 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: Control the mixing ratio of mobile phase A and mobile phase B stepwise or via the gradient elution as follows.

Mobile phase A: A mixture prepared by dissolving 2.87 g of sodium 1-heptanesulfonate in water to make 1000 mL and adjusting the pH to 3.0 with diluted phosphoric acid (1 in 10) and methanol (3 : 2).

Mobile phase B: Methanol

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 - 50	95 → 75	5 → 25

Flow rate: Adjust the flow rate so that the retention time of trimetazidine is about 25 minutes.

Time span of measurement: About 2 times the retention time of trimetazidine after the solvent peak.

System suitability

Test for required detectability: Pipet 5 mL of the standard solution and add water to make exactly 20 mL. Confirm that the peak area of trimetazidine obtained with 10 μL of this solution is equivalent to 18 to 32% of the peak area of trimetazidine obtained with 10 μL of the standard solution.

System performance: Proceed with 10 μL of the standard solution according to the above operating conditions; the number of theoretical plates and symmetry factor of the trimetazidine peak are NLT 15000 and NMT 1.5, respectively.

System repeatability: Perform the test 6 times with 10 μL each of the standard solution according to the above operating conditions; the relative standard deviation of the peak area of trimetazidine is NMT 2.0%.

Water NMT 1.5% (2 g, volumetric titration, direct titration).

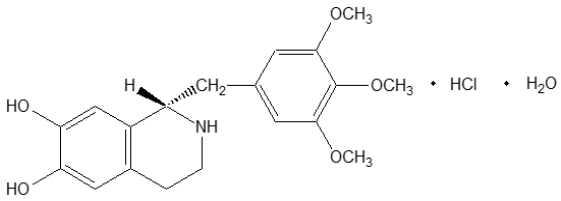
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.12 g of Trimetazidine Hydrochloride, dissolve in 5 mL of formic acid, add exactly 15 mL of 0.1 mol/L perchloric acid, and heat at 90 to 100℃ for 30 minutes. After cooling, add 45 mL of acetic acid(100) and titrate the excess perchloric acid with 0.1 mol/L sodium acetate VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner.

Each mL of 0.1 mol/L perchloric acid VS
= 16.963 mg of $C_{14}H_{22}N_2O_3 \cdot 2HCl$

Packaging and storage Preserve in tight containers.

Trimetoquinol Hydrochloride Hydrate
트리메토퀴놀염산염수화물



Trimetoquinol Hydrochloride

$C_{19}H_{23}NO_5 \cdot HCl \cdot H_2O$: 399.87

1-(3,4,5-Trimethoxybenzyl)-1,2,3,4-tetrahydro-6,7-isoquinolinediol hydrate hydrochloride [*8559-59-6,* anhydride]

Trimetoquinol Hydrochloride Hydrate contains NLT 98.0% and NMT 101.0% of Trimetoquinol Hydrochloride ($C_{19}H_{23}NO_5 \cdot HCl$: 381.85), calculated on the anhydrous basis.

Description Trimetoquinol Hydrochloride Hydrate occurs as white crystals or a crystalline powder and is odorless.

It is freely soluble in methanol or water and sparingly soluble in ethanol(99.5).

Melting point—About 151 ℃ (with decomposition, in vacuum, dried for 4 hours at 105 ℃).

Identification (1) Determine the absorption spectra of solutions of Trimetoquinol Hydrochloride Hydrate and trimetoquinol hydrochloride hydrate RS in 0.01 mol/L hydrochloric acid TS (1 in 20000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Trimetoquinol Hydrochloride Hydrate and trimetoquinol hydrochloride hydrate RS as directed in the potassium chloride disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) An aqueous solution of Trimetoquinol Hydrochloride Hydrate (1 in 50) responds to the Qualitative Analysis (1) for chloride.

Optical rotation $[\alpha]_D^{20}$: Between -16° and -19° (0.25 g calculated on the anhydrous basis, water, warming, after cooling, 25 mL, 100 mm).

pH Dissolve about 1.0 g of Trimetoquinol Hydrochloride Hydrate in 100 mL of water by warming; the pH of the solution is between 4.5 and 5.5.

Purity (1) ***Clarity and color of solution***—Dissolve 0.10 g of Trimetoquinol Hydrochloride Hydrate in 10 mL of water by warming; the solution is colorless and clear.

(2) ***Sulfate***—Weigh 0.5 g of Trimetoquinol Hydrochloride Hydrate and perform the test. Prepare the control solution with 0.40 mL of 0.005 mol/L sulfuric acid (NMT 0.038%).

(3) ***Heavy metals***—Proceed with 1.0 g of Trimetoquinol Hydrochloride Hydrate according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(4) ***Related substances***—Dissolve about 50 mg of Trimetoquinol Hydrochloride Hydrate in 50 mL of the mobile phase and use this solution as the test solution. Pipet 1 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with each 20 μL of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak area of each peak from the test solution and the standard solution by the automatic integration method; the total area of the peaks other than trimetoquinol from the test solution is not larger than the peak area of trimetoquinol from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 283 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: Dissolve 2 g of potassium dihydrogen phosphate and 2 g of sodium 1-pentanesulfonate in 1000 mL of water. Adjust the pH of the solution to 2.8 to 3.2 with phosphoric acid and filter with a membrane filter (0.4 μm in pore size). Take 800 mL of the filtrate and add 200 mL of acetonitile.

Flow rate: Adjust the flow rate so that the retention time of trimetoquinol is about 7 minutes.

System suitability

Test for required detectability: Pipet 2 mL of the standard solution and add the mobile phase to make exactly 20 mL. Confirm that the peak area of trimetoquinol obtained from 20 μL of this solution is equivalent to 7 to 13% of that of trimetoquinol from the standard solution.

System performance: Dissolve 5 mg of Trimetoquinol Hydrochloride Hydrate and 1 mg of Procaine Hydrochloride in 50 mL of the mobile phase. Proceed with 20 μL of this solution according to the above operating conditions; procaine and trimetoquinol are eluted in this order with the resolution being NLT 4.

System repeatability: Perform the test 6 times with 20 μL each of the standard solution according to the above operating conditions; the relative standard deviation of the peak area of trimetoquinol is NMT 2.0%.

Time span of measurement: About 2 times the retention time of the trimetoquinol after the solvent peak.

Water Between 3.5% and 5.5% (0.3 g, volumetric titration, direct titration).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.5 g of Trimetoquinol Hydrochloride Hydrate, add 2 mL of 0.1 mol/L hydrochloric acid and 70 mL of ethanol(99.5), dissolve by stirring well to mix, and titrate with 0.1 mol/L potassium hydroxide-ethanol VS (potentiometric titration under the Titrimetry). Determine the amount of 0.1 mol/L potassium hydroxide-ethanol VS between the first inflection point and the second inflection point.

Each mL of 0.1 mol/L potassium hydroxide-ethanol VS
= 38.185 mg of $C_{19}H_{23}NO_5 \cdot HCl$

Packaging and storage Preserve in light-resistant, well-closed containers.

Tripotassium Bismuth Dicitrate
비스무트시트르산염칼륨

Tripotassium Bismuth Dicitrate, when dried, contains NLT 39.0% and NMT 42.0% of bismuth oxide (Bi_2O_3 : 465.96) and NLT 10.8% and NMT 13.2% of potassium (K : 39.10).

Description Tripotassium Bismuth Dicitrate occurs as a white to milky white powder and has an ammonia-like odor.

Identification Weigh about 1 g of Tripotassium Bismuth Dicitrate and dissolve in 10 mL of water; the resulting solution responds to the Qualitative Analysis for potassium salt, citrate and bismuth salt.

pH Between 6.0 and 8.0 (10% aqueous solution).

Purity (1) ***Clarity and color of solution***—Dissolve 0.10 g of Tripotassium Bismuth Dicitrate in 10 mL of water; the resulting solution is not more intense than the following control solution.

Control solution—Weigh 46.0 g of ferric chloride and dissolve in 25 mL of hydrochloric acid and water to make 1000 mL. To 1.25 mL of this solution, add 8.75 mL of water, and use this solution as the control solution.

(2) ***Chloride***—Weigh about 1.0 g of Tripotassium Bismuth Dicitrate and dissolve in water to make 100.0 mL. With 25.0 mL of this solution, perform the test as directed under the Chloride. Prepare the control solution with 0.13 mL of 0.01 mol/L hydrochloric acid (NMT 0.018%).

Loss on drying NMT 5.0% (1 g, 105 ℃, 3 hours).

Assay (1) ***Bismuth oxide***—Weigh accurately about 1.0 g of Tripotassium Bismuth Dicitrate, previously dried, dissolve in 20 mL of diluted nitric acid (2 in 5), add water to make exactly 100 mL, and filter. Pipet 50 mL of this solution, add 100 mL of water, and titrate with 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS (indicator: 5 drops of xylenol orange TS). The endpoint of the titration is when the reddish purple color of the solution changes to yellow.

Each mL of 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS
= 11.65 mg of Bi_2O_3

(2) ***Potassium***—Weigh accurately about 0.17 g of Tripotassium Bismuth Dicitrate [an amount equivalent to about 20 mg of potassium (K)], previously dried, and dissolve in water to make 100 mL. Pipet 1.0 mL of this solution, add 5.0 mL of 2% sodium chloride and water to make 100 mL, and use this solution as the test solution (about 2 μg/mL of potassium). Separately, weigh accurately about 190 mg of potassium chloride standard reagent, previously dried at 105 °C for 2 hours, and add water to make 1000 mL (about 100 μg/mL of potassium). Pipet a certain amount of this solution, add 5.0 mL each of 2% sodium chloride, add water to prepare a solution containing a range of 0 μg/mL - 25 μg/mL of potassium, and use this solution as the standard solution for calibration curve. Perform the test with the test solution and the standard solution as directed under the Atomic Absorption Spectroscopy according to the following conditions. Determine the potassium (K) content in the test solution based on the calibration curve obtained from the absorbance of the standard solution.

Gas: Air–acetylen
Lamp: Potassium hollow cathode lamp
Wavelength: 766 nm

Packaging and storage Preserve in well-closed containers.

Tripotassium Bismuth Dicitrate Tablets
비스무트시트르산염칼륨 정

Tripotassium Bismuth Dicitrate Tablets contain bixmuth oxide (Bi_2O_3: 465.96) equivalent to NLT 38.5% and NMT 42.5% and potassium equivalent to NLT 10.8% and NMT 13.2% of the labeled amount of tripotassium bismuth dicitrate.

Method of preparation Prepare as directed under Tablets, with Tripotassium Bismuth Dicitrate.

Identification Weight an amount equivalent to about 0.5 g of tripotassium bismuth dicitrate according to the labeled amount of Tripotassium Bismuth Dicitrate Tablets and add 20 mL of water to dissolve; the solution responds to the Qualitative Analysis for citrate, bismuth salt and potassium salt.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay (1) ***Bismuth oxide***—Weigh accurately the mass of NLT 20 Tripotassium Bismuth Dicitrate Tablets, and powder the tablets. Weigh accurately an amount equivalent to about 1 g of tripotassium bismuth dicitrate, dissolve in 20 mL of diluted nitric acid (2 in 5), add water to make 100.0 mL and filter. Take 50.0 mL of the filtrate, add 100 mL of water and titrate with 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS (indicator: 5 drops of xylenol orange TS). The endpoint of the titration is when the reddish purple color of the solution changes to yellow.

Each mL of 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS
= 11.650 mg of Bi_2O_3

(2) ***Potassium***—Weigh accurately the mass of NLT 20 Tripotassium Bismuth Dicitrate Tablets, and powder the tablets. Weigh accurately an amount equivalent to about 0.17 g of tripotassium bismuth dicitrate, dissove in water to make 100.0 mL, and filter. Discard the first 10 mL of the filtrate, take 1.0 mL of the subsequent filtrate, add 5.0 mL of 2% sodium chloride solution and water to

make 100 mL, and use this solution as the test solution (potassium about 2 μg/mL). Separately, dry potassium chloride for 2 hours at 105 ℃, weigh accurately about 190 mg of potassium chloride, and add water to make 1000 mL (potassium about 100 μg/mL). Pipet a certain amount of this solution, add 5.0 mL of 2% sodium chloride solution and water to prepare a solution with potassium concentration in range between 0 and 25 μg/mL, and use this solution as the standard solution for calibration curve. Perform the test with the test solution and the standard solution as directed under the Atomic Absorption Spectroscopy according to the following conditions. Determine potassium (K) content in the test solution with the calibration curve obtained from the absorbance of the standard solution.

Gas: Air–acetylene
Lamp: Potassium hollow cathode lamp
Wavelength: 766 nm

Packaging and storage Preserve in well-closed containers.

Tripotassium Bismuth Dicitrate, Sucralfate and Ranitidine Hydrochloride Tablets
비스무트시트르산염칼륨·수크랄페이트·라니티딘염산염 정

Tripotassium Bismuth Dicitrate, Sucralfate and Ranitidine Hydrochloride Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of bismuth oxide (Bi_2O_3 : 465.96) and potassium (K : 39.10) in tripotassium bismuth dicitrate, aluminum (Al : 26.98) and sucrose octasulfate ester ($C_{12}H_{22}O_{35}S_8$: 982.81) in sucralfate hydrate, and ranitidine ($C_{13}H_{22}N_4O_3S$: 314.40).

Method of preparation Prepare as directed Tablets, with Tripotassium Bismuth Dicitrate, Sucralfate Hydrate, and Ranitidine Hydrochloride.

Identification (1) ***Tripotassium Bismuth Dicitrate***—Weigh about 0.5 g of tripotassium bismuth dicitrate according to the labeled amount of Tripotassium Bismuth Dicitrate, Sucralfate and Ranitidine Hydrochloride Tablets, and dissolve in 20 mL of water; the resulting solution responds to the Qualitative Analysis for citrate, bismuth salt, and potassium salt.

(2) ***Sucralfate Hydrate***—(i) Dissolve 0.5 g of Sucralfate Hydrate in 10 mL of dilute hydrochloric acid; the solution responds to the Qualitative Analysis for aluminum salt.

(ii) Transfer 50 mg of Sucralfate Hydrate to a small test tube, add 50 mg of freshly cut pieces of sodium metal, and melt by careful heating. Immerse the test tube immediately in 100 mL of water, break the test tube, shake well to mix, and filter. To 5 mL of the filtrate, add 1 drop of sodium pentacyanonitrosylferrate(III) TS; the solution exhibits a reddish purple color.

(iii) Dissolve 40 mg of Sucralfate Hydrate in 2 mL of dilute sulfuric acid, and add gently 2 mL of anthrone TS to form 2 layers; the boundary layer exhibits a blue color, and gradually changes to bluish green.

(3) ***Ranitidine Hydrochloride***—(i) Weigh 0.22 g each of Tripotassium Bismuth Dicitrate, Sucralfate and Ranitidine Hydrochloride Tablets and ranitidine hydrochloride RS, dissolve in 100 mL of methanol, and use these solutions as the test solution and the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Separately, drop the test solution, and on top of the test solution, drop a solution prepared by dissolving 5-[[(2-aminoethyl)thio]methyl]-*N*,*N*-dimethyl-2-furan-methanamine in methanol so that the solution contains 1.27 mg per mL, and air-dry the plate. Develop the plate with a mixture of ethyl acetate, 2-propanol, ammonia water(28) and water (25 : 15 : 5 : 1) as a developing solvent so that the end of the developing solvent moves to a distance of about 15 cm from the starting line, and air-dry the plate. Then, expose the plate to iodine vapor until the chromatogram fully appears in a closed developing chamber. The R_f values and color of the spots from the test solution and the standard solution are the same.

(ii) The retention times of the major peaks obtained from the test solution and the standard solution in the Assay are the same.

(iii) Take a portion of the powdered Ranitidine Hydrochloride, weigh an amount, equivalent to about 100 mg of ranitidine, dissolve in 2 mL of water, and filter; the solution responds to the Qualitative Analysis for chloride.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay (1) ***Tripotassium Bismuth Dicitrate***—(i) Bismuth oxide: Weigh accurately the mass of NLT 20 Tripotassium Bismuth Dicitrate, Sucralfate and Ranitidine Hydrochloride Tablets, and powder them. Weigh accurately an amount, equivalent to about 1.0 g of tripotassium bismuth dicitrate, dissolve in 20 mL of diluted nitric acid (2 in 5), add water to make 100.0 mL, and filter. Take 50.0 mL of the filtrate, add 100 mL of water, and titrate with 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS. (5 drops of xylenol orange TS). The endpoint of the titration is when the reddish purple color of the solution changes to yellow. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS
= 11.649 mg of Bi2O3

(ii) Potassium*:* Weigh accurately the mass of NLT 20 Tripotassium Bismuth Dicitrate, Sucralfate and

Ranitidine Hydrochloride Tablets, and powder the tablets. Weigh accurately an amount equivalent to about 0.17 g of tripotassium bismuth dicitrate, dissolve in water to make 100.0 mL, and filter. Discard the first 10 mL of the filtrate, take 1.0 mL of the subsequent filtrate, add 5.0 mL of 2% sodium chloride solution and water to make 100 mL, and use this solution as the test solution (potassium about 2 μg/mL). Separately, weigh accurately about 190 mg of potassium chloride, previously dried at 105 °C for 2 hours, and add water to make 1000 mL (about 100 μg/mL of potassium). Pipet a suitable amount of this solution, add 5.0 mL each of 2% sodium chloride solution, add water to prepare a solution containing potassium in the concentration range of 0 μg/mL - 25 μg/mL, and use this solution as the standard solution for calibration curve. Perform the test with the test solution and the standard solution as directed under the Atomic Absorption Spectroscopy according to the following conditions. Determine potassium (K) content in the test solution with the calibration curve obtained from the absorbance of the standard solution.

Gas: Air–acetylene
Lamp: Potassium hollow cathode lamp
Wavelength: 766 nm

(2) ***Sucralfate hydrate***—(i) Aluminum: Weigh accurately the mass of NLT 20 Sucralfate Hydrate Tablets, and powder the tablets. Weigh accurately an amount equivalent to about 1.0 g of sucralfate hydrate, add 10 mL of dilute hydrochloric acid and dissolve by warming. Cool, and add water to make 250.0 mL. Pipet 25.0 mL of this solution, add 25.0 mL of 0.05 mol/L ethylenediaminetetraacetic acid disodium salt solution and 20 mL of acetic acid-ammonium acetate buffer solution, pH 4.5, and boil for 5 minutes. After cooling, add 50 mL of ethanol, and titrate the excess ethylenediaminetetraacetic acid disodium salt solution with 0.05 mol/L zinc acetate VS (indicator: 3 mL of dithizone TS). The endpoint of the titration is when the color of this solution changes from greenish purple through violet to red. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS
= 1.3491 mg of Al

(ii) Sucrose octasulfate ester*:* Weigh accurately the mass of NLT 20 Sucralfate Hydrate Tablets, and powder them. Weigh accurately an amount, equivalent to about 0.5 g of sucralfate, add 10.0 mL of sulfuric acid-sodium hydroxide TS, and shake vigorously to mix. Sonicate the mixture for 5 minutes to dissolve while maintaining the temperature below 30 ℃. Add 0.1 mol/L sodium hydroxide solution to make 25.0 mL, and use this solution as the test solution. Separately, weigh accurately about 0.25 g of sucrose octasulfate ester RS, add the mobile phase to make 25.0 mL, and use this solution as the standard solution. Prepare rapidly the test solution and the standard solution, and perform the test immediately. Take exactly 50 μL each of the test solution and the standard solution, perform the test as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas A_T and A_S of sucrose octasulfate ester of each solution.

Amount (mg) of sucrose octasulfate ester ($C_{12}H_{22}O_{35}S_8$)
= Amount (mg) of sucrose octasulfate ester RS (calculated on the dried basis)$\times \frac{A_T}{A_S} \times 0.7633$

Operating conditions

Detector: A differential refractometer

Column: A stainless steel column about 4 mm in internal diameter and 30 cm in length, packed with aminopropylsilyl silica gel for liquid chromatography (about 8 μm in particle diameter).

Mobile phase: Dissolve an appropriate amount (26 g to 132 g) of ammonium sulfate in 1000 mL of water, and adjust the pH to 3.5 with phosphoric acid. Allow a solution of sucrose octasulfate ester RS in dilute hydrochloric acid (1 in 100) to stand at 60 °C for 10 minutes, cool, and perform the test immediately. Determine the amount of ammonium sulfate so that the peak of related substances with the relative retention time to that of sucrose octasulfate ester being about 0.7 is almost close to the base line, and the peak of sucrose octasulfate ester is eluted most rapidly.

Flow rate: Adjust the flow rate so that the retention time of sucrose octasulfate ester is between 6 and 11 minutes.

System suitability

System performance: Allow a solution of sucrose octasulfate ester RS in dilute hydrochloric acid (1 in 100) to stand at 60 °C for 10 minutes, cool, and proceed immediately with 50 μL of this solution according to the above operating conditions; the resolution of the peaks of the related substances with relative retention time to sucrose octasulfate ester being about 0.7 is NLT 1.5.

System repeatability: Repeat the test 6 times with 50 μL of the standard solution under the above conditions; the relative standard deviation of the peak area of sucrose octasulfate ester is NMT 2.0%.

(3) ***Ranitidine hydrochloride***—Add 10 tablets of Tripotassium Bismuth Dicitrate, Sucralfate and Ranitidine Hydrochloride Tablets in NLT 250 mL of the mobile phase, shake to completely disintegrate, and filter. Dilute the concentration according to the concentration of the standard solution, and use this solution as the test solution. Separately, weigh accurately ranitidine hydrochloride RS, dissolve in the mobile phase to obtain a concentration of 0.112 mg/mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of ranitidine.

Amount (mg) of ranitidine
= Concentration (mg/mL) of standard ranitidine hydro-

$$\text{chloride solution} \times \frac{A_T}{A_S} \times \frac{314.40}{350.86}$$
$$\times \text{dilution factor of the test solution}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 322 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and between 10 and 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 μm to 10 μm in particle diameter).

Mobile phase: A mixture of methanol and 0.1 mol/L ammonium acetate (85 : 15).

Flow rate: 2 mL/min

System suitability

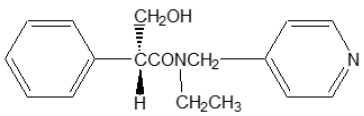
System performance: Proceed with 10 μL of the standard solution under the above operating conditions; the symmetry factor of ranitidine hydrochloride peak is NMT 2.0.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution according to the above conditions; the relative standard deviation is NMT 2.0%.

Packaging and storage Preserve in well-closed containers.

Label Indicate bismuth oxide and potassium from tripotassium bismuth dicitrate, and aluminum and sucrose octasulfate ester from sucralfate hydrate.

Tropicamide
트로픽아미드



and enantiomer

$C_{17}H_{20}N_2O_2$: 284.35

N-Ethyl-3-hydroxy-2-phenyl-*N*-(pyridin-4-ylmethyl)propanamide [*1508-75-4*]

Tropicamide, when dried, contains NLT 98.5% and NMT 101.0% of tropicamide ($C_{17}H_{20}N_2O_2$).

Description Tropicamide occurs as a white crystalline powder. It is odorless and has a bitter taste.
It is freely soluble in ethanol(95) or chloroform, slightly soluble in water or ether and practically insoluble in petroleum ether.
It dissolves in dilute hydrochloric acid.
Dissolve 1.0 g of Tropicamide in 500 mL of water; the pH of the solution is between 6.5 and 8.0.

Identification (1) To 5 mg of Tropicamide, add 0.5 mL of ammonium vanadate in sulfuric acid solution (1 in 200) and heat; the resulting solution exhibits a bluish purple color.

(2) Dissolve 5 mg of Tropicamide in 1 mL of ethanol(95) and 1 mL of water, add 0.1 g of 1-chloro-2,4-dinitrobenzene, and heat on a steam bath for 5 minutes. After cooling, add 2 to 3 drops of sodium hydroxide solution (1 in 10) and 3 mL of ethanol(95); the resulting solution exhibits a purple color.

Melting point Between 96 and 99 ºC.

Absorbance $E_{1cm}^{1\%}$ (255 nm): Between 166 and 180 (5 mg after drying, 2 mol/L hydrochloric acid TS, 200 mL).

Purify (1) ***Chloride***—Dissolve 1.0 g of Tropicamide in 30 mL of ethanol(95) and add 6 mL of dilute nitric acid and water to make 50 mL. Use this solution as the test solution and perform the test. To 0.45 mL of 0.01 mol/L hydrochloric acid, add 30 mL of ethanol(95), 6 mL of dilute nitric acid and water to make 50 mL and use this solution as the control solution (NMT 0.016%).

(2) ***Heavy metals***—Dissolve 1.0 g of Tropicamide in 30 mL of ethanol(95) and add 2 mL of dilute acetic acid and water to make 50 mL. Use this solution as the test solution to perform the test. Prepare the control solution by adding 30 mL of ethanol(95), 2 mL of dilute acetic acid and water to 2.0 mL of the lead standard solution to make 50 mL (NMT 20 ppm).

(3) ***N-Ethyl-γ-picolylamine***—Add 5 mL of water to 0.10 g of Tropicamide, heat to dissolve, add 1 mL of acetaldehyde solution (1 in 20), and shake well to mix. Add 1 to 2 drops of sodium pentacyanonitrosylferrate(III) TS and 1 to 2 drops of sodium bicarbonate TS and shake to mix; the resulting solution does not exhibit a blue color.

(4) ***Tropic acid***—To 10 mg of Tropicamide, add 5 mg of sodium borate and 7 drops of 4-dimethylaminobenzaldehyde TS and heat on a steam bath for 3 minutes. Cool in iced water and add 5 mL of acetic anhydride; the resulting solution does not exhibit a purple color.

Loss on drying NMT 0.3% (1 g, in vacuum, silica gel, 24 hours).

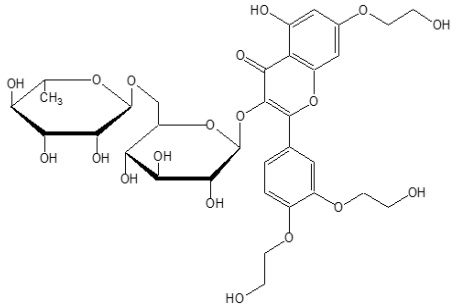
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.5 g of Tropicamide, previously dried, dissolve in 50 mL of acetic acid(100), and titrate with 0.1 mol/L perchloric acid VS (indicator: 3 drops of methylrosaniline chloride TS). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 28.435 mg of $C_{17}H_{20}N_2O_2$

Packaging and storage Preserve in light-resistant, tight containers.

Troxerutin
트록세루틴



$C_{33}H_{42}O_{19}$: 742.68

2-[3,4-Bis(2-hydroxyethoxy)phenyl]-3-[[6-*O*-(6-deoxy-α-L-mannopyranosyl)-β-*D*-glucopyranosyl]oxy]-5-hydroxy-7-(2-hydroxyethoxy)-4*H*-1-benzopyran-4-one[tris(hydroxyethyl)rutin], [*7085-55-4*]

Troxerutin contains NLT 98.0% and NMT 101.0% of troxerutin ($C_{33}H_{42}O_{19}$), calculated on the dried basis.

Description Troxerutin occurs as a yellow to orange powder and is odorless.
It is freely soluble in water, very slightly soluble in ethanol or methanol and practically insoluble in chloroform.
The pH of a 10% aqueous solution of Troxerutin is between 6.0 and 7.0.

Identification Dissolve about 0.1 g of Teicoplanin in water to make 100 mL and use this solution as the test solution. Dissolve about 0.1 g of troxerutin in water to make 100 mL and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, n-propanol, acetic acid(100) and water (30 : 40 : 1: 30) as the developing solvent, and air-dry. Examine the plate under ultraviolet rays (main wavelength: 254 nm) or spray the plate with a solution of diphenylboric acid aminoethylester in methanol; the R_f values of the spots obtained from the test solution and the standard solution are the same.

(2) Determine the infrared spectra of Troxerutin and troxerutin RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) Determine the absorption spectrum of an aqueous solution of Troxerutin (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; it exhibits maxima at 254 nm and 348 nm.

Melting point Between 155 and 160 °C.

Purity (1) ***Clarity and color of solution***—A 5% aqueous solution of Troxerutin is yellow and almost clear.

(2) ***Heavy metals***—Proceed with 1.0 g of Troxerutin according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Arsenic***—Proceed with 0.2 g of Troxerutin according to Method 1 and perform the test (NMT 10 ppm).

Loss on drying NMT 5.0% (1 g, 4 hours).

Residue on ignition NMT 0.3% (0.5 g).

Assay Weigh accurately about 0.2 g of Troxerutin and dissolve in water to make 100.0 mL. Take 5.0 mL of the solution and add ethanol to make 100 mL. Take 5.0 mL of this solution and add 12.5 mL of a mixture of 0.1 mol/L sodium hydroxide, 0.05 mol/L sodium bicarbonate and methanol (1 : 1: 1), and ethanol to make 25.0 mL. Separately, weigh accurately 0.2 g of troxerutin RS and proceed in the same manner as in the test solution. Use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at 248 nm as directed under the Ultraviolet-visible Spectroscopy.

$$\text{Amount (mg) of troxerutin } (C_{33}H_{42}O_{19}) = \text{Amount (mg) of troxerutin RS} \times \frac{A_T}{A_S}$$

Packaging and storage Preserve in tight containers.

Crystallized Trypsin and Bromelain Tablets
결정트립신·브로멜라인 정

Crystallized Trypsin and Bromelain Tablets contain NLT 90.0% and NMT 130.0% of the labeled amount of crystallized trypsin and bromelain.

Method of preparation Prepare as directed under Tablets, with Crystallized Trypsin and Bromelain.

Identification (1) ***Crystallized trypsin***—When tested as directed under the Assay of Crystallized Trypsin and Bromelain Tablets, the result is positive.

(2) ***Bromelain***—To a quantity of powdered Crystallized Trypsin and Bromelain Tablets, equivalent to about 10 mg of bromelain, add a 20% solution (pH 5.5) of skim milk powder, and warm to 37 ℃; the resulting solution solidifies (Rennet reaction).

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay (1) ***Crystallized trypsin***—Add 200 μL of 1 mmol/L hydrochloric acid to 3 mL of the substrate solution, and test this solution as directed under the Ultraviolet-visible Spectroscopy to ensure that the absorbance at a wavelength of 253 nm is 0.050. Pipet 200 μL of the crystallized trypsin solution containing between 10 and 12

units of trypsin RS, add 3 mL of the substrate solution, and immediately measure the absorbance at 30-second intervals for 5 minutes. Draw an absorbance curve with respect to time, and use the values of the straight line in which the rate of change remains constant for NLT 3 minutes as the activity value of crystallized trypsin. If necessary, lower concentrations may be used. Under the conditions of this Assay, the activity of 1 unit of trypsin RS shows a rate of change of absorbance of 0.003 per minute. Trypsin units per mg are obtained by the following formula.

$$\frac{A_1 - A_2}{0.003\mathrm{TW}}$$

A_1: Final activity value of the straight line
A_2: First activity value of the straight line
T: Elapsed time from the first time to the last time (minutes)
W: Weight (mg) of crystallized trypsin used for absorbance measurement

Substrate solution—Dissolve 85.7 mg of hydrochloric acid *N*-benzoyl-L-arginine-ethyl ester in water to make 100.0 mL. Take 10 mL of this solution and add 0.067 mol/L phosphate buffer to make 100 mL. Maintain this solution at 25 ± 0.1 ℃ in a 1 cm cell, use water as a control solution, and measure the absorbance at a wavelength of 253 nm as directed under the Ultraviolet-visible Spectroscopy. The absorbance before and after dilution with phosphate buffer should be between 0.575 and 0.585.

Crystallized trypsin solution—Weigh accurately a suitable amount of crystallized trypsin and dissolve it in 0.001 mol/L hydrochloric acid to make a crystallized trypsin solution with about 50 - 60 units/mL.

(2) ***Bromelain***—Weigh accurately the mass of NLT 20 Crystallized Trypsin and Bromelain Tablets, and powder. Weigh accurately an amount equivalent to about 50,000 units of bromelain, and add the enzyme diluent to make A mL. Dilute this solution by B times again to obtain a solution containing about between 40 and 50 units in 1 mL, and use it as the test solution. Put 1 mL of the test solution into a test tube, allow to stand in a thermostat at 37 ± 0.2 ℃ for 5 minutes, and quickly add 5 mL of 0.6% casein substrate solution preheated to 37 ℃ to the above test solution. At the same time, use a stopwatch to stop the reaction by adding 5 mL of precipitation TS after exactly 10 minutes have passed. Filter the contents of the test tube kept at 37 ℃ for 40 minutes through filter paper. Test this filtrate within 2 hours as directed under the Ultraviolet-visible Spectroscopy using water as a control solution, and measure the absorbance A_T at a wavelength of 275 nm.
Separately, add the precipitation TS and casein substrate solution to 1 mL of the test solution in the order, and measure the absorbance A_0 by treating with the test solution. Also, weigh accurately tyrosine RS and dissolve it in 0.1 mol/L hydrochloric acid to make a solution containing 50 μg of tyrosine per mL. Measure Absorbance A_S as directed under the Ultraviolet-visible Spectroscopy using water as a control solution.

$$\text{Potency of bromelain (unit/mg)} = \frac{A_T - A_0}{A_S} \times 50 \times \frac{11}{10} \times \frac{\mathrm{A} \times \mathrm{B}}{\text{Amount of sample taken (mg)}}$$

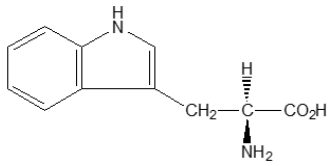
Enzyme dilute solution—Prepare a solution containing 0.03 mol/L cysteine hydrochloride and 0.006 mol/L ethylenediaminetetraacetic acid disodium salt as a final concentration. Adjust pH to 4.5 with 0.1 mol/L sodium hydroxide or 0.1 mol/L hydrochloric acid (prepare before use).

Casein substrate solution—Dissolve 0.6 g of casein by the Hammersteim method in 80 mL of 0.05 mol/L potassium monohydrogen phosphate, adjust the pH to 7.0 with 1 mol/L hydrochloric acid, and add water to make 100 mL (prepare before use).

Precipitation TS—Prepare a solution containing 0.11 mol/L trichloroacetic acid, 0.22 mol/L sodium acetate and 0.33 mol/L acetic acid.

Packaging and storage Preserve in tight containers.

L-Tryptophan
L-트리프토판



$C_{11}H_{12}N_2O_2$: 204.23
(2*S*)-2-Amino-3-(1*H*-indol-3-yl)propanoic acid [*73-22-3*]
L-Tryptophan, when dried, contains NLT 98.5% and NMT 101.0% of L-tryptophan ($C_{11}H_{12}N_2O_2$).

Description L-Tryptophan occurs as white to yellowish white crystals or a crystalline powder. It is odorless and has a slightly bitter taste.
It is freely soluble in formic acid, slightly soluble in water, very slightly soluble in ethanol(95), and practically insoluble in ether.
It dissolves in dilute hydrochloric acid.

Identification (1) Determine the infrared spectra of L-Tryptophan and L-tryptophan RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Optical rotation $[\alpha]_D^{20}$: Between -30.0° and -33.0°. Weigh accurately about 0.25 g of L-Tryptophan, previ-

ously dried, and dissolve in 20 mL of water by warming. After cooling, add water to make exactly 25 mL and determine the optical rotation with the layer length of 100 mm.

pH Dissolve 1.0 g of L-Tryptophan in 100 mL of water by warming; the pH of the cooled solution is between 5.4 and 6.4.

Purity (1) ***Clarity and color of solution***—Dissolve 0.20 g of L-Tryptophan in 10 mL of 2.0 mol/L hydrochloric acid TS; the resulting solution is clear.

(2) ***Chloride***—Dissolve 0.5 g of L-Tryptophan in 6 mL of dilute nitric acid and add water to make 50 mL. Use this solution as the test solution to perform the test. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid (NMT 0.021%).

(3) ***Sulfate***—Dissolve 0.6 g of L-Tryptophan in 40 of water and 1 mL of dilute hydrochloric acid and add water to make 50 mL. Use this solution as the test solution to perform the test. Prepare the control solution with 0.35 mL of 0.005 mol/L sulfuric acid (NMT 0.028%).

(4) ***Ammonium***—Perform the test with 0.25 g of L-Tryptophan. Prepare the control solution with 5.0 mL of ammonium standard solution (NMT 0.02%).

(5) ***Heavy metals***—Proceed with 1.0g of L-Tryptophan according to Method 4 and perform the test. Prepare the control solution with 2.0 mL of the lead standard solution (NMT 20 ppm).

(6) ***Iron***—Dissolve 0.333 g of L-Tryptophan in water to make 45 mL, add 2 mL of hydrochloric acid, and use this solution as the test solution. Add water to 1.0 mL of the iron standard solution to make 45 mL, add 2 mL of hydrochloric acid, and use this solution as the standard solution. Add 50 mg of ammonium peroxydisulfate and 3 mL of 30% ammonium thiocyanate to the test solution and the standard solution and mix; the color of the test solution is not darker than that from the standard solution (NMT 30 ppm).

(7) ***Arsenic***—Dissolve 1.0 g of L-Tryptophan in 3 mL of 1 mol/L hydrochloric acid TS and 2 mL of water by heating and perform the test (NMT 2 ppm).

(8) ***Related substances***—Dissolve 0.30 g of L-Tryptophan in 1 mL of hydrochloric acid TS, add water to make 50 mL, and use this solution as the test solution. Pipet 1 mL of this solution and add water to make exactly 50 mL. Pipet 5 mL of this solution, add water to make exactly 20 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot each 5 μL of the test solution and the standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of 1-butanol, water, and acetic acid(100) (3 : 1 : 1) to a distance of about 10 cm and air-dry at 80 °C for 30 minutes. Spray a solution of ninhydrin in acetone (1 in 50) evenly on the plate and heat at 80 °C for 5 minutes; the spots other than the principal spot from the test solution are not darker than the spots from the standard solution.

Loss on drying NMT 0.3% (1 g, 105 ℃, 3 hours)

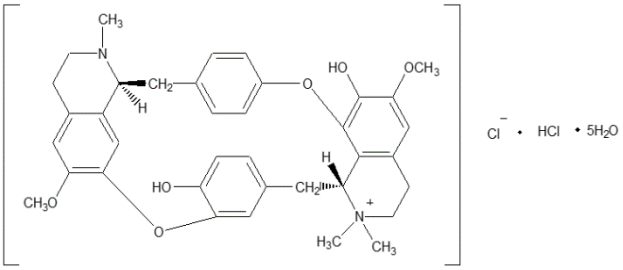
Residue on ignition NMT 0.1% (1 g)

Assay Weigh accurately about 0.2 g of L-Tryptophan, previously dried, dissolve in 3 mL of formic acid, add 50 mL of acetic acid(100), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 20.423 mg of $C_{11}H_{12}N_2O_2$

Packaging and storage Preserve in light-resistant, tight containers.

Tubocurarine Chloride Hydrochloride Hydrate
투보쿠라린염화물염산염수화물



Tubocurarine Chloride

$C_{37}H_{41}ClN_2O_6 \cdot HCl \cdot 5H_2O$: 771.72

(1*S*,16*R*)-9,21-Dihydroxy-10,25-dimethoxy-15,15,30-trimethyl-7,23-dioxa-15,30-diazaheptacyclo[22.6.2.2^{3,6}.1^{8,12}.1^{18,22}.0^{27,31}.0^{16,34}]hexatriaconta-3,5,8,10,12(34),18(33),19,21,24(32),25,27(31),35-dodecaen-15-ium chloride, hydrochloride, pentahydrate [*6989-98-6*]

Tubocurarine Chloride Hydrochloride Hydrate contains NLT 98.0% and NMT 101.0% of tubocurarine chloride hydrochloride ($C_{37}H_{41}ClN_2O_6 \cdot HCl$: 681.65), calculated on the dried basis.

Description Tubocurarine Chloride Hydrochloride Hydrate occurs as white crystals or a crystalline powder and is odorless.

It is sparingly soluble in water or ethanol(95), slightly soluble in acetic acid(100), and practically insoluble in ether or chloroform.

Dissolve 1.0 g of Tubocurarine Chloride Hydrochloride Hydrate in 100 mL of water; the pH of the solution is between 4.0 and 6.0.

Melting point—About 270 °C (with decomposition).

Identification (1) To 20 mL of the aqueous solution of Tubocurarine Chloride Hydrochloride Hydrate (1 in

2000), add 0.2 mL of sulfuric acid and 2 mL of potassium iodate solution(1 in 100), shake to mix, and heat on a steam bath for 30 minutes; the solution exhibits a yellow color.

(2) Take 1 mL of an aqueous solution of Tubocurarine Chloride Hydrochloride Hydrate (1 in 100), and add 1 mL of Reinecke salt monohydrate TS (1 in 100); a red precipitate is formed.

(3) Determine the absorption spectra of aqueous solutions of Tubocurarine Chloride Hydrochloride Hydrate and tubocurarine chloride hydrochloride hydrate RS (3 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(4) An aqueous solution of Tubocurarine Chloride Hydrochloride Hydrate (1 in 50) responds to the Qualitative Analysis (2) for chloride.

Optical rotation $[\alpha]_D^{20}$: Between +210° and +220° (0.1 g, calculated on the dried basis, water, 10 mL, after allowing to stand for 3 hours, 100 mm)

Purity (1) ***Clarity and color of solution***—Dissolve about 0.1 g of Tubocurarine Chloride Hydrochloride Hydrate in 10 mL of ethanol(95); the resulting solution is colorless and clear.

(2) ***Chloroform solubles***—Weigh accurately 0.2 g of Tubocurarine Chloride Hydrochloride Hydrate, calculated on the dried basis, add 200 mL of water and 1 mL of the saturated sodium bicarbonate, and extract three times with 20 mL of chloroform. Combine all the chloroform extracts, and rinse with 10 mL of water. Filter through a absorbent cotton into a tared beaker, wash the cotton twice with each 5 mL of chloroform, combine the filtrate and the washings, evaporate chloroform on a steam bath, and dry the residue at 105 ° C for 1 hour; the amount is NMT 2.0%. The residue does not dissolve on the addition of 10 mL of water, but dissolves when stirring with 1 mL of hydrochloric acid added.

(3) ***Related substances***—Weigh accurately about 30 mg of Tubocurarine Chloride Hydrochloride Hydrate, add the mobile phase to make exactly 100 mL, and use this solution as the test solution. Perform the test with 10 μL of the test solution as directed under the Liquid Chromatography according to the following conditions and determine each peak area A_i and the total area A_S for all peaks other than the major peak from the test solution; the total amount of related substances is NMT 5.0%.

$$\text{Content (\%) of each related substance} = 100 \times \frac{A_i}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (between 1.5 μm and 10 μm in particle diameter).

Mobile phase: Mix 270 mL of a mixture of acetonitrile and methanol (3 : 2) and 20 mL of 25% tetramethylammonium hydroxide-methanol TS, add water to make 1000 mL, and adjust the pH to 4.0 with phosphoric acid.

Flow rate: 1 mL/min

System suitability

System performance: Weigh accurately 30 mg of tubocurarine chloride hydrochloride RS and 50 mg of phenol, dissolve in 100 mL of the mobile phase to prepare the solution containing 0.3 mg and 0.5 mg per mL, respectively, and use these solutions as the system suitability solution. Proceed with 10 μL of these solutions according to the under above conditions; the relative retention time of tubocurarine chloride with respect to phenol is about 0.50 with the resolution being NLT 2.0, and the symmetry factor of the peak of tubocurarine chloride is NMT 2.0.

System repeatability: Weigh accurately 30 mg of tubocurarine chloride hydrochloride RS, dissolve in 100 mL of the mobile phase to prepare a solution containing 0.3 mg per mL, and repeat the test 5 times with each 10 μL of this solution according to the above conditions; the relative standard deviation of the peak area of tubocurarine chloride is NMT 2.0%.

Loss on drying Between 9% and 12% (0.5 g, in vacuum, phosphorus pentoxide, 105 ℃, 4 hours).

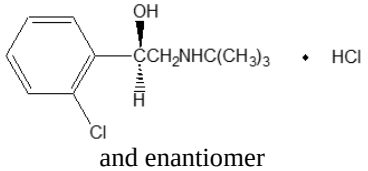
Residue on ignition NMT 0.2% (0.5 g).

Assay Weigh accurately about 0.5 g of Tubocurarine Chloride Hydrochloride Hydrate, add 20 mL of acetic acid(100), dissolve by heating on a steam bath, cool, add 60 mL of acetic anhydride, and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 34.082 mg of $C_{37}H_{41}ClN_2O_6 \cdot HCl$

Packaging and storage Preserve in light-resistant, tight containers.

Tulobuterol Hydrochloride
툴로부테롤염산염



and enantiomer

$C_{12}H_{18}ClNO \cdot HCl$: 264.19

1-(2-Chlorophenyl)-2-[(2-methyl-2-propanyl)amino]ethanol hydrochloride [*56776-01-3*]

Tulobuterol Hydrochloride, when dried, contains NLT 98.5% and NMT 101.0% of tulobuterol hydrochloride ($C_{12}H_{18}ClNO \cdot HCl$).

Description Tulobuterol Hydrochloride occurs as white crystals or a crystalline powder.
It is very soluble in methanol, freely soluble in water, ethanol(95) or acetic acid(100), soluble in acetic anhydride, and very slightly soluble in ether.
An aqueous solution of Tulobuterol Hydrochloride (1 in 20) shows no optical rotation.

Melting point—About 163 °C.

Identification (1) Determine the absorption spectra of solutions of Tulobuterol Hydrochloride and tulobuterol hydrochloride RS (1 in 2500) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectrum of Tulobuterol Hydrochloride and tulobuterol hydrochloride RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) An aqueous solution of Tulobuterol Hydrochloride (1 in 20) responds to the Qualitative Analysis for chloride.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Tulobuterol Hydrochloride in 10 mL of water; the solution is clear and colorless.

(2) ***Heavy metals***—Proceed with 2.0 g of Tulobuterol Hydrochloride according to Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Related substances***—Dissolve 0.30 g of Tulobuterol Hydrochloride in 5 mL of methanol and use this solution as the test solution. Pipet 1 mL of this solution, add methanol to make exactly 50 mL, and use it as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Prepare a thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography, develop the plate with the upper layer of a mixture of ethyl acetate and ammonia water(28) (200 : 9) to the upper part in advance, and air-dry the plate. Spot 5 μL each of the test solution and the standard solution on the plate. Develop the plate with the upper layer of a mixture of ethyl acetate and ammonia water(28) (200 : 9) (as the developing solvent) to a distance about 10 cm, and air-dry the plate. Expose the plate under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot and the origin spot from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 0.5% (0.5 g, in vacuum, 60 ℃, 4 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately 0.5 g of Tulobuterol Hydrochloride, previously dried, dissolve in 80 mL of a mixture of acetic anhydride and acetic acid(100) (7 : 3), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 26.419 mg of $C_{12}H_{18}ClNO \cdot HCl$

Packaging and storage Preserve in tight containers.

Tyrothricin
티로트리신

Tyrothricin consists principally of Gramicidin and tyrocidine and contains NLT 900 μg and NMT 1400 μg (potency) of tyrothricin per mg.

Description Tyrothricin occurs as a white to brownish powder, is odorless or almost odorless and is almost tasteless.
It is soluble in ethanol(95), freely soluble in acetic acid(100), slightly soluble in acetone and practically insoluble in water, chloroform or ether.

Identification To 5 mg (potency) of Tyrothricin, add 5 mL of 4-dimethylaminobenzaldehyde-iron(III) chloride TS, shake well to mix for 2 minutes, and add 2 drops of 0.1 mol/L sodium nitrite and 5 mL of water; the solution appears blue.

Purity Fat—Weigh accurately about 1.0 g of Tyrothricin, previously dried at 105 °C for 3 hours, mix with 2 g of asbestos, previously ignited and washed with hexane, transfer into a thimble filter for extraction inside a Soxhlet extractor, and extract with hexane for 18 hours using an 85 to 100 mL extraction flask, previously weighed. Remove the extraction flask, evaporate the solvent on a steam bath, and dry at 105 °C for 2 hours. Cool and weigh the extraction flask; the fat content is determined by the weight difference before and after the procedure (NMT 6.0%).

Loss on drying NMT 5.0% (0.1 g, 0.7 kPa, 60 ℃, 3 hours).

Residue on ignition NMT 3.5% (1 g).

Assay (1) ***Medium***—(i) Agar medium for transferring test organism

Peptone	5.0 g
Potassium dihydrogen phosphate	2.0 g
Yeast extract	20.0 g
Polysorbate 80	0.1 g
Glucose	100 g
Agar	15.0 - 20.0 g

Weigh the above, mix, add purified water to make 1000

mL, and sterilize. Adjust the pH of the solution so that it is 6.7 to 6.8 after sterilization.

(ii) Liquid medium for suspension of the test organism

Peptone	5.0 g
Glucose	1.0 g
Yeast extract	1.5 g
Dibasic potassium phosphate	3.68 g
Meat extract	1.5 g
Potassium dihydrogen phosphate	1.32 g
Sodium chloride	3.5 g

Weigh the above, mix, add purified water to make 1000 mL, and sterilize. Adjust the pH of the solution so that it is 6.95 to 7.05 after sterilization.

(2) ***Test organism and the suspension of test organism***—Use *Streptococcus faecium* ATCC 10541 as the test organism. Inoculate the test organism onto the stab agar medium for transferring the test organism, subculture NLT 3 times at 37 °C for 20 to 24 hours, and keep below 5 °C. Transfer the test organism to 8 to 10 mL of the liquid medium for suspension of test organism, incubate at 37 °C for 20 to 24 hours, and use as the suspension culture of the test organism. Before use, take 1.0 mL of the suspension culture, add to 100 mL of the liquid medium for suspension of test organism, and use it as the test culture.

(3) Weigh accurately a suitable amount of Tyrothricin and dissolve in ethanol(95) to obtain a solution with an appropriate concentration. Dilute with ethanol so that each mL contains 0.200 μg (potency), and use this solution as the test solution. Separately, weigh accurately an appropriate amount of gramicidin RS, dissolve in ethanol(95) so that each mL contains 1 mg (potency), and use this solution as the standard stock solution. Keep the standard stock solution below 5 °C and use it within 30 days. Pipet an appropriate amount of the standard stock solution, dilute with ethanol so that each mL contains 0.028, 0.034, 0.040, 0.048, and 0.057 μg (potency), and use these solutions as the standard solutions. Transfer each 1.0 mL of the standard solutions and the test solution to separate test tubes. Measure the average absorbance of the test solution, calculate the concentration of gramicidin from the calibration curve, and multiply the value by 5 to determine the amount (μg) of tyrothricin in the sample.

Packaging and storage Preserve in tight containers.

Tyrothricin Gel
티로트리신 겔

Tyrothricin Gel contains NLT 90.0% and NMT 120.0% of the labeled amount of tyrothricin.

Method of preparation Prepare as directed under gels, with Tyrothricin.

Identification Weigh 5 mg (potency) of Tyrothricin Gel, add 10 mL of ethyl acetate, shake well to mix, and filter. Add 10 mL of ethyl acetate to the residue, repeat the above operation 3 times, and then filter. Evaporate the filtrate to dryness on a steam bath, add 5 mL of 4-dimethylaminobenzaldehyde and iron(III) chloride TS to about 5 mg (potency) of the solution, shake well to mix for 2 minutes, and add 2 drops of 0.1 mol/L sodium nitrite solution and 5 mL of water; the resulting solution exhibits a blue color.

pH Dissolve Tyrothricin Gel in water to make 0.1 mg (potency) per mL; the pH of the solution is between 6.5 and 8.5.

Assay ***Turbidmetry***—(1) ***Medium*** (i) Agar medium for transferring test organisms

Peptone	5.0 g
Glucose	10.0 g
Yeast extract	20.0 g
Potassium dihydrogen phosphate	2.0 g
Agar	15.0 to 20.0 g
Polysorbate 80	0.1 g

Weigh the above, add purified water to make 1000 mL, sterilize, and adjust the pH to between 6.7 and 6.8.

(ii) Liquid media for suspending test organisms

Peptone	5.0 g
Glucose	1.0 g
Yeast extract	1.5 g
Dipotassium hydrogen phosphate	3.68 g
Meat extract	1.5 g
Potassium dihydrogen phosphate	1.32 g
Sodium chloride	3.5 g

Weigh the above, add purified water to make 1000 mL, sterilize, and adjust the pH to between 6.95 and 7.05.

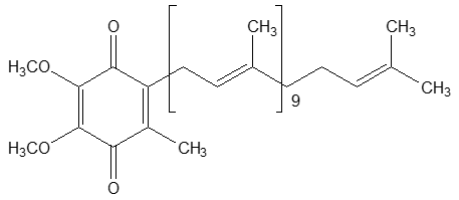
(2) ***Test organism and test organism suspension***—Use *Enterococcus hirae* ATCC 10541 as the test organism. Inoculate the test organism on the agar medium for transferring test organisms, and incubate at 37 ± 0.5 °C for 20 to 24 hours. Subculture at least 3 times at 37 ± 0.5 °C with agar medium for transferring test organisms or liquid media for suspending test organisms. Transparent the organism of the last passage into 8 to 10 mL of liquid media for suspending test organisms, and culture at 37 ± 0.5 °C for 20 to 24 hours, and use this solution as the bacterial solution. When using, add about 1.0 mL of the test suspension to 100 mL of the liquid media for suspending test organisms, and use this solution as the test organism solution. However, instead of the agar medium for transferring test organisms, a nutrient agar medium suitable for the characteristics of the strain can be used.

(3) Weigh accurately an appropriate amount of Tyrothricin Gel, and dissolve in ethanol to obtain a solution with appropriate concentration. Take an appropriate amount of this solution, dilute with ethanol to contain 0.2 μg (potency) per mL, and use this solution as the test solution. Separately, weigh an appropriate amount of gramicidin RS, and dissolve in methanol to obtain a solution containing 1 mg per mL. Store the standard stock solution at below 5 °C, and use it within 30 days. Pipet an appropriate amount of the standard stock solution, and dilute

with ethanol to obtain solutions containing 0.028, 0.034, 0.040, 0.048 and 0.057 μg (potency) of gramicidin per mL, respectively, and use these solutions as the standard solutions. Assign 3 test tubes to Group 1. For each concentration of the standard solution, assign it to Group 1, and also use Group 1 for the test solution. Transfer 100 μL each of the standard solution and the test solution with each concentration into each group's test tube, add 10 mL each of the stock suspension of test organisms, close the stopper, and incubate at 37°C for 3 to 4 hours. Separately, culture the test tube containing 100 μL of ethanol and 10 mL of liquid media for suspending test organisms, and use this solution as the control solution. After incubation, add 0.5 mL each of formaldehyde solution (1 in 3) to each group's test tube and the control solution, and measure the average absorbance at a wavelength of 530 nm using a spectrophotometer. Calculate the average absorbance of the test solution to obtain the concentration of gramicidin from the standard curve of gramicidin, and multiply this value by 5 to obtain the amount (μg) of tyrotricin in the sample.

Packaging and storage Preserve in tight containers.

Ubidecarenone
유비데카레논



$C_{59}H_{90}O_4$: 863.34

2-[(2*E*,6*E*,10*E*,14*E*,18*E*,22*E*,26*E*,30*E*,34*E*)-3,7,11,15,19,23,27,31,35,39-Decamethyltetraconta-2,6,10,14,18,22,26,30,34,38-decaenyl]-5,6-dimethoxy-3-methylcyclohexa-2,5-diene-1,4-dione [*303-98-0*]

Ubidecarenone contains NLT 98.0% and NMT 101.0% of ubidecarenone ($C_{59}H_{90}O_4$), calculated on the anhydrous basis.

Description Ubidecarenone occurs as a yellow to orange crystalline powder, and is odorless and tasteless.
It is freely soluble in ether, very slightly soluble in ethanol(99.5), and practically insoluble in water.
It is gradually decomposed and strongly colored by light.

Melting point—About 48 °C.

Identification (1) Dissolve 50 mg of Ubidecarenone in 1 mL of ether and add 10 mL of ethanol(99.5). To 2 mL of this solution, add 3 mL of ethanol(99.5) and 2 mL of dimethylmalonic acid, then add dropwise 1 mL of potassium hydroxide solution (1 in 5) and shake to mix; the solution exhibits a blue color.

(2) Determine the infrared spectra of Ubidecarenone and ubidecarenone RS according to the potassium bromide disk method as directed under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wave numbers.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Ubidecarenone and perform the test according to Method 4. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Related substance***—Add 50 mL of ethanol(99.5) to 50 mg of Ubidecarenone, dissolve by heating for 2 minutes at about 50 ℃, cool, and use this solution as the test solution. Pipet 1 mL of this solution, add ethanol(99.5) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 5 μL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak area obtained from each solution according to the automatic integration method; the sum of peak areas other than the major peak for the test solution is not larger than the major peak area for the standard solution.

Operating conditions

For the detector, column, column temperature, mobile phase, flow rate and selection of column, proceed as directed under the operating conditions in the Assay.

Detection sensitivity: Adjust the detection sensitivity so that the peak height of ubidecarenone obtained from 5 μL of the standard solution is 20 mm to 40 mm.

Time span of measurement: About 2 times of the retention time of ubidecarenone after the solvent peak.

Water NMT 0.2% (1 g, volumetric titration, direct titration).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 50 mg each of Ubidecarenone and ubidecarenone RS (measure moisture content beforehand), add 40 mL of ethanol(99.5) to each, dissolve by heating for 2 minutes at about 50 ℃, cool, add ethanol(99.5) to make exactly 50 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 5 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak area of ubidecarenone, A_T and A_S, in each solution.

$$\text{Amount (mg) of ubidecarenone } (C_{59}H_{90}O_4) = \text{Amount (mg) of ubidecarenone RS, as calculated on the anhydrous basis} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 275 nm).

Column: A stainless steel column about 5 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 35 °C.

Mobile phase: A mixture of methanol and ethanol(99.5) (13 : 7).

Flow rate: Adjust the flow rate so that the retention time of ubidecarenone is about 10 minutes.

System suitability

System performance: Weigh 10 mg each of Ubidecarenone and ubiquinone-9, add 20 mL of ethanol(99.5), dissolve by heating for 2 minutes at about 50 ℃, and cool. Proceed with 5 μL of this solution under the above conditions; uniquinone-9 and ubidecarenone are eluted in this order with the resolution being NLT 4.

System repeatability: Repeat the test 6 times with 5 μL of the standard solution according to the above conditions; the relative standard deviation of the peak area for ubidecarenone is NMT 0.8%.

Packaging and storage Preserve in light-resistant, tight containers.

Undecylenic Acid
운데실렌산

$CH_2=CHCH_2(CH_2)_6CH_2CO_2H$

$C_{11}H_{20}O_2$: 184.28

Undec-10-enoic acid [*112-38-9*]

Undecylenic Acid contains NLT 97.0% and NMT 100.5% of undecylenic acid ($C_{11}H_{20}O_2$).

Description Undecylenic Acid occurs as a clear, colorless to pale yellow liquid and has a characteristic odor.
It is miscible with ethanol(95), ether, chloroform, benzene or non-volatile and volatile oil.
It is practically insoluble in water.

Identification (1) Add 1 mL of potassium permanganate TS to 1 mL of Undecylenic Acid; the color of the potassium permanganate solution disappears.

(2) To 3 mL of Undecylenic Acid, add 3 mL of newly distilled aniline, and heat for 10 minutes under a reflux condenser. After cooling, add 10 mL of ethanol(95) and 10 mL of ether, and transfer to a separatory funnel. Wash the ether solution 4 times with 20 mL of water each time; discard the washings. Heat on a steam bath until the odor of ether is no longer detectable, add a small amount of activated charcoal, shake vigorously to mix and filter. Evaporate the filtrate to dryness, then recrystallize the residue with 70% ethanol; the melting point is between 66.0 and 67.5 ℃.

Refractive index n_D^{25}: Between 1.447 and 1.448.

Specific gravity d_{25}^{25}: Between 0.910 and 0.913.

Iodine value Between 131 and 138.

Congealing temperature NLT 21 ℃.

Purity (1) ***Water-soluble acid***—Add 5 mL of water to 5 mL of Undecylenic Acid, shake to mix, and filter the water layer using filter paper pre-soaked in water. To the filtrate, add 1 drop of methyl orange TS and titrate with 0.01 mol/L sodium hydroxide solution; NMT 1.0 mL of 0.01 mol/L sodium hydroxide is required to match the color produced by 1 drop of methyl orange in 5 mL of water.

(2) ***Heavy metals***—Proceed with 1.0 g of Undecylenic Acid as directed under Method 2 and perform the test. Prepare the control solution with 1.0 mL of lead standard solution (NMT 10 ppm).

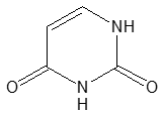
Residue on ignition NMT 0.15% (3 g).

Assay Weigh accurately about 0.75 g of Undecylenic Acid, dissolve in 50 mL of ethanol(95), and titrate with 0.1 mol/L sodium hydroxide VS (indicator: 3 drops of phenolphthalein TS). The endpoint is when a light red color appears and persists for 30 seconds. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS
= 18.428 mg of $C_{11}H_{20}O_2$

Packaging and storage Preserve in light-resistant, tight containers.

Uracil
우라실



$C_4H_4N_2O_2$: 112.09

2,4-(1*H*,3*H*)-Pyrimidinedione, [*66-22-8*]

Uracil, when dried, contains NLT 98.0% and NMT 101.0% of uracil ($C_4H_4N_2O_2$).

Description Uracil occurs as a white, crystalline, odorless powder.
It dissolves in hot water or dilute alkaline solution, and is slightly soluble in water.

Melting point—About 335 ℃.

Identification (1) Determine the absorption spectrum of a phosphate buffer solution (pH 7.0) (0.6 in 100000) of Uracil as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum between 259 nm and 261 nm.

(2) Determine the infrared spectra of Uracil and uracil RS as directed in the paste method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Purity (1) ***Clarity and color of solution***—Dissolve 0.5 g of Uracil in 10 mL of a sodium hydroxide solution (1 in 10); the solution is clear and colorless.

(2) ***Heavy metals***—Proceed with 1.0 g of Uracil as directed under Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Arsenic***—Proceed with 2.0 g of Uracil as directed under Method 3 and perform the test (NMT 1 ppm).

(4) ***Related substances***—Weigh 0.1 g of Uracil and dissolve in sodium hydroxide solution (1 in 10) to make 100 mL; perform the test with this solution as directed under the Thin Layer Chromatography. Spot 50 μL of this solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of 1-butanol, acetic acid(31) and water (4 : 2 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); any spot other than the principal spot does not appear.

Loss on drying NMT 0.3% (1 g, 105 ℃, 3 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 60 mg of Uracil, previously dried, and dissolve in phosphate buffer solution (pH 7.0) to make exactly 100 mL. Pipet 2 mL of this solution, add phosphate buffer solution (pH 7.0) to make exactly 200 mL, and use this solution as the test solution. Separately, weigh accurately about 60 mg of uracil RS, proceed in the same manner as in the test solution, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at the wavelength of 260 nm as directed under the Ultraviolet-visible Spectroscopy.

Amount (mg) of uracil ($C_4H_4N_2O_2$)
= Amount (mg) of uracil RS × (A_T / A_S)

Packaging and storage Preserve in well-closed containers.

Urea Ointment
요소 연고

Urea Ointment contains NLT 90.0% and NMT 110.0% of the labeled amount of urea (CH_4N_2O: 60.06).

Method of preparation Prepare as directed under Ointments, with Urea.

Identification (1) Weigh an amount of Urea Ointment equivalent to 50 mg of urea according to the labeled amount, add 1 mL of water, warm, then cool. Dissolve this solution in 4 mL of acetone, centrifuge, and use the clear supernatant as the test solution. Separately, weigh 50 mg of urea RS and proceed in the same manner as the test solution. Use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of 2,2,4-trimethylpenthane or ethanol and 13.5 mol/L ammonia (99 : 1) as the developing solvent, and air-dry the plate. Spray evenly 0.5% 4-dimethylaminobenzaldehyde solution and 0.5% ethanol sulfate solution; the R_f value and color of the spots obtained from the test solution and the standard solution are the same.

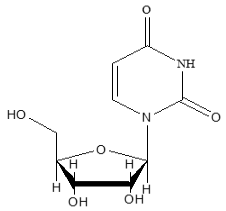
(2) Weigh an amount of Urea Ointment equivalent to 0.1 g of urea according to the labeled amount, add 50 mL of water and heat until dispersed. Chill on ice and filter with a glass filter. If the filtrate is not transparent, adjust pH to 6 to 7 using 0.1 mol/L hydrochloric acid TS or 0.1 mol/L sodium hydroxide TS. To 5 mL of this solution, add 5 mL of 0.1% urease active meal, allow to stand for 30 minutes at 37 ℃, then heat on a steam bath. The gas produced turns red litmus paper blue.

Assay Weigh accurately an amount of Urea Ointment equivalent to about 40 mg of urea (CH_4N_2O) according to the labeled amount, mix for 20 minutes in 150 mL of hot water and cool. Add water to make 500 mL, filter using glass filter paper (Whatman GF/C). Place 0.1 mL of the filtrate and 2.0 mL of 0.1% urease active meal in a stoppered flask, and allow to stand for 15 minutes at 37 ℃. Immediately add to this solution 25 mL of a solution prepared by adding water to 12 g of sodium salicylate and 0.24 g of sodium nitroprusside to make 200 mL, and then add 25 mL of a solution prepared by adding 0.2 mol/L of sodium hydroxide TS to a sodium hypochlorite solution containing an equivalent of 0.66 g of chlorine. Allow to stand for 5 minutes at 37 ℃, then add water to make 100 mL, and use this solution as the test solution. Separately, weigh accurately about 40 mg of urea RS, proceed in the same manner as in the test solution, and use this solution as the standard solution. Perform the test with the test solution and the standard solution as directed under Ultraviolet-visible Spectroscopy and determine the absorbances, A_T and A_S, respectively, at the wavelength of 665 nm.

Amount (mg) of urea (CH_4N_2O)
$= \text{Amount (mg) of urea RS} \times \frac{A_T}{A_S}$

Packaging and storage Preserve in tight containers.

Uridine
우리딘



$C_9H_{12}N_2O_6$: 244.20

1-β-*D*-Ribofuranosyluracil, [*58-96-8*]

Uridine contains NLT 99.0% and NMT 101.0% of uridine ($C_9H_{12}N_2O_6$), calculated on the anhydrous basis.

Description Uridine occurs as a white, crystalline, odorless powder.
It is freely soluble in water and sparingly soluble in ethanol.
The pH of 1% aqueous solution of Uridine is between 4.5 and 5.5.

Identification (1) To 5 mL of 0.1% aqueous solution of Uridine, add 0.1% iron(III) chloride TS and 5 mL of hydrochloric acid solution containing 0.1% orcin and warm on a steam bath; the solution turns green after 15 minutes.

(2) Prepare 0.1% aqueous solutions of Uridine and uridine RS, and use these solutions as the test solution and the standard solution, respectively. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on thin-layer chromatographic plate made of cellulose for thin-layer chromatography (with fluorescence agent). Next, develop the plate with 1 mol/L sodium bicarbonate solution as the developing solvent, and air-dry the plate. Examine under ultraviolet light; the spots from the test solution and the standard solution have the same R_f values and colors.

(3) Determine the absorption spectra of a solution of Uridine in 0.05 mol/L phophate buffer solution (pH 7.0) (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum at the wavelength of 262 nm. Comparing absorbances at 250 nm, 260 nm, and 280 nm, 250 nm / 260 nm = 0.74 ± 0.02, and 280 nm / 260 nm = 0.36 ± 0.02.

Melting point Between 164 and 169 ℃.

Purity ***Heavy metals***—Proceed with 2.0 g of Uridine as directed under Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

Water NMT 1.0% (1.0 g, volumetric titration, direct titration).

Residue on ignition 0.1% (1.0 g).

Assay Weigh accurately about 0.1 g of Uridine and dissolve in 0.2 mol/L phosphate buffer solution (pH 7.0) to make 100 mL. Pipet 2.0 mL of this solution, add 0.2 mol/L phosphate buffer solution (pH 7.0) to make 200 mL, and use this solution as the test solution. Separately, weigh accurately about 50 mg of uridine RS and dissolve in 0.2 mol/L phosphate buffer solution (pH 7.0) to make exactly 100 mL. Pipet 2 mL of this solution and add 0.2 mol/L phosphate buffer solution (pH 7.0) to make exactly 100 mL. Use this solution as the standard solution. Perform the test with the test solution and the standard solution using 0.2 mol/L phosphate buffer solution (pH 7.0) as the control solution as directed under the Ultraviolet-visible Spectroscopy, and measure the absorption A_T and A_S at the absorbance maximum wavelength of around 260 nm to 262 nm.

$$\text{Amount (mg) of uridine } (C_9H_{12}N_2O_6) = \text{Amount (mg) of uridine RS} \times \frac{A_T}{A_S} \times 2$$

Packaging and storage Preserve in tight containers.

Urokinase
유로키나제

[*62229-50-9*]

Urokinase is an enzyme obtained from human urine, having a molecular weight of about 54000 and having plasminogen-activating activity. Urokinase is a solution having an appropriate buffer solution as the solvent.

Urokinase contains NLT 60000 units of urokinase per mL, and NLT 120000 units of urokinase of protein per mg.

Description Urokinase occurs as a clear, colorless liquid.
The pH of Urokinase is between 5.5 and 7.5.

Identification (1) Dissolve 70 mg of fibrinogen in 10 mL of phosphate buffer solution (pH 7.4). To this solution, add and mix 1 mL of thrombin dissolved in isotonic sodium chloride injection to a concentration of 10 units per mL, then transfer to a petri dish about 90 mm in internal diameter and allow to stand level until the solution coagulates. To the surface, add 10 μL of a solution of gelatin-tris buffer solution added to Urokinase to a concentration of 100 units per mL dropwise and leave overnight; lysis circle is appeared.

(2) Dissolve 1.0 g of agar powder in 100 mL of a boric acid and sodium hydroxide buffer solution (pH 8.4) at by warming, then transfer to a petri dish to a depth of about 2 mm. After cooling, make 2 holes of diameter 2.5 mm, 6 mm apart. Into each of the holes, inject 10 μL of a solution of Urokinase in isotonic sodium chloride injection containing 30000 units per mL and 10 μL of anti-urokinase serum, then leave overnight; a clear precipitation line is formed.

Purity (1) ***Heavy Metals***—Proceed with 2.0 mL of Urokinase as directed under Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Blood group substance***—Add isotonic sodium chloride injection to Urokinase to obtain a solution containing 12000 units per mL, and use this solution as the test solution. Add isotonic sodium chloride injection to anti-A blood typing antibody and dilute by factors of 32, 64, 128, 256, 512 and 1024, and transfer 25 μL of each in the first six wells of the first and second column of a v-shaped 96-well micro plate. Next, put 25 μL of the test solution into each of the 6 wells of the first column, and put 25 μL of isotonic sodium chloride injection into each of the 6 wells of the second column. Shake to mix and allow to stand for 30 minutes. Put 50 μL of red blood cell suspension for type A into each well, shake to mix, and allow to stand for 2 hours. Compare the hemagglutination of red blood cells of the two sides; the anti-A antibody dilution factors of the wells where hemagglutination is observed are the same. Repeat the test, using anti-B blood typing antibody and red blood cell suspension for type B.

Abnormal toxicity Add isotonic sodium chloride injection to Urokinase to obtain a solution containing 12000 units per mL, and use this solution as the test solution. Use at least 2 healthy and well-fed guinea pigs of body weight about 350 g and at least 2 healthy and well-fed mice of about 5 weeks old. Inject 5.0 mL of the test solution into the abdominal cavity of each guinea pig, and inject 0.5 mL of the test solution into the abdominal cavity of each mouse, then observe for NLT 7 days; none of the animals exhibit abnormal symptoms.

High molecular weight urokinase Add gelatin and phosphate buffer solution to Urokinase to obtain a solution containing 10000 units per mL, and use this solution as the test solution. Take 100 μL of the test solution and perform the test as directed under the Liquid Chromatography according to the following conditions. Of the two peaks that appear at a retention time of near 35 minutes, measure the peak area *A*a whose retention time is shorter, and the peak area *A*b whose retention time is longer, using the automatic area integration method; *A*a/(*A*a+*A*b) is NLT 0.85.

Operating conditions

Device: Use a mobile phase transfer pump, sample injection port, column, reaction TS transfer pump, reaction coil, reaction vessel, fluorometer and data collection device; connect a 3-way tube to the mobile phase exit of the column, connect to the reaction TS transfer pump and reaction coil, then connect the reaction coil exit to the fluorometer.

Detector: A fluorometer (excitation wavelength: 365 nm, measurement wavelength: 460 nm).

Column: A stainless steel column about 7.5 mm in internal diameter and about 60 cm in length, packed with porous silica gel for liquid chromatography (10 to 12 μm in particle diameter).

Column temperature: A constant temperature of about 20 ℃.

Reaction coil: Stainless steel column about 0.25 mm in internal diameter and about 150 cm in length.

Reaction coil temperature: 37 ℃

Mobile phase: Gelatin and phosphate buffer solution

Flow rate: 0.5 mL/min

Reaction reagent: 7-(glutarylglycil-L-alginylamino)-4-methylcoumarine TS

Reaction reagent flow rate: 0.75 mL/min

Selection of column: Add sodium hydroxide TS to Urokinase and adjust pH to 7.5, then allow to stand for at least 24 hours at 37 ℃. Add gelatin and phosphate buffer solution to this solution to a concentration of 20000 units per mL. Proceed with 100 μL each of this solution according to the above conditions; high molecular weight urokinase of molecular weight 54000 and low molecular weight urokinase of molecular weight 33000 are eluted in this order, with a resolution of NLT 1.0.

Assay (1) ***Urokinase***—Pipet 1 mL of Urokinase and add gelatin and phosphate buffer solution, then dilute precisely to a concentration of about 30 units per mL, and use this solution as the test solution. Dissolve 1 ampoule of high molecular weight urokinase RS in 2 mL of gelatin and phosphate buffer solution, pipet 1mL of this solution, and add gelatin and phosphate buffer solution to dilute precisely to a concentration of about 30 units per mL. Use this solution as the standard solution. Add 1.0 mL of L-pyrroglutamilglycyl-L-alginine-*P*-nitroanilide TS to each of two silicone-coated test tubes of internal diameter 10 mm, warm for 5 minutes on a steam bath at 35 ± 0.2 ℃, add 0.50 mL each of the test solution and the standard solution, warm for precisely 30 minutes at 35 ± 0.2 ℃, then add 0.50 mL of diluted acetic acid(100) (2 in 5) to each. With these solutions, and using water as the blank, measure the absorbances A_T and A_S at 405 nm as directed under the Ultraviolet-visible Spectroscopy. Separately, add 1.0 mL of L-pyrroglutamilglycyl-L-alginine-*P*-nitroanilide to each of 2 test tubes, add 0.50 mL of diluted acetic acid(100) (2 in 5) to each, then add 0.50 mL of the test solution and the standard solution respectively. With these solutions, and using water as the blank, measure the absorbances A_{TO} and A_{SO} at 405 nm as directed under the Ultraviolet-visible Spectroscopy.

$$\text{Amount (units) of urokinase} = \frac{A_T - A_{T0}}{A_S - A_{S0}} \times a \times b$$

a: Amount (units) of urokinase in 1 mL of the standard solution

b: Total volume (mL) when the test solution was prepared

(2) ***Protein***—Pipet an amount of Urokinase equivalent to about 15 mg of protein and perform the test as directed under the Nitrogen Determination.

Each mL of 0.005 mol/L sulfuric acid

= 0.87544 mg of protein

Packaging and storage Preserve in tight containers and store at NMT -20 ℃.

Purified Urokinase Solution
정제유로키나제 액

Purified Urokinase Solution is a purified solution of crude urokinase, and contains NLT 8000 IU per mL of urokinase when tested in the potency assay. Purified Urokinase Solution is a drug substance.

Description Purified Urokinase Solution occurs as a clear liquid.

Identification Perform the test with Purified Urokinase Solution as directed under the Potency assay; the result is positive.

Pyrogen It meets the requirements when used in the manufacturing of sterile preparations. Weigh a suitable amount of Purified Urokinase Solution, dissolve in water to prepare a solution containing 100 IU per mL and use this solution as the test solution. Dose of injection is 3 mL per kg of rabbit weight.

Potency assay Pipet the amount of Purified Urokinase Solution equivalent to 300 IU, dissolve in distilled water for injection or isotonic sodium chloride injection, dilute to 200, 160, 140, 120, 100, and 80 IU/mL with phosphate buffer solution (pH 7.2), and use this solution as the test solution. Add 0.5 mL each of the test solution into a test tube of about 10 mm in internal diameter and about 10 mm in length, add 0.2 mL each of thrombin solution, and mix well taking care to avoid forming air bubbles. Then, add 1.0 mL of fibrinogen solution, mix well while tilting the test tube for about 15 seconds. Immediately, place the test tube on a thermostat at 37 °C and start the timer. After exactly 1 minute, gently drop a nylon ball (about 8.0 mm in diameter, about 297 mg in weight) into the test tube. Measure the time until the nylon ball reaches the bottom of the test tube, and use this time as the time to dissolve. Measure the time 3 times for each diluent, calculate the mean value of each measured time to dissolve, read the concentration according to the standard calibration curve, and calculate the total potency using the following formula.

$$\text{Potency (IU) of urokinase} = U \times V_1 \times V_2$$

U: Concentration (IU/mL) calculated from the standard calibration curve

V_1: Amount (mL) of distilled water for injection or isotonic sodium chloride injection with Purified Urokinase Solution dissolved

V_2: Dilution factor for preparation of each test solution with 0.1 mol/L phosphate buffer solution

Setting of the standard calibration curve

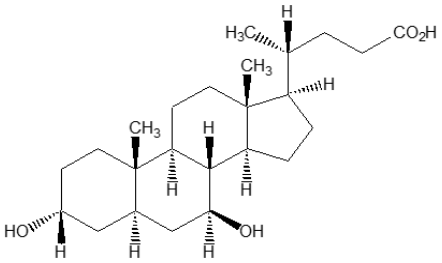
Preparation of standard urokinase solution: Dilute urokinase RS (with unit indicated) with 0.1 mol/L phosphate buffer solution (pH 7.2) and prepare 6 to 7 standard solutions with different concentrations (50 IU/mL to 300 IU/mL).

Measurement of the time to dissolve: Use thrombin solution, fibrinogen solution, and standard urokinase solution, and determine the time to dissolve of each standard urokinase solution.

Preparation of the standard calibration curve: Draw a calibration curve with the time to dissolve (second) on the vertical axis and concentration of standard urokinase solution on the horizontal axis of a logarithmic graph paper.

Packaging and storage Preserve in hermetic containers.

Ursodeoxycholic Acid
우르소데옥시콜산



$C_{24}H_{40}O_4$: 392.57

(4R)-4-[(1*S*,2*S*,5*R*,7*S*,9*S*,10*R*,11*S*,14*R*,15*R*)-5,9-Dihydroxy-2,15-dimethyltetracyclo[8.7.0.0^{2,7}.0^{11,15}]heptadecan-14-yl]pentanoic acid [*128-13-2*]

Ursodeoxycholic Acid, when dried, contains NLT 98.5% and NMT 101.0% of ursodeoxycholic acid ($C_{24}H_{40}O_4$).

Description Ursodeoxycholic Acid occurs as white crystals or a powder and has a bitter taste.
It is freely soluble in methanol, ethanol(99.5) or acetic acid(100), and practically insoluble in water.

Identification (1) Dissolve 10 mg of Ursodeoxycholid Acid in 1 mL of sulfuric acid and 1 drop of formaldehyde solution, and allow to stand for 5 minutes. Add 5 mL of water to this solution; a bluish green floating matter is formed.

(2) Determine the infrared spectra of Ursodeoxycholic Acid and ursodeoxycholic acid RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Optical rotation $[\alpha]_D^{20}$: Between +59.0° and +62.0° (1.0 g, previously dried, ethanol(99.5), 25 mL, 100 mm).

Melting point Between 200 and 204 ℃.

Purity (1) ***Odor***—To 2.0 g of Ursodeoxycholic Acid, add 100 mL of water and boil for 2 minutes; the solution is odorless.

(2) ***Chloride***—Add 20 mL of acetic acid(100) to 2.0 g of Ursodeoxycholic Acid, shake to mix and dissolve. Add water to make 200 mL, shake to mix, and allow to stand for 10 minutes. Filter this solution, discard the first 10 mL of the filtrate, and collect the subsequent filtrate. To 40 mL of this solution, add 6 mL of dilute nitric acid and water to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution by adding, to 0.25 mL of 0.01 mol/L hydrochloric acid, 4 mL of acetic acid(100), 6 mL of dilute nitric acid and water to make 50 mL (NMT 0.022%).

(3) ***Sulfate***—Take 40 mL of the test solution obtained in (2), add 1 mL of dilute hydrochloric acid and water to make 50 mL and perform the test using this solution as the test solution. Prepare the control solution by adding, to 0.40 mL of 0.005 mol/L sulfuric acid, 4 mL of acetic acid(100), 1 mL of dilute hydrochloric acid and water to make 50 mL (NMT 0.048%).

(4) ***Heavy metals***—Proceed with 1.0 g of Ursodeoxycholic Acid as directed under Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(5) ***Barium***—To the solution obtained in (1), add 2 mL of hydrochloric acid and boil for 2 minutes. After cooling, filter and wash with water until 100 mL of the filtrate is obtained. To 10 mL of this solution, add 1 mL of dilute sulfuric acid; no turbidity is produced.

(6) ***Arsenic***—Proceed with 1.0 g of Ursodeoxycholic Acid as directed under Method 3 and perform the test (NMT 2 ppm).

(7) ***Related substances***—Weigh 0.20 g of Ursodeoxycholic Acid, dissolve in 1 mL of methanol, add acetone to make exactly 10 mL, and use this solution as the test solution. Take 1 mL of this solution and add acetone to make exactly 100 mL. Take 1 mL and 2 mL each of this solution, add acetone to make exactly 20 mL, and use these solutions as the standard solution (1) and the standard solution (2), respectively. Separately, weigh 50 mg of chenodeoxycholic acid RS, dissolve in 5 mL of methanol and add acetone to make exactly 50 mL. Take 2 mL of this solution, add acetone to make exactly 10 mL and use this solution as the standard solution (3). Weigh 25 mg of lithocholic acid RS, dissolve in 5 mL of methanol, and add acetone to make exactly 50 mL. Take 2 mL of this solution, add acetone to make exactly 50 mL and use this solution as the standard solution (4). With these solutions, perform the test as directed under the Thin Layer Chromatography. Apply 10 μL each of the test solution and the standard solutions (1), (2), (3) and (4), on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Develop the plate with a mixture of isooctane, ethanol(95), ethyl acetate and acetic acid(100) (10 : 2 : 7 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Dry at 120 ℃ for 30 minutes, then immediately spray evenly with a solution prepared by adding ethanol(99.5) to 5 g of phosphomolybdic acid hydrate to make 50 mL, dropping 5 mL of sulfuric acid to this solution, then adding ethanol(99.5) to make 100 mL, and heat for 3 to 5 minutes at 120 ℃; the spots of the test solution are not more intense than the spots of the standard solutions (3) and (4), and the principal spot of the test solution and spots other than the above spots are not more intense than the spots obtained from the standard solution (2). Further, the total of the principal spot of the test solution and the spots other than the above spots is NMT 0.25% when compared to the spots obtained from the standard solutions (1) and (2).

Loss on drying NMT 1.0% (1 g, 105 ℃, 2 hours)

Residue on ignition NMT 0.2% (1 g)

Assay Weigh accurately about 0.5 g of Ursodeoxycholic Acid, previously dried, and dissolve by adding 40 mL of ethanol(95) and 20 mL of water. Titrate with 0.1 mol/L sodium hydroxide VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS
= 39.26 mg of $C_{24}H_{40}O_4$

Packaging and storage Preserve in well-closed containers.

Ursodeoxycholic Acid Capsules
우르소데옥시콜산 캡슐

Ursodeoxycholic Acid Capsules contain NLT 95.0% and NMT 105.0% of the labeled amount of ursodeoxycholic acid ($C_{24}H_{40}O_4$: 392.57).

Method of preparation Prepare as directed under Capsules, with Ursodeoxycholic Acid.

Identification Put the content of NLT 10 capsules of Ursodeoxycholic Acid Capsules into a Soxhlet extractor, extract with chloroform for 1 hour, evaporate the chloroform, dissolve the residue with 2 mL to 3 mL of acetic anhydride, and use this solution as the test solution. Separately, prepare a 0.1% acetic anhydride solution of ursodeoxycholic acid RS, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution to the thin-layer chromatographic plate made of silica gel for thin-layer chromatography, develop the plate with a mixture of isoamyl alcohol, acetic acid(31) and water (10 : 5 : 2) as the developing solvent, and air-dry the plate. Spray evenly sulfuric acid on the plate; the colors and R_f values of the spots obtained from the test solution and the standard solution are the same.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 Ursodeoxycholic Acid Capsules. Weigh accurately an amount of the content, equivalent to about 1 g of ursodeoxycholic acid ($C_{24}H_{40}O_4$), add the acetone, shake vigorously to mix, and make 100 mL. Centrifuge, take 50.0 mL of the clear supernatant, evaporate in vacuum, add 40 mL of neutralized ethanol to the residue, and shake for 5 minutes. Then, add 20 mL of water, and titrate with 0.1 mol/L sodium hydroxide VS using phenolphthalein as an indicator. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS
= 39.26 mg of $C_{24}H_{40}O_4$

Packaging and storage Preserve in well-closed containers.

Ursodeoxycholic Acid, Thiamine Hydrochloride and Riboflavin Capsules
우르소데옥시콜산·티아민염산염·리보플라빈 캡슐

Ursodeoxycholic Acid, Thiamine Hydrochloride and Riboflavin Capsules contain NLT 90.0% and NMT 110.0% of the labeled amount of ursodeoxycholic acid ($C_{24}H_{40}O_4$: 392.57) and NLT 90.0% and NMT 150.0% of the labeled amount of thiamine hydrochloride ($C_{12}H_{17}ClN_4OS{\cdot}HCl$: 337.27) and riboflavin ($C_{17}H_{20}N_4O_6$: 376.36).

Method of preparation Prepare as directed under Capsules, with Ursodeoxycholic Acid, Thiamine Hydrochloride and Riboflavin.

Identification (1) ***Ursodeoxycholic Acid***—Put the content of NLT 10 capsules of Ursodeoxycholic Acid, Thiamine Hydrochloride and Riboflavin Capsules into a Soxhlet extractor, extract with ethyl acetate for 1 hour, evaporate the ethyl acetate, dissolve the residue with 2 mL to 3 mL of acetic anhydride, and use this solution as the test solution. Separately, prepare a 0.1% acetic anhydride solution of ursodeoxycholic acid RS, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 20 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of toluene, acetone and acetic acid (60 : 30: : 1), and air-dry the plate. Spray evenly sulfuric acid on the plate; the colors and R_f values of the spots obtained from the test solution and the standard solution are the same.

(2) ***Thiamine hydrochloride and riboflavin***—Perform the test with the content of Ursodeoxycholic Acid, Thiamine Hydrochloride and Riboflavin Capsules as directed under the Analysis for Vitamins.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay (1) ***Ursodeoxycholic acid***—Weigh accurately the mass of about 20 capsules of Ursodeoxycholic Acid, Thiamine Hydrochloride and Riboflavin Capsules. Weigh accurately an amount of the content, equivalent to about 50 mg of ursodeoxycholic acid ($C_{24}H_{40}O_4$), add 40 mL of methanol, shake for 30 minutes to dissolve, then add 5.0 mL of the internal standard solution and methanol to make 50 mL, filter, and use this filtrate as the test solution. Separately, weigh accurately about 50 mg of ursodeoxycholic acid RS, dissolve in 40 mL of methanol, and add 5.0 mL of the internal standard solution and methanol to make 50 mL, use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the ratios, Q_T and Q_S, of peak area of the ursodeoxycholic acid to that of the internal standard.

Amount (mg) of ursodeoxycholic acid ($C_{24}H_{40}O_4$)
= Amount (mg) of ursodeoxycholic acid RS× $\frac{Q_T}{Q_S}$

Internal standard solution—Weigh 0.5 g of cholic acid, and add methanol to make 50 mL.

Operating conditions

Detector: A differential refractometer

Column: A stainless steel column about 4 mm in internal diameter and about 15 cm to 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm to 10 μm in particle diameter).

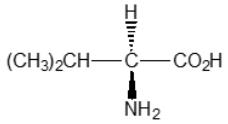
Mobile phase: To 500 mL of a mixture of methanol and water (70 : 50), add 0.1 mol/L phosphoric acid to adjust its pH to 3.5.

Flow rate: 1.0 mL/min

(2) ***Thiamine hydrochloride and riboflavin***—Weigh accurately the mass of the content of NLT 20 capsules of Ursodeoxycholic Acid, Thiamine Hydrochloride and Riboflavin Capsules, and perform the test as directed under the Analysis for Vitamins.

Packaging and storage Preserve in well-closed containers.

L-Valine
L-발린



$C_5H_{11}NO_2$: 117.15

(2*S*)-2-Amino-3-methylbutanoic acid [*72-18-4*]

L-Valine, when dried, contains NLT 98.5% and NMT 101.0% of L-valine ($C_5H_{11}NO_2$).

Description L-Valine occurs as white crystals or a crystalline powder. It is odorless or has a slightly characteristic odor. It has a sweet taste, but the aftertaste is bitter.
It is freely soluble in formic acid, soluble in water, and practically insoluble in ethanol(95) and ether.
It is soluble in dilute hydrochloric acid.

Identification Determine the infrared spectra of L-Valine and L-valine RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Optical rotation $[a]_D^{20}$: Between +26.5° and +29.0° (2 g, previously dried, 6 mol/L hydrochloric acid TS, 25 mL, 100 mm).

pH Dissolve 0.5 g of L-Valine in 20 mL of water; the pH of this solution is between 5.5 and 6.5.

Purity (1) ***Clarity and color of solution***—Dissolve 0.5 g of L-Valine in 20 mL of water; the resulting solution is clear and colorless.

(2) ***Chloride***—Perform the test with 0.5 g of L-Valine. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid (NMT 0.021%).

(3) ***Sulfate***—Perform the test with 0.6 g of L-Valine. Prepare the control solution with 0.35 mL of 0.005 mol/L sulfuric acid (NMT 0.028%).

(4) ***Ammonium***—Perform the test with 0.25 g of L-Valine. Prepare the control solution with 5.0 mL of ammonium standard solution (NMT 0.02%).

(5) ***Heavy metals***—Proceed with 2.0 g of L-Valine according to Method 1 under the Heavy Metals and perform the test. Prepare the control solution with 3.0 mL of lead standard solution (NMT 15 ppm).

(6) ***Iron***—Dissolve about 0.333 g of L-Valine in water to make 45 mL, add 2 mL of hydrochloric acid, and use this solution as the test solution. Add water to 1.0 mL of iron standard solution to make 45 mL, add 2 mL of hydrochloric acid, and use this solution as the standard solution. Add 50 mg of ammonium peroxydisulfate and 3 mL of 30% ammonium thiocyanate solution in the test solution and the standard solution and mix; the color obtained from the test solution is not more intense than that from the standard solution (NMT 30 ppm).

(7) ***Arsenic***—Prepare the test solution with 1.0 g of L-Valine according to Method 2 and perform the test (NMT 2 ppm).

(8) ***Related substances***—Dissolve 0.10 g of L-Valine in 25 mL of water, and use this solution as the test solution. Pipet 1 mL of this solution and add water to make exactly 50 mL. Pipet 5 mL of this solution, add water to make exactly 20 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on a plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of 1-butanol, water and acetic acid(100) (3 : 1 : 1) (as the developing solvent) to a distance of about 10 cm, and air-dry the plate. Spray evenly a solution of ninhydrin in acetone (1 in 50) on the plate and heat at 80 ℃ for 5 minutes; the spots other than the principal spot obtained from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 0.3% (1 g, 105 ℃, 3 hours).

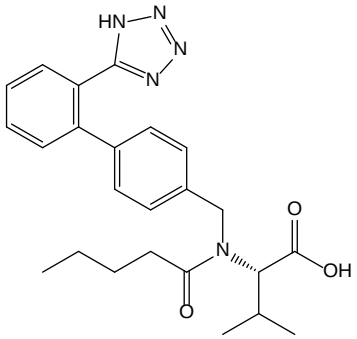
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.12 g of L-Valine, previously dried, and dissolve in 3 mL of formic acid, add 50 mL of acetic acid(100), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 11.715 mg of $C_5H_{11}NO_2$

Packaging and storage Preserve in tight containers.

Valsartan
발사르탄



$C_{24}H_{29}N_5O_3$: 435.52

(*S*)-3-Methyl-2-[pentanoyl-[[4-[2-(2*H*-tetrazol-5-yl)phenyl]phenyl]methyl]amino]butanoic acid [*137862-53-4*]

Valsartan contains NLT 98.0% and NMT 102.0% of valsartan ($C_{24}H_{29}N_5O_3$: 435.52), calculated on the anhydrous basis.

Description Valsartan occurs as a white powder.
It is freely soluble in ethanol(95), sparingly soluble in

dichloromethane, and practically insoluble in water.
It is hygroscopic.

Identification (1) Determine the infrared spectra of Valsartan and valsartan RS, as directed in the paste method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Valsartan in 20 mL of methanol and perform the test as directed under the Ultraviolet-visible Spectroscopy; the absorbance at a wavelength of 420 nm divided by the layer length is NMT 0.02.

(2) ***Heavy metals***—Proceed with 1.0 g of Valsartan according to Method 2 and perform the test. Prepare the control solution with 1.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Related substances***— (i) Valsartan related substance I: Weigh accurately about 50 mg of Valsartan, add 40 mL of the mobile phase, dissolve with sonication for 5 minutes, add the mobile phase to make exactly 50 mL, and use this solution as the test solution. Separately, weigh an appropriate amount of valsartan related substance I {*R*-*N*-valeryl-*N*-([2'-(1*H*-tetrazol-5-yl)biphen-4-yl]methyl)valine} RS, add the mobile phase to make a solution containing 0.01 mg in 1 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak area of each solution as directed in the automatic integration method and calculate the amount of valsartan related substance I; it is NMT 1.0%.

$$\text{Content (\%) of valsartan related substance I} = 100 \times \frac{C_S}{C_T} \times \frac{A_T}{A_S}$$

C_T: Concentration (mg/mL) of Valsartan in the test solution

C_S: Concentration (mg/mL) of valsartan related substance I in the standard solution

A_T: Peak area of valsartan related substance I obtained from the test solution

A_S: Peak area of valsartan related substance I obtained from the standard solution

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 230 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with cellulose tris-(3,5-dimethylcarbamate)-coated porous silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of hexane, 2-propanol and trifluoroacetic acid (85 : 15 : 0.1).

Flow rate: 0.8 mL/min

System suitability

System performance: Proceed with 10 μL of the system suitability solution according to the above conditions; the resolution between the peak of valsartan and the peak of valsartan related substance I is NLT 2.0.

System repeatability: Repeat the test 6 times with 10 μL each of the system suitability solution according to the above conditions; the relative standard deviation of the peak area of valsartan related substance I is NMT 5.0%

System suitability solution: Weigh accurately an appropriate amount of valsartan RS and valsartan related substance I RS, dissolve in the mobile phase so that each solution contains 0.04 mg per mL.

(ii) Vaslartan related substance II, valsartan related substance III and other related substances: Weigh accurately about 50 mg of Valsartan, add the mobile phase to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately an appropriate amount of valsartan RS, valsartan related substance II {*S*-*N*-butyryl-*N*-(2'-(1*H*-tetrazol-5-yl)biphen-4-yl]methyl)-valine} RS and valsartan related substance III {*S*-*N*-valeryl-*N*-([2'-(1*H*-tetrazol-5-yl)biphen-4-yl]methyl)-valine benzyl ester} RS, add the mobile phase, make solutions containing 0.001 mg per mL, respectively, and use these solutions as the standard solutions. Perform the test with 10 μL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions, determine the peak area of each solution as directed in the automatic integration method, and calculate the amount of related substances; the amount of valsartan related substance II is NMT 0.2%, the amount of valsartan related substance III is NMT 0.1%, the each amount of other related substances other than valsartan related substance I is NMT 0.1%, and the total amount of related substances other than valsartan related substance I is NMT 0.3%.

$$\text{Content (\%) of related substances} = 100 \times \frac{C_S}{C_T} \times \frac{A_i}{A_S}$$

C_T: Concentration (mg/mL) of Valsartan in the test solution

C_S: Concentration (mg/mL) of each valsartan related substance in the standard solution (concentration (mg/mL) of valsartan RS in the standard solution in the case of calculating other individual related substances)

A_i: Peak area of each valsartan related substance obtained from the test solution

A_S: Peak area of each valsartan related substance obtained from the standard solution (peak area of valsartan obtained from the standard solution in the case of calculating other individual related substances)

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 225 nm).

For the column, mobile phase and flow rate, comply

with the operating conditions in the Assay.

System suitability

System performance: Proceed with 10 μL each of the standard solution according to the above conditions; the resolution between valsartan peak and valsartan related substance II is NLT 1.8.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area of valsartan related substance II is NMT 10.0% and the relative standard deviation of valsartan peak area is NMT 2.0%

Water NMT 2.0% (1 g, volumetric titration, direct titration).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 50 mg of Valsartan and valsartan RS, respectively, dissolve in the mobile phase to make exactly 100 mL, and use these solutions as the test solution and the standard solution. Perform the test with 10 μL each of these solutions as directed under the Liquid Chromatography according to the following conditions and determine the peak areas, A_T and A_S, of valsartan.

$$\text{Amount (mg) of valsartan } (C_{24}H_{29}N_5O_3) = \text{Amount (mg) of valsartan RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 273 nm).

Column: A stainless steel column about 3.0 mm in internal diameter and 125 mm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: Filter a mixture of water, acetonitrile and acetic acid(100) (500 : 500 : 1) and deaerate to use.

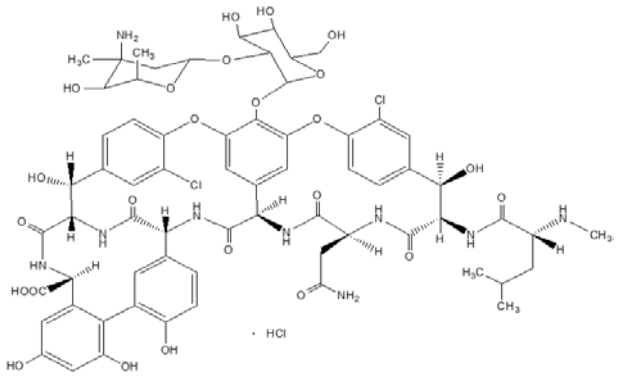
Flow rate: 0.4 mL/min

System suitability

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area of valsartan is NMT 2.0%.

Packaging and storage Preserve in tight containers.

Vancomycin Hydrochloride
반코마이신염산염



$C_{66}H_{75}Cl_2N_9O_{24}\cdot HCl$: 1485.71

(1*S*,2*R*,18*R*,19*R*,22*S*,25*R*,28*R*,40*S*)-50-[3-Amino-2,3,6-trideoxy-3-*C*-methyl-α-L-*lyxo*-hexopyranosyl-(1→2)-β-D-glucopyranosyloxy]-22-carbamoylmethyl-5,15-dichloro-2,18,32,35,37-pentahydroxy-19-[(2*R*)-4-methyl-2-(methylamino)pentanoylamino]-20,23,26,42,44-pentaoxo-7,13-dioxa-21,24,27,41,43-pentaazaoctacyclo[26.14.2.2^{3,6}.2^{14,17}.1^{8,12}.1^{29,33}.0^{10,25}.0^{34,39}]pentaconta-3,5,8,10,12(50),14,16,29,31,33(49),34,36,38,45,47-pentadecaene-40-carboxylic acid monohydrochloride [*1404-93-9*]

Vancomycin Hydrochloride is the hydrochloride of a kind of glycopeptide substance having antibacterial activity produced by the growth of *Streptomyces orientalis*.

Vancomycin Hydrochloride contains NLT 1000 μg (potency) and NMT 1200 μg (potency) of vancomycin ($C_{66}H_{75}N_2O_{24}S$: 1000) per mg, calculated on the anhydrous basis.

Description Vancomycin Hydrochloride occurs as a white powder.

It is freely soluble in formamide, slightly soluble in methanol, very slightly soluble in ethanol(95), and practically insoluble in acetonitrile. It is hygroscopic.

Identification (1) Determine the absorption spectra of solutions of Vancomycin Hydrochloride and vancomycin hydrochloride RS (1 in 10000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Vancomycin Hydrochloride and vancomycin hydrochloride RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) Dissolve 20 mg of Vancomycin Hydrochloride in 10 mL of water and add 1 drop of silver nitrate TS; the resulting solution is turbid.

Optical rotation $[\alpha]_D^{20}$: Between -30° and -40° (0.2 g, calculated on the anhydrous basis, water, 20 mL, 100 mm).

pH Dissolve 0.25 g of Vancomycin Hydrochloride in 5 mL of water; the pH of this solution is between 2.5 and

4.5.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Vancomycin Hydrochloride according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Related substances***—Dissolve 0.1 g of Vancomycin Hydrochloride in 10 mL of the mobile phase A, and use this solution as the test solution. Pipet 1 mL of this solution, add the mobile phase A to make exactly 25 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. If necessary, proceed with 20 μL of the mobile phase A in the same manner and make any necessary correction for the solvent peak and the baseline change. Determine peak areas of the test solution and the standard solution by the automatic integration method; each peak area other than the peak of vancomycin obtained from the test solution is not larger than the peak area of vancomycin from the standard solution. The total area of the peaks other than vancomycin from the test solution is not larger than 3 times the peak area of vancomycin from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 280 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: Use mobile phases A and B to control a step or gradient elution as follows.

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 - 12	100	0
12 - 20	100 → 0	0 → 100
20 - 22	0	100

Mobile phase A: Add water to 4 mL of triethylamine to make 2000 mL. Adjust the pH to 3.2 with phosphoric acid. Take 920 mL of this solution, add 70 mL of acetonitrile, and add 10 mL of tetrahydrofuran. Adjust the amount of acetonitrile so that the retention time of vancomycin is 7.5 minutes - 10.5 minutes.

Mobile phase B: Add water to 4 mL of triethylamine to make 2000 mL. Adjust the pH to 3.2 with phosphoric acid. Take exactly 700 mL of this solution, add 290 mL of acetonitrile, and add 10 mL of tetrahydrofuran.

Flow rate: 1.5 mL/min

System suitability

Detection sensitivity: The peak area of vancomycin obtained from 20 μL of the standard solution is 3% - 5% of the peak area of vancomycin from 20 μL of the test solution.

System performance: Dissolve 5 mg of Vancomycin Hydrochloride in 10 mL of water, warm at 65 °C for 48 hours, and cool at the ordinary temperature. Proceed with 20 μL of this solution according to the above conditions; related substances I and related substances II are eluted in this order. The resolution between related substances I and vancomycin is NLT 3, the number of theoretical plate of vancomycin peak is NLT 1500, and related substances II is eluted between 15 and 18 minutes.

System repeatability: Repeat the test 5 times with 20 μL each of the standard solutions according to the above conditions; the relative standard deviation of peak areas of vancomycin is NMT 2.0%

Time span of measurement: About 2.5 times the retention time of vancomycin after the solvent peak.

Water NMT 5.0% (0.1 g, volumetric titration, direct titration). Use a mixture of formamide for water determination and methanol for water determination (3 : 1).

Residue on ignition NMT 1.0% (1.0 g).

Sterility It meets the requirements when used in sterile preparations. However, it is exempt from the requirements when there is a final sterilization process in the manufacturing processes of the sterile preparations.

Bacterial endotoxins It is NMT 0.25 EU per mg of vancomycin when used in sterile preparations

Assay ***Cylinder-plate method***—(1) Medium (i) Agar media for seed and base layers

Peptone	5.0 g
Meat extract	3.0 g
Agar	15.0 g

Weigh the above materials, add purified water to make 1000 mL, sterilize, and adjust the pH to between 6.2 and 6.4.

(2) Test organism-Use *Bacillus subtilis* ATCC 6633 as the test organism.

(3) Weigh accurately about 25 mg (potency) of Vancomycin Hydrochloride and dissolve in water to make exactly 25 mL. Take exactly an appropriate amount of this solution add 0.1 mol/L phosphate buffer solution. pH 4.5, to make solutions containing 100.0 μg (potency) and 25.0 μg (potency) per mL, and use these solutions as the high concentration test solution and low concentration test solution, respectively. Separately, weigh accurately about 25 mg of vancomycin hydrochloride RS, dissolve in water to make exactly 25 mL, and use this solution as the standard stock solution. Store the standard stock solution at below 5 °C and use it within 7 days. Take exactly an appropriate amount of the standard stock solution, add 0.1 mol/L phosphate buffer solution, pH 4.5, to make solutions containing 100.0 μg (potency) and 25.0 μg (potency) per mL, and use these solutions as the high concentration standard solution and low concentration stand-

ard solution, respectively. With these solutions, perform the test as directed under the Microbial Assays for Antibiotics (i) (8).

Packaging and storage Preserve in tight containers.

Vancomycin Hydrochloride Capsules
반코마이신염산염 캡슐

Vancomycin Hydrochloride Capsules are Vancomycin Hydrochloride separated in polyethylene glycol and contain NLT 90.0% and NMT 120.0% of the labeled amount of vancomycin hydrochloride ($C_{66}H_{75}Cl_2N_9O_{24}$: 1449.26).

Method of preparation Prepare as directed under Capsules, with Vancomycin Hydrochloride.

Identification Weigh an amount of the contents of Vancomycin Hydrochloride Capsules equivalent to 10 mg of vancomycin hydrochloride and dissolve in water to make 100 mL. Determine the absorption spectrum of this solution as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum between 279 nm and 284 nm.

Water NMT 8.0% (0.2 g, volumetric titration, direct titration).

Dissolution Perform the test with 1 capsule of Vancomycin Hydrochloride Capsules at 100 revolutions per minute according to Method 2 under the Dissolution, using 900 mL of water as the test solution. Take the dissolved solution 45 minutes from the start of the test and filter. Use the filtrate as the test solution and perform the test as directed under the Assay of Vancomycin Hydrochloride. Meets the requirements if the dissolution rate in 45 minutes is NLT 85%.

Uniformity of dosage units Meets the requirements.

Assay ***Cylinder plate method***—Proceed as directed under the Assay under Vancomycin Hydrochloride. Weigh accurately the contents of NLT 20 capsules of Vancomycin Hydrochloride Capsules. According to the labeled potency, weigh accurately an amount equivalent to about 25 mg (potency) of Vancomycin Hydrochloride and dissolve in water to make exactly 25 mL. Take exactly an appropriate amount of this solution, add 1 mL of 0.1 mol/L phosphate buffer solution (pH 4.5) to obtain solutions having known concentrations of 100 μg (potency) and 25 μg (potency) per mL, and use this solution as the high concentration test solution and low concentration test solution, respectively.

Packaging and storage Preserve in tight containers.

Vancomycin Hydrochloride for Injection
주사용 반코마이신염산염

Vancomycin Hydrochloride for Injection, dissolved before use, contains NLT 90.0% and NMT 115.0% of the labeled amount of vancomycin ($C_{66}H_{75}Cl_2N_9O_{24}$: 1449.25).

Method of preparation Prepare as directed under Injections, with Vancomycin Hydrochloride.

Description Vancomycin Hydrochloride for Injection occurs as a white mass or a powder.

Identification (1) Prepare 50 mL of a solution made by dissolving an amount equivalent to 5 mg (potency) of vancomycin hydrochloride, according to the labeled amount of Vancomycin Hydrochloride for Injection, in 50 mL of water, and determine the absorption spectrum of the solution as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum between 279 nm and 283 nm.

(2) Weigh an amount equivalent to 20 mg (potency) of vancomycin hydrochloride, according to the labeled amount of Vancomycin Hydrochloride for Injection, dissolve in 10 mL of water, and add 1 drop of silver nitrate TS; a white turbidity is produced.

pH Dissolve an amount equivalent to about 0.5 g (potency) of vancomycin hydrochloride, according to the labeled amount of Vancomycin Hydrochloride for Injection in 10 mL of water; the pH of the solution is between 2.5 and 4.5.

Purity (1) ***Clarity and color of solution***—Weigh an amount equivalent to about 0.5 g (potency) of vancomycin hydrochloride, according to the labeled amount of Vancomycin Hydrochloride for Injection, and dissolve in 10 mL of water; the color of the solution is colorless to pale yellow and clear. Perform the test with this solution as directed under the Ultraviolet-visible Spectroscopy; the absorbance at 465 nm is NMT 0.05.

(2) ***Heavy metals***—Weigh 0.66 g of Vancomycin Hydrochloride for Injection and perform the test as directed under Method 2. Prepare the control solution with 3.0 mL of lead standard solution (NMT 30 ppm).

(3) ***Related substances***—Weigh the amount equivalent to 0.1 g of vancomycin hydrochloride, according to the labeled amount of Vancomycin Hydrochloride for Injection, dissolve in 10 mL of the mobile phase A, and use this solution as the test solution. Perform the test as directed under Purity (2) of Vancomycin Hydrochloride.

Water NMT 5.0% (0.1 g, volume titration, direct titration). Use a mixture of formamide for water determination and methanol for water determination (3 : 1).

Sterility It meets the requirements when used in a sterile preparation.

Bacterial endotoxins It is less than 0.25 EU per mg (potency) of vancomycin when used in a sterile preparation.

Particulate contamination: Visible particles Meets the requirements.

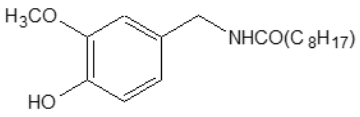
Insoluble particulate matter in injections Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay ***Cylinder plate method***—Perform the test as directed under the Assay of Vancomycin Hydrochloride. However, weigh accurately the mass of the contents of NLT 10 Vancomycin Hydrochloride for Injections. Weigh accurately an amount equivalent to 25 mg (potency) of Vancomycin Hydrochloride, according to the labeled potency, and dissolve in water to make exactly 25 mL. Take exactly an appropriate amount of this solution, add 0.1 mol/L phosphate buffer solution, pH 4.5, to make solutions containing 100 μg (potency) and 25 μg (potency) per mL, and use these solutions as the high concentration test solution and the low concentration test solution, respectively.

Packaging and storage Preserve in hermetic containers.

Vanillyl Nonylamide
노닐산바닐릴아미드



$C_{17}H_{27}NO_3$: 293.41

N-(4-Hydroxy-3-methoxybenzyl) nonanamide, [*2444-46-4*]

Vanillyl Nonylamide, when dried, contains NLT 95.0% and NMT 101.0% of vanillyl nonylamide ($C_{17}H_{27}NO_3$).

Description Vanillyl Nonylamide occurs as a white to pale yellow crystalline powder, grain, or a mass.
It has a very spicy taste.
It is freely soluble in ethanol(95), chloroform, dimethylformamide or ether and practically insoluble in water.

Identification (1) Weigh about 0.1 g of Vanillyl Nonylamide, dissolve in 5 mL of 0.1 mol/L sodium hydroxide TS, add 1 mL of phosphomolybdic acid solution (3 in 100), and allow it to stand; the resulting solution exhibits a blue color.

(2) Weigh about 0.1 g of Vanillyl Nonylamide, dissolve in 5 mL of ethanol, add 1 to 4 drops of ferric chloride TS; the resulting solution exhibits a blue green color.

Melting point Between 48 and 51 ℃.

Acid value NMT 10.

Purity (1) ***Amine***—Weigh accurately about 0.1 g of Vanillyl Nonylamide, dissolve in 25 mL of methanol, add 0.1 mol/L of sodium dihydrogen phosphate TS, pH 3.0, to make exactly 100 mL. Filter and use the filtrate as the test solution. Separately, weigh accurately about 20 mg of vanillyl amine hydrochloride (4-hydroxy-3-methoxybenzylamine hydrochloride) RS, dissolve in 25 mL of methanol, and add 0.1 mol/L of sodium dihydrogen phosphate TS, pH 3.0, to make exactly 100 mL. Pipet 5 mL of this solution and add 0.1 mol/L of sodium dihydrogen phosphate TS, pH 3.0, to make exactly 50 mL. Use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of vanillyl amine(NMT 1.53% as vanillyl amine).

$$\text{Content (\%) of vanillyl amine } (C_8H_{11}NO_2) = \frac{[\text{Amount (mg) of vanillyl amine hydrochloride RS}]}{\text{Amount (mg) of Vanillyl Nonylamide taken}} \times \frac{A_T}{A_S} \times \frac{153.18}{189.64} \times 10$$

153.18: Molecular weight of vanillyl amine
189.64: Molecular weight of vanillyl amine hydrochloride

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 280 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of 0.5% ammonium carbonate solution and methanol (95 : 5).

Flow rate: 1.0 mL/min

(2) ***Arsenic***—Proceed with1.0 g of Vanillyl Nonylamide according to Method 3 and perform the test (NMT 2 ppm).

Loss on drying NMT 0.5% (1 g, sulfuric acid, 5 hours).

Residue on ignition NMT 0.01% (1.0 g).

Assay Weigh accurately about 0.1 g of Vanillyl Nonylamide, previously dried, and dissolve in ethanol to make 100 mL. Take 5.0 mL of this solution, add methanol to make 100 mL, and use it as the test solution. Separately, proceed in the same manner as in the preparation of the test solution with about 0.1 g of vanillyl nonylamide RS, and use this solution as the standard solution. Determine the absorbance, A_T and A_S, of the test solution and the standard solution at 282 nm as directed under the Ultra-

violet-visible Spectroscopy.

$$\text{Amount (mg) of vanillyl nonylamide } (C_{17}H_{27}NO_3) = \text{Amount (mg) of vanillyl nonylamide RS} \times \frac{A_T}{A_S}$$

Packaging and storage Preserve in tight containers.

Vasopressin Injection
바소프레신 주사액

Vasopressin Injection is an aqueous solution for injection. Vasopressin Injection contains synthetic vasopressin or the pressor principle, vasopressin, obtained from the posterior lobe of the pituitary of healthy cattle and pigs, from which the majority of the oxytocic principle, oxytocin, has been removed.

Vasopressin Injection contains NLT 85.0% and NMT 120.0% of labeled Vasopressin units.

Method of preparation Prepare as directed under Injections, with vasopressin obtained from the posterior pituitary gland or synthetically produced vasopressin.

Description Vasopressin Injection occurs as a colorless and clear liquid, which is odorless or has a slightly characteristic odor.

pH—Between 3.0 and 4.0.

Purity ***Uterine contraction component***—Perform the test according to the following procedure; the amount of uterine contraction component is NMT 0.6 units of oxytocin per quantified 10 vasopressin units.

(1) ***Standard stock solution***—Dissolve 200 units of oxytocin RS according to the labeling unit in exact 10 mL of diluted acetic acid(100) (1 in 400). Pipet 1 mL of this solution, and add diluted acetic acid(100) (1 in 400) to make exactly 10 mL. Store this solution in a cold place, avoiding freezing, and use it within 6 months after preparation.

(2) ***Standard solution***—Add isotonic sodium chloride injection to the standard stock solution to dilute so that 1 mL of this solution contains 0.020 units of oxytocin.

(3) ***Test solution***—Assume oxytocin units are equivalent to 6/100 of the determined vasopressin units. Add isotonic sodium chloride injection to Vasopressin Injection to dilute so that 1 mL of this solution contains the assumed 0.020 units of oxytocin.

(4) ***Apparatus***—Use the apparatus for the uterus contraction test, equipped with a thermostatic bath. Maintain a temperature of the bath at 37 ℃ to 38 ℃ with a variation of NMT 0.1 ℃ during the course of the test. Also, use a 100-mL Magnus container to suspend the uterus vertically.

(5) ***Test animals***—Perform with healthy virgin guinea pigs weighing between 175 g and 350 g, in a non-estrus stage. Separate and raise them without exposure to males from a young age, and be prevented from sensing the scent of males.

(6) ***Procedure***—Immerse the Magnus container in a thermostat maintained at a constant temperature, add Locke-Ringer TS to the container, and ensure adequate oxygen flow. Sacrifice a guinea pig by means of a blow on the head, immediately remove the uterus from the body, suspend it vertically in the Magnus container, and connect one end of the uterine horn to the lever with a thread. If necessary, the lever is weighted and its mass is not changed throughout the Assay. Perform the test after 15 to 30 minutes when the uterus has sufficiently expanded. Place the same quantities of 0.1 to 0.5 mL, each of the standard solution and the test solution alternatively to the Magnus container twice at regular intervals of 10 to 20 minutes. Finally add a 25% increase in the amount of the standard solution separately to contract the uterus, and measure the height of every contraction.

The average height of the uterus contraction by the standard solution is equal or NLT that by the test solution. In addition, the height of contraction caused by the last increased standard solution is distinctly higher than those caused by the previous standard solution.

Sterility Meets the requirements.

Bacterial endotoxins Less than 15 EU per unit of vasopressin

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Extractable volume of injections Meets the requirements.

Assay (1) ***Test animals***—Perform with healthy male white rats weighing between 200 g and 300 g.

(2) ***Standard stock solution***—Dissolve about 2000 units of oxytocin RS according to the labeling unit in exact 100 mL of diluted acetic acid(100) (1 in 400). Pipet 1 mL of this solution, and add diluted acetic acid(100) (1 in 400) to make exactly 10 mL. Store this solution in a cold place, avoiding freezing, and use it within 6 months after preparation.

(3) ***Standard solution***—Dilute the standard stock solution with Isotonic Sodium Chloride Injection. Inject 0.2 mL of the obtained solution according to (6) to the test animals; it adjusts the blood pressure of the test animal to increase by 35 mmHg to 60 mmHg and use this solution as the high-dose standard solution (S_H). Then dilute this solution with Isotonic Sodium Chloride Injection to 1.5 to 2.0 times by volume and use this solution as the low-dose standard solution (S_L).

(4) ***Test solution***—Dilute an accurately measured volume of Vasopressin Injection with Isotonic Sodium Chloride Injection so that the obtained solution contains the same concentration in units as the high-dose standard solution based on the labeled units and use this solution

as the high-dose test solution (T_H). Then dilute this solution with Isotonic Sodium Chloride Injection to 1.5 to 2.0 times by volume and use this solution as the low-dose test solution (T_L). Make the concentration ratio of S_H to S_L equal to the ratio of T_H to T_L. When a change in reaction occurs, adjust the concentration of S_H and S_L at the beginning of the next test in set 1. In this case, set the concentration ratio between S_H and S_L and between T_H to T_L the same as the initial concentration ratio.

(5) ***Dose of injection***—Although 0.2 mL of each solution is usually injected, the dose of injection can be determined based from preliminary tests or experiences. Inject the same volume throughout set 1 of tests.

(6) ***Procedure***—Anesthetize the test animals by subcutaneous injection (s.c.) of 0.7 mL of ethyl carbamate solution (1 in 4) per 100 g of body weight, insert the cannula into the trachea for artificial respiration (respiratory rate: approximately 60 breaths per minute), remove a part of the second cervical vertebra to sever the spinal cord, and destroy the brainstem through the foramen magnum. Insert cannula filled with Isotonic Sodium Chloride Injection into the femoral vein. Through this cannula, inject the solution prepared by dissolving 200 heparin units of heparin sodium in 0.1 mL of Isotonic Sodium Chloride Injection per 100 g of body weight and then immediately inject 0.3 mL of Isotonic Sodium Chloride Injection. Insert a cannula into a carotid artery and connect the cannula to a manometer for blood pressure measurement with vinyl tube. The artery cannula and the vinyl tube have previously been filled with Isotonic Sodium Chloride Injection. Inject the standard and the test solutions at regular intervals of 10 to 15 minutes into the femoral vein through the cannula when the blood pressure increased caused by each solution returns to the original level. Measure the height of blood pressure increases within 1 mmHg on the kymogram. Maintain a constant temperature between 20 and 25 ℃ during the assay. In addition, make four pairs from S_H, S_L, T_H, T_L as follows. Randomize the order of injection for pairs, but keep the order of injection within pairs as indicated.

Pair 1 S_H, T_L, Pair 2 S_L, T_H,
Pair 3 T_H, S_L, Pair 4 T_L, S_H

Perform the test by creating four pairs for set 1 using the same test animal; however, it can also be conducted with set 2. If necessary, however, use the different animals for each set of tests.

(7) ***Calculation***—Set the differences in blood pressure caused by high and low doses in each of Pair 1, 2, 3 and 4 as y_1, y_2, y_3 and y_4, respectively. Add y_1, y_2, y_3 and y_4 for each set to obtain Y_1, Y_2, Y_3 and Y_4.

Number of units in each mL of Vasopressin Injection = anti log M × (Number of units in each mL of the high-dose standard solution)× $\frac{b}{a}$

$$M = \frac{IY_a}{Y_b}$$

$$I = \log \frac{S_H}{S_L} = \log \frac{T_H}{T_L}$$

$$Y_a = - Y_1 + Y_2 + Y_3 - Y_4$$
$$Y_b = Y_1 + Y_2 + Y_3 + Y_4$$

a: Volume (mL) of sample taken
b: Total volume (mL) when diluted with an isotonic sodium chloride injection to create a high-dose test solution from the volume of sample taken

However, when calculating L (p = 0.95) using the following equation, L is NMT 0.15. If this value is exceeded, increase the number of test sets until it falls below this value, or adjust the experimental conditions, and then repeat the test.

$$L = 2\sqrt{(C-1)(CM^2 + I^2)}$$
$$C = \frac{Y_b^2}{Y_b^2 - 4fs^2t^2}$$

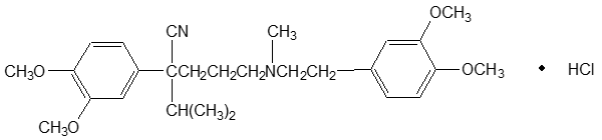
f = Number of the test set
$s^2 = \sum y^2 - \frac{Y}{f} - \frac{Y'}{4} + \frac{Y_b^2 4f}{n}$

$\sum y^2$: Sum of the squares of y_1, y_2, y_3, and y_4 for each set
$Y = Y_1^2 + Y_2^2 + Y_3^2 + Y_4^2$
Y': Square of the sum of y_1, y_2, y_3, and y_4 for set 1, summed across all sets.
$n = 3(f\text{-}1)$
t^2: Values in the table in the Assay under Insulin Injection for n when s^2 calculated.

Packaging and storage Preserve in hermetic containers in a cold place, avoiding freezing.

Expiration date 36 months after preparation.

Verapamil Hydrochloride
베라파밀염산염



Iproveratril Hydrochloride $C_{27}H_{38}N_2O_4 \cdot HCl$: 491.06
2-(3,4-Dimethoxyphenyl)-5-[2-(3,4-dimethoxyphenyl)ethyl-methylamino]-2-propan-2-yl-pentanenitrile hydrochloride [*152-11-4*]

Verapamil Hydrochloride, when dried, contains NLT 98.5% and NMT 101.0% of verapamil hydrochloride ($C_{27}H_{38}N_2O_4 \cdot HCl$).

Description Verapamil Hydrochloride occurs as a white crystalline powder and it is odorless.
It is freely soluble in methanol, acetic acid(100) or chlo-

roform, soluble in ethanol(95) or acetic anhydride, sparingly soluble in water, and practically insoluble in ether.

Identification (1) Add 5 drops of Reinecke Salt TS to 2 mL of an aqueous solution of Verapamil Hydrochloride (1 in 50); a pale red precipitate is formed.

(2) Determine the absorption spectra of solutions of Verapamil Hydrochloride and verapamil hydrochloride RS in 0.01 mol/L hydrochloric acid TS (1 in 50000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared spectra of Verapamil Hydrochloride and verapamil hydrochloride RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(4) An aqueous solution of Verapamil Hydrochloride (1 in 50) responds to the Qualitative Analysis for chloride.

Melting point Between 141 and 145 ℃.

pH Weigh 1.0 g of Verapamil Hydrochloride and dissolve in 20 mL of freshly boiled and cooled water by warming, and allow to cool; the pH of this solution is between 4.5 and 6.5.

Purity (1) ***Clarity and color of solution***—Add 1.0 g of Verapamil Hydrochloride in 20 mL of water to dissolve by warming; the solution is clear and colorless.

(2) ***Heavy metals***—Proceed with 1.0 g of Verapamil Hydrochloride according to Method 2 under the Heavy Metals and perform the test. Prepare the control solution with 1.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Arsenic***—Proceed with 1.0 g of Verapamil Hydrochloride according to Method 3 and perform the test (NMT 2 ppm).

(4) ***Related substances***—Weigh 0.50 g of Verapamil Hydrochloride and dissolve in 10 mL of chloroform. Use this solution as the test solution. Pipet 1 mL of the test solution, and add chloroform to make exactly 100 mL. Use this solution as the standard stock solution. Pipet 5 mL of the standard stock solution, and add chloroform to make exactly 100 mL. Use this solution as the standard solution (1). Separately, pipet 5 mL of the standard stock solution, and add chloroform to make exactly 50 mL. Use this solution as the standard solution (2). With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution, standard solution (1), and standard solution (2) on 2 plates of silica gel for thin-layer chromatography. Develop one of the 2 plates with a mixture of cyclohexane and diethylamine (17 : 3) (as the developing solvent) to a distance of about 15 cm, air-dry the plate, then dry at 110 ℃ for 1 hour, and allow to cool. Spray evenly iron(III) chloride-iodine TS on that plate and examine it immediately; the three intense spots, other than the principal spot and the spot of the origin spot from the test solution, are not more intense than the spots obtained from the standard solution (2). Additionally, other spots are not more intense than the spots from the standard solution (1). Perform the test with the remaining 1 plate in the same manner specified above, using a mixture of toluene, methanol, acetone and acetic acid(100) (14 : 4 : 1 : 1) (as the developing solvent).

Loss on drying NMT 1.0% (1 g, 105 ℃, 2 hours).

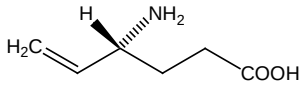
Residue on Ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.7 g of Verapamil Hydrochloride, previously dried, dissolve it in 50 mL of a mixture of acetic anhydride and acetic acid(100) (7 : 3), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 49.11 mg of $C_{27}H_{38}N_2O_4 \cdot HCl$

Packaging and storage Preserve in light-resistant, well-closed containers.

Vigabatrin
비가바트린



and enantiomer

$C_6H_{11}NO_2$: 129.16

4-Aminohex-5-enoic acid [*68506-86-5*]

Vigabatrin contains NLT 98.0% and NMT 102.0% of vigabatrin ($C_6H_{11}NO_2$), calculated on the anhydrous basis.

Description Vigabatrin occurs as a white powder.
It is very soluble in water.

Identification (1) Determine the infrared spectra of Vigabatrin and vigabatrin RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

Optical rotation $[\alpha]_D^{20}$: Between -0.5° and +0.5° (2 g, water, 10 mL, 100 mm).

Purity (1) ***Heavy metals***—Proceed with 2.0 g of Vigabatrin according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Ethanol***—Weigh accurately 0.5 g of Vigabatrin, transfer to a 5-mL head space vial, dissolve in 10 mL of 0.0025 w/v% toluene solution (internal standard solution), close tightly with a stopper, and heat at 60 ℃ for 30 minutes. Use this solution as the test solution. Separately, prepare a solution containing 0.025 w/v% ethanol and 0.0025 w/v% toluene in water, and use this solution as the standard solution. Use water as the blank test solution. Perform the test with 10 μL each of the blank test solution, the test solution, and the standard solution according to the following conditions using a headspace sample injector as directed under the Gas Chromatography and calculate ratios of the peak area of ethanol to the peak area of the internal standard from each solution, respectively; the amount of ethanol is NMT 0.6%.

Operating conditions

Detector: A flame ionization detector (FID)

Column: A glass column about 0.25 mm in internal diameter and about 30 m in length, packed with 5% phenylmethylsilicone polymer for gas chromatograph y (5 μm in particle diameter).

Carrier gas: Helium

Sample injection port temperature: 200 ℃

Detector temperature: 250 ℃

Column temperature: Maintain at 35 ℃ for the first 12 minutes and increase at a speed of 10 ℃ per min up to 175 ℃.

Split ratio: About 100 : 1.

(3) ***Related substances***—The total amount of related substances calculated form the two methods is NMT 0.5%.

(i) Dissolve 0.4 g of Vigabatrin in the mobile phase to make exactly 100 mL and use this solution as the test solution. Separately, dissolve 4.0 mg of 3-aminopent-4-en-1,1-dicarboxylic acid RS in the mobile phase to make exactly 100 mL, add the mobile phase to 5.0 mL of this solution to make exactly 50 mL, and use this solution as the standard solution (1). Dissolve 4.0 mg of 5-vinyl-2-pyrrolidinone RS in the mobile phase to make exactly 100 mL, add the mobile phase to 5.0 mL of this solution to make exactly 50 mL, and use this solution as the standard solution (2). Dissolve 4.0 mg of (*E*)-4-amino-2-ethylidene-butyrate RS in the mobile phase to make exactly 100 mL, add the mobile phase to 5.0 mL of this solution to make exactly 50 mL, and use this solution as the standard solution (3). Dissolve 2.0 mg of 5-vinyl-2-pyrrolidinone RS and 0.40 g of vigabatrin RS in the mobile phase to make exactly 100 mL and use this solution as the standard solution (4). Perform the test with 20 μL each of the test solution, the standard solution (1), the standard solution (2), and the standard solution (3) as directed under the Liquid Chromatography according to the following conditions, and determine the peak area of each solution by the automatic integration method. The peak areas of 5-vinyl-2-pyrrolidinone and (*E*)-4-amino-2-ethylidene-butyrate obtained from the test solution are not greater than the peak area from each of the standard solution (2) and the standard solution (3) (each NMT 0.1%). The peak area of each of related substances is not greater than the peak area from the standard solution (1) (NMT 0.1%). Calculate the amount of 5-vinyl-2-pyrrolidinone and (*E*)-4-amino-2-ethylidene-butyrate of Vigabatrin from the peak areas of the major peak from the standard solution (2) and the standard solution (3), calculate the amount of related substances from 0.1% of the major peak area of the standard solution (1), and calculate the total amount of related substances.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 210 nm).

Column: Use by connecting column 1 and column 2.

Column 1: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with hexyl silyl silica gel for liquid chromatography (5 μm in particle diameter).

Column 2: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with cation exchange resin for liquid chromatography (10 μm in particle diameter).

Mobile phase: A mixture of water, acetonitrile and phosphate buffer (950 : 25 : 25).

Flow rate: 1.0 mL/min

System suitability

System performance: Proceed with 20 μL of the standard solution (4) according to the above conditions; 5-vinyl-2-pyrrolidinone and vigabatrin are eluted in this order with the resolution between these peaks being NLT 1.5.

Time span of measurement: About twice the retention time of the major peak obtained from the test solution.

Phosphate buffer—Dissolve 58.5 g of sodium dihydrogen phosphate monohydrate in water, add 23 mL of phosphoric acid, and add water to make 1000 mL.

(2) Dissolve 20.0 mg of Vigabatrin in water to make exactly 10 mL. To 1.0 mL of this solution, add 2 mL of a solution, prepared by dissolving 7.7 g of boric acid in water, adjusting the pH to 7.7 with 50% sodium hydroxide and adding water to make 250 mL, and mix. To this solution, add 3 mL of a solution of 0.16 w/v% 9-fluorenylmethyl chloroformate in acetone and 3 mL of ethyl acetate, shake strongly for a few seconds, and use the separated bottom layer as the test solution within 8 hours. Separately, dissolve 2.0 mg of 4-aminobutyric acid and 0.20 g of Vigabatrin in water to make 100 mL. Take 1.0 mL of this solution and proceed in the same manner as in the preparation of the above solution, and use this solution as the standard solution. Perform the test with 25 μL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak area of 4-aminobutyric acid for each solution by the automatic integration method and calculate the amount of 4-aminobutyric acid; it is NMT 0.2%.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 263 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with phenyl silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of acetate buffer and acetonitrile (75 : 25).

Flow rate: 1.0 mL/min

System suitability

System performance: Proceed with 25 μL of the standard solution according to the above conditions; 9-fluorenylmethanol, 4-aminobutyric acid and vigabatrin are eluted in this order with the retention time of each being about 6 minutes, about 9 minutes, and about 14 minutes, respectively, and the resolution between the peak of each of the derivative from 4-aminobutyric acid and 9-fluorenylmethanol being NLT 2.0.

Acetate buffer—Dissolve 8.2 g of sodium acetate anhydride in water, adjust the pH to 4.2 with acetic acid(100), and add water to make 2000 mL.

Water NMT 0.5% (0.3 g, purified methanol, 50 mL, volumetric titration, direct titration).

Assay Weigh accurately about 0.2 g each of Vigabatrin and vigabatrin RS, dissolve in water to make 100 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 20 μL of these solutions as directed under the Liquid Chromatography according to the following conditions and determine the peak areas of vigabatrin, A_T, and A_S, respectively, from each solution.

$$\text{Amount (mg) of vigabatrin } (C_6H_{11}NO_2) = \text{Amount (mg) of vigabatrin RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 210 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with cation exchange resin for liquid chromatography (10 μm in particle diameter).

Mobile phase: A mixture of phosphate buffer solution, methanol and acetonitrile (1000 : 40 : 4).

Flow rate: 1.5 mL/min

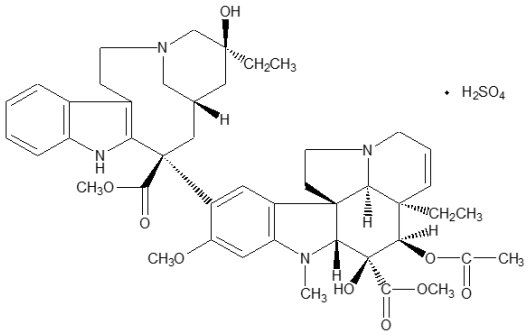
System suitability

System performance: dissolve 2.0 mg of 5-vinyl-2-pyrrolidinon RS and 0.2 g of vigabatrin RS in water to make 100 mL, proceed with 20 μL of this solution according to the above conditions; 5-vinyl-2-pyrrolidinon and vigabatrin are eluted in this order with the resolution between these peaks being NLT 1.5.

Phosphate buffer—Weigh 3.4 g of potassium dihydrogen phosphate, dissolve in water to make 1000 mL, and adjust the pH to 2.8 with phosphoric acid.

Packaging and storage Preserve in well-closed containers.

Vinblastine Sulfate
빈블라스틴황산염



$C_{46}H_{58}N_4O_9 \cdot H_2SO_4$: 909.05

Methyl (3a*R*,4*R*,5*S*,5a*R*,10b*R*,13a*R*)-4-acetyloxy-3a-ethyl-9-[(5*S*,7*S*,9*S*)-5-ethyl-5-hydroxy-9-methoxycarbonyl-1,4,5,6,7,8,9,10-octahydro-3,7-methano-3-azacycloundecino[5,4-*b*]indol-9-yl]-5-hydroxy-8-methoxy-6-methyl-3a,4,5,5a,6,11,12,13a-octahydro-1*H*-indolizino[8,1-*cd*]carbazole-5-carboxylate monosulfate [*143-67-9*]

Vinblastine Sulfate contains NLT 96.0% and NMT 102.0% of vinblastine sulfate ($C_{46}H_{58}N_4O_9 \cdot H_2SO_4$), calculated on the dried basis.

Description Vinblastine Sulfate occurs as a white to pale yellow powder.
It is soluble in water, sparingly soluble in methanol and practically insoluble in ethanol(95) or ether.
It is hygroscopic.

Identification (1) Determine the absorption spectra of the aqueous solutions of Vinblastine Sulfate and vinblastine sulfate RS (1 in 50000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the absorption spectra of Vinblastine Sulfate and vinblastine sulfate RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both exhibit similar intensities of absorption at the same wavenumbers.

(3) An aqueous solution of Vinblastine Sulfate (1 in 100) responds to the Qualitative Analysis for sulfate.

Optical rotation $[\alpha]_D^{20}$: Between -28° and -35° (20 mg calculated on the dried basis, methanol, 10 mL, 100 mm).

pH Dissolve 15 mg of Vinblastine Sulfate in 10 mL of water; the pH of this solution is between 3.5 and 5.0.

Purity (1) ***Clarity and color of solution***—Dissolve 50

mg of Vincristine Sulfate in 10 mL of water; the solution is clear and colorless.

(2) ***Related substances***—Dissolve 10 mg of Vinblastine Sulfate in 10 drug mL of water and use this solution as the test solution. Pipet 1 mL of this solution, add water to make exactly 25 mL, and use this solution as the standard solution. Perform the test with 200 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak area from each of the solutions according to the automatic integration method; the peak area of individual peaks other than the major peak from the test solution is not greater than 1/4 the peak area of vinblastine from the standard solution. The sum of areas of all peaks other than the major peak from the test solution is not greater than 3/ 4 of the peak area of vinblastine from the standard solution.

Operating conditions

For the detector, column, column temperature, mobile phase and flow rate, proceed as directed in the operating conditions under the Assay.

System suitability

System performance: Proceed as directed under the system suitability under the Assay.

Test for required detectability: Pipet 2.5 mL of the standard solution and add water to make exactly 100 mL. Proceed with 200 μL of this solution according to the conditions; the peak area of vinblastine is 1.7% to 3.3% of the peak area of vinblastine from the standard solution.

System repeatability: Repeat the test 6 times with 200 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area of vinblastine is NMT 1.5%.

Time span of measurement: About 4 times the retention time of vinblastine after the solvent peak.

Loss on drying Perform the test according to the following conditions as directed according to Method 2 under the Thermal Analysis; it is NMT 15.0%.

Operating conditions

Heating rate: 5 ℃ per minute.

Measured temperature range: Room temperature to 200 ℃.

Atmosphere gas: Dried nitrogen

Flow rate of atmosphere gas: 40 mL per minute.

Sterility It meets the requirements when used in sterile preparations.

Bacterial endotoxins Less than 10.0 EU/mg per mg when used in a manufacturing of sterile preparations.

Assay Weigh accurately about 10 mg each of Vinblastine Sulfate and vinblastine sulfate RS (determine the loss on drying in the same manner as vincristine sulfate in advance), dissolve in water to make exactly 10 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with exactly 20 μL each of these solutions as directed under the Liquid Chromatography according to the following conditions and determine the peak areas, A_T and A_S, of vinblastine.

Amount (mg) of vinblastine sulfate ($C_{46}H_{58}N_4O_9 \cdot H_2SO_4$) = Amount (mg) of vinblastine sulfate RS, calculated on the dried basis $\times \frac{A_T}{A_S}$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 262 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: To 7 mL of diethylamine, add water to make 500 mL and adjust the pH to 7.5 by adding phosphoric acid. To 380 mL of this solution, add 620 mL of a mixture of methanol and acetonitrile (4 : 1).

Flow rate: Adjust the flow rate so that the retention time of vinblastine is about 8 minutes.

System suitability

System performance: Dissolve 10 mg each of Vinblastine Sulfate and vincristine sulfate in 25 mL of water. Proceed with 20 μL of this solution according to the above conditions; vincristine and vinblastine are eluted in this order with the resolution being NLT 4.

System repeatability: Repeat the test 6 times with 20 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area of vinblastine is NMT 1.0%.

Packaging and storage Preserve in light-resistant, tight containers at NMT -20 ℃.

Vinblastine Sulfate for Injection
주사용 빈블라스틴황산염

When dried, Vinblastine Sulfate for Injection contains NLT 90.0% and NMT 110.0% of the labeled amount of vinblastine sulfate (C46H58N4O9·H2SO4: 909.05).

Method of preparation Prepare as directed under Injections, with Vinblastine Sulfate.

Description Vinblastine Sulfate for Injection occurs as a white to pale yellow solid mass or a powder.
It is freely soluble in water.
The pH of its aqueous solution (1 in 1000) is 3.5 to 5.0.

Identification Perform the test as directed under the Identification (1) of Vinblastine Sulfate.

Purity ***Related substances***—Dissolve 4 mg of Vinblastine Sulfate for Injection in 10 mL of water, and use this

solution as the test solution. Pipet 1 mL of this solution, add water to make exactly 25 mL, and use this solution as the standard solution. Perform the test with 200 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak area from each of the solutions by the automatic integration method; the peak area of individual peaks other than the major peak from the test solution is not greater than 1/2 the peak area of vinblastine from the standard solution. And the total area of any peaks other than the major peak from the test solution is not larger than 2 times the peak area of vinblastine from the standard solution.

Operating conditions

Proceed as directed under the operating conditions under the Purity (2) of Vinblastine Sulfate.

System suitability

Proceed as directed under the system suitability under the Purity (2) of Vinblastine Sulfate.

Sterility Meets the requirements.

Bacterial endotoxins Less than 10 EU per mg of Vinblastine Sulfate for Injection

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Uniformity of dosage units It meets the requirements when the procedure for content uniformity is performed according to the following procedure.

Take 1 container of Vinblastine Sulfate for Injection, dissolve in water to make *V* mL of a solution containing about 0.4 mg of vinblastine sulfate ($C_{46}H_{58}N_4O_9 \cdot H_2SO_4$) according to the labeled amount per mL, and use this solution as the test solution. Separately, weigh accurately about 10 mg of Vinblastine Sulfate RS (previously determine the loss on drying in the same manner as Vinblastine Sulfate), dissolve in water to make exactly 25 mL, and use this solution as the standard solution. Proceed as directed under the Asay under Vinblastine Sulfate.

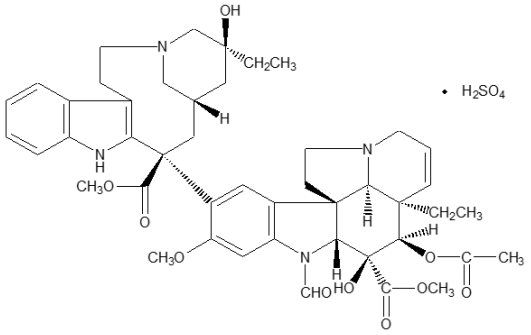
Amount (mg) of vinblasine sulfate ($C_{46}H_{58}N_4O_9 \cdot H_2SO_4$) = Amount (mg) of vinblastine sulfate RS, calculated on the dried basis $\times \frac{A_T}{A_S} \times \frac{25}{V}$

Assay Take a number of Vinblastine Sulfate for Injection, equivalent to 0.10 g of vinblastine sulfate ($C_{46}H_{58}N_4O_9 \cdot H_2SO_4$), dissolve each content in water, and transfer to a 100-mL volumetric flask. Wash each container with water, transfer the washings into the volumetric flask, and add water to make exactly 100 mL. Pipet 10 mL of this solution, add water to make exactly 25 mL, and use this solution as the test solution. Separately, weigh accurately about 10 mg of Vinblastine Sulfate RS (previously determine the loss on drying in the same manner as Vinblastine Sulfate), dissolve in water to make exactly 25 mL, and use this solution as the standard solution. Proceed as directed under the Asay under Vinblastine Sulfate.

Amount (mg) of vinblastine sulfate ($C_{46}H_{58}N_4O_9 \cdot H_2SO_4$) = Amount (mg) of vinblastine sulfate RS, calculated on the dried basis $\times \frac{A_T}{A_S} \times 10$

Packaging and storage Preserve in light-resistant, hermetic containers in a cold place.

Vincristine Sulfate
빈크리스틴황산염



$C_{46}H_{56}N_4O_{10} \cdot H_2SO_4$: 923.04

Methyl (3a*R*,4*R*,5*S*,5a*R*,10b*R*,13a*R*)-4-acetyloxy-3a-ethyl-9-[(5*S*,7*S*,9*S*)-5-ethyl-5-hydroxy-9-methoxycarbonyl-1,4,5,6,7,8,9,10-octahydro-3,7-methano-3-azacycloundecino[5,4-*b*]indol-9-yl]-6-formyl-5-hydroxy-8-methoxy-3a,4,5,5a,6,11,12,13a-octahydro-1*H*-indolizino[8,1-*cd*]carbazole-5-carboxylate monosulfate [*2068-78-2*]

Vincristine Sulfate contains NLT 95.0% and NMT 105.0% of vincristine sulfate ($C_{46}H_{56}N_4O_{10} \cdot H_2SO_4$), calculated on the dried basis.

Description Vincristine Sulfate occurs as a white to pale yellowish white powder.

It is very soluble in water and practically insoluble in ethanol(95).

It is hygroscopic.

Optical rotation $[\alpha]_D^{20}$: Between +28.5° and +35.5° (0.2 g, calculated on the dried basis, water, 10 mL, 100 mm).

Identification (1) Determine the absorption spectra of aqueous solutions of Vincristine Sulfate and vincristine sulfate RS (1 in 50000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the absorption spectra of Vincristine Sulfate and vincristine sulfate RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of ab-

sorption at the same wavenumbers.

(3) An aqueous solution of Vincristine Sulfate (1 in 100) responds to the Qualitative Analysis for sulfate.

pH Dissolve 10 mg of Vincristine Sulfate in 10 mL of water; the pH of this solution is between 3.5 and 4.5.

Purity (1) ***Clarity and color of solution***—Dissolve 50 mg of Vincristine Sulfate in 10 mL of water; the solution is clear and colorless.

(2) ***Related substances***—Dissolve 10 mg of Vincristine Sulfate in 10 mL of water and use this solution as the test solution. Pipet 2 mL of this solution, add water to make exactly 50 mL, and use this solution as the standard solution. Perform the test with 200 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak area of these solutions each according to the automatic integration method; the peak area of desacetylvincristine with a relative retention time of about 0.9 to that of vincristine and the peak area of vinblastine with a relative retention time of about 1.6 from the test solution is not greater than 1/8 and 3/20 of vincristine peak area from the standard solution, respectively. The sum of peak areas other than vincristine, desacetylvincristine and vinblastine from the test solution is not greater than 1/4 of the peak area of vincristine from the standard solution. In addition, the sum of peak areas other than vincristine from the test solution is not greater than that of vincristine from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 297 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase A: Methanol

Mobile phase B: To a mixture of water and diethylamine (197 : 3), add phosphoric acid to adjust the pH to 7.5.

Rosin of the mobile phase: Control the mixing ratio of mobile phase A and mobile phase B via the gradient elution as follows.

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 - 12	62	38
12 - 27	62 → 92	38 → 8

Flow rate: Adjust the flow rate so that the retention time of vincristine is about 15 minutes.

System suitability

Test for required detectability: Pipet 5 mL of the standard solution and add water to make exactly 200 mL. Confirm that the peak area of vincristine obtained from 200 μL of this solution is equivalent to 1.75% to 3.25% of the peak area of vincristine from the standard solution.

System performance: Dissolve 15 mg each of Vincristine Sulfate and vinblastine sulfate in 100 mL of water. Proceed with 200 μL of this solution according to the above conditions; vincristine and vinblastine are eluted in this order with the resolution being NLT 4.

System repeatability: Repeat the test 6 times with 200 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area of vincristine is NMT 1.5%.

Time span of measurement: About 1.7 times the retention time of vincristine after the solvent peak.

Loss on drying Perform the test with about 10 mg of Vincristine Sulfate as directed in Method 2 under the Thermal Analysis according to the following conditions; it is NMT 12.0%.

Operating conditions

Heating rate: 5 ℃ per minute.

Measured temperature range: Room temperature to 200 °C.

Atmosphere gas: Dried nitrogen

Flow rate of atmosphere gas: 40 mL per minute.

Assay Weigh accurately about 10 mg each of Vincristine Sulfate and vincristine sulfate RS (determine the loss on drying in the same manner as vincristine sulfate beforehand), dissolve each in water to make exactly 10 mL, and use these solutions as the test solution and the standard solution, respectively. Pipet 10 μL each of these solutions, perform the test as directed under the Liquid Chromatography according to the following conditions, and calculate the peak areas, A_T and A_S, of vincristine.

$$\text{Amount (mg) of vincristine sulfate } (C_{46}H_{56}N_4O_{10}\cdot H_2SO_4) = \text{Amount (mg) of vinblastine sulfate RS, calculated on the dried basis} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 297 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: To a mixture of water and diethylamine (59 : 1), add phosphoric acid to adjust the pH to 7.5. Add 700 mL of methanol to 300 mL of this solution.

Flow rate: Adjust the flow rate so that the retention time of vinblastine is about 7 minutes.

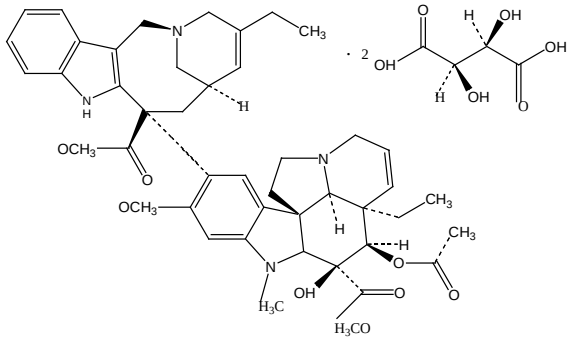
System suitability

System performance: Dissolve 5 mg each of Vincristine Sulfate and vinblastine sulfate in 5 mL of water. Proceed with 10 μL of this solution according to the above conditions; vincristine and vinblastine are eluted in this order with the resolution being NLT 4.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area of vincristine is NMT 1.0%.

Packaging and storage Preserve in light-resistant, tight containers at below -20 ℃.

Vinorelbine Tartrate
비노렐빈타르타르산염



$C_{45}H_{54}N_4O_8 \cdot 2C_4H_6O_6$: 1079.11

Methyl (1*R*,9*R*,10*R*,11*R*,12*R*,19*R*)-11-(acetyloxy)-12-ethyl-4-[(12S,14R)-16-ethyl-12-(methoxycarbonyl)-1,10-diazatetracyclo[12.3.1.03,11.04,9]octadeca-3(11),4,6,8,15-pentaen-12-yl]-10-hydroxy-5-methoxy-8-methyl-8,16-diazapentacyclo[10.6.1.0^{1,9}.02,7.016,19]nonadeca-2,4,6,13-tetraene-10-carboxylate bis[(2R,3R)-2,3-dihydroxybutanedioate] [*125317-39-7*]

Vinorelbine Tartrate contains NLT 98.0% and NMT 102.0% of vinorelbine tartrate ($C_{45}H_{54}N_4O_8 \cdot 2C_4H_6O_6$), calculated on the anhydrous basis.

Description Vinorelbine Tartrate occurs as a white to yellow or bright brown amorphous powder.
It is freely soluble in water.

Identification (1) Dissolve 50 mg of Vinorelbine Tartrate in 1 mL of water. To 0.1 mL of this solution, add 0.1 mL of 10 w/v% potassium bromide solution, 0.1 mL of 2 w/v% resorcinol solution, and 3 mL of sulfuric acid. Heat on a steam bath for 5 to 10 minutes until a deep blue color develops. Allow to cool and pour the solution into the water; the color of the solution changes to red.

(2) Dissolve 10 mg each of Vinorelbine Tartrate and vinorelbine tartrate RS in 5 mL of water, add 0.5 mL of 5 mol/L sodium hydroxide TS, and extract with 5 mL of methylene chloride. Filter the organic layer through anhydrous sodium sulfate and evaporate the filtrate to make about 0.5 mL. Use these solutions as the test solution and the standard solution. Determine the infrared spectra of these solutions as directed in the potassium bromide disk method under Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) The retention time of the major peak from the test solution for related substances under the Purity is identical to the retention time of the major peak from the standard solution (2).

pH Dissolve 0.5 g of Vinorelbine Tartrate in 50 mL of water; the pH of this solution is between 3.3 and 3.8.

Purity (1) ***Clarity and color of solution***—Dissolve 0.1 g of Vinorelbine Tartrate in 10 mL of water: the solution is clear. Determine the absorbance at the wavelength of 420 nm of this solution as directed under Ultraviolet-visible Spectroscopy using water as the control solution; its absorption is NMT 0.03.

(2) ***Related substances*** —Weigh exactly 35 mg of Vinorelbine Tartrate, dissolve it in a mobile phase to make exactly 25 mL, and use this solution as the test solution. Separately, weigh exactly 35 mg of Vinorelbine Tartrate, dissolve in the mobile phase to make exactly 25 mL, and use this solution as the standard solution (1). Add the mobile phase to 1.0 mL of the standard solution to make exactly 50 mL and then add the mobile phase to 1.0 mL of this mixture to make exactly 100 mL. Use this solution as the standard solution (2). Perform the test with 20 μL each of the test solution and standard solution under the following conditions as directed under the Liquid Chromatography, and determine the peak areas in each solution by the automatic integration method; The amount of photodegradation products obtained from the test solution is NMT 0.3%, and the amount of any of each individual related substance or co-eluted related substance is NMT 0.2%. Additionally, the total amount of related substances, excluding the photodegradation product, is NMT 0.7%. Exclude any peaks whose area is NMT 0.5 times the area of the peak of vinorelbine obtained from the standard solution (2).

$$\text{Content (\%) of each related substance} = 100 \times \frac{A_i}{A_S}$$

A_i: Area of each peak from the test solution
A_S: Sum of areas of all peaks from the test solution

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 267 nm).

Column: A stainless steel column about 3.9 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μ*m* in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Flow rate: 1.0 mL/min

Mobile phase: Dissolve 1.22 g of sodium 1-decanesulfonate in 620 mL of methanol, and add 380 mL of phosphate buffer to mix.

System suitability

System performance: Dissolve an appropriate amount of vinorelbine tartrate RS and vinorelbine-related substance I (4-O-deacetylvinorelbine) RS in water to prepare solutions containing 1.4 mg and 0.01 mg per mL respectively. Expose this solution to an appropriate xenon

lamp capable of emitting a dose of 1600 KJ/m2 in the range of 310 nm to 800 nm with an intensity of 500 W/m² for 1 hour to obtain an additional photodegradation product (3',4',7,8-tetradehydro-3,4'-dideoxy3,6-epoxy-6,7-dihydro-C'-norvincaleukoblastine) with a relative retention time of approximately 0.8. Proceed with 20 μL of this solution under the above conditions; the retention time of vinorelbine is 13.5 minutes, the relative retention time of photodegradation product with respect to the retention time of vinorelbine is about 0.8, and the relative retention time of vinorelbine-related substance I is 1.2. Additionally, the resolution factor between vinorelbine tartrate and vinorelbine-related substance I is NLT 1.1.

Time span of measurement: About 3 times the retention time of vinorelbine.

Phosphate buffer—Dissolve 6.9 g of sodium dihydrogen phosphate monohydrate in 900 mL of water, adjust with phosphoric acid to a pH of 4.2, and add water to make 1000 mL.

Water NMT 4.0% (1 g, volumetric titration, direct titration).

Residue on ignition NMT 0.1% (1 g).

Assay Dissolve about 0.35 g of Vinorelbine Tartrate, accurately weighed, in 40 mL of acetic acid(100), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration, Endpoint Detection Method in Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 53.96 mg of $C_{45}H_{54}N_4O_8 \cdot 2C_4H_6O$

Packaging and storage Preserve in light-resistant, tight containers. Store in a freezer.

Vitamin A Oil
비타민A유

Retinol Oil

Vitamin A Oil is synthetic vitamin A ester diluted in vegetable oil.

Each gram of Vitamin A Oil contains NLT 30000 unit of Vitamin A.

Vitamin A Oil may contain appropriate antioxidants.

Vitamin A Oil contains NLT 90.0% and NMT 120.0% of the labeled units of vitamin A.

Description Vitamin A Oil occurs as a clear, yellow to yellowish brown or slightly turbid latex. It is odorless or has a characteristic odor.
Decomposition of Vitamin A Oil is accelerated by air or light.

Identification Weigh an amount, equivalent to 15000 unit of Vitamin A Oil, retinol acetate RS, and retinol palmitate RS, respectively, dissolve in 5 mL of petroleum ether, and use these solutions as the test solution, the standard solution (1), and the standard solution (2). With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot each 5 μL each of the test solution, the standard solution (1), and the standard solution (2) on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of cyclohexane and ether (12 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Spray evenly a solution of antimony(III) chloride TS; the color and the R_f value of the major peak obtained from the test solution is equal to the blue major peak from the standard solution (1) or (2).

Purity (1) ***Acidity***—To 1.2 g of Vitamin A Oil, add 30 mL of a mixture of neutralized ethanol and ether (1 : 1), attach the reflux condenser, boil with mild heat for 10 minutes, and dissolve. Cool it down, add 5 drops of phenolphthalein TS and 0.60 mL of 0.1 mol/L sodium hydroxide; the resulting solution exhibits a red color.

(2) ***Rancidity***—No unpleasant odor of rancid oil is perceptible when warming Vitamin A Oil.

(3) ***Related substances***—Vitamin A Oil meets the requirements for the conditions that can be determined according to Method 1 under the assay of Vitamin A. The *f* value is NLT 0.85 when quantified.

Assay Perform the test according the Assay of Vitamin A.

Packaging and storage Preserve in light-resistant, tight containers. The reservoir must be almost filled with vitamin A or under nitrogen gas.

Vitamin A Oil Capsules
비타민A유 캡슐

Vitamin A Capsules

Vitamin A Oil Capsules contain NLT 90.0% and NMT 130.0% of the labeled unit of vitamin A.

Method of preparation Prepare as directed under Capsules, with Vitamin A Oil.

Description Extract the contents of Vitamin A Oil Capsules and perform the test with the contents; it meets the requirements of the Description of Vitamin A Oil.

Identification Extract the contents of Vitamin A Oil Capsules and perform the test with the contents as directed under the Identification of Vitamin A Oil; it meets the requirements

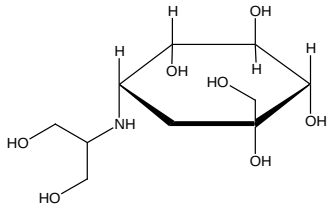
Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of about 20 capsules of Vitamin A Oil Capsules, cut the capsules, take oil contents, and mix well. Perform the test with this oil contents as directed under the Vitamin A Assay. Wash the capsules with a small amount of ether, allow to stand at room temperature to evaporate the ether and weigh accurately. Calculate the weight of Vitamin A Oil from the difference between the weights before and after the above-described procedure. Calculate the Vitamin A units per 1 capsule from the weight and the Vitamin A units of the oil.

Packaging and storage Preserve in light-resistant, well-closed containers.

Voglibose
보글리보스



$C_{10}H_{21}NO_7$: 267.28

(1*S*,2*S*,3*R*,4*S*,5*S*)-5-(1,3-dihydroxypropan-2-yl-amino)-1-(hydroxymethyl)cyclohexane-1,2,3,4-tetrol [*83480-29-9*]

Voglibose contains NLT 99.5% and NMT 101.0% of voglibose ($C_{10}H_{21}NO_7$), calculated on the anhydrous basis.

Description Voglibose occurs as white crystals or a crystalline powder.
It is very soluble in water, freely soluble in acetic acid(100), slightly soluble in methanol and very slightly soluble in ethanol(99.5).
It dissolves in 0.1 mol/L hydrochloric acid TS.

Identification (1) Determine the infrared spectra of Voglibose and voglibose RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) Determine the ^1H spectrum of a solution of Voglibose in deuterium oxide for nuclear magnetic resonance spectroscopy (3 in 70) as directed under the Nuclear Magnetic Resonance Spectroscopy, using 3-(trimethyl)-propionic acid-d_4 sodium salt as an internal standard; it exhibits two double signal A at about δ 1.5 ppm, two double signal B at around δ 2.1 ppm, a multiple signal C at about δ 2.9 ppm and a multiple signal D at between δ 3.4 ppm and δ 3.9 ppm. The area intensity ratio of signals A : B : C : D is about 1 : 1 : 1 : 10.

Optical rotation $[\alpha]_D^{20}$: Between +45° and +48° (0.2 g, calculated on the anhydrous basis, 0.1 mol/L hydrochloric acid TS, 20 mL, 100 mm).

Melting point Between 163 and 168 ℃.

pH Dissolve 1.0 g of Voglibose in 10 mL of water; the pH of this solution is between 9.8 and 10.4.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Voglibose as directed under Method 1 and perform the test. Adjust pH of the test solution to between 3.0 and 3.5 with dilute hydrochloric acid instead of dilute acetic acid. Prepare the control solution with 1.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Related substances***—Dissolve 50 mg of Voglibose in 50 mL of the mobile phase, and use this solution as the test solution. Pipet 1.0 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 50 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine peak areas of each solution by the automatic integration method; each area of the peaks other than the peak of voglibose obtained from the test solution is not greater than 0.2 times the peak area of voglibose from the standard solution. For the calculation of the peak area for peaks having the retention times with respect to voglibose of about 1.7, 2.0 and 2.3, multiply them by the response factors, 2, 2 and 2.5, respectively.

Operating conditions

Apparatus: Use the pumping systems for transporting the mobile phase and the reaction reagent, sample injection port, column, reaction coil, cooling coil, detector and data collection device. Attach a 3-way tube to the outlet for the mobile phase of the column, connect it to the pumping system for transporting the reaction reagent and the reaction coil, and then connect the outlet of the reaction coil to the fluorometer.

Detector: A fluorometer (excitation wavelength: 350 nm, fluorescence measurement wavelength: 430 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with penta ethylenehexaaminated polyvinyl alcohol polymer for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 ℃.

Reaction coil: A polytetrafluoroethylene tube about 0.5 mm in internal diameter and about 20 m in length.

Cooling coil: A polytetrafluoroethylene tube about 0.3 mm in internal diameter and about 2 m in length.

Mobile phase: To 1.56 g of sodium dihydrogen phosphate hydrate, add water to make 500 mL. To this solution, add a solution prepared by dissolving 3.58 g of sodium dihydrogen phosphate dodecahydrate in water to make 500 mL, and adjust pH to 6.5. To 370 mL of this solution, add 630 mL of acetonitrile.

Reaction reagent: Dissolve 6.25 g of taurine and 2.56 g of sodium periodate in water to make 1000 mL.

Reaction coil temperature: A constant temperature of about 100 ℃.

Cooling coil temperature: A constant temperature of about 15 ℃.

Flow rate: Adjust the flow rate so that the retention time of voglibose is about 20 minutes.

Flow rate of the reaction reagent: The same as the flow rate of the mobile phase.

System suitability

Test for required detectability: Pipet 10 mL of the standard solution and add the mobile phase to make exactly 100 mL. The peak area obtained from 50 μL of this solution is 7% to 13% of the peak area of voglibose from the standard solution.

System performance: Proceed with 50 μL of the standard solution according to the above conditions; for the peak areas of voglibose, the number of theoretical plate is NLT 7000 and the symmetry factor is between 0.8 and 1.2.

System repeatability: Repeat the test 6 times with 50 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak areas of voglibose is NMT 3.0%.

Time span of measurement: About 2.5 times the retention time of voglibose.

Water NMT 0.2% (0.5 g, coulometric titration).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.4 g of Voglibose, dissolve in 80 mL of acetic acid(100), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 26.73 mg of $C_{10}H_{21}NO_7$

Packaging and storage Preserve in tight containers.

Voglibose Tablets
보글리보스 정

Voglibose Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of voglibose ($C_{10}H_{21}NO_7$: 267.28).

Method of preparation Prepare as directed under Tablets, with Voglibose.

Identification Weigh an amount of Voglibose Tablets, previously powdered, equivalent to 5 mg of voglibose according to the labeled amount, add 40 mL of water, shake vigorously to mix, and then centrifuge. Inject the clear supernatant into a glass column about 8 mm in internal diameter and about 130 mm in length, packed with 1.0 mL of strongly acidic ion exchange resin for column chromatography (H type) (100 μm to 200 μm in particle diameter). Elute at the rate of about 5 mL per minute. Next, use 200 mL of water to wash the column, and use 10 mL of dilute ammonia TS (1 in 4) to elute at the rate of about 5 mL per minute. Filter this eluate 2 times through a membrane filter with a pore size of NMT 0.22 μm. Evaporate this filtrate to dryness in vacuum at 50 ℃, dissolve the residue in 0.5 mL of a mixture of water and methanol (1 : 1), and use this solution as the test solution. Separately, dissolve 20 mg of voglibose RS for assay in 2 mL of a mixture of water and methanol (1 : 1), and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 20 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of acetone, ammonia water(28), and water (5 : 3 : 1) to a distance of about 12 cm, and air-dry the plate. Allow the plate to stand in a stream of iodine vapor; the spots obtained from the test solution and the standard solution exhibit a yellowish brown color and have the same R_f value.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 Voglibose Tablets, add 80 mL of the mobile phase, and mix by shaking to completely collapse. Pipet an amount equivalent to about 4 mg of voglibose ($C_{10}H_{21}NO_7$) according to the labeled amount, add the mobile phase to make exactly 100 mL, and centrifuge. Filter the upper clear liquid through a membrane filter with a pore size of NMT 0.45 μm. Discard the first 1 mL of the filtrate and use the subsequent filtrate as the test solution. Separately, weigh accurately about 20 mg of voglibose RS (previously measure the water content), and dissolve in the mobile phase to make exactly 25 mL. Pipet 5 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 50 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak areas of voglibose, A_T and A_S, for the test solution and the standard solution, respectively.

$$\text{Amount (mg) of voglibose } (C_{10}H_{21}NO_7) = W_S \times \frac{A_T}{A_S} \times \frac{V}{500}$$

W_S: Amount (mg) of voglibose RS, calculated on the anhydrous basis.

Operating conditions

Apparatus: Use the pumping systems for transporting the mobile phase and the reaction reagent, sample injection port, column, reaction coil, cooling coil, detector, and data collection device. Attach a 3-way tube to the outlet for the mobile phase of the column, connect it to the pumping system for transporting the reaction reagent and the reaction coil, and then connect the outlet of the

reaction coil to the fluorometer.

Detector: A fluorometer (excitation wavelength: 350 nm, fluorescence measurement wavelength: 430 nm).

Column: A stainless steel column about 4.0 mm in internal diameter and 15 cm in length, packed with aminopropylsilyl silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 ℃.

Reaction coil: A polytetrafluoroethylene tube about 0.5 mm in internal diameter and about 20 m in length.

Cooling coil: A polytetrafluoroethylene tube about 0.3 mm in internal diameter and about 2 m in length.

Mobile phase: To 1.56 g of sodium dihydrogen phosphate hydrate, add water to make 500 mL. To this solution, add a solution prepared by dissolving 3.58 g of sodium hydrogen phosphate decahydrate in water to make 500 mL, and adjust the pH to 6.5. To 300 mL of this solution, add 600 mL of acetonitrile.

Reaction reagent: Dissolve 6.25 g of taurine and 2.56 g of sodium periodate in water to make 1000 mL.

Reaction coil temperature: A constant temperature of about 100 ℃.

Cooling coil temperature: A constant temperature of about 15 ℃.

Flow rate: Adjust the flow rate so that the retention time of voglibose is about 20 minutes.

Flow rate of the reaction reagent: The same as the flow rate of the mobile phase.

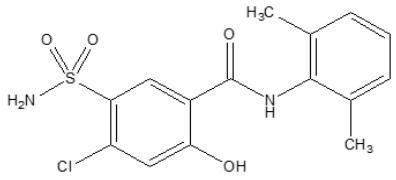
System suitability

System performance: Dissolve 2 mg of voglibose for assay and 0.2 g of lactose hydrate in 5 mL of water, and add the mobile phase to make 50 mL. Proceed with 50 μL of this solution according to the above conditions; lactose and voglibose are eluted in this order with the resolution being NLT 4.0.

System repeatability: Repeat the test 6 times with 50 μL each of the standard solutions according to the above conditions; the relative standard deviation of the peak areas of voglibose is NMT 2.0%.

Packaging and storage Preserve in tight containers.

Xipamide
지파미드



$C_{15}H_{15}ClN_2O_4S$: 354.80

5-(Aminosulfonyl)-4-chloro-*N*-(2,6-dimethylphenyl)-2-hydroxy-benzamide, [*14293-44-8*]

Xipamide contains NLT 98.0% and NMT 102.0% of xipamide ($C_{15}H_{15}ClN_2O_4S$), calculated on the dried basis.

Description Xipamide occurs as a white powder.
It is freely soluble in acetone, soluble in ethanol(95), slightly soluble in chloroform or ether, and practically insoluble in water.

Melting point—Between 259 and 261 ℃ (with decomposition).

Identification (1) Determine the absorption spectrum of a solution of Xipamide in 0.01 mol/L methanolic hydrochloric acid (1 in 200000) as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum absorption at the wavelength of about 302 nm.

(2) Determine the infrared spectra of Xipamide and xipamide RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Purity (1) ***Clarity and color of solution***—To 0.5 g of Xipamide, dissolve in 10 mL of methanol; the solution is clear and colorless.

(2) ***Chloride***—Weigh 2.5 g of Xipamide, add 20 mL of water, shake for 10 minutes to mix, and filter using a glass filter. Perform the test with 2.0 mL of the filtrate as directed under the Chloride. Prepare the control solution with 0.14 mL of 0.01 mol/L hydrochloric acid (NMT 0.02%).

(3) ***Heavy metals***—Proceed with 1.0 g of Xipamide according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(4) ***Related substances***—Weigh 0.4 g of Xipamide, add methanol to make 100 mL, and use this solution as the test solution. Pipet 1.0 mL of the test solution and add methanol to make 100 mL. Pipet 10.0 mL of this solution, add methanol to make 100 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on a thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography, develop the plate with a mixture of chloroform and methanol (4 : 1) as the developing solvent and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot in the chromatogram obtained from the test solution are not more intense than the principal spot from the standard solution.

Loss on drying NMT 0.5% (1 g, 120 ℃, 1 hour).

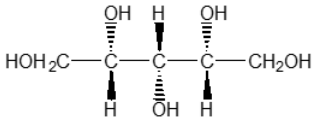
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.5 g of Xipamide, add 40 mL of methanol to dissolve, add 10 mL of water to mix, and titrate with potassium hydroxide-ethanol VS (potentiometric titration under the Titrimetry, electrode: combination glass electrode). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L potassium hydroxide-ethanol VS = 35.48 mg of $C_{15}H_{15}ClN_2O_4S$

Packaging and storage Preserve in tight containers.

Xylitol
자일리톨



Xylite

$C_5H_{12}O_5$: 152.15

(2*R*,4*S*)-Pentane-1,2,3,4,5-pentol [*87-99-0*]

Xylitol, when dried, contains NLT 98.0% and NMT 101.0% of xylitol ($C_5H_{12}O_5$).

Description Xylitol occurs as a white crystalline powder, is odorless and has a sweet taste.
It is very soluble in water and slightly soluble in ethanol(95).
It is hygroscopic.

Identification (1) To 1 mL of an aqueous solution of Xylitol (1 in 2), add 2 mL of iron(II) sulfate TS and 1 mL of a sodium hydroxide solution (1 in 5); the resulting solution exhibits a bluish green color with no turbidity.

(2) Determine the infrared spectra of Xylitol and Xylitol RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

pH Dissolve 5.0 g of Xylitol in 10 mL of freshly boiled and cooled water; the pH of this solution is between 5.0 and 7.0.

Melting point Between 93.0 and 95.0 °C.

Purity (1) ***Clarity and color of solution***—Dissolve 5 g of Xylitol in 10 mL of water; the solution is clear and colorless.

(2) ***Chloride***—Perform the test with 2.0 g of Xylitol. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid (NMT 0.005%).

(3) ***Sulfate***—Perform the test with 4.0 g of Xylitol. Prepare the control solution with 0.50 mL of 0.005 mol/L sulfuric acid (NMT 0.006%).

(4) ***Heavy metals***—Proceed with 4.0 g of Ceftazidime Hydrate according to Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 5 ppm).

(5) ***Nickel***—Dissolve 0.5 g of Xylitol in 5 mL of water, add 3 drops of dimethylglyoxime TS and 3 drops of ammonia TS, and allow to stand for 5 minutes: the solution exhibits no red color.

(6) ***Arsenic***—Prepare the test solution with 1.5 g of Xylitol, according to Method 1 and perform the test (NMT 1.3 ppm).

(7) ***Sugars***—Dissolve 5.0 g of Xylitol in 15 mL of water, add 4.0 mL of dilute hydrochloric acid, and heat on a steam bath for 3 hours with a reflux condenser attached. After cooling, neutralize with sodium hydroxide TS (indicator: 2 drops of methyl orange TS) Then, add water to make 50 mL, transfer 10 mL of this solution to a flask, add 10 mL of water and 40 mL of Fehling's TS, boil gently for 3 minutes, and allow to stand to precipitate cuprous oxide. Filter the clear supernatant through a glass filter and wash the precipitate with warm water until the washing does not show alkalinity. Filter the washings through the glass filter mentioned above. Dissolve the precipitate in the flask in 20 mL of iron(III) sulfate TS, filter the solution through the glass filter mentioned above, wash with water, combine the washings with the filtrate, heat at 80 °C and titrate with 0.02 mol/L potassium permanganate VS; the consumed amount is NMT 1.0 mL.

(8) ***Related substances (other polyols)***—Weigh accurately 1.0 g of Xylitol, dissolve in water to make 100 mL, and use this solution as the test solution. Separately, weigh accurately 50 mg each of L-arabinitol RS, galactitol RS, D-mannitol RS, and sorbitol RS, dissolve in water to make 100 mL, and use this solution as the standard solution (1). Separately, weigh accurately 0.5 g of Xylitol RS, dissolve in water to make 25 mL, and use this solution as the standard solution (2). Pipet 1 mL of the standard solution (1) and 5 mL of the standard solution (2), add water to make 10 mL so that the solution contains about 0.05 mg each of L-arabinitol, galactitol, D-mannitol, and sorbitol and about 10 mg of Xylitol per mL, and use this solution as the standard solution. Pipet 1.0 mL each of the test solution and standard solution into a 10 mL round-bottom flask, add exactly 1.0 mL of the internal standard solution to each flask, and evaporate to dryness with a reflux condenser on a steam bath at 60 °C. Add 1 mL of ethanol(99.5), shake carefully, and evaporate to dryness under the same conditions as above. To each residue, add exactly 1 mL of pyridine and 1 mL of acetic acid(100), stopper the flask, mix for 30 seconds, and allow to stand in a dry oven at 70 °C for 30 minutes. Perform the test with 1 μL each of the test solution and standard solution as directed under the Gas Chromatography according to the following conditions; the total amount of related substances is NMT 2.0%.

$$\text{Content (\%) of related substances} = 100 \times \frac{C_S}{C_T} \times \frac{Q_T}{Q_S}$$

C_S: Concentration (mg/mL) of each related substance in the standard solution

C_T: Concentration (mg/mL) of Xylitol in the test solution

Q_T: Ratio of the peak area of each derivatized related substance to that of derivatized erythritol obtained from the test solution

Q_S: Ratio of the peak area of each derivatized related substance to that of derivatized erythritol obtained from the standard solution

Internal standard solution—A solution of erythritol (7 in 2000).

Operating conditions

Detector: A hydrogen flame ionization detector

Column: A column about 0.25 mm in internal diameter and about 30 m in length, coated with 0.25 μm-thick 14% cyanopropylphenol-86% methylpolysiloxane.

Column temperature: Maintain at 170 °C for 5 minutes, raise the temperature to 215 °C at the rate of 6 °C per minute, and maintain at 215 °C for 8 minutes. Then, raise the temperature to 270 °C at the rate of 10 °C per minute, and maintain at 270 °C for 14 minutes.

Carrier gas: Helium

Flow rate: 1 mL/min

Sample injection port temperature: 270 °C

Detector temperature: 280 °C

System suitability

System performance: Proceed with 1 μL of the standard solution under the above operating conditions; the relative retention times of derivatives of erythritol, L-arabinitol, xylitol, D-mannitol, and galactitol to the retention time of derivatized sorbitol are about 0.47, about 0.75, 0.81, 0.98 and 0.99, respectively.

System repeatability: Repeat the test 5 times with 1 μL each of the standard solution under the above operating conditions; the relative standard deviation of the ratios of the peak area of Xylitol to that of erythritol is NMT 1.5%.

Loss on drying NMT 1.0% (1 g, in vacuum, phosphorus pentoxide, 24 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.2 g of Xylitol, previously dried, dissolve in water to make exactly 100 mL. Pipet 10 mL of this solution into an iodine flask, add exactly 50 mL of potassium periodate TS, and heat for 15 minutes on a steam bath. After cooling, add 2.5 g of potassium iodide, stopper the flask immediately, shake well to mix, allow to stand for 5 minutes in a dark place, and titrate with 0.1 mol/L sodium thiosulfate VS (indicator: 3 mL of starch TS). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L sodium thiosulfate VS
= 1.9018 mg of $C_5H_{12}O_5$

Packaging and storage Preserve in tight containers.

Xylitol Injection
자일리톨 주사액

Xylite Injection

Xylitol Injection is an aqueous solution for injection and contains NLT 95.0% and NMT 105.0% of the labeled amount of xylitol ($C_5H_{12}O_5$: 152.15).

Method of preparation Prepare as directed under Injections, with Xylitol.
No preservative is added.

Description Glucose Injection occurs as a clear, colorless liquid and has a sweet taste.

Identification Weigh an amount of Xylitol Injection, equivalent to 0.1 g of xylitol, according to the labeled amount, add water to make 10 mL, and use this solution as the test solution. Separately, dissolve 0.1 g of Xylitol RS in 10 mL of water and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 2 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Develop the plate with a mixture of ethanol(95), ammonia water(28) and water (25 : 4 : 3) as the developing solvent to a distance of about 10 cm and air-dry the plate. Spray silver nitrate-ammonia TS evenly on the plate, and heat at 105 °C for 15 minutes; the spots obtained from the test solution and the standard solution exhibit blackish brown color and the R_f values of these solutions are the same.

pH Between 4.5 and 7.5.

Sterility Meets the requirements.

Bacterial endotoxins Less than 0.50 EU per mL of glucose injection.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Extractable volume of injections Meets the requirements.

Assay Pipet an amount of Xylitol Injection, equivalent to about 5 g of xylitol ($C_5H_{12}O_5$), add 5.0 mL of the internal standard solution and water to make exactly 25 mL, and use this solution as the test solution. Separately, weigh accurately about 0.5 g of xylitol RS, previously dried for 24 hours in a desiccator (in vacuum, phosphorus pentoxide), dissolve in 5.0 mL of the internal standard solution, add water to make exactly 25 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak area ratios, Q_T and Q_S, of xylitol to the peak area of the internal standard.

$$\text{Amount (g) of xylitol } (C_5H_{12}O_5) = \text{Amount (g) of xylitol RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of white sugar (5 in 50).

Operating conditions

Detector: A differential refractometer

Column: A stainless steel column, about 7.8 mm in internal diameter and about 15 to 30 cm in length, packed with strong acidic ion exchange resin (the calcium form of the sulfonated styrene divinylbenzene copolymer, 9 μm in particle diameter).

Column temperature: Ordinary temperature

Mobile phase: A mixture of acetonitrile and water (75 : 25).

Flow rate: Adjust the flow rate so that the retention time of xylitol is about 5 minutes.

System suitability

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, xylitol and the internal standard are eluted in this order with the resolution between their peaks being NLT 2.0.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area ratio is NMT 2.0%.

Packaging and storage Preserve in hermetic containers.

Dried Yeast
건조효모

Dried Yeast is dried and powdered cells of yeast belonging to Saccharomyces.

Dried Yeast contains NLT 0.4 g of protein and NLT 100 μg of thiamine compounds [as thiamine hydrochloride ($C_{12}H_{17}ClN_4OS \cdot HCl$: 337.27)] per g.

Description Dried Yeast occurs as a pale yellow to brown powder and has a characteristic odor and taste.

Identification Dried Yeast is composed of single cells in round or oval shape with its length between 6 μm and 12 μm when examined under a microscope.

Purity (1) ***Rancidity***—Dried Yeast is free from any unpleasant or rancid odor or taste.

(2) ***Starch***—Add iodine TS to Dried Yeast and examine microscopically; no or only a few granules are tinted blackish purple.

Loss on drying NMT 8.0% (1 g, 100 °C, 8 hours).

Ash NMT 9.0% (1 g, perform the test as directed under the Ash under the Crude drugs test).

Assay (1) ***Protein***—Weigh accurately about 50 mg of Dried Yeast and perform the test as directed under the Nitrogen Determination.

$$\text{Amount of protein per g of Dried Yeast (mg)} = \text{Amount of nitrogen (N)} \times 6.25 \times \frac{1}{\text{Amount of sample (g)}}\ (\text{mg})$$

(2) ***Thiamine***—Weigh accurately about 1 g of Dried Yeast, add 1 mL of dilute hydrochloric acid and 80 mL of water, and heat in the water bath at 80 - 85 ℃ for 30 minutes with occasional shaking. After cooling, add water to make exactly 100 mL and centrifuge for 10 minutes. Pipet 4.0 mL of the clear supernatant, add exactly 5 mL of acetic acid-sodium acetate TS and 1 mL of enzyme TS, and allow to stand at 45 - 50 ℃ for 3 hours. Take exactly 2 mL of this solution, put it into a chromatographic column about 1 cm in internal diameter and about 17 cm in height, prepared by pouring 2.5 mL of a weakly acidic CM-bridged cellulose cation exchanger (H type) (40 - 110 μm in particle diameter), and elute at the flow of about 0.5 mL per minute. Next, wash the inner wall of the chromatographic column with a small amount of water, and wash the column again with 10 mL of water at the flow rate of about 1 mL per minute. Repeat this procedure twice. Elute the column with 2.5 mL of diluted phosphoric acid (1 in 50) twice at the flow rate of about 0.5 mL of per minute, and combine the eluate. Add exactly 1 mL of the internal standard solution and 10 mg of sodium 1-octanesulfonate to the eluate, dissolve, and use this solution as the test solution. Separately, weigh accurately about 15 mg of thiamine hydrochloride RS (determine in advance its water content in the same way as the Thiamine Hydrochloride), dissolve in 0.001 mol/L hydrochloric acid TS, and make exactly 100 mL. Pipet 1 mL of this solution and add the mobile phase to make exactly 100 mL. Pipet 1 mL of this solution, and add 1 mL of the internal standard solution and additional 3 mL of the mobile phase, and use this solution as the standard solution. Perform the test with 200 μL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions. Calculate the peak area ratios, Q_T and Q_S, of thiamine to that of the internal standard.

$$\text{Amount of thiamine per g of Dried Yeast (μg)} = \text{Amount of thiamine hydrochloride RS calculated on the anhydrous basis (mg)} \times \frac{Q_T}{Q_S} \times \frac{1}{\text{Amount of sample (g)}} \times 12.5$$

Internal standard solution—Dissolve 10 mg of phenacetin in acetonitrile to make 100 mL. To 1 mL of this solution, add diluted acetonitrile (1 in 5) to make 100 mL.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in

internal diameter and about 15 cm to 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm to 10 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

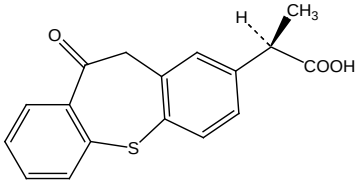
Mobile phase: Dissolve 2.7 g of potassium dihydrogen phosphate in 1000 mL of water and adjust pH to 3.5 with diluted phosphoric acid (1 in 10). Dissolve 1.6 g of sodium 1-octanesulfonate in 800 mL of dried Yeas and add 200 mL of acetonitrile.

Flow rate: Adjust the flow rate so that the retention time of thiamine is about 8 minutes.

Selection of column: Proceed with 200 μL of the standard solution under the above conditions; thiamine and the internal standard are eluted in this order with the resolution being NLT 8.

Packaging and storage Preserve in tight containers.

Zaltoprofen
잘토프로펜



and enantiomer

$C_{17}H_{14}O_3S$: 298.36

2-(10-Oxo-10,11-dihydrodibenzo[b,f]thiepin-2-yl)propanoic acid [*74711-43-6*]

Zaltoprofen, when dried, contains NLT 99.0% and NMT 101.0% of zaltoprofen ($C_{17}H_{14}O_3S$).

Description Zaltoprofen occurs as white to light yellow crystals or a crystalline powder.
It is freely soluble in acetone, soluble in methanol or ethanol(99.5), and practically insoluble in water.
It is gradually decomposed by light.
A solution of Zaltoprofen in acetone (1 in 10) shows no optical rotation.

Identification (1) To 0.2 g of Zaltoprofen, add 0.5 g of sodium hydroxide, heat gradually, and carbonize. After cooling, add 5 mL of diluted hydrochloric acid (1 in 2); the gas produced darkens moist lead acetate paper.

(2) Determine the absorption spectra of solutions of Zaltoprofen and zaltoprofen RS in ethanol(99.5) (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared spectra of Zaltoprofen and zaltoprofen RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Melting point Between 135 and 139 °C.

Purity (1) ***Heavy metals***—Proceed with 2.0 g of Zaltoprofen according to Method 4 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Arsenic***—Prepare the test solution with 1.0 g of Zaltoprofen according to Method 3 and perform the test. Use a solution of magnesium nitrate hexahydrate in ethanol(95) (2 in 25) (NMT 2 ppm).

(3) ***Related substances***—Dissolve 50 mg of Zaltoprofen in 50 mL of the mobile phase, and use this solution as the test solution. Pipet 1 mL of the test solution and add the mobile phase to make exactly 20 mL. Pipet 1 mL of this solution, add the mobile phase to make exactly 20 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak area of each solution by the automatic integration method; the peak area other than the peaks of zaltoprofen from the test solution and peaks with relative retention time to zaltoprofen of about 0.7 is not greater than the peak area of zaltoprofen from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 240 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: A mixture of acetonitrile, water and acetic acid(100) (300 : 200 : 1).

Flow rate: Adjust the flow rate so that the retention time of zaltoprofen is about 4 minutes.

System suitability

Test for required detectability: Pipet 2 mL of the standard solution and add the mobile phase to make exactly 20 mL. Confirm that the peak area obtained from 20 μL of this solution is equivalent to 8% to 12% of the peak area of zaltoprofen from the standard solution.

System performance: Dissolve 25 mg of zaltoprofen and 50 mg of isopropyl benzoate in 100 mL of ethanol(99.5). Pipet 1 mL of this solution and add the mobile phase to make exactly 50 mL. Proceed with 20 μL of this solution according to the above operating conditions; zaltoprofen and isopropyl benzoate are eluted in this order with the resolution being NLT 6.0.

System repeatability: Repeat the test 6 times with 20 μL each of the standard solution under the above operating conditions; the relative standard deviation of the peak areas of zaltoprofen is NMT 2.0%.

Time span of measurement: About 15 times the retention time of zaltoprofen after the solvent peak.

Loss on drying NMT 0.5% (1 g, 105 °C, 4 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.5 g of Zaltoprofen, dissolve in 50 mL of methanol, and titrate with 0.1 mol/L sodium hydroxide VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS
= 29.84 mg of $C_{17}H_{14}O_3S$

Packaging and storage Preserve in light-resistant, tight containers.

Zaltoprofen Tablets
잘토프로펜 정

Zaltoprofen Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of zaltoprofen ($C_{17}H_{14}O_3S$: 298.36).

Method of preparation Prepare as directed under Tablets, with Zaltoprofen.

Identification Powder Zaltoprofen Tablets, weigh an amount of this powder, equivalent to 80 mg of zaltoprofen according to the labeled amount, add 30 mL of ethanol(99.5), shake to mix well, and centrifuge. To 1 mL of the clear supernatant, add ethanol(99.5) to make 20 mL. To 2 mL of this solution, add ethanol(99.5) to make 25 mL, and determine the absorption spectrum of this solution as directed under the Ultraviolet-visible Spectroscopy; it exhibits absorption maxima at wavelengths of between 227 to 231 nm and between 329 nm to 333 nm, and a shoulder between 241 nm to 245 nm.

Dissolution Perform the test with 1 tablet of Definition of Zaltoprofen Tablets at 50 revolutions per minute according to Method 2 under the Dissolution, using 900 mL of the solution 2 for the dissolution test as the dissolution medium. Take NLT 20 mL of the dissolved solution after 30 minutes from the start of the dissolution test, and filter through a membrane filter with a pore size of NMT 0.45 μm. Discard the first 10 mL of the filtrate, pipet *V* mL of the subsequent filtrate, add the solution 3 for the dissolution test to make *V'* mL so that each mL contains about 44 μg of zaltoprofen ($C_{17}H_{14}O_3S$) per mL according to the labeled amount, and use this solution as the test solution. Separately, weigh accurately about 22 mg of zaltoprofen RS, previously dried at 105 °C for 4 hours, and dissolve in 20 mL of ethanol(99.5), then add the solution 2 for the dissolution test to make exactly 100 mL. Pipet 4 mL of this solution, add the solution 2 for the dissolution test to make exactly 20 mL, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at the absorption maximum wavelength of about 340 nm as directed under the Ultraviolet-visible Spectroscopy, using the dissolution medium as the control solution. It meets the requirements if the dissolution rate of Zaltoprofen Tablets in 30 minutes is NLT 75%.

Dissolution rate (%) of the labeled amount of zaltoprofen ($C_{17}H_{14}O_3$)
= Amount (mg) of zaltoprofen RS (mg)
$$\times \frac{A_T}{A_S} \times \frac{V'}{V} \times \frac{1}{C} \times 180$$

C: Labeled amount (mg) of zaltoprofen ($C_{17}H_{14}O_3$) in 1 tablet

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 10 tablets of Zaltoprofen Tablets, add 40 mL of water, and shake well to disintegrate. Next, add ethanol(95), shake well to mix, and add ethanol(95) to make exactly 200 mL. Centrifuge this solution, take exactly an amount of the clear supernatant, equivalent to about 8 mg of zaltoprofen ($C_{17}H_{14}O_3S$), add exactly 10 mL of internal standard solution, add ethanol(95) to make 50 mL, and use this solution as the test solution. Separately, weigh accurately about 80 mg of zaltoprofen RS, previously dried at 105 °C for 4 hours, add 4 mL of water, and add ethanol(95) to make exactly 20 mL. Take 2 mL of this solution, add exactly 10 mL of the internal standard solution, add ethanol(95) to make 50 mL, and use this solution as the standard solution. Perform the test with 5 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the ratios, Q_T and Q_S, of the peak area of zaltoprofen to that of internal standard, respectively.

Amount (mg) zaltoprofen ($C_{17}H_{14}O_3S$)
$$= \text{Amount (mg) of zaltoprofen RS} \times \frac{Q_T}{Q_S} \times \frac{1}{10}$$

Internal standard solution—A solution of benzyl benzoate in acetonitrile (1 in 1000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 240 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: A mixture of acetonitrile, water and acetic acid(100) (300 : 200 : 1).

Flow rate: Adjust the flow rate so that the retention time of zaltoprofen is about 4 minutes.

System suitability

System performance: Proceed with 5 μL of the standard solution according to the above conditions;

zaltoprofen and the internal standard are eluted in this order with the resolution being NLT 10.

System repeatability: Repeat the test 6 times with 5 μL each of the standard solution according to the above conditions; the relative standard deviation of peak area of zaltoprofen to that of the internal standard is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Zinc Chloride
염화아연

$ZnCl_2$: 136.32

Dichlorozinc [*7646-85-7*]

Zinc Chloride contains NLT 97.0% and NMT 101.0% of zinc chloride ($ZnCl_2$).

Description Zinc Chloride occurs as a white, crystalline powder, rod or a mass, and is odorless.
It is very soluble in water and freely soluble in ethanol(95); it may sometimes be slightly turbid. The solution becomes clear by addition a small amount of hydrochloric acid.
The pH of a solution of 1.0 g of Zinc Chloride in 2 mL of water is between 3.3 and 5.3.
It is deliquescent.

Identification An aqueous solution of Zinc Chloride (1 in 30) responds to the Qualitative Analysis for zinc salt and chloride.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Zinc Chloride in 10 mL of water and 2 drops of hydrochloric acid: the solution is colorless and clear.

(2) ***Oxychloride***—Weigh 0.25 g of Zinc Chloride, add 5 mL of water and 5 mL of ethanol(95), shake thoroughly to mix well, and add 0.30 mL of 1 mol/L hydrochloric acid; the solution is clear.

(3) ***Sulfate***—Perform the test with 2.0 g of Zinc Chloride. Prepare the control solution with 0.40 mL of 0.005 mol/L sulfuric acid (NMT 0.010%).

(4) ***Ammonium***—Dissolve 0.5 g of Zinc Chloride in 5 mL of water, and warm with 10 mL of sodium hydroxide solution (1 in 6); the evolving gas does not change the moistened red litmus paper to blue.

(5) ***Heavy metals***—Dissolve 0.5 g of Zinc Chloride in 5 mL of water in a Nessler tube, shake thoroughly with 15 mL of potassium cyanide TS, add 1 drop of sodium sulfide TS, allow to stand for 5 minutes, and observe from the top downward against a white background; the color of the solution is not more intense than that of the following control solution.

Control solution—To 2.5 mL of lead standard solution, add 3 mL of water and 15 mL of potassium cyanide TS, shake thoroughly, and add 1 drop of sodium sulfide TS (NMT 50 ppm).

(6) ***Alkali earth metals and alkali metals***—Dissolve 2.0 g of Zinc Chloride in 120 mL of water, add ammonium sulfide TS to complete precipitation, add water to make 200 mL, shake thoroughly, and filter through dry filter paper. Discard the first 20 mL of the filtrate, take the following 100 mL of the filtrate, evaporate with 3 drops of sulfuric acid to dryness, and heat the residue strongly at 600 °C to a constant mass; the mass is NMT 10.0 mg.

(7) ***Arsenic***—Proceed with 0.40 g of Zinc Chloride according to Method 1 and perform the test (NMT 5 ppm).

Assay Weigh accurately about 0.3 g of Zinc Chloride, add 0.4 mL of dilute hydrochloric acid and water to make exactly 200 mL. Pipet 20 mL of the resulting solution, add 80 mL of water, 2 mL of ammonia-ammonium chloride buffer solution (pH 10.7) and titrate with 0.01 mol/L ethylenediaminetetraacetic acid disodium salt solution VS (indicator: 40 mg of Eriochrome black T-sodium chloride indicator).

Each mL of 0.01 mol/L Ethylenediaminetetraacetic acid disodium salt VS
= 1.3630 mg of $ZnCl_2$

Packaging and storage Preserve in tight containers.

Zinc Oxide
산화아연

ZnO : 81.41

[*1314-13-2*]

Zinc Oxide, when ignited, contains NLT 99.0% and NMT 101.0% of zinc oxide (ZnO).

Description Zinc Oxide occurs as a white, amorphous powder. It is odorless and tasteless.
It is practically insoluble in water, acetic acid(100), ethanol(95) or ether.
It dissolves in dilute hydrochloric acid or in sodium hydroxide TS.
It slowly absorbs carbon dioxide in the air.

Identification (1) Zinc Oxide exhibits a yellow color when ignited and exhibits its original color when cooled.

(2) A solution of Zinc Oxide in dilute hydrochloric acid (1 in 10) responds to the Qualitative Analysis for zinc salt.

Purity (1) ***Carbonate, and clarity and color of solution***—To 2.0 g of Zinc Oxide, add 10 mL of water, shake for mixing, add 30 mL of dilute sulfuric acid, and heat on a steam bath with stirring for mixing. The solution does not exhibit bubbles. Also, the solution is colorless and clear.

(2) ***Alkalinity***—To 1.0 g of Zinc Oxide, add 10 mL of water, boil for 2 minutes and cool. Filter with a glass

filter (G 3). To the filtrate, add 2 drops of phenolphthalein TS and 0.20 mL of 0.1 mol/L hydrochloric acid VS. The solution is colorless.

(3) ***Sulfate*—**To 0.5 g of Zinc Oxide, add 40 mL of water, shake for mixing, and filter. To 20 mL of the filtrate, add 1 mL of dilute hydrochloric acid, and add water to make 50 mL. Use this as the test solution and perform the test. Prepare the control solution with 0.50 mL of 0.005 mol/L sulfuric acid VS (NMT 0.096%).

(4) ***Iron*—**Dissolve 1.0 g of Zinc Oxide in 50 mL of diluted hydrochloric acid (1 in 2), dissolve in 0.1 g of ammonium peroxydisulfate, and perform extraction with 20 mL of 4-methyl-2-pentanone. To the 4-methyl-2-pentanone layer, add 30 mL of pH 4.5 acetic acid-sodium acetate buffer for iron test for extraction. Use the pH 4.5 acetic acid-sodium acetate buffer layer as the test solution. Separately, proceed in the same manner with 1.0 mL of iron standard solution, and use this solution as the control solution. Add 2 mL of a solution of ascorbic acid for iron test (1 in 100) to each of the test solution and the control solution for mixing, and allow to stand for 30 minutes. To each of the solutions, add 5 mL of a solution of α,α'-dipyridyl in ethanol(95) (1 in 200), add water to make 50 mL, and allow to stand for 30 minutes. Compare the colors of the respective resulting solutions in the white background; the color of the test solution is not more intense than that of the control solution (NMT 10 ppm).

(5) ***Cadmium*—**Dissolve 2.0 g of Zinc Oxide in 14 mL of diluted dilute nitric acid (1 in 2), boil for 1 minute, cool, and add water to make exactly 100 mL. Use this solution as the test solution. Separately, prepare the standard solution by mixing cadmium standard solution and 3.5% nitric acid. Perform the test with the test solution and the standard solution as directed under the Atomic Absorption Spectroscopy according to the following conditions; the absorbance of the test solution is NMT that of the standard solution (NMT 10 ppm).

Gas: Air–acetylene or propane
Lamp: Cadmium hollow-cathode lamp
Wavelength: 228.8 nm

(6) ***Lead*—**To 2.0 g of Zinc Oxide, add 20 mL of water. While shaking for mixing, add 5 mL of acetic acid(100), and heat on a steam bath to dissolve. After cooling, add 5 drops of potassium chromate TS. The solution is not turbid.

(7) ***Arsenic*—**Dissolve 0.5 g of Zinc Oxide in 5 mL of dilute hydrochloric acid. Use this as the test solution and perform the test (NMT 4 ppm).

Loss on ignition NMT 1.0% (1 g, 850 ℃, 1 hour).

Assay Weigh accurately about 0.8 g of Zinc Oxide, previously ignited at 850 ℃ for 1 hour, dissolve in 2 mL of water and 3 mL of hydrochloric acid, and add water to make exactly 100 mL. Pipet 10 mL of this solution, add 80 mL of water and add sodium hydroxide solution (1 in 50) until a little of precipitate is produced. Add 5 mL of pH 10.7 ammonia-ammonium chloride buffer solution, and titrate with 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS (indicator: 40 mg of eryochrome black T-sodium chloride indicator).

Each mL of 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS
= 4.069 mg of ZnO

Packaging and storage Preserve in tight containers.

Zinc Sulfate Hydrate
황산아연수화물

$ZnSO_4 \cdot 7H_2O$: 287.58
Zinc Sulfate Heptahydrate [*7446-20-0*]

Zinc Sulfate Hydrate contains NLT 99.0% and NMT 102.0% of zinc sulfate ($ZnSO_4 \cdot 7H_2O$).

Description Zinc Sulfate Hydrate occurs as colorless crystals or a white crystalline powder.
It is very soluble in water and practically insoluble in ethanol(99.5).
It effloresces in dry air.

Identification (1) An aqueous solution of Zinc Sulfate Hydrate (1 in 20) responds to the Qualitative Analysis for zinc salt.

(2) An aqueous solution of Zinc Sulfate Hydrate (1 in 20) responds to the Qualitative Analysis for sulfate.

pH Dissolve 1.0 g of Zinc Sulfate Hydrate in 20 mL of water; the pH of this solution is between 4.4 and 6.0.

Purity (1) ***Clarity and color of solution***—Dissolve 0.25 g of Zinc Sulfate Hydrate in 5 mL of water; the solution is clear and colorless.

(2) ***Heavy metals***—Transfer 1.0 g of Zinc Sulfate Hydrate into a Nessler tube, dissolve in 10 mL of water, add 20 mL of potassium cyanide TS, and shake well to mix. Add 2 drops of sodium sulfide TS, and after 5 minutes, observe from the above using diffuse light against a white background; it is not more intense than the following control solution.

Control solution—To 1.0 mL of lead standard solution, add 10 mL of water and 20 mL of potassium cyanide TS, mix well, and add 2 drops of potassium cyanide TS (NMT 10 ppm).

(3) ***Alkaline earth metals and alkali metals***—Dissolve 2.0 g of Zinc Sulfate Hydrate in 150 mL of water, add ammonium sulfide TS to complete the precipitation, add water to make exactly 200 mL, and shake well to mix. Then, filter with a dry filter paper. Discard the first 20 mL of the filtrate, pipet the subsequent 100 mL of the filtrate, evaporate to dryness, and ignite as directed under the Residue on ignition; the residue is NMT 5.0

mg.

(4) ***Arsenic***—Prepare the test solution with 1.0 g of Zinc Sulfate Hydrate according to Method 1, and perform the test (NMT 2 ppm).

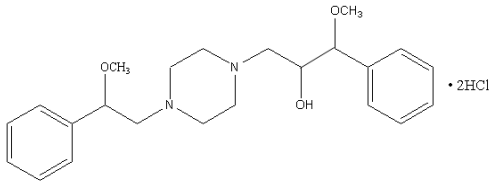
Loss on drying Between 35.5% and 38.5% (1.0 g, 105 ℃, 3 hours).

Assay Weigh accurately about 0.3 g of Zinc Sulfate Hydrate, and dissolve in water to make 100 mL exactly. Pipet 25 mL of this solution, add 100 mL of water and 2 mL of pH 10.7 ammonia-ammonium chloride buffer solution, and titrate with 0.01 mol/L ethylenediaminetetraacetic acid disodium salt VS (indicator: 40 mg of eryochrome black T-sodium chloride indicator).

Each mL of 0.01 mol/L ethylenediaminetetraacetic acid disodium salt VS
= 2.8756 mg of $ZnSO_4 \cdot 7H_2O$

Packaging and storage Preserve in tight containers.

Zipeprol Dihydrochloride
지페프롤염산염



$C_{23}H_{32}N_2O_3 \cdot 2HCl$: 457.43
4-(2-Methoxy-2-phenylethyl)-α-(methoxyphenylmethyl)-1-piperazineethanol dihydrochloride, [*34758-84-4*]

Zipeprol Dihydrochloride contains NLT 98.5% and NMT 101.0% of zolpidem tartrate (C42H48N6O8), calculated on the anhydrous basis.

Description Zipeprol Dihydrochloride occurs as a white fine powder.
It is soluble in water, sparingly soluble in ethanol(95) and chloroform and insoluble in petroleum ether and ether.

Melting point—Between 227 and 231 °C.

Identification (1) An aqueous solution of Zipeprol Dihydrochloride responds to the Qualitative Analysis for chloride.

(2) 0.5% ethanol solutions of Zipeprol Dihydrochloride and zipeprol dihydrochloride RS are used as the test solution and the standard solution, respectively. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Develop the plate with a mixture of water, 1-butanol, and acetic acid(100) (5 : 4 : 1) as the developing solvent, and air-dry the plate. Spray Dragendorff's TS evenly onto the plate; the R_f value and the color of the spots obtained from the test and the standard solutions are the same.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Zipeprol Dihydrochloride according to Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Related substances***—To about 0.1 g of Zipeprol Dihydrochloride, add ethanol(95) to make exactly 10 mL, and use this solution as the test solution. Separately, weigh about 10 mg of 2-phenyl-(2-methoxyethyl)piperazine, dissolve in ethanol(95) to make exactly 100 mL, and use this solution as the standard solution. Spot 5 μL each of the test solution and the standard solution on two thin-layer chromatographic plates made of silica gel for thin-layer chromatography, develop the plates with a mixture of water, 1-butanol, and acetic acid(100) (5 : 4 : 1) and a mixture of water, 1-butanol, and ammonia water (5 : 4 : 1), respectively, and air-dry the plates. Spray Dragendorff's TS and 0.1 mol/L sodium nitrate solution evenly onto the plate in this order; the spots other than the principal spot obtained from the test solution are not greater or more intense than the spots obtained from the standard solution (NMT 1.0%).

Loss on drying NMT 1.0% (1.0 g, 105 °C, 4 hours).

Residue on ignition NMT 0.1% (2.0 g).

Assay Weigh accurately about 0.4 g of Zipeprol Dihydrochloride, put into an Erlenmeyer flask, add 40 mL of acetic acid(100) for non-aqueous titration, and warm the flask slightly to dissolve. Cool to room temperature, slowly add 10 mL of mercury(II) acetic acid for non-aqueous titration TS, and titrate with 0.1 mol/L perchloric acid VS. However, the endpoint is when the color of the solution changes to bluish green (indicator: 3 drops of methylrosaniline chloride TS) Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 22.87 mg of $C_{23}H_{32}N_2O_3 \cdot 2HCl$

Packaging and storage Preserve in tight containers.

Zipeprol Dihydrochloride Syrup
지페프롤염산염 시럽

Zipeprol Dihydrochloride Syrup contains NLT 95.0% and NMT 105.0% of the labelled amount of zipeprol dihydrochloride ($C_{23}H_{32}N_2O_3 \cdot 2HCl$: 457.43).

Method of preparation Prepare as directed under Syrups, with Zipeprol Dihydrochloride.

Identification The retention times of the major peaks from the test solution and the standard solution prepared

as directed under the Assay are the same.

pH Between 4.3 and 6.3.

Uniformity of dosage units (distribution) Meets the requirements.

Assay Weigh accurately an amount of Zipeprol Dihydrochloride Syrup, equivalent to 0.1 g of zipeprol dihydrochloride ($C_{23}H_{32}N_2O_3 \cdot 2HCl$) according to the labeled amount, add 50 mL of water and 4 mL of 1 mol/L sodium hydroxide TS, extract 3 times with each 50 mL of chloroform. Combine the chloroform extracts, pass through anhydrous sodium sulfate to remove water, filter, and evaporate the filtrate to dryness. Add the mobile phase to the residue and use the solution as the test solution. Separately, weigh accurately about 0.1 g of zipeprol dihydrochloride RS, add the mobile phase to make 250 mL, and use the solution as the standard solution. Perform the test with each 10 μL of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions and determine the peak areas, A_T and A_S, of zipeprol dihydrochloride from each solution.

$$\text{Amount (mg) of zipeprol dihydrochloride } (C_{23}H_{32}N_2O_3 \cdot 2HCl) = \text{Amount (mg) of zipeprol dihydrochloride RS} \times \frac{A_T}{A_S}$$

Operating conditions

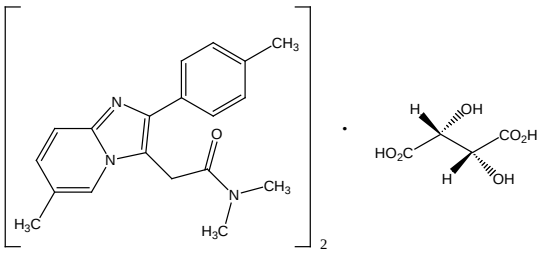
Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm to 10 μm in particle diameter).

Mobile phase: A mixture of 0.1 mol/L potassium dihydrogen phosphate, acetonitrile and phosphoric acid (60 : 40 : 0.5).

Packaging and storage Preserve in well-closed containers.

Zolpidem Tartrate
졸피뎀타르타르산염



$C_{42}H_{48}N_6O_8$: 764.87

2,3-Dihydroxybutanedioic acid; *N*,*N*-dimethyl-2-[6-methyl-2-(4-methylphenyl)imidazo[1,2-a]pyridin-3-yl]acetamide [*99294-93-6*]

Zolpidem Tartrate contains NLT 98.5% and NMT 101.0% of zolpidem tartrate ($C_{42}H_{48}N_6O_8$), calculated on the anhydrous basis.

Description Zolpidem Tartrate occurs as a white crystalline powder.
It is sparingly soluble in methanol, slightly soluble in water, and practically insoluble in dichloromethane.
It is hygroscopic.

Identification (1) Dissolve 0.10 g each of Zolpidem Tartrate and zolpidem tartrate RS in 10 mL of 0.1 mol/L hydrochloric acid TS, add 10 mL of water, then add dropwise 1 mL of 3.4 w/v% ammonia water while stirring. Filter the resulting precipitate, wash the precipitate with water, and then dry at 100 to 105 °C for 2 hours. Determine the infrared spectra of the precipitates as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy: both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) Dissolve 50 mg of Zolpidem Tartrate in 5 mL of methanol, add 0.1 mL of diethylamine and methanol to make 10 mL, and use this solution as the test solution. Separately, dissolve 50 mg of zolpidem tartrate RS in 5 mL of methanol, add 0.1 mL of diethylamine and methanol to make 10 mL, and use this solution as the standard solution (1). Also, dissolve 50 mg of flunitrazepam RS in dichloromethane to make 10 mL. Mix 1 mL of the solution with 1 ml of the standard solution (1), and use this solution as the standard solution (2). With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution, the standard solution (1) and (2) on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, cyclohexane and diethylamine (45 : 45 : 10) as the developing solvent to a distance of about 12 cm and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm); the R_f value of the principal spot obtained from the test solution is the same as that of the principal spot from the standard solution (1). The test is valid when the chromatogram from the standard solution (2) shows two clearly separated spots.

(3) Dissolve about 0.1 g of Zolpidem Tartrate in 1 mL of warm methanol. 0.1 mL of this solution responds to the Chemical identification reaction 3) for tartrate.

Purity (1) ***Clarity and color of solution solution***—Mix 0.25 g of Zolpidem Tartrate with 0.125 g of L-tartaric acid, dissolve the mixture in 20 mL of water, and add to make 25 mL; the solution is clear.

(2) ***Heavy metals***—Proceed with 2.0 g of Zolpidem Tartrate according to Method 4 under the Heavy Metals, and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Related substances***—Dissolve 10 mg of Zolpidem Tartrate in 20 mL of methanol, and use this solution as the test solution. Pipet 1 mL of this solution

and add methanol to make exactly 100 mL. Pipet 2 mL of this solution, add methanol to make exactly 20 mL, and use this solution as the standard solution. Perform the test with 5 μL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions. Determine each peak area of each solution by the automatic integration method; the total area of the peaks other than zolpidem from the test solution is not greater than the peak area of zolpidem from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 7.5 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: A mixture of a solution prepared by adding 1000 mL of water to 4.9 g of phosphoric acid and adjusting the pH to 5.5 with triethylamine, methanol, and acetonitrile (11 : 5 : 4).

Flow rate: Adjust the flow rate so that the retention time of zolpidem is about 5 minutes.

System suitability

System performance: Dissolve 10 mg each of Zolpidem Tartrate and benzyl p-hydroxybenzoate in 100 mL of methanol. Proceed with 5 μL of this solution according to the above operating conditions; zolpidem and benzyl p-hydroxybenzoate are eluted in this order with the resolution being NLT 9.

System repeatability: Repeat the test 6 times with 5 μL each of the standard solution under the above operating conditions; the relative standard deviation of the peak areas of zolpidem is NMT 5.0%.

Time span of measurement: About 5 times the retention time of zolpidem.

Water NMT 3.0% (0.5 g, volumetric titration, direct titration).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.30 g of Zolpidem Tartrate, dissolve in a mixture of 20 mL of acetic anhydride and 20 mL of acetic acid(100), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 38.24 mg of $C_{42}H_{48}N_6O_8$

Packaging and storage Preserve in light-resistant, tight containers.

Zolpidem Tartrate Tablets
졸피뎀타르타르산염 정

Zolpidem Tartrate Tablets contains NLT 95.0% and NMT 105.0% of the labeled amount of zolpidem tartrate (C42H48N6O8 : 764.87).

Method of preparation Prepare as directed under Tablets, with Zolpidem Tartrate.

Identification Take 1 tablet of Zolpidem Tartrate Tablets, add 100 mL of 0.1 mol/L hydrochloric acid TS, shake to mix well for 30 minutes, and then filter. Discard the first 20 mL of filtrate, weigh an amount of the subsequent filtrate, equivalent to 1 mg of zolpidem tartrate according to the labeled amount, and add 0.1 mol/L hydrochloric acid TS to make 100 mL. Determine the absorption spectra of this solution as directed under the Ultraviolet-visible Spectroscopy; it exhibits maxima at wavelengths of 235 nm to 239 nm and 292 nm to 296 nm.

Dissolution Perform the test with 1 tablet of Zolpidem Tartrate Tablets at 50 revolutions per minute according to Method 2 under the Dissolution, using 900 mL of water as the dissolution solution. Take NLT 20 mL of the dissolved solution after 15 minutes from the start of the dissolution test, and filter through a membrane filter with a pore size of NMT 0.45 μm. Discard the first 10 mL of the filtrate, pipet *V* mL of the subsequent filtrate, add the solution 2 for the dissolution test to make exactly *V′* mL so that each mL contains about 2.8 μg of zolpidem tartrate according to the labeled amount, and use this solution as the test solution. Separately, weigh accurately about 22 mg of the zolpidem tartrate RS (previously determined the water content in the same manner as for Zolpidem Tartrate Tablets), dissolve with water to make exactly 100 mL. Take 5 mL of this solution and add water to make exactly 200 mL. Pipet 25 mL of this solution, add the solution 2 for the dissolution test to make exactly 50 mL, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, at the wavelength of 242 nm as directed under the Ultraviolet-visible Spectroscopy, using diluted solution 2 for the dissolution test (1 in 2) as a control solution. Meets the requirements if the dissolution rate of Zolpidem Tartrate Tablets in 15 minutes is NLT 80%.

Dissolution rate (%) for the labeled amount of zolpidem tartrate ($C_{42}H_{48}N_6O_8$)
= Amount (mg) of zolpidem tartrate RS, as calculated on the anhydrous basis $\times \frac{A_T}{A_S} \times \frac{V'}{V} \times \frac{1}{C} \times \frac{45}{4}$

C: Amount (mg) of zolpidem tartrate ($C_{42}H_{48}N_6O_8$) in 1 tablet

Uniformity of dosage units It meets the requirements when the Content uniformity test is performed according

to following method.

Take 1 tablet of Zolpidem Tartrate Tablets, add *V* / 10 mL of 0.1 mol/L hydrochloric acid TS and shake to mix well for 15 minutes to disintegrate. Add *2V* / 5 mL of methanol, add exactly *V* / 10 mL of internal standard solution, shake to mix well for 15 minutes, and add methanol make it *V* mL so that each mL contains about 0.1 mg of zolpidem tartrate ($C_{42}H_{48}N_6O_8$). Centrifuge this solution, and use the clear supernatant as the test solution. Separately, weigh accurately about 25 mg of zolpidem tartrate RS (previously determined water content in the same manner as for Zolpidem Tartrate Tablets), dissolve in 25 mL of 0.1 mol/L hydrochloric acid TS, add exactly 25 mL of internal standard solution, add methanol to make 250 mL, and use this solution as the standard solution. Perform the test with 5 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions.

Amount (mg) zolpidem tartrate ($C_{42}H_{48}N_6O_8$)
= Amount (mg) of zolpidem tartrate RS, as calculated on the anhydrous basis$\times \frac{Q_T}{Q_S} \times \frac{V}{500}$

Internal standard solution—A solution of benzyl p-hydroxybenzoate in methanol (1 in 1000).

Assay Take NLT 20 tablets of Zolpidem Tartrate Tablets, add *V* / 10 mL of 0.1 mol/L hydrochloric acid TS, and shake to mix well for 15 minutes to disintegrate. Add exactly *2V* / 5 mL of methanol and *V* / 10 mL of internal standard solution, shake to mix well for 15 minutes, and add methanol to make *V* mL so that each mL contains about 1 mg of zolpidem tartrate. After centrifuging this solution, add a mixture of methanol and 0.1 mol/L hydrochloric acid TS (9 : 1) to 1 mL of the clear supernatant to make 10 mL, and use this solution as the test solution. Separately, weigh accurately about 25 mg of zolpidem tartrate RS (separately, determined water content in the same manner as for Zolpidem Tartrate Tablets), dissolve in 0.1 mol/L hydrochloric acid TS, add exactly 2.5 mL of the internal standard solution, add methanol to make 250 mL, and use this solution as the standard solution. Perform the test with 5 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, Q_T and Q_S of the zolpidem to the peak area of the internal standard.

C: Labeled amount (mg) of zolpidem tartrate ($C_{42}H_{48}N_6O_8$) in 1 tablet
= Amount (mg) of zolpidem tartrate RS, as calculated on the anhydrous basis$\times \frac{Q_T}{Q_S} \times \frac{V}{500}$

Internal standard solution—A solution of benzyl p-hydroxybenzoate in methanol (1 in 100).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 7.5 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: A mixture of a solution prepared by adding 1000 mL of water to 4.9 g of phosphoric acid and then adding triethylamine to adjust the pH to 5.5, methanol and acetonitrile (55: 25 : 20).

Flow rate: Adjust the flow rate so that the retention time of zolpidem is about 5 minutes.

System suitability

System performance: Proceed with 5 μL of the standard solution according to the above conditions; zolpidem and the internal standard are eluted in this order with the resolution being NLT 9.

System repeatability: Repeat the test 6 times with 5 μL each of the standard solution according to the above conditions; the relative standard deviation of ratios of the peak area of zolpidem to that of the internal standard is NMT 1.0%.

Packaging and storage Preserve in well-closed containers.
