Sodium 4-[2-[(8*S*,9*S*,10*R*,11*S*,13*S*,14*S*,17*R*)-11,17-dihydroxy-10,13-dimethyl-3-oxo-2,6,7,8,9,11,12,14,15,16-decahydro-1*H*-cyclopenta[a]phenanthren-17-yl]-2-oxoethoxy]-4-oxobutanoate [*125-04-2*]

Hydrocortisone Sodium Succinate contains NLT 97.0% and NMT 103.0% of hydrocortisone sodium succinate ($C_{25}H_{33}NaO_8$), calculated on the dried basis.

Description Hydrocortisone Sodium Succinate occurs as a white powder or a mass, which is odorless.
It is freely soluble in water, methanol or ethanol(95), and practically insoluble in ether.
It is hygroscopic.
It is gradually colored by light.

Identification (1) Dissolve 0.2 g of Hydrocortisone Sodium Succinate in 20 mL of water, stir to mix, and add 0.5 mL of dilute hydrochloric acid; a white precipitate is produced. Filter the precipitate, wash twice each with 10 mL of water, and dry for 3 hours at 105 °C. To 3 mg of the dried matter, add 2 mL of sulfuric acid; the resulting solution exhibits a yellowish green fluorescence immediately, and changes gradually from orange-yellow to dark red. Examine this solution under ultraviolet light; the solution shows a very pale green fluorescence. Add carefully 10 mL of water to this solution; the color changes from yellow to orange with a pale green fluorescence, and a yellowish brown flocculent precipitate is produced.

(2) Dissolve 10 mg of the dried matter obtained in (1) in 1 mL of methanol, add 1 mL of Fehling's TS, and heat; an orange to red precipitate is produced.

(3) Dissolve 0.1 g of the dried matter obtained in (1) in 2 mL of sodium hydroxide TS, and allow to stand for 10 minutes. Filter the precipitated produced, mix the filtrate with 1 mL of dilute hydrochloric acid, shake to mix, and filter if necessary. Adjust the filtrate to the pH of about 6 with dilute ammonia TS (1 in 10), and add 2 to 3 drops of iron(III) chloride TS; a brown precipitate is produced.

(4) Determine the infrared spectra of the dried matter obtained in (1) and hydrocortisone succinate RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers. If any difference appears between the spectra, dissolve Hydro-

cortisone Sodium Succinate and hydrocortisone succinate RS in methanol, respectively, then evaporate the methanol to dryness, and repeat the test on the residues.

(5) Hydrocortisone Sodium Succinate responds to the Qualitative Analysis (1) for sodium salt.

Optical rotation $[\alpha]_D^{20}$: Between +135° and +145° (0.1 g as a calculated dried basis, ethanol(95), 10 mL, 100 mm).

Purity (1) ***Clarity and color of solution***—Dissolve 0.5 g of Hydrocortisone Sodium Succinate in 10 mL of water; the solution is colorless and clear.

(2) ***Related substances***—Weigh 25 mg of Hydrocortisone Sodium Succinate, dissolve in methanol to make exactly 10 mL, and use this solution as the test solution. Separately, dissolve 25 mg of hydrocortisone RS in methanol to make exactly 10 mL. Pipet 1 mL of this solution, add methanol to make exactly 20 mL, and use this solution as the standard solution (1). Pipet 6 mL of the standard solution (1), add methanol to make exactly 10 mL, and use this solution as the standard solution (2). With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 3 µL each of the test solution, the standard solution (1) and (2) on a plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of chloroform, ethanol(99.5) and formic acid (150 : 10 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm); the spot obtained from the test solution equivalent to the location of spot from the standard solution (1) is not more intense than the spot from the standard solution (1). Any spot other than the principal spot and the above spot from the test solution is NMT one, and is not more intense than the spot from the standard solution (2).

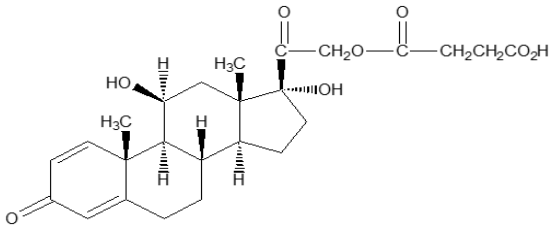
Loss on drying NMT 2.0% (0.5 g, 105 °C, 3 hours).

Assay Weigh accurately about 10 mg of Hydrocortisone Sodium Succinate and dissolve in methanol to make exactly 100 mL. Pipet 5 mL of this solution, add methanol to make exactly 50 mL, and use this solution as the test solution. Separately, weigh accurately about 10 mg of hydrocortisone succinate RS, previously dried at 105 °C for 3 hours, and proceed with it in the same manner as the test solution. Use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at the wavelength of 240 nm as directed under the Ultraviolet-visible Spectroscopy.

$$\text{Amount (mg) of hydrocortisone sodium succinate } (C_{25}H_{33}NaO_8) = \text{Amount (mg) of hydrocortisone succinate RS} \times \frac{A_T}{A_S} \times 1.0475$$

Packaging and storage Preserve in light-resistant, tight containers.

Hydrocortisone Succinate
히드로코르티손숙시네이트



$C_{25}H_{34}O_8$: 462.53

4-[2-[(8*S*,9*S*,10*R*,11*S*,13*S*,14*S*,17*R*)-11,17-dihydroxy-10,13-dimethyl-3-oxo-2,6,7,8,9,11,12,14,15,16-decahydro-1*H*-cyclopenta[a]phenanthren-17-yl]-2-oxoethoxy]-4-oxobutanoic acid [*2203-97-6*]

Hydrocortisone Succinate, when dried, contains NLT 97.0% and NMT 103.0% of hydrocortisone succinate ($C_{25}H_{34}O_8$).

Description Hydrocortisone Succinate occurs as a white crystalline powder, which is odorless.
It is very soluble in methanol, freely soluble in ethanol(99.5), sparingly soluble in ethanol(95), very slightly soluble in ether, and practically insoluble in water.

Identification (1) Dissolve 3 mg of Hydrocortisone Succinate in 2 mL of sulfuric acid; the resulting solution exhibits a yellowish green fluorescence initially, and changes gradually to orange to dark red. Examine this solution under ultraviolet light; the solution shows a very pale green fluorescence. Add carefully 10 mL of water to this solution; the color changes from yellow to orange with a pale green fluorescence, and a yellowish brown flocculent precipitate is produced.

(2) Determine the infrared spectrum of Hydrocortisone Succinate and hydrocortisone succinate RS as directed in the potassium bromide disk method under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers. If any difference appears between the spectra, dissolve Hydrocortisone Succinate and hydrocortisone succinate RS in methanol, respectively, then evaporate the methanol to dryness, and repeat the test on the residues.

Optical rotation $[\alpha]_D^{20}$: Between +147° and +153° (after drying, 0.1 g, ethanol(99.5), 10 mL, 100 mm).

Purity (1) ***Clarity and color of solution***—Dissolve 0.5 g of Hydrocortisone Succinate in 10 mL of water; the solution is colorless and clear.

(2) ***Related substances***—Weigh 25 mg of Hydrocortisone Succinate, dissolve in methanol to make exactly

10 mL, and use this solution as the test solution. Separately, dissolve 25 mg of hydrocortisone RS in methanol to make exactly 10 mL. Pipet 1 mL of this solution, add methanol to make 50 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 3 μL each of the test solution and the standard solution on a thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of chloroform, ethanol(99.5) and formic acid (150 : 10 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot obtained from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 2.0% (0.5 g, 105 °C, 3 hours).

Residue on ignition NMT 0.1% (0.5 g).

Assay Weigh accurately about 50 mg each of Hydrocortisone Succinate and hydrocortisone succinate RS, previously dried, and dissolve in methanol to make exactly 50 mL. Pipet 5 mL each of these solutions, add exactly 5 mL each of the internal standard solution, add methanol to make exactly 50 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 10 μL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the ratios of the peak area, Q_T and Q_S, of hydrocortisone succinate to that of internal standard, respectively.

$$\text{Amount (mg) of hydrocortisone succinate } (C_{25}H_{34}O_8) = \text{Amount (mg) of hydrocortisone succinate RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of butyl p-hydroxybenzoate in methanol (1 in 2500).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm to 10 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: A mixture of acetic acid-sodium acetate buffer solution (pH 4.0) and acetonitrile (3 : 2).

Flow rate: Adjust the flow rate so that the retention time of hydrocortisone succinate is about 5 minutes.

System suitability

System performance: Proceed with 10 μL of the standard solution according to the above operating conditions; hydrocortisone succinate and internal standard are eluted in this order with the resolution being NLT 9.

System repeatability: Repeat the test 6 times with 10 μL of the standard solution under the above operating conditions; the relative standard deviation of the ratios of peak area of hydrocortisone succinate to that of the internal standard is NMT 1.0%.

Packaging and storage Preserve in light-resistant, tight containers.

Hydrogen Peroxide Solution
과산화수소수

[*7722-84-1*]

Hydrogen Peroxide Solution contains NLT 2.5 w/v% and NMT 3.5 w/v% of hydrogen peroxide (H_2O_2: 34.02).
It contains NMT 0.05% of suitable preservatives.

Description Hydrogen Peroxide Solution occurs as a clear, colorless liquid. It is odorless or has an ozone-like odor.
It is acidic and forms bubbles on the mouth of the container.
It rapidly decomposes when in contact with oxidizing agents or reducing agents.
It can be decomposed by heating.
It is affected by light.

Specific gravity—d_{20}^{20}: About 1.01.

Identification Add 10 mL of water with 1 drop of dilute sulfuric acid to 1 mL of Hydrogen Peroxide Solution, shake, add 2 mL of ether, and add 1 drop of potassium dichromate TS; the water layer exhibits a light blue color. Shake well to mix and allow to stand; the light blue color is moved to the etheric layer.

Purity (1) ***Acid***—Pipet 25.0 mL of Hydrogen Peroxide Solution, add 2 drops of phenolphthalein TS and 2.5 mL of 0.1 mol/L sodium hydroxide TS; the resulting solution exhibits red color.

(2) ***Heavy metals***—Pipet 5.0 mL of Hydrogen Peroxide Solution, add 20 mL of water and 2 mL of ammonia TS, evaporate to dryness on a steam bath, dissolve the residue in 2 mL of dilute acetic acid by heating, and add water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution by adding 2 mL of dilute acetic acid and water to 2.5 mL of lead standard solution to make 50 mL (NMT 5 ppm).

(3) ***Arsenic***—Pipet 1.0 mL of Hydrogen Peroxide Solution, add 1 mL of ammonia TS and evaporate to dryness on a steam bath. Proceed with the residue according to Method 1 and perform the test (NMT 2 ppm).

(4) ***Barium***—Pipet 10 mL of Hydrogen Peroxide Solution, add 2 drops of dilute sulfuric acid; no turbidity or precipitate is produced within 10 minutes.

(5) ***Preservative***—Pipet 100 mL of Hydrogen Peroxide Solution, previously shaken well, and extract with

50 mL, 25 mL and 25 mL of a chloroform-ether mixture (3 : 2). Combine all the extracts, put them in a tared container, evaporate at room temperature, and dry the residue in a desiccator (silica gel) for 2 hours; the mass of residue is NMT 50 mg.

(6) ***Evaporation residue*—**Evaporate to dryness 20.0 mL of Hydrogen Peroxide Solution on a steam bath and dry the residue at 105 ℃ for 1 hour; the mass of the residue is NMT 20 mg.

Assay Pipet 2 mL of Hydrogen Peroxide Solution, put it into a flask containing 20 mL of water, add 20 mL of dilute sulfuric acid, and titrate with 0.02 mol/L potassium permanganate VS.

Each mL of 0.02 mol/L potassium permanganate VS
= 1.701 mg of H_2O_2

Packaging and storage Preserve in light-resistant, tight containers, at below 30 ℃.

Hydrogen Peroxide Solution 35%
과산화수소수35%

H_2O_2 : 34.01

Hydrogen Peroxide Solution 35% is an aqueous solution, and contains an appropriate stabilizer. Hyrdogen Peroxide Solution 35% contains NLT 34.5% and NMT 35.5% of hydrogen peroxide (H_2O_2 : 34.01).

Description Hyrdogen Peroxide Solution 35% occurs as clear and colorless liquid. It is odorless or has an ozon-like odor.

Identification 1 ml of Hyrdogen Peroxide Solution 35% responds to the Qualitative Analysis.

pH Between 2.0 and 3.7.

Specific gravity d_{20}^{20}: Between 1.132 and 1.137 (Method 1).

Purity (1)***Acid***—Take 30.0 g of Hydrogen Peroxide Solution 35%, and add 150 mL of newly boiled and cooled water, 2 drops of methyl red TS and 0.60 mL of 0.1 mol/L sodium hydroxide solution. Then, the resulting solution exhibits a yellow color.

(2) ***Heavy metals***—Take 5 mL of Hydrogen Peroxide Solution 35%, add 20 mL of water and 2 mL of ammonia TS and evaporate on a steam bath to dryness. Dissolve the residue in 2 mL of dilute acetic acid by heating and add water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 2.5 mL of lead standard solution (NMT 5 ppm).

(3) ***Arsenic***—Add 1.0 g of Hydrogen Peroxide Solution 35% in 1 mL of ammonia TS, evaporate on a steam bath to dryness, and dissolve the residue in 10 mL of water. Use this solution as the test solution and perform the test (NMT 2 ppm).

(4) ***Organic Stabilizer***—With 100 g of Hydrogen Peroxide Solution 35%, extract using 50 mL, 25 mL, and 25 mL of a mixture of ether and chloroform (2:3), add all the extracted solutions and heat on a steam bath to evaporate ether and chloroform, and dry the residue in a desiccator (silica gel) to a constant mass (NMT 50 mg).

(5) ***Residue on evaporation***—Evaporate about 20.0 g of Hydrogen Peroxide Solution 35% on a steam bath to dryness and dry the residue at 105 ℃ for 1 hour (NMT 20 mg).

Assay Weigh accurately about 1 g of Hydrogen Peroxide Solution 35%, dissolve in water to make exactly 100 mL. Take 10 mL of this solution, add 10 mL of dilute sulfuric acid, and titrate with 0.02 mol/L potassium permanganate VS. The endpoint of the titration is when the color of the solution is red and persists for 30 seconds. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.02 mol/L potassium permanganate VS
= 1.7007 mg of H_2O_2

Packaging and storage Preserve in light-resistant, tight containers, at below 30 ℃.

Hydrotalcite Granules
히드로탈시트 과립

Hydrotalcite Granules contain NLT 90.0% and NMT 110.0% of the labeled amount hydrotalcite [$Al_2Mg_6(OH)_{16}CO_3 \cdot 4H_2O$: 603.98].

Method of preparation Prepare as directed under Granules, with Hydrotalcite.

Identification Weigh an appropriate amount of Hydrotalcite Granules, equivalent to 1.0 g of hydrotalcite, according to the labeled amount, add 20 mL of 2 mol/L hydrochloric acid, shake vigorously to mix, and filter. Add 30 mL of water to the resulting mixture, filter, and heat. Add 2 mol/L ammonia until it turns alkaline verifying with methyl red, heat for 2 minutes, and filter. Wash the precipitate with 50 mL of warm 2 w/v% ammonium chloride TS, and dissolve with 15 mL of 2 mol/L hydrochloric acid. To 2 mL of this solution, add about 0.5 mL of 7.3 w/v% hydrochloric acid and 0.5 mL of thioacetamide TS; no precipitate forms. To this solution, drop 8.5 w/v% sodium chloride solution; a white gel precipitate forms, and it dissolves when more 8.5 w/v% sodium chloride solution is added. To this solution, slowly add 10.7 w/v% ammonium chloride solution; the white precipitate appears again.

Acid-neutralizing capacity Perform the test as directed under the Acid-neutralizing Capacity with Hydrotalcite Granules.
Hydrotalcite Granules, equivalent to each g of hydrotalcite consumes NLT 260 mL of 0.1 mol/L hydrochloric acid VS.

Particle size estimation by analytical sieving Meets the requirements.

Disintegration Meets the requirements.

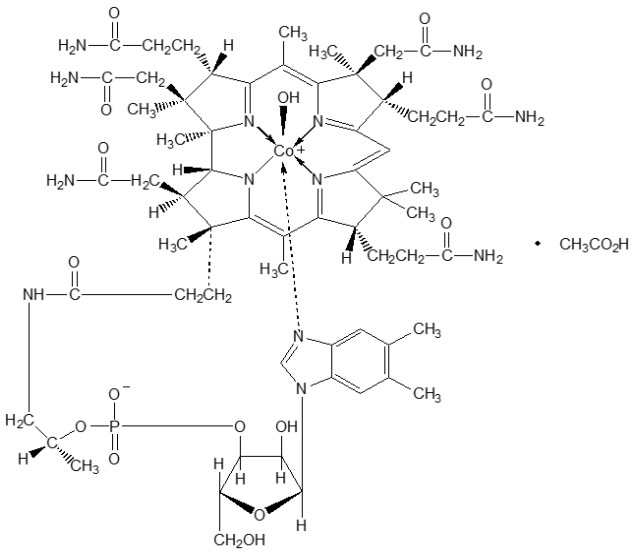
Uniformity of dosage units (distribution) Meets the requirements.

Assay Weigh accurately an amount of pulverized Hydrotalcite Granules equivalent to about 300 mg of hydrotalcite $Al_2Mg_6(OH)_{16}CO_3 \cdot 4H_2O$], add 2 mL of 7 mol/L hydrochloric acid, heat on a steam bath for 15 minutes, and cool. Add exactly 250 mL of water and 50 mL of 0.05 mol/L ethylenediaminetetraacetic acid disodium salt solution. Neutralize this solution with 1 mol/L sodium hydroxide VS (indicator: methyl red TS), heat on a steam bath for 30 minutes, and cool. Add 3 g of hexamine, and titrate excess 0.05 mol/L ethylenediaminetetraacetic acid disodium salt with 0.05 mol/L lead nitrate VS (indicator: xylenol orange TS). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS
= 15.09 mg of $Al_2Mg_6(OH)_{16}CO_3 \cdot 4H_2O$

Packaging and storage Preserve in well-closed containers.

Hydroxocobalamin Acetate
히드록소코발라민아세트산염



$C_{62}H_{89}CoN_{13}O_{15}P \cdot C_2H_4O_2$: 1406.41
Cobaltous [(2*R*,3*S*,4*R*,5*S*)-5-(5,6-dimethylbenzimidazol-1-yl)-4-hydroxy-2-(hydroxymethyl)tetrahydrofuran-3-yl] [(1*R*)-1-methyl-2-[3-[(2*R*,3*R*,4*Z*,7*S*,9*Z*,12*S*,13*S*,14*Z*,17*S*,18*S*,19*R*)-2,13,18-tris(2-amino-2-oxo-ethyl)-7,12,17-tris(3-amino-3-oxo-propyl)-3,5,8,8,13,15,18,19-octamethyl-2,7,12,17-tetrahydro-1*H*-corrin-21-id-3-yl]propanoylamino]ethyl] phosphate hydrate [*22465-48-1*]

Hydroxocobalamin Acetate contains NLT 95.0% and NMT 101% of hydroxocobalamin acetate ($C_{62}H_{89}CoN_{13}O_{15}P \cdot C_2H_4O_2$), calculated on the dried basis.

Description Hydroxocobalamin Acetate is deep red crystals or a powder which is odorless.
It is freely soluble in water, slightly solution in ethanol(95) and practically insoluble in ether.
It is hygroscopic.

Identification (1) Determine the absorption spectra of a solution of Hydroxocobalamin Acetate in pH 4.5 acetic acid-sodium acetate buffer solution (1 in 50000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) Add 50 mg of potassium hydrogen sulfate to 1 mg of Hydroxocobalamin Acetate to mix and fuse by igniting. After cooling, crush the fused mass with a glass rod, dissolve in 3 mL of water by boiling, and add 1 drop of phenolphthalein TS. Put sodium hydroxide TS dropwise until the solution shows pale light red, and add 0.5 g of add trihydrate, 0.5 mL of dilute acetic acid and 0.5 mL of 1-nitroso-2-naphthol-3,6-disulfonic acid disodium (1 in 500); the resulting solution exhibits red to orange immediately. Then add 0.5 mL of hydrochloric acid and boil

for 1 minute; the red color of the solution does not disappear.

(3) To 20 mg of Hydroxocobalamin Acetate, add 0.5 mL of ethanol(99.5) and 1 mL of sulfuric acid, and heat; it gives the odor of ethyl acetate.

Purity ***Cyanocobalamin and colored related substances*—**Prepare 2 test tube with 50 mg of Hydroxocobalamin Acetate, and add exactly 5 mL of acetic acid-sodium acetate buffer solution, pH 5.0, in each tube. Add 0.15 mL of potassium thiocyanate TS in one tube, allow to stand for 30 minutes, and use this solution as the test solution (1). Add 0.10 mL of potassium thiocyanate TS in the other tube, allow to stand for 30 minutes, and use this solution as the test solution (2). Separately, weigh about 3.0 mg of cyanocobalamin RS, add exactly 10 mL of pH 5.0 acetic acid-sodium acetate buffer solution, pH 5.0, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 20 μL each of the test solution (1), (2) and the standard solution onto a thin-layer chromatographic plate made of silica gel for thin-layer chromatography, with a spacing of approximately 10 mm and a length of 25 mm each, following the original line. Next, develop the plate with water-saturated n-butanol as the developing solvent, tilted at an angle of about 15°, for 18 hours, and air-dry the plate. The spots obtained from the test solution (1) at the positions corresponding to the standard solution's spots are not more intense than the spots obtained from the standard solution; spots other than the principal spot obtained from the test solution (2) are not more intense than the spots obtained from the standard solution.

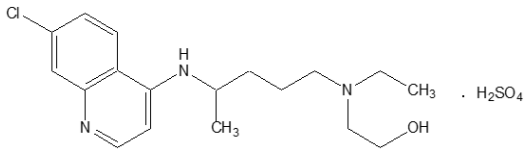
Loss on drying NMT 12.0% (50 mg, NMT 0.67 kPa, phosphorus pentoxide, 100 °C, 6 hours).

Assay Weigh accurately about 20 mg of Hydroxocobalamin Acetate and dissolve in acetic acid-sodium acetate buffer solution, pH 5.0 to make exactly 50 mL. Pipet 2 mL of this solution in a volumetric flask of 50 mL, add 1 mL of potassium cyanide solution (1 in 1000), allow to stand at ordinary temperature for 30 minutes, add acetic acid-sodium acetate buffer solution, pH 5.0 to make exactly 50 mL, and use this solution as the test solution. Separately, weigh accurately about 20 mg of cyanocobalamin RS (previously measure for loss on drying) and dissolve in water to make exactly 50 mL. Take exactly 2 mL of this solution, add acetic acid and sodium acetate buffer solution, pH 5.0, to make exactly 50 mL, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at the wavelength of 361 nm as directed under the Ultraviolet-visible Spectroscopy.

Amount (mg) of Hydroxocobalamin acetate ($C_{62}H_{89}CoN_{13}O_{15}P \cdot C_2H_4O_2$)
= Amount (mg) of cyanocobalamin RS, calculated on the dried basis $\times \frac{A_T}{A_S} \times 1.0377$

Packaging and storage Preserve in light-resistant, tight containers in a cold place.

Hydroxychloroquine Sulfate
히드록시클로로퀸황산염



$C_{18}H_{26}ClN_3O \cdot H_2SO_4$: 433.95

2-[4-[(7-Chloroquinolin-4-yl)amino]pentylethylamino]ethanol;sulfuric acid [*747-36-4*]

Hydroxychloroquine Sulfate contains NLT 98.0% and NMT 102.0% of hydroxychloroquine sulfate ($C_{18}H_{26}ClN_3O \cdot H_2SO_4$), calculated on the dried basis.

Description Hydroxychloroquine Sulfate occurs as a white crystalline powder, which is odorless and has a bitter taste.
It is freely soluble in water and practically insoluble in ethanol(95), chloroform or ether.
It shows polymorphism.
The typical form of Hydroxychloroquine Sulfate melts at about 240 ℃, while other forms melt at approximately 198 ℃.

Identification (1) Determine the absorption spectra of solutions of Hydroxychloroquine Sulfate and hydroxychloroquine sulfate RS in diluted hydrochloric acid (1 in 100) (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit the same intensities of absorption at the same wavelengths.

(2) Determine the infrared spectrum of Hydroxychloroquine Sulfate and hydroxychloroquine sulfate RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) An aqueous solution of Hydroxychloroquine Sulfate (1 in 100) responds to the Qualitative Analysis for sulfate.

Purity ***Related substances*—**Dissolve 0.10 g of Hydroxychloroquine Sulfate in a mixture of methanol and water (90: 10) to make exactly 10 mL, and use this solution as the test solution. Separately, weigh exactly a suitable amount of hydroxychloroquine sulfate RS, dissolve in a mixture of methanol and water (90 : 10) to make a solution containing 0.01, 0.05, 0.1 and 0.2 mg, per mL respectively, and use these solutions as the standard solu-

tions. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 20 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of ethanol(95), water and ammonia water(28) (80 : 16 : 4) as the developing solvent to a distance of about 15 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm and 366 nm); the spots other than the principal spot obtained from the test solution are not more intense than the spots from the standard solution.

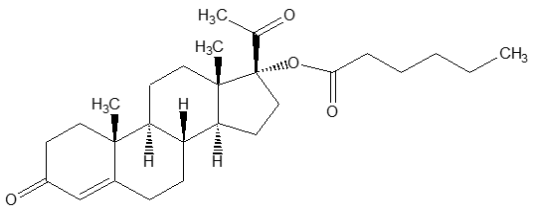
Loss on drying NMT 2.0% (1 g, 105 ℃, 2 hours).

Assay Weigh accurately about 0.1 g each of Hydroxychloroquine Sulfate and hydroxychloroquine sulfate RS, dissolve in 5 mL of water, and add diluted hydrochloric acid (1→ 100) to make exactly 100 mL, respectively. Pipet 1.0 mL each of these solutions, add diluted hydrochloric acid (1→ 100) to make exactly 100 mL, and use these solutions as the test solution and the standard solution, respectively. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at the absorbance maximum wavelength of around 343 nm, as directed under the Ultraviolet-visible Spectroscopy.

$$\text{Amount (mg) hydroxychloroquine sulfate } (C_{18}H_{26}ClN_3O\cdot H_2SO_4) = \text{Amount (mg) of hydroxychloroquine sulfate RS} \times \frac{A_T}{A_S}$$

Packaging and storage Preserve in light-resistant, well-closed containers.

Hydroxyprogesterone Caproate
히드록시프로게스테론카프로에이트



$C_{27}H_{40}O_4$: 428.60

(8*R*,9*S*,10*R*,13*S*,14*S*,17*R*)-17-Acetyl-10,13-dimethyl-3-oxo-2,3,6,7,8,9,10,11,12,13,14,15,16,17-tetradecahydro-1*H*-cyclopenta[a]phenanthren-17-yl hexanoate [*630-56-8*]

Hydroxyprogesterone Caproate contains NLT 97.0% and NMT 103.0% of hydroxyprogesterone caproate ($C_{27}H_{40}O_4$), calculated on the anhydrous basis.

Description Hydroxyprogesterone Caproate occurs as a white to milky white crystalline powder and is odorless. It is soluble in ether and practically insoluble in water.

Identification Determine the infrared spectra of Hydroxyprogesterone Caproate and hydroxyprogesterone caproatee RS, previously dried in a desiccator (in vacuum, silica gel) for 4 hours, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit the maxima at the same wavenumbers.

Specific optical rotation $[\alpha]_D^{20}$: Between +58° and +64° (0.1 g calculated on the anhydrous basis, chloroform, 10 mL, 100 mm).

Melting point Between 120 and 124 ℃.

Purity (1) ***Free n-caproic acid***—Dissolve 0.20 g of Hydroxyprogesterone Caproate in 25 mL of ethanol, neutralized before by adding 2 to 3 drops of phenolphthalein TS until a red color exhibits, and titrate with 0.02 mol/L sodium hydroxide VS; the consumption is NMT 0.50 mL (NMT 0.58%).

(2) ***Related substances***—Weigh 0.1 g of Hydroxyprogesterone Caproate, dissolve in 10 mL of chloroform, and use this solution as the test solution. Separately, weigh accurately about 10 mg of hydroxyprogesterone caproate RS, previously dried in a desiccator (vacuum, silica gel) for 4 hours, and dissolve in chloroform to make exactly 10 mL. Pipet 0.1 mL, 0.5 mL, 1 mL and 2 mL of this solution and add chloroform to each to make exactly 10 mL, and use these solutions as the standard solutions (1),(2), (3) and (4). With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 20 μL each of the test solution and the standard solutions (1), (2), (3) and (4), on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of chloroform and ethyl acetate (3 : 1) as the developing solvent to a distance of about 15 cm, and air-dry the plate. On the plate, spray evenly the solution, prepared by adding 10 mL of sulfuric acid to 90 mL of ethanol(95) in an ice bath, and heat the plate until it carbonizes. After cooling, expose to ultraviolet light (main wavelength: 366 nm), and compare the intensities of any spot other than the principal spot from the test solution with those from the standard solution; the relative intensity is NMT 2.0%.

Water NMT 0.1% (5 g, volume titration, direct titration).

Assay Weigh accurately about 50 mg each of Hydroxyprogesterone Caproate and hydroxyprogesterone caproatee RS (previously vacuum dried in a silica gel desiccator for 4 hours), separately dissolve in ethanol(95) to make exactly 100 mL, and shake to mix. Pipet 2 mL each of these solutions, add ethanol(95) to make exactly 100 mL and use these solutions as the test solution and the standard solution, respectively. Determine the absorbances, A_T and A_S, of the test solution and the standard solution,

respectively, at the absorbance maximum wavelength of around 240 nm, as directed under the Ultraviolet-visible Spectroscopy, using ethanol(95) to as the control solution.

$$\text{Amount (mg) of hydroxyprogesterone caproate}(C_{27}H_{40}O_4) = \text{Amount (mg) of hydroxyprogesterone caproate RS} \times \frac{A_T}{A_S}$$

Packaging and storage Preserve in light-resistant, well-closed containers.

Hydroxyprogesterone Caproate Injection
히드록시프로게스테론카프로에이트 주사액

Hydroxyprogesterone Caproate Injection is an oily injection. Hydroxyprogesterone Caproate Injection contains NLT 90.0% and NMT 110.0% of the labeled amount of hydroxyprogesterone caproate ($C_{27}H_{40}O_4$: 428.60).

Method of preparation Prepare as directed under Injections, with Hydroxyprogesterone Caproate.

Description Hydroxyprogesterone Caproate Injection occurs as a colorless to pale yellow, clear, oily liquid.

Identification (1) Take Hydroxyprogesterone Caproate Injection in the amount equivalent to 0.125 g of hydroxyprogesterone caproate according to the labeled amount, place it in a 60-mL separatory funnel containing 10 mL of hexane, 8 mL of methanol and 2 mL of water. Stopper the funnel, shake well for 2 minutes to mix, allow to stand until separated. Take 3 mL of the lower layer, add sulfuric acid dropwise until it exhibits a color, and add 3 mL of methanol; the solution exhibits a violet color. Examine the solution under the long-wavelength ultraviolet light; the solution exhibits a pale yellow fluorescence.

(2) Evaporate 4 mL of the test solution of the Assay to dryness by heating on a steam bath. Dissolve the residue in 0.5 mL of chloroform and use this solution as the test solution. Dissolve a suitable amount of Hydroxyprogesterone Caproate RS in a suitable amount of chloroform so as to contain 400 μg of hydroxyprogesterone caproate per mL. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of chloroform and ethyl acetate (3 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Spray evenly a mixture of sulfuric acid and ethanol(95) (1 : 3) onto the plate, and heat the plate at 105 ℃ for 5 minutes; the principal spots obtained from the test solution and the standard solution exhibit a yellowish green color and have the same R_f value.

Water NMT 0.2% (5 g, volumetric titration, direct titration).

Sterility Meets the requirements.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Extractable volume of injections Meets the requirements.

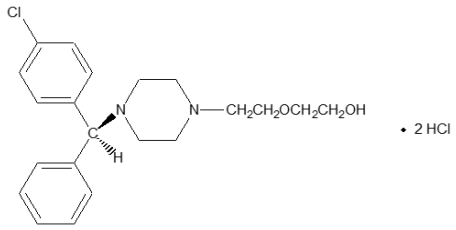
Assay Pipet Hydroxyprogesterone Caproate Injection in the amount equivalent to about 0.25 g of hydroxyprogesterone caproate ($C_{27}H_{40}O_4$) according to the labeled amount, add methanol to make exactly 250 mL, and mix. Pipet 5 mL of this solution, add methanol to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 50 mg of hydroxyprogesterone caproate RS, and add methanol to make exactly 50 mL. Pipet 5 mL of this solution, add methanol to make exactly 100 mL, and use this solution as the standard solution. Pipet 5 mL each of the test solution and the standard solution, place in a respective stoppered flask, add 10.0 mL of isoniazid solution to each, and shake to mix. Allow each to stand in a 30 ℃ water bath for about 45 minutes. With these solutions, perform the test as directed under the Ultraviolet-visible Spectroscopy, using a mixture of methanol and isoniazid solution (1 : 2) as a control solution, and determine the absorbances, A_T and A_S, of the solutions, respectively, at the absorbance maximum wavelength of about 380 nm.

$$\text{Amount (mg) of hydroxyprogesterone caproate}(C_{27}H_{40}O_4) = \text{Amount (mg) of hydroxyprogesterone caproate RS} \times \frac{A_T}{A_S} \times 5$$

Isoniazid solution—Dissolve 0.375 g of isoniazid and 0.47 mL of hydrochloric acid in 500 mL of methanol.

Packaging and storage Preserve in hermetic containers.

Hydroxyzine Hydrochloride
히드록시진염산염



and enantiomer

$C_{21}H_{27}ClN_2O_2 \cdot 2HCl$: 447.83

2-[2-[4-[(4-Chlorophenyl)-phenylmethyl]piperazin-1-yl]ethoxy]ethanoldihydrochloride [*2192-20-3*]

Hydroxyzine Hydrochloride, when dried, contains NLT 98.5% and NMT 101.0% of hydroxyzine hydrochloride ($C_{21}H_{27}ClN_2O_2 \cdot 2HCl$).

Description Hydroxyzine Hydrochloride occurs as a white crystalline powder, which is odorless and has a bitter taste.
It is very soluble in water, freely soluble in ethanol(95), methanol or acetic acid(100), very slightly soluble in acetic anhydride, and practically insoluble in ether.

Melting point—About 200 °C (with decomposition).

Identification (1) To 5 mL of an aqueous solution of Hydroxyzine Hydrochloride (1 in 100), add 2 to 3 drops of ammonium thiocyanate-cobalt nitrate TS; a blue precipitate is produced.

(2) Determine the absorption spectra of a solution of Hydroxyzine Hydrochloride in methanol (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) An aqueous solution of Hydroxyzine Hydrochloride (1 in 10) responds to the Qualitative Analysis for chloride.

pH Dissolve 1.0 g of Hydroxyzine Hydrochloride in 20 mL of water; the pH of this solution is between 1.3 and 2.5.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Hydroxyzine Hydrochloride in 10 mL of water; the solution is colorless and clear.

(2) ***Heavy metals***—Proceed with 1.0 g of Hydroxyzine Hydrochloride according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Related substances***—Dissolve 0.20 g of Hydroxyzine Hydrochloride in 10 mL of methanol and use this solution as the test solution. Pipet 1 mL of this solution, add methanol to make exactly 200 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL of the test solution and the standard solution onto a plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of ethyl acetate, ethanol(95) and ammonia water(28) (150 : 95 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Allow the plate to stand in iodine steam; the spots other than the principal spot from the test solution are not more intense than those from the standard solution.

Loss on drying NMT 3.0% (1 g, 105 ℃, 2 hours).

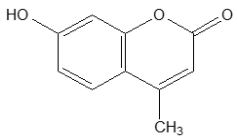
Residue on ignition NMT 0.2% (1 g).

Assay Weigh accurately about 0.1 g of Hydroxyzine Hydrochloride, previously dried, dissolve in 60 mL of a mixture of acetic anhydride and acetic acid(100) (7 : 3), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 22.392 mg of $C_{21}H_{27}ClN_2O_2 \cdot 2HCl$

Packaging and storage Preserve in tight containers.

Hymecromone
히메크로몬



Hymecromone $C_{10}H_8O_3$: 176.17

7-Hydroxy-4-methyl-2*H*-chromen-2-one [*90-33-5*]

Hymecromone, when dried, contains NLT 98.0% and NMT 101.0% of hymecromone ($C_{10}H_8O_3$).

Description Hymecromone occurs as white crystals or a crystalline powder, which is odorless and tasteless.
It is freely soluble in *N*,*N*-dimethylformamide, sparingly soluble in ethanol(99) or ethanol(99.5) or acetone, slightly soluble in ether and practically insoluble in water.

Identification (1) Dissolve about 2 mg of Hymecromone in 5 mL of ammonia-ammonium chloride buffer solution, pH 11; the solution exhibits an intense bluish purple fluorescence.

(2) Dissolve 25 mg of Hymecromone in 5 mL of diluted ethanol (1 in 2), and add 1 drop of iron(III) chloride TS; the solution initially exhibits dark brown and turns yellowish brown after standing for a while.

(3) Determine the absorption spectra of solutions of Hymecromone and hymecromone RS in ethanol(99.5) (1 in 250000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of ab-

sorption at the same wavelengths.

(4) Determine the infrared spectra of Hymecromone and hymecromone RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Melting point Between 187 and 191 ºC.

Purity (1) ***Chloride***—Dissolve 0.8 g of Hymecromone in 40 mL of a mixture of acetone and water (2 : 1), and add 6 mL of dilute nitric acid and a mixture of acetone and water (2 : 1) to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution by adding 6 mL of dilute nitric acid and a mixture of acetone and water (2 : 1) to 0.25 mL of 0.01 mol/L hydrochloric acid to make 50 mL (NMT 0.011%).

(2) ***Sulfate metals***—Dissolve 0.8 g of Hymecromone in 40 mL of a mixture of acetone and water (2 : 1), and add 1 mL of dilute hydrochloric acid and a mixture of acetone and water (2 : 1) to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution by adding 1 mL of dilute hydrochloric acid to 0.40 mL of 0.005 mol/L sulfuric acid, and add a mixture of acetone and water (2 : 1) to make 50 mL (NMT 0.024%).

(3) ***Heavy metals***—Proceed with 2.0 g of Hymecromone according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(4) ***Arsenic***—Prepare the test solution with 1.0 g of Hymecromone according to Method 3, and perform the test (NMT 2 ppm).

(5) ***Related substances***—Dissolve 80.0 mg of Hymecromone in 10 mL of ethanol(95) and use this solution as the test solution. Pipet 1 mL of this solution and add ethanol(95) to make exactly 50 mL. Pipet 1 mL of this solution, add ethanol(95) to make exactly 20 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of chloroform and ethanol(95) (10 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Allow the plate to stand in iodine vapor for 5 minutes; the spots other than the principal spot obtained from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 0.5% (1 g, 105 ℃, 4 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.25 g of Hymecromone, previously dried, dissolve in 90 mL of *N*,*N*-Dimethylformamide, and titrate with 0.1 mol/L tetramethylammonium hydroxide VS (potentiometric titration under the Titrimetry). Perform a blank test with a solution prepared by adding 14 mL of water to 90 mL of *N*,*N*-dimethylformamide and make any necessary correction.

Each mL of 0.1 mol/L tetramethylammonium hydroxide VS
= 17.617 mg of $C_{10}H_8O_3$

Packaging and storage Preserve in tight containers.

Hypromellose and Dextran 70 Ophthalmic Solution
히프로멜로오스·덱스트란70 점안액

Hypromellose and Dextran 70 Ophthalmic Solution contains NLT 90.0% and NMT 110.0% of the labeled amount of hypromellose 2910 and dextran 70.

Method of preparation Prepare as directed under Ophthalmic Solutions, with Hypromellose 2910 and Dextran 70.

Identification (1) ***Hypromellose 2910***—(i) Add gradually 1 mL of anthrone TS to 2 mL of Hypromellose and Dextran 70 Ophthalmic Solution; the boundary layer exhibits a blue to green color.

(ii) A white precipitation is formed when heating this solution on a steam bath; the white precipitation disappears when cooling the solution.

(2) ***Dextran 70***—Add gradually 2 mL of anthrone TS to 1 mL of Hypromellose and Dextran 70 Ophthalmic Solution; the resulting solution exhibits a bluish green color which gradually changes to a dark bluish green color. To this solution, add 1 mL of diluted sulfuric acid (1 in 2) or 1 mL of acetic acid(100); the resulting solution does not change in color.

pH Between 6.5 and 8.5.

Sterility Meets the requirements.

Particulate contamination: Visible particles Meets the requirements.

Particulate matter in ophthalmic solutions Meets requirements.

Assay Pipet 5 mL of Hypromellose and Dextran 70 Ophthalmic Solution, add water to make 50 mL, and use this solution as the test solution. Separately, weigh accurately about 150 mg of hypromellose 2910 RS and about 50 mg of dextran 70 RS, place them in a 500-mL volumetric flask, and add slowly 350 mL of hot water, stirring continuously until the mixture reaches room temperature. Allow to stand overnight, then completely dissolve, and use this solution as the standard solution.

Take 2.0 mL each of the test solution and the standard solution, put in a test tube, add 2.0 mL each of water,

and use this solution as the test solution and the standard solution for total carbohydrates assay.

Separately, take 2.0 mL each of the test solution and the standard solution, put in a centrifuge tube, add 2.0 mL of saturated sodium sulfate solution, centrifuge, and use the clear supernatant as the test solution and the standard solution for dextran 70 assay.

Take 1.0 mL each of the test solution and the standard solution for total carbohydrates assay and those for dextran 70 assay, add 5.0 mL of diphenylamine TS, react for 30 minutes in an oil bath maintained at a constant temperature of 105 to 110 ℃, and then cool in iced water for 10 minutes to bring to room temperature. Determine the absorption spectra of these solutions, A_{CT}, A_{CS}, A_{DT}, and A_{DS}, as directed under the Ultraviolet-visible Spectroscopy at the 635 nm wavelength.

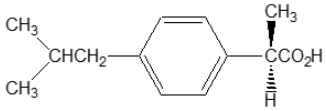
Amount (mg/mL) of total carbohydrate
= Concentration (mg/mL) of the standard solution for total carbohydrate assay $\times \frac{A_{CT}}{A_{CS}}$

Amount (mg/mL) of dextran 70
= Amount (concentration) (mg/mL) of dextran 70 $\times \frac{A_{DT}}{A_{DS}}$

Amount (mg/mL) of hypromellose 2910
= Amount (mg/mL) of total carbohydrate - Concentration (mg/mL) of dextran 70

Packaging and storage Preserve in tight containers.

Ibuprofen
이부프로펜



and enantiomer

$C_{13}H_{18}O_2$: 206.28

2-[4-(2-Methylpropyl)phenyl]propanoic acid [*15687-27-1*]

Ibuprofen, when dried, contains NLT 98.5% and NMT 101.0% of ibuprofen ($C_{13}H_{18}O_2$).

Description Ibuprofen occurs as a white crystalline powder.
It is freely soluble in ethanol(95) or acetone and practically insoluble in water.
It is soluble in dilute sodium hydroxide TS.

Identification (1) Determine the absorption spectra of Ibuprofen and ibuprofen TS in dilute sodium hydroxide solution (15 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelength.

(2) Determine the infrared spectrum of Ibuprofen and ibuprofen RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wave numbers.

Melting point Between 75 and 77 ºC.

Purity (1) ***Heavy metals***—Proceed with 3.0 g of Ibuprofen as directed under Method 2 and perform the test. Prepare the control solution with 3.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Arsenic***—Proceed with 1.0 g of Ibuprofen as directed under Method 3 and perform the test (NMT 2 ppm).

(3) ***Related substances***—Weigh 0.50 g of Ibuprofen, dissolve in exactly 5 mL of acetone, and use this solution as the test solution. Pipet 1 mL of this solution, add acetone to make exactly 100 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on a thin-layer chromatographic plate made of silica gel for thin-layer chromatography (with a fluorescent indicator). Next, develop the plate with a mixture of hexane, ethyl acetate and acetic acid(100) (15 : 5 : 1) as the developing solvent to a distance of about 10 cm and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot obtained from the test solution are not more intense than the spot from the standard solution.

Loss on drying NMT 0.5% (1 g, NMT 0.67 kPa, phosphorus pentoxide, 4 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.5 g of Ibuprofen, previously dried, dissolve in 50 mL of ethanol(95), and titrate with 0.1 mol/L sodium hydroxide VS (indicator: 3 drops of phenolphthalein TS). Perform a blank test in the same manner and make any necessary correction.

1 mL of 0.1 mol/L sodium hydroxide VS
= 20.63 mg of $C_{13}H_{18}O_2$

Packaging and storage Preserve in well-closed containers.

Ibuprofen Capsules
이부프로펜 캡슐

Ibuprofen Capsules contain NLT 95.0% and NMT 105.0% of the labeled amount of ibuprofen ($C_{13}H_{18}O_2$: 206.28).

Method of preparation Prepared as directed under Cap-

sules, with Ibuprofen.

Identification (1) Weigh an amount of Ibuprofen Capsules, equivalent to 0.2 g of ibuprofen according to the labeled amount, add 20 mL of methanol, shake well to mix, centrifuge, and use the clear supernatant as the test solution. Separately, weigh 0.1 g of ibuprofen RS, add methanol to make 10 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 20 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography, develop the plate with a mixture of 1-butanol, 20% ammonia water and water (12 : 1 : 1), and air-dry the plate. Spray evenly bromocresol green TS on the plate; the colors and R_f values of the spots obtained from the test solution and the standard solution are the same.

(2) The retention times of the major peaks obtained from the test solution and the standard solution under Assay are the same.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Related substances Weigh accurately the mass of the content of NLT 20 capsules of Ibuprofen Capsules. Weigh accurately an amount of the content, equivalent to about 0.2 g of ibuprofen ($C_{13}H_{18}O_2$), add 30 mL of methanol, shake to dissolve for 30 minutes, then add 30 mL of methanol and water to make exactly 100 mL, filter, and use the filtrate as the test solution. Pipet 2 mL of this solution, add the mobile phase to make 200 mL, and use this solution as the standard solution (1). Separately, take about 50 mg of ibuprofen RS, add 2.5 mL of 0.006% methanolic 2-(4-butylphenyl)-propionic acid RS and methanol to make 25 mL, and use this solution as the standard solution (2). Perform the test with 20 μL each of the test solution, the standard solutions (1) and (2) as directed under the Liquid Chromatography according to the following operating conditions. Determine the peak area of each solution as directed in the automatic integration method, and measure the amount of each related substance; the peak area of 2-(4-butylphenyl)-propionic acid obtained from the test solution is not larger than that of 2-(4-butylphenyl)-propionic acid obtained from the standard solution (2) (NMT 0.3%), and peak areas other than ibuprofen are not greater than 0.3 times the major peak area obtained from standard solution (1) (NMT 0.3%), and the sum of each peak area is not greater than 0.7 times the major peak area obtained from standard solution (1) (NMT 0.7%). However, ignore the peaks attributed to the solvent on chromatogram from the test solution and the peaks less than 0.1 times of major peak area from standard solution (1) (NMT 0.1%).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 214 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: Add 0.5 mL of phosphoric acid, 340 mL of acetonitrile and 600 mL of water, then add water to make 1000 mL.

Flow rate: 2.0 mL/min

Time span of measurement: About 1.5 times the retention time of ibuprofen

System suitability

System performance: Determine the peak height (a) of 2-(4-butylphenyl)-propionic acid and the lowest height (b) of the ibuprofen peaks from the standard solution (2). The value of (a) is NLT 1.5 times that of (b).

Assay Take NLT 20 capsules of Ibuprofen Capsules, weigh an amount of the content, equivalent to 0.12 g of ibuprofen ($C_{13}H_{18}O_2$), add 10.0 mL of the internal standard solution, add the mobile phase to make exactly 100 mL, filter, and use this solution as the test solution. Separately, weigh accurately about 0.12 g of ibuprofen RS, add 10.0 mL of the internal standard solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 5 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak area ratios, Q_T and Q_S, of ibuprofen to the internal standard.

$$\text{Amount (mg) of ibuprofen } (C_{13}H_{18}O_2) = \text{Amount (mg) of ibuprofen RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—Weigh 35 mg of valerophenone, and add the mobile phase to make 0.35 mg/mL.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 μm to 10 μm in particle diameter).

Mobile phase: Dissolve 4.0 g of chloroacetic acid in 400 mL of water, adjust the pH to 3.0 with ammonia water, add 600 mL of acetonitrile, and filter.

Flow rate: 2 mL/min

System suitability

System performance: Weigh accurately 4-isobutylacetophenone, dissolve in acetonitrile to make 0.6 mg/mL, and take 2.0 mL of the resulting solution. Add the internal standard solution to make 100 mL, and use this solution as the 4-isobutylacetophenone standard solution. Proceed with 20 μL of this solution according to the above conditions; valerophenone and 4-isobutylacetophenone are eluted in this order with the

resolution being NLT 2.5.

System repeatability: Repeat the test 6 times with 20 μL of the 4-isobutylacetophenone standard solution according to the above conditions; the relative standard deviation is NMT 2.0%.

Packaging and storage Preserve in tight containers.

Ibuprofen Syrup
이부프로펜 시럽

Ibuprofen Syrup contains NLT 90.0% and NMT 110.0% of the labeled amount of ibuprofen ($C_{13}H_{18}O_2$: 206.28).

Method of preparation Prepare as directed under Syrups, with Ibuprofen.

Identification The retention time of major peak of the test solution and the standard solution for Assay is the same.

pH Between 3.0 and 5.0.

Uniformity of dosage units (distribution) Meets the requirements.

Assay Weigh accurately an amount of Ibuprofen Syrup, equivalent to 0.12 g of ibuprofen ($C_{13}H_{18}O_2$) according to the labeled amount, add 10.0 mL of the internal standard solution, and add the mobile phase to make exactly 100 mL. Filter and use the filtrate as the test solution. Separately, weigh accurately about 0.12 g of ibuprofen RS, add 10.0 mL of the internal standard solution, add the mobile phase to make exactly 100 mL, and use the solution as the standard solution. Perform the test with 5 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak area ratios, Q_T and Q_S, of ibuprofen to the internal standard.

$$\text{Amount (mg) of ibuprofen } (C_{13}H_{18}O_2) = \text{Amount (mg) of ibuprofen RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—Weigh 35 mg of valerophenone, and add the mobile phase to make 0.35 mg/mL.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column, about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 μm to 10 μm in particle diameter).

Mobile phase: Dissolve 4.0 g of chloroacetic acid in 400 mL of water, adjust the pH to 3.0 with ammonia water, add 600 mL of acetonitrile, and filter.

Flow rate: 2 mL/min

System suitability

System performance: Weigh accurately 4-isobutylacetophenone, dissolve in acetonitrile to make 0.6 mg/mL, and take 2.0 mL of the resulting solution. Add the internal standard solution to make 100 mL, and use this solution as the 4-isobutylacetophenone standard solution. Proceed with 20 μL of this solution according to the above operating conditions and perform the test; valerophenone and 4-isobutylacetophenone are eluted in this order, with the resolution between these peaks being NLT 2.5.

System repeatability: Repeat the test 6 times with 20 μL of the 4-isobutylacetophenone standard solution according to the above conditions; the relative standard deviation is NMT 2.0%.

Packaging and storage Preserve in tight containers.

Ichthammol
이크타몰

[*8029-68-3*]

Ichthammol contains NLT 2.5% of ammonia (NH_3 : 17.03), NMT 8.0% of ammonium sulfate [$(NH_4)_2SO_4$: 132.14] and NLT 10.0% of total sulfur (S : 32.07), calculated on the dried basis.

Description Ichthammol occurs as a reddish brown to blackish brown, viscous liquid and has a characteristic odor.
It is miscible with water.
It is sparingly soluble in ethanol(95) or ether.

Identification (1) To 4 mL of an aqueous solution of Ichthammol (3 in 10), add 8 mL of hydrochloric acid; a yellowish brown to blackish brown, oily or resinous precipitate is formed. Cool the precipitate with ice to solidify the precipitate, and discard the water layer by decantation. Wash the residual precipitate with ether; a part of the precipitate dissolves but it does not dissolve completely until the last washing is almost colorless. Perform the following test with this residue.

(i) To 0.1 g of the residue, add 1 mL of a mixture of ether and ethanol(95) (1 : 1); it dissolves.

(ii) To 0.1 g of the residue, add 2 mL of water; it dissolves. To 1 mL of this solution, add 0.4 mL of hydrochloric acid; a yellowish brown to blackish brown oily or resinous precipitate is formed.

(iii) To 1 mL of the solution obtained in (B), add 0.3 g of sodium chloride; a yellowish brown or blackish brown oily or resinous precipitate is formed.

(2) Boil 2 mL of an aqueous solution of Ichthammol (1 in 10) with 2 mL of sodium hydroxide TS; the gas evolved changes the color of the moistened red litmus

paper to blue.

Loss on drying NMT 50% (0.5 g, 105 °C, 6 hours).

Residue on ignition NMT 0.5% (1 g).

Assay (1) ***Ammonia***—Weigh accurately about 5 g of Ichthammol, put into a Kjeldahl flask, and add 60 mL of water, 1 mL of 1-octanol and 4.5 mL of a solution of sodium hydroxide (2 in 5). Connect the flask to a distilling tube and a condenser with a spray trap. To a receiver, add exactly 30 mL of 0.25 mol/L sulfuric acid, and immerse the lower outlet end of the condenser. Distill slowly, collect about 50 mL of the distillate and titrate the excess sulfuric acid with 0.5 mol/L sodium hydroxide VS (indicator: 3 drops of methyl red TS). Perform a blank test in the same manner.

Each mL of 0.25 mol/L sulfuric acid VS
= 8.515 mg of NH_3

(2) ***Ammonium sulfate***—Weigh accurately about 1 g of Ichthammol, add 25 mL of ethanol(95), stir thoroughly to mix, and filter. Wash with a mixture of ethanol(95) and ether (1 : 1) until the washings are clear and colorless. Air-dry the residue and the filter paper. Dissolve the residue in 200 mL of warm water acidified slightly with hydrochloric acid, and filter. Boil the filtrate, add 30 mL of barium chloride TS slowly, heat for 30 minutes on a steam bath, and filter. Wash the precipitate with water, dry, and ignite to constant weight. Weigh the residue as the amount (mg) of barium sulfate ($BaSO_4$: 233.39).

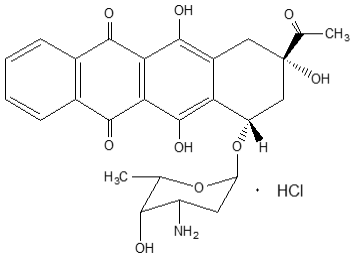
Amount (mg) of ammonium sulfate [$(NH_4)_2SO_4$]
= Amount (mg) of barium sulfate ($BaSO_4$) × 0.5662

(3) ***Total sulfur***—Weigh accurately about 0.6 g of Ichthammol, put into a 200-mL Kjeldahl flask, add 30 mL of water and 5 g of potassium chlorate, then add slowly 30 mL of nitric acid, and evaporate the solution by heating to about 5 mL. Put into a 300-mL beaker washing with 25 mL of hydrochloric acid, and evaporate by heating to 5 mL. Add 100 mL of water to this solution, boil, filter and wash with water. Heat the combined filtrate and washings to boil, add gradually 30 mL of barium chloride TS, heat on a steam bath for 30 minutes. Wash the precipitate with water, dry, and ignite to constant weight. Weigh the residue as the amount (mg) of barium sulfate ($BaSO_4$).

Amount (mg) of total sulfur (S)
= Amount (mg) of barium sulfate ($BaSO_4$) × 0.13739

Packaging and storage Preserve in tight containers.

Idarubicin Hydrochloride
이다루비신염산염



$C_{26}H_{27}NO_9 \cdot HCl$: 533.95

(7*S*,9*S*)-9-Acetyl-7-[(2*R*,4*S*,5*S*,6*S*)-4-amino-5-hydroxy-6-methyloxan-2-yl]oxy-6,9,11-trihydroxy-8,10-dihydro-7*H*-tetracene-5,12-dione hydrochloride [*57852-57-0*]

Idarubicin Hydrochloride contains NLT 960 μg and NMT 1030 μg (potency) of idarubicin hydrochloride ($C_{26}H_{27}NO_9 \cdot HCl$: 533.95) per mg, calculated on the anhydrous basis.

Description Idarubicin Hydrochloride occurs as a yellowish red powder.
It is sparingly soluble in methanol, slightly soluble in water or ethanol(95), and practically insoluble in acetonitrile or ether.

Identification (1) Determine the absorption spectra of solutions of Idarubicin Hydrochloride and idarubicin hydrochloride RS in methanol (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Idarubicin Hydrochloride and idarubicin hydrochloride RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Dissolve 2 mg of Idarubicin Hydrochloride in 3 mL of water, and add 1 mL of dilute nitric acid and 3 drops of silver nitrate TS; the solution becomes turbid in white.

Crystallinity Meets the requirements.

Optical rotation $[\alpha]_D^{20}$: Between 191° and +197° (20 mg, calculated on the anhydrous basis, methanol, 20 mL, 100 mm).

pH Dissolve 0.1 g of Idarubicin Hydrochloride in 20 mL of water; the pH of this solution is between 5.0 and 6.5.

Absorbance $E_{1cm}^{1\%}$ (482 nm): Between 204 and 210 (20 mg calculated on the anhydrous basis, methanol, 1000 mL).

Purity ***Related substances***—Perform the test as directed

under the Assay to determine the peak area ratios for each related substance to the total peak area of the test solution excluding the solvent peak; total related substances is NMT 3.0% and each related substance is respectively NMT 1.0% with respect to the total amount.

Water NMT 5.0% (0.1 g, coulometric titration).

Sterility It meets the requirements when used in the manufacturing of sterile preparations.

Bacterial endotoxins It is less than 8.9 EU per mg (potency) of idarubicin hydrochloride when used in the manufacturing of sterile preparations.

Assay Weigh accurately about 10 mg (potency) each of Idarubicin Hydrochloride and idarubicin hydrochloride RS, dissolve in the mobile phase without sodium lauryl sulfate to make exactly 50 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak area of idarubicin, A_T and A_S, in each solution.

$$\text{Potency (μg) of idarubicin hydrochloride } (C_{26}H_{27}NO_9 \cdot HCl) = \text{Idarubicin hydrochloride RS (μg)} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 3.9 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (4 μm in particle diameter).

Column temperature: A constant temperature of about 35 °C.

Mobile phase: Dissolve 10.2 g of potassium dihydrogen phosphate in water, add 1 mL of phosphoric acid and water to make 750 mL, and add 250 mL of tetrahydrofuran. To 500 mL of this solution, add 0.72 g of sodium lauryl sulfate and 0.5 mL of *N*,*N*-dimethyl-*n*-octylamine, and adjust the pH to 4 with sodium hydroxide TS.

Flow rate: Adjust the flow rate so that the retention time of idarubicin is about 15 minutes.

System suitability

System performance: Proceed with 20 μL of the standard solution under the above conditions; the number of theoretical plates of the peak of idarubicin is NLT 3000.

System repeatability: Repeat the test 6 times with 20 μL each of the standard solutions according to the above operating conditions; the relative standard deviation of the peak area of idarubicin is NMT 2.0%.

Packaging and storage Preserve in tight containers.

Idarubicin Hydrochloride for Injection
주사용 이다루비신염산염

Idarubicin Hydrochloride for Injection is a preparation for injection, which is dissolved before use, and contains NLT 90.0% and NMT 110.0% of the labeled amount of idarubicin hydrochloride ($C_{26}H_{27}NO_9 \cdot HCl$: 533.95).

Method of preparation Prepare as directed under Injections, with Idarubicin Hydrochloride.

Description Idarubicin Hydrochloride for Injection occurs as a yellowish red mass.

Identification (1) Weigh an amount of Idarubicin Hydrochloride for Injection, equivalent to 2 mg (potency) of idarubicin hydrochloride, according to the labeled amount, and dissolve in 5 mL of sodium hydroxide TS; the solution exhibits bluish purple.

(2) Weigh an amount of Idarubicin Hydrochloride for Injection, equivalent to 1 mg (potency) of idarubicin hydrochloride, according to the labeled amount, dissolve in 1 mL of water and add methanol to make 100 mL. Determine the absorption spectrum of this solution as directed under the Ultraviolet-visible Spectroscopy; it exhibits maxima between 250 nm to 254 nm, 285 nm to 289 nm, 480 nm to 484 nm and 510 nm to 520 nm.

pH Dissolve an amount of Idarubicin Hydrochloride for Injection, equivalent to 5 mg (potency) of idarubicin hydrochloride, in 5 mL of water; the pH of this solution is 5.0 to 7.0.

Purity ***Clarity and color of solution***—Weigh an amount of Idarubicin Hydrochloride for Injection, equivalent to 5 mg (potency) of idarubicin hydrochloride, according to the labeled amount, and dissolve in 5 mL of water; the solution is clear and the color is yellowish red.

Water NMT 4.0% (0.3 g, volumetric titration, direct titration).

Sterility Meets the requirements.

Bacterial endotoxins Less than 8.9 EU per mg (potency) of idarubicin hydrochloride.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Uniformity of dosage units Perform the Content uni-

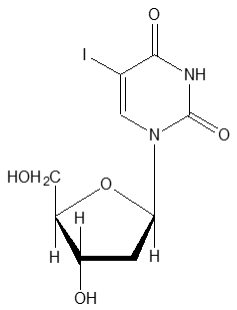
formity test according to the following procedure; it meets the requirements. Weigh 1 container of Idarubicin Hydrochloride for Injection, add the mobile phase containing no sodium lauryl sulfate to obtain V mL of a solution containing 0.2 mg (potency) of idarubicin hydrochloride ($C_{26}H_{27}NO_9 \cdot HCl$) per mL according to the labeled amount, and use this solution as the test solution. Separately, weigh accurately an amount of idarubicin hydrochloride RS, equivalent to about 10 mg (potency), add the mobile phase containing no sodium lauryl sulfate to make exactly 50 mL, and use this solution as the standard solution. Perform the test as directed under the Assay of Idarubicin Hydrochloride.

$$\text{Potency (mg) of idarubicin hydrochloride } (C_{26}H_{27}NO_9 \cdot HCl) = \text{Potency (mg) of idarubicin hydrochloride RS} \times \frac{A_T}{A_S} \times \frac{V}{50}$$

Assay Perform the test as directed under the Assay of Idarubicin Hydrochloride. However, weigh accurately a volume of Idarubicin Hydrochloride for Injection, equivalent to about 5 mg (potency) according to the labeled potency, dissolve in the mobile phase containing no sodium lauryl sulfate to make exactly 25 mL, and use this solution as the test solution.

Packaging and storage Preserve in hermetic containers.

Idoxuridine
이독수리딘



$C_9H_{11}IN_2O_5$: 354.10

1-[(2*R*,4*S*,5*R*)-4-Hydroxy-5-(hydroxymethyl) oxolan-2-yl]-5-iodo-1,2,3,4-tetrahydropyrimidine-2,4-dione [*54-42-2*]

Idoxuridine, when dried, contains NLT 98.0% and NMT 101.0% of idoxuridine ($C_9H_{11}IN_2O_5$).

Description Idoxuridine occurs as colorless crystals or a white crystalline powder and is odorless.

It is freely soluble in *N*,*N*-Dimethylformamide, slightly soluble in water, very slightly soluble in ethanol(95), and practically insoluble in ether.

It is soluble in sodium hydroxide TS.

Melting point—About 176 °C (with decomposition).

Identification (1) Add 5 mL of water to 0.01 g of Idoxuridine, dissolve by warming, add 5 mL of diphenylamine-acetic acid(100) TS, and heat for 5 minutes; the solution exhibits a blue color.

(2) Heat 0.1 g of Idoxuridine; a purple gas is generated.

(3) Dissolve 2 mg of Idoxuridine and idoxuridine RS in 50 mL of 0.01 mol/L sodium hydroxide TS, and with these solutions, determine the absorption spectra as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

Optical rotation $[\alpha]_D^{20}$: Between +28° and +31° (0.20 g after drying, sodium hydroxide TS, 20 mL, 100 mm).

Purity (1) ***Clarity and color of solution***—Dissolve 0.20 g of Idoxuridine in 5 mL of sodium hydroxide solution (1 in 200); the solution is colorless and clear.

(2) ***Iodine and iodide***—Dissolve 0.10 g of Idoxuridine in 20 mL of water and 5 mL of sodium hydroxide TS, add 5 mL of dilute sulfuric acid while immediately chilling with ice, mix with an occasional shaking, allow to stand for 10 minutes, and filter. Transfer the filtrate to a Nessler tube, add 10 mL of chloroform and 3 drops of a solution of potassium iodide (1 in 100), shake to mix for 30 seconds, and allow to stand; the chloroform layer is not more intense than the following control solution.

Control solution—Weigh accurately 0.111 g of potassium iodide and dissolve in water to make 1000 mL. Pipet 1 mL of this solution, add 19 mL of water, 5 mL of sodium hydroxide TS and 5 mL of dilute sulfuric acid, shake to mix, transfer the filtrate to a Nessler tube, and proceed in the same manner as the above.

(3) ***Heavy metals***—Proceed with 2.0 g of Idoxuridine according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(4) ***Related substances***—Weigh 0.10 g of Idoxuridine, dissolve in 10 mL of a mixture of dilute ethanol and ammonia water(28) (99 : 1), and use this solution as the test solution. Perform the test with this solution as directed under the Thin Layer Chromatography. Spot 50 μL of the test solution on a thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of ethyl acetate and diluted 2-propanol (2 in 3) (4 : 1) as the developing solvent to about 10 cm, and air-dry the plate. Again, change the developing direction to the perpendicular direction, proceed in the same manner to develop a second time, and air-dry the plate. Examine the plate under ultraviolet light (principal wavelength 254 nm); any spot other than the principal spot does not appear.

Loss on drying NMT 0.5% (2 g, in vacuum, 60 °C, 3

hours).

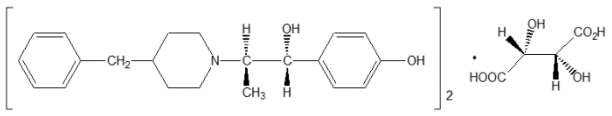
Residue on ignition NMT 0.3% (1 g).

Assay Weigh accurately about 0.7 g of Idoxuridine, previously dried, dissolve in 80 mL of *N*,*N*-dimethylformamide, and titrate the solution with 0.1 mol/L tetramethyl ammonium hydroxide VS (indicator: 5 drops of thymol blue-dimethyl formamide TS). The endpoint of the titration is when the yellow color of this solution turns to yellowish green and then finally to blue. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L tetramethylammonium hydroxide VS
= 35.410 mg of $C_9H_{11}IN_2O_5$

Packaging and storage Preserve in light-resistant, tight containers.

Ifenprodil Tartrate
이펜프로딜타르타르산염



$(C_{21}H_{27}NO_2)_2 \cdot C_4H_6O_6$: 800.98
4-[2-(4-Benzylpiperidin-1-yl)-1-hydroxypropyl]phenol; 2,3-dihydroxybutanedioic acid [*23210-58-4*]

Ifenprodil Tartrate contains NLT 98.5% and NMT 101.0% of ifenprodil tartrate [$(C_{21}H_{27}NO_2)_2 \cdot C_4H_6O_6$], calculated on the anhydrous basis.

Description Ifenprodil Tartrate occurs as a white crystalline powder and is odorless.
It is freely soluble in acetic acid(100), soluble in ethanol(95), slightly soluble in water or methanol, and practically insoluble in ether.

Optical rotation $[\alpha]_D^{20}$: Between + 11° and + 15° (1.0 g calculated on the anhydrous basis, ethanol(95), 20 mL, 100 mm).

Melting point About 148 °C (with decomposition).

Identification (1) Determine the absorption spectra of solutions of Ifenprodil Tartrate and Ifenprodil Tartrate RS in methanol (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Ifenprodil Tartrate and Ifenprodil Tartrate RS as directed in the potassium bromide disc method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers

(3) Dissolve 0.4 g of Ifenprodil Tartrate in 40 mL of water by warming. After cooling, add 0.5 mL of ammonia TS to this solution, extract twice with 40 mL each of chloroform, and collect the water layer separately. Take 30 mL of the water layer, and evaporate on a steam bath to dryness. After cooling, dissolve the residue in 6 mL of water; the resulting solution responds to the Qualitative Analysis for tartrate.

Purity (1) ***Heavy metals***—Proceed with 2.0 g of Ifenprodil Tartrate according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Related substances***—Dissolve 0.30 g of Ifenprodil Tartrate in 10 mL of diluted ethanol (3 in 4), and use this solution as the test solution. Pipet 1.0 mL of the test solution, add diluted ethanol (3 in 4) to make exactly 200 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Then, develop the plate with a mixture of ethyl acetate, hexane, 1-butanol and ammonia water(28) (140 : 40 : 20 : 1) to a distance of about 10 cm, and air-dry the plate. Spray hexachloroplatinic(IV) acid-potassium iodide TS evenly on the plate; the spots other than the principal spot obtained from the test solution are not more intense than the spots from the standard solution.

Water NMT 4.0% (0.5 g, volume titration, direct titration).

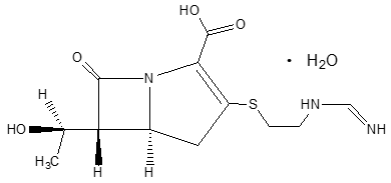
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.5 g of Ifenprodil Tartrate, dissolve in 50 mL of acetic acid(100), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 40.05 mg of $(C_{21}H_{27}NO_2)_2 \cdot C_4H_6O_6$

Packaging and storage Preserve in light-resistant, well-closed containers.

Imipenem Hydrate
이미페넴수화물



$C_{12}H_{17}N_3O_4S \cdot H_2O$: 317.36

(5*R*,6*S*)-3-({2-[(*E*)-(aminomethylidene)amino]ethyl}sulfanyl)-6-[(1*R*)-1-hydroxyethyl]-7-oxo-1-aza-bicyclo[3.2.0]hept-2-ene-2-carboxylic acid [*54-42-2*]

Imipenem Hydrate contains NLT 980 μg and NMT 1010 μg (potency) of imipenem ($C_{12}H_{17}N_3O_4$: 299.35) per mg, calculated on the anhydrous basis.

Description Imipenem Hydrate occurs as a white to sulfur yellow crystalline powder.
It is sparingly soluble in water and practically insoluble in ethanol(99.5).

Identification (1) Determine the absorption spectra of solutions of Imipenem Hydrate and imipenem RS 0.1 mol/L 3-(*N*-morpholino) propanesulfonate buffer solution (pH 7.0) (1 in 50000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Imipenem Hydrate and imipenem RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wave numbers.

Crystallinity Meets the requirements.

Optical rotation $[\alpha]_D^{20}$: Between +89° and +94° (50 mg, calculated on the anhydrous basis, 3-(*N*-morpholino)propanesulfonate buffer solution (pH 7.0), 10 mL, 100 mm).

pH Dissolve 1.0 g of Imipenem Hydrate in 200 mL of water; the pH of this solution is between 4.5 and 7.0.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Imipenem and perform the test according to Method 2. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Arsenic***—Weigh 2.0 g of Imipenem Hydrate in a crucible, add 5 mL of nitric acid and 1 mL of sulfuric acid, and heat carefully until white fumes are produced. Cool, add 2 mL of nitric acid, heat, and repeat this step one more time. Next, add 2 mL of hydrogen peroxide, heat, and repeat until the solution becomes colorless to pale yellow. After cooling, heat again until white fumes are produced. After cooling, perform the test with a solution prepared by adding water to make 5 mL (NMT 1 ppm).

(3) ***Related substances***—Weigh accurately about 50 mg of Imipenem Hydrate, dissolve in 0.1 mol/L 3-(*N*-morpholino)propanesulfonate buffer solution (pH 7.0) to make exactly 50 mL, and use this solution as the test solution. Pipet 1 mL of this solution, add 0.1 mol/L 3-(*N*-morpholino) propanesulfonate buffer solution (pH 7.0) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions and determine the peak area of each solution as directed in the automatic integration method; the peak area of thienamycin from the test solution is not greater than 1.4 times the peak area of imipenem from the standard solution, and each of the peak areas other than those of imipenem and thienamycin from the test solution is not greater than 1/3 of the peak area of imipenem from the standard solution. Also, the sum of the peak areas other than those of imipenem and thienamycin from the test solution is not greater than the peak area of imipenem from the standard solution.

Operating conditions

For the detector, column, column temperature, mobile phase and flow rate, proceed as directed under the operating conditions in the Assay.

System suitability

System performance: Proceed as directed under the system suitability under the Assay.

Test for required detectability: Pipet 5 mL of the standard solution and add 0.1 mol/L 3-(*N*-morpholino)propanesulfonate buffer solution (pH 7.0) to make exactly 50 mL. Confirm that the peak area of imipenem obtained from 10 μL of this solution is within the range between 7% and 13% of the peak area of imipenem from the standard solution.

System repeatability: Repeat the test 6 times according to the above conditions with 10 μL each of the standard solutions; the relative standard deviation of the peak area of imipenem is NMT 2.0%.

Relative retention time: The relative retention time of thienamycin with respect to imipenem is about 0.8.

Time span of measurement: About 2 times the retention time of imipenem.

Water Between 5.0% and 8.0% (20 mg, coulometric titration, moisture evaporation temperature 140 ℃).

Sterility It meets the requirements when used in the manufacturing of sterile preparations. However, it is excluded in cases where there is a terminal sterilization process in the manufacturing of sterile preparations.

Bacterial endotoxins Less than 0.17 EU per mg (potency) of imipenem when used in the manufacturing of sterile preparations.

Residue on ignition NMT 0.2% (1 g).

Assay Weigh accurately about 50 mg (potency) of

imipenem hydrate and imipenem RS, dissolve in 0.1 mol/L 3-(*N*-morpholino) propanesulfonate buffer solution (pH 7.0) to make exactly 50 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions and determine the peak areas A_T and A_S of imipenem. However, perform the test within 30 minutes after preparing the test solution and the standard solution.

$$\text{Potency (μg) of imipenem } (C_{12}H_{17}N_3O_4S) = \text{Potency (μg) of imipenem RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 280 nm).

Column: A stainless steel column about 3.9 mm in internal diameter and 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: A mixture of 0.1 mol/L 3-(*N*-morpholino)propanesulfonate buffer solution (pH 7.0) and acetonitrile (100 : 1).

Flow rate: Adjust the flow rate so that the retention time of imipenem is about 6 minutes.

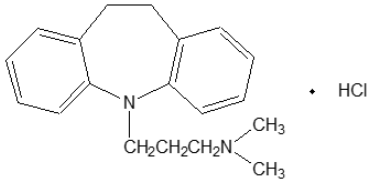
System suitability

System performance: Weigh accurately about 50 mg of Imipenem Hydrate and about 75 mg of resorcinol and dissolve in 50 mL of 0.1 mol/L 3-(*N*-morpholino) propanesulfonate buffer solution (pH 7.0). Proceed with 10 μL of this solution under the above conditions; imipenem and resorcinol are eluted in this order with the resolution being NLT 4.

System repeatability: Repeat the test 5 times according to the above conditions with 10 μL each of the standard solutions; the relative standard deviation of the peak area of imipenem is NMT 0.80%.

Packaging and storage Preserve in hermetic containers.

Imipramine Hydrochloride
이미프라민염산염



$C_{19}H_{24}N_2 \cdot HCl$: 316.87

3-(10,11-Dihydro-5H-dibenzo[b,f]azepin-5-yl)-*N*,*N*-dimethylpropan-1-amine Hydrochloride [*113-52-0*]

Imipramine Hydrochloride, when dried, contains NLT 98.5% and NMT 101.0% of imipramine hydrochloride ($C_{19}H_{24}N_2 \cdot HCl$).

Description Imipramine Hydrochloride occurs as a white to pale yellowish white crystalline powder and is odorless.

It is freely soluble in water or ethanol(95) and practically insoluble in ether.

Dissolve 1.0 g of Imipramine Hydrochloride in 10 mL of water; the pH of this solution is between 4.2 and 5.2.

It is gradually colored by light.

Identification (1) Dissolve 5 mg of Imipramine Hydrochloride in 2 mL of nitric acid; the resulting solution exhibits a deep blue color.

(2) Determine the absorption spectra of solutions prepared by dissolving 5 mg each of Imipramine Hydrochloride and imipramine hydrochloride RS in 250 mL of 0.01 mol/L hydrochloric acid TS as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Dissolve 50 mg of Imipramine Hydrochloride in 5 mL of water, add 1 mL of ammonia TS, allow to stand for 5 minutes, and filter. Acidify the filtrate with dilute nitric acid; the solution responds to the Qualitative Analysis (2) for chloride.

Melting point Between 170 and 174 ℃ (with decomposition).

Purity (1) ***Clarity and color of solution*—**Dissolve 1.0 g of Imipramine Hydrochloride in 10 mL of water; the solution is clear and the color is not more intense than the following control solution.

Control solution—Pipet accurately 1.0 mL of cobaltous(II) chloride hexahydrate colorimetric stock solution, 2.4 mL of iron(III) chloride hexahydrate colorimetric stock solution, 0.4 mL of copper(II) Sulfate pentahydrate colorimetric stock solution and 6.2 mL of diluted hydrochloric acid (1 in 40) to mix, pipet 0.5 mL of the resulting solution, and add exactly 9.5 mL of water to mix.

(2) ***Heavy metals*—**Proceed with 1.0 g of Imipramine Hydrochloride according to Method 2 and perform the test. Prepare the control solution with 1.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Iminodibenzyl*—**Weigh 50 mg of Imipramine Hydrochloride, transfer to a 25-mL brown volumetric flask, dissolve in 10 mL of a mixture of hydrochloric acid and ethanol(95) (1 : 1), add 5 mL of ethanol(95) solution of furfural (1 in 250) and 5 mL of hydrochloric acid while cooling with iced water, and allow to stand at 25 ℃ for 3 hours. Next, add a mixture of hydrochloric acid and ethanol(95) (1 : 1) to make 25 mL. Determine the absorption spectra of the solution according to the Ultraviolet-visible Spectroscopy; absorbance at wavelength of 565

nm is NMT 0.16.

(4) ***Related substances***—Dissolve 0.20 g of Imipramine Hydrochloride in 10 mL of ethanol(95) and use this solution as the test solution. Pipet 1 mL of this solution and add ethanol(95) to make exactly 50 mL. Pipet 5 mL of this solution, add ethanol(95) to make exactly 50 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on a plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of ethyl acetate, acetic acid(100), hydrochloric acid and water (11 : 7 : 1 : 1) as the developing solvent to a distance of about 12 cm, and air-dry the plate. Spray potassium dichromate-hydrochloric acid TS evenly onto the plate; spots other than the principal spot from the test solution are not more intense than the spot from the standard solution.

Loss on drying NMT 0.5% (1 g, 105 ℃, 2 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.3 g of Imipramine Hydrochloride, previously dried, dissolve in 20 mL of water, and add 5 mL of sodium hydroxide TS. Extract 3 times with 20 mL of chloroform. Each time, filter the chloroform extract with a funnel with anhydrous sodium sulfate on cotton wool. Combine all of the chloroform extracts and titrate with 0.1 mol/L perchloric acid VS (indicator: 10 drops of metanil yellow). However, the endpoint of titration is when the yellow color of the solution turns purple. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 31.687 mg of $C_{19}H_{24}N_2 \cdot HCl$

Packaging and storage Preserve in light-resistant, tight containers.

Imipramine Hydrochloride Tablets
이미프라민염산염 정

Imipramine Hydrochloride Tablets contain NLT 93.0% and NMT 107.0% of the labeled amount of imipramine hydrochloride ($C_{19}H_{24}N_2 \cdot HCl$: 316.87).

Method of preparation Prepare as directed under Tablets, with Imipramine Hydrochloride.

Identification (1) Weigh an amount of Imipramine Hydrochloride Tablets, previously powdered, equivalent to 0.25 g of imipramine hydrochloride according to the labeled amount, add 25 mL of chloroform, shake well to mix, and then filter. Evaporate the filtrate to dryness on a steam bath, and perform the test with the residue as directed under the Identification (1) of Imipramine Hydrochloride.

(2) Take an amount of the residue from (1), equivalent to 5 mg of imipramine hydrochloride, and dissolve in 250 mL of 0.01 mol/L hydrochloric acid TS. Determine the absorption spectra of this solution as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum between 249 nm and 253 nm and a shoulder between 270 nm and 280 nm.

(3) Dry the residue from (1) at 105 ℃ for 2 hours; the melting point is between 170 and 174 ℃ (with decomposition).

Dissolution Perform the test with 1 tablet of Imipramine Hydrochloride Tablets at 75 revolutions per minute according to Method 2 under the Dissolution, using 900 mL of diluted pH 6.8 phosphate buffer solution (1 in 2) as the dissolution medium. Take 20 mL or more of the dissolved solution 60 minutes after starting the test, and filter through a membrane filter with a pore size of NMT 0.8 μm. Discard the first 10 mL of the filtrate, pipet *V* mL of the subsequent filtrate, add diluted pH 6.8 phosphate buffer solution (1 in 2) to make exactly *V* mL of a solution containing about 10 μg per mL according to the labeled amount, and use this solution as the test solution. Separately, weigh accurately about 25 mg of imipramine hydrochloride RS, previously dried at 105 ℃ for 2 hours, and dissolve in pH 6.8 phosphate buffer solution (1 in 2) to make exactly 100 mL. Pipet 4 mL of this solution, add diluted pH 6.8 phosphate buffer solution (1 in 2) to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances of the test solution and the standard solution, A_T and A_S, as directed under the Ultraviolet-visible Spectroscopy at the wavelength of 250 nm.

The acceptable dissolution criterion is that dissolution rate of Imipramine Hydrochloride Tablets in 60 minutes is NLT 75%.

Dissolution rate (%) of the labeled amount of imipramine hydrochloride ($C_{19}H_{24}N_2 \cdot HCl$)

$$= W_S \times \frac{A_T}{A_S} \times \frac{V'}{V} \times \frac{1}{C} \times 36$$

W_s: Amount (mg) of the reference standard

C: Labeled amount (mg) of imipramine hydrochloride ($C_{19}H_{24}N_2 \cdot HCl$) in 1 tablet

Uniformity of dosage units Meets the requirements.

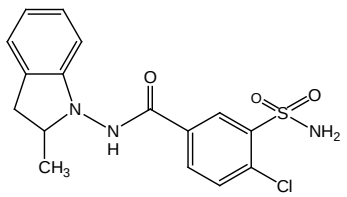
Assay Take 20 tablets of Imipramine Hydrochloride Tablets, add exactly 200 mL of 0.01 mol/L hydrochloric acid TS, and shake well to mix until the tablets completely disintegrate. After centrifuging this solution, pipet an amount of the clear supernatant equivalent to about 25 mg of imipramine hydrochloride ($C_{19}H_{24}N_2 \cdot HCl$), add 0.01 mol/L hydrochloric acid TS to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 25 mg of imipramine hydrochlo-

ride RS, previously dried at 105 ℃ for 2 hours, dissolve in 0.01 mol/L hydrochloric acid TS to make exactly 100 mL, and use this solution as the standard solution. Pipet 3 mL each of the test solution and the standard solution, transfer into two separatory funnels containing 15 mL of pH 5.6 potassium hydrogen phthalate, 8 mL of bromocresol green-sodium hydroxide TS and 30 mL of chloroform, respectively, and shake to mix. Filter the chloroform layer through a small amount of absorbent cotton placed on the funnel, and transfer into a 100-mL volumetric flask. Then repeat the same procedure 2 times with 30 mL each of chloroform, combine the chloroform layer into the volumetric flask above, and add chloroform to make 100 mL. Perform the test with these solutions as directed under the Ultraviolet-visible Spectroscopy, using a solution, prepared with 3 mL of 0.01 mol/L hydrochloric acid TS in the same manner, as a control solution, and determine the absorbances of each solution obtained from the test solution and the standard solution, A_T and A_S, at the wavelength of 416 nm, respectively.

Amount (mg) of imipramine hydrochloride ($C_{19}H_{24}N_2 \cdot HCl$)
= Amount (mg) of imipramine hydrochloride RS$\times \frac{A_T}{A_S}$

Packaging and storage Preserve in tight containers.

Indapamide
인다파미드



$C_{16}H_{16}ClN_3O_3S$: 365.84
4-Chloro-*N*-(2-methyl-2,3-dihydroindol-1-yl)-3-sulfamoylbenzamide [*26807-65-8*]

Indapamide contains NLT 98.0% and NMT 101.0% of indapamide ($C_{16}H_{16}ClN_3O_3S$), calculated on the dried basis

Description Indapamide occurs as a white crystalline powder.
It is freely soluble in ethanol(99.5) and practically insoluble in water.
A solution of Indapamide in ethanol(99.5) (1 in 10) shows no optical rotation.

Identification (1) Determine the absorption spectra of solutions of Indapamide and indapamide RS in methanol (1 in 200000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Indapamide and Indapamide RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) Perform the test with Indapamide as directed under the Flame Coloration; it exhibits a green color.

Melting point Between 167 and 171 ℃.

Purity (1) ***Chloride***—Dissolve 1.5 g of Indapamide in 50 mL of water, shake to mix for 15 minutes, allow to stand in an ice water for 30 minutes, and filter. To 30 mL of the filtrate, add 6 mL of dilute acetic acid and water to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution with 0.25 mL of 0.01 mol/L hydrochloric acid (NMT 0.01%).

(2) ***Heavy metals***—Proceed with 2.0 g of Indapamide according to Method 2 under the Heavy Metals, and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Related substances***—Perform the test while protected from light. Dissolve 0.3 g of Indapamide in methanol to make exactly 10 mL, and use this solution as the test solution. Separately, dissolve 30 mg of Indapamide RS in methanol to make exactly 100 mL, and use this solution as the standard solution (1). Add methanol to 10 mL of the standard solution (1) to make exactly 20 mL, and use this solution as the standard solution (2). And, add methanol to 10 mL of the standard solution (2) to make exactly 20 mL, and use this solution as the standard solution (3). With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution, the standard solution (1), the standard solution (2) and the standard solution (3) on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of toluene, ethyl acetate and acetic acid(100) (70 : 30 : 1) to a distance of about 15 cm, and air-dry the plate. Examine under ultraviolet light; the spots other than the principal spot obtained from the test solution are not larger or more intense than the spots from the standard solution (2) (0.5%), and the total intensity of the spots other than the principal spot obtained from the test solution is NMT 2.0%.

Loss on drying NMT 3.0% (0.5 g, NMT 0.67 kPa, phosphorus pentoxide, 110 ℃, 2 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.1 g of Indapamide, dissolve in 5.0 mL of the internal standard solution, add the mobile phase to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately 20 mg of Indapamide RS, dissolve in 1.0 mL of the internal standard solution, add the mobile phase to make exactly 20 mL, and use this solution as the standard solution. Perform the test with 5 μL each of the test solution and

the standard solution as directed under the Liquid Chromatography according to the following operating conditions, and determine the ratios Q_T and Q_S, of the peak area of indapamide to the peak area of the internal standard substance from each solution.

$$\text{Amount (mg) of Indapamide } (C_{16}H_{16}ClN_3O_3S) = \text{Amount (mg) of indapamide RS} \times \frac{Q_T}{Q_S} \times 5$$

Internal standard solution—Weigh accurately 50 mg of *p*-chloroacetanilide, and dissolve in methanol to make exactly 10 mL.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 μm to 10 μm in particle diameter).

Mobile phase: A mixture of water, acetonitrile, methanol and acetic acid(100) (650 : 175 : 175 : 1).

Flow rate: 2.0 mL/min

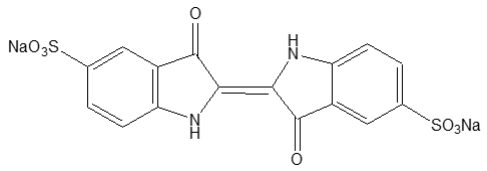
System suitability

System performance: Proceed with 5 μL of the standard solution according to the above conditions; the resolution between *the p*-chloroacetanilide peak and the indapamide peak is NLT 2.0, and the symmetry factor of Indapamide peak is NMT 2.0.

System repeatability: Repeat the test 5 times with 5 μL each of the standard solution according to the above operating conditions; the relative standard deviation of the peak areas of Indapamide is NMT 2.0%.

Packaging and storage Preserve in light-resistant, tight containers.

Indigocarmine
인디고카르민



$C_{16}H_8N_2Na_2O_8S_2$: 466.35

Disodium (2*E*)-3-oxo-2-(3-oxo-5-sulfonato-1*H*-indol-2-ylidene)-1*H*-indole-5-sulfonate [*860-22-0*]

Indigocarmine, when dried, contains NLT 95.0% and NMT 101.0% of Indigocarmine ($C_{16}H_8N_2Na_2O_8S_2$).

Description Indigocarmine occurs as a blue to dark blue powder or grain, and is odorless.

It is sparingly soluble in water and practically insoluble in ethanol(95) or ether.

It is hygroscopic.

When compressed, it exhibits a color and luster similar to those of copper.

Identification (1) An aqueous solution of Indigocarmine (1 in 100) exhibits a dark blue color. Perform the test as below using this solution as the test solution; the dark blue color of each solution disappears.

(i) Add 1 mL of nitric acid to 2 mL of the test solution.

(ii) Add 1 mL of bromine TS to 2 mL of the test solution.

(iii) Add 1 mL of chlorine TS to 2 mL of the test solution.

(iv) Add 2 mL of sodium hydroxide TS and 0.2 g of zinc powder to 2 mL of the test solution, and warm the solution.

(2) Dissolve 0.1g of Indigocarmine and Indigocarmine RS in 100 mL of ammonium acetate (1 in 650). Add ammonium acetate (1 in 650) to 1 mL each of these solutions to make 100 mL and determine the absorption spectra of these solutions as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Ignite 1 g of Indigocarmine to carbonize After cooling, add 20 mL of water to the residue, shake to mix and filter; the filtrate responds to the Qualitative Analysis (1) for sodium salt and sulfate.

pH Dissolve 0.10 g of Indigocarmine in 20 mL of water; the pH of this solution is between 5.0 and 6.0.

Purity (1) ***Water insoluble matter***—Add 200 mL of water to 1.0 g of Indigocarmine and shake to mix, filter it through a tared glass filter, wash with water until the last washings exhibit no blue color, and dry at 105 ℃ for 4 hours; the mass of the residue is NMT 5.0 mg.

(2) ***Lead***—Put 4.0 g of Indigocarmine in a Kjeldahl flask, moisten it with water, and then add 10 mL of sulfuric acid and 5 mL of nitric acid. As soon as the initial violent reaction subsides, heat until the most of the brown fumes disappears. Add 1 to 3 mL of nitric acid repeatedly while heating until Indigocarmine is almost decomposed and most of the organic matter becomes a solution. Then, carefully add 5 mL of perchloric acid little by little. When the initial violent reaction subsides, keep adding nitric acid little by little while heating until it becomes colorless. Add perchloric acid and allow to stand for 10 to 20 minutes. If the solution does not become clear, add 1 to 3 mL of perchloric acid and add nitric acid until the solution becomes colorless. Boil this solution for 10 to 15 minutes, then cool, and neutralize with 1 mol/L sodium hydroxide. Transfer this solution into a 100-mL volumetric flask, add water to make 100 mL, and use this solution as the test solution. Put 5 mL of the test solution into a separatory funnel, wash the flask with 10 mL of water and combine the washings into it. Add 3 mL of diammonium hydrogen citrate, 0.5 mL of hydroxylamine hydrochloride TS and 2 drops of phenol red TS, and then add

ammonia water(28) until the solution becomes alkaline. Cool the solution, if necessary, add 1 mL of potassium cyanide solution, then extract with 5 mL of extracting dithizone solution until the extract turns green, and combine the extract into another separatory funnel. Add 20 mL of diluted nitric acid (1 in 100) to the combined extracts, shake to mix for 30 seconds, and discard the chloroform layer. Add 5.0 mL of standard dithizone solution and 4 mL of ammonia-cyanide TS to the nitric acid layer, and shake for 30 seconds to mix. The purple color of the chloroform layer is not more intense than that of the solution prepared in the same manner as the test solution with 10 mL of diluted lead standard solution (NMT 10 ppm).

Diluted lead standard solution—Pipet 5 mL of the lead standard solution, and add diluted nitric acid (1 in 100) to make 50 mL.

(3) ***Arsenic***—Put 0.8 g of Indigocarmine into a Kjeldahl flask, add 5 mL each of sulfuric acid and nitric acid, and heat gently. Add 2 to 3 mL of nitric acid from time to time, and continue heating until the liquid becomes colorless to pale yellow. After cooling, add 15 mL of saturated ammonium oxalate, then heat to concentrate until thick white fumes appear, and make 2 to 3 mL. After cooling, add water to make 10 mL, and perform the test with 5 mL of this solution as the test solution (NMT 5 ppm).

Loss on drying NMT 10.0% (1 g, 105 ℃, 2 hours).

Residue on ignition Between 28.0% and 38.0% (1 g after drying).

Assay Weigh accurately about 0.5 g of Indigocarmine, previously dried, dissolve it in 15 g of sodium hydrogen tartrate monohydrate and 200 mL of water, boil while passing through carbon dioxide, and titrate with 0.1 mol/L titanium(III) chloride VS while hot. The endpoint of the titration is when the blue color of this solution turns yellow to orange.

Each mL of 0.1 mol/L titanium(III) chloride VS
= 23.318 mg of $C_{16}H_8N_2Na_2O_8S_2$

Packaging and storage Preserve in light-resistant, tight containers.

Indigocarmine Injection
인디고카르민 주사액

Indigocarmine Injection is an aqueous solution for injection. Indigocarmine Injection contains NLT95.0% and NMT 105.0% of the labeled amount of indigocarmine ($C_{16}H_8N_2Na_2O_8S_2$: 466.35).

Method of preparation Prepare as directed under Injections, with Indigocarmine.

Description Indigocarmine Injection occurs as a dark blue liquid.

pH—Between 3.0 and 5.0.

Identification (1) Take an amount of Indigocarmine Injection, equivalent to 20 mg of Indigocarmine, according to the labeled amount, add 1 mL of nitric acid; the dark blue color of the solution disappears and a yellowish brown color develops.

(2) Take an amount of Indigocarmine Injection, equivalent to 20 mg of Indigocarmine, according to the labeled amount, add 1 mL of bromine TS; the dark blue color disappears and a yellowish brown color develops.

(3) Take an amount of Indigocarmine Injection, equivalent to 20 mg of Indigocarmine, according to the labeled amount, add 1 mL of chlorine TS; the dark blue color disappears and a yellowish brown color develops.

(4) Take an amount of Indigocarmine Injection, equivalent to 10 mg of Indigocarmine, according to the labeled amount, add ammonium acetate solution (1 in 650) to make 1000 mL and determine the absorption spectrum of the solution as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum at 610 nm to 614 nm.

Sterility Meets the requirements.

Bacterial endotoxins Less than 7.5 EU per mg of indigocarmine.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

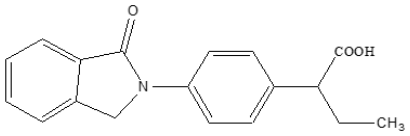
Extractable volume of injections Meets the requirements.

Assay Pipet an amount of Indigocarmine Injection equivalent to about 0.2 g of indigocarmine ($C_{16}H_8N_2Na_2O_8S_2$), dissolve in 6 g of sodium hydrogen tartrate monohydrate and water to make 200 mL, boil under a carbon dioxide stream, and perform the test as directed in the Assay of Indigocarmine.

Each mL of 0.1 mol/L titanium(III) chloride VS
= 23.318 mg of $C_{16}H_8N_2Na_2O_8S_2$

Packaging and storage Preserve in light-resistant, hermetic containers.

Indobufen
인도부펜



$C_{18}H_{17}NO_3$: 295.33

(±)-4-(1,3-Dihydro-1-oxo-2*H*-isoindol-2-yl)-α-ethylbenzeneacetic acid, [*63610-08-2*]

Indobufen contains NLT 97.0% and NMT 101.0% of indobufen ($C_{18}H_{17}$ NO $_3$), calculated on the anhydrous basis.

Description Indobufen occurs as a white creamy powder.
It is freely soluble in dimethylformamide and slightly soluble in methanol and practically insoluble in water.

Identification Determine the infrared spectra of Indobufen and indobufen RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wave numbers.

Absorbance $E_{1cm}^{1\%}$ (282 nm): Between 460 and 510 (calculated on the anhydrous basis, 1 mg, methanol, 100 mL).

Melting point Between 180 ℃ and185 ˚C.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Indobufen in 40 mL of 0.1 mol/L sodium hydroxide; the solution is clear and colorless.

(2) ***Heavy metals***—Proceed with 1.0 g of Indobufen according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Zinc***—Dissolve 1.0 g of Indobufen in 50 mL of water and 5 mL of 30% ammonia water, add water to make 100 mL, and use this solution as the test solution. Separately, take 2.0 mL of standard zinc solution, add 5 mL of 30% ammonia water, add water to make 100 mL, and use this solution as the standard solution. Perform the test with the test solution and the standard solution as directed under the Atomic Absorption Spectroscopy according to the following conditions; the absorbance of the test solution is not greater than that of the standard solution (NMT 50 ppm).

Gas: Air–acetylene
Lamp: Zinc hollow cathode lamp
Wavelength: 213.9 nm

(4) ***Related substances***—Weigh accurately 0.1 g of Indobufen, add methanol to make 50 mL, and use this solution as the test solution. Perform the test with the test solution as directed under the Liquid Chromatography according to the conditions under the Assay. Determine the peak area of each solution as directed in the automatic integration method, and calculate the amount of each related substance; the area of the peaks other than indobufen is NMT 2.0% of the total peak areas.

Water NMT 1.0% (1 g, volumetric titration, direct titration).

Residue on ignition NMT 0.2% (1 g).

Assay Weigh accurately about 0.1 g each of Indobufen and indobufen RS and dissolve in methanol to make 50 mL. Pipet 2.0 mL of the resulting solution, add methanol to make 100 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak area of indobufen, A_T and A_S, in each solution.

$$\text{Amount (g) of Indobufen } (C_{18}H_{17}NO_3) = \text{Amount (g) of indobufen RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 256 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 10 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 to 10 μm in particle diameter).

Mobile phase: A mixture of acetic acid buffer solution (pH 4.5) and methanol (55 : 45).

Flow rate: 2.0 mL/min

Packaging and storage Preserve in tight containers.

Indobufen Tablets
인도부펜 정

Indobufen Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of indobufen ($C_{18}H_{17}NO_3$: 295.33).

Method of preparation Prepare as directed under Tablets, with Indobufen.

Identification The retention times of major peaks of the test solution and the standard solution for Assay is the same.

Dissolution Perform the test with 1 tablet of Indobufen Tablets at 150 revolutions per minute according to Method 1, using 900 mL of phosphate buffer solution, pH 6.8, as the dissolution medium. Filter the medium 20 minutes after starting the dissolution test, take 10.0 mL of the filtrate, add phosphate buffer solution, pH 6.8, to make 250 mL, and use this solution as the test solution. Sepa-

rately, weigh accurately about 50 mg of indobufen RS, add phosphate buffer solution, pH 6.8, dissolve on a steam bath by warming gently to make a solution having 8 μg/mL of indobufen concentration, and use this solution as the standard solution. Perform the test with the test solution and the standard solution as directed under the Ultraviolet-visible Spectroscopy, and determine the absorbance at the wavelength of 279 nm. The dissolution rate in 20 minutes is NLT 70%.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 tablets of Indobufen Tablets, and powder. Weigh accurately an amount, equivalent to about 0.1 g of indobufen ($C_{18}H_{17}NO_3$), add 40 mL of methanol, shake for about 1 hour to mix, and add methanol to make 50 mL. After filtering this solution, take 2.0 mL of the filtrate, add methanol to make 100 mL, and use this solution as the test solution. Separately, weigh accurately about 0.1 g of indobufen RS, and add methanol to make 50 mL. Take 2.0 mL of this solution, add methanol to make 100 mL, and use it as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of indobufen in each solution.

$$\text{Amount (mg) of indobufen } (C_{18}H_{17}NO_3) = \text{Amount (mg) of indobufen RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 256 nm).

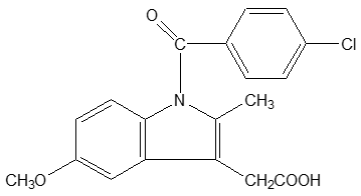
Column: A stainless steel column about 4.6 mm in internal diameter and 10 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 μm to 10 μm in particle diameter).

Mobile phase: A mixture of pH 4.5 acetic acid buffer solution and methanol (55 : 45).

Flow rate: 2.0 mL/min

Packaging and storage Preserve in well-closed containers.

Indometacin
인도메타신



$C_{19}H_{16}ClNO_4$: 357.79

2-{1-[(4-chlorophenyl)carbonyl]-5-methoxy-2-methyl-1*H*-indol-3-yl}acetic acid [*53-86-1*]

Indometacin, when dried, contains NLT 98.0% and NMT 101.0% of indometacin ($C_{19}H_{16}ClNO_4$).

Description Indometacin occurs as a fine white to pale yellow crystalline powder.
It is sparingly soluble in methanol, ethanol(95) or ether and is practically insoluble in water.
It dissolves in sodium hydroxide TS.
It is colored by light.

Melting point—Between 155 and 162 °C.

Identification (1) Prepare 100 mL of a solution made by dissolving 2 mg of Indometacin in 100 mL of methanol, and determine the absorption spectrum of the solution as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum between 317 nm and 321 nm.

(2) Determine the infrared spectra of Indometacin and Indometacin RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wave numbers. If any difference appears between the spectra, recrystallize each from ether, take the crystals, previously dried, and perform the test.

(3) Perform the test with Indometacin as directed under the Flame Coloration (2); a green color is observed.

Purity (1) ***Acid***—Add 50 mL of water to 1.0 g of Indometacin, shake well to mix for 5 minutes, and filter it. To the filtrate, add 0.20 mL of 0.1 mol/L sodium hydroxide TS and 1 drop of phenolphthalein TS; the solution exhibits a red color.

(2) ***Heavy metals***—Proceed with 1.0 g of Indometacin according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Arsenic***—Proceed with 1.0 g of Indometacin according to Method 3 and perform the test (NMT 2 ppm).

(4) ***Related substances***—Dissolve 0.10 g of Indometacin in 10 mL of methanol and use this solution as the test solution. Pipet 1 mL of this solution and add methanol to make exactly 50 mL. Pipet 5 mL of this solution, add methanol to make exactly 20 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 25 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Then, develop the plate with a mixture of anhydrous ether and acetic acid(100) (100: 3) to a distance of about 10 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 0.5% (1 g, 105 °C, 4 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.7 g of Indometacin, previously dried, dissolve in 60 mL of methanol, add 30 mL of water, and titrate with 0.1 mol/L sodium hydroxide VS (indicator: 3 drops of phenolphthalein TS). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS
= 35.779 mg of $C_{19}H_{16}ClNO_4$

Packaging and storage Preserve in light-resistant, tight containers.

Indometacin Capsules
인도메타신 캡슐

Indometacin Capsules contain NLT 90.0% and NMT 110.0% of indometacin ($C_{19}H_{16}ClNO_4$: 357.79).

Method of preparation Prepare as directed under Capsules, with Indometacin.

Identification Take out the content of Indometacin Capsules, powder, and use it as a sample. Weigh an amount of powder, equivalent to 0.1 g of indometacin according to the labeled amount, add 20 mL of chloroform, and shake well to mix. Then centrifuge, and filter the clear supernatant. Evaporate the filtrate to dryness, cool, and dissolve in 20 mL of methanol. Add methanol to 10 mL of this solution to make 50 mL. Add methanol to 2 mL of this solution to make 100 mL, and use this solution as the test solution. Determine the absorption spectrum of this solution as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum at 317 nm to 321 nm.

Purity ***Related substances***—Take out the content of Indometacin Capsules and power. Take a portion of the powder, equivalent to 0.10 g of Indometacin according to the labeled amount, add exactly 10 mL of methanol, shake well, filter and use the filtrate as the test solution. Separately, weigh 25 mg of indometacin RS and dissolve in methanol to make exactly 50 mL. Pipet 1 mL of this solution, add methanol to make exactly 10 mL, and use this solution as the standard solution. Perform the test as directed under the Purity (4) of Indometacin.

Dissolution Perform the test with 1 capsule of Indometacin Capsules at 100 revolutions per minute as directed under the Method 1 under the Dissolution, using 900 mL of a mixture of water and phosphate buffer solution, pH 7.2, (4 : 1) as the dissolution medium. Take NLT 20 mL of the dissolved solution after 20 minutes from starting the dissolution test, and filter through a membrane filter with a pore size of NMT 0.8 μm. Discard the first 10 mL of the filtrate and use the subsequent filtrate as the test solution. Separately, weigh accurately about 30 mg of indometacin RS, previously dried at 105 ℃ for 4 hours, dissolve in a mixture of water and phosphate buffer solution, pH 7.2, (4 : 1) to make exactly 1000 mL, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at the wavelength of 320 nm as directed under the Ultraviolet-visible Spectroscopy.

It meets the requirements if the dissolution rate of Indometacin Capsules in 20 minutes is NLT 75%.

Dissolution rate (%) of the labeled amount of indometacin ($C_{19}H_{16}ClNO_4$) $= W_S \times \frac{A_T}{A_S} \times \frac{90}{C}$

W_s: Amount (mg) of the reference standard
C: Labeled amount (mg) of indometacin ($C_{19}H_{16}ClNO_4$) per capsule

Uniformity of dosage units Meets the requirements.

Assay With NLT 20 capsules of Indometacin Capsules, open the capsule, carefully take out the content, weigh accurately the mass, and powder. Weigh accurately an amount the powder, equivalent to about 50 mg of indometacin ($C_{19}H_{16}ClNO_4$), dissolve with 40 mL of methanol, and add methanol again to make exactly 50 mL. Filter this solution, discarding the first 10 mL of the filtrate. Pipet the subsequent 5.0 mL of the filtrate, add exactly 3 mL of the internal standard solution, add the mobile phase to make 100 mL and use this solution as the test solution. Separately, weigh accurately about 50 mg of indometacin RS, previously dried at 105 °C for 4 hours, and dissolve in methanol to make exactly 50 mL. Pipet 5 mL of this solution, add exactly 3 mL of the internal standard solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under Liquid Chromatography according to the following conditions and calculate the ratios, QT and QS, of the peak area of Indometacin to that of the internal standard, for the test solution and the standard solution, respectively.

Amount (mg) of indometacin ($C_{19}H_{16}ClNO_4$)
= Amount (mg) of indometacin RS $\times \frac{Q_T}{Q_S}$

Internal standard solution—A solution of butyl p-hydroxybenzoate in methanol (1 in 1000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (7 μm in particle diameter).

Column temperature: A constant temperature of

about 25 °C.

Mobile phase: A mixture of methanol and diluted phosphoric acid (1 in 1000) (7 : 3).

Flow rate: Adjust the flow rate so that the retention time of indometacin is about 8 minutes.

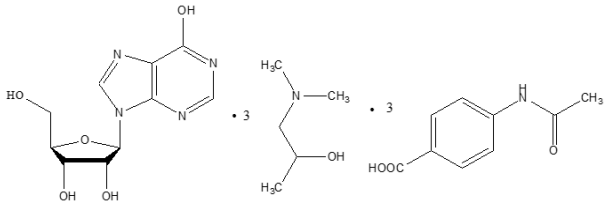
System suitability

System performance: Dissolve 50 mg of 4-chlorobenzoate, 30 mg of butyl p-hydroxybenzoate, and 50 mg of indometacin in 50 mL of methanol. To 5 mL of this solution, add the mobile phase to make 100 mL. Proceed with 20 μL of this solution under the above operating conditions; 4-chlorobenzoate, butyl p-hydroxybenzoate and indometacin are eluted in this order. The resolution between 4-chlorobenzoate and butyl p-hydroxybenzoate is NLT 2.0, and the resolution between butyl p-hydroxybenzoate and indometacin is NLT 5.0

System repeatability: Repeat the test 6 times with 20 μL each of the standard solution under the above operating conditions; the relative standard deviation of the ratios of the peak areas of indometacin to that of the internal standard is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Inosiplex
이노시플렉스



$C_{52}H_{78}N_{10}O_{17}$: 1115.23

Inosine 1-(dimethylamino)-2-propanol 4-(acetylamino)benzoate (1:3:3), *[36703-88-5]*

Inosiplex contains *N*,*N*-dimethylaminoisopropanol, para-acetaminobenzoic acid and inosine at a molecular ratio of 3 : 3 : 1. Inosiplex, when dried, contains NLT 26.4% and NMT 29.1% of *N*,*N*-dimethylaminoisopropanol ($C_5H_{13}NO$: 103.16), NLT 45.8% and NMT 50.6% of para-acetaminobenzoic acid ($C_9H_9NO_3$: 179.17), and NLT 22.9% and NMT 25.3% of inosine ($C_{10}H_{12}N_4O_5$: 268.23).

Description Inosiplex occurs as a white to milky white crystalline powder.
It is freely soluble in water, and practically insoluble in acetone, chloroform or toluene.
It has a slightly bitter taste.

Identification (1) Determine the absorption spectra of an aqueous solution (1 in 100000) of Inosiplex as directed under Ultraviolet-visible Spectroscopy; it exhibits a maximum at the wavelength of 260 nm.

(2) Perform the test with Inosiplex according to the Assay (2); the retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

Purity (1) ***Clarity and color of solution*—**An aqueous solution of Inosiplex (1 in 10) is colorless and clear.

(2) ***Chloride*—**Dissolve 0.70 g of Inosiplex in 30 mL of water and add 6 mL of dilute nitric acid to mix. Filter the precipitate that forms using a glass filter (G_4) under vacuum, wash with 15 mL of water, collect the washed filtrate and washings, and add water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.2 mL of 0.01 mol/L hydrochloric acid (NMT 0.01%).

(3) ***Sulfate*—**Weigh 1.0 g of Inosiplex, dissolve in 30 mL of water, add 1 mL of dilute hydrochloric acid, and shake to mix. Filter the precipitate that forms using a glass filter (G_4) under vacuum, wash with a small amount of water, collect the washed filtrate and washings and add water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.4 mL of 0.005 mol/L sulfuric acid (NMT 0.002%).

(4) ***Heavy metals***—Proceed with 2.0 g of Inosiplex according to Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

Loss on drying NMT 1.0% (1 g, 60℃, 30 minutes, in vacuum).

Assay (1) ***N,N-dimethylaminoisopropanol***—Weigh accurately about 0.1 g of Inosiplex, previously dried, and dissolve in 10 mL of 1 mol/L sodium hydroxide VS and 10 mL of water in a distillation flask. Add 20 mL of 0.1 mol/L hydrochloric acid VS to the receptacle and distill under weak vacuum. Stop distillation when the solution in the distillation flask becomes about 5 mL, cool, add 10 mL of water, and continue distilling until the solution in the distillation flask becomes about 5 mL. Titrate the distillate collected in the receptacle with 0.1 mol/L sodium hydroxide VS (indicator: 3 drops of bromocresol green-methyl red TS). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L hydrochloric acid VS
= 10.316 mg of $C_5H_{13}NO$

(2) ***Para-acetaminobenzoic acid and inosine***—Weigh accurately about 0.1 g of Inosiplex, previously dried, and add the mobile phase to make 100 mL. Pipet 5.0 mL of this solution, add 5.0 mL of the internal standard solution, add the mobile phase to make 50 mL, and use this solution as the test solution. Separately, weigh accurately about 50 mg of para-acetaminobenzoic acid RS and about 25 mg of inosine RS, and add the mobile phase to make 100 mL. Pipet 5.0 mL of this solution, add 5.0 mL of the internal standard solution, add the mobile

phase to make 50 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions and determine the peak area ratios of para-acetaminobenzoic acid and inosine, Q_{T1}, Q_{T2}, Q_{S1} and Q_{S2}, with respect to the peak area of the internal standard.

Amount (mg) of para-acetaminobenzoic acid ($C_9H_9NO_3$)
= Amount (mg) of para-acetaminobenzoic acid RS× $\frac{Q_{T1}}{Q_{S1}}$

Amount (mg) of inosine ($C_{10}H_{12}N_4O_5$)
= Amount (mg) of inosine RS× $\frac{Q_{T2}}{Q_{S2}}$

Internal standard solution—Weigh about 50 mg of methyl chlorothiazide RS and add the mobile phase to make 50 mL.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.0 mm in internal diameter and about 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 - 10 μm in particle diameter).

Mobile phase: A mixture of water and acetonitrile (65 : 35), adjusted the pH to 2.2 with 0.2% trifluoroacetic acid.

Flow rate: 1.5 mL/min

Packaging and storage Preserve in tight containers.

Inosiplex Syrup
이노시플렉스 시럽

Inosiplex Syrup contains NLT 26.4% and NMT 29.1% of *N*,*N*-dimethylaminoisopropanol ($C_5H_{13}NO$: 103.16), NLT 45.8% and NMT 50.6% of *p*-acetaminobenzoic acid ($C_9H_9NO_3$: 179.17) and NLT 22.9% and NMT 25.3% of inosine ($C_{10}H_{12}N_4O_5$: 268.23), according to the labeled amount of inosiplex.

Method of preparation Prepare as directed under Syrups, with Inosiplex

Identification Perform the test as directed under the Assay (2); the retention times of the major peaks obtained from the test solution and the standard solution are the same.

pH Between 5.2 and 7.2.

Uniformity of dosage units (distribution) Meets the requirements.

Assay (1) ***N,N-Dimethylaminoisopropanol***—Weigh accurately an amount of Inosiplex Syrup, equivalent to 0.25 g of inosiplex, transfer to a distillation flask filled with 10 mL of water, add 10 mL of 1 mol/L sodium hydroxide solution, and distill in vacuum until the volume of the solution is reduced to about 5 mL. Add 20 mL of 0.1 mol/L hydrochloric acid to the receiver. Titrate the solution collected into the receiver with 0.1 mol/L sodium hydroxide VS (indicator: 3 drops of bromocresol green-methyl red TS). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L hydrochloric acid VS
= 10.316 mg of $C_5H_{13}NO$

(2) ***p-Acetaminobenzoic acid and inosine***—Weigh accurately an amount of Inosiplex Syrup, equivalent to 0.1 g of inosiplex, add the mobile phase to make 100 mL, and filter with a Millipore filter paper. Take 5.0 mL of the filtrate, add 5.0 mL of the internal standard solution, add the mobile phase to make 50 mL, and use the solution as the test solution. Separately, weigh accurately about 50 mg of para-acetaminobenzoic acid RS and about 25 mg of inosine RS, and add the mobile phase to make 100 mL. Pipet 5.0 mL of this solution, add 5.0 mL of the internal standard solution, add the mobile phase to make 50 mL, and use the solution as the standard solution. Perform the test with each 10 μL of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions and determine the peak area ratios, Q_{T1} and Q_{T2}, Q_{S1} and Q_{S2}, of *p*-acetaminobenzoic acid and inosine to the internal standard, respectively, from each solution.

Amount (mg) of p-acetaminobenzoic acid ($C_9H_9NO_3$)
= Amount (mg) of *p*-acetaminobenzoic acid RS× $\frac{Q_{T1}}{Q_{S1}}$

Amount (mg) of inosine ($C_{10}H_{12}N_4O_5$)
= Amount (mg) of inosine RS× $\frac{Q_{T2}}{Q_{S2}}$

Internal standard solution—Weigh about 50 mg of methylclothiazide RS and add the mobile phase to make 50 mL.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.0 mm in internal diameter and about 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 μm to 10 μm in particle diameter).

Mobile phase: A mixture of water and acetonitrile (65 : 35), adjusted to pH 2.2 with 0.2% trifluoroacetic acid.

Flow rate: 1.5 mL/min

Packaging and storage Preserve in tight containers.

Inosiplex Tablets
이노시플렉스 정

Inosiplex Tablets contain NMT 26.4% and NLT 29.1% of *N,N*-dimethylaminoisopropanol ($C_5H_{13}NO$: 103.16), NMT 45.8% and NLT 50.6% of para-acetaminobenzoic acid ($C_9H_9NO_3$: 179.17), and NLT 22.9% and NMT 25.3% of inosine ($C_{10}H_{12}N_4O_5$: 268.23).

Method of preparation Prepare as directed under Tablets, with Inosiplex.

Identification (1) Filter an aqueous solution of Inosiplex Tablets (1 in 100000), and determine the absorption spectra of this filtrate as directed under Ultraviolet-visible Spectroscopy; it exhibits a maximum at the wavelength of 260 nm.

(2) Perform the test according to the Assay (2); the retention times of the major peaks obtained from the test solution and the standard solution are the same.

Dissolution Perform the test with 1 tablet of Inosiplex Tablet at 100 revolutions per minute according to Method 2, using 900 mL of 0.05 mol/L of sodium acetate buffer solution, pH 4.0, as the dissolution medium. Take the dissolved solution 45 minutes after starting the test, and filter. Discard the first 10 mL of the filtrate, pipet *V* mL of the subsequent filtrate, add the dissolution medium to make *V'* mL of a solution containing about 10 μg of inosine per mL according to the labeled amount, and use this solution as the test solution. Separately, weigh accurately about 24 mg of inosine RS, add the dissolution medium to make 200 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions and determine the peak areas, A_T and A_S, of inosine in each solution. The acceptable dissolution criterion of Inosiplex Tablets is NLT 75% of inosine dissolved in 45 minutes.

Dissolution rate (%) of inosine ($C_{10}H_{12}N_4O_5$) in labeled amount of inosiplex

$$= W_S \times \frac{V'}{V} \times \frac{A_T}{A_S} \times \frac{1}{C} \times \frac{1115.23}{268.23}$$

Ws: Amount of inosine RS (mg)

C: Labeled amount (mg) of Inosiplex ($C_{52}H_{78}N_{10}O_{17}$) in 1 tablet

1115.23: Molecular weight of inosiplex ($C_{52}H_{78}N_{10}O_{17}$)

268.23: Molecular weight of inosine ($C_{10}H_{12}N_4O_5$)

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 3.9 mm in internal diameter and 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: To a mixture of water and acetonitrile (65 : 35), add 0.2% trifluoroacetic acid to adjust the pH to 2.2.

Flow rate: 1.5 mL/min

Uniformity of dosage units Meets the requirements.

Assay (1) ***N,N-dimethylaminoisopropanol***—Weigh accurately the mass of NLT 20 Inosiplex Tablets, and powder. Weigh accurately an amount equivalent to about 0.25 g of inosiplex ($C_{52}H_{78}N_{10}O_{17}$), and transfer into a distillation flask containing 10 mL of 1 mol/L sodium hydroxide TS and 10 mL of water to dissolve. To the collector, add 20 mL of 0.1 mol/L hydrochloric acid, then distill under a weak vacuum. Stop distillation when the solution in the distillation flask becomes about 5 mL, then cool, add 10 mL of water, and continue distilling until the solution in the distillation flask becomes about 5 mL. Titrate the distillate received in the collector with 0.1 mol/L sodium hydroxide VS (indicator: 3 drops of bromocresol green-methyl red TS). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L hydrochloric acid VS
= 10.316 mg of $C_5H_{13}NO$

(2) ***Para-acetaminobenzoic acid***—Weigh accurately the mass of NLT 20 Inosiplex Tablets, and powder. Weigh accurately an amount equivalent to 0.1 g of inosiplex, add 100 mL of the mobile phase, shake to mix, and then filter. Take 5.0 mL of this filtrate, add 5.0 mL of the internal standard solution, add the mobile phase to make 50 mL, and use this solution as the test solution. Separately, weigh accurately about 50 mg of para-acetaminobenzoic acid RS and about 25 mg of inosine RS, and add the mobile phase to make 100 mL. Pipet 5.0 mL of this solution, add 5.0 mL of the internal standard solution, add the mobile phase to make 50 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions and determine the peak area ratios, Q_{T1}, Q_{T2}, Q_{S1} and Q_{S2}, of para-acetaminobenzoic acid and inosine to the peak area of the internal standard, respectively.

Amount (mg) of para-acetaminobenzoic acid ($C_9H_9NO_3$)
= Amount (mg) of para-acetaminobenzoic acid RS $\times \frac{Q_{T1}}{Q_{S1}}$

Amount (mg) of inosine ($C_{10}H_{12}N_4O_5$)
= Amount (mg) of inosine RS $\times \frac{Q_{T2}}{Q_{S2}}$

Internal standard solution—Weigh 50 mg of methyl chlorothiazide RS, and add the mobile phase to make 50 mL.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

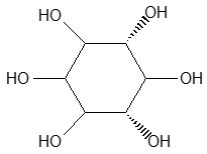
Column: A stainless steel column about 4.0 mm in internal diameter and about 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 μm to 10 μm in particle diameter).

Mobile phase: A mixture of water and acetonitrile (65 : 35), adjusted the pH to 2.2 with 0.2% trifluoroacetic acid.

Flow rate: 1.5 mL/min

Packaging and storage Preserve in tight containers.

Inositol
이노시톨



Inosit $C_6H_{12}O_6$: 180.16

Cyclohexane-1,2,3,4,5,6-hexol [*87-89-8*]

Inositol, when dried, contains NLT 97.0% and NMT 101.0% of inositol ($C_6H_{12}O_6$).

Description Inositol occurs as white crystals or a crystalline powder, is odorless and has a sweet taste.
It is freely soluble in water and practically insoluble in ethanol(95), chloroform or ether.
It has no optical rotation.
An aqueous solution of Inositol is neutral.

Identification (1) Add 6 mL nitric acid to 1 mL of an aqueous solution of Inositol (1 in 50) and evaporate to dryness on a steam bath; add 0.5 mL of strontium nitrate solution (1 in 10) to the residue and evaporate to dryness on a steam bath again; the residue exhibits a purple color.

(2) Add 1 mL of lead subacetate TS to 4 mL of an aqueous solution of Inositol (1 in 100) and shake to mix and heat on a steam bath for 5 minutes; the solution turns into a translucent gel.

(3) Weigh accurately about 0.2 g of Inositol, previously dried, transfer to a 250-mL beaker, add 5 mL of a mixture of 1 mL of dilute hydrochloric acid and 50 mL of acetic anhydride, cover the beaker with a watch glass, heat on a steam bath for 20 minutes, and cool with ice. Next, add 100 mL of water, boil for 20 minutes and cool, put the contents of the beaker into a 250 mL separatory funnel, wash with a small amount of water again, and transfer the washings. Extract with 30 mL, 25 mL, 20 mL, 15 mL, 10 mL and 10 mL of chloroform, combine all of the chloroform extracts, and wash with 10 mL of water. Filter the chloroform layer with cotton wool, wash the water layer and cotton wool with 10 mL of chloroform, combine the filtrate and washings, evaporate to dryness on a steam bath, and dry for 2 hours at 105 ℃. Cool to obtain hexacetylinositol with a melting point of between 212 and 216 ℃.

Melting point Between 223 and 227 ℃.

Purity (1) ***Clarity and color of solution*—**Dissolve 1.0 g of Inositol in water; the solution is colorless and clear.

(2) ***Chloride*—**Perform the test with 2.0 g of Inositol. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid (NMT 0.005%).

(3) ***Sulfate***—Perform the test with 4.0 g of Inositol. Prepare the control solution with 0.50 mL of 0.005 mol/L sulfuric acid (NMT 0.006%).

(4) ***Lead***—Weigh 20.0 g of Inositol and dissolve in dilute acetic acid to make 100 mL. Add 2 mL of saturated ammonium pyrrolidinedithiocarbamate solution and 10 mL of 4-methyl-2-pentanone to this solution, shake for 30 seconds, and allow to stand until the layers separate while protected from light. Then, take the 4-methyl-2-pentanone layer, and use this solution as the test solution. Separately, weigh 20.0 g each of Inositol, add 0.5 mL, 1.0 mL and 1.5 mL of lead standard solution, respectively, and proceed in the same manner as the test solution. and use these solutions as the standard solutions. Add 2 mL of saturated ammonium pyrrolidinedithiocarbamate solution and 10 mL of 4-methyl-2-pentanone, shake for 30 seconds, and allow to stand until the layers separate while protected from light. Then, take the 4-methyl-2-pentanone layer, and use this solution as the blank test solution. Perform the test with the test solution, the standard solution and the blank test solution as directed under the calibration curve under the Atomic Absorption Spectroscopy according to the following conditions, and determine the concentration of lead in the test solution; it is NMT 0.5 ppm.

Gas: Air–acetylene
Lamp: Lead hollow-cathode lamp
Wavelength: 283.3 nm

(5) ***Barium***—Weigh 10.0 g of Inositol, dissolve in water to make 100 mL, pipet 10 mL of this solution, add 1 mL of dilute sulfuric acid, and allow to stand for 1 hour; the turbidity of the solution is not more intense than that of the control solution.

Control solution—Weigh 10.0 g of Inositol, dissolve in water to make 100 mL, pipet 10 mL of this solution, and add 1 mL of distilled water.

(6) ***Iron***—Dissolve 2.0 g of Inositol in 40 mL of water, and add 2 mL of hydrochloric acid, 40 mg of ammonium peroxysulfate and 2 mL of ammonium thiocyanate TS; the color of the solution is not more intense than that of the following control solution.

Control solution—Take 1.0 mL of iron standard solution instead of Inositol and proceed as above.

(7) ***Calcium***—Dissolve 1.0 g of Inositol in water, add 1 mL of ammonium oxalate TS, and allow to stand for 1 minute; the solution is clear.

(8) ***Fehling's TS reducing substances***—Dissolve 0.5 g of inositol in 10 mL water, add 5 mL of Fehling's TS, boil for 3 minutes, and allow to stand for 30 minutes; no orange to red precipitate is produced.

(9) ***Related substances***—Weigh accurately 0.5 g of Inositol, dissolve in water to make 10 mL, and use this solution as the test solution. Separately, weigh accurately 0.5 g of inositol RS, dissolve in water to make 10 mL, and use this solution as the standard stock solution. Pipet 2.0 mL of this solution, dissolve in water to make 100 mL of a solution containing 1 mg of Inositol per mL, and use this solution as the standard solution. Perform the test according to the Liquid Chromatography with 20 μL each of the test solution and the standard solution under the following conditions and determine the amount of related substances; the amount of each related substance is NMT 0.3% and the total amount of related substances is NMT 1.0%. However, exclude any related substances with the amount less than 0.05%.

$$\text{Content (\%) of related substances} = 100 \times \frac{C_S}{C_T} \times \frac{A_i}{A_S}$$

C_S: Concentration (mg/mL) of Inositol in the standard solution

C_T: Concentration (mg/mL) of Inositol in the test solution

A_i: Peak area of each related substance obtained from the test solution

A_S: Peak area of Inositol obtained from the standard solution

Operating conditions

For the detector, column, column temperature, mobile phase and flow rate, proceed as directed under the operating conditions in the Assay.

System suitability

System performance: Weigh accurately appropriate amounts of inositol RS and D-mannitol, dissolve in water to make a solution containing 0.05 mg of each per mL, and use this solution as the system suitability solution. Proceed with 20 μL of this solution under the above operating conditions; the relative retention time of D-mannitol with respect to the retention time of Inositol is about 1.3, and the resolution between the two peaks is NLT 4.0.

System repeatability: Repeat the test 5 times according to the above conditions with 20 μL of the standard stock solution each time; the relative standard deviation of the peak areas is NMT 2.0%.

Loss on drying NMT 0.5% (1 g, 105 ℃, 4 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.5 g each of Inositol and inositol RS, dissolve each in water to make exactly 10 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions and determine the peak areas A_T and A_S of inositol.

$$\text{Amount (mg) of inositol } (C_6H_{12}O_6) = \text{Amount (mg) of inositol RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: A differential refractometer (constant temperature of about 30 to 35 ℃).

Column: A stainless steel column about 7.8 mm in internal diameter and about 30 cm in length or equivalent, packed with strong acidic ion exchange resin for liquid chromatography (styrene-divinylbenzene copolymer sulfonic acid resin calcium type) (9 μm in particle diameter).

Column temperature: A constant temperature of about 85 °C.

Mobile phase: Water

Flow rate: 0.5 mL/min

System suitability

System performance: Weigh accurately appropriate amounts of inositol RS and D-mannitol, dissolve in water to make a solution containing 0.05 mg of each per mL, and use this solution as the system suitability solution. Proceed with 10 μL of this solution under the above operating conditions; the relative retention time of D-mannitol with respect to the retention time of inositol is about 1.3, and the resolution between the two peaks is NLT 4.0.

System repeatability: Repeat the test 5 times according to the above conditions with 10 μL of the standard solution each time; the relative standard deviation of the peak area is NMT 2.0%.

Packaging and storage Preserve in well-closed containers.

Insulin
인슐린

Insulin is obtained from the pancreas of healthy bovine or porcine, and lowers blood sugar. It contains NLT 26 insulin units per mg, calculated on the dried basis.

Insulin is labeled to indicate the animal species from which it is derived.

Description Insulin occurs as a white, crystalline pow-

der and is odorless.
It is practically insoluble in water, ethanol(95) or ether.
It is soluble in diluted hydrochloric acid (1 in 360) or dilute sodium hydroxide TS.
It is hygroscopic.

Identification Dissolve 10 mg of Insulin in 10 mL of 0.1 mol/L hydrochloric acid TS, and use this solution as the test solution. Perform the test with the test solution as directed under the Identification for Insulin Injection

Purity (1) ***Clarity and color of solution*—**Dissolve 0.10 g of Insulin in 10 mL of diluted hydrochloric acid; the resulting solution is colorless to pale yellow.

(2) ***Related substances*—**Put 7.5 mg of Insulin in a vial with a suitable cap, and add 2.0 mL of 0.01 mol/L hydrochloric acid. Cap the vial and shake gently. Do not store this solution for more than 2 hours at room temperature or 12 hours in the refrigerator. Separately, weigh accurately 37.5 mg of Insulin RS, dissolve in 0.01 mol/L hydrochloric acid to make 10 mL, and use this solution as the standard solution (1). Pipet 1 mL of the standard solution (1), add 0.01 mol/L hydrochloric acid to make 10 mL, and use this solution as the standard solution (2). Pipet 1 mL of the standard solution (2), add 0.01 mol/L hydrochloric acid to make 10 mL, and use this solution as the standard solution (3). The standard solution can be stored at room temperature for 12 hours or refrigerated for up to 48 hours. Take 20 μL of the test solution and perform the test as directed under the Liquid Chromatography according to the following conditions. Determine the peak area A_I of insulin, the peak area A_D of A-21 desamido insulin, and the sum of all peak areas A_S according to the automatic integration method and determine each amount as directed under the percentage peak area method; A-21 desamido insulin is NMT 10.0%, and the sum of other related substances excluding Insulin and A-21 desamido insulin is NMT 5.0%. However, in the case of insulin derived from a single species, the amount of cross contamination is NMT 1.0% when the peak corresponding to the bovine or porcine insulin is measured.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 214 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: Control the mixing ratio of mobile phase A and mobile phase B stepwise or via the gradient elution as follows. Adjust the composition of the mobile phase so that the retention time of insulin is about 31 minutes, and the A-21 desamido insulin elutes at the beginning of the gradient elution.

Mobile phase A: A mixture of a solution prepared by dissolving 28.4 mg of anhydrous sodium sulfate in 1000 mL of water, then adding 2.7 mL of phosphoric acid and, if necessary, and adding 2-Aminoethanol to adjust the pH to 2.3; resulting solution and acetonitrile (82 : 18).

Mobile phase B: A mixture of a solution prepared by dissolving 28.4 mg of anhydrous sodium sulfate in 1000 mL of water, then adding 2.7 mL of phosphoric acid and, if necessary, and adding 2-Aminoethanol to adjust the pH to 2.3 and acetonitrile (50 : 50).

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0	81	19
0 - 60	81	19
60 - 85	81 → 36	19 → 64
85 - 91	36	64
91 - 92	36 → 81	64 → 19

Flow rate: 1 mL/min

System suitability

Test for required detectability: Proceed with 20 μL of standard solutions (1), (2) and (3) under the above conditions to obtain the peak area A_A of the standard solution (1), the peak area A_B of the standard solution (2), and the peak area A_C of the standard solution (3). Calculate according to the following equations (1) and (2), and confirm that the values are 0.91 to 1.09 and 0.7 to 1.3, respectively.

$$(1)\ 10 \times \frac{A_B}{A_A}$$

$$(2)\ 10 \times \frac{A_C}{A_A}$$

System performance: Weigh about 1.5 mg of Insulin, and dissolve in 1.0 mL of 0.01 mol/L hydrochloric acid Allow this solution to stand at room temperature for NMT 3 days to obtain a solution containing NLT 5% of A-21 desamido insulin, and use the solution as the system suitability solution. Proceed with 20 μL of this solution under the above operating conditions; the resolution between Insulin and A-21 desamido insulin is NLT 2.0 with the symmetry factor of the insulin peak being NMT 1.8.

Loss on drying NMT 10.0% (0.2 g, 105 °C, 16 hours).

Residue on ignition Weigh accurately 20 to 40 mg of Insulin in a tared platinum dish, previously measured the mass, add 2 drops of nitric acid, and heat it gently at first, and then heat strongly to incinerate. Put it back into the furnace and heat it at 600 °C for 15 minutes, then cool it in a desiccator (silica gel) and weigh its mass; the residue is NMT 2.5%.

Bacterial endotoxins Less than 10 EU in each mg of Insulin.

Microbiological examination of non-sterile products When tested, the total aerobic microbial count is NMT 300 CFU per each gram of Insulin, and the total combined yeasts/molds count is NMT 100 CFU. Also, *Escherichia coli*, *Salmonella*, *Pseudomonas aeruginosa* and *Staphylococcus aureus* are not detected.

Zinc Content Weigh accurately about 10 mg of Insulin, dissolve in 5 mL of 0.1 mol/L hydrochloric acid TS and water to make exactly 50 mL, if necessary, add water again to dilute the solution so that each mL contains 0.4 to1.0 μg of zinc (Zn: 65.41, and use this solution as the test solution. Separately, take an appropriate amount of standard zinc solution for atomic absorption spectrophotometry, add water to dilute the solution so that each mL contains 0.3 to 1.2 μg of zinc, and use this solution as the standard solution. Perform the test using the test solution and the standard solution according to the Atomic Absorption Spectroscopy under the following conditions. Obtain the content of zinc in the solution using a calibration curve made from the absorbance of the standard solution; the content is NLT 0.27% and NMT 1.08%, calculated on the dried basis.

Gas: Air–acetylene
Lamp: Zinc hollow-cathode lamp
Wavelength: 213.9 nm

Nitrogen content Weigh accurately about 20 mg of Insulin, dissolve in 10 mL of 0.1 mol/L hydrochloric acid TS, and perform the test as directed under the Nitrogen Determination; the content of nitrogen (N: 14.01) is NLT 14.5% and NMT 16.5%, calculated on the dried basis.

Assay (1) ***Test animals*—**Raise healthy rabbits weighing NLT 1.8 kg in the laboratory by feeding with an appropriate and regular diet and water for at least 1 week before testing.

(2) ***Solvent for insulin*—**Dissolve 1.0 to 2.5 g of phenol or *m*-cresol in 500 mL of 0.01 mol/L hydrochloric acid, and add 14 to 18 g of glycerin and 0.01 mol/L hydrochloric acid to make 1000 mL.

(3) ***Standard stock solution*—**Weigh accurately about 20 mg of Insulin RS, dissolve in the solvent for insulin to make a solution containing 20.0 units of Insulin per mL. Store this solution at 1 to 15 ℃ and use it within 6 months after preparation.

(4) ***Standard solutions*—**Dilute the standard stock solution using the solvent for Insulin to make solutions containing 2.0 units and 1.0 unit of Insulin per mL, respectively. Use these solutions as the high-capacity standard solution S_H and the low-capacity standard solution S_L, respectively.

(5) ***Test solutions*—**Weigh accurately about 20 mg of Insulin, dissolve in the solvent for insulin to make solutions containing 2.0 units and 1.0 unit of Insulin per mL, respectively. Use these solutions as the high-capacity test solution T_H and the low-capacity test solution T_L, respectively.

(6) ***Injection amount*—**It is determined by preliminary testing or experience, but is usually 0.3 to 0.5 mL. Use the same amount throughout each test.

(7) ***Procedure*—**Select test animals of similar weight and divide them into 4 groups, with each group having the same number of animals (NLT 6). Do not feed each test animal for more than 14 hours before injection. During the test, do not give water until the last blood draw is completed. Also, during the test, handle the test animal with care to avoid causing strong irritation.
For the first injection, inject the standard solution and the test solution subcutaneously into each test animal as follows.

Group 1	S_H	Group 2	S_L
Group 3	T_H	Group 4	T_L

Make a second injection the next day or within one week using the standard and test solutions as follows.

Group 1	T_L	Group 2	T_H
Group 3	S_L	Group 4	S_H

At 1 hour and 2.5 hours after injection, collect sufficient blood from the veins around the ears of each test animal, and quantify the blood sugar level according to (8).

Conversion Table for Blood Sugar Levels (%)

* Indicate the consumption of 0.005 mol/L sodium thiosulfate. For example, according to the table above, the blood sugar level for 1.28 mL is 0.127%.

(8) ***Guantification of blood sugar*—**Put 5.0 mL of zinc sulfate (9 in 2000) in a test tube with an outer diameter of 18 mm and a length of 165 mm, add 1.0 mL of sodium hydroxide (1 in 250), and then gently transfer 0.10 mL of blood using a blood sugar pipette. To combine the blood remaining on the inner wall of the pipette into the test tube, repeatedly suck up the clear liquid from the surface of the test tube, and add the washings to the test tube (repeat it until the pipette is completely washed). Shake the content of the test tube well to mix, then heat on a steam bath for 3 minutes. Cover this solution with a small amount of cotton wool, and filter it into a test tube with an inside diameter of 30 mm and a length of 90 mm using a funnel with a diameter of 30 to 40 mm (prepared by washing it twice with 3 mL of warm water each). Wash the previous test tube and funnel twice with 3 mL of water each and add the washings to the filtrate. Add 2.0 mL of alkaline potassium hexacyanoferrate(III) acid TS to this solution, heat on a steam bath for 15 minutes, and then cool immediately. After adding 3.0 mL of Potassium iodide-zinc sulfate TS and 2.0 mL of diluted acetic acid(100) (3 in 100), titrate the free iodine with 0.005 mol/L sodium thiosulfate VS (indicator: 2-4 drops of starch-sodium chloride TS). Perform a blank test in the same manner and make any necessary correction. Obtain the blood sugar level (%) from the consumption amount (mL) of 0.005 mol/L sodium thiosulfate according to the Conversion Table of Blood Sugar Levels (%).

(9) ***Calculation method*—**After injection for each test animal, add up the two quantitative values of blood sugar for each test animal. Obtain the difference between the blood sugar values obtained in the first injection test and those values obtained in the second injection test of the test animals in groups 1 and 3, and name them y_1 and y_3, respectively. Obtain the difference between the blood sugar values obtained in the second injection test and those values obtained in the first injection test of the test animals in groups 2 and 4, and name them y_2 and y_4, respectively. Sum up NLT 6 of y_1, y_2, y_3 and y_4, respectively, and name them Y_1, Y_2, Y_3 and Y_4, respectively.

$$\text{Number of units in each mg of Insulin} = \text{anti log } M \times (\text{Number of units in Each mL of the high-capacity standard solution}) \times \frac{b}{a}$$

$$M = 0.301 \times \frac{Y_a}{Y_b}$$
$$Y_a = -Y_1 + Y_2 + Y_3 - Y_4$$
$$Y_b = Y_1 + Y_2 + Y_3 + Y_4$$

a: Weight (mg) of sample taken

b: Total volume (mL) when diluted with an insulin solvent to create a high-capacity test solution from the weight (mL) of sample taken

However, when calculating L ($p = 0.95$) using the following equation, L is NMT 0.1212.

If this value is exceeded, increase the number of test animals until it falls below this value, or adjust the experimental conditions, and then repeat the test.

$$L = 2\sqrt{(C-1)(CM^2 + 0.09062}$$
$$C = \frac{Y_b^2}{Y_b^2 - 4fa^2t^2}$$
$$s^2 = \frac{\sum y^2 - \frac{Y}{f}}{n}$$
$$Y = Y_1^2 + Y_2^2 + Y_3^2 + Y_4^2$$
$$n = 4(f\text{-}1)$$

f: Number of test animals in each group

Σy_2: The sum of the squares of y_1, y_2, y_3 and y_4 in each group.

t^2: The values in the following table for *n* when s^2 was calculated.

n	$t^2 = F$	*n*	$t^2 = F$	*n*	$t^2 = F$
1	161.45	13	4.667	25	4.242

12	4.747	24	4.260		

Packaging and storage Preserve in tight containers and store at below 8 ℃.

Insulin Injection
인슐린 주사액

Insulin Injection is an aqueous solution for injection. Insulin Injection contains NLT 95.0% and NMT 105.0% of the labeled Insulin units.

Method of preparation Suspend Insulin in water for injection, dissolve by adding hydrochloric acid and prepare as directed under Injections. Insulin Injection contains 0.10 to 0.25 g of phenol or cresol and 1.4 to 1.8 g of concentrated glycerin for each 100 mL of Insulin Injection. It contains no sodium chloride.

Description Insulin Injection occurs as a clear, colorless to pale yellow liquid.

Identification Adjust the pH of Insulin Injection to 5.1 to 5.3 with a solution of sodium hydroxide (1 in 100); a precipitate is formed. Adjust the pH of the solution to 2.5 to 3.5 by adding dilute hydrochloric acid; the precipitate dissolves.

pH Between 2.5 and 3.5.

Residue on ignition Pipet an amount of Insulin Injection, containing 500 to 1000 units according to the labeled units, in a tared platinum dish and evaporate slowly on a steam bath to dryness. Add 2 drops of nitric acid to the residue and heat at first gently, then strongly to incinerate. Place in a muffle furnace and heat at 600 ºC for 15 minutes, cool in a desiccator (silica gel) and weigh: the weight of the residue is NMT 1.0 mg for each labeled 1000 units.

Sterility Meets the requirements.

Bacterial endotoxins Less than 80 EU per 100 insulin units of Insulin Injection.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Extractable volume of injections Meets the requirements.

Nitrogen content Perform the test as directed under the Nitrogen Determination; the amount of nitrogen (N: 14.01) for the labeled 100 units is NLT 0.50 mg and NMT 0.64 mg.

Assay Perform the test as directed under the Assay under Insulin. However, (5) Test solution and (9) Calculation are as follows.

(5) ***Test solution***—According to the labeled units, dilute Insulin Injection with the diluent for Insulin to make two different test solutions, one to contain exactly 2.0 units in each mL which is designated as the high-dose test solution, T_H and the other to contain exactly 1.0 unit in each mL which is designated as the low-dose test solution, T_L.

(9) ***Calculation***—Proceed as directed under the Assay under Insulin, using the following equation.

Number of units in each mg of Insulin Injection "= anti log M×(number of units in each mL of the high-dose standard solution)× $\frac{b}{a}$

a: Mass (mg) of the sample taken" is changed to

Number of units in each mg of Insulin Injection "= anti log M×(number of units in each mL of the high-dose standard solution) × $\frac{b}{a}$

a: Volume (mL) of the sample taken".

Packaging and storage Preserve in hermetic containers in a cold place, avoiding freezing.

Expiration date 24 months after preparation.

Isophane Insulin Injection (Aqueous Suspension)
이소판인슐린 수성현탁주사액

Isophane Insulin Injection (Aqueous Suspension) is an aqueous suspension for injection. Isophane Insulin Injection (Aqueous Suspension) contains NLT 90.0% and NMT 110.0% of the labeled Insulin units It also contains NLT 10 μg and NMT 40 μg of zinc (Zn: 65.41) for each labeled 100 units. When sodium chloride is used in the method of preparation for Isophane Insulin Injection (Aqueous Suspension), this should be indicated on the label.

Method of preparation Prepare as directed under Injections, with Insulin and Protamine Sulfate. To each 100 mL of Isophane Insulin Injection (Aqueous Suspension), add either 0.38 g to 0.63 g of dibasic sodium phosphate, 1.4 g to 1.8 g of concentrated glycerin, 0.15 g to 0.17 g of cresol and 0.06 g to 0.07 g of phenol, or 0.38 g to 0.63 g of dibasic sodium phosphate, 0.42 g to 0.45 g of sodium chloride, 0.7 g to 0.9g of concentrated glycerin and 0.18 g to 0.22 g of cresol.

Description Isophane Insulin Injection (Aqueous Suspension) occurs as a white aqueous suspension. When allowed to stand, it separates into a white precipitate and colorless, clear supernatant and the precipitate easily re-

turns to the form of suspension by gentle shaking.
When examined microscopically, the precipitate mostly consists of fine, oblong crystals of 5 μm to 30 μm and does not contain amorphous substances or large aggregates.

Identification Adjust the pH of Isophane Insulin Injection (Aqueous Suspension) to 2.5 to 3.5 with dilute hydrochloric acid; the precipitate dissolves and the solution is clear and colorless.

pH Between 7.0 and 7.4.

Purity (1) ***Protein***—Perform the test as directed under the Nitrogen Determination; the amount of nitrogen (N: 14.01) for the labeled 100 units is NMT 0.85 mg.

(2) ***Isophane ratio***—(i) Buffer solution A: Dissolve 2.0 g of anhydrous sodium dihydrogen phosphate, 16 g of glycerin, 1.6 g of *m*-cresol and 0.65 g of phenol in water to make exactly 200 mL.

(ii) Buffer solution B: Dissolve 2.0 g of anhydrous sodium dihydrogen phosphate, 4.35 g of sodium chloride, 8.0 g of glycerin and 2.0 g of *m*-cresol in water to make exactly 200 mL.

(iii) Insulin solution: Weigh accurately 1000 units of Insulin RS, dissolve in 1.5 mL of diluted hydrochloric acid (1 in 360) and add 5.0 mL of buffer solution A and water to make 20 mL. Adjust the pH to 7.2 with dilute hydrochloric acid or sodium hydroxide TS. The solution is clear. Dilute with water to make exactly 25 mL, The solution is clear and the pH is 7.1 to 7.4. When it is stated on the label that sodium chloride is used in the preparation, use 5.0 mL of buffer solution B instead of buffer solution A in the above procedure. To this solution, add dilute hydrochloric acid or sodium hydroxide TS to adjust the pH to 7.2. The solution is clear. Then, add water to make exactly 25 mL. The solution is clear and the pH is 7.1 to 7.4. When it is stated on the label that Sodium Chloride is used in the preparation, use 5.0 mL of buffer solution B instead of buffer solution A in the above procedure.

(iv) Protamine solution: Weigh accurately 50 mg of protamine sulfate RS, and add 2 mL of buffer solution A and water to make 8 mL. To this solution, add dilute hydrochloric acid or sodium hydroxide TS to adjust the pH to 7.2, and add water to make exactly 10 mL. The solution is clear and the pH is 7.1 to 7.4. When it is stated on the label that Sodium Chloride is used in the preparation, use 2 mL of buffer solution B instead of buffer solution A in the above procedure.

(v) Procedure: When Isophane Insulin Injection (Aqueous Suspension) contains 40 units per ml, centrifuge a portion of the suspension, measure exactly two 10 mL volumes of the supernatant in two tubes A and B, respectively, add exactly 1 mL of the Insulin solution to tube, A and 1 mL of the protamine solution to tube B, mix the contents of each tube, allow to stand for 10 minutes and determine the turbidity of each mixture by using a photometer or a nephelometer: the turbidity of the mixture in tube B is not greater than that in tube A. When Isophane Insulin Injection (Aqueous Suspension) contains 80 units per ml, measure exactly 5 mL of the supernatant and proceed in the same manner.

Sterility Meets the requirements.

Bacterial endotoxins Less than 80 EU per 100 insulin units.

Extractable volume of injections Meets the requirements.

Assay (1) ***Insulin***—To Isophane Insulin Injection (Aqueous Suspension), add diluted hydrochloric acid (1 in 100) to adjust the pH to about 2.5 and perform the test with the resulting clear solution as directed under the Assay under Insulin Injection.

(2) ***Zinc***—Pipet a volume of Isophane Insulin Injection (Aqueous Suspension), equivalent to about 400 units according to the labeled units, add 1 mL of 0.1 mol/L hydrochloric acid TS and water to make exactly 100 mL, dilute, if necessary, with water to contain 0.6 to 1.0 μg of zinc pet mL and use this solution as the test solution. Separately, pipet a volume of standard zinc solution for the Atomic Absorption Spectrophotometry, dilute with water to contain 0.4 to 1.2 μg of zinc per mL and use this solution as the standard solution. Perform the test with the test solution and the standard solution according to the Atomic Absorption Spectrophotometry under the following conditions and determine the amount of zinc in the test solution using the analytical curve obtained from the absorbance of the standard solution.

Gas: Air–acetylene
Lamp: Zinc hollow-cathode lamp
Wavelength: 213.9 nm

Packaging and storage Preserve in hermetic containers and store in a cold place.

Expiration date 24 months after preparation.

Insulin Zinc Injection (Aqueous Suspension)
인슐린아연 수성현탁주사액

Insulin Zinc Injection (Aqueous Suspension), is an aqueous suspension for injection, which contains NLT 90.0% and NMT 110.0% of the labeled insulin units. and NLT 0.12 mg and NMT 0.30 mg of zinc (Zn: 65.41) for each labeled 100 units.

Method of preparation Prepare as directed under Injections, with Insulin and Zinc Chloride. Insulin Zinc Injection (Aqueous Suspension) contains 0.15 g to 0.17 g of sodium acetate trihydrate, 0.65 g to 0.75 g of sodium chloride and 90 mg to 110 mg of methyl *p*-hydroxybenzoate per 100 mL.

Description Insulin Zinc Injection (Aqueous Suspension) occurs as a white suspension. When allowed to stand, it separates into a white precipitate and colorless, clear supernatant and the precipitate easily returns to the suspension state by gentle shaking.
When it is examined microscopically, most part of the particles in the suspension are crystals, the dimension of which is mostly 10 μm to 40 μm. Others are amorphous with less than 2 μm.

Identification Adjust the pH of Insulin Zinc Injection (Aqueous Suspension) to 2.5 to 3.5 with dilute hydrochloric acid; the precipitate dissolves and the solution is clear and colorless.

pH Between 7.1 and 7.5.

Purity ***Dissolved insulin***—Perform the test according to the Purity (2) of Insulin Zinc Protamine Injection (Aqueous Suspension).

Sterility Meets the requirements.

Bacterial endotoxins Less than 80 EU per 100 insulin units.

Extractable volume of injections Meets the requirements.

Nitrogen content Perform the test as directed under the Nitrogen Determination; the amount of nitrogen (N: 14.01) for the labeled 100 units is NLT 0.50 mg and NMT 0.64 mg.

Assay (1) ***Insulin***—To Insulin Zinc Injection (Aqueous Suspension), add diluted hydrochloric acid (1 in 100) to adjust the pH to about 2.5 and proceed with the clear liquid according to the Assay under Insulin Injection.

(2) ***Zinc***—Perform the test according to the Assay (2) of Insulin Zinc Protamine Injection (Aqueous Suspension).

(3) ***Crystalline insulin***—Pipet an amount of Insulin Zinc Injection (Aqueous Suspension), equivalent to about 600 units according to the labeled units, centrifuge, discard the clear supernatant, and suspend the residue in 5 mL of water. Add 10 mL of sodium acetate-acetone TS, shake for 3 minutes to mix and centrifuge. Discard the clear supernatant and repeat the procedure in the same manner. Wash down the residue into a Kjeldahl flask with 15 mL of sulfuric acid and perform the test as directed under the Nitrogen Determination; the amount of nitrogen (N: 14.01) is NLT 55.0% and NMT 70.0% of the total nitrogen amount. Calculate the total nitrogen content for insulin units of a sample from the values of nitrogen obtained in the nitrogen content.

Packaging and storage Preserve in hermetic containers and store in a cold place.

Expiration date 24 months after preparation.

Iodine
요오드

I : 126.90

Iodine contains NLT 99.5% and NMT 101.0% of iodine (I).

Description Iodine occurs as grayish black plate crystals or heavy granular crystals having a metallic luster and a characteristic odor.
It is freely soluble in ether, soluble in ethanol(95), sparingly soluble in chloroform, and very slightly soluble in water.
It is soluble in potassium iodide TS.
It volatilizes at ordinary temperature.

Identification (1) A solution of iodine in ethanol(95) (1 in 50) exhibits a reddish brown color.

(2) A solution of Iodine in chloroform (1 in 1000) exhibits a purple to violet color.

(3) Add 0.5 mL of starch TS to 10 mL of saturated solution of Iodine; the solution exhibits a dark blue color. When boiled, the color of the solution disappears, and the color reappears when cooled.

Purity (1) ***Sublimation residue***—Heat and sublime 2.0 g of iodine on a steam bath, and dry the residue for 1 hour at 105 ℃; the amount of residue is NMT 1.0 mg.

(2) ***Chloride or bromide***—Add 1.0 g of Iodine, previously powdered, to 20 mL of water, shake well to mix, and filter. Add diluted sulfurous acid solution (1 in 5) dropwise to 10 mL of the filtrate until the yellow color disappears. Add 1 mL of ammonia TS to this solution and add 1 mL of silver nitrate TS in small amounts. Add water to make 20 mL, shake well to mix, and filter. Discard the first 2 mL of filtrate and take the subsequent 10 mL of filtrate, then add 2.0 mL of nitric acid and water to make 20 mL; the turbidity of the resulting solution is not more intense than that of the following control solution.

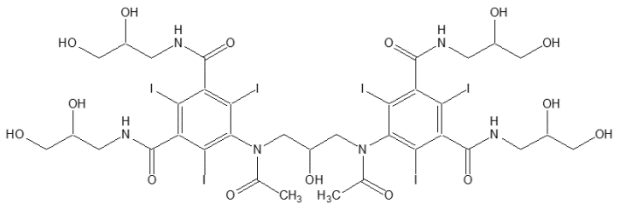
Control solution—To 0.20 mL of 0.01 mol/L hydrochloric acid, add 5 mL of water, 2.5 mL of ammonia TS, 1 mL of silver nitrate TS, 2.0 mL of nitric acid, and then water to make 20 mL.

Assay Weigh accurately 1 g of potassium iodide and 1 mL of water in a stoppered flask, add about 0.3 g of Iodine to this solution, weigh accurately and shake gently to mix and dissolve. Add 20 mL of water and 1 mL of dilute hydrochloric acid and titrate with 0.1 mol/L sodium thiosulfate VS (indicator: 1 mL of starch TS).

Each mL of 0.1 mol/L sodium thiosulfate VS
= 12.690 mg of I

Packaging and storage Preserve in tight containers.

Iodixanol
이오딕산올



$C_{35}H_{44}I_6N_6O_{15}$: 1550.18

5-{*N*-[3-(*N*-{3,5-*bis*[(2,3-Dihydroxypropyl) carbamoyl]-2,4,6-triiodophenyl}acetamido)-2-hydroxypropyl]acetamido}-1-*N*,3-*N*-*bis*(2,3-dihydroxypropyl)-2,4,6-triiodobenzene-1,3-dicarboxamide [*92339-11-2*]

Iodixanol contains NLT 98.6% and NMT 101.0% of Iodixanol ($C_{35}H_{44}I_6N_6O_{15}$), calculated on the anhydrous basis.

Description Iodixanol occurs as a white, amorphous powder and is odorless.
It is very soluble in water.
It is hygroscopic.

Identification (1) Determine the infrared spectra of Iodixanol and iodixanol RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption of absorption at the same wavenumbers.

(2) The retention times of the two major peaks obtained from the test solution in the Related substance (B) is same as the retention times of the two peaks obtained from the standard solution (2). A third isomer may appear as a minor peak.

(3) Take about 0.5 g of Iodixanol and heat in a crucible; purple gases are evolved.

Optical rotation $[\alpha]_D^{25}$: Between -0.5° and +0.5° (1 g, water, 20 mL, 100 mm).

Purity (1) ***Heavy metals***—Proceed with 1 g of Iodixanol according to Method 1 and perform the test. Prepare the control solution with 1.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Free iodine***—Weigh 2.0 g of Iodixanol, add 20 mL of water, 5 mL of toluene, and 5 mL of 1 mol/L sulfuric acid TS, shake vigorously, and allow to stand; the toluene layer does not exhibit a red or pink color.

(3) ***Free iodide***—Weigh 5.0 g of Iodixanol, dissolve in about 30 mL of water, and titrate with 0.001mol/L silver nitrate VS (potentiometric titration under the Titrimetry); NMT 10 μg per g of Iodixanol.

Each mL of 0.001 mol/L silver nitrate VS
= 126.9 μg of I

(4) ***Free aromatic amine***—Weigh accurately about 0.2 g of Iodixanol, dissolve in 15 mL of water, and use this solution as the test solution. Weigh accurately a suitable amount of iohexol related substance III RS, dissolve in water so that the solution contains 10 μg per mL. To 10 mL of this solution, add 5 mL of water and use this solution as the standard solution. Separately, use 15 mL of water as the blank test solution. Cool the test solution, the standard solution, and the blank test solution in an ice bath for 5 minutes, add 1.5 mL of 6 mol/L hydrochloric acid TS, stir to mix, add 1.0 mL each of sodium nitrite solution (2 in 100), mix, and allow to stand in the ice bath for 4 minutes. Remove the solutions from the ice bath, add 1.0 mL of 4% sulfamic acid, and stir gently until gas evolution ceases. Add 1.0 mL of a solution of *N*-(1-Naphthyl) ethylenediamine dihydrochloride in a mixture of propylene goycol and water (70 : 30) (3 in 10000), prepared before use, mix, add water to make exactly 25 mL, and allow to stand for 5 minutes. Compare the color with these solutions; the color obtained from the test solution is not more intense than the color obtained from the standard solution (0.05%). If the color obtained from the test solution is same as or more intense than the color from the standard solution, perform the test with the blank test solution, the test solution and the standard solution as directed under the Ultraviolet-visible Spectroscopy, determine the absorbance A_B, A_T and A_S, in 5 cm cells, at the absorbance maximum wavelength of about 495 nm, using water as the control solution(NMT 0.05%).

$$\text{Content (\%) of free aromatic amine} = \frac{C}{W} \times \frac{A_T - A_B}{A_S - A_B}$$

C: Concentration of iohexol related compound III RS in the standard solution (μg/mL)
W: Amount (mg) of Iodixanol taken

(5) ***Calcium***—Weigh accurately about 2.0 g of Iodixanol, dissolve in 10 mL of water, add 2 mL of the internal standard solution water to make exactly 20 mL, and use this solution as the test solution. Prepare a solution containing 10 μg of calcium per mL with the calcium standard solution. Pipet 0.5 mL, 2.5 mL, 5.0 mL and 10.0 mL each of this solution, add 5.0 mL of the Internal standard solution to each solution, add water to make exactly 50 mL, and use these solutions as the standard solution (1), (2), (3) and (4). Pipet 5.0 mL of the internal standard solution, add water to make 50 mL, and use this solution as the blank test solution. Perform the test with the test solution and the standard solutions (1), (2), (3) and (4) as directed under the Atomic Absorption Spectroscopy. Determine the absorbances of each standard solution and the test solution at 393.366 nm (calcium emission line) and 361.38 nm (scandium emission line) using the blank test solution, calculate the ratio of calcium absorbance to scandium absorbance, plot a calibration curve relative to calcium concentrations in the standard solutions. From the calibration curve, determine the calcium concentration, C (μg per mL), in the test so-

lution, and calculate the content of calcium (μg/g) (NMT 5 μg per g of Iodixanol).

$$\text{Amount (μg /g) of calcium (μg/g)} = 20 \times \frac{C}{W}$$

W: Amount (g) of Iodixanol taken to prepare the test solution

Internal standard solution—Weigh 3.067g of scandium oxide and dissolve in 1000 mL of water. To 10 mL of this solution and add water to make 100 mL.

(6) ***Ionic substances***—Wash all glass apparatus with water before use. Determine the conductivity of the aqueous solution of Iodixanol (2 in 100); the conductivity is not greater than the conductivity of sodium chloride solution (4 μg per mL) (NMT 0.02%).

(7) ***Methanol, 2-propanol and methoxyethanol***—Weigh accurately about 0.25 g of Iodixanol, transfer to a headspace vial, add 1.0 mL of the Internal standard solution, seal the vial with a cap, mix until dissolved, and use this solution as the test solution. Weigh accurately about 0.5 g of methanol, about 1.0 g of 2-propanol and 1.0 g of methoxyethanol, and add water to make exactly 500 mL. Add water to 5.0 mL to this solution to make exactly 100 mL. Pipet 10.0 mL of this solution and 1.0 mL of the internal standard solution and add water to make exactly 100 mL. Pipet 1.0 mL of this solution, seal, and use this solution as the standard solution. This solution contains about 0.005 mg of methanol, 0.01 mg of 2-propanol and 0.01 mg of methoxyethanol per mL. Perform the test with each 1 mL of the test solution and the standard solution as directed under the Gas Chromatography according to the following operating conditions, and determine the ratios Q_T and Q_S, of each peak area of methanol, 2-propanol and methoxyethanol to the peak area of the internal standard. Amounts of methanol, 2-propanol and methoxyethanol per g of Iodixanol are NMT 50 μg, respectively.

$$\text{Content (\%) of methanol, isopropanol and methoxyethanol} = 100 \times \frac{C}{W} \times \frac{Q_T}{Q_S}$$

C: Concentration (mg/mL) of each related substance
W: Amount (mg) of Iodixanol taken

Internal standard solution—Weigh about 0.5 g of 2-butanol and add water to make 500 mL. Pipet 1.0 mL of this solution and add water to make 100 mL.

Operating conditions

Detector: A flame ionization detector

Column: A capillary column about 0.54 mm in internal diameter and about 30 m in length, coated the inside with a 1 μm thick layer of polyethylene glycol with an average molecular weight of about 15000 (carbowax 20M).

Column temperature: Maintain at 40 ºC for 3 minutes, then increase linearly to 100 ºC at a rate of 8 ºC per minute, and maintain at 100 ºC for 1 minute.

Sample injection port temperature: 150 ºC

Detector temperature: 200 °C.

Carrier gas: Helium

Flow rate: 11 mL/min

System suitability

System performance: Perform the test with 1 mL of the standard solution according to the above operating conditions; methanol, 2-propanol, 2-butanol and methoxy ethanol are eluted in this order with the resolution between the methanol peak and the 2-propanol peak is NLT 1.0.

System repeatability: Repeat the test six time with 1mL of the standard solution according to the above operating conditions; the relative standard deviation of the ratios of the peak area for methanol and 2-propanol is NMT 0.5% and the relative standard deviation of the ratios of the peak area for methoxy ethanol is NMT 10%.

(8) ***Related substances***—(i) Weigh accurately an amount of Iodixanol, equivalent to 0.5 g of anhydrous Iodixanol, dissolve in water to make exactly 20 mL, and use this solution as the test solution (1). To 5.0 mL of the test solution (1), add water to make exactly 50 mL, and use this solution as the test solution (2). Separately, weigh accurately an appropriate amount of iodixanol RS and dissolve in water so that the solution contains 12.5 mg of anhydrous Iodixanol per mL, and use this solution as the standard stock solution (1). Weigh accurately an appropriate amount of iodixanol related substance I ((5-[acetyl[3-[[3,5-bis[[2,3-dihydroxypropyl)amino]carbonyl]-2,4,6-triiodophenyl]amino]-2-hydroxypropyl]amino]-*N*,*N*′-bis(2,3-dihydroxypropyl)-2,4,6-triiodo-1,3-benzenedicarboxamide) RS, dissolve in water to obtain a solution containing about 0.25 mg of anhydrous iodixanol related substance I per mL, and use this solution as the standard stock solution (2). Weigh accurately an suitable amount of iodixanol related substance II (5-[acetyl(2-hydroxy-3-methoxypropyl)amino]-*N*,*N*′-bis(2,3-dihydroxypropyl)-2,4,6-triiodo-1,3-benzenecarboxamide) RS, dissolve in water to obtain a solution containing about 0.025 mg of anhydrous iodixanol related substance II per mL, and use this solution as the standard stock solution (3). Pipet 2.0 mL of the standard stock solution (1), add water to make exactly 10 mL, and use this solution as the standard solution (1). Pipet 5.0 mL of the standard stock solution (1), 2.5 mL of the standard stock solution (2) and 2.5 mL of the standard stock solution (3), add water to make exactly 25 mL, use these solutions as the standard solution (2). Pipet 5.0 mL of the test solution (1) and 2.5 mL of the standard stock solution (2), add water to make exactly 50 mL, and use this solution as the control solution. Use water as the blank test solution. Perform the test with 10 μL each of the blank test solution, the test solution (1) and the test solution (2) as directed under the Liquid Chromatography according to the following operating conditions. With the test solution (1)

and the test solution (2), determine the content (%) of each related substance, when specified, according to the following formula.

$$\text{Content (\%) of related substances} = \frac{10X}{0.1Y + Z} \quad (1)$$

X: Peak area of the specified related substance obtained from the test solution (1)

Y: Total area of all the peaks eluted before and after iodixanol peak from test solution (1). However, disregard any peaks resulting from injection noise or solvent.

Z: Total area of the Iodixanol major peak and all related substances peaks obtained from the test solution (2)

① Iohexol—If Iohexol is present, two peaks appear at the relative retention time of about 0.37 and 0.39 to Iodixanol in the chromatogram obtained from the test solution (1). Draw a baseline at the height of the baseline obtained from the blank test solution. Determine the total area of the two peaks of Iohexol and calculate the amount of Iohexol according to the formular (1) (NMT 0.6%).

② Iodixanol related substance III—Related substance III (5-(acetylamino)-*N*,*N*′-bis(2,3-dihydroxypropyl)-2,4,6-triiodo-1,3-benzenecarboxamide) is eluted as a single peak at the relative retention time of 0.34 to Iodixanol in the chromatogram obtained from the test solution (1). Determine the peak area of related substance III and calculate the amount of related substance III according to the equation (1) (NMT 0.2%).

③ Iodixanol related substance I—The first peak of related substance I appears at the relative retention time of 1.07, between the two major peaks of Iodixanol, and the second peak of related substances I co-elutes with iodixanol. The area of the first peak is about 80% of the total area of the peaks of related substance I. Determine the area of the first peak, X_2, and calculate the amount of related substance I using the following formular (NMT 0.4%).

$$\text{Content (\%) of Iodixanol related substances (\%)} = \frac{12.5X_2}{0.1Y + Z} \quad (2)$$

Y, *Z*: See formular (1)

④ Iodixanol related substance IV—Only the first peak of related substance IV {2-[[acetyl[3,5-bis[[2,3-dihydroxypropyl)amino]carbonyl]-2,4,6-triiodophenyl]methyl]-*N*,*N*′-bis(2,3-dihydroxypropyl)-2,3-dihyro-5,7-diiodie-4H-1,4-benzoxazine-6,8-dicarboxamide} appears at the relative retention time of 0.8 to the Iodixanol in the chromatogram obtained from the test solution (1). The second peak co-elutes with iodixanol peak. The area of the first peak is about 25% of the total area of related substance IV. Determine the area of the first peak X_1, and calculate the amount of related substance IV using the following formula (NMT 0.2%).

$$\text{Content (\%) of Iodixanol related substance IV} = \frac{40X_1}{0.1Y + Z} \quad (3)$$

Y, *Z*: See formular (1)

⑤ Iodixanol related substance V—Only the second peak of related substance V {4-acetyl-2-[[acetyl[3,5-bis[[2,3-dihydroxypropyl)amino]carbonyl]-2,4,6-triiodophenyl]methyl]amino]-methyl]-*N*,*N*′-bis(2,3-dihydroxypropyl)-2,3-dihyro-5,7-diiodide-4*H*-1.4-benzoxazine-6,8-dicarboxamide} appears at the relative retention time of 1.18 to Iodixanol in the chromatogram obtained from the test solution (1). The first peak co-elutes with iodixanol. The area of the second peak is about 85% of the total area of related substance V. Determine the area of the second peak, X3, and calculate the amount of related substance V using the following formular (NMT 0.2%).

$$\text{Content (\%) of Iodixanol related substance V} = \frac{10X_3}{0.85(0.1Y + Z)} \quad (4)$$

Y, *Z*: See formular (1)

⑥ Overalkylated related substances—Overalkylated related substances appear, after related substance V, with a retention time larger than the relative retention time of 1.18 to the last Iodixanol peak in the chromatogram of the test solution (1). Calculate the amount of overalkylated related substances by the formula (1) used to determine the amount of related substances (NMT 1.0%).

⑦ Unspecified related substance 1—Determine the area of each peak eluting before and after the major peak of Iodixanol, excluding the above mentioned peaks, in the chromatogram obtained from the test solution (1), and calculate the amount of unspecified related substance 1 according to the formula (1).

⑧ Unspecified related substance 2—Determine the area of each peak eluting between the major peaks of Iodixanol, excluding the above mentioned peaks, in the chromatogram obtained from the test solution (1), and calculate the amount of unspecified related substance 2. Amount of each related substance of ⑦ and ⑧ is NMT 2.0%, and amount of total unspecified related substances is NMT 0.5%.

⑨ Total related substances—Determine total area of all peaks eluting between the major peaks of Iodixanol in the chromatogram obtained from the test solution (1), and calculate the amount of total related substances (NMT 1.5%).

Content (%) of total related substances

$$= \frac{\left[100\left(Y - X_1 - X_3 + \frac{X_1}{0.25} + \frac{X_2}{0.8} + \frac{X_3}{0.85}\right)\right]}{10(0.1Y + Z)}$$

In which the variables are as defined above.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: Control the mixing ratio of mobile phase A and mobile phase B in stages or gradient elution as follows.

Mobile phase A: A mixture of acetonitrile and water (1 : 1).

Mobile phase B: Water

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0	6	94
0 - 30	6 → 20	94 → 80
30 - 70	20 → 100	80 → 0
70 - 80	100	0
80 - 81	100 → 6	0 → 94
81 - 90	6	94

Flow rate: 1.0 mL/min

System suitability

Blank test solution: Inject in sequence of standard solution (1), the control solution and three replicates of the standard solution (2).

System performance: Proceed with 10 μL of the standard solution (1) according to the above operating conditions; the chromatogram obtained exhibits two or three unresolved major peaks. If the chromatogram exhibits two major peaks, their relative areas are 60% and 40%. If the chromatogram exhibits three major peaks, their relative areas are about 60%, 38% and 2%. Proceed with 10 μL of the standard solution (2) according to the above operating conditions; the chromatogram obtained exhibits two resolved peaks due to related substance II, which is eluted before Iodixanol, and one peak due to related substance I between the two principal Iodixanol peaks. The area of the two related substance II peaks is between 0.075% and 0.125% of the total peak area. However, disregard any peak due to the solvent front and any peak due to the blank test solution.

System repeatability: Repeat the test three times with each 10 μL of the standard solution (2) according to the above operating conditions; the relative standard deviation of total areas of two isomer peaks for related substance II is NMT 5%. Measure the height of the related substance I peak, and adjust the sensitivity to obtain a peak height between 80% and 100% of the full scale. Measure the height above the baseline, A, of the Iodixanol related substance I peak and the height above the baseline, B, of the lowest part of the curve where the peak of related substance I is separated from the first major peak of Iodixanol peak; A is NLT 1.3B. Perform the test with 10 μL of the control solution according to the above operating conditions; the peak of Iodixanol related substance I is measurable.

(ii) Weigh accurately an amount of Iodixanol, equivalent to about 0.125 g of anhydrous iodixanol, dissolve in water to make exactly 50 mL, and use this solution as the test solution. Weigh accurately an amount of iodixanol RS, equivalent to about 0.125 g of anhydrous iodixanol, dissolve in water to make exactly 10 mL, and use this solution as the standard stock solution (1). Weight accurately an amount of iodixanol related substance II RS, equivalent to about 0.125 g of anhydrous iodixanol, dissolve in water to make exactly 100 mL, and use this solution as the standard stock solution (2). Weigh accurately an amount of iodixanol related substance IV RS, equivalent to about 25 mg of anhydrous iodixanol, dissolve in water to make exactly 10 mL, and use this solution as the standard stock solution (3). Pipet 2.0 mL of the standard stock solution (1), add water to make exactly 10 mL, and use this solution as the standard solution (1). Pipet 5.0 mL of the standard stock solution (1) and 2.5 mL of the standard stock solution (2), add water to make exactly 25 mL, and use these solutions as the standard solution (2). Pipet 1.0 mL of the standard solution (1) and 1.0 mL of the standard stock solution (3), add water to make 3.0 mL, and use this solution as the standard solution (3). Use water as the blank test solution. Perform the test with 10 μL each of the test solution, the standard solution (1), the standard solution (2) and the standard solution (3) as directed under the Liquid Chromatography according to the following operating conditions. For the standard solution (2), inject three times. Compare the retention times of the peaks eluting from the test solution to those from the standard solution (3). Iodixanol related substance VI exhibits two partially overlapping peaks. Use only the area of the first and larger peak, which corresponds to about 60% of the total area of related substance V, and determine. the percent area of Iodixanol related substance VI {5-[[3-[[3-[[2,3-dihydroxypropyl)amino] carbonyl]-5-[[amino]carbonyl]-2,4,6-triiodophenyl] (acetylimino]-2-hydroxypropyl]-(acetylimino)]-N,N'-bis(2,3-dihydroxypropyl)-2,4,6-triiod-1,3-benzenedicarboxide} by dividing this area obtained from the test solution by 0.6; it is NMT 0.3%. Calculate the percent area of the related substance VII peak appearing as a single peak, with a shoulder on the tail of the iodixanol peak, is NMT 0.6%.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with a monomolecular layer of aminopropylsilyl silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: Control the mixing ratio of mobile

phase A and mobile phase B in stages or gradient elution as follows.

Mobile phase A: Acetonitrile
Mobile phase B: Water

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0	85	15
0 - 25	85 → 66	15 → 34

Flow rate: 2.5 mL/min
System suitability

System performance: Perform the test with 10 μL of the standard solution (1) according to the above operating conditions; three iodixanol peaks appear with the relative peak area of 62%, 35% and 3% and the retention time of the last peak is NMT 14 minutes. Perform the test with 10 μL of the standard solution (2) according to the above operating conditions; related substance II produces two partially overlapping peaks at the relative retention time of 0.33 and 0.39, respectively, and the peak area of each peak is between 0.075% and 0.125% of the total area. Perform the test with 10 μL of the standard solution (3) according to the above operating conditions; related substance VI produces two overlapping peaks at the relative retention time of 0.67 and 0.72, respectively. The resolution between the first peak of related substance VI and the first major peak of Iodixanol is NLT 5.0.

System repeatability: Repeat the test three times with each 10 μL of the standard solution (2) according to the above operating conditions; the relative standard deviation of total areas of two isomer peaks for related substance II is NMT 5%.

Water NMT 4.0% (0.5 g, volumetric titration, direct titration).

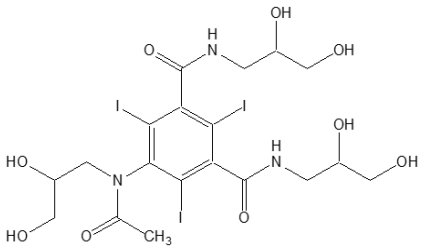
Microbiological examination of non-sterile products The total aerobic microbial count is NMT 100 CFU per g.

Assay Weigh accurately about 0.5 g of Iodixanol, add 25 mL of sodium hydroxide (1 in 20) and 0.5 g of zinc powder, connect the flask to a reflux condenser, and reflux for 1 hour. Cool the flask to room temperature, wash the condenser with 20 mL of water, combine the washings with the reaction mixture, and filter. Wash the flask and the filter with a small amount of water several times, filter, and combine the washings to the filtrate. Add 5 mL of acetic acid(100) and titrate with 0.1 mol/L silver nitrate VS (potentiometric titration under the Titrimetry).

Each mL of 0.1 mol/L silver nitrate VS
= 25.84 mg of $C_{35}H_{44}I_6N_6O_{15}$

Packaging and storage Preserve in light-resistant, well-closed containers.

Iohexol
이오헥솔



$C_{19}H_{26}I_3N_3O_9$: 821.14

1-*N*,3-*N*-*bis*(2,3-Dihydroxypropyl)-5-[*N*-(2,3-dihydroxypropyl)acetamido]-2,4,6-triiodobenzene-1,3-dicarboxamide [*66108-95-0*]

Iohexol contains NLT 98.0% and NMT 102.0% of iohexol ($C_{19}H_{26}I_3N_3O_9$), calculated on the anhydrous basis.

Description Iohexol occurs as a white or grayish white powder and is odorless.
It is very soluble in water or methanol, and practically insoluble in ether or chloroform.
It is hygroscopic.

Identification (1) Transfer about 0.5 g of Iohexol to a crucible, and heat; a purple gas is evolved.

(2) Determine the absorption spectra of aqueous solutions of Iohexol and Iohexol RS (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit a maximum and a minimum of absorption at the same wavelengths.

(3) Determine the infrared spectra of Iohexol and Iohexol RS as directed in the potassium bromide disk method under the Mid-infrared absorption Spectrophotometry; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(4) Weigh 0.1 g each of Iohexol and iohexol RS, dissolve in 10 mL of methanol, and use these solutions as the test solution and the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of 1-butanol, water and acetic acid(100) (50 : 25 : 11) to a distance of about 15 cm, and air-dry the plates. Examine under ultraviolet light (main wavelength: 254 nm); two principal spots corresponding to exo-isomer and endo-isomer appears from the test solution and the standard solution, and the R_f values of the spots obtained from the test solution and the standard solution are the same.

Optical rotation $[\alpha]_D^{20}$: Between -0.5° and +0.5° (0.5 g, water, 10 mL, 100 mm).

Purity (1) ***Clarity and color of solution***—Weigh 16.18 g

of Iohexol, dissolve in water to make exactly 25 mL, and filter through a membrane filter with a porosity of 0.22 μm. Determine the absorbances with this filtrate as directed under the Ultraviolet-visible Spectroscopy using water as the blank test solution at wavelengths of 400 nm, 420 nm and 450 nm; the absorbances are NMT 0.180, 0.030 and 0.015, respectively.

(2) ***Heavy metals***—To 5.0 g of Iohexol, add water to make 50 mL. Use 12 mL of this solution as the test solution. Separately, mix 10 mL of diluted lead standard solution with 2 mL of the test solution, and use this solution as the control solution. Separately, mix 10 mL of water with 2 mL of the test solution, and use this solution as the blank test solution. To 12 mL each of the test solution, the control solution and the blank test solution, add 2 mL of acetate buffer solution, pH 3.5, mix, add 1.2 mL of thioacetamide TS, and mix immediately. Allow to stand for 2 minutes; the color of the test solution is not more intense than that of the control solution (NMT 10 ppm).

Diluted lead standard solution—Immediately before use, pipet accurately 5 mL of lead standard solution, and add water to make 50 mL.

System suitability: The control solution exhibits a faint brown color compared to the blank test solution.

(3) ***Free aromatic amine***—Weigh accurately 0.2 g of Iohexol, transfer to a 50-mL volumetric flask, and dissolve with 15 mL of water. To a second 50-mL volumetric flask, transfer 5 mL of water and 10.0 mL of a solution prepared by dissolving Iohexol related substance I {5-(amino)-N,N,-bis(2,3-dihydroxypropyl)-2,4,6-triiod-1,3-benzenedicarboxyamide)} RS in water to make the concentration of 10 μg per mL. To a third 50-mL volumetric flask, add 15 mL of water. Place these solutions in an ice bath, and cool for 5 minutes. Add 3.0 mL each of 5 mol/L hydrochloric acid TS to each flask, stir to mix, add 2.0 mL of sodium nitrite solution (1 in 50), mix, and allow to stand for 4 minutes. Add 2.0 mL each of sulfamic acid solution (1 in 25), shake, and allow to stand for 1 minute. Remove these solutions from the ice bath, add 2 mL each of a solution of *N*-(1-naphthyl) ethylenediamine dihydrochloride dissolved in diluted propylene glycol (7 in 10) (1 in 1000), and mix. Add water to make 50 mL, allow to stand for 5 minutes, and use these solutions as the test solution, the standard solution and the blank test solution, respectively. With these solutions, perform the test as directed under the Ultraviolet-visible Spectroscopy, and determine the absorbances of the test solution and the standard solution at 495 nm; the absorbance of the test solution is not larger than that of the standard solution (NMT 0.05%).

(4) ***Free iodine***—Weigh 2.1 g of Iohexol, transfer to a 50-mL centrifuge tube with a stopper, add 20 mL of water, and shake vigorously to dissolve. Add 5.0 mL of toluene and 5 mL of 1 mol/L sulfuric acid TS, shake, and centrifuge at high speed; the toluene layer exhibits no red or pink color.

(5) ***Free iodide***—Weigh 5.0 g of Iohexol, dissolve in about 20 mL of water, transfer to a centrifuge tube with a stopper. Add 20 mL of water, shake vigorously or heat gently to dissolve, and titrate with 0.001 mol/L silver nitrate VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction (0.001%).

Each mL of 0.001 mol/L $AgNO_3$
= 126.9 μg of I

(6) ***Ionic substances***—Rinse all glassware 5 times with distilled water. With an aqueous solution of Iohexol (1 in 50), determine the specific resistance (R_{SP}) at 20 ºC, and calculate the specific conductance, κ; the specific conductance is not larger than that of 0.0002% sodium chloride solution (NMT 0.01%).

$$\text{Specific conductance} = (1/R_{SP}) \times 106$$

(7) ***Methanol, 2propanol and methoxyethanol***—Weigh accurately 6.25 g of Iohexol, add 5 mL of internal standard solution, add water to make 25 mL, and use this solution as the test solution (1). Transfer 5.0 mL of the test solution (1) and 1 mL of water to a vial fitted with an elastomeric closure, and seal. Heat the sealed vial at 95 ºC for 15 minutes, and use this solution as the test solution (2). Transfer 5.0 mL of the test solution (1) and 1 mL of the standard solution (2) to a vial fitted with an elastomeric closure and seal. Heat the sealed vial at 95 ºC for 15 minutes, and use this solution as the test solution (3). Transfer 5.0 mL of the test solution (1) and 1.0 mL of the standard solution (3) to a vial fitted with an elastomeric closure and seal. Heat the sealed vial at 95 ºC for 15 minutes, and use this solution as the test solution (4). Transfer 5.0 mL of the test solution (1) and 1.0 mL of the standard solution (4) to a vial fitted with an elastomeric closure and seal. Heat the sealed vial at 95 ºC for 15 minutes, and use this solution as the test solution (5). Separately, weigh accurately about 0.6 g of methanol, add about 100 mL of water, mix, add about 0.6 g of 2-propanol, accurately weighed, add about 100 mL of water, and mix. To this solution, add about 0.6 g of methoxyethanol (95), accurately weighed, add 100 mL of water, mix, add water to make exactly 1000 mL, and use this solution as the standard solution (1). Pipet 10.0 mL of the standard solution (1), add water to make exactly 50 mL, pipet 10.0 mL of this solution, add water to make 100 mL, and use this solution as the standard solution (2). Pipet 5.0 mL of the standard solution (1), add water to make exactly 100 mL, and use this solution as the standard solution (3). To 10.0 mL of the standard solution (1), add water to make exactly 100 mL, and use this solution as the standard solution (4). To 10.0 mL of the standard solution (4) and 10.0 mL of internal standard solution, add water to make exactly 50 mL, transfer 6.0 mL of this solution to a vial fitted with an elastomeric closure, and seal. Heat the sealed vial at 95 ºC for 15 minutes, and use this solution as the standard solution (5). Perform the test with 2 mL each of the test

solution (2), the test solution (3), the test solution (4), the test solution (5) and the standard solution (5) as directed under the Gas Chromatography according to the following operating conditions using the injection port apparatus for the headspace, and calculate the area of the major peak from each chromatogram. Plot the peak area ratios of each component obtained from the test solutions against the amount of methanol RS, amount of 2-propanol RS and amount of methoxyethanol RS added per g of Iohexol. Extrapolate the line joining the points until the line intercepts the concentration axis. Determine the amounts (mg/g) of methanol, 2-propanol and methoxyethanol as the distance between the intercept and the point of intersection. Amounts (%) of methanol and 2-propanol are NMT 0.005%, respectively, and the content (%) of methoxyethanol is NMT 0.002%.

Internal standard solution—2-Prepare a solution by dissolving 2-butanol in water, containing about 0.05 mg per mL.

Operating conditions

Detector: A flame ionization detector

Column: A fused silica capillary column about 0.53 mm in internal diameter and 30 m in length, coated the inside with a 3 μm layer of 6% cyanopropylphenyl and 94% dimethylpolysiloxane.

Column temperature: Maintain at 40 ºC for 5 minutes, followed by an increase at a rate of 10 ºC per minute to 100 ºC, and maintain at 100 ºC for 1 minute.

Sample injection port temperature: 140 ºC

Detector temperature: 250 °C

Carrier gas: Helium

Flow rate: 14 mL/min

System suitability

System performance: Proceed with the standard solution (5) according to the above operating conditions; the relative retention times of methanol, 2-propanol, 2-butanol and methoxyethanol are about 0.3, 0.5, 1.0 and 1.3, respectively, with the resolution between methanol peak and 2-propanol peak being NLT 2.5.

System repeatability: Repeat the test 6 times with the standard solution (5) according to the above operating conditions, the relative standard deviation of each peak area is NMT 5%.

(8) ***3-chloro-1,2-propanediol***—Weigh accurately about 1 g of Iohexol, dissolve in 1.0 mL of water, extract 4 times with 2 mL of ethyl acetate, and combine the extracts. Dry the combined extracts with anhydrous sodium sulfate and filter. Wash the filter with a small amount of ethyl acetate, and combine the washings with the filtrate. Evaporate this solution to the volume of 2.0 mL on a warm water bath and under a stream of nitrogen, filter through a membrane filter, and use the filtrate as the test solution. Separately, dissolve 3-chloro-1,2-propanediol in ethyl acetate to prepare a solution containing 20 μg per mL, and use this solution as the standard solution. Perform the test with 2 μL each of the test solution and the standard solution as directed under the Gas Chromatography according to the following operating conditions; 3-chloro-1,2-propanediol, a mixture of two isomers, exhibits two major peaks at 12 and 12.5 minutes, respectively. Measure the total of two peak areas of 3-chloro-1,2-propanediol, A_{ST} and A_{SA}, and calculate the amount of 3-chloro-1,2-propanediol (NMT 0.0025%).

$$\text{Amount (μg) of 3-chloro-1,2-propanediol} = 100 \times \frac{A_{ST}}{A_{SA}} \times \frac{2C_{ST}}{R}$$

C_{ST}: Concentration (μg/mL) of 3-chloro-1,2-propanediol in the standard solution

R: Recovery rate (%) measured in the system suitability test

Operating conditions

Detector: A flame ionization detector

Column: A fused silica capillary column about 0.32 mm in internal diameter and about 30 m in length, coated the inside with a 1-μm layer of 14% cyanopropylphenyl-86% methylpolysiloxane.

Column temperature: At first, maintain at 50 ºC for 2 minutes, followed by an increase at a rate of 10 ºC per minute to 200 ºC.

Sample injection port temperature: 230 ºC

Detector temperature: 250 °C

Carrier gas: Helium

System suitability

System performance: Proceed with the system suitability solution according to the above operating conditions; the recovery rate of 3-chloro-1,2-propanediol from Iohexol is between 60 and 90%.

$$\text{Recovery rate (\%) of 3-chloro-1,2-propanediol} = 100 \times \frac{A_{RC}}{A_{ST}} \times \frac{C_{ST}}{C_{RS}}$$

C_{RS}: Concentration (μg/mL) of 3-chloro-1,2-propanediol in the system suitability solution

C_{ST}: Concentration (μg/mL) of 3-chloro-1,2-propanediol in the standard solution

A_{RC}: Peak area of 3-chloro-1,2-propanediol obtained from the system suitability solution

A_{ST}: Peak area of 3-chloro-1,2-propanediol obtained from the standard solution

System repeatability: Repeat the test 6 times with the standard solution according to the above conditions; the relative standard deviation of peak area is NMT 10%.

System suitability solution—Add a solution of 1 g of Iohexol containing NMT 5 μg of 3-chloro-1,2-propanediol dissolved in 1 mL of water and 2.0 mL of a solution prepared by dissolving 3-chloro-1,2-propanediol in ethyl acetate, containing 25 μg per mL, and shake to mix. Separately store the ethyl acetate layer, and extract the aqueous layer three times with 2 mL each of ethyl acetate. Combine all the extracts, dry with anhydrous sodium sulfate, filter, and wash the filter with a

small amount of ethyl acetate. Combine the washings, concentrate to 2.0 mL under nitrogen stream, filter through a membrane filter, and use the filtrate as the system suitability solution.

(9) ***Related substances*—**Weigh accurately 75 mg of Iohexol, dissolve in water to make 50 mL, and use this solution as the test solution. Perform the test with 10 μL of this solution as directed under the Liquid Chromatography according to the following operating conditions, and determine the amount of each related substance; the peaks other than the major peak are NMT 0.1%, respectively, the peaks of O-alkylated substances are NMT 0.6%, and the sum of all the related substances other than O-alkylated substances is NMT 0.3%.

$$\text{Content (\%) of the related substance} = 100 \times \frac{A_i}{A_S}$$

A_i: Each peak area other than the major peak
A_S: total area of all the peaks

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 μm to 10 μm in particle diameter).

Mobile phase: Change the rate of acetonitrile and water to increase the percentage of acetonitrile from 1% to 13% at a rate of 0.2% per minute.

Flow rate: 1.0 mL/min

System suitability

System performance: Proceed with 10 μL of the system suitability solution according to the above operating conditions; the relative retention time for the O-alkylated substances to 1.0 of the retention time for the exo-isomer of Iohexol is between 1.1 and 1.4, the resolution between the peaks of iohexol related substance II and Iohexol related substance III is NLT 20.0, and the peak area of iohexol related substance III is 0.5% ± 0.1% of the total area of all peaks in the chromatogram.

System suitability solution—Dissolve iohexol RS, Iohexol related substance II RS and Iohexol related substance I RS in water to prepare solutions containing 1.5 mg, 0.0075 mg and 0.0069 mg per mL, respectively, and use the solutions as the system suitability solutions.

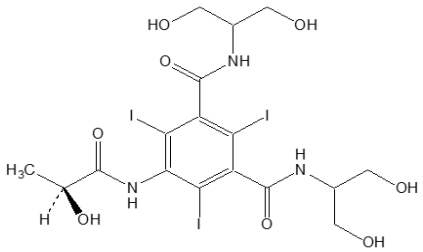
Water NMT 4.0% (0.3 g, volumetric titration, direct titration).

Assay Weigh accurately about 0.5 g of Iohexol, add 25 mL of 1.25 mol/L sodium hydroxide TS and 0.5 g of zinc powder, connect to a reflux condenser, and reflux the mixture for 1 hour. Cool to room temperature, rinse the condenser with 20 mL of water, add the washings in the reaction mixture, mix, and filter. Rinse the flask and the filter thoroughly with a small amount of water, and combine the washings to the filtrate. Add 5 mL of acetic acid(100), and titrate with 0.1 mol/L silver nitrate VS (potentiometric titration under the Titrimetry).

Each mL of 0.1 mol/L silver nitrate
= 27.37 mg of $C_{19}H_{26}I_3N_3O_9$

Packaging and storage Preserve in light-resistant, well-closed containers.

Iopamidol
이오파미돌



$C_{17}H_{22}I_3N_3O_8$: 777.09

1-*N*,3-*N*-*bis*(1,3-Dihydroxypropan-2-yl)-5-[[(2*S*)-2-hydroxypropanoyl]amino]-2,4,6-triiodo-benzene-1,3-dicarboxamide [*60208-45-9*]

Iopamidol, when dried, contains NLT 99.0% and not more the 101.0% of Iopamidol ($C_{17}H_{22}I_3N_3O_8$).

Description Iopamidol occurs as a white crystalline powder.
It is very soluble in water, sparingly soluble in methanol, and practically insoluble in ethanol(99.5).

Identification (1) To 0.05 g of Iopamidol, add 5 mL of hydrochloric acid, and heat on a steam bath for 10 minutes; the resulting solution responds to the Qualitative Analysis for primary aromatic amine.

(2) Heat 0.1 g of Iopamidol over a flame: a violet gas is evolved.

(3) Determine the infrared spectra of Iopamidol and Iopamidol RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared absorption Spectrophotometry; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Optical rotation $[\alpha]_{463nm}^{20}$: Between -4.6° and -5.2° (after drying, 4 g, water, warming, after cooling, 10 mL, 100 mm).

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Iopamidol in 10 mL of water; the solution is clear and colorless.

(2) ***Free acid or alkali***—Weigh accurately about 10.0 g of Iopamidol, dissolve in 100 mL of freshly boiled and cooled water, and titrate with 0.01 mol/L hydrochloric acid VS or 0.01 mol/L sodium hydroxide VS until the pH of the solution becomes 7.0; NMT 1.37 mL of 0.01 mol/L sodium hydroxide VS (NMT 0.005% as free acid)

or NMT 0.75 mL of 0.01 mol/L hydrochloric acid VS (NMT 0.003% as free alkali) is consumed to adjust the pH of the test solution to 7.0.

(3) ***Primary aromatic amine***—Dissolve 0.60 g of Iopamidol in 8 mL of water, add 1 mL of sodium nitrite solution (1 in 50) and 12 mL of 2 mol /L hydrochloric acid TS, shake to mix, and allow to stand for 2 minutes. Add 1 mL of ammonium sulfamate solution (1 in 10), shake to mix, allow to stand for 1 minute, and add 1 mL of naphthylethylenediamine TS and water to make 50 mL. Determine the absorbance of this solution at the wavelength of 495 nm as directed under the Ultraviolet-visible Spectroscopy using a blank test solution prepared in the same manner as the control solution; the absorbance is NMT 0.12 (NMT 0.020%).

(4) ***Iodine***—Dissolve 2.0 g of Iopamidol in 25 mL of water, add 5 mL of 1 mol/L sulfuric acid TS and 5 mL of toluene, shake well to mix, and allow to stand; the toluene layer is colorless.

(5) ***Free iodine ion***—Weigh accurately about 5.0 g of Iopamidol, dissolve in 70 mL of water, and adjust the pH to about 4.5 with dilute acetic acid. To this solution, add 2 mL of 0.1 mol/L sodium chloride TS, and titrate with 0.001 mol/L silver nitrate VS (potentiometric titration under the Titrimetry). Determine the content (%) of iodine ion; it is NMT 0.001%.

Each mL of 0.001 mol/L silver nitrate VS
= 0.1269 mg of I

(6) ***Heavy metals***—Weigh 1.0 g of Iopamidol, moisten with a small quantity of sulfuric acid, and heat gently until almost incinerated at the lowest possible temperature. Allow to stand for cooling, moisten again with a small quantity of sulfuric acid, heat gently until a white fume is no longer evolved, and incinerate by ignition at 450 to 550 °C. Proceed according to Method 2 and perform the test. Prepare the control solution with 1.0 mL of lead standard solution (NMT 10 ppm).

(7) ***Related substances***—Weigh accurately 0.10 g of Iopamidol, dissolve in water to make exactly 10 mL, and use this solution as the test solution. Separately, weigh 10 mg of N,N'-bis[2-hydroxy-1-(hydroxymethyl)ethyl]-5-hydroxyacetyl-amino–2,4,6-triiodoisophthalamide, and dissolve in water to make exactly 100 mL. Pipet 5 mL of this solution, add water to make exactly 50 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak area of each solution by the automatic integration method; each area of the peaks other than iopamidol from the test solution is not larger than the peak area of N,N'-bis[2-hydroxy-1-(hydroxymethyl)ethyl]-5-hydroxyacetyl-amino–2,4,6-triiodoisophthalamidearea from the standard solution. And the total area of these peaks is not larger than 2.5 times the peak area of N,N'-bis[2-hydroxy-1-(hydroxymethyl)ethyl]-5-hydroxyacetyl-amino–2,4,6-triiodoisophthalamide from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 240 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 35 °C.

Mobile phase: Control the mixing ratio of mobile phase A and mobile phase B stepwise or via the gradient elution as follows.

Mobile phase A: Water

Mobile phase B: A mixture of water and methanol (3 : 1).

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 - 6	92	8
6 - 18	92 → 65	8 → 35
18 - 30	65 → 8	35 → 92
30 - 34	8	92

Flow rate: 1.5 mL/min

System suitability

System performance: Dissolve 1 mL of the test solution and 10 mg of N,N'-bis[2-hydroxy-1-(hydroxymethyl)ethyl]-5-hydroxyacetylamino-2,4,6-triiodoisophthalamide in water to make 100 mL proceed with 20 μL of this solution according to the above operating conditions; N,N'-bis[2-hydroxy-1-(hydroxymethyl)ethyl]-5-hydroxyacetylamino-2,4,6-triiodoisophthalamide and iopamidol are eluted in this order with the resolution being NLT 7.

System repeatability: Repeat the test 6 times with 20 μL each of the standard solution according to the above operating conditions; the relative standard deviation of the peak areas of N,N'-bis[2-hydroxy-1-(hydroxymethyl)ethyl]-5-hydroxyacetylamino-2,4,6-triiodoisophthalamide is NMT 1.0%.

Time span of measurement: About 4.3 times the retention time of Iopamidol.

Loss on drying NMT 0.3% (1 g, 105 °C, 3 hours).

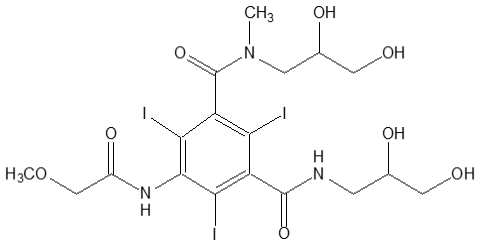
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.5 g of Iopamidol, previously dried, transfer to a saponification flask, dissolve with 40 mL of sodium hydroxide TS, add 1 g of zinc powder, boil for 30 minutes under a reflux condenser, cool, and filter. Wash the flask and the filter paper with 50 mL of water, and combine the washings with the filtrate. Add 5 mL of acetic acid(100) to this solution, and titrate with 0.1 mol/L silver nitrate VS (potentiometric titration under the Titrimetry).

Each mL of 0.1 mol/L silver nitrate VS
= 25.90 mg of $C_{17}H_{22}I_3N_3O_8$

Packaging and storage Preserve in light-resistant, well-closed containers.

Iopromide
이오프로미드



$C_{18}H_{24}I_3N_3O_8$: 791.11

1-*N*,3-*N*-*bis*(2,3-Dihydroxypropyl)-2,4,6-triiodo-5-[(2-methoxyacetyl)amino]-3-*N*-methylbenzene-1,3-dicarboxamide [*73334-07-3*]

Iopromide contains NLT 97.0% and NMT 102.5% of Iopromide ($C_{18}H_{24}I_3N_3O_8$), calculated on the anhydrous and solvent-free basis.

Description Iopromide occurs as a white or pale yellow powder.
It is freely soluble in water and dimethylsulfoxide, and practically insoluble in acetone, ethanol(95) or ether.

Identification (1) Determine the infrared spectra of Iopromide and Iopromide RS, as directed in the potassium bromide disk method under the Mid-infrared absorption Spectrophotometry; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) Perform the test according to the other related substances under the Purity; the principal spots obtained from the test solution and the standard solution have the same R_f values.

Purity (1) ***Heavy metals***—Weigh 2.0 g of Iopromide, and add water to make 20 mL. Take 12 mL of this solution, and use this solution as the test solution. Separately, mix 10 mL of diluted lead standard solution with 2 mL of the test solution, and use this solution as the control solution. Separately, mix 10 mL of water with 2 mL of the test solution, and use this solution as the blank test solution. To 12 mL each of the test solution, the control solution and the blank test solution, add 2 mL of acetate buffer solution, pH 3.5, and mix. Add 1.2 mL of thioacetamide TS, and mix immediately. Allow to stand for 2 minutes; the color of the test solution is not more intense than that of the control solution (NMT 10 ppm).

Diluted lead standard solution—Immediately before use, pipet accurately 5 mL of lead standard solution, and add water to make 50 mL.

System suitability: The control solution exhibits a faint brown color compared to the blank test solution.

(2) ***Free iodine***—Weigh 2.0 g of Iopromide, dissolve in 20 mL of water, add 2 mL of toluene and 2 mL of diluted sulfuric acid, and shake vigorously to mix; the toluene layer does not exhibit a red color.

(3) ***Free iodide***—Weigh 10.0 g of Iopromide, dissolve in 70 mL of water, adjust pH to 3.5 ± 0.5 with 0.05 mol/L sulfuric acid TS, and titrate with 0.001 mol/L silver nitrate VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction (NMT 0.002%).

Each mL of 0.001 mol/L silver nitrate VS
= 126.9 μg of I

(4) ***Free aromatic amine***—Weigh accurately 0.5 g of Iopromide, transfer to a 25 mL volumetric flask, dissolve with 20 mL of water, and use this solution as the test solution. Separately, weigh accurately 25 mg of Iopromide related substance I [5-(acetylamino)-N,N'-bis(2,3-dihydroxypropyl-2,4,6-troiodo-N-methyl-1,3-benzene-dicarboxamide)] RS, and dissolve in water to make exactly 100 mL. Transfer 2.0 mL of this solution to a 25 mL volumetric flask, add 18.0 mL of water, mix, and use this solution as the standard solution Transfer 20 mL of water to a 25 mL volumetric flask, and use this solution as the blank test solution Place each flask in an ice bath while protected from light, add slowly 1.0 mL of 8 mol/L hydrochloric acid TS, mix, and allow to stand for 5 minutes. Add 1.0 mL of sodium nitrite solution (1 in 50), mix, and allow to stand for 5 minutes. Add 0.5 mL of freshly prepared sulfamic acid solution (8 in 100), shake vigorously for 5 minutes, venting off the gas that evolves. Then, to a mixture of propylene glycol and water (70 : 30), add 1.0 mL of freshly prepared solution of N-(1-naphthyl)ethylenediamine dihydrochloride (1 in 100), shake, remove the flasks from the ice bath, and allow to stand on a steam bath at 25 °C for 10 minutes. Add water in each flask to make exactly 25 mL, and degas by sonication for 1 minute.` With these solutions, determine the absorbances, A_T and A_S, from the test solution and the standard solution at the absorbance maximum wavelength at about 495 nm as directed under the Ultraviolet-visible Spectroscopy, using the blank test solution as the control solution, and calculate the content (%) of aromatic amine according to the following formula; it is NMT 0.10%. The absorbance of the standard solution is NLT 0.40.

$$\text{Content (\%) of aromatic amine} = 10 \times \frac{W_S}{W_U} \times \frac{A_T}{A_S}$$

W_S: Amount (mg) of Iopromide related substance I RS taken
W_U: Amount (mg) of sample taken

(5) ***Ethanol—***Weigh accurately 0.5 g of Iopromide, dissolve in *N*,*N*-dimethylformamide to make exactly 10 mL, and use this solution as the test solution. Separately,

weigh accurately a suitable amount of ethanol(95), add *N*,*N*-dimethylformamide and mix to prepare a solution containing about 0.050 mg of ethanol (C_2H_5OH) per mL, and use this solution as the standard solution. Use *N*,*N*-dimethylformamide as the blank test solution. Transfer 2.0 mL each of the test solution, the standard solution and the blank test solution to separate headspace vials, add 10 μL each of 1 mol/L hydrochloric acid TS, and then seal the vials tightly with stoppers. Perform the test as directed under the Gas Chromatography according to the following operating conditions, and determine the peak areas of ethanol, A_T and A_S (NMT 0.4%).

$$\text{Concentration (mg/mL) of ethanol} = \frac{C}{I} \times \frac{A_T}{A_S}$$

C: Concentration (mg/mL) of ethanol in the standard solution

I: Concentration (mg/mL) of Iopromide in the test solution

Operating conditions

Detector: A flame ionization detector

Column: A capillary column about 0.25 mm in internal diameter and about 30 cm in length, coated the inside with liquid 6% cyanopropylphenyl-94% dimethylpolysiloxane in a thickness of 1.4 μm.

Column temperature: Maintain at 40 ºC for 10 minutes, then increase at a rate of 5 ºC per minute to 70 ºC. Then, increase at a rate of 30 ºC per minute to 220 ºC.

Sample injection port temperature: 160 ºC

Headspace sampler temperature: 80 ºC

Detector temperature: Maintain at 250 ºC.

Carrier gas: Helium

Flow rate: 27 mm/second

System suitability

System performance: Proceed with 2.0 mL of the standard solution according to the above operating conditions; the retention time of ethanol is about 3 minutes.

System repeatability: Repeat the test 3 times with 2.0 mL each of the standard solution; the relative standard deviation of the peak area is NMT 4.0%. Proceed with the blank test solution according to the above operating conditions; there is no peak in the retention time range for ethanol.

(6) ***N-acetyl compound (iopromide related substance I)***—Calculate the content (%) of *N*-acetyl compound relative to the Iopromide from the chromatogram obtained in the Assay by the following formula; it is NMT 1.5%.

$$\text{Content (\%) of } N\text{-acetyl compound} = 20 \times \frac{W_B}{W_1} \times \left[\frac{(A_{Y1} + A_{Y2})}{(R_{Y1} + R_{Y2})}\right]$$

W_B: Amount (mg) of iopromide related substance I RS taken in preparing the related substance B standard solution

W_1: Amount (mg) of Iopromide taken in preparing the test solution

A_{Y1}, A_{Y2}: Peak areas of the Y1-isomer and Y2-isomer of Iopromide related substance I, respectively, obtained from the test solution

R_{Y1}, R_{Y2}: Peak areas of the Y1-isomer and Y2-isomer of Iopromide related substance I, respectively, obtained from the related substance I standard solution

(7) ***Other related substances***—Weigh accurately about 0.1 g of Iopromide, dissolve in a mixture of methanol and water (1 : 1) to make exactly 10 mL, and use this solution as test solution. Separately, weigh accurately a suitable amount of Iopromide RS, dissolve and dilute accordingly with a mixture of methanol and water (1 : 1) to make solutions containing 0.01 mg, 0.05 mg, 0.1 mg and 0.2 mg per mL, and use these solutions as the standard solutions. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 1 μL and 2 μL of the test solution and 1 μL each of the standard solutions on two separate thin-layer chromatographic plates of silica gel with fluorescent indicator for thin-layer chromatography. Immerse each plate in acidic developing solvent and basic developing solvent, respectively, develop the plates to a distance about 15 cm, and air-dry the plates. Examine the plates under ultraviolet light (main wavelength: 254 nm). Also, expose the plate developed in the acidic developing solvent to ammonia vapor for 10 to 30 minutes, and air-dry the plates. Expose both plates to ultraviolet light until the principal spots turn yellow, spray evenly coloring agent, examine the plate, and determine total concentration of spots other than principal spots, excluding free aromatic amines and *N*-acetyl compounds obtained from the test solution; it is NMT 3.0%.

Acidic developing solvent—A mixture of chloroform, methanol, water and formic acid (62 : 32 : 6 : 2).

Basic developing solvent—A mixture of 1,4-dioxane, water and ethanol(95) (85 : 15 : 4).

Coloring agent—Dissolve 2.7 g of iron(III) chloride hexahydrate in 100 mL of 2.4 mol/L hydrochloric acid TS, and use this solution as the solution A. Store this solution in a refrigerator. Dissolve 3.5 g of potassium hexacyanoferrate(III) in 100 mL of water, and use this solution as the solution B. Store this solution in a refrigerator. Dissolve 5.0 g of sodium arsenite in 30 mL of 1 mol/L sodium hydroxide TS, previously cooled to 0 ºC, add 65 mL of 2.4 mol/L hydrochloric acid TS, mix, and use this solution as the solution C. Store this solution at room temperature and use the clear supernatant. Mix 10 mL of the solution A, 10 mL of the solution B and 2.0 mL of the solution C, and use the resulting solution within 30 minutes after preparation.

(8) *Isomer*—Using the chromatogram obtained from

the test solution in the Assay, calculate the content (%) of each isomer of Iopromide according to the following formula; the amount of E_1-isomer and Z_1-isomer is between 40.0% and 51.0%, and the amount of E_2-isomer and Z_2-isomer is between 49.0% and 60.0%.

Content (%) of E1-isomer and Z1-isomer of Iopromide
$= 100(r_{E1} + r_{Z1})/(r_{E1} + r_{E2} + r_{Z1} + r_{Z2})$

Content (%) of E2-isomer and Z2-isomer of Iopromide
$= 100(r_{E2} + r_{Z2})/(r_{E1} + r_{E2} + r_{Z1} + r_{Z2})$

r_{E1}, r_{E2}, r_{Z1} and r_{Z2}: Peak areas of E_1, E_2, Z_1 and Z_2-isomers of Iopromide

Water NMT 1.5% (1 g, volumetric titration, direct titration)

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 38 mg of Iopromide, dissolve in a mixture of methanol and water (1 : 1) to make exactly 20 mL, and use this solution as the test solution. Separately, weigh accurately about 38 mg of Iopromide RS (previously determine the water), dissolve in a mixture of methanol and water (1 : 1) to make exactly 20 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions, and determine the peak area of Iopromide from each solution. However, the peak of E-isomer is determined as follows. Transfer a suitable amount of the standard solution to a vial, seal, heat at 121 ºC for 15 minutes, and cool. Perform the test with the cooled solution according to the following operating conditions, and compare the peak with that of the standard solution unheated; identify the isomer with the retention time of the peak increasing after heating.

Amount (mg) of Iopromide ($C_{18}H_{24}I_3N_3O_8$)
$$= C \times \frac{A_T}{A_S}$$

C: Concentration (mg/mL) of Iopromide RS in the standard solution

A_T: Sum of peak areas of E_1, E_2, Z, and Z_2-Isomers obtained from the test solution

A_S: Sum of peak areas of E_1, E_2, Z, and Z_2-Isomers obtained from the standard solution

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: Mix 6 g of chloroform with 59 g of methanol, add 900 g of water, and gently mix. Do not shake or strongly extrude the mobile phase during use. Allow the mobile phase to flow for NLT 60 minutes after each injection.

Flow rate: About 1.2 mL/min

Column temperature: A constant temperature of about 20 °C.

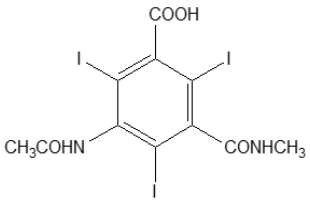
System suitability

System performance: Proceed with 10 μL of the standard solution according to the above operating conditions; the relative retentiontimes of iopromide E_1-isomer, E_2-isomer, Z_1-isomer and Z_2-isomer are about 0.70, 0.75, 0.85, and 1.0, respectively with the resolution between peaks of iopromide Z_1 and Z_2 isomers being NLT 2.0. Separately, weigh accurately about 1.9 mg of Iopromide related substance I RS, and dissolve in a mixture of methanol and water (1 : 1) to make exactly 100 mL. Proceed with 10 μL of this solution according to the above operating conditions; the relative retention times of Y_1- and Y_2-isomers of the Iopromide related substance I are about 0.28 and 0.31, respectively, and the signal-to-noise ratio for Y_2-isomer peak is NLT 20.

System repeatability: Repeat the test 5 times with 10 μL each of the standard solution according to the above operating conditions; the relative standard deviation of the total peak areas of iopromide is NMT 2.0%.

Packaging and storage Preserve in light-resistant, well-closed containers.

Iotalamic Acid
이오탈람산



$C_{11}H_9I_3N_2O_4$: 613.91

3-Acetamido-2,4,6-triiodo-5-(methylcarbamoyl) benzoic acid [*2276-90-6*]

Iotalamic Acid, when dried, contains NLT 99.0% and NMT 101.0% of Iotalamic acid ($C_{11}H_9I_3N_2O_4$).

Description Iotalamic Acid occurs as a white powder and is odorless.
It is slightly soluble in ethanol(95), very slightly soluble in water, and practically insoluble in ether.
It dissolves in sodium hydroxide TS.
It is gradually colored by light.

Identification (1) Heat 0.1 g of Iotalamic Acid over a flame; a purple gas is evolved.

(2) Determine the infrared spectra of Iotalamic Acid and iotalamic acid RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the

same wavenumbers.

Purity (1) ***Clarity and color of solution***—Dissolve 2.0 g of Iotalamic Acid in 10 mL of sodium hydroxide TS; the resulting solution is clear and colorless.

(2) ***Primary aromatic amine***—To 0.50 g of Iotalamic Acid, add 15 mL of water and dissolve in1 mL of sodium hydroxide TS while ice0cooling, add 4 mL of sodium nitrite solution (1 in 100), immediately add 12 mL of 1 mol/L hydrochloric acid TS, and shake gently to mix. Allow to stand for exactly 2 minutes, add 8 mL of ammonium sulfamate TS, and shake occasionally to mix for 5 minutes. Add 3 drops of 1-naphthol in ethanol(95) (1 in 10), allow to stand for 1 minute, add 3.5 mL of ammonia-ammonium chloride buffer solution, pH 10.7, mix, and immediately add water to make 50 mL. Within 20 minutes, determine the absorbance of this solution at 485 nm as directed under the Ultraviolet-visible Spectroscopy, using a blank test solution prepared in the same manner as the control solution; the absorbance is NMT 0.25.

(3) ***Soluble halides***—Dissolve 0.5 g of Iotalamic Acid in 20 mL of diluted ammonia TS (1 in 40), add 6 mL of dilute nitric acid, and shake to mix. Allow to stand for 5 minutes, filter, and transfer the filtrate to a Nessler tube. Wash the residue with 20 mL of water, combine the filtrate and the washings, and add water to make 50 mL. Use the resulting solution as the test solution and proceed as directed under the Chloride. To 0.10 mL of 0.01 mol/L hydrochloric acid VS, add 20 mL of diluted ammonia TS (1 in 40), 6 mL of dilute nitric acid, and water to make 50 mL. Use this solution as the control solution.

(4) ***Iodine***—Dissolve 0.20 g of Iotalamic Acid in 2.0 mL of sodium hydroxide TS, add 2.5 mL of 0.5 mo1/L sulfuric acid TS, and allow to stand for 10 minutes with occasional shaking. Add 5 mL of chloroform, shake well to mix and allow to stand; the chloroform layer is colorless.

(5) ***Heavy metals***—Proceed with 1.0 g of Iotalamic Acid according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(6) ***Arsenic***—Weigh 0.6 g of Iotalamic Acid and proceed according to Method 3 and perform the test (NMT 3.3 ppm).

Loss on drying NMT 0.5% (1 g, 105 ℃, 4 hours).

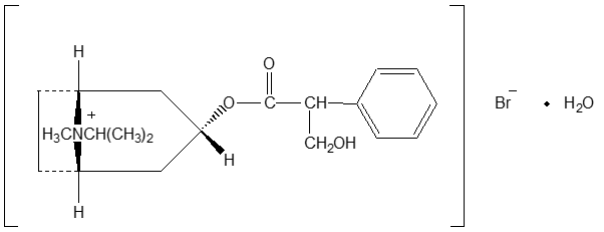
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.4 g of Iotalamic Acid, previously dried, transfer to a flask, and dissolve in 40 mL of sodium hydroxide TS. Add 1 g of zinc powder, boil for 30 minutes under a reflux condenser, cool, and filter. Wash the flask and the filter paper with 50 mL of water and combine the washings and the filtrate. Add 5 mL of acetic acid(100) to this solution and titrate with 0.1 mol/L silver nitrate VS (indicator: 1 mL of tetrabromophenolphthalein ethyl ester TS). However, the endpoint of titration is when the color of the precipitate changes from yellow to green.

Each mL of 0.1 mol/L silver nitrate VS
= 20.464 mg of $C_{11}H_9I_3N_2O_4$

Packaging and storage Preserve in light-resistant, tight containers.

Ipratropium Bromide Hydrate
이프라트로퓸브롬화물수화물



Ipratropium Bromide $C_{20}H_{30}BrNO_3 \cdot H_2O$: 430.38
(1*R*,3*R*,5*S*,8*R*)-3-[(3-hydroxy-2-phenylpropanoyl)oxy]-8-methyl-8-(propan-2-yl)-8-azabicyclo[3.2.1] octan-8-ium bromide hydrate [*66985-17-9*]

Ipratropium Bromide, when dried, contains NLT 99.0% and NMT 101.0% of Ipratropium Bromide ($C_{20}H_{30}BrNO_3$: 412.36).

Description Ipratropium Bromide occurs as a white crystalline powder.
It is freely soluble in water, soluble in ethanol(99.5), slightly soluble in acetonitrile or acetic acid(100), and practically insoluble in ether.
The pH of a solution of 1.0 g of Ipratropium Bromide dissolved in 20 mL of water is between 5.0 and 7.5.

Melting point—About 223 ºC (with decomposition, after drying).

Identification (1) To 5 mg of Ipratropium Bromide, add 0.5 mL of fuming nitric acid, and evaporate on a steam bath to dryness. After cooling, dissolve the residue in 5 mL of acetone, and add 2 drops of potassium hydroxide-ethanol TS; the solution exhibits a purple color.

(2) Determine the absorption spectra of solutions of Ipratropium Bromide Hydrate and ipratropium bromide hydrate RS in 0.01 mol/L hydrochloric acid TS (3 in 2000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared spectra of Ipratropium Bromide Hydrate and Ipratropium Bromide Hydrate RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(4) An aqueous solution of Ipratropium Bromide Hydrate (1 in 100) responds to the Qualitative Analysis for bromide.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Ipratropium Bromide Hydrate in 20 mL of water; the

solution is clear and colorless.

(2) ***Sulfate***—Perform the test with 1.0 g of Ipratropium Bromide Hydrate. Prepare the control solution with 0.50 mL of 0.005 mol/L sulfuric acid (NMT 0.024%).

(3) ***Heavy metals***—Proceed with 2.0 g of Ipratropium Bromide Hydrate according to Method 4 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(4) ***Arsenic***—Proceed with 2.0 g of Ipratropium Bromide Hydrate according to Method 3 and perform the test. However, use a solution of magnesium nitrate in ethanol(95) (1 in 10) (NMT 1 ppm).

(5) ***Isopropylatropine bromide***—Dissolve 25 mg of Ipratropium Bromide Hydrate in the mobile phase to make exactly 100 mL, and use this solution as the test solution. With 25 μL of this solution, perform the test as directed under the Liquid Chromatography according to the following conditions. Determine the peak area, A_a, of ipratropium and the peak area, A_b, having a ratio of the retention time to ipratropium about 1.3 by the automatic integration method; $A_b/(A_a+A_b)$ is NMT 0.01. No peak other than the peak of ipratropium and the peak having a ratio of the retention time to ipratropium about 1.3 appears within about 14 minutes of the retention time after the solvent peak.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 210 nm).

Column: A stainless steel column about 4 mm in internal diameter and 10 cm to 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of diluted phosphoric acid (1 in 200), acetonitrile and methanesulfonic acid (1000 : 120 : 1)

Flow rate: Adjust the flow rate so that the retention time of ipratropium is about 7 minutes.

System suitability

Detection sensitivity: Adjust the detection sensitivity so that the peak height of ipratropium obtained from 25 μL of the test solution composes 50% to 80% of the full scale.

System performance: Heat a solution of Ipratropium Bromide Hydrate in 1 mol/L hydrochloric acid TS (1 in 100) at 100 ºC for 1 hour. After cooling, to 2.5 mL of this solution, add the mobile phase to make 100 mL. Proceed with 25 μL of this solution according to the above operating conditions; the resolution between the peak of ipratropium and the peak having a ratio of the retention time to ipratropium about 0.6 is NLT 3.

(6) ***Apo-compounds***—Weigh 0.14 g of Ipratropium Bromide Hydrate and dissolve in 0.01 mol/L hydrochloric acid TS to make 100 mL. Perform the test with this solution as directed under the Ultraviolet-visible Spectroscopy and determine the absorbances, A_1 and A_2, at 246 nm and 263 nm, respectively: A_1/A_2 is NMT 0.91.

Loss on drying Between 3.9% and 4.4% (1 g, 105 ºC, 4 hours).

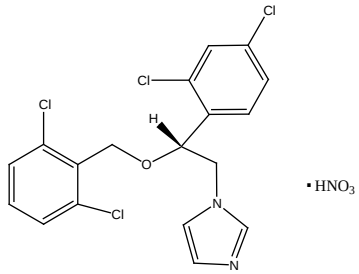
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.3 g of Ipratropium Bromide Hydrate, previously dried, dissolve in 40 mL of acetic acid(100), add 40 mL of 1,4-dioxane and 2.5 mL of bismuth nitrate TS, and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 41.24 mg of $C_{20}H_{30}BrNO_3$

Packaging and storage Preserve in tight containers.

Isoconazole Nitrate
이소코나졸질산염



and enantiomer

$C_{18}H_{14}Cl_4N_2O \cdot HNO_3$: 479.14

1-{2-[(2,6-Dichlorobenzyl)oxy]-2-(2,4-dichlorophenyl)ethyl}-1*H*-imidazole; nitric acid [*24168-96-5*]

Isoconazole Nitrate contains NLT 99.0% and NMT 101.0% of isoconazole nitrate ($C_{18}H_{14}Cl_4N_2O \cdot HNO_3$), calculated on the dried basis.

Description Isoconazole Nitrate occurs as a white powder.

It is soluble in methanol, slightly soluble in ethanol(95), and very slightly soluble in water.

Identification (1) Weigh the amount of Isoconazole Nitrate, equivalent to about 1 mg of nitric acid, add a mixture of 0.1 mL of nitrobenzene and 0.2 mL of sulfuric acid, and allow to stand for 5 minutes. After cooling in iced water, add 5 mL of water gently while stirring, add 5 mL of 10 mol/L sodium hydroxide TS and 5 mL of acetone, shake, and allow to stand; the upper layer of the resulting solution exhibits an intense purple color.

(2) Determine the infrared spectra of Isoconazole Nitrate and isoconazole nitrate RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) Dissolve 30 mg of Isoconazole Nitrate in 5 mL

of methanol, and use this solution as the test solution. Separately, dissolve 30 mg of isoconazole nitrate RS in 5 mL of methanol, and use this solution as the standard solution (1). Also, dissolve 30 mg of isoconazole nitrate RS and 30 mg of econazole nitrate RS in 5 mL of methanol, and use this solution as the standard solution (2). With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution, the standard solution (1), and the standard solution (2) on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of heptane, 2-propanol, and ammonium acetate TS (50 : 50 : 1) as the developing solvent to a distance of about 15 cm, and air-dry the plate for about 15 minutes. Apply iodine vapor to the plate; the R_f values of the principal spots obtained from the test solution and the standard solution (1) are the same. This test is valid when the two spots obtained from the standard solution (2) separate clearly.

Optical rotation $[\alpha]_D^{20}$: Between -0.10° and +0.10° (0.2 g, methanol, 20 mL, 100 mm).

Melting point Between 178 and 182 ℃.

Purity (1) ***Clarity and color of solution***—Dissolve 0.2 g of Isoconazole Nitrate in methanol to make 20 mL; the resulting solution is clear.

(2) ***Related substances***—Weigh exactly about 0.10 g of Isoconazole Nitrate, dissolve in the mobile phase to make exactly 10 mL, and use this solution as the test solution. Separately, dissolve 2.5 mg of isoconazole nitrate RS and 2.5 g of econazole nitrate RS in the mobile phase to make exactly 100 mL, and use this solution as the standard solution (1). To 1.0 mL of the test solution, add the mobile phase to make exactly 100 mL. To 5.0 mL of this solution, add the mobile phase to make exactly 20 mL, and use this solution as the standard solution (2). Perform the test with 10 μL each of the test solution and the standard solution (2) as directed under the Liquid Chromatography according to the following operating conditions, and determine the peak area of each solution by the automatic integration method; the peak area other than the major peak obtained from the test solution is not greater than the area of the major peak obtained from the standard solution (2)(0.25%). The sum of total peak areas other than the major peak obtained from the test solution is not greater than 2 times the area of the major peak of the standard solution (2)(0.5%). However, exclude any peaks having an area smaller than 0.2 times the area of the solvent, nitrate ion, and the major peak obtained from the standard solution (2).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 235 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 10 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 μm in particle diameter).

Mobile phase: Dissolve 6 g of ammonium acetate in a mixture of water, methanol and acetonitrile (380 : 320 : 300).

Flow rate: 2.0 mL/min

System suitability

Detection sensitivity: Adjust the detection sensitivity so that the height of major peak obtained from 10 μL of the standard solution (2) is 50.0% of the full scale.

System performance: Proceed with 10 μL of the standard solution (1) under the above conditions; econazole and isoconazole are eluted in this order, the retention time is about 10 minutes and 14 minutes, respectively, and the resolution between the peak of econazole and the peak of isoconazole NLT 5.0.

Loss on drying NMT 0.5% (1 g, 105 ℃, 2 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.35 g of Isoconazole Nitrate, dissolve in 75 mL of a mixture of 2-butanone and acetic acid(100) (7 : 1), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 47.91 mg of $C_{18}H_{15}Cl_4N_3O_4$

Packaging and storage Preserve in light-resistant, well-closed containers.

Isoconazole Nitrate Cream
이소코나졸질산염 크림

Isoconazole Nitrate Cream contains NLT 90.0% and NMT 110.0% of the labeled amount of isoconazole nitrate ($C_{18}H_{14}Cl_4N_2O \cdot HNO_3$: 479.14).

Method of preparation Prepare as directed under Creams, with Isoconazole Nitrate.

Identification Weigh an amount of Isoconazole Nitrate Cream equivalent to 10 mg of isoconazole nitrate ($C_{18}H_{14}Cl_4N_2O \cdot HNO_3$), and extract 4 times with 10 mL of ethyl acetate each. For each extraction, add 8 g of anhydrous sodium sulfate and shake. Filter the clear supernatant with filter paper and evaporate to dryness on a steam bath. Dissolve the residue in 10 mL of ethyl acetate and use this solution as the test solution. Separately, dissolve isoconazole nitrate RS in ethyl acetate to make 1 mg/mL and use this solution as the standard solution. Perform the test with the test solution and the standard solution as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Develop the plate with a mixture of n-hexane, ethyl acetate and

methanol (6 : 3 : 1) as the developing solvent and air-dry the plate. Spray evenly Dragendorff's TS on the plate; the R_f value and the color of the spots obtained from the test solution and the standard solution are the same.

Assay Weigh accurately an amount of Isoconazole Nitrate Cream equivalent to about 25 mg of isoconazole nitrate ($C_{18}H_{14}Cl_4N_2O \cdot HNO_3$), add 25.0 mL of the internal standard solution, and warm on a steam bath. After cooling, add chloroform to make 50 mL. Use this solution as the test solution. Separately, weigh accurately about 25 mg of isoconazole nitrate RS, dissolve in 25.0 mL of the internal standard solution, add chloroform to make 50 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography, and calculate the peak area ratios, Q_T and Q_S, of isoconazole nitrate to the peak area of the internal standard.

$$\text{Amount (mg) of isoconazole nitrate } (C_{18}H_{14}Cl_4N_2O \cdot HNO_3) = \text{Amount (mg) of isoconazole nitrate RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—Weigh about 50 mg of diflucortolone valerate and add chloroform to make 100 mL.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 280 nm).

Column: A stainless steel column about 3.9 mm in internal diameter and about 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of methanol and 0.1 mol/L acetate buffer solution (pH 4.7) (8 : 2).

Flow rate: 2.0 mL/min

Packaging and storage Preserve in well-closed containers.

Isoconazole Nitrate and Diflucortolone Valerate Cream

이소코나졸질산염·

디플루코르톨론발레레이트 크림

Isoconazole Nitrate and Diflucortolone Valerate Cream contains NLT 90.0% and NMT 110.0% of isoconazole nitrate ($C_{18}H_{14}Cl_4N_2O \cdot HNO_3$: 479.15) and diflucortolone valerate ($C_{27}H_{36}F_2O_5$: 478.58) of the labeled amount.

Method of preparation Prepare as directed under Creams, with Isoconazole Nitrate and Diflucortolone Valerate.

Identification (1) ***Diflucortolone valerate***—Take 20 mL of the solution obtained from the Assay under Diflucortolone Valerate, evaporate to dryness on a steam bath, and dissolve the residue in 0.5 mL of chloroform. Use this solution as the test solution. Separately, dissolve diflucortolone valerate RS in chloroform to make 1 mg/mL, and use this solution as the standard solution. Perform the test with the test solution and the standard solution as directed under the Thin Layer Chromatography. Spot 10 mL of each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of ether and diethylamine (98 : 2) as the developing solvent and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the colors and R_f values of the spots obtained from the test solution and the standard solution are the same.

(2) ***Isoconazole nitrate***—Perform the test as directed under the Identification under Isoconazole nitrate cream.

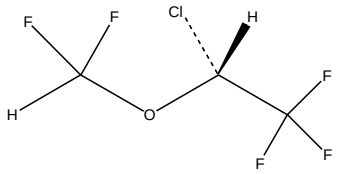
Assay (1) ***Diflucortolone valerate***—Weigh accurately an amount of Isoconazole Nitrate and Diflucortolone Valerate Cream equivalent to about 1 mg of diflucortolone valerate ($C_{27}H_{36}F_2O_5$), transfer to a 50-mL separatory funnel, add 30 mL of n-hexane and 10 mL of 90% methanol, and shake vigorously for 5 minutes until the cream completely becomes suspension. Next, extract 3 times using 10 ml of 90% methanol each time. If the extract is oily, add sodium chloride and remove. Collect the methanol extracts in a beaker, add a small amount of toluene, and evaporate to dryness on a steam bath. Add 10 mL of methanol to the evaporation residue and warm to dissolve. After cooling, filter into a 50-mL volumetric flask using a glass filter. Wash the filter with methanol, combine the washings, and fill with methanol to the gauge line. Use this solution as the test solution. Separately, weigh accurately about 10 mg of diflucortolone valerate RS and dissolve in methanol to a final concentration of 20 μg per mL. Pipet 1 mL each of the test solution, the standard solution and the blank test solution, place in a 20-mL volumetric flask and add 4.0 mL of 0.02 mol/L isoniazid solution to each volumetric flask. Fill with methanol to the gauge line and shake to mix. Warm each flask at 60 ℃ for 60 minutes, then cool to room temperature. With the test solution and the standard solution, using the blank test solution as a control solution, determine the absorbances A_T and A_S at the absorbance maximum wavelength near 401 nm.

$$\text{Amount (mg) of diflucortolone valerate } (C_{27}H_{36}F_2O_5) = \text{Amount (mg) of diflucortolone valerate RS} \times \frac{A_T}{A_S} \times \frac{1}{100}$$

(2) ***Isoconazole nitrate***—Perform the test as directed under the Assay under Isoconazole nitrate cream.

Packaging and storage Preserve in well-closed containers.

Isoflurane
이소플루란



and enantiomer

$C_3H_2ClF_5O$: 184.49

2-Chloro-2-(difluoromethoxy)-1,1,1-trifluoroethane

[*26675-46-7*]

Isoflurane contains NLT 99.9% and NMT 101.0% of isoflurane ($C_3H_2ClF_5O$), calculated on the anhydrous basis.

It is a clear, colorless fluidal liquid.

It is slightly soluble in water.

It is miscible with ethanol(99.5), methanol or *o*-xylene.

It is volatile and has no inflammability.

It shows no optical rotation.

Refractive index n_D^{20}: About 1.30.

Boiling point: Between 47 and 50 ℃.

Identification (1) Determine the infrared spectra of Isoflurane and isoflurane RS as directed under the liquid film method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wave numbers.

(2) Prepare the test solution with 50 μL of Isoflurane using 40 mL of water as the absorbing liquid as directed under the Oxygen Flask Combustion; the test solution responds to the Qualitative Analysis for chloride and fluoride.

Specific gravity d_{20}^{20}: Between 1.500 and 1.520.

Purity (1) ***Acidity or alkalinity***—To 10 mL of Isoflurane, add 5 mL of freshly boiled and cooled water, and shake to mix for 1 minute; the separated water layer is neutral.

(2) ***Soluble chloride***—Weigh 60 g of Isoflurane, add 40 mL of water, shake well to mix, and separate the water layer. To 20 mL of the water layer, add 6 mL of dilute nitric acid and water to make 50 mL. Perform the test with this solution as the test solution as directed under the Chloride. Prepare the control solution with 0.25 mL of 0.01 mol/L hydrochloric acid (NMT 3 ppm).

(3) ***Soluble fluoride***—To 6 g of Isoflurane, add 12 mL of diluted 0.01 mol/L sodium hydroxide TS (1 in 20), and shake to mix for 10 minutes. Take 4.0 mL of the diluted 0.01 mol/L sodium hydroxide TS (1 in 20) layer, transfer into a Nessler tube, add 30 mL of a mixture of alizarin complexone TS, acetic acid-potassium acetate buffer solution, pH 4.3, and cerium(III) nitrate TS (1 : 1 : 1), and add water to make 50 mL. Allow to stand for 60 minutes and use this solution as the test solution. Separately, take 0.4 mL of the fluorine standard solution and 4.0 mL of diluted 0.01 mol/L sodium hydroxide TS (1 in 20), transfer to a Nessler tube, add 30 mL of a mixture of alizarin complexone TS, acetic acid-potassium acetate buffer solution, pH 4.3, and cerium(III) nitrate TS (1 : 1 : 1), then proceed in the same manner as in the preparation of the test solution, and use this solution as the standard solution. Perform the test with the test solution and the standard solution at 600 nm as directed under the Ultraviolet-visible Spectroscopy, using a solution, obtained by proceeding with 4.0 mL of diluted 0.01 mol/L sodium hydroxide TS (1 in 20) in the same manner as above, as the control solution; the absorbance obtained from the test solution is NMT that of the standard solution (NMT 2 ppm).

Fluorine standard solution—Weigh accurately 2.21 g of sodium fluoride and dissolve in water to make exactly 1000 mL. Pipet 10 mL of this solution and add water to make exactly 1000 mL. 1 mL of the resulting solution contains 0.01 mg of fluorine (F).

(4) ***Related substances***—Use Isoflurane as the test solution. Pipet 1 mL of the test solution and add *o*-xylene to make exactly 100 mL. Pipet 1 mL of this solution, add *o*-xylene to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 5 μL each of the test solution and the standard solution as directed under the Gas Chromatography according to the following conditions, and determine each peak area by the automatic integration method; the area of the peak other than the Isoflurane obtained from the test solution is NMT the peak area of isoflurane from the standard solution. The total area of all peaks other than Isoflurane from the test solution is NMT 3 times the peak area of Isoflurane from the standard solution.

Operating conditions

Detector, column, column temperature, carrier gas and flow rate; proceed as directed in the operating conditions under the Assay.

System suitability

System performance and System repeatability; proceed as directed in System suitability under the Assay.

Test for required detectability: Pipet 1 mL of the standard solution and add *o*-xylene to make exactly 2 mL. Confirm that the peak area of Isoflurane obtained with 5 μL of this solution is between 35% and 65% of the peak area of Isoflurane obtained with 5 μL of the standard solution.

Time span of measurement: About 5 times of the Isoflurane retention time.

(5) ***Peroxide***—Transfer 10 mL of Isoflurane to a Nessler tube, add 1 mL of freshly prepared potassium iodide solution (1 in 10), shake vigorously to mix, and allow to stand in a dark place for 1 hour; the water layer does not exhibit a yellow color.

(6) ***Residue on evaporation***—Take exactly 65 mL of Isoflurane, evaporate on a steam bath, and dry the resi-

due at 105 ºC for 1 hour; the mass of residue is NMT 1 mg.

Water NMT 0.1% (2 g, coulometric titration).

Assay Pipet 5 mL each of Isoflurane and isoflurane RS (previously determine the water content in the same manner as Isoflurane), add exactly 3 mL of ethyl acetate as the internal standard, and add *o*-xylene to make exactly 50 mL. Pipet 5 mL each of these solutions and add *o*-xylene to make exactly 50 mL, and use these solutions as the test solution and the standard solution. Perform the test with 2 μL each of the test solution and standard solution as directed under the Gas Chromatography according to the following conditions, and determine the ratios, Q_T and Q_S, of the peak area of Isoflurane to that of the internal standard.

$$\text{Amount (mg) of isoflurane } (C_3H_2ClF_5O) \text{ in 5 mL of Isoflurane} = V_s \times \frac{Q_T}{Q_S} \times 1000 \times 1.506$$

*V*s: Amount (mL) of Isoflurane RS taken, calculated on the anhydrous basis

1.506: Specific gravity (d_{20}^{20}) of Isoflurane

Operating conditions

Detector: A flame ionization detector

A stainless steel column about 3 mm in internal diameter and about 3.5 m in length, packed with diatomaceous earth for gas chromatography (125 μm - 149 μm in particle diameter), coated with nonylphenoxypoly(ethyleneoxy)-ethanol (10%) for gas chromatography and polyalkylene glycol (15%) for gas chromatography.

Column temperature: A constant temperature of about 80 °C.

Carrier gas: Nitrogen

Flow rate: Adjust the flow rate so that the retention time of isoflurane is about 7 minutes.

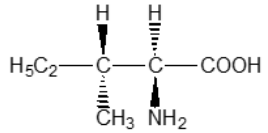
System suitability

System performance: Perform the test with 2 μL of the standard solution according to the above operating conditions; isoflurane and the internal standard are eluted in this order with the peak resolution is NLT 3.

System repeatability: Repeat the test six times with 2 μL of the standard solution according to the above operating conditions; the relative standard deviation of the peak areas of the Isoflurane is NMT 1.0%.

Packaging and storage Preserve in tight containers at NMT 30 ℃.

L-Isoleucine
L-이소류신



Isoleucine $C_6H_{13}NO_2$: 131.17

(2*S*,3*S*)-2-Amino-3-methylpentanoic acid [*73-32-5*]

L-Isoleucine, when dried, contains NLT 98.5% and NMT 101.0% of L-isoleucine ($C_6H_{13}NO_2$).

Description L-Isoleucine occurs as white crystals or a crystalline powder. It is odorless or has a faint characteristic odor and a slightly bitter taste.
It is freely soluble in formic acid, sparingly soluble in water, and practically insoluble in ethanol(95) or ether.
It is soluble in dilute hydrochloric acid.

Identification Determine the infrared spectra of L-Isoleucine and L-isoleucine RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Optical rotation $[\alpha]_D^{20}$: Between +39.5° and +41.5° (1 g, after drying, 6 mol/L hydrochloric acid TS, 25 mL, 100 mm).

pH Dissolve 1.0 g of L-Isoleucine in 100 mL of water; the pH of this solution is 5.5 to 6.5.

Purity (1) ***Clarity and color of solution***—Dissolve 0.5 g of L-Isoleucine in 10 mL of 1 mol/L hydrochloric acid TS; the resulting solution is clear and colorless.

(2) ***Chloride***—Perform the test with 0.5 g of L-Isoleucine. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid (NMT 0.021%).

(3) ***Sulfate***—Perform the test with 0.6 g of L-Isoleucine. Prepare the control solution with 0.35 mL of 0.005 mol/L sulfuric acid (NMT 0.028%).

(4) ***Ammonium***—Perform the test with 0.25 g of L-Isoleucine. Prepare the control solution with 5.0 mL of ammonium standard solution (NMT 0.02%).

(5) ***Heavy metals***—Dissolve 1.0 g of L-Isoleucine in 40 mL of water and 2 mL of dilute acetic acid by warming. After cooling, add water to make 50 mL, and use this solution as the test solution. Prepare the control solution by adding 2 mL of lead standard solution, 2 mL of dilute acetic acid, and water to make 50 mL (NMT 20 ppm).

(6) ***Iron***—Dissolve about 0.333 g of L-Isoleucine in water to make 45 mL, add 2 mL of hydrochloric acid, and use this solution as the test solution. Add water to 1.0 mL of iron standard solution to make 45 mL, add 2 mL of hydrochloric acid, and use this solution as the standard solution. Add 50 mg of ammonium peroxydisulfate, 3 mL of 30% ammonium thiocyanate in the test solution, and the standard solution, and mix; the color obtained from the test solution is not more intense than that from the standard solution (NMT 30 ppm).

(7) ***Arsenic***—Prepare the test solution with 1.0 g of

L-Isoleucine according to Method 2 and perform the test (NMT 2 ppm).

(8) ***Related substances***—Dissolve 0.10 g of L-Isoleucine in 25 mL of water and use this solution as the test solution. Pipet 1 mL of this solution and add water to make exactly 50 mL. Pipet 5 mL of this solution, add water to make exactly 20 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on a thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of 1-butanol, water, and acetic acid(100) (3 : 1 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Spray evenly a solution of ninhydrin in acetone (1 in 50) on the plate and heat at 80 ℃ for 5 minutes; the spots other than the principal spot obtained from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 0.3% (1 g, 105 ℃, 3 hours).

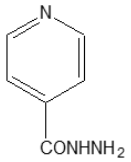
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.13 g of L-Isoleucine, previously dried, dissolve in 3 mL of formic acid, add 50 mL of acetic acid(100), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 13.117 mg of $C_6H_{13}NO_2$

Packaging and storage Preserve in tight containers.

Isoniazid
이소니아지드



Isonicotinic Acid Hydrazide $C_6H_7N_3O$: 137.14
Pyridine-4-carbohydrazide [*54-85-3*]

Isoniazid, when dried, contains NLT 98.5% and NMT 101.0% of isoniazid ($C_6H_7N_3O$).

Description Isoniazid occurs as colorless crystals or white crystalline powder and is odorless.
It is freely soluble in water or acetic acid(100), sparingly soluble in ethanol(95), slightly soluble in acetic anhydride, and very slightly soluble in ether.

Identification (1) Dissolve 20 mg each of Isoniazid and isoniazid RS in water to make 200 mL. Take 5 mL of this solution and add 1 mL of 0.1 mol/L hydrochloric acid TS and water to make 50 mL. Determine the absorption spectra of both solutions as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectrum of Isoniazid and isoniazid RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wave numbers.

Melting point Between 170 and 173 ºC.

pH Dissolve 1.0 g of Isoniazid in 10 mL of freshly boiled and cooled water; the pH of this solution is between 6.5 and 7.5.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Isoniazid in 20 mL of water; the solution is colorless and clear.

(2) ***Heavy metals***—Proceed with 1.0 g of Isoniazid as directed under Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Arsenic***—Proceed with 0.40 g of Isoniazid as directed under Method 3 and perform the test. However, add 10 mL of ethanol(95) solution (1 in 50) of magnesium nitrate, add 1.5 mL of hydrogen peroxide water, and ignite and combust (NMT 5 ppm).

(4) ***Hydrazine***—Dissolve 0.10 g of Isoniazid in 5 mL of water, add 0.1 mL of an ethanol(95) solution (1 in 20) of salicylaldehyde, shake to mix immediately, and allow to stand for 5 minutes; the resulting solution is not turbid.

Loss on drying NMT 0.5% (1 g, 105 ℃, 2 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.3 g of Isoniazid, previously dried, dissolve in 50 mL of acetic acid(100) and 10 mL of acetic anhydride, and titrate with 0.1 mol/L perchloric acid VS (indictor: 0.5 mL of 1-naphtholbenzein TS). However, the endpoint of the titration is when the color of the solution changes from yellow to green. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 13.714 mg of $C_6H_7N_3O$

Packaging and storage Preserve in light-resistant, tight containers.

Isoniazid Tablets
이소니아지드 정

Isonicotinic Acid Hydrazide Tablets

Isoniazid Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of isoniazid ($C_6H_7N_3O$: 137.14).

Method of preparation Prepare as directed under Tablets, with Isoniazid.

Identification Weigh an amount of Isoniazid Tablets, previously powdered, equivalent to 20 mg of isoniazid according to the labeled amount, add 200 mL of water, shake to mix, and filter. To 5 mL of the filtrate, add 1 mL of 0.1 mol/L hydrochloric acid TS and water to make 50 mL. Determine the absorption spectrum of this solution as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum at the wavelengths 264 nm to 268 nm.

Dissolution Perform the test with 1 tablet of Isoniazid Tablets at 50 revolutions per minute according to Method 2 under the Dissolution, using 900 mL of water as the dissolution medium. Take NLT 20 mL of the dissolved solution 20 minutes after starting the dissolution test, and filter through a membrane filter with a pore size of NMT 0.45 μm. Discard the first 10 mL of the filtrate, then pipet 5 mL of the subsequent filtrate, add water to make exactly 50 mL, and use this solution as the test solution. Separately, weigh accurately about 0.10 g of isoniazid RS, previously dried at 105 ℃ for 2 hours, dissolve in water to make exactly 100 mL, then pipet 5 mL of this solution, and add water to make 50 mL. Again, pipet 5 mL of this solution, add water to make exactly 50 mL, and use this solution as the standard solution. Determine the absorbances of the test solution and the standard solution, A_T and A_S, as directed under the Ultraviolet-visible Spectroscopy at a wavelength of 267 nm.
The dissolution rate of Isoniazid Tablets in 20 minutes is NLT 75%.

Rate of dissolution (%) of the labeled amount of isoniazid ($C_6H_7N_3O$)

$$= W_S \times \frac{A_T}{A_S} \times \frac{90}{C}$$

W_S: Amount (mg) of the reference standard
C: Labeled amount (mg) of isoniazid ($C_6H_7N_3O$) in 1 tablet

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 tablets of Isoniazid Tablets, and powder. Weigh accurately an amount, equivalent to about 0.10 g of isoniazid ($C_6H_7N_3O$), add 150 mL of water, shake for about 30 minutes to mix, add water to make exactly 200 mL, and filter. Discard the first 10 mL of the filtrate, pipet 5 mL of the subsequent filtrate, add the mobile phase to make 50 mL, and use this solution as the test solution. Separately, weigh accurately about 50 mg of the isoniazid RS, previously dried at 105 °C for 2 hours, and dissolve in water to make exactly 100 mL. Pipet 5 mL of this solution, add the mobile phase to make exactly 50 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions and determine the peak areas, A_T and A_S, of isoniazid in each solution.

Amount (mg) of isoniazid ($C_6H_7N_3O$)

$$= \text{Amount (mg) of isoniazid RS} \times \frac{A_T}{A_S} \times 2$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 265 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: Dissolve 6.80 g of potassium dihydrogen phosphate in water to make 1000 mL. Separately, add water to 5.76 g of phosphoric acid to make 1000 mL. Mix these solutions to adjust the pH to 2.5. To 400 mL of this solution, add 600 mL of methanol, and then dissolve in 2.86 g of sodium tridecanesulfonate.

Flow rate: Adjust the flow rate so that the retention time of isoniazid is about 5 minutes.

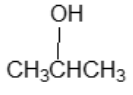
System suitability

System performance: Dissolve 5 mg each of Isoniazid Tablets and isonicotinic acid in 100 mL of the mobile phase. Proceed with 10 μL of this solution according to the above conditions; isonicotinic acid and isoniazid are eluted in this order with the resolution being NLT 1.5.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution according to the above operating conditions; the relative standard deviation of the peak areas of isoniazid is NMT 1.0%.

Packaging and storage Preserve in light-resistant, tight containers.

Isopropanol
이소프로판올



Isopropyl Alcohol C_3H_8O: 60.10
Propan-2-ol [*67-63-0*]

Description Isopropanol is a clear and colorless liquid. It has a characteristic odor.
It is miscible with water, methanol, ethanol(95), or ether.
It is volatile and easily flammable.

Identification (1) To 1 mL of Isopropanol, add 2 mL of iodine TS and 2 mL of sodium hydroxide TS, and shake

to mix; pale yellow precipitates are formed.

(2) To 5 mL of Isopropanol, add 20 mL of potassium dichromate TS and 5 mL of sulfuric acid carefully, and heat gently on a steam bath; the resulting gas has the smell of acetone and turns the filter paper moistened with a solution of salicylaldehyde in ethanol(95) (1 in 10) and sodium hydroxide solution (3 in 10) reddish brown.

Refractive index n_D^{20}: Between 1.376 and 1.378.

Specific gravity d_{20}^{20}: Between 0.785 and 0.788.

Purity (1) ***Clarity and color of solution***—To 2.0 mL of Isopropanol, add 8 mL of water, and shake mix: the resulting solution is clear.

(2) ***Acid***—To 15.0 mL of Isopropanol, add 50 mL of freshly boiled and cooled water, add 2 drops of phenolphthalein TS, and add 0.40 mL of 0.01 mol/L sodium hydroxide VS; the resulting solution exhibits a red color.

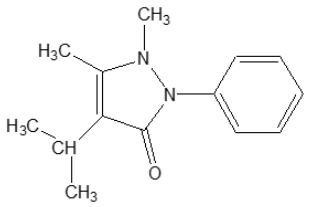
(3) ***Evaporation residue***—Evaporate 20.0 mL of Isopropanol on a steam bath, and dry the residue at 105 ℃ for 1 hour; the amount is NMT 1.0 mg.

Water NMT 0.75 w/v% (2 mL, volumetric titration, direct titration).

Distilling range Between 81 and 83 °C, NLT 94 vol%.

Packaging and storage Preserve in tight containers away from fire.

Isopropylantipyrine
이소프로필안티피린



Propyphenazone $C_{14}H_{18}N_2O$: 230.31
1,5-Dimethyl-2-phenyl-4-propan-2-ylpyrazol-3-one [*479-92-5*]

Isopropylantipyrine, when dried, contains NLT 98.0% and NMT 101.0% of isopropylantipyrine ($C_{14}H_{18}N_2O$).

Description Isopropylantipyrine occurs as white crystals or a crystalline powder. It is odorless and has a slightly bitter taste.
It is very soluble in acetic acid(100), freely soluble in ethanol(95) or acetone, soluble in ether and slightly soluble in water.

Identification (1) To 2 mL of an aqueous solution of Isopropylantipyrine (1 in 500), add 1 drop of iron(III) chloride TS; the resulting solution exhibits pale red color. To this solution, add 3 drops of sulfuric acid; the color turns pale yellow.

(2) To 5 mL of potassium hexacyanoferrate(III) TS, add 1 to 2 drops of iron(III) chloride TS, and add 5 mL of an aqueous solution of Isopropylantipyrine (1 in 500); the resulting solution slowly exhibits dark green color.

(3) To 2 mL of an aqueous solution of Isopropylantipyrine (1 in 500), add 2 to 3 drops of tannic acid TS; white precipitates are formed.

Melting point Between 103 and 105 ℃.

Purity (1) ***Chloride***—Dissolve 1.0 g of Isopropylantipyrine in 30 mL of dilute ethanol, and add 6 mL of dilute nitric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution by adding 0.4 mL of 0.01 mol/L hydrochloric acid, 6 mL of dilute nitric acid, 30 mL of dilute ethanol, and water to make 50 mL (NMT 0.014%).

(2) ***Sulfate***—Dissolve 1.0 g of Isopropylantipyrine in 30 mL of dilute ethanol, and add 1 mL of dilute hydrochloric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution by adding 0.40 mL of 0.005 mol/L sulfuric acid, 1 mL of dilute hydrochloric acid, 30 mL of dilute ethanol acid, and water to make 50 mL (NMT 0.019%).

(3) ***Heavy metals***—Proceed with about 1.0 g of Isopropylantipyrine, add 4 mL of a solution of magnesium sulfate heptahydrate in dilute sulfuric acid (1 in 4), mix, and evaporate to dryness by heating on a steam bath. Ignite the residue at NMT 800 °C to incinerate. After cooling, moisten the residue with a small amount of dilute sulfuric acid. Evaporate to dryness, and ignite within 2 hours to incinerate. After cooling, extract the residue twice each with 5 mL of 2 mol/L hydrochloric acid TS, add 0.1 mL of phenolphthalein TS, and add ammonia water(28) dropwise until the solution turns pale red. After cooling, add acetic acid(100) until the color disappears, and add another 0.5 mL. Filter, if necessary, and wash. Add water to make 20 mL, and use this solution as the test solution. Separately, add 1.0 mL of lead standard solution, instead of Isopropylantipyrine, and proceed in the same manner as the preparation of the test solution. To 10 mL of this solution, add 2 mL of the test solution, and use this solution as the control solution. Separately, to 10 mL of water, add 2 mL of the test solution, and use this solution as the blank test solution. To 12 mL each of the test solution, the control solution, and the blank test solution, add 2 mL of pH 3.5 acetate buffer solution, mix, add 1.2 mL of thioacetamide TS, and mix immediately. Allow to stand for 2 minutes; the color of the test solution is not more intense than that of the control solution (NMT 10 ppm).

System suitability: The control solution exhibits a faint brown color compared to the blank test solution. Also, add 5.0 mL of lead standard solution to the test solution. To 10 mL of this solution, add 2 mL of the test solution, and use this solution as the system suitability

solution. The system suitability solution is not less intense than the control solution.

(4) ***Arsenic***—Prepare the test solution with 1.0 g of Isopropylantipyrine according to Method 3, and perform the test (NMT 2 ppm).

(5) ***Antipyrine***—Dissolve 1.0 g of Isopropylantipyrine in 10 mL of dilute ethanol, and add 1 mL of sodium nitrite TS and 1 mL of dilute sulfuric acid; the resulting solution does not exhibit green color.

Loss on drying NMT 0.5% (1 g, in vacuum, silica gel, 5 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.4 g of Isopropylantipyrine, previously dried, dissolve in 60 mL of a mixture of acetic acid(100) and acetic anhydride (2 : 1), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 23.031 mg of $C_{14}H_{18}N_2O$

Packaging and storage Preserve in tight containers.

Isopropylantipyrine, Acetaminophen and Caffeine Tablets
이소프로필안티피린·아세트아미노펜·카페인 정

Isopropylantipyrine, Acetaminophen and Caffeine Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of isopropylantipyrine ($C_{14}H_{18}N_2O$: 230.31), acetaminophen ($C_8H_9NO_2$: 151.16) and anhydrous caffeine ($C_8H_{10}N_4O_2$: 194.19).

Method of preparation Prepare as directed under Tablets, with Isopropylantipyrine, Acetaminophen and Anhydrous Caffeine.

Identification The retention time of major peaks of the test solution and the standard solution for Assay are the same.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 tablets of Isopropylantipyrine, Acetaminophen and Caffeine Tablets, and powder. Weigh accurately an amount, equivalent to about 150 mg of isopropylantipyrine ($C_{14}H_{18}N_2O$) [about 300 mg of acetaminophen ($C_8H_9NO_2$) and about 50 mg of anhydrous caffeine ($C_8H_{10}N_4O_2$)], and add water to make exactly 1000 mL. After sonicating for 20 minutes, filter, and use the filtrate as the test solution. Separately, weigh accurately about 30 mg of isopropylantipyrine RS, about 60 mg of acetaminophen RS and 10 mg of anhydrous caffeine RS, add water to exactly 200 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_{T1}, A_{T2}, A_{T3}, A_{S1}, A_{S2} and A_{S3}, of isopropylantipyrine, acetaminophen and anhydrous caffeine in each solution.

Amount (mg) of isopropylantipyrine ($C_{14}H_{18}N_2O$)
= Amount (mg) of isopropylantipyrine RS
× (A_{T1} / A_{S1}) × 5

Amount (mg) of acetaminophen ($C_8H_9NO_2$)
= Amount (mg) of acetaminophen RS × (A_{T2} / A_{S2}) × 5

= Amount (mg) of anhydrous caffeine ($C_8H_{10}N_4O_2$)
= Amount (mg) of anhydrous caffeine RS
× (A_{T3} / A_{S3}) × 5

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 30 °C.

Mobile phase: Control the mixing ratio of mobile phase A and mobile phase B stepwise or via the gradient elution as follows.

Mobile phase A: A mixture of water and methanol (4 : 1).

Mobile phase B: A mixture of methanol and water (9 : 1).

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 - 1	100	0
1 - 10	100 → 0	0 → 100
10 - 15	0	100
15 - 25	100	0

Flow rate: 1.0 mL/min

System suitability

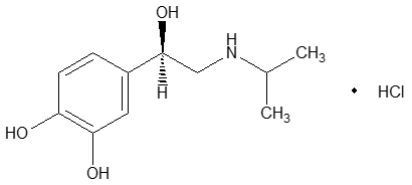
System performance: Proceed with 10 μL of the standard solution according to the above conditions; acetaminophen, anhydrous caffeine and isopropylantipyrine are eluted in this order with the resolution between the isopropylantipyrine peak and the anhydrous caffeine peak being NLT 28.0.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution according to the above operating conditions; the relative standard devia-

tion of the peak areas of isopropylantipyrine, acetaminophen and anhydrous caffeine is NMT 1.0%.

Packaging and storage Preserve in well-closed containers.

Isoproterenol Hydrochloride
이소프로테레놀염산염



and enantiomer

Isoprenaline Hydrochloride $C_{11}H_{17}NO_3 \cdot HCl$: 247.72
4-[1-Hydroxy-2-(propan-2-ylamino)ethyl]benzene-1,2-diol hydrochloride [*51-30-9*]

Isoproterenol Hydrochloride, when dried, contains NLT 97.0% and NMT 101.5% of isoproterenol hydrochloride ($C_{11}H_{17}NO_3 \cdot HCl$).

Description Isoproterenol Hydrochloride occurs as a white crystalline powder. It is odorless.
It is freely soluble in water, sparingly soluble in ethanol(95), and practically insoluble in acetic acid(100), acetic anhydride, chloroform or ether.
It is gradually colored by air or light.

Identification (1) Determine the absorption spectra of solutions of Isoproterenol Hydrochloride and isoproterenol hydrochloride RS in 0.1 mol/L hydrochloric acid TS (1 in 20000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectrum of Isoproterenol Hydrochloride and isoproterenol hydrochloride RS, previously dried, as directed in the potassium bromide disk method under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Melting point Between 165 and 170 ℃.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Isoproterenol Hydrochloride in 20 mL of 0.1 mol/L hydrochloric acid TS; the resulting solution is colorless and clear.

(2) ***Sulfate***—Perform the test with 0.10 g of Isoproterenol Hydrochloride. Prepare the control solution with 0.40 mL of 0.005 mol/L sulfuric acid (NMT 0.2%).

(3) ***Heavy metals***—Proceed with 1.0 g of Isoproterenol Hydrochloride according to Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(4) ***Isoproterenone***—Weigh 50 mg of Isoproterenol Hydrochloride, and dissolve in 0.01 mol/L hydrochloric acid TS to make exactly 25 mL. Determine the absorbance of this solution as directed under the Ultraviolet-visible Spectroscopy; the absorbance at a wavelength of 310 nm is NMT 0.040.

Loss on drying NMT 1.0% (1 g, in vacuum, silica gel, 4 hours).

Residue on ignition NMT 0.2% (1 g).

Assay Weigh accurately about 0.125 g of Isoproterenol Hydrochloride, and dissolve in sodium hydrogen sulfate (3 in 1000) to make exactly 25 mL. Take 5.0 mL of this solution, add 0.17 mol/L acetic acid to make exactly 100 mL, and use it as the test solution. Separately, weigh accurately an appropriate amount of isoproterenol hydrochloride RS, and add the mobile phase to make a solution containing 2.5 mg per mL. Take 5.0 mL of this solution, add 0.17 mol/L acetic acid to make a solution containing 0.25 mg per mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak area of isoproterenol hydrochloride, A_T and A_S, in each solution.

$$\text{Amount (mg) of isoproterenol hydrochloride } (C_{11}H_{17}NO_3 \cdot HCl) = 0.5 \times C \times \frac{A_T}{A_S}$$

C: Concentration of the standard solution (μg/mL)

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 278 nm).

Column: A stainless steel column, about 4 mm in internal diameter and about 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography.

Mobile phase: 0.17 mol/L acetic acid

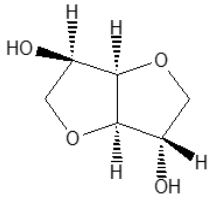
Flow rate: 1.5 mL/min

System suitability

System repeatability: Repeat the test 6 times according to the above conditions with 10 μL each of the standard solution; the relative standard deviation of the peak area is NMT 3.0%.

Packaging and storage Preserve in light-resistant, tight containers.

Isosorbide
이소소르비드



$C_6H_{10}O_4$: 146.14

(3*S*,3a*R*,6*R*,6a*R*)-2,3,3a,5,6,6a-Hexahydrofuro[3,2-b]furan-3,6-diol [*652-67-5*]

Isosorbide contains NLT 98.5% and NMT 101.0% of isosorbide ($C_6H_{10}O_4$), calculated on the anhydrous basis.

Description Isosorbide occurs as white crystals or grains. It is odorless or has a slightly characteristic odor and a bitter taste.
It is very soluble in water or methanol, freely soluble in ethanol(95), and slightly soluble in ether.
It is hygroscopic.

Identification (1) Dissolve 0.1 g of Isosorbide in 6 mL of diluted sulfuric acid (1 in 2) by heating on a steam bath. After cooling, add 1 mL of potassium permanganate (1 in 30), shake well to mix, and heat on a steam bath until the color of the potassium permanganate disappears. To this solution, add 10 mL of 2,4-dinitrophenylhydrazine TS, and heat on a steam bath; orange precipitates are formed.

(2) To 2 g of Isosorbide, add 30 mL of pyridine and 4 mL of benzoyl chloride, and boil under a reflux condenser for 50 minutes. After cooling, add this solution slowly to 100 mL of cold water. Filter the produced precipitate with a glass filter, wash with water, recrystalize 2 times with ethanol(95), and dry in a desiccator (in vacuum, silica gel) for 4 hours; the melting point is 102 to 103 ℃.

(3) Determine the infrared spectra of Isosorbide and isosorbide RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both exhibit similar intensities of absorption at the same wavenumbers.

Optical rotation $[\alpha]_D^{20}$: Between +45.0° and +46.0° (5 g, calculated on the anhydrous basis, water, 50 mL, 100 mm).

Purity (1) ***Clarity and color of solution***—Transfer 25 g of Isosorbide into the Nessler tube, and dissolve in water to make 50 mL; the resulting solution is clear, and the color is not more intense than the following control solution.

Control Solution—To a mixture of 1.0 mL of cobaltous(II) chloride hexahydrate colorimetric stock solution, 3.0 mL of colorimetric stock solution, and 2.0 mL of copper(II) sulfate pentahydrate colorimetric stock solution, and add water to make 10.0 mL. Take 3.0 mL of this solution, and add water to make 50 mL.

(2) ***Sulfate***—Perform the test with 2.0 g of Isosorbide. Prepare the control solution with 1.0 mL of 0.005 mol/L sulfuric acid VS (NMT 0.024%).

(3) ***Heavy metals***—Proceed with 5.0 g of Isosorbide according to Method 1, and perform the test. Prepare the control solution with 2.5 mL of lead standard solution (NMT 5 ppm).

(4) ***Arsenic***—Prepare the test solution with 1.0 g of Isosorbide according to Method 1, and perform the test (NMT 2 ppm).

(5) ***Related substances***—Dissolve 0.10 g of Isosorbide in 10 mL of methanol and use this solution as the test solution. Pipet 2 mL of this solution, add methanol to make exactly 100 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of ethanol(95) and cyclohexane (1 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Spray evenly a solution of ninhydrin in a mixture of ethanol(95) and sulfuric acid (9 : 1) on the plate, and heat at 105 ℃ for 30 minutes; the spots other than the principal spot obtained from the test solution are not more intense than the spots from the standard solution.

Water NMT 1.5% (2 g, volumetric titration, direct titration).

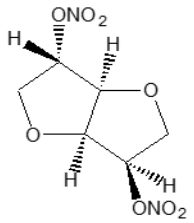
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 10 g of Isosorbide, calculated on the anhydrous basis, and dissolve in water to make exactly 100 mL. Determine the optical rotation α_D with this solution at the layer length of 100 mm at 20 ± 1 ℃.

$$\text{Amount (mg) of isosorbide } (C_6H_{10}O_4) = \alpha_D \times 2.1978$$

Packaging and storage Preserve in tight containers.

Isosorbide Dinitrate
이소소르비드질산염



$C_6H_8N_2O_8$: 236.14

(3*R*,3a*S*,6*S*,6a*S*)-6-(Nitrooxy)-hexahydrofuro[3,2-b]furan-3-yl nitrate[*87-33-2*]

Isosorbide Dinitrate contains NLT 95.0% and NMT 101.0% of isosorbide dinitrate ($C_6H_8N_2O_8$), calculated on the anhydrous basis.

Description Isosorbide Dinitrate occurs as white crystals or a crystalline powder. It is odorless and has a slightly nitric acid-like odor.

It is very soluble in *N*,*N*-dimethylformamide or acetone, freely soluble in chloroform or toluene, soluble in methanol, ethanol(95), or ether, and practically insoluble in water.

It explodes when rapidly heated or subjected to shock.

Identification (1) To 10 mg of Isosorbide Dinitrate, add 1 mL of water, and dissolve in 2 mL of sulfuric acid carefully. After cooling, layer 3 mL of iron(II) sulfate TS to this solution and allow to stand for 5 to 10 minutes; a brown band forms at the interface.

(2) To 0.1 g of Isosorbide Dinitrate, add 6 mL of diluted sulfuric acid (1 in 2), and dissolve on a steam bath by heating. After cooling, add 1 mL of potassium permanganate (1 in 30), shake well to mix, and heat on a steam bath until the color of the potassium permanganate disappears. To this solution, add 10 mL of 2,4-dinitrophenylhydrazine TS, and heat on a steam bath; orange precipitates are formed.

Optical rotation $[\alpha]_D^{20}$: Between +134° and +139° (1 g, calculated on the dried basis, ethanol(95), 100 mL, 100 mm).

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Isosorbide Dinitrate in 10 mL of acetone; the resulting solution is colorless and clear.

(2) ***Nitrate***—Dissolve 50 mg of Isosorbide Dinitrate in 30 mL of toluene, and extract 3 times each with 20 mL of water. Combine the water layer, wash twice each with 20 mL of toluene, take the water layer, and add water to make 100 mL. Use this solution as the test solution. Transfer 5 mL of nitric acid standard solution and 25 mL of the test solution into a separate Nessler tube, add 60 mL of Griess-Romijin's nitric acid reagent, shake well to mix, and allow to stand for 30 minutes. Observe the solution from the side of the Nessler tube; the color of the test solution is not more intense than that of the standard solution.

(3) ***Sulfate***—Dissolve 1.5 g of Isosorbide Dinitrate in 15 mL of *N*,*N*-dimethylformamide, and add 60 mL of water. After cooling, filter. Wash the paper 3 times each with 20 mL of water, combine the washings with the filtrate, and add water to make 150 mL. To 40 mL of this solution, add 1 mL of dilute hydrochloric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 0.40 mL of 0.005 mol/L sulfuric acid VS (NMT 0.048%).

(4) ***Heavy metals***—Dissolve 1.0 g of Isosorbide Dinitrate in 30 mL of acetone, and add 2 mL of dilute acetic acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution by adding 1.0 mL of lead standard solution, 30 mL of acetone, 2 mL of dilute acetic acid, and water to make 50 mL (NMT 10 ppm).

Water NMT 1.5% (0.3 g, volumetric titration, direct titration).

Assay Weigh accurately about 0.1 g of Isosorbide Dinitrate, transfer into a Kjeldahl flask for nitrogen determination, dissolve in 10 mL of methanol, and add 3 g of Devarda's alloy and 50 mL of water. Connect the distillation apparatus for nitrogen determination. Pipet 25 mL of 0.05 mol/L sulfuric acid, transfer into the collector, add 5 drops of bromocresol green-methyl red TS, and dip the bottom end of the cooler into this solution. Add 15 mL of sodium hydroxide solution (1 in 2) with the funnel, wash carefully with 20 mL of water, immediately close the pinch cock on the rubber tube, and distill slowly by passing through the water vapor condenser until about 100 mL of distillate is obtained. Remove the bottom end of the cooler from the surface of the liquid, wash the part with a small amount of water, and titrate with 0.1 mol/L sodium hydroxide VS. However, the endpoint of the titration is when the red solution turns reddish purple to bluish green. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.05 mol/L sulfuric acid VS
= 11.807 mg of $C_6H_8N_2O_8$

Packaging and storage Preserve in light-resistant, tight containers in a cold place.

Isosorbide Dinitrate Tablets
이소소르비드질산염 정

Isosorbide Dinitrate Tablets contain NLT 93.0% and NMT 107.0% of the labeled amount of isosorbide dinitrate ($C_6H_8N_2O_8$: 236.14).

Method of preparation Prepare as directed under Tablets, with Isosorbide Dinitrate.

Identification Weigh an amount of Isosorbide Dinitrate

Tablets, previously powdered, equivalent to 0.1 g of isosorbide dinitrate according to the labeled amount, add 50 mL of ether, shake well to mix, and then filter. Take 5 mL of the filtrate, evaporate the ether carefully, add 1 mL of water, and carefully dissolve in 2 mL of sulfuric acid. After cooling, superimpose 3 mL of iron(II) sulfate TS on this solution, and allow to stand for 5 to 10 minutes; a brown band forms at the interface.

Purity ***Nitrate***—Weigh accurately an amount of Isosorbide Dinitrate Tablets, previously powdered, equivalent to 50 mg of isosorbide dinitrate according to the labeled amount, transfer into a separatory funnel, add 30 mL of toluene, and shake well to mix. Then, extract 3 times each with 20 mL of water, and perform the test as directed in Purity (2) under Isosorbide Dinitrate.

Disintegration Meets the requirements. However, for sublingual preparations, the time of the test is 2 minutes, and omit the use of the auxiliary disk.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 tablets of Isosorbide Dinitrate Tablets, and powder. Weigh accurately an amount, equivalent to about 5 mg of isosorbide dinitrate ($C_6H_8N_2O_8$), dissolve with the mobile phase, add 5.0 mL of the internal standard solution, and add the mobile phase to make exactly 20 mL. Then, filter, and use this filtrate as the test solution. Separately, weigh accurately about 0.2 g of isosorbide dinitrate RS (25%, diluted with lactose), and dissolve with the mobile phase to make exactly 50 mL. Pipet 5 mL of this solution, add 5.0 mL of the internal standard solution, add the mobile phase to make exactly 20 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak area ratios, Q_T and Q_S, of isosorbide dinitrate to the peak area of the internal standard, respectively.

$$\text{Amount (mg) isosorbide dinitrate } (C_6H_8N_2O_8) = \text{Amount (mg) of isosorbide dinitrate RS} \times \frac{Content\ (\%)\ of\ \text{isosorbide dinitrate in RS}}{100} \times \frac{Q_T}{Q_S} \times \frac{1}{10}$$

Internal standard solution—Weigh 3 g of nitroglycerine RS (10%, diluted with lactose), dissolve in the mobile phase to make 100 mL.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and 15 cm to 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm to 10 μm in particle diameter).

Column temperature: Ordinary temperature

Mobile phase: To a mixture of methanol and 0.005 mol/L triethylamine (50 : 50), add acetic acid to adjust the pH to 5.0.

Flow rate: 1.0 mL/min

System suitability

System performance: Proceed with 10 μL of the standard solution according to the above conditions; isosorbide dinitrate and the internal standard are eluted in this order with the resolution not being less than 2.0.

System repeatability: Repeat the test 6 times with 10 μL of the standard solution according to the above conditions; the relative standard deviation of the peak area ratios is NMT 2.0%.

Packaging and storage Preserve in tight containers.

Isotonic Sodium Chloride Injection
생리식염 주사액

0.9% Sodium Chloride Injection
Isotonic Saline

Isotonic Sodium Chloride Injection is an aqueous solution for injection. Isotonic Sodium Chloride Injection contains NLT 0.85% and NMT 0.95% of sodium chloride (NaCl: 58.44).

Method of preparation

Sodium chloride	9 g
Water for Injection	A sufficient quantity
Total volume	1000 mL

Prepare as directed under Injections, with the above ingredients.
No preservative is added.

Description Isotonic Sodium Chloride Injection occurs as a clear, colorless liquid and has a slightly saline taste.

Identification Isotonic Sodium Chloride Injection responds to the Qualitative Analysis for sodium salt and chloride.

pH Between 4.5 and 8.0.

Purity (1) ***Heavy metals***—Concentrate 100 mL of Isotonic Sodium Chloride Injection on a steam bath to make about 40 mL, and add 2 mL of dilute acetic acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution by adding 2 mL of dilute acetic acid and water to 3.0 mL of lead standard solution to make 50 mL (NMT 0.3 ppm).

(2) ***Arsenic***—Prepare the test solution with 20 mL of Isotonic Sodium Chloride Injection, and perform the test (NMT 0.1 ppm).

Sterility Meets the requirements.

Bacterial endotoxins Less than 0.50 EU/mL of Glucose Injection.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

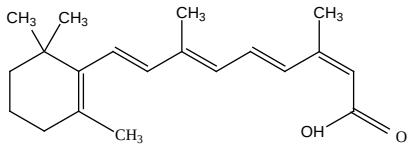
Extractable volume of injections Meets the requirements.

Assay Measure exactly 20 mL of Isotonic Sodium Chloride Injection, add 30 mL of water, and titrate with 0.1 mol/L silver nitrate VS with vigorous shaking (indicator: 3 drops of fluorescein sodium TS).

Each mL of 0.1 mol/L silver nitrate VS
= 5.844 mg of NaCl

Packaging and storage Preserve in hermetic containers. Plastic containers for aqueous injections may be used.

Isotretinoin
이소트레티노인



$C_{20}H_{28}O_2$: 300.44

(2*Z*,4*E*,6*E*,8*E*)-3,7-Dimethyl-9-(2,6,6-trimethylcyclohexen-1-yl)nona-2,4,6,8-tetraenoic acid [*4759-48-2*]

Isotretinoin contains NLT 98.0% and NMT 102.0% of isotretinoin ($C_{20}H_{28}O_2$), calculated on the dried basis.

Description Isotretinoin occurs as yellow crystals.
It is soluble in chloroform, sparingly soluble in ethanol(95), 2-propanol, or polyethylene glycol 400, and practically insoluble in water.

Identification (1) Determine the absorption spectra of solutions of Isotretinoin and isotretinoin RS in a solution of 0.01 mol/L hydrochloric acid TS in 2-propanol (1 in 1000) (1 in 25000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Isotretinoin and isotretinoin RS as directed in the paste method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Isotretinoin according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Tretinoin***—Weigh accurately about 25 mg of Isotretinoin, dissolve in a small amount of dichloromethane, add isooctane to make exactly 100 mL, and use this solution as the test solution. Separately, dissolve about 25 mg of tretinoin RS in a small amount of dichloromethane, add isooctane to make exactly 100 mL. To 1.0 mL of this solution, and add isooctane to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak area of tretinoin of each solution, A_T and A_S, according to the automatic integration method; the amount of tretinoin is NMT 1.0%.

$$\text{Content (\%) of tretinoin} = 10 \times \frac{C}{W} \times \frac{A_T}{A_S}$$

C: Concentration (μg/mL) of tretinoin in the standard solution

W: Amount (mg) of Isotretinoin taken

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 352 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 25 cm in length, packed with porous silica gel for liquid chromatography (3 to 10 μm in particle diameter).

Mobile phase: A mixture of isooctane, 2-propanol, and acetic acid(100) (99.65 : 0.25 : 0.1).

Flow rate: 1 mL/min

System suitability

System performance: Dissolve 25 mg of isotretinoin RS in a small amount of dichloromethane, add isooctane to make 100 mL, and use this solution as the system suitability stock solution. To 1 mL of standard stock solution, add the system suitability stock solution to make 100 mL, and use this solution as the system suitability solution. Proceed with 20 μL of this solution according to the above conditions; the relative retention time of the peaks of isotretinoin and tretinoin are about 0.84 and 1.0, respectively, and the resolution between the two peaks is NLT 2.0.

System repeatability: Repeat the test 5 times with 20 μL each of the system suitability solutions according to the above conditions; the relative standard deviation of the peak area of tretinoin is NMT 2.0%.

Loss on drying NMT 0.5% (1 g, room temperature, in vacuum, 16 hours).

Residue on ignition NMT 0.1% (1 g).

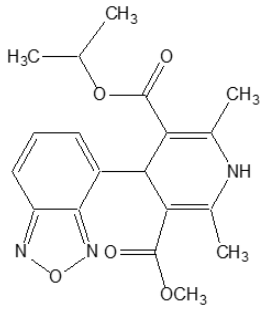
Assay Weigh accurately about 0.24 g of Isotretinoin, dissolve in 50 mL of *N*,*N*-dimethylformamide, and titrate with 0.1 mol/L sodium methoxide VS [indicator: 3 drops of a solution of titration in *N*,*N*-dimethylformamide (1 in 100)]. The endpoint of the titration is when the solution

turns green. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L sodium methoxide VS
= 30.04 mg of $C_{20}H_{28}O_2$

Packaging and storage Preserve in light-resistant, tight containers, and fill with an inert gas.

Isradipine
이스라디핀



$C_{19}H_{21}N_3O_5$: 371.39
3-Methyl 5-propan-2-yl 4-(2,1,3-benzoxadiazol-4-yl)-2,6-dimethyl-1,4-dihydropyridine-3,5-dicarboxylate
[*75695-93-1*]

Isradipine contains NLT 98.0% and NMT 102.0% of Isradipine ($C_{19}H_{21}N_3O_5$), calculated on the dried basis.

Description Isradipine occurs as a yellow fine crystalline powder.
It is freely soluble in acetone, soluble in methanol or acetonitrile, and practically insoluble in *n*-hexane or water.

Identification (1) Determine the infrared spectra of Isradipine and isradipine RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Melting point Between 166 and 170 ºC.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Isradipine according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Related substances***—Weigh exactly 50 mg of Isradipine, dissolve in 5.0 mL of methanol, add the mobile phase to make exactly 25 mL, and use this solution as the test solution. Weigh exactly 6 mg of Isradipine RS, dissolve in 5 mL of methanol, and add the mobile phase to make exactly 100 mL. To 5 mL of this solution, add the mobile phase to make exactly 50 mL and use the resulting solution as the standard solution. Perform the test with each 25 μL of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions, and determine the peak areas other than isradipine; the total area of all peaks obtained from the test solution is not greater than 4 times the peak area of isradipine from the standard solution (1.2%), the largest peak area other than the isradipine peak from the test solution is not greater than 1.6 times the peak area of isradipine from the standard solution (0.5%), and the area of other individual peaks from the test solution is not greater than the peak area of isradipine from the standard solution (0.3%).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 230 nm).

Mobile phase: A mixture of water, methanol and tetrahydrofuran (50 : 40 : 10).

Column: A stainless steel column about 4.6 mm in internal diameter and 10 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (about 3 μm to 10 μm in particle diameter).

Flow rate: 1.7 mL/min

System suitability

System performance: Weigh 0.2 g of isradipine RS and 10 mg of isradipine related substance I RS, dissolve in 5 mL of methanol, and add the mobile phase to make 100 mL. To 5.0 mL of this solution, add the mobile phase to make 50 mL and use this solution as the system suitability solution. Perform the test with 25 μL of this solution according to the above operating conditions; the resolution of the peaks of Isradipine and isradipine related substance I is NLT 1.5.

System repeatability: Repeat the test five times with 25 μL each of the system suitability solution according to the above operating conditions; the relative standard deviation of the Isradipine peak areas is NMT 1.5%.

Time span of measurement: NLT 3 times of the retention time of Isradipine peak.

Loss on drying NMT 0.2% (105 ℃, 4 hours, constant mass).

Residue on ignition NMT 0.1% (1 g).

Assay Use light-resistant containers in this procedure. Weigh accurately about 20 mg of Isradipine, dissolve in 20 mL of methanol, add the mobile phase to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately a suitable amount of isradipine RS and isradipine related substance I [isopropylmethyl 4-(4-benzofurzanyl)-2,6-dimethyl-3,5 -pyridinedicarboxylate] RS, dissolve in methanol, and add the mobile phase so that the resulting solutions contain 0.2 mg of isradipine RS and 10 μg of isradipine related substance I RS per mL, respectively. Use these solution as the standard solution. Perform the test with 25 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of isradipine.

Amount (mg) of isradipine ($C_{19}H_{21}N_3O_5$)

$$= 100 \times C \times \frac{A_T}{A_S}$$

C: Concentration (mg/mL) of isradipine in the standard solution

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 326 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 10 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (about 3 μm to 10 μm in particle diameter).

Mobile phase: A mixture of water, methanol and tetrahydrofuran (50 : 40 : 10).

Flow rate: 1.7 mL/min

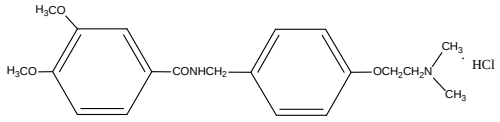
System suitability

System performance: Perform the test with 25 μL of the standard solution according to the above operating conditions; the resolution of the peaks of isradipine and isradipine related substance I is NLT 1.5.

System repeatability: Repeat the test five times with 25 μL each of the standard solution according to the above conditions; the relative standard deviation of the Isradipine peak areas is NMT 1.5%.

Packaging and storage Preserve in light-resistant, tight containers.

Itopride Hydrochloride
이토프리드염산염



$C_{20}H_{26}N_2O_4 \cdot HCl$: 394.90

N-[[4-[2-(Dimethylamino)ethoxy]phenyl]methyl]-3,4-dimethoxy-benzamide hydrochloride (1:1), [*122892-31-3*]

Itopride Hydrochloride, when dried, contains NLT 98.5% and NMT 101.0% of itopride hydrochloride ($C_{20}H_{26}N_2O_4 \cdot HCl$).

Description Itopride Hydrochloride occurs as white to pale yellow crystals or a crystalline powder.

It is odorless.

It is very soluble in water, freely soluble in methanol or acetic acid(100), slightly soluble in ethanol(95), and practically insoluble in ether.

The pH of a solution of 1 g of Itopride Hydrochloride in 10 mL of water is between 4.0 and 5.0.

Identification (1) Weigh 0.1 g of Itopride Hydrochloride, dissolve in 3 mL of citric acid-acetic acid TS, and heat on a steam bath; the solution exhibits a dark reddish purple color.

(2) Determine the absorption spectrum of a solution of Itopride Hydrochloride in 0.1 mol/L hydrochloric acid TS (1 in 80000) as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum between 256 nm and 260 nm and no absorption between 277 nm and 281 nm.

(3) Determine the infrared spectra of Itopride Hydrochloride and itopride hydrochloride RS, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(4) Dissolve 0.4 g of Itopride Hydrochloride in 20 mL of water, add 2 mL of ammonia TS, shake and mix. If necessary, filter the precipitate collected by scratching the inner wall of the column with a glass rod to remove. Acidify the filtrate with dilute acetic acid; the resulting solution responds to the Qualitative Analysis for chloride.

Melting point Between 193 and 198 °C.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Itopride Hydrochloride in 10 mL of water; the solution is clear and colorless to pale yellow.

(2) ***Heavy metals***—Proceed with 2.0 g of Itopride Hydrochloride according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Related substances***—Dissolve 0.2 g of Itopride Hydrochloride in 10 mL of methanol and use this solution as the test solution. Pipet 1 mL of this solution and add methanol to make exactly 20 mL. Pipet 1 mL of this solution, add methanol to make exactly 10 mL, and use this solution as the standard solution. With the test solution and the standard solution, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, methanol, ammonia water(28) and water (18 : 4 : 2 : 1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot obtained from the test solution are not larger or more intense than the spots from the standard solution.

Loss on drying NMT 0.10% (2 g, 105 °C, 2 hours).

Residue on ignition NMT 0.10% (1 g).

Assay Weigh accurately about 0.5 g of Itopride Hydrochloride, dissolve in 2 mL of acetic acid(100), add 100 mL of acetic anhydride, and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 39.49 mg of $C_{20}H_{26}N_2O_4 \cdot HCl$

Packaging and storage Preserve in light-resistant, tight

containers.

Itopride Hydrochloride Tablets
이토프리드염산염 정

Itopride Hydrochloride Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of itopride hydrochloride ($C_{20}H_{26}N_2O_4$·HCl: 394.90).

Method of preparation Prepare as directed under Tablets, with Itopride Hydrochloride.

Identification (1) Weigh an amount of Itopride Hydrochloride Tablets, previously powdered, equivalent to about 0.2 g of itopride hydrochloride ($C_{20}H_{26}N_2O_4$·HCl), add 10 mL of methanol, shake vigorously to mix, and then centrifuge. Take 0.5 mL of the clear supernatant, remove methanol in the vacuum, then add 3 mL of citric acid-acetic acid TS to the residue, and heat on a steam bath; the resulting solution exhibits a dark reddish purple color.

(2) Determine the absorption spectrum of a solution of Itopride Hydrochloride Tablets in 0.1 mol/L hydrochloric acid TS (1 in 80000) as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum between 256 nm and 260 nm and no absorption between 277 nm and 281 nm.

(3) Weigh an amount of Itopride Hydrochloride Tablets, previously powered, equivalent to about 0.2 g of itopride hydrochloride ($C_{20}H_{26}N_2O_4$·HCl: 394.90), add 10 mL of methanol, shake vigorously to mix, and then centrifuge. Use the clear supernatant as the test solution. Separately, dissolve 0.02 g of itopride hydrochloride RS in 1 mL of methanol, and use this solution as the standard solution. Perform the test with the test solution and the standard solution as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, methanol, strong ammonia water and water (18 : 4 : 2 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the R_f values of the spots obtained from the test solution and the standard solution are the same.

Dissolution Perform the test with 1 tablet of Itopride Hydrochloride Tablets at 50 revolutions per minute according to Method 2 under the Dissolution, using 900 mL of 0.1 mol/L hydrochloric acid TS as the dissolution medium. Filter the medium 45 minutes after starting the test and use this solution as the test solution. Separately, weigh accurately about 5.5 mg of itopride hydrochloride RS, dissolve in 0.1 mol/L hydrochloric acid TS to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography, and determine the peak areas, A_T and A_S, of itopride hydrochloride in each solution. The dissolution rate in 45 minutes is NLT 80%.

Dissolution rate (%) of the labeled amount of itopride hydrochloride ($C_{20}H_{26}N_2O_4$·HCl)
= Amount (mg) of itopride hydrochloride RS
$$\times \frac{A_T}{A_S} \times \frac{1}{C} \times 300$$

C: Labeled amount (mg) of itopride hydrochloride ($C_{20}H_{26}N_2O_4$·HCl) in 1 tablet

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 Itopride Hydrochloride Tablets, and powder. Weigh accurately an amount, equivalent to about 50 mg of itopride hydrochloride ($C_{20}H_{26}N_2O_4$·HCl), and add the mobile phase to make exactly 50 mL. After filtering this solution, discard the first 10 mL of the filtrate, pipet 10 mL of the subsequent filtrate, transfer into a 100-mL volumetric flask, add the mobile phase to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 50 mg of itopride hydrochloride RS, proceed in the same manner as the test solution, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of itopride hydrochloride in each solution.

Content (%) of the labeled amount of itopride hydrochloride ($C_{20}H_{26}N_2O_4$·HCl)
= Amount (mg) of itopride hydrochloride RS$\times \frac{A_T}{A_S}$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 257 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: To 13.6 g of potassium dihydrogen phosphate, add water to make 1 L, then take 800 mL of this solution, and add 200 mL of acetonitrile.

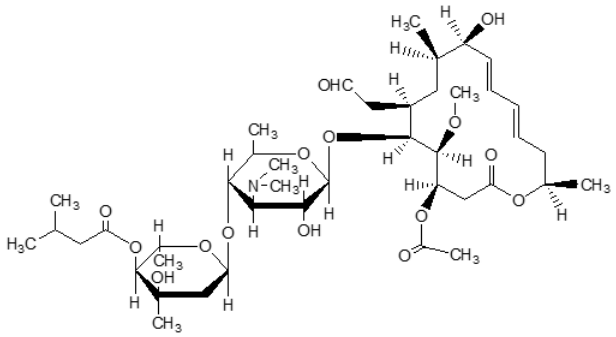
Flow rate: 1.0 mL/min

System suitability

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution according to the above operating conditions; the relative standard deviation of the peak areas of itopride hydrochloride is NMT 2.0%.

Packaging and storage Preserve in tight containers.

Josamycin
조사마이신



$C_{42}H_{69}NO_{15}$: 827.99

[(2*S*,3*S*,4*R*,6*S*)-6-[(2*R*,3*S*,4*R*,5*R*,6*S*)-6-[[(4*R*,5*S*,6*S*,7*R*,9*R*,10*R*,11*E*,13*E*,16*R*)-4-Acetyloxy-10-hydroxy-5-methoxy-9,16-dimethyl-2-oxo-7-(2-oxoethyl)-1-oxacyclohexadeca-11,13-dien-6-yl]oxy]-4-(dimethylamino)-5-hydroxy-2-methyloxan-3-yl]oxy-4-hydroxy-2,4-dimethyloxan-3-yl] 3-methylbutanoate [*16846-24-5*]

Josamycin is a macrolide compound with antimicrobial activity produced by the growth of *Streptomyces narbonensis* var. *josamyceticus*.

Josamycin contains NLT 900 μg and NMT 1100 μg (potency) per mg of josamycin ($C_{42}H_{69}NO_{15}$: 827.99), calculated on the dried basis.

Description Josamycin occurs as a white to yellowish white powder.
It is very soluble in methanol or ethanol(95), and very slightly soluble in water.

Identification (1) Determine the absorption spectra of solutions of Josamycin and josamycin RS in methanol (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Dissolve 5 mg each of Josamycin and josamycin RS in 1 mL of methanol, add diluted methanol (1 in 2) to make 100 mL, and use these solutions as the test solution and the standard solution, respectively. With 10 μL each of the test solution and standard solution, perform the test as directed under the Liquid Chromatography according to the following conditions; the retention time of josamycin from the test solution is the same as that of josamycin from the standard solution.

Operating conditions

For the detector, column, column temperature, mobile phase and flow rate, proceed as directed under the operating conditions under the Purity (2).

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Josamycin according to Method 2 and perform the test. Prepare the control solution with 3.0 mL of lead standard solution (NMT 30 ppm).

(2) ***Related substances***—Dissolve 50 mg of Josamycin in 5 mL of methanol, add diluted methanol (1 in 2) to make 50 mL, and use this solution as the test solution. Perform the test with 10 μL of the test solution as directed under the Liquid Chromatography according to the following conditions, and determine each peak area. Calculate the amount of each peak other than josamycin by the percentage peak area method; the amount is NMT 6% and the sum of all peak areas other than josamycin is NMT 20%.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 231 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 50 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: Dissolve 119 g of sodium perchlorate hydrate in water to make 1000 mL, and adjust the pH to 2.5 with 1 mol/L hydrochloric acid TS. To 600 mL of this solution, add 400 mL of acetonitrile.

Flow rate: Adjust the flow rate so that the retention time of josamycin is about 10 minutes.

System suitability

Test for required detectability: Pipet 3 mL of the test solution, add dilute methanol (1 in 2) to make exactly 50 mL, and use this solution as the system suitability solution. Pipet 2 mL of the system suitability solution, and add dilute methanol (1 in 2) to make exactly 20 mL. Confirm that the peak area of josamycin obtained from 10 μL of this solution is equivalent to 8 to 12% of the peak area of josamycin from the system suitability solution.

System performance: Dissolve 0.05 g of Josamycin in 50 mL of 0.1 mol/L potassium dihydrogen phosphate TS (pH 2.0), and allow to stand at 40 °C for 3 hours. Adjust the pH of this solution to 6.8 to 7.2 with 2 mol/L sodium hydroxide TS, and add 50 mL of methanol. Proceed with 10 μL of this solution under the above operating conditions; the resolution between the peaks of josamycin and josamycin S_1, eluted at the relative retention time of about 0.9 is NLT 1.5.

System repeatability: Repeat the test 6 times with 10 μL each of the system suitability solution under the above operating conditions; the relative standard deviation of the peak areas of josamycin is NMT 1.5%.

Time span of measurement: About 4 times the retention time of josamycin after the solvent peak.

Loss on drying NMT 1.0% (0.5 g, in vacuum, phosphorus pentoxide, 3 hours).

Residue on ignition NMT 0.1% (1 g).

Assay ***Cylinder plate method*** (1) Medium: Agar medium for seed and base layer Use the medium of the Potency assay (A) (2) (a) ① ⓐ.

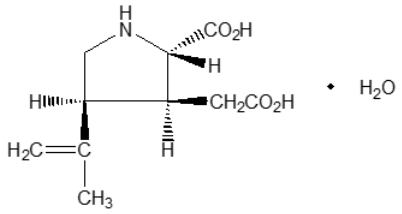
(2) Test organism: Use *Bacillus subtilis* ATCC 6633

as the test organism.

(3) Weigh accurately about 30 mg (potency) of Josamycin, dissolve in 5 mL of methanol, add sterile purified water to make exactly 100 mL, and use this solution as the test stock solution. Pipet a suitable amount of the test stock solution, dilute it with sterile purified water so that the solution contains 30.0 μg and 7.5 μg (potency) per mL, and use these solutions as the high concentration test solution and the low concentration test solution, respectively. Separately, weigh accurately about 30 mg (potency) of josamycin RS, dissolve in 5 mL of methanol, add sterile purified water to make exactly 100 mL, and use this solution as the standard stock solution. Store the standard stock solution at a temperature NMT 5 °C, and use it within 7 days. Pipet a suitable amount of the standard stock solution, dilute with sterile purified water so that the solution contains 30.0 μg and 7.5 μg (potency), and use these solutions as the high concentration standard solution and the low concentration standard solution, respectively. Perform the test with these solutions as directed in (A) (8) under Microbial Assays for Antibiotics.

Packaging and storage Preserve in light-resistant, tight containers.

Kainic Acid Hydrate
카인산수화물



Kainic Acid $C_{10}H_{15}NO_4 \cdot H_2O$: 231.25
(2*S*,3*S*,4*S*)-3-(Carboxymethyl)-4-prop-1-en-2-ylpyrrolidine-2-carboxylic acid hydrate

Kainic Acid Hydrate, when dried, contains NLT 99.0% and NMT 101.0% of kainic acid ($C_{10}H_{15}NO_4$: 213.23).

Description Kainic Acid Hydrate occurs as white crystals or a crystalline powder. It is odorless and has a sour taste.

It is sparingly soluble in water or warm water, very slightly soluble in ethanol(95) and acetic acid(100), and practically insoluble in ether.

It is soluble in dilute hydrochloric acid or sodium hydroxide TS.

Dissolve 1.0 g of Kainic Acid Hydrate in 100 mL of water; the pH of this solution is between 2.8 and 3.5.

Melting point—About 252 °C (with decomposition).

Identification (1) Take 5 mL of an aqueous solution of Kainic Acid Hydrate (1 in 5000), add 1 mL of ninhydrin TS, and warm on a steam bath between 60 and 70 ℃ for 5 minutes; the resulting solution exhibits a yellow color.

(2) Dissolve 50 mg of Kainic Acid Hydrate in acetic acid(100), and add 0.5 mL of bromine TS; the color of the test solution disappears immediately.

Optical rotation $[\alpha]_D^{20}$: Between -13° and -17° (0.5 g, water, 50 mL, 200 mm).

Purity (1) ***Clarity and color of solution***—Dissolve 0.10 g of Kainic Acid Hydrate in 10 mL of water; the solution is colorless and clear.

(2) ***Chloride***—Transfer 0.5 g of Kainic Acid Hydrate into platinum crucible, dissolve in 5 mL of sodium carbonate TS, evaporate to dryness on a steam bath, and ignite by heating slowly almost to incineration. After cooling, dissolve 12 mL of dilute nitric acid by warming, and filter. Wash the residue with 15 mL of water, combine the washings with the filtrate, and add water to make 50 mL. Use this solution as the test solution and perform the test.

Control solution—To 0.30 mL of 0.01 mol/L hydrochloric acid, add 5 mL of sodium carbonate TS, and proceed in the same manner as the test solution (NMT 0.021%).

(3) ***Sulfate***—To 0.5g of Kainic Acid Hydrate, add 40 mL of water, and dissolve by warming. After cooling, add 1 mL of dilute hydrochloric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 0.30 mL of 0.005 mol/L sulfuric acid (NMT 0.028%).

(4) ***Ammonium***—Perform the test with 0.25 g of Kainic Acid Hydrate. Prepare the control solution with 5.0 mL of ammonium standard solution (NMT 0.02%).

(5) ***Heavy metals***—Proceed with 1.0 g of Kainic Acid Hydrate according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(6) ***Arsenic***—Weigh 1.0 g of Kainic Acid Hydrate, and dissolve in 5 mL of dilute hydrochloric acid. Use this solution as the test solution, and perform the test (NMT 2 ppm).

(7) ***Related substances***—Weigh 0.10 g of Kainic Acid Hydrate, dissolve in exactly 10 mL of water, and use this solution as the test solution. Pipet 2 mL of this solution, and add water to make exactly 100 mL. Take 1.0 mL of this solution, add water to make exactly 20 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on a plate made of silica gel for thin-layer chromatography. Next, develop the plate with the upper layer of a mixture of water, 1-butanol, and acetic acid(100) (5 : 4 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Spray evenly a solution of ninhydrin in acetone (1 in 50) on the plate, and dry at 80 ℃ for 5 minutes; the spots other than the principal spot obtained from the test

solution are not more intense than the spots from the standard solution.

Loss on drying Between 6.5% and 8.5% (1 g, 105 ºC, 4 hours).

Residue on ignition NMT 0.1% (0.5 g).

Assay Weigh accurately 0.4 g of Kainic Acid Hydrate, previously dried, dissolve in 50 mL of warm water, cool, and titrate with 0.1 mol/L sodium hydroxide VS (indicator: 10 drops of bromothymol blue TS).

Each mL of 0.1 mol/L sodium hydroxide VS
= 21.323 mg of $C_{10}H_{15}NO_4$

Packaging and storage Preserve in tight containers.

Kallidinogenase
칼리디노게나제

[*9001-01-8*]

Kallidinogenase is an enzyme obtained from pancreas of healthy pigs and has the effect of decomposing kininogen to release kinins. It contains NLT 25 units of kallidinogenase in 1 mg.

It is generally diluted with Lactose Hydrate, etc.

Kallidinogenase contains NLT 90.0% and NMT 110.0% of the labeling unit.

Description Kallidinogenase occurs as a white to pale brown powder. It is odorless or has a faint, characteristic odor.

It is freely soluble in water and practically insoluble in ethanol(95) or ether.

The pH of an aqueous solution of Kallidinogenase (1 in 300) is between 5.5 and 7.5.

Identification (1) Weigh accurately an appropriate amount of Kallidinogenase according to the labeled amount, dissolve in 0.05 mol/L phosphate buffer solution of pH 7.0, and prepare a solution containing 10 Units of kallidinogenase in 1 mL. Pipet 5 mL of this solution, and add exactly 1 mL of the Trypsin Inhibitor TS and additional 0.05 mol/L phosphate buffer solution of pH 7.0 to make exactly 10 mL. Pipet 4 mL each of this solution, and transfer to each test tube. Add exactly 1 mL of aprotinin TS on one side and 1 mL of 0.05 mol/L phosphate buffer solution of pH 7 on the other side, allow to stand at room temperature for 20 minutes, and use these solutions as the test solution (1) and the test solution (2). Separately, pipet 1 mL of trypsin inhibitor TS, and add 0.05 mol/L phosphate buffer solution of pH 7.0 to make exactly 10 mL. Pipet 4 mL each of this solution, and transfer to each test tube. Add exactly 1 mL of aprotinin TS on one side and 1 mL of 0.05 mol/L phosphate buffer solution of pH 7 on the other side, allow to stand at room temperature for 20 minutes, and use these solutions as the test solutions (3) and (4), respectively. Next, add exactly 2.5 mL of substrate reagent TS (1) for kallidinogenase assay previously warmed for 5 minutes at 30 ± 0.5 ℃, put in a cell with the layer length of 1 cm, and add exactly 0.5 mL of the test solution 1 warmed for 5 minutes at 30 ± 0.5 ℃ while starting a stopwatch at the same time. Perform the test as directed under the Ultraviolet-visible Spectroscopy using water at 30 ± 0.5 ℃ as the control solution, and determine the absorbances, $A_{1\text{-}2}$ and $A_{1\text{-}6}$, at the wavelength of 405 nm, exactly after 2 minutes and 6 minutes. Perform the same procedure for the test solutions (2), (3) and (4), and determine the absorbances $A_{2\text{-}2}$, $A_{2\text{-}6}$, $A_{3\text{-}2}$, $A_{3\text{-}6}$, $A_{4\text{-}2}$, and $A_{4\text{-}6}$. Calculate of the value of I according to the following equation; the value I is less than 0.2.

$$\mathrm{I} = \frac{(A_{1-6} - A_{1-2}) - (A_{3-6} - A_{3-2})}{(A_{2-6} - A_{2-2}) - (A_{4-6} - A_{4-2})}$$

(2) Take exactly 2.9 mL of substrate reagent TS (2) for kallidinogenase assay previously warmed for 5 minutes at 30 ± 0.5℃, put in a cell with the layer length of 1 cm, and add exactly 0.1 mL of the test solution obtained from the Assay while starting a stopwatch at the same time. Perform the test as directed under the Ultraviolet-visible Spectroscopy at 30 ± 0.5 ℃, and determine a change in absorbance at the wavelength of 253 nm for 4 minutes to 6 minutes. However, add exactly 1 mL of trypsin inhibitor TS separately, and add 0.05 mol/L phosphate buffer solution of pH 7.0 to make exactly 10 mL. Pipet 0.1 mL of this solution, add to a solution prepared by taking exactly 2.9 mL of substrate reagent TS (2) for kallidinogenase assay previously warmed for 5 minutes at 30 ± 0.5℃, and use this solution as the control solution. Calculate a quantity of change in absorbance *A* per minute when the rate of change in absorbance is constant. Calculate of the value R according to the following equation; the value is between 0.12 and 0.16.

$$R = \frac{A}{0.0383} \times \frac{1}{a \times b}$$

a: Amount (mg) of Kallidinogenase in 1 mL of the test solution

b: Units of kallidinogenase in 1 mg of Kallidinogenase obtained in the Assay

Inactivity Determine the nitrogen content of Kallidinogenase according to the Nitrogen Determination, convert 1 mg of nitrogen into 6.25 mg of protein, and calculate the inactivity from the number of units obtained from the Assay; the result is NLT 100 units of Kallidinogenase per mg of protein.

Purity (1) ***fat***—Add 20 mL of ether to 1.0 g of Kallidinogenase, extract for 30 minutes while shaking occasionally, filter, and wash with 10 mL of ether. Combine the filtrate and the washings to evaporate, and dry for 2 hours at 105 °C; the amount is NMT 1 mg.

(2) ***Kininase***—(i) bradykinin solution: Weigh an appropriate amount of bradykinin solution, and dissolve

in the gelatin-phosphate buffer solution of pH 7.4 to prepare a solution containing 0.200 μg of bradykinin in 1 mL.

(ii) Kallidinogenase solution: Weigh accurately an appropriate amount of Kallidinogenase according to the labeling unit, and dissolve in the gelatin-phosphate buffer solution of pH 7.4 to prepare a solution containing 1 unit of Kallidinogenase in 1 mL.

(iii) Test solution: Pipet 0.5 mL of bradykinin solution, warm for 5 minutes at 30 ± 0.5 ℃, add accurately 0.5 mL of the kallidinogenase solution previously warmed for 5 minutes at 30 ± 0.5℃, and shake immediately to mix. Allow this solution to stand at 30 ± 0.5 ℃ for 150 seconds exactly, add exactly 0.2 mL of trichloroacetic acid solution (1 in 5), and shake to mix. Boil for 3 minutes, cool with cold water immediately, centrifuge, and allow to stand at room temperature for 15 minutes. Pipet 0.5 mL of the clear supernatant, add accurately 0.5 mL of gelatin-tris buffer solution of pH 8.0, and shake to mix. Pipet 0.1 mL of this solution, add accurately 0.9 mL of trichloroacetic acid-gelatin-tris buffer solution, and shake to mix. Pipet 0.2 mL of this solution, mix exactly 0.6 mL of trichloroacetic acid-gelatin-tris buffer solution, and use this solution as the test solution.

(iv) Control solution: Take 0.5 mL of gelatin-phosphate buffer solution of pH 7.4, proceed with it in the same manner as (c), and use this solution as the control solution.

(v) Procedure: Add 0.1 mL of anti-bradykinin antibody TS to anti-rabbit antibody-coated wells of a 96-well microplate, shake to mix, and allow to stand at a constant temperature of about 25 °C for 1 hour. Remove the anti-bradykinin antibody TS, and add 0.3 mL of phosphate buffer solution for microplate washing to remove. Repeat this procedure 3 times, and remove the solution thoroughly. Add 100 μL each of the test solution and the control solution, and 50 μL of gelatin-phosphate buffer solution of pH 7.0, shake to mix, and allow to stand at a constant temperature of about 25 °C for 1 hour. Next, add 50 μL of peroxidase-labeled bradykinin TS, shake to mix, and allow to stand overnight in a cool place. Remove the reaction solution, and add 0.3 mL of phosphate buffer solution for microplate washing to remove. Repeat this procedure 4 times to remove the solution thoroughly, add 100 μL of substrate solution for peroxidase assay, and allow to stand at a constant temperature of about 25 °C for 30 minutes exactly while protected from light. Add 100 μL of diluted sulfuric acid (23 in 500), shake to mix, and determine the absorbance at the wavelengths between 490 nm and 492 nm. Separately, weigh an appropriate amount of bradykinin, dissolve in pH 7.0 gelatin-phosphate buffer solution to prepare solutions containing exactly 100, 25, 6.25, 1.56, 0.39 and 0.098 ng in 1 mL, and use these solutions as the standard solution (1), the standard solution (2), the standard solution (3), the standard solution (4), the standard solution (5) and the standard solution (6), respectively. Also, use 1 mL of gelatin-phosphate buffer solution of pH 7.0 as the standard solution (7). Put 50 μL each standard solution and 100 μL of trichloroacetic acid-gelatin-tris buffer solution in the well, and proceed in the same manner as the test solution and the control solution below. Prepare a calibration curve from the amount and the absorbance of bradykinin in the standard solution, and calculate the amount of bradykinin, B_T (pg) and B_S (pg), of the test solution and the control solution. The absorbance of this test is usually determined by using a spectrophotometer for microplate. Take care of contamination and scratch since the well is a spectrophotometric cell. Also, put a certain exact amount of solution into the well since the layer length varies according to the quantity of the solution.

(vi) Interpretation: Calculate the value R according to the following equation; the value is NLT 0.8.

$$\mathrm{R} = \frac{B_\mathrm{T}}{B_\mathrm{S}}$$

(3) ***Trypsin-like substance***—Pipet 4 mL of the sample stock solution obtained from Assay, add exactly 1 mL of trypsin inhibitor TS and additional 0.05 mol/L phosphate buffer solution of pH 7.0 to make exactly 10 mL, and use this solution as the test solution. Take exactly 2.5 mL of substrate reagent TS (1) for kallidinogenase assay previously warmed for 5 minutes at 30 ± 0.5℃, put in a cell with the layer length of 1 cm, and add exactly 0.5 mL of the test solution warmed for 5 minutes at 30 ± 0.5℃ while starting a stopwatch at the same time. Perform the test as directed under the Ultraviolet-visible Spectroscopy using water as the control solution at 30 ± 0.5 ℃, and determine the absorbances, A_2 and A_6, at the wavelength of 405 nm, exactly after 2 minutes and 6 minutes. Separately, pipet 4 mL of the sample stock solution, add 0.05 mol/L phosphate buffer solution of pH 7.0 to make exactly 10 mL, and use this solution as the control solution. With the control solution, perform the same test as the test solution to determine the absorbances A'_2 and A'_6. Calculate the value T according to the following equation; the value is NMT 0.05.

$$\mathrm{T} = \frac{(A'_6 - A'_2) - (A_6 - A_2)}{(\mathrm{A}'_6 - \mathrm{A}'_2)}$$

(4) ***Protease***—Weigh accurately an appropriate amount of Kallidinogenase according to the labeled amount, dissolve by adding 0.05 mol/L phosphate buffer solution of pH 7.0, prepare a solution containing 1 unit of kallidinogenase in 1 mL, and use this solution as the test solution. Take exactly 1 mL of the test solution, put in a test tube, and allow to stand at 35 ± 0.5 ℃ for 5 minutes. Next, take exactly 2.9 mL of substrate reagent TS (3) for kallidinogenase assay previously warmed at 35 ± 0.5℃, add to the test solution in a test tube, and allow to react at 35 ± 0.5 ℃ for exactly 20 minutes. Add exactly 5 mL of trichloroacetic acid TS, shake well to mix, allow to stand at a room temperature for 1 hour, and filter through a membrane filter with a pore size of 5 μm. Discard the first 3 mL of the filtrate, perform the test with the subsequent filtrate as directed under the Ultraviolet-visible Spectroscopy using water as the control solution within 2

hours, and determine the absorbance A at the wavelength of 280 nm. Separately, take exactly 1 mL of the test solution, add exactly 5 mL of trichloroacetic acid TS, and shake well to mix. Add exactly 5 mL of substrate reagent TS (3) for kallidinogenase assay, and perform the test in the same manner to determine the absorbance A_0. Determine A - A_0 from the values obtained previously; the result is NMT 0.2.

Loss on drying NMT 2.0% (0.5 g, in vacuum, phosphorus pentoxide, 4 hours).

Residue on ignition NMT 3.0% (0.5 g, between 650 and 750 ℃).

Kinin-releasing activity (a) ***Kallidinogenase solution*** —Weigh accurately an appropriate amount of Kallidinogenase according to the labeling unit, dissolve in 0.02 mol/L phosphate buffer solution of pH 8.0, and prepare a solution containing 0.1 unit of kallidinogenase in 1 mL. In addition, use glass containers to prepare this solution.

(b) ***Test solution***—Pipet 0.5 mL of kininogen TS, warm for 5 minutes at 30 ± 0.5 ℃, add exactly 0.5 mL of kallidinogenase solution previously warmed for 5 minutes at 30 ± 0.5℃, and shake immediately to mix. Allow this solution to stand at 30 ± 0.5 ℃ for 2 minutes exactly, add exactly 0.2 mL of trichloroacetic acid solution (1 in 5), and shake to mix. Boil for 3 minutes, cool with iced water immediately, centrifuge, allow to stand at room temperature for 15 minutes. Pipet 0.5 mL of the clear supernatant, add accurately 0.5 mL of gelatin-tris buffer solution of pH 8.0, and shake to mix. Pipet 0.1 mL of this solution, add exactly 1.9 mL of trichloroacetic acid-gelatin-tris buffer solution, shake to mix, and use this solution as the test solution.

(c) ***Procedure***—Determine the amount of kinins per well, B (pg), with the test solution as directed under the purity (2). Calculate the Kinin-releasing activity per unit of Kallidinogenase according to the following equation; the result is NLT 500 ng bradykinin equivalent/min/unit.

Kinin-releasing activity per unit of Kallidinogenase (ng bradykinin equivalent/min/unit)
= B × 4.8

Determination Weigh accurately an appropriate amount of Kallidinogenase according to the labeling unit, dissolve in the 0.05 mol/L phosphate buffer solution of pH 7.0, prepare a solution containing about 10 unit of kallidinogenase in 1 mL, and use this solution as the sample stock solution. Pipet 4 mL of the sample stock solution, add exactly 1 mL of the trypsin inhibitor TS and additional 0.05 mol/L phosphate buffer solution of pH 7.0, to make exactly 10 mL, and use this solution as the test solution. Take exactly 2.5 mL of substrate reagent TS (1) for kallidinogenase assay previously warmed for 5 minutes at 30 ± 0.5℃, put in a cell with the layer length of 1 cm, and add exactly 0.5 mL of the test solution warmed for 5 minutes at 30 ± 0.5℃ while starting a stopwatch at the same time. Perform the test as directed under the Ultraviolet-visible Spectroscopy, using water as the control solution at 30 ± 0.5 ℃, and determine the absorbances, A_{T2} and A_{T6}, at the wavelength of 405 nm, exactly after 2 minutes and 6 minutes. Separately, dissolve kallidinogenase RS by adding 0.05 mol/L phosphate buffer solution of pH 7.0, prepare a solution containing exactly 10 units in 1 mL, and use this solution as the standard stock solution. Pipet 4 mL of this solution, add exactly 1 mL of trypsin inhibitor TS and additional 0.05 mol/L phosphate buffer solution of pH 7.0 to make exactly 10 mL, and use this solution as the standard solution. Pipet 0.5 mL of the standard solution, perform the same test as the test solution, and determine the absorbances, A_{S2} and A_{S6}, after 2 minutes and 6 minutes exactly. Separately, pipet 1 mL of trypsin inhibitor TS, and add 0.05 mol/L phosphate buffer solution of pH 7.0 to make exactly 10 mL. Pipet 0.5 mL of this solution, perform the same test as the test solution, and determine the absorbances, A_{02} and A_{06}, after 2 minutes and 6 minutes exactly.

$$\text{Units of kallidinogenase in 1 mg of Kallidinogenase} = \frac{(A_{T6} - A_{T2}) - (A_{06} - A_{02})}{(A_{S6} - A_{S2}) - (A_{06} - A_{02})} \times \frac{W_S}{a} \times \frac{1}{b}$$

W_S: Amount of kallidinogenase RS taken (unit)
a: Volume of the standard stock solution (mL)
b: Amount of Kallidinogenase in 1 mL of the sample stock solution (mg)

Packaging and storage Preserve in tight containers.

Kallidinogenase Tablets
칼리디노게나제 정

Kallidinogenase Tablets contains NLT 90.0% and NMT 130.0% of the labeled potency of kallidinogenase.

Method of preparation Prepare as directed under Tablets, with Kallidinogenase.

Identification Perform the test as directed under the Assay; it shows a positive response.

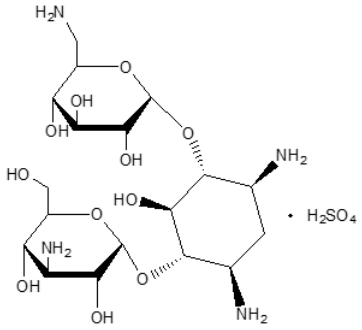
Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the contents of NLT 20 tablets of Kallidinogenase Tablets, and powder. Perform the test as directed under the Assay under Kallidinogenase in Japanese Pharmacopoeia.

Packaging and storage Preserve in well-closed containers.

Kanamycin Monosulfate
카나마이신일황산염



$C_{18}H_{36}N_4O_{11}\cdot H_2SO_4$: 582.58

(2*R*,3*S*,4*S*,5*R*,6*R*)-2-(Aminomethyl)-6-{[(1*R*,2*R*,3*S*,4*R*,6*S*)-4,6-diamino-3-{[(2*S*,3*R*,4*S*,5*S*,6*R*)-4-amino-3,5-dihydroxy-6-(hydroxymethyl)oxan-2-yl]oxy}-2-hydroxycyclohexyl]oxy}oxane-3,4,5-triol monosulfate [*25389-94-0*]

Kanamycin Monosulfate is the sulfate of aminoglycoside compound having antibacterial activity produced by cultivating *Streptomyces kanamyceticus*.

Kanamycin Monosulfate contains NLT 750 μg and NMT 832 μg (potency) of kanamycin ($C_{18}H_{36}N_4O_{11}$: 484.50) per mg, calculated on the dried basis.

Description Kanamycin Monosulfate occurs as a white crystalline powder.
It is freely soluble in water and practically insoluble in ethanol(99.5).

Identification (1) Dissolve 50 mg of Kanamycin Monosulfate in 3 mL of water, and add 6 mL of anthrone TS; the resulting solution exhibits bluish purple color.

(2) Dissolve 20 mg each of Kanamycin Monosulfate and kanamycin monosulfate RS in 1 mL of water, respectively, and use these solutions as the test solution and the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with the clear supernatant of a mixture of chloroform, ammonia water(28) and methanol (2 : 1 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Spray evenly 0.2% ninhydrin-water saturated 1-butanol TS on the plate and heat the plate at 100 ℃ for 10 minutes; the principal spot obtained from the test solution and the spots obtained from the standard solution are purple and have the same R_f value.

(3) To an aqueous solution of Kanamycin Monosulfate (1 in 5), add 1 drop of barium chloride TS; a white precipitate forms.

Optical rotation $[\alpha]_D^{20}$: Between +112° and +123° (0.2 g calculated on the dried basis, water, 20 mL, 100 mm).

pH Dissolve 0.1 g of Kanamycin Monosulfate in 10 mL of water; the pH of this solution is between 6.5 and 8.5.

Purity (1) ***Sulfate***—Weigh accurately 0.25 g of Kanamycin Monosulfate, dissolve in 100 mL of water, and adjust the pH to 11.0 with ammonia water(28). To this solution, add exactly 10 mL of 0.1 mol/L barium chloride VS, and titrate with 0.1 mol/L ethylenediaminetetraacetic acid disodium salt VS (indicator: phthalein purple, 0.5 mg). However, when the color of the solution begins to change, add 50 mL of ethanol(99.5), and the endpoint of the titration is when the bluish purple color of this solution turns colorless. Perform a blank test in the same manner. Kanamycin Monosulfate contains NLT 15.0% and NMT 17.0% of sulfate (SO_4^{2-}), calculated on the dried basis.

Each mL of 0.1 mol/L barium chloride VS
= 9.606 mg of sulfate (SO_4^{2-})

(2) ***Heavy metals***—Proceed with 2.0 g of Kanamycin Monosulfate according to Method 4 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Arsenic***—Prepare the test solution with 2.0 g of Kanamycin Monosulfate according to Method 4 and perform the test (NMT 1 ppm).

(4) ***Related substances***—Weigh accurately 0.30 g of Kanamycin Monosulfate, dissolve in water to make exactly 10 mL, and use this solution as the test solution. Separately, weigh accurately 45 mg of kanamycin monosulfate RS, dissolve it in water to make exactly 50 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 1 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with potassium dihydrogen phosphate solution (3 in 40) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Spray evenly a solution of ninhydrin in 1-butanol (1 in 100) on the plate, and heat at 110 ℃ for 10 minutes; the spots other than the principal spot obtained from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 4.0% (5 g, in vacuum, NMT 0.67 kPa, 60 ℃, 3 hours).

Residue on ignition NMT 0.5% (1 g).

Sterility It meets the requirements when used in a sterile preparation. However, it is excluded in cases where there is a terminal sterilization process in the manufacturing of a sterile preparation.

Bacterial endotoxins Less than 0.50 EU per mg of kanamycin when used for the manufacturing of sterile preparations.

Abnormal toxicity Dissolve 2 mg of Kanamycin Mono-

sulfate in 0.5 mL of water for injection, and inject intravenously for 15 to 30 seconds to each of 5 healthy mice weighing 17 g to 22 g. Use animals in which no abnormalities are observed for NLT 5 days prior to the test. No animals die when observed for 24 hours after administration. If 1 animal dies, repeat the test with 5 animals, and make sure that no animal dies when observed for 24 hours.

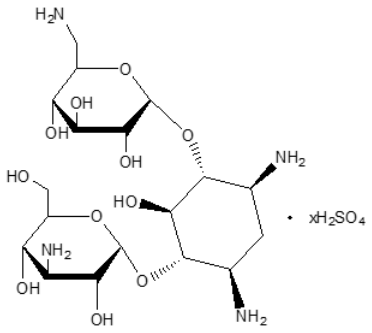
Assay ***Cylinder-plate method*** (1) Medium: Agar media for seed and base layer Use the culture medium in (A) (2) (a) ① ⓐ under the Microbial Assays for Antibiotics.

(2) Test organism: Use *Bacillus subtilis* ATCC 6633 as the test organism.

(3) Weigh accurately about 20 mg (potency) of Kanamycin Monosulfate and dissolve in water to make exactly 50 mL. Take exactly an appropriate amount of this solution, dilute with 0.1 mol/L phosphate buffer solution (pH 8.0) to make two solutions containing each 20.0 μg and 5.0 μg (potency) per mL, and use these solutions as the high concentration test solution and the low concentration test solution, respectively. Separately, dry an appropriate amount of kanamycin monosulfate RS, weigh accurately about 20 mg of kanamycin monosulfate RS, dissolve in diluted phosphate buffer solution, pH 6.0 (1 in 2) to make exactly 50 mL, and use this solution as the standard stock solution. Store the standard stock solution at 5 to 15 °C and use them within 30 days. Take exactly an appropriate amount of this standard stock solution, dilute with 0.1 mol/L phosphate buffer solution (pH 8.0) to obtain solutions containing each 20.0 μg and 5.0 μg (potency) per mL, and use these solutions as the high concentration standard solution and the low concentration standard solution, respectively. With these solutions, perform the test according to (A)(8) under the Microbial Assays for Antibiotics.

Packaging and storage Preserve in well-closed containers.

Kanamycin Sulfate
카나마이신황산염



$C_{18}H_{36}N_4O_{11}\cdot xH_2SO_4$

(2*R*,3*S*,4*S*,5*R*,6*R*)-2-(Aminomethyl)-6-{[(1*R*,2*R*,3*S*,4*R*,6*S*)-4,6-diamino-3-{[(2*S*,3*R*,4*S*,5*S*,6*R*)-4-amino-3,5-dihydroxy-6-(hydroxymethyl)oxan-2-yl]oxy}-2-hydroxycyclohexyl]oxy}oxane-3,4,5-triol sulfate [*25389-94-0*]

Kanamycin Sulfate is the sulfate of aminoglycoside compound having antibacterial activity produced by cultivating *Streptomyces kanamyceticus*. Kanamycin Sulfate contains NLT 690 μg and NMT 740 μg (potency) of kanamycin ($C_{18}H_{36}N_4O_{11}$: 484.50) per mg, calculated on the dried basis.

Description Kanamycin Sulfate occurs as a white to yellowish white powder.
It is very soluble in water and practically insoluble in ethanol(99.5).

Identification (1) Dissolve 20 mg each of Kanamycin Sulfate and kanamycin sulfate RS in 1 mL of water, and use these solutions as the test solution and the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Develop the plate with a mixture of chloroform, ammonia water(28), and methanol (2 : 1 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Spray evenly 0.2% ninhydrin-water saturated 1-butanol TS on the plate and heat the plate at 100 ℃ for 10 minutes; the principal spot obtained from the test solution and the spots obtained from the standard solution are purplish brown and have the same R_f value.

(2) An aqueous solution of Kanamycin Sulfate (1 in 10) responds to the Qualitative Analysis (1) for sulfate.

Optical rotation $[\alpha]_D^{20}$: Between +103° and +115° (0.5 g calculated on the dried basis, water, 50 mL, 100 mm).

pH Dissolve 1.0 g of Kanamycin Sulfate in 20 mL of water; the pH of this solution is between 6.0 and 7.5.

Purity (1) ***Clarity and color of solution***—Dissolve 1.5 g of Kanamycin Sulfate in 5 mL of water; the solution is clear and colorless to pale yellow.

(2) ***Heavy metals***—Proceed with 1.0 g of Kanamycin Sulfate according to Method 4 and perform the test. Prepare the control solution with 3.0 mL of lead standard solution (NMT 30 ppm).

(3) ***Arsenic***—Prepare the test solution with 2.0 g of Kanamycin Sulfate according to Method 3 and perform the test (NMT 1 ppm).

(4) ***Related substances***—Dissolve 0.30 g of Kanamycin Sulfate in water to make exactly 10 mL, and use this solution as the test solution. Separately, weigh accurately 9.0 mg of kanamycin monosulfate RS, dissolve in water to make exactly 10 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 1 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate

with potassium dihydrogen phosphate solution (3 in 40) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Spray evenly a solution of ninhydrin in 1-butanol (1 in 100) on the plate, heat at 110 ℃ for 10 minutes; the spots other than the principal spot obtained from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 5.0% (0.5 g, NMT 0.67 kPa, 60 ℃, 3 hours).

Sterility It meets the requirements when used in a sterile preparation. However, it is excluded in cases where there is a terminal sterilization process in the manufacturing of a sterile preparation.

Pyrogen It meets the requirements when used in a sterile preparation. Weigh an appropriate amount of Kanamycin Sulfate, make the solution so that each mL contains 10 mg, and use the solution as the test solution. However, inject the test solution into a rabbit by 1.0 mL per kg of the rabbit weight.

Assay Cylinder plate method Perform the test according to the Assay under Kanamycin Monosulfate. However, weigh accurately about 20 mg (potency) of Kanamycin Sulfate, and dissolve it in water to make exactly 50 mL.

Packaging and storage Preserve in tight containers.

Kanamycin Sulfate for Injection
주사용 카나마이신황산염

Kanamycin Sulfate for Injection is a preparation for injection, which is dissolved before use. It contains NLT 90.0% and NMT 120.0% of the labeled amount of kanamycin ($C_{18}H_{36}N_4O_{11}$: 484.50).

Method of preparation Prepare as directed under Injections, with Kanamycin Sulfate.

Description Kanamycin Sulfate for Injection occurs as a white powder.

Identification (1) Dissolve 50 mg of Kanamycin Sulfate for Injection in 3 mL of water, and add 2 mL of anthrone TS; the solution exhibits a bluish purple color.

(2) Dissolve 20 mg of Kanamycin Sulfate for Injection in 2 mL of 1/15 mol/L phosphate buffer solution (pH 5.6), add 1 mL of ninhydrin TS, and boil; the solution exhibits a bluish purple color.

(3) Dissolve 10 mg of Kanamycin Sulfate for Injection in 1 mL of water, add 1 mL of a solution of ninhydrin in 1-butanol (1 in 500) and 0.5 mL of pyridine, heat on a steam bath for 5 minutes, and then add 1 mL of water; the solution exhibits a deep violet color.

pH Dissolve Kanamycin Sulfate for Injection in water to make 50 mg (potency) per mL; the pH of the solution is between 6.0 and 8.5.

Loss on drying NMT 5.0% (0.1 g, 0.7 kPa, 60 ℃, 3 hours).

Sterility Meets the requirements.

Bacterial endotoxins Less than 0.50 EU per mg (potency) of kanamycin.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Uniformity of dosage units Meets the requirements.

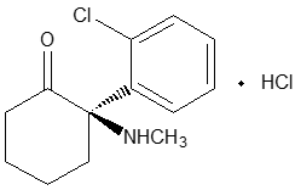
Assay ***Cylinder plate method*** (1) Medium: Agar media for seed and base layer Use the medium in (A) (2) (a) ① ⓐ under the Microbial Assays for Antibiotics.

(2) Test organism: Use *Bacillus subtilis* ATCC 6633 as the test organism.

(3) Weigh accurately about 0.1 g (potency) of Kanamycin Sulfate for Injection according to the labeled potency, add sterile purified water, shake to mix, and make exactly 200 mL. Take an appropriate amount of this solution, dilute to contain exactly 20 μg and 5 μg (potency) per mL with 0.1 mol/L phosphate buffer solution (pH 8.0), and use these solutions as the high-dose test solution and the low-dose test solution, respectively. Separately, take an appropriate amount of kanamycin sulfate RS, dry, weigh accurately about 20 mg (potency), and dissolve in 0.05 mol/L phosphate buffer solution (pH 6.0) to prepare a standard stock solution containing exactly 400 μg (potency) per mL. Keep this standard stock solution at 5 to 15 ℃, and use within 30 days. Take an appropriate amount of this standard stock solution and dilute with 0.1 mol/L phosphate buffer solution (pH 6.0) to contain 20 μg and 5 μg (potency) per mL, and use these solutions as the high-dose standard solution and the low-dose standard solution, respectively. With these solutions, perform the test according to (A) (8) under the Microbial Assays for Antibiotics.

Packaging and storage Preserve in hermetic containers.

Ketamine Hydrochloride
케타민염산염



and enantiomer

$C_{13}H_{16}ClNO \cdot HCl$: 274.19
2-(2-Chlorophenyl)-2-(methylamino)cyclohexan-1-one hydrochloride [*1867-66-9*]

Ketamine Hydrochloride, when dried, contains NLT 99.0% and NMT 101.0% of ketamine hydrochloride ($C_{13}H_{16}ClNO \cdot HCl$).

Description Ketamine Hydrochloride occurs as white crystals or a crystalline powder.
It is very soluble in formic acid, freely soluble in water or methanol, sparingly soluble in ethanol(95) or acetic acid(100), and practically insoluble in acetic anhydride or ether.
An aqueous solution of Ketamine Hydrochloride (1 in 10) shows no optical rotation.

Melting point—About 258 °C (with decomposition).

Identification (1) Determine the absorption spectra of solutions of Ketamine Hydrochloride and ketamine hydrochloride RS in 0.1 mol/L hydrochloric acid TS (1 in 3000) as directed under the Ultraviolet-visible spectrophotometry; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Ketamine Hydrochloride and ketamine hydrochloride RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) An aqueous solution of Ketamine Hydrochloride (1 in 10) responds to the Qualitative Analysis (2) for chloride.

pH Dissolve 1.0 g of Ketamine Hydrochloride in 10 mL of freshly boiled and cooled water. The pH of this solution is between 3.5 and 4.5.

Absorbance $E_{1cm}^{1\%}$ (269 nm): Between 22.0 and 24.5 (30 mg, after drying, 0.1 mol/L hydrochloric acid TS, 100 mL).

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Ketamine Hydrochloride in 5 mL of water; the solution is clear and colorless.

(2) ***Heavy metals***—Proceed with 1.0 g of Ketamine Hydrochloride as directed under the Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Arsenic***—Proceed with 1.0 g of Ketamine Hydrochloride as directed under the Method 1 and perform the test (NMT 2 ppm).

(4) ***Related substances***—Dissolve 0.5 g of Ketamine Hydrochloride in 10 mL of methanol and use this solution as the test solution. Pipet 1 mL of the test solution, add methanol to make exactly 200 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 2 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of cyclohexane and isopropylamine (49 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Spray evenly Dragendorff's TS on the plate. (; the spots other than the major spot obtained from the test solution are not more intense than the spots from the standard solution as dry the plate and spray evenly hydrogen peroxide TS on the plate.

Loss on drying NMT 0.5% (1 g, 105 ℃, 3 hours).

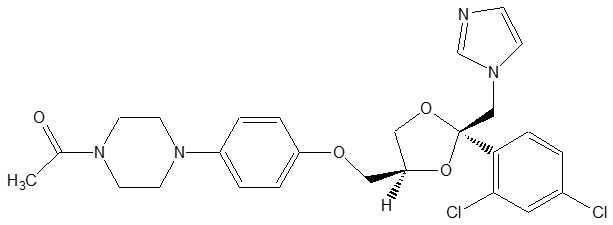
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.5 g of Ketamine Hydrochloride, previously dried, dissolve in 1 mL of formic acid, add 70 mL of a mixture of acetic anhydride and acetic acid(100) (6 : 1), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 27.419 mg of $C_{13}H_{16}ClNO \cdot HCl$

Packaging and storage Preserve in tight containers.

Ketoconazole
케토코나졸



and enantiomer

$C_{26}H_{28}Cl_2N_4O_4$: 531.43
1-[4-(4-{[2-(2,4-Dichlorophenyl)-2-(1*H*-imidazol-1-ylmethyl)-1,3-dioxolan-4-yl]methoxy}phenyl)piperazin-1-yl]ethan-1-one [*65277-42-1*]

Ketoconazole, when dried, contains NLT 98.0% and NMT 102.0% of ketoconazole ($C_{26}H_{28}Cl_2N_4O_4$).

Description Ketoconazole occurs as a white powder.
It is soluble in methanol, sparingly soluble in ethanol(95), and practically insoluble in water.

Identification Determine the infrared spectra of Ketoconazole and ketoconazole RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared spectrophotometry; both spectra exhibit the similar intensities of absorption at the same wavenumbers.

Optical rotation $[\alpha]_D^{20}$: Between -1° and +1° (0.4 g,

methanol, 10 mL, 100 mm).

Melting point Between 148 and 152 ℃.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Ketoconazole as directed under the Method 2 under the Heavy Metals and perform the test. Prepare the control solution with 1.0 mL of lead standard solution (NMT 10 ppm).

(2) **Related substances**—Dissolve 0.10 g of Ketoconazole in 10 mL of methanol and use this solution as the test solution. Pipet 5 mL of this solution and add methanol to make exactly 100 mL. Pipet 1 mL of this solution, add methanol to make exactly 10 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak area of each solution by the automatic integration method; each peak area other than the peak of ketoconazole from the test solution is not greater than 2/5 of the peak area of ketoconazole from the standard solution. Also, the total area of the peaks other than the peak of ketoconazole from the test solution is not greater than the peak area of ketoconazole from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 10 cm in length, packed with octadecylsilanized silical gel for liquid chromatography (3 μm in particle diameter).

Column temperature: A constant temperature of about 25 ℃.

Mobile phase: Control the mixing ratio of mobile phase A and mobile phase B in stages or gradient elution as follows.

Mobile phase A: Acetonitrile

Mobile phase B: Tetrabutylammonium hydrogen sulfate solution (17 in 5000).

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 - 10	5 → 50	95 → 50
10 - 15	50	50

Flow rate: 2.0 mL/min

System suitability

Test for required detectability: Pipet 2 mL of the standard solution and add methanol to make exactly 20 mL. Confirm that the peak area of ketoconazole obtained from 10 μL of this solution is equivalent to between 7% and 13% of the peak area of ketoconazole obtained from the standard solution.

System performance: Proceed with 10 μL of the standard solution under the above operating conditions; the number of theoretical plates and symmetry factor of the peak of ketoconazole are NLT 40000 and NMT 1.5, respectively.

System repeatability: Repeat the test 6 times according to the above conditions with 10 μL of the standard solution each time; the relative standard deviation of the peak areas of ketoconazole is NMT 2.5%.

Time span of measurement: From the solvent peak until 15 minutes after introduction.

Loss on drying NMT 0.5% (1 g, vacuum, 80 ℃, 4 hours).

Residue on ignition NMT 0.1% (2 g).

Assay Weigh accurately about 0.2 g of Ketoconazole, dissolve in 40 mL of acetic acid(100), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 26.572 mg of $C_{26}H_{28}Cl_2N_4O_4$

Packaging and storage Preserve in well-closed containers.

Ketoconazole Solution
케토코나졸 액

Ketoconazole Solution contains NLT 90.0% and NMT 110.0% of the labeled amount of ketoconazole ($C_{26}H_{28}Cl_2N_4O_4$: 531.43).

Method of preparation Prepare as directed under the Liquids, with Ketoconazole.

Identification The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

pH Between 6.0 and 8.0.

Assay Pipet an amount of Ketoconazole Solution equivalent to 0.2 g of ketaconazole ($C_{26}H_{28}Cl_2N_4O_4$) according to the labeled amount, and add a mixture of methanol and dichloromethane (1 : 1) to make 50 mL. Take 5.0 mL of this solution, add 5.0 mL of the internal standard solution, add a mixture of methanol and dichloromethane (1 : 1) to make 50 mL, and use this solution as the test solution. Separately, weigh accurately about 20 mg of ketaconazole RS, add 5.0 mL of the internal standard solution, and add a mixture of methanol and dichloromethane (1 : 1) to make 50 mL. Use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the peak area ratios, Q_T and Q_S, of ketaconazole to the internal standard, respectively.

Amount (mg) of ketaconazole ($C_{26}H_{28}Cl_2N_4O_4$)

$$= \text{Amount (mg) of ketaconazole RS} \times \frac{A_T}{A_S} \times 10$$

Internal standard solution—Weigh an appropriate amount of terconazole, and dissolve in a mixture of methanol and dichloromethane (1 : 1) to prepare a solution containing 5 mg per mL.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 225 nm).

Column: A stainless steel column about 3.9 mm in internal diameter and 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (about 3 μm to 10 μm in particle diameter).

Column temperature: Room temperature

Mobile phase: A mixture of methanol solution of diisopropylamine (1 in 500) and ammonium acetate solution (1 in 200) (70 : 30).

Flow rate: 3 mL/min

System suitability

System performance: Proceed with 20 μL of the standard solution under the above conditions; the relative peak retention time of ketoconazole and terconazole are about 0.6 and 1.0, respectively, with the resolution being NLT 2.0.

System repeatability: Repeat the test 6 times with 20 mL each of the standard solution under the above operating conditions; the relative standard deviation of the peak areas of ketoconazole and terconazole is NMT 2.0%.

Packaging and storage Preserve in tight containers.

Ketoconazole Tablets
케토코나졸 정

Ketoconazole Tablets contains NLT 90.0% and NMT 110.0% of labeled amount of ketoconazole ($C_{26}H_{28}Cl_2N_4O_4$: 531.43).

Method of preparation Prepare as directed under Tablets, with Ketoconazole.

Identification Weigh the amount of powdered Ketoconazole Tablets, equivalent to about 50 mg of ketoconazole according to the labeled amount, add 50 mL of chloroform, shake for 2 minutes, filter, and use the filtrate as the test solution. Separately, dissolve an appropriate amount of ketoconazole RS in chloroform to make a solution containing 1 mg per mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of *n*-hexane, ethyl acetate, methanol, water and acetic acid(100) (42: 40 : 15 : 2 : 1) as the developing solvent to a distance of about 15 cm, and air-dry the plate. Observe the plate under the ultraviolet light (main wavelength: 254nm); the R_f values of the principal spots obtained from the test solution and the standard solution are the same.

Dissolution Perform the test with 1 tablet of Ketoconazole Tablets at 50 revolutions per minute according to Method 2 under the Dissolution, using 900 mL of 0.1 mol/L hydrochloric acid TS as the dissolution medium. Take NLT 20 mL of the dissolved solution 30 minutes after starting the dissolution text and filter through a membrane filter with a pore size of 0.45 μ. Discard the first 10 mL of the filtrate, pipet V mL of the subsequent filtrate, add the dissolution medium to make exactly V' mL, and use this solution as the test solution. Separately, weigh accurately an appropriate amount of ketoconazole RS, dissolve it in the dissolution medium to make it the same concentration as the test solution, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at the absorption maximum wavelength of about 270 nm as directed under the Ultraviolet-visible Spectroscopy, using the dissolution medium as a control solution. It meets the requirements when the dissolution rate of Ketoconazole Tablets in 30 minutes is NLT 80% (Q).

Dissolution rate (%) with respect to the labeled amount of ketoconazole ($C_{26}H_{28}Cl_2N_4O_4$)

$$= CS \times \frac{A_T}{A_S} \times \frac{V'}{V} \times \frac{1}{C} \times 90000$$

C_S: Concentration (mg/mL) of the standard solution

C: Labeled amount (mg) of ketoconazole ($C_{26}H_{28}Cl_2N_4O_4$) in 1 tablet

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 tablets of Ketoconazole Tablets, and powder. Weigh accurately an amount of this powder, equivalent to about 0.2 g of ketoconazole ($C_{26}H_{28}Cl_2N_4O_4$), put it in a centrifuge tube, add exactly 50 mL of a mixture of methanol and dichloromethane (1 : 1), shake to mix on a shaker for 30 minutes, and centrifuge. Pipet 5 mL of the clear supernatant, add exactly 5 mL of the internal standard solution, put the mixture of methanol and dichloromethane (1 : 1) to make exactly 50 mL, and use this solution as the test solution. Separately, weigh accurately about 20 mg of ketoconazole RS, add exactly 5 mL of the internal standard solution, add the mixture of methanol and dichloromethane (1 : 1) to make exactly 50 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the peak area ratios, Q_T and Q_S, of ketoconazole to the peak area of the internal standard.

Amount (mg) of ketoconazole ($C_{26}H_{28}Cl_2N_4O_4$)

$$= \text{Amount (mg) of ketoconazole RS} \times \frac{Q_T}{Q_S} \times 10$$

Internal standard solution—Weigh an appropriate amount of terconazole RS and dissolve it in the mixture of methanol and dichloromethane (1 : 1) to make a solution containing 5 mg per mL.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 225 nm).

Column: A stainless steel column about 3.9 mm in internal diameter and 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 μm to 10 μm in particle diameter).

Mobile phase: A mixture of diisopropylamine in methanol (1 in 500) and ammonium acetate solution (1 in 200) (7 : 3).

Flow rate: 3 mL/min

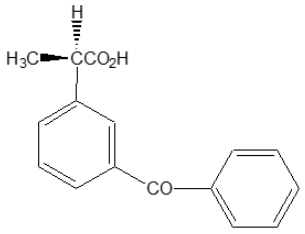
System suitability

System performance: Proceed with 20 μL of the standard solution according to the above operating conditions; ketoconazole and terconazole are eluted in this order with resolution being NLT 2.0.

System repeatability: Perform the test 6 times with 20 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area ratios is NMT 2.0%.

Packaging and storage Preserve in well-closed containers.

Ketoprofen
케토프로펜



and enantiomer

$C_{16}H_{14}O_3$: 254.28

2-(3-Benzoylphenyl)propanoic acid [*22071-15-4*]

Ketoprofen, when dried, contains NLT 99.0% and NMT 100.5% of ketoprofen ($C_{16}H_{14}O_3$).

Description Ketoprofen occurs as a white crystalline powder.

It is very soluble in methanol, freely soluble in ethanol(95) or acetone, and practically insoluble in water.

A solution of Ketoprofen in ethanol(99.5) (1 in 100) shows no optical rotation.

It is colored by light to pale yellow.

Identification (1) Determine the absorption spectra of Ketoprofen and ketoprofen RS in methanol (1 in 200000) as directed under the Ultraviolet-visible spectrophotometry; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectrum of Ketoprofen and ketoprofen RS, previously dried, as directed in the potassium bromide disk method under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Melting point Between 94 and 97 ºC.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Ketoprofen in 10 mL of acetone; the solution is clear and the color is not more intense than the following control solution.

Control solution—Add dilute hydrochloric acid (1 in 10) to a mixture of 0.6 mL of cobaltous(II) chloride hexahydrate colorimetric stock solution and 2.4 mL of iron(III) chloride hexahydrate colorimetric stock solution to make 100 mL.

(2) ***Heavy metals***—Proceed with 2.0 g of Ketoprofen according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Related substances***—Perform the test using a light-resistant container, protected from direct sunlight. Dissolve 20 mg of Ketoprofen in 20 mL of the mobile phase and use this solution as the test solution. Pipet 1.0 mL of this solution and add the mobile phase to make exactly 50 mL. Pipet 1 mL of this solution, add the mobile phase to make exactly 10 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak area of each solution by the automatic integration method; the peaks areas of relative retention time about 1.5 times and about 0.3 times that of ketoprofen from the test solution are not greater than 4.5 times and 2 times, respectively, the peak area of ketoprofen from the standard solution. In addition, the peak areas of ketoprofen and about 1.5 times and about 0.3 times the relative retention time of ketoprofen from the test solution are not greater than the peak area of ketoprofen from the standard solution, and the sum of these areas is not greater than 2 times the peak area of ketoprofen from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 233 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: Dissolve 68.0 g of potassium dihydrogen phosphate in water to make 1000 mL; add phosphoric acid to this solution and adjust pH to 3.5. Add

430 mL of acetonitrile and 550 mL of water to 20 mL of this solution.

Flow rate: Adjust the flow rate so that the retention time of ketoprofen is about 7 minutes.

System suitability

Test for required detectability: Pipet 1 mL of the standard solution and add the mobile phase to make exactly 10 mL. Confirm that the peak area of ketoprofen obtained from 20 μL of this solution is equivalent to 9% to 11% of the peak area of ketoprofen obtained from the standard solution.

System performance: Proceed with 20 μL of the standard solution under the above operating conditions; the number of theoretical plates and symmetry factor of the peak of ketoprofen are NLT 8000 and NMT 1.5, respectively.

System repeatability: Repeat the test 6 times with 20 μL of the standard solution according to the above operating conditions; the relative standard deviation of the peak area for ketoprofen is NMT 2.0%.

Time span of measurement: About 7 times the retention time of ketoprofen.

Loss on drying NMT 0.5% (0.5 g, in vacuum, 60 ℃, 24 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.3 g of ketoprofen, previously dried, dissolve in 25 mL of ethanol(95), add 25 mL of water, and titrate with 0.1 mol/L sodium hydroxide VS (potentiometric titration under the Titrimetry) Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS
= 25.428 mg of $C_{16}H_{14}O_3$

Packaging and storage Preserve in light-resistant, tight containers.

Ketoprofen Injection
케토프로펜 주사액

Ketoprofen Injection is an aqueous solution for injection, which contains NLT 95.0% and NMT 105.0% of the labeled amount of ketoprofen ($C_{16}H_{14}O_3$: 254.28).

Method of preparation Prepare as directed under Injections, with Ketoprofen.

Identification (1) Weigh an amount of Ketoprofen Injection, equivalent to 10 mg of ketoprofen according to the labeled amount, add ethanol to make 10 mL, and use this solution as the test solution. Separately, weigh 10 mg of ketoprofen RS, dissolve in 10 mL of ethanol, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on a thin-layer chromatographic plate made using silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of toluene, ethyl acetate, ethanol and acetic acid (50 : 20 : 10 : 1) as the developing solvent to a distance of about 15 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the colors and the Rf values obtained from the test solution and the standard solution are the same.

(2) Determine the absorption spectrum of the test solution in the Assay as directed under the Ultraviolet-visible Spectroscopy using methanol as a control solution; it exhibits a maximum absorbance around 255 nm.

pH Between 6.1 and 8.1.

Sterility Meets the requirements.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

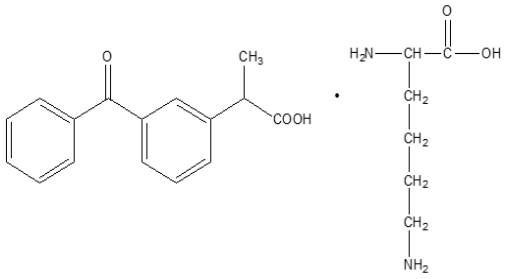
Extractable volume of injections Meets the requirements.

Assay Pipet an amount of Ketoprofen Injection, equivalent to 50 mg of ketoprofen ($C_{16}H_{14}O_3$) according to the labeled amount, and add methanol to make exactly 250 mL. Take 5 mL of this solution, add methanol to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 50 mg of ketoprofen RS, previously dried to a constant mass in vacuum at 60 ℃, add methanol to make exactly 250 mL. Pipet 5 mL of this solution, add methanol to make exactly 100 mL, and use this solution as the standard solution. Perform the test with the test solution and the standard solution as directed under the Ultraviolet-visible Spectroscopy, using methanol as a control solution and determine the absorbances, A_T and A_S, at 255 nm.

$$\text{Amount (mg) of ketoprofen } (C_{16}H_{14}O_3) = \text{Amount (mg) of ketoprofen RS} \times \frac{A_T}{A_S}$$

Packaging and storage Preserve in light-resistant, hermetic containers.

Ketoprofen Lysinate
케토프로펜리신



$C_{22}H_{28}N_2O_5$: 400.47
L-Lysine 3-benzoyl-α-methylbenzeneacetate (1:1),
[*57469-78-0*]

Ketoprofen Lysinate, when dried, contains NLT 98.0% and NMT 101.0% of ketoprofen lysinate ($C_{22}H_{28}N_2O_5$: 400.47).

Description Ketoprofen Lysinate occurs as a white crystalline powder.
It is very soluble in water.

Melting point—Between 161 and 165 ℃ (with decomposition).

Identification (1) Weigh 10 mg of Ketoprofen Lysinate, and dissolve in 5 mL of pH 5.25 acetate buffer solution, add ninhydrine glycol monoethylether solution, and heat for a few minutes; the solution exhibits a bluish purple color.

(2) Determine the absorption spectra of an aqueous solution of Ketoprofen Lysinate (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; a maximum is exhibited at near 260 nm, and $E_{1cm}^{1\%}$ is 410 ± 15.

(3) Determine the infrared spectra of Ketoprofen Lysinate and ketoprofen lysinate RS as directed in the paste method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(4) Weigh 20 mg each of Ketoprofen Lysinate and ketoprofen lysinate RS, dissolve in 100 mL of water, respectively, and use these solutions as the test solution and the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography (with a fluorescent indicator). Develop the plate with a mixture of isooctane, 1-butanol and acetic acid(100) (210 : 90 : 1) as the developing solvent to a distance of about 15 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm); the spot of the test solution exhibits an R_f value and color corresponding to that of the standard solution.

pH Between 6.5 and 7.5 (10% aqueous solution).

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Ketoprofen Lysinate in 10 mL of water; the resulting solution is colorless and clear.

(2) ***Chloride***—Weigh 166.7 mg of Ketoprofen Lysinate, dissolve in 15 mL of water, and use this solution as the test solution. Prepare the control solution with 10 mL of sodium chloride solution and 5 mL of water (NMT 0.03%).

(3) ***Sulfate***—Weigh 1.0 g of Ketoprofen Lysinate, dissolve in water, add 1.0 mL of acetic acid, then add water to make 50 mL, and take 10 mL of this solution. Use this solution as the test solution. Separately, add water to 0.711 g of potassium sulfate to make 1000 mL, take 0.1 mL of this solution, add water to make 100 mL, and take 10 mL of this solution. Use this solution as the control solution. To the test solution and the control solution, add 0.75 mL of ethanol and 0.5 mL of barium chloride solution (25%), allow it to stand for 30 seconds, then add 0.3 mL acetic acid TS to each, and perform the test under the Sulfate (NMT 0.02%).

(4) ***Heavy metals***—Proceed with 1.0 g of Ketoprofen Lysinate, and perform the test as directed under Method 1. Prepare the control solution with 1.0 mL of lead standard solution (NMT 10 ppm).

Loss on drying NMT 1.0% (1 g, 105 ℃, constant mass).

Residue on ignition NMT 0.2% (1 g).

Assay Weigh accurately about 0.5 g of Ketoprofen Lysinate, previously dried, place in a beaker, and dissolve in 100 mL of acetic acid(100), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 20.024 mg of $C_{22}H_{28}N_2O_5$

Packaging and storage Preserve in tight containers.

Ketoprofen Lysinate Capsules
케토프로펜리신 캡슐

Ketoprofen Lysinate Capsules contain NLT 95.0% and NMT 105.0% of the labeled amount of ketoprofen lysinate ($C_{22}H_{28}N_2O_5$: 400.47).

Method of preparation Prepared as directed under Capsules, with Ketoprofen Lysinate.

Identification (1) Weigh an amount of Ketoprofen Lysinate Capsules equivalent to about 50 mg of ketoprofen lysinate according to the labeled amount, dissolve in 5 mL of water by shaking, filter, and use the filtrate as the test solution. Weigh about 20 mg of ketoprofen lysinate RS, dissolve in 2 mL of water, and use this solution as the standard solution. Perform the test with these solutions as directed under the Thin Layer Chromatog-

raphy. Spot 10 μL each of the test solution and the standard solution on a thin-layer chromatographic plate made using silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of isoctane, dioxane and acetic acid(100) (200 : 100 : 1) as the developing solvent, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the Rf values obtained from the test solution and the standard solution are the same.

(2) Determine the absorption spectrum of the test solution obtained under Assay as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum absorbance at the wavelength of 260 ± 1 nm.

Disintegration Meets the requirements.

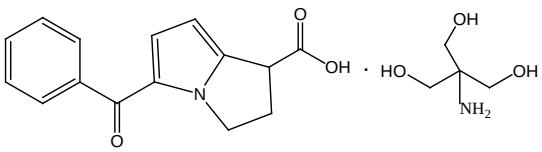
Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the contents of NLT 20 capsules of Ketoprofen Lysinate Capsules. Weigh accurately an amount, equivalent to about 50 mg of ketoprofen lysinate ($C_{22}H_{28}NaO_2$), transfer to a 250-mL volumetric flask, add 200 mL of water, dissolve by shaking for 30 minutes, and add water to make 250 mL. Filter the resulting solution, discard 25 mL of the first filtrate, pipet 5.0 mL of the subsequent filtrate, add water to make 100 mL, and use this solution as the test solution. Separately, weigh accurately about 50 mg of ketoprofen lysinate RS, proceed in the same manner as in the preparation of the test solution, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at the wavelength of 260 nm as directed under the Ultraviolet-visible Spectroscopy.

$$\text{Amount (mg) of ketoprofen lysinate } (C_{22}H_{28}N_2O_5) = \text{Amount (mg) of ketoprofen lysinate RS} \times \frac{A_T}{A_S}$$

Packaging and storage Preserve in well-closed containers.

Ketorolac Tromethamine
케토롤락트로메타민염



$C_{15}H_{13}NO_3 \cdot C_4H_{11}NO_3$: 376.40
2-Amino-2-(hydroxymethyl)propane-1,3-diol;
5-benzoyl-2,3-dihydro-1*H*-pyrrolizine-1-carboxylic acid [*74103-07-4*]

Ketorolac Tromethamine contains NLT 98.5% and NMT 101.5% of ketorolac tromethamine ($C_{15}H_{13}NO_3 \cdot C_4H_{11}NO_3$), calculated on the dried basis.

Description Ketorolac Tromethamine occurs as a white crystalline powder.
It is freely soluble in water and methanol, slightly soluble in ethanol(95), ethanol(99.5) and tetrahydrofuran, and practically insoluble in acetonitrile, acetone, dichloromethane, toluene, ethyl acetate, 1,4-dioxane, hexane or butanol.

Melting point—Between 165 and 170 ℃ (with decomposition).

Identification (1) Determine the absorption spectra of solutions of Ketorolac Tromethamine and ketorolac tromethamine RS in methanol (1 in 100000) as directed under the Ultraviolet-visible spectrophotometry; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Ketorolac Tromethamine and ketorolac tromethamine RS according to the potassium bromide disk method as directed under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) Dissolve 50 mg each of Ketorolac Tromethamine and ketorolac tromethamine RS in 10 mL of a mixture of dichloromethane and methanol (2:1), to make 10 mL, and use these solutions the test solution and the standard solution, respectively. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 40 μL each of the test solution and the standard solution on a plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of dichloromethane, acetone and acetic acid(100) (95 : 5 : 2) as the developing solvent to a distance of about 15 cm, and air-dry the plate. Evenly spray the plate with a solution of 0.3 g of ninhydrin dissolved in 10 mL of ethanol(95), and heat for 2 to 5 minutes at 150 ℃; yellow spots with pink to violet edges appear around the drops of the test solution and the standard solution.

pH Dissolve 1 g of Ceftazidime Hydrate in 100 mL of water; the pH of this solution is between 5.7 and 6.7.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Ketorolac Tromethamine as directed under the Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Related substances***—Take 10 μL of the test solution and perform the test as directed under the Liquid Chromatography according to the following conditions and determine the areas of the peaks by the automatic integration method to determine the amounts of each related substances; ketorolac 1-keto derivatie or ketorolac 1-hydroxy derivative are NMT 0.1%, each of the other related substances is NMT 0.5%, and total related substances are NMT 1.0%.

$$\text{Content (\%) of related substances} = 100 \times rf_1 \times \frac{A_i}{A_S}$$

rf: The correction factor for each related substance

with respect to the ketorolac peak

Ketorolac 1-keto analog: 0.52

Ketorolac 1-hydroxy analog: 0.67

Peak of related substance whose relative retention time with respect to the ketorolac peak is 0.54: 2.2.

Peak of related substance whose relative retention time with respect to the ketorolac peak is 0.66: 0.91.

A_i: Peak area of each related substance

A_S: Sum of all related substance peaks and the major peak of ketorolac

Operating conditions

Follow the conditions under the Assay for the test solution, the standard solution, the resolution solution, detector, column, column temperature, mobile phase, flow rate and system suitability.

Time span of measurement: About 3 times the retention time of ketorolac.

Loss on drying NMT 0.5% (1 g, 60 ℃, 3 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Dissolve about 50 mg each of Ketorolac Tromethamine and ketorolac tromethamine RS, accurately weighed, in a mixture of water and tetrahydrofuran (70 : 30) to make exactly 50 mL, and use these solutions as the test solution and the standard solution, respectively. The test solution and the standard solution are protected from light. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of each solution.

$$\text{Amount (mg) of ketorolac tromethamine } (C_{15}H_{13}NO_3 \cdot C_4H_{11}NO_3) = \text{Amount (mg) of ketorolac tromethamine RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 313 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: A mixture of ammonium phosphate buffer solution and tetrahydrofuran (70 : 30).

Flow rate: 1.5 mL/min

System suitability

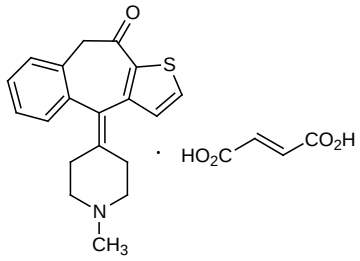
System performance: Add 100 mL of water, 100 mL of dichloromethane, 30 mg of ketorolac tromethamine RS and 1 mL of 1 mol/L hydrochloric acid to a 250 mL separatory funnel, shake and let stand. Transfer the bottom dichloromethane layer to a flask and discard the upper layers. Expose the dichloromethane extract to direct sunlight for 10 to 15 minutes, transfer 1.0 mL of the solution to a vial, evaporate to dryness under an air or nitrogen atmosphere, and dissolve the residue in 1.0 mL of a mixture of water and tetrahydrofuran (70 : 30). Store the solution refrigerated, and test according to the above conditions; ketorolac 1-keto derivative and ketorolac 1-hydroxy derivative are identified and can be used when suitable for the resolution test. Proceed with 10 μL of this solution according to the above conditions; the relative retention time of the peaks of ketorolac 1-hydroxy derivative and ketorolac 1-keto derivative with respect to the ketorolac peak are 0.63 and 0.89, respectively, and the resolution between the two peaks is NLT 1.5. In addition, proceed with 10 μL of the standard solution under the above operating conditions; the number of theoretical plates is NLT 5500.

System repeatability: Repeat the test 5 times with 10 μL of the standard solution according to the above conditions; the relative standard deviation of the peak area of ketorolac is NMT 1.5%.

Ammonium phosphate buffer—Dissolve 5.75 g of ammonium dihydrogen phosphate in water to make 1000 mL, then add phosphoric acid to adjust pH to 3.0. If necessary, adjust the flow rate so that the retention time of the ketorolac peak is between 8 and 12 minutes.

Packaging and storage Preserve in light-resistant, tight containers.

Ketotifen Fumarate
케토티펜푸마르산염



$C_{19}H_{19}NOS \cdot C_4H_4O_4$: 425.50

(*E*)-But-2-enedioic acid; 2-(1-methylpiperidin-4-ylidene)-6-thiatricyclo[8.4.0.0^{3,7}]tetradeca-1(10),3(7),4,11,13-pentaen-8-one [*34580-14-8*]

Ketotifen Fumarate, when dried, contains NLT 99.0% and NMT 101.0% of ketotifen fumarate ($C_{19}H_{19}NOS \cdot C_4H_4O_4$).

Description Ketotifen Fumarate occurs as a white to bright yellow crystalline powder. It is sparingly soluble in methanol or acetic acid(100), and slightly soluble in ethanol(99.5) or acetic anhydride.

Melting point—About 190 °C (with decomposition).

Identification (1) Proceed with 0.03 g of Ketotifen Fumarate as directed under the Oxygen Flask Combustion, using 20 mL of water as the absorbent; the test solution obtained responds to the Qualitative Analysis for sulfate.

(2) Determine the absorption spectra of solutions of Ketotifen Fumarate and ketotifen fumarate RS in methanol (1 in 50000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared spectra of Ketotifen Fumarate and ketotifen fumarate RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both exhibit similar intensities of absorption at the same wavenumbers.

Purity (1) ***Chloride***—Dissolve 0.6 g of Ketotifen Fumarate in 2.5 mL of sodium carbonate TS in a crucible, dry by heating on a steam bath, then ignite at 500 ℃. Dissolve the residue in 15 mL of water, filter as needed, neutralize with diluted nitric acid (3 in 10), then add 6 mL of dilute nitric acid and add water to make 50 mL. Use this as the test solution and perform the test as directed under the Chloride. As the matching fluid, add 0.25 mL of 0.01 mol/L hydrochloric acid and 2.5 mL of sodium carbonate TS, then add diluted nitric acid (3 in 10) equivalent to the amount used for preparation of the test solution, add 6 mL of dilute nitric acid, then add water to make 50 mL (NMT 0.015%).

(2) ***Heavy metals***—Proceed with 1.0 g of Ketotifen Fumarate as directed under the Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Related substances***—Dissolve 0.10 g of Ketotifen Fumarate in 10 mL of a mixture of methanol and ammonia TS (99 : 1), and use this solution as the test solution. Pipet 1 mL of this solution and add a mixture of methanol and ammonia TS (99 : 1) to make exactly 25 mL. Pipet 1 mL of this solution and add a mixture of methanol and ammonia TS (99 : 1) to make 20 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography, develop the plate with a mixture of acetonitrile, water and ammonia water(28) (90 : 10 : 1) as the developing solvent to a distance of about 15 cm, and air-dry the plate. Spray evenly Dragendorff TS for spraying and hydrogen peroxide TS on the plate; the number of the spots other than the principal spot from the test solution is NMT 4, and the spots other than the principal spot are not more intense than the spots from the standard solution.

Loss on drying NMT 0.5% (1 g, 105 ℃, 4 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh exactly about 0.35 g of Ketotifen Fumarate, previously dried, dissolve in 80 mL of a mixture of acetic anhydride and acetic acid(100) (7 : 3), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 42.55 mg of $C_{19}H_{19}NOS{\cdot}C_4H_4O_4$

Packaging and storage Preserve in tight containers.

Ketotifen Fumarate Syrup
케토티펜푸마르산염 시럽

Ketotifen Fumarate contains NLT 90.0% and NMT 110.0% of the labeled amount of ketotifen fumarate ($C_{19}H_{19}NOS{\cdot}C_4H_4O_4$: 425.50).

Method of preparation Prepare as directed under Syrups, with Ketotifen Fumarate.

Identification Take an amount of Ketotifen Fumarate Syrup equivalent to 5 mg of ketotifen fumarate, transfer to a separatory funnel, extract 3 times with 50 mL of ether each, and combine the ether extracts. Evaporate to dryness in vacuum. Dissolve the residue in methanol to make 5 mL, and use this solution as the test solution. Separately, weigh about 5 mg of ketotifen fumarate RS, dissolve in 5 mL of methanol, and use this solution as the standard solution. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography as directed under the Thin Layer Chromatography. Next, develop the plate with a mixture of acetonitrile, water and strong ammonia water (90 : 10 : 1) as the developing solvent, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm), and the R_f values of the spots from the test solution and the standard solution are the same.

pH Between 4.0 and 6.0.

Uniformity of dosage units (distribution) Meets the requirements.

Assay Shake Ketotifen Fumarate Syrup well to mix, pipet an amount equivalent to about 1.38 mg of ketotifen fumarate ($C_{19}H_{19}NOS{\cdot}C_4H_4O_4$), and transfer to a 50-mL volumetric flask. Add water to the gauge line, mix, and use this solution as the test solution. Separately, weigh accurately about 13.8 mg of ketotifen fumarate RS, place in a 50-mL volumetric flask, dissolve in water to the gauge line, and mix. Then take 1.0 mL of the resulting solution, add water to make 10 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of ketotifen fumarate from each solution.

Amount (mg) of ketotifen fumarate ($C_{19}H_{19}NOS{\cdot}C_4H_4O_4$)
= Amount (mg) of ketotifen fumarate RS$\times \frac{A_T}{A_S} \times \frac{1}{10}$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 280 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm to 10 μm in particle diameter).

Mobile phase: A mixture of methanol, water and triethylamine (65 : 35 : 0.35).

Flow rate: 2.0 mL/min

Packaging and storage Preserve in well-closed containers.

Ketotifen Fumarate Tablets
케토티펜푸마르산염 정

Ketotifen Fumarate Tablets contains NLT 90.0% and NMT 110.0% of the labeled amount of ketotifen fumarate ($C_{19}H_{19}NOS \cdot C_4H_4O_4$: 425.50).

Method of preparation Prepare as directed under Tablets, with Ketotifen Fumarate.

Identification Weigh the amount of Ketotifen Fumarate Tablets, equivalent to about 5 mg of ketotifen fumarate according to the labeled amount, add 5 mL of methanol, shake to mix for 15 minutes, filter, and use the filtrate as the test solution. Separately, weigh about 5 mg of ketotifen fumarate RS, dissolve in 5 mL of methanol, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on a thin-layer chromatographic plate made using silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of acetonitrile, water and strong ammonia water (90 : 10 : 1) as the developing solvent to a distance of about 15 cm, and air-dry the plate. Spray Dragendorff's TS or 3% hydrogen peroxide solution on the plate or examine the plate under ultraviolet light (main wavelength: 254 nm); the colors and the Rf values obtained from the test solution and the standard solution are the same.

Dissolution Perform the test with 1 tablet of Ketotifen Fumarate Tablets at 120 revolutions per minute according to Method 1 under the Dissolution, using 500 mL of 0.1 mol/L hydrochloric acid as the dissolution medium. Take 20 mL of the dissolved solution 30 minutes after starting the test, filter, and use this solution as the test solution. Separately, weigh accurately about 14 mg of ketotifen fumarate RS, put it into a 500-mL volumetric flask, dissolve with 0.1 mol/L hydrochloric acid to fill up to the gauge line, and mix. Pipet 2 mL of this solution, add 0.1 mol/L hydrochloric acid to make 20 mL, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution at the wavelength of 300 nm as directed under the Ultraviolet-visible Spectroscopy, using 0.1 mol/L hydrochloric acid as a control solution. Meets the requirements if the amount dissolved of Ketotifen Fumarate Tablets in 30 minutes is NLT 80%.

Amount dissolved (%) with respect to the labeled amount of ketotifen fumarate ($C_{19}H_{19}NOS \cdot C_4H_4O_4$)

$$= W_S \times \frac{A_T}{A_S} \times \frac{1}{C} \times 100$$

W_S: Amount (mg) of ketotifen fumarate RS

C: Labeled amount (mg) of ketotifen fumarate ($C_{19}H_{19}NOS \cdot C_4H_4O_4$) in 1 tablet

Uniformity of dosage units It meets the requirements when the Content uniformity test is performed according to the following method. Take 1 tablet of Ketotifen Fumarate Tablets, add 25.0 mL of a mixture of water and ethanol (1 : 1), stir it for 20 minutes, centrifuge at 4000 rpm for 15 minutes, take 5.0 mL of the clear supernatant, add the mixture of water and ethanol (1 : 1) to make 25 mL, and use this solution as the test solution. Separately, weigh accurately about 13.8 mg of ketotifen fumarate RS, put it into a 250-mL volumetric flask, dissolve with the mixture of water and ethanol to fill up to the gauge line, and mix. Take 10.0 mL of the resulting solution, add a mixture of water and ethanol (1 : 1) to make 50 mL, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, at a wavelength of 300 nm as directed under the Ultraviolet-visible Spectroscopy, using a mixture of water and ethanol (1 : 1) as a control solution.

Amount (mg) of ketotifen fumarate ($C_{19}H_{19}NOS \cdot C_4H_4O_4$)

$$= \text{Amount (mg) of ketotifen fumarate RS} \times \frac{A_T}{A_S} \times \frac{1}{10}$$

Assay Weigh accurately the contents of NLT 20 tablets of Ketotifen Fumarate Tablets, weigh accurately an amount equivalent to about 10 mg of ketotifen fumarate ($C_{19}H_{19}NOS \cdot C_4H_4O_4$), and put it in a 100-mL volumetric flask, add 90 mL of a mixture of 0.1 mol/L hydrochloric acid and acetonitrile (1 : 1), and sonicate it for 5 minutes on an ultrasonic shaker. Add 0.6 mL of triethylamine, shake to mix for 5 minutes, add the mixture of 0.1 mol/L hydrochloric acid and acetonitrile (1 : 1) to fill up to the gauge line, mix, filter, and use the filtrate as the test solution. Separately, weigh accurately about 10 mg of ketotifen fumarate RS, and proceed in the same manner as in the preparation of the test solution, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak area, A_T and A_S, of ketotifen fumarate in each solution.

Amount (mg) of ketotifen fumarate ($C_{19}H_{19}NOS \cdot C_4H_4O_4$)

$$= \text{Amount (mg) of ketotifen fumarate RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer

(wavelength: 280 nm).

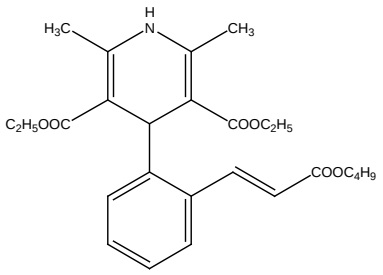
Column: A stainless steel column about 4 mm in internal diameter and about 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm to 10 μm in particle diameter).

Mobile phase: A mixture of methanol, water, and trietylamine (65 : 35 : 0.35).

Flow rate: 2.0 mL/min

Packaging and storage Preserve in well-closed containers.

Lacidipine
라시디핀



$C_{26}H_{33}NO_6$: 455.54

Diethyl-2,6-dimethyl-4-[2-[(*E*)-3-[(2-methylpropan-2-yl)oxy]-3-oxoprop-1-enyl]phenyl]-1,4-dihydro-pyridine-3,5-dicarboxylate [*103890-78-4*]

Lacidipine contains NLT 97.5% and not more 102.0% of lacidipine ($C_{26}H_{33}NO_6$), calculated on the anhydrous basis and solvent-free basis.

Description Lacidipine occurs as a white to pale yellow crystalline powder.

It is very soluble in acetone or dichloromethane, sparingly soluble in ethanol(99.5) and practically insoluble in water.

Melting point—About 178 °C.

Identification (1) Determine the infrared spectra of Lacidipine and lacidipine RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

Purity (1) ***2-Propanol***—Weigh accurately about 1.0 g of Lacidipine, dissolve in the internal standard solution to make exactly 50 mL, and use this solution as the test solution. Pipet 2 μL of 2-propanol, add the internal standard solution to make exactly 100 mL, and use this solution as the standard solution. Perform the test solution with 1 μL each of the test solution and the standard solution according to the following conditions as directed under the Gas Chromatography, and calculate the content (%) of 2-propanol (NMT 0.5%).

Internal standard solution—Pipet 2 μL of toluene and dissolve in dimethylacetamide to make exactly 100 mL.

Operating conditions

Detector: A hydrogen flame ionization detector

Column: A stainless steel column about 0.25 mm in internal diameter and about 30 cm in length, packed with 5% phenylmethylsilicone polymer for gas chromatography (0.25 μm in particle diameter).

Column temperature: Maintain the initial temperature to 40 ℃ for 1 minute, increase to 100 ℃ with a velocity of 2 ℃ every minute, increase to 200 ℃ with a velocity of 25 ℃ every minute, and maintain the temperature for the next 5 minutes.

Carrier gas: Nitrogen

Sample injection port temperature: 250 ℃

Detector temperature: 250 °C

Flow rate: 1.0 mL/minute

System suitability

System performance: Proceed with 1 μL of the standard solution according to the above conditions; the two peaks are clearly separated, and the retention time of 2-propanol and toluene is about 6.2 minutes and 3.5 minutes, respectively.

(2) ***Related substances***—Weigh accurately about 10.0 mg of Lacidipine and dissolve in ethanol(99.5) to make exactly 100 mL. Take 1.0 mL of this solution, add the mobile phase to make exactly 5 mL, and use this solution as the test solution. Take 1.0 mL of the test solution, add the mobile phase to make exactly 500 mL, and use the test solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution according to the above conditions; the peak area of lacidipine related substances I is not greater than 2 times the major peak area from the standard solution (0.2%, relative correction factor:2), and the area of related substances is not greater than the major peak area from the standard solution (0.2%). Also, determine lacidipine related substances I with the relative correction factor and determine the amount of other related substances using the standard solution; the amount of total related substances is NMT 0.5%.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 240 nm)

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with cyanosilyl silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of *n*-hexane and ethanol(99.5) (97 : 3). Adjust so that the retention time of lacidipine is about 10 minutes.

Flow rate: About 2.0 mL per minute.

Water NMT 0.2% (0.5 g, coulometric titration).

Assay Weigh accurately about 10.0 mg each of Lacidipine and Lacidipine RS and dissolve in ethanol(99.5) to make exactly 10 mL. Take 5.0 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the test solution and the standard solution, respectively. Perform the test with 20 μL of each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions, and determine the peak areas, A_T and A_S, of lacidipine.

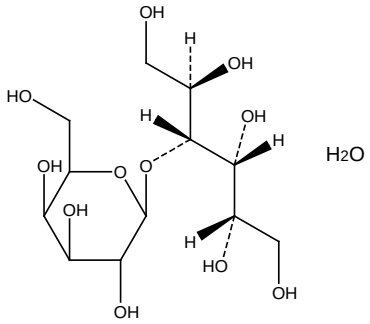
$$\text{Amount (mg) of lacidipine } (C_{26}H_{33}NO_6) = \text{Amount (mg) of lacidipine RS} \times \frac{A_T}{A_S}$$

Operating conditions and system suitability

Proceed as directed according to the operating conditions of the related substances.

Packaging and storage Preserve in well-closed containers.

Lactitol Hydrate
락티톨수화물



$C_{12}H_{24}O_{11}\cdot H_2O$: 362.34

(2*S*,3*R*,4*R*,5*R*)-4-[(2*S*,3*R*,4*S*,5*R*,6*R*)-3,4,5-Trihydroxy-6-(hydroxymethyl)oxan-2-yl]oxyhexane-1,2,3,5,6-pentolhydrate [*81025-04-9*]

Lactitol Hydrate contains NLT 98.0% and NMT 101.0% of lactitol ($C_{12}H_{24}O_{11}$: 344.31), calculated on the anhydrous basis.

Description Lactitol Hydrate occurs as white or light brown crystals. It is odorless and has a slightly sweet taste without an aftertaste.

Identification Determine the infrared spectra of Lactitol Hydrate and Lactitol Hydrate RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Purity (1) ***Heavy metals***—Proceed with about 4.0 g of Lactitol Hydrate according to Method 1 and perform the test. Prepare the control solution with 2.5 mL of lead standard solution (NMT 5 ppm).

(2) ***Reducing sugar***—Dissolve about 0.5 g of Lactitol Hydrate in 2.0 mL of water and use this solution as the test solution. Separately, use 2.0 mL of glucose TS with a concentration of 0.5 g/L as the standard solution. Add 1 mL of alkaline copper tartrate TS to each solution at the same time, heat, and cool. At this time, the turbidity of the test solution is not more intense than the standard solution with reddish brown precipitation (as glucose, NMT 0.2%).

(3) ***Related substances***—Weigh accurately about 1 g of Lactitol Hydrate, dissolve in water to make 100 mL, and use this solution as the test solution. Separately, weigh accurately 30 mg of Lactitol RS, add water to make 100 mL, and use this solution as the standard solution. Perform the test with 25 μL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak area of each solution as directed in the automatic integration method; the relative retention time for lactitol peak of the test solution is 0.53 for lactose, 0.58 for glucose, 0.67 for galactose, 0.72 for lactitol, 1.55 for galactitol, and 1.68 for sorbitol. Determine the amount of galactitol, sorbitol, lactitol, lactose, glucose and galactose on lactitol according to the following formula; the amount of the total related substances is NMT 1.5%.

$$\text{Content (\%) of any other individual related substances} = 100 \times \frac{C_S}{C_T} \times \frac{A_i}{A_S}$$

C_S: Concentration (mg/mL) of lactitol in the standard solution

C_T: Concentration (mg/mL) of Lactitol Hydrate in the test solution

A_i: Peak area of each related substances in the test solution

A_S: Peak area of lactitol in the standard solution

Operating conditions

For the detector, column, column temperature, mobile phase and flow rate, proceed as directed in the operating conditions under the Assay.

Water Between 4.5% and 5.5% (volumetric titration, direct titration).

Residue on ignition NMT 0.5% (1 g).

Assay Weigh accurately about 1 g of Lactitol Hydrate, dissolve in water to make 100 mL, and use this solution as the test solution. Separately, weigh accurately 0.1 g of Lactitol RS, dissolve in water to make 10 mL, and use this solution as the standard solution. Perform the test with 25 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions. Determine the peak areas, A_T and A_S, of lactitol in the test solution and the standard solution, respectively.

Amount (mg) of lactitol ($C_{12}H_{24}O_{11}$)
= Concentration (mg/mL) of lactitol in the standard solution $\times \frac{A_T}{A_S} \times 100$

Operating conditions

Detector: A differential refractometer

Column: A stainless steel column about 7.8 mm in internal diameter and about 30 cm in length, packed with strongly acidic ion exchange resin for liquid chromatography (9 μm in particle diameter).

Column temperature: A constant temperature of about 85 °C.

Mobile phase: Water

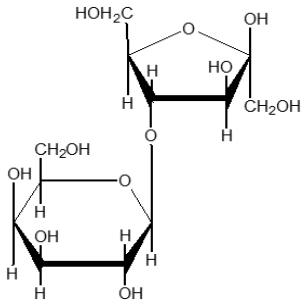
Flow rate: About 0.7 mL per minute.

System suitability

System repeatability: Repeat the test 6 times with 25 μL of the standard solution according to the above operating conditions; the relative standard deviation of the peak area of lactitol is NMT 1.0%

Packaging and storage Preserve in tight containers.

Lactulose
락툴로오스



$C_{12}H_{22}O_{11}$: 342.30

(2*S*,3*R*,4*S*,5*R*,6*R*)-2-[(2*R*,3*S*,4*S*,5*R*)-4,5-Dihydroxy-2,5-*bis*(hydroxymethyl)oxolan-3-yl]oxy-6-(hydroxymethyl)oxane-3,4,5-triol [*4618-18-2*]

Lactulose is an aqueous solution, which is obtained from isomerizing lactose in alkaline and purified with ion exchange resin.

Lactulose contains NLT 50.0% and NMT 56.0% of lactulose ($C_{12}H_{22}O_{11}$).

Description Lactulose occurs as a colorless to pale yellow clear viscous solution. It is odorless and has a sweet taste.

It is miscible with water or formamide.

Identification (1) Add 10 mL of water to about 0.7 g of Lactulose, put 10 mL of ammonium heptamolybdate (VI) tetrahydrate (1 in 25) and 0.2 mL of acetic acid(100), and heat on a steam bath for between 5 and 10 minutes; the resulting solution exhibits a blue color.

(2) Mix about 0.3 g of Lactulose and 30 mL of water, add 16 mL of 0.5 mol/L iodine TS, and immediately add 2.5 mL of 8 mol/L sodium hydroxide TS, allow it to stand for 7 minutes, and put 2.5 mL of diluted sulfuric acid (3 in 20). Add the saturated sodium sulfite solution until the solution turns pale yellow, add 3 drops of methyl orange TS, neutralize with the sodium hydroxide solution (4 in 25), and add water to make 100 mL. Take 10 mL of this solution, add 5 mL of Fehling's TS, and boil for 5 minutes; the red precipitate is formed.

Specific gravity d_{20}^{20}: Between 1.320 and 1.360.

pH Dissolve 2.0 g of Lactulose in 15 mL of water; the pH of this solution is between 3.5 and 5.5.

Purity (1) ***Heavy metals***—Proceed with about 5.0 g of Lactulose and perform the test according to Method 4. Prepare the control solution with 2.5 mL of lead standard solution (NMT 5 ppm).

(2) ***Arsenic***—Proceed with about 1.0 g of Lactulose according to Method 1 and perform the test (NMT 2 ppm).

(3) ***Other sugars***—Determine the peak height of galactose and lactose from chromatograms of the test solution and the standard solution in Assay and determine the peak height ratios, Q_{Ta} and Q_{Tb}, of galactose and lactose against the peak height of the internal standard in the test solution and the peak height ratios Q_{Sa} and Q_{Sb} of galactose and lactose against the peak height of the internal standard in the standard solution; the amount of galactose is NMT 11% and the amount of lactose is NMT 6%.

Amount (mg) of galactose ($C_6H_{12}O_6$)
= Amount (mg) of D-galactose $\times \frac{Q_{Ta}}{Q_{Sa}}$

Amount (mg) of lactose ($C_{12}H_{22}O_{11}\cdot H_2O$)
= Amount (mg) of lactose hydrate $\times \frac{Q_{Tb}}{Q_{Sb}}$

Loss on drying NMT 35.0% (0.5 g, in vacuum, 80 ℃, 5 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 1 g of Lactulose, dissolve in 10 mL of internal standard solution, add water to make 50 mL, and use this solution as the test solution. Separately, weigh accurately about 0.5 g of Lactulose RS, about 80 mg of D-galactose and about 40 mg of lactose, add exactly 10 mL of internal standard solution to make 50 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution according to the following conditions as directed under the Liquid Chromatography, and determine the peak height ratios, Q_T and Q_S, of lactulose to that of the peak height of the internal standard.

Amount (mg) of lactulose ($C_{12}H_{22}O_{11}$)

$$= \text{Amount (mg) of lactulose RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—D-mannitol solution (1 in 20).

Operating conditions

Detector: A differential refractometer

Column: A stainless steel column about 8 mm in internal diameter and about 50 cm in length, packed with gel-type strongly acidic ion-exchange resin for liquid chromatography (cross-linking: 6%) (11 μm in particle diameter).

Column temperature: A constant temperature of about 75 °C.

Mobile phase: Water

Flow rate: Adjust the flow rate so that the retention time of lactulose is about 18 minutes.

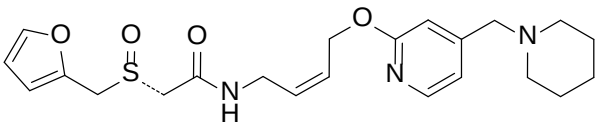
System suitability

System performance: Proceed with 20 μL of the standard solution under the above operating conditions; lactulose and the internal standard are eluted in this order with the resolution between their peaks being NLT 8.

System repeatability: Repeat the test 6 times with 20 μL each of the standard solution according to above operating conditions; the relative standard deviation of the ratios of peak height of lactulose, galactose and lactose to that of the internal standard is NMT 2.0%.

Packaging and storage Preserve in tight containers.

Lafutidine
라푸티딘



and enantiomer

$C_{22}H_{29}N_3O_4S$: 431.55

2-[(RS)-Furan-2-ylmethylsulfinyl]-N-{4-[4-(piperidin-1-ylmethyl)pyridin-2-yl] oxy-(2Z) but-2-en-1-yl} acetamide *[206449-93-6]*

Lafutidine, when dried, contains NLT 99.0% and NMT 101.0% lafutidine ($C_{22}H_{29}N_3O_4S$).

Description Lafutidine occurs as a white to pale yellowish white crystalline powder.

It is freely soluble in acetic acid(100), soluble in methanol, sparingly soluble in ethanol(99.5) and practically insoluble in water.

A solution of Lafutidine in methanol (1 in 100) shows no optical rotation.

It shows polymorphism.

Identification (1) Determine the absorption spectra of solutions of Lafutidine and lafutidine RS in methanol (1 in 20000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Lafutidine and lafutidine RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Purity (1) ***Heavy metals***—Proceed with about 2.0 g of Lafutidine as directed under Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Related substances***—Dissolve about 0.10 g of Lafutidine in 100 mL of the mobile phase and use this solution as the test solution. Pipet 1 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 5 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak area of each solution as directed in the automatic integration method; the peak area of lafutidine related substance I with a relative retention time of about 0.85 to lafutidine in the test solution is not lager than 3/10 of the peak area of lafutidine in the standard solution (NMT 0.3%). The peak area other than lafutidine in the test solution and the peak from above is not lager than 1/10 of the peak area of lafutidine in the standard solution (NMT 0.1%). The sum of peak areas other than lafutidine in the test solution is not lager than 2/5 of the peak area of lafutidine in the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

Column: A stainless steel column about 6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: Dissolve 0.87 g of sodium 1-pentanesulfonate in dilute phosphoric acid (1 in 1000) to make 1000 mL. To 850 mL of this solution, add 150 mL of acetonitrile.

Flow rate: Adjust the flow rate so that the retention time of lafutidine is about 15 minutes.

Time span of measurement: About 6 times the retention time of lafutidine.

System suitability

Test for required detectability: Pipet 1 mL of the standard solution and add the mobile phase to make exactly 20 mL. Confirm that the peak area of lafutidine obtained from 5 μL of this solution is equivalent to 3.5% to 6.5% of the peak area of lafutidine in the standard solution.

System performance: Proceed with 5 μL of the standard solution under the above operating conditions; the number of theoretical plates and symmetry factor of

the peak of lafutidine are NLT 8000 and NMT 1.5, respectively.

System repeatability: Repeat the test 6 times with 5 μL of the standard solution according to the above operating conditions; the relative standard deviation of the peak area of lafutidine is NMT 2.0%.

Loss on drying NMT 0.5% (1 g, in vacuum, NMT 0.67 kPa, 60 ℃, phosphorus (V) oxide, 4 hours).

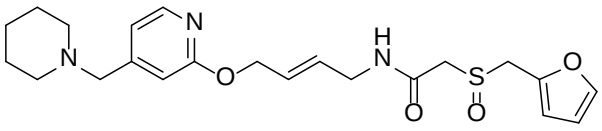
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.3 g of Lafutidine, previously dried, dissolve in 50 mL of acetic acid(100), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

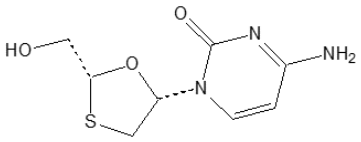
Each mL of 0.1 mol/L perchloric acid VS
= 21.58 mg of $C_{22}H_{29}N_3O_4S$

Packaging and storage Preserve in tight containers.

Note Lafutidine related substance I : (±)-2-(furfurylsulfinyl)-N-[4-[4-(piperidinomethyl)-2-pyridin]oxy-(E)-2-butenyl]acetamide



Lamivudine
라미부딘



$C_8H_{11}N_3O_3S$: 229.26

4-Amino-1-[(2*R*,5*S*)-2-(hydroxymethyl)-1,3-oxathiolan-5-yl]pyrimidin-2-one [*134678-17-4*]

Lamivudine contains NLT 98.0% and NMT 102.0% of lamivudine ($C_8H_{11}N_3O_3S$), calculated on the anhydrous basis and solvent-free basis.

Description Lamivudine occurs as a white solid.
It is soluble in water.

Melting point—About 176 °C.

Identification (1) Determine the infrared spectra of Lamivudine and Lamivudine RS, as directed in the paste method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) The retention time of the major peak obtained from the test solution in the Lamivudine isomer test is the same as that of the major peak from the resolution solution.

Purity (1) ***Color of the solution***—Perform the test with the aqueous solution of Lamivudine (1 in 20) as directed under the Ultraviolet-visible Spectroscopy at the wavelength of 440 nm, with a layer length of 4 cm; the absorbance is NMT 0.0015.

(2) ***Heavy metals***—Weight about 1.0 g of Lamivudine, put into a flask, set the angle of the flask to about 45°, and mix after adding 8 mL of sulfuric acid and 10 mL of nitric acid. Apply low heat until the reaction starts, add 8 mL of sulfuric acid and 10 mL of nitric acid again, increase the temperature, and heat until the solution turns black. After cooling, add 2 mL of nitric acid, and heat again until the solution turns black. Continue heating until the solution does not get darker and heat strongly again until rich fumes are formed. After cooling, add 5 mL of water, and heat until rich fumes are formed, and continue heating until the amount of residue is NLT 2 mL and NMT 3 mL. After cooling, add 5 mL of water and confirm the color of the solution. If the color is yellow, add 1 mL of strong hydrogen peroxide, heat until rich fumes are formed, and continue until the residue is NLT 2 mL and NMT 3 mL. If the solution still exhibits a yellow color, add 5 mL of water and 1 mL of strong hydrogen peroxide, and repeat the procedure until the solution turns colorless. After cooling, and dilute it with water so the total amount is NMT 25 mL, and transfer to a 50-mL Nessler tube. Adjust the pH to between 3.0 and 4.0 with dilute ammonia water and add water to dilute to 40 mL. Add 2 mL of acetate buffer solution, pH 3.5 and 1.2 mL of thioacetamide TS, mix, add water to make 50 mL, and use this solution as the test solution. Separately, prepare the control solution in the same manner as the preparation of the test solution with 2 mL of lead standard solution at the same time. Allow the solution to stand for 2 minutes and compare on a white background; the brown color from the test solution is not more intense than the color from the standard solution (NMT 20 ppm).

If reading is difficult, filter slowly with a low pressure using a filter with a pore size of 0.45 μm, and compare the color of the filter paper.

System suitability: Proceed in the same manner as the preparation of the test solution without adding the sample separately, and use this solution as the blank test solution. The control solution has a slightly brownish color compared to the blank test solution. Add 2 mL of lead standard solution in the test solution and use the solution as the system suitability solution. The system suitability solution is more intense than or equal to the control solution.

(3) ***Lamivudine isomer***—Weigh accurately about 25 mg of Lamivudine, dissolve in water to make 100 mL, and use this solution as the test solution. Perform the test with about 10 μL of the test solution according to the following conditions as directed under the Liquid Chromatography, determine the areas of the major peaks and the amount of lamivudine isomer; the amount of lamivu-

dine isomer is NMT 0.3%.

$$\text{Content (\%) of lamivudine isomer} = 100 \times \frac{A_\text{i}}{A_\text{i} + A_\text{S}}$$

A_i: Peak area of lamivudine isomer
A_S: Peak area of lamivudine

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 270 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with betacyclodextrin silica gel (5 μm to 10 μm in particle diameter).

Mobile phase: A mixture of 0.1 mol/L ammonium acetate solution and methanol (95 : 5).

Melting point—Between 15 and 30 ℃.

Flow rate: About 1.0 mL per minute.

System suitability

System performance: Dissolve the content of 1 vial of lamivudine resolution mixture I RS in 5 mL of water, wash the vial with 2 mL each of water, and add water to make 10 mL. Proceed with 10 μL of this solution according to the above operating conditions; the relative retention times are about 1.0 for lamivudine and about 1.2 for lamivudine isomer, and the resolution between the peak of lamivudine and that of lamivudine isomer is NLT 1.5.

0.1 mol/L ammonium acetate solution—Dissolve about 7.7 g of ammonium acetate in water to make 1000 mL.

(4) ***Residual solvent***—Weigh accurately about 5 g of Lamivudine, add 10 mL of internal standard solution, add a mixture of water and dimethylsulfoxide (1 : 1) to make exactly 100 mL, and use this solution as the test solution. To 10 mL of the internal standard solution, add exactly 100 μL each of ethanol(99.5), isopropyl acetate, methanol and triethylamine, add a mixture of water and dimethylsulfoxide (1 : 1) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 0.5 μL each of the test solution and the standard solution according to the following conditions as directed under the Gas Chromatography, determine the peak areas of the test solution and the standard solution, and determine the content of residual solvent in Lamivudine; the amount of ethanol is NMT 0.2%, isopropyl acetate is NMT 0.2%, triethylamine is NMT 0.1% and the total residual solvent is NMT 0.3%.

$$\text{Content (\%) of residual solvent} = 10 \times \frac{C}{W} \times \frac{Q_\text{i}}{Q_\text{S}}$$

C: Concentration (mg/mL) of each component in the standard solution
W: Amount of Lamivudine taken (g)
Q_i: Peak area ratio of each component of the internal standard solution in the test solution
Q_S: Peak area ratio of each component of the internal standard solution in the standard solution

Pipet 1 mL of 2-pentanone, the internal standard solution, and add a mixture of dimethylsulfoxide and water to make 100 mL.

Operating conditions

Detector: A hydrogen flame ionization detector

Column: A fused silica column about 0.53 mm in internal diameter and about 50 m in length, packed with dimethylsiloxane (5 μm in particle diameter).

Column temperature: Maintain at 70 ℃ for the first 3 minutes, increase by 30 ℃ every minute until 200 ℃, and keep the temperature for 6.5 minutes.

Carrier gas: Hydrogen

Flow rate: 320 mL/minute

Sample injection port temperature: 150 ℃

Detector temperature: 250 ℃

(5) ***Related substances***—Weigh accurately about 25 mg of Lamivudine, dissolve in the mobile phase of the Assay to make exactly 100 mL, and use this solution as the test solution. Weigh accurately an appropriate amount of salicylic acid, dissolve in the mobile phase, dilute appropriately so the solution contains 0.625 μg per mL, and use it as the salicylic acid solution. Perform the test with 10 μL each of the test solution and the salicylic acid solution according to the conditions in the Assay as directed under the Liquid Chromatography and determine the peak area of the test solution and the salicylic acid solution; the amount of salicylic acid in Lamivudine is NMT 0.1% when calculated according to formula (1). Determine the amount of other related substances according to formula (2); the related substances with the relative retention time of about 0.4 are NMT 0.3%, the related substances with the relative retention time of about 0.9 are NMT 0.2%, the other related substances are NMT 0.1%, and the total amount of related substances is NMT 0.6%.

$$\text{Content (\%) of salicylic acid} = 10 \times \frac{C}{W} \times \frac{A_\text{T}}{A_\text{S}} \quad (1)$$

C: Concentration (μg/mL) of salicylic acid in the salicylic acid solution
W: Amount (mg) of Lamivudine taken
A_T: Peak area of salicylic acid from the test solution
A_S: Peak area of salicylic acid from the salicylic acid solution

$$\text{Content (\%) of other related substances} = 100 \times \frac{A_\text{I}}{A_\text{S}} \quad (2)$$

A_I: Peak area of related substances other than the salicylic acid from the test solution
A_S: Total area of all peaks from the test solution

Water NMT 0.2% (1 g, coulometric titration).

Assay Weigh accurately about 25 mg each of Lamivudine and Lamivudine RS, dissolve in a mixture of 0.025 mol/L ammonium acetate buffer solution and methanol (95 : 5) to make exactly 100 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the area of the major peak, A_T and A_S in the test solution and the standard solution.

$$\text{Amount (mg) of lamivudine } (C_8H_{11}N_3O_3S) = \text{Amount (mg) of lamivudine RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 277 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel (3 μm to 10 μm in particle diameter).

Mobile phase: A mixture of 0.025 mol/L ammonium acetate buffer solution and methanol (95 : 5).

Column temperature: A constant temperature of about 35 °C.

Flow rate: About 1.0 mL per minute.

System suitability

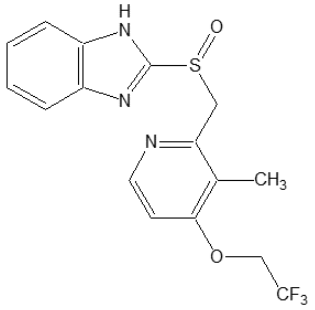
System performance: Dissolve 2 mL of the mobile phase in the content of 1 vial of lamivudine resolution mixture II RS, and proceed with 10 μL of this solution according to the above operating conditions; the relative retention times are about 1.0 for lamivudine and 0.9 for lamivudine isomer, respectively, and the resolution between the peak of lamivudine and that of lamivudine isomer is NLT 1.5.

System repeatability: Repeat the test 5 times with 10 μL each of the standard solution under the above operating conditions; the relative standard deviation of the peak area is NMT 2.0%.

0.025 mol/L ammonium acetate buffer solution—Weigh about 1.9 g of ammonium acetate, dissolve in 900 mL of water, adjust the pH to 3.8 ± 0.2 with acetic acid, and add water to make 1000 mL.

Packaging and storage Preserve in light-resistant, well-closed containers.

Lansoprazole
란소프라졸



$C_{16}H_{14}F_3N_3O_2S$: 369.36

2-[[3-Methyl-4-(2,2,2-trifluoroethoxy)pyridin-2-yl]methylsulfinyl]-1*H*-benzimidazole [*103577-45-3*]

Lansoprazole contains NLT 99.0% and NMT 101.0% of lansoprazole ($C_{16}H_{14}F_3N_3O_3S$), calculated on the anhydrous basis.

Description Lansoprazole occurs as a white or brown crystalline powder.

It is freely soluble in *N*,*N*-Dimethylformamide, soluble in methanol, sparingly soluble in ethanol(99.5), very slightly soluble in ether and practically insoluble in water.

Melting point—About 166 °C (with decomposition).

Identification (1) Determine the absorption spectra of solutions of Lansoprazole and Lansoprazole RS in methanol (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Lansoprazole and Lansoprazole RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Purity ***Related substances***—Weigh accurately about 0.125 g of Lansoprazole, dissolve in methanol to make exactly 50 mL, take 1.0 mL of this solution, and add a mixture of mobile phase A and mobile phase B (9 : 1) to make exactly 10 mL. Use this solution as the test solution. Prepare the test solution before use. Separately, weigh accurately about 25 mg of Lansoprazole RS, dissolve in methanol to make 100 mL, and add methanol to 5.0 mL of this solution to make exactly 50 mL. Add a mixture of mobile phase A and mobile phase B (9 : 1) to 1.0 mL of this solution to make exactly 10 mL, and use this solution as the standard solution. Mix 9 mL of a mixture of mobile phase A and mobile phase B (9 : 1) with 1 mL of methanol, and use it as the blank test solution. Perform the test with 40 μL each of the test solution, the standard solution and the blank test solution according to the following conditions by the percentage peak area method under the Liquid Chromatography. Other than the peak from the blank test solution, determine the peak area of each related substance, A_i other than the major peak

from the test solution and the major peak from the standard solution, A_S; the amount of the total related substances is NMT 1.0%.

$$\text{Content (\%) of individual related substances} = 50 \times \frac{C}{W} \times \frac{A_i}{A_S}$$

C: Concentration (μg/mL) of lansoprazole in the standard solution

W: Amount of Lansoprazole taken (mg)

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 285 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: Use mobile phases A and B to control stepwise or based on the gradient elution as follows.

Mobile phase A: Water

Mobile phase B: A mixture of acetonitrile, water and triethylamine (160 : 40 : 1). Adjust the pH to 7.0 by adding phosphoric acid.

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 - 40	90 → 20	10 → 80
40 - 50	20	80
50 - 51	20 → 90	80 → 10
51 - 60	90	10

Flow rate: 0.8 mL/minute

System suitability

System performance: Weigh 5 mg of Lansoprazole RS and 5 mg of Lansoprazole related substance I {2-[[[3-Methyl-4-(2,2,2-trifluoroethoxy)-2-pyridin]methyl]sulfinyl]benzimidazole}, dissolve in methanol to make 200 mL, add a mixture of mobile phase A and mobile phase B (9 : 1) to 1.0 mL of this solution to make 10 mL. Proceed with 40 μL of this solution; the resolution between the peaks of lansoprazole and lansoprazole related substance I is NLT 6.

System repeatability*:* Weigh accurately about 2.5 mg of lansoprazole related substance I RS, dissolve in methanol to make 100 mL, take 1.0 mL of this solution, and add a mixture of mobile phase A and mobile phase B (9 : 1) to make 10 mL. Repeat the test 6 times with 40 μL of this solution under the above operating conditions; the relative standard deviation of the peak area of related substance I is NMT 3%.

Water NMT 0.1% (1.0 g, volumetric titration, direct titration). However, use 50 mL of a mixture of pyridine and ethylene glycol (9 : 1 or 8 : 2) as a vehicle.

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately 50 mg each of Lansoprazole and Lansoprazole RS and dissolve in the internal standard solution to make exactly 10 mL. To 1.0 mL of these solutions, add a mixture of water, acetonitrile and triethylamine (60 : 40 : 1), in which pH is adjusted to 10 with phosphoric acid, to make exactly 50 mL, and use each solution as the test solution and the standard solution, respectively. Perform the test with 10 μL each of the test solution and the standard solution according to the following operating conditions as directed under the Liquid Chromatography, and determine the ratio of peak areas for lansoprazole, Q_T and Q_S, to the internal reference for each solution.

$$\text{Amount (mg) of lansoprazole } (C_{16}H_{14}F_3N_3O_2S) = \text{Amount (mg) of lansoprazole RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—Weigh 25 mg of 4′-ethoxyacetophenone and dissolve in a mixture of water, acetonitrile and triethylamine (60 : 40 : 1), in which pH is adjusted to 10 with phosphoric acid, to make 10 mL.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 285 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of water, acetonitrile and triethylamine (60 : 40 : 1). Adjust the pH to 7.0 by adding phosphoric acid.

Flow rate: 1 mL/min

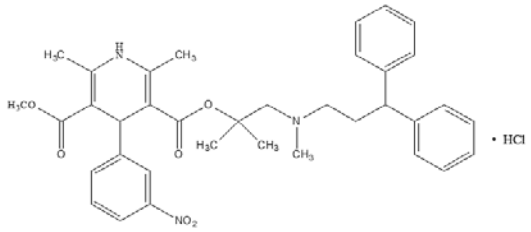
System suitability

System performance: Weigh 5 mg of Lansoprazole RS and 5 mg of Lansoprazole related substance I RS and dissolve in a mixture of water, acetonitrile, and triethylamine (60 : 40 : 1), in which pH is adjusted to 10 with phosphoric acid, to make 50 mL. Proceed with 10 μL of this solution according to the above conditions; the resolution between the peaks of lansoprazole and the related substance I is NLT 5.

System repeatability: Repeat the test 5 times with 10 μL each of the standard solution according to the above operating conditions; the relative standard deviation of the peak area of lansoprazole is NMT 0.5%

Packaging and storage Preserve in light-resistant, well-closed containers.

Lercanidipine Hydrochloride
레르카니디핀염산염



$C_{36}H_{41}N_3O_6 \cdot HCl$: 648.21

3,5-Pyridinedicarboxylic acid, 1,4-dihydro-2,6-dimethyl-4-(3-nitrophenyl)-2-[(3,3-diphenylpropyl)methylamino]-1,1-dimethylethylmethylester hydrochloride, [*132866-11-6*]

Lercanidipine Hydrochloride contains NLT 99.0% and NMT 101.0% of lercanidipine hydrochloride ($C_{36}H_{41}N_3O_6 \cdot HCl$: 648.21), calculated on the dried basis.

Description Lercanidipine Hydrochloride is light yellow crystals or a crystalline powder and is odorless.
It is very soluble in chloroform and methanol, soluble in ethanol(95), sparingly soluble in acetone, and practically insoluble in water.

Identification (1) Determine the absorption spectra of Lercanidipine Hydrochloride and lercanidipine hydrochloride RS as directed under the ATR method under the Mid-infrared Spectroscopy in the General Tests of the Korean Pharmacopoeia (KP); both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) Perform the test as directed under the Liquid Chromatography in Related substances; the peak retention time from the test solution and the standard solution is the same.

Melting point Between 185 and 190 ℃.

Loss on drying NMT 1.0% (1 g, 105 °C, 3 hours).

Residue on ignition NMT 0.1% (1 g).

Clarity and color of solution Dissolve 0.5 g of Lercanidipine Hydrochloride in chloroform to make 10 mL; the resulting solution exhibits a yellow color and is clear.

Related substances (1) ***Thin layer chromatography***—Perform as directed under the following test method; the total impurity is NMT 0.5%, the single impurity is NMT 0.2%, and the single unidentified impurity is NMT 0.1%. Weigh about 0.5 g of Lercanidipine Hydrochloride, dissolve in 10 mL of chloroform, and use this solution as the test solution (A). Pipet 0.1 mL (B), 0.2 mL (C), and 0.5 mL (D) of this solution, add chloroform to each to make 100 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography in the General Tests of the pharmacopoeia. Spot 10 μL each of the test solution and the standard solution on a plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of chloroform, methanol and acetic acid (90 : 7 :3) as a developing solvent to a distance of about 15 cm, and dry the plate. Expose the plate under ultraviolet rays (main wavelength: 254 mm), confirm the spots, spray Dragendorff's TS, spray again 3% hydrogen peroxide solution, and confirm the spots. The color of the total spots other than the principal spot from the test solution are not more intense than the spot from the standard solution D. Other than the principal spot from the test solution, the spot of single impurity 1, 2, 3, and 5 spot (relative R_f value - lercanidipine hydrochloride : 1, impurity 1 : 1.5, impurity 2 : 0.5, impurity 3 : 2.0, impurity 5 : 1.7) is not more intense than the spot from the standard solution C, and the spot of single unidentified impurity, other than the spot of impurity, 1, 2, 3 and 5 is not more intense than the spot from the standard solution B.

(2) ***Liquid chromatography***—Weigh 10 mg of Lercanidipine Hydrochloride, dissolve in 10 mL of acetonitrile to make exactly 10 mL, and use this solution as the test solution. Pipet 0.2 mL of the test solution, dissolve in acetonitrile to make exactly 100 mL, and use this solution as the diluted test solution. Separately, weigh accurately about 100 mg of lercanidipine hydrochloride RS, dissolve in acetonitrile to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution, the diluted test solution, the standard solution and the blank test solution (acetonitrile) according to the following operating conditions as directed under the Liquid Chromatography, and determine the amount of related substances; the amount of related substances I, III, IV and V is NMT 0.2%, respectively, the amount of any other individual related substances is NMT 0.1%, and the amount of total related substances is NMT 0.5%.

$$\text{Content (\%) of each related substance} = 0.2 \times (A_i / A_S) / RF$$

A_i: Peak area of each related substance in the test solution

A_s: Peak area of lercanidipine hydrochloride in the diluted test solution

RF: Response factor of each related substance

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 240 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of acetonitrile and phosphoric acid (675 : 325).

Flow rate: 1.5 mL/minute

Running time: 30 minutes

System suitability

System performance: Weigh 100 mg of the standard solution and 1 mg of related substance III, add ace-

tonitrile to make 100 mL, take 10 μL of this resulting solution, and perform the test according to the above operating conditions; the resolution between lercanidipine hydrochloride and related substance III is NLT 1.5.

Related substance III—1,1-dimethyl-2-[(3,3-diphenylpropyl)methylamino] ethylmethyl 2,6-dimethyl-4-(3-nitrophenyl)pyridine-3,5-dicarboxylate

<Relative retention time and response factor of each related substance>

Name	Relative retention Time	Response factor (*RF*)
Related substance I	0.16	1.14
Related substance V	0.25	1.88
Related substance III	0.90	0.47
Lercanidipine hydrochloride	1.00	1.00
Related substance IV	1.24	0.83

Assay Weigh accurately about 500 mg of Lercanidipine Hydrochloride, dissolve in 15 mL of formic acid, add 35 mL of acetic anhydride, and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 64.82 mg of $C_{36}H_{41}N_3O_6 \cdot HCl$

Packaging and storage Preserve in tight containers.

Lercanidipine Hydrochloride Tablets
레르카니디핀염산염 정

Lercanidipine Hydrochloride Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of lercanidipine hydrochloride ($C_{36}H_{41}N_3O_6 \cdot HCl$: 648.205).

Method of preparation Prepare as directed under Tablets, with Lercanidipine Hydrochloride.

Identification The retention time of the major peak obtained from the test solution and the standard solution from the Assay and the ultraviolet absorption spectrum between 200 nm and 400 nm are the same.

Uniformity of dosage units Meets the requirements.

Dissolution Perform the test with 1 tablet of Lercanidipine Hydrochloride Tablets at 50 revolutions per minute according to Method 2 under the Dissolution using 900 mL of 0.1 mol/L hydrochloric acid TS of 0.3 w/v% polysorbate 80 as the dissolution medium. Take the solution 45 minutes after starting the dissolution test and filter. Use this filtrate as the test solution. Separately, weigh accurately about 10 mg of lercanidipine hydrochloride RS, add 10 mL of acetonitrile, and dissolve it. Add the dissolution medium to make the same concentration as that of the test solution, and use this solution as the standard solution. Prepare the test solution and the standard solution before use. Inject 20 μL of the test solution and the standard solution as directed by the following assay of content or potency. Meets the requirements if the dissolution rate of Lercanidipine Hydrochloride Tablets in 45 minutes is NLT 75%.

Dissolution rate (%) with respect to the labeled amount of lercanidipine hydrochloride ($C_{36}H_{41}N_3O_6 \cdot HCl$)
$= A_T / A_S \times C_S \times 1 / C \times 90000$

C_S: Concentration (mg/mL) of the standard solution
C: Labeled amount (mg) of lercanidipine hydrochloride ($C_{36}H_{41}N_3O_6 \cdot HCl$) in 1 tablet

System suitability
System repeatability: Repeat the test 6 times with 20 μL each of the standard solution according to the above operating conditions; the relative standard deviation of the peak area of lercanidipine hydrochloride is NMT 2.0%.

Assay Weigh accurately the mass of NLT 20 tables of Lercanidipine Hydrochloride Tablets and powder. Weigh accurately an amount equivalent to 80 mg of lercanidipine hydrochloride ($C_{36}H_{41}N_3O_6 \cdot HCl$) and put it into 200 mL of volumetric flask. Add 20 mL of 0.01 mol/L hydrochloric acid and sonicate for about 15 minutes. Add 100 mL of methanol and sonicate for about 15 minutes. Cool at room temperature and add methanol to make exactly 200 mL. Filter this solution to have a clear supernatant. Pipet 10.0 mL of the clear supernatant, and add the mobile phase to make exactly 100 mL. Use this solution as the test solution. Separately, weigh accurately 80 mg of lercanidipine hydrochloride RS and put it into a 200-mL volumetric flask containing 100 mL of methanol, dissolve in 20 mL of 0.01 mol/L hydrochloric acid, and add methanol to make exactly 200 mL. Pipet 10 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Prepare the test solution and the standard solution before use. Perform the test with 15 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak areas, A_T and A_S of lercanidipine hydrochloride, for the test solution and the standard solution, respectively.

Amount (mg) of lercanidipine hydrochloride ($C_{36}H_{41}N_3O_6 \cdot HCl$)
= Amount (mg) of lercanidipine hydrochloride $\times A_T / A_S$

Operating conditions
Detector: An ultraviolet absorbance photometer (wavelength: 240 nm). However, a photo-diode array detector (200 nm to 400 nm) is used when the Identifica-

tion is performed.

Column: A stainless steel column about 4 mm in internal diameter and about 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 to 10 um in particle diameter), or an equivalent column.

Column temperature: A constant temperature of about 30 °C.

Mobile phase: A mixture of acetonitrile and 0.15 mol/L sodium perchlorate solution (adjusted the pH to 3.0 with perchloric acid) (61 : 39).

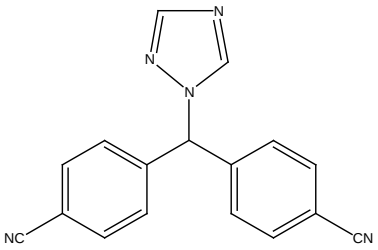
Flow rate: 1.3 mL/min

System suitability

System repeatability: Repeat the test 6 times with 15 μL each of the standard solutions according to the above operating conditions; the relative standard deviation of the peak area of lercanidipine hydrochloride is NMT 2.0%.

Packaging and storage Preserve in tight containers.

Letrozole
레트로졸



$C_{17}H_{11}N_5$: 285.30

4-[(4-Cyanophenyl)-(1,2,4-triazol-1-yl)methyl]benzonitrile [*112809-51-5*]

Letrozole contains NLT 98.0% and NMT 102.0% of letrozole ($C_{17}H_{11}N_5$), calculated on the anhydrous basis.

Description Letrozole occurs as white to pale yellow crystals or a crystalline powder.
It is freely soluble in dichloromethane, slightly soluble in ethanol(95), and practically insoluble in water.

Identification (1) Determine the infrared spectra of Letrozole and Letrozole RS, as directed in the paste method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Letrozole according to Method 2 and perform the test. Prepare the control solution with 1.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Related substances***—Weigh accurately about 25 mg of Letrozole, dissolve in 75 mL of acetonitrile, add water to make exactly 250 mL, and use this solution as the test solution. Separately, weigh accurately 10 mg of Letrozole RS, dissolve by adding 30 mL of acetonitrile, and put water to make exactly 100 mL. To 5.0 mL of this solution, add a mixture of water and acetonitrile (7 : 3) to make exactly 50 mL. To 5.0 mL of this solution, add a mixture of water and acetonitrile (7 : 3) to make exactly 50 mL, and use this solution as the standard solution. Perform the test with 15 μL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions and determine the peak area of the major peak. The letrozole related substance I (4,4-(1*H*-1,3,4-triazol-1-ylmethylene)dibenzonitrile) obtained from the test solution is NMT 0.3%, 4,4′,4″methylidentribenzonitrile is NMT 0.2%, other related substances are NMT 0.1%, and the sum of all related substances is NMT 0.3% (the relative retention time of 4,4′,4″methanetriyltribenzonitrile is about 2.4).

$$\text{Content (\%) of related substances} = \frac{A_i}{A_S} \times \frac{C_S}{C_T}$$

A_T: Peak area of each related substance obtained from the test solution

A_S: The area of the major peak obtained from the standard solution

C_S: Concentration (mg/L) of letrozole in the standard solution

C_T: Concentration (mg/mL) of letrozole in the test solution

Operating conditions

For detector, column, mobile phase and flow rate, proceed as directed in the operating conditions under the Assay.

System suitability

System performance: Weigh 2 mg of letrozole related substance I RS and 10 mg of Letrozole RS each, dissolve in 30 mL of acetonitrile, and add water to make 100 mL. To 5.0 mL of this solution, add a mixture of water and acetonitrile (7 : 3) to make 50 mL. Proceed with 15 μL of this solution according to the above conditions; the relative retention times for letrozole related substance I and letrozole are about 0.67 and 1.0, respectively, with the resolution being NLT 2.0.

System repeatability: Repeat the test 6 times with 15 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area of letrozole is NMT 10.0%.

Water NMT 0.3% (1 g, volumetric titration, direct titration).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 20 mg each of Letrozole and letrozole RS, dissolve in 30 mL of acetonitrile, and dissolve by adding water to make exactly 100 mL. To 5.0 mL of these solutions, add a mixture of water and ace-

tonitrile (7 : 3) to make exactly 100 mL, and use these solutions as the test solution and standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of letrozole.

$$\text{Amount (mg) of letrozole } (C_{17}H_{11}N_5) = \text{Amount (mg) of letrozole RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 230 nm)

Column: A stainless steel column about 4.6 mm in internal diameter and about 12.5 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: Use the mobile phases A and B to control stepwise or based on the gradient elution as follows.

Mobile phase A: Water

Mobile phase B: Acetonitrile

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0	70	30
0 - 25	70 → 30	30 → 70

Flow rate: 1.0 mL/min

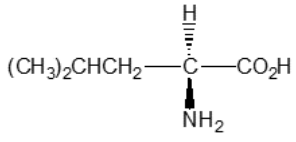
System suitability

System performance: Proceed with 20 μL of the standard solution according to the above conditions; the symmetry factor of the peak of letrozole is between 0.8 and 1.5.

System repeatability: Repeat the test 5 times with 20 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area of letrozole is NMT 2.0%.

Packaging and storage Preserve in tight containers.

L-Leucine
L-류신



$C_6H_{13}NO_2$: 131.17

(2*S*)-2-Amino-4-methylpentanoic acid [*61-90-5*]

L-Leucine, when dried, contains NLT 98.5% and NMT 101.0% of L-leucine ($C_6H_{13}NO_2$).

Description L-Leucine occurs as white crystals or a crystalline powder. It is odorless or has a slightly characteristic odor and has a bitter taste.

It is freely soluble in formic acid, sparingly soluble in water and practically insoluble in ethanol(95).

It dissolves in dilute hydrochloric acid.

Identification Determine the infrared spectra of L-Leucine and L-Leucine RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both exhibit similar intensities of absorption at the same wavenumbers.

Optical rotation $[\alpha]_D^{20}$: Between +14.5° and +16.0° (after drying, 1 g, 6 mol/L hydrochloric acid TS, 25 mL, 100 mm).

pH Dissolve 1.0 g of L-Leucine in 100 mL of water; the pH of this solution is between 5.5 and 6.5.

Purity (1) ***Clarity and color of solution*—**Dissolve 0.5 g of L-Leucine in 10 mL of 1 mol/L hydrochloric acid TS; the solution is clear and colorless.

(2) ***Chloride*—**Dissolve 0.5 g of L-Leucine in 40 mL of water and 6 mL of dilute nitric acid and add water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid (NMT 0.021%).

(3) ***Sulfate*—**Dissolve 0.6 g of L-Leucine in 40 mL of water and 1 mL of dilute hydrochloric acid and add water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 0.35 mL of 0.005 mol/L sulfuric acid (NMT 0.028%).

(4) ***Ammonium*—**Perform the test with 0.25 g of L-Leucine. Prepare the control solution with 5.0 mL of ammonium standard solution (NMT 0.02%).

(5) ***Heavy metals*—**Proceed with 1.0 g of L-Leucine according to Method 4 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(6) ***Iron*—**Dissolve 0.333 g of L-Leucine in water to make 45 mL, add 2 mL of hydrochloric acid, and use this solution as the test solution. To 1.0 mL of iron standard solution, add water to make 45 mL, add 2 mL of hydrochloric acid, and use this solution as the standard solution. Add 50 mg of ammonium peroxydisulfate and 3 mL of 30% ammonium thiocyanate solution to the test solution and the standard solution, respectively, and mix. The color obtained from the test solution is not more intense than that obtained from the standard solution (NMT 30 ppm).

(7) ***Arsenic*—**Prepare the test solution with 1.0 g of L-Leucine according to Method 2 and perform the test (NMT 2 ppm).

(8) ***Related substances*—**Dissolve 0.10 g of L-Leucine in water by warming. After cooling, add water to make 25 mL and use this solution as the test solution. Perform the test as directed under Purity (8) of L-Isoleucine.

Loss on drying NMT 0.3% (1 g, 105 ℃, 3 hours).

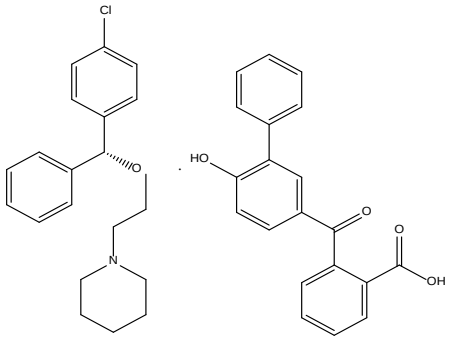
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.13 g of L-Leucine, previously dried, dissolve in 3 mL of formic acid, add 50 mL of acetic acid(100) and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 13.117 mg of $C_6H_{13}NO_2$

Packaging and storage Preserve in well-closed containers.

Levocloperastine Fendizoeate
레보클로페라스틴펜디조산염



$C_{20}H_{24}ClNO \cdot C_{20}H_{14}O_4$: 648.20

2-[(6-Hydroxy[1,1'-biphenyl]-3-yl)carbonyl]-benzoic acid compound with 1-[2-[(*S*)-(4-chlorophenyl)phenylmethoxy]ethyl]piperidine (1:1), [*220329-19-1*]

Levocloperastine Fendizoate contains NLT 95.0% and NMT 101.0% of levocloperastine fendizoate ($C_{20}H_{24}ClNO \cdot C_{20}H_{14}O_4$: 648.20), calculated on the anhydrous basis.

Description Levocloperastine Fendizoate occurs as white or pale yellow crystals or a crystalline powder. It is odorless.
It is slightly soluble in ethanol(95), methanol or pyridine, and practically insoluble in water and ether.

Identification (1) Determine the infrared spectra of Levocloperastine Fendizoeate and levocloperastine fendizoeate RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) Dissolve 20 mg of Levocloperastine Fendizoeate in ethanol(95) to make 100 mL, and determine the absorption spectrum as directed under the Ultraviolet-visible Spectroscopy; it exhibits maxima between 202 nm and 206 nm, between 250 nm and 254 nm, and between 286 nm and 290 nm.

Melting point Between 178 and 184 ℃.

Optical rotation $[\alpha]_D^{20}$: Between -4.5° and -5.0° (0.1 g as converted anhydride, dimethylformamide, 10 mL, 100 mm).

Purity (1) ***Chloride***—Add 50 mL of water to 2.0 g of Levocloperastine Fendizoeate, heat at 70 °C for 5 minutes, cool, and filter. Take 25 mL of the filtrate and add 6 mL of dilute nitric acid and water to make 50 mL. Use this as the test solution and perform the test. Prepare the control solution with 0.40 mL of 0.01 mol/L hydrochloric acid VS (NMT 0.1%).

(2) ***Heavy metals***—Proceed with 1.0 g of Levocloperastine Fendizoeate according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Dextrocloperastine fendizoate***—Weigh accurately about 10 mg of Levocloperastine Fendizoeate, dissolve it in 10 mL of chloroform, add the mobile phase to make exactly 100 mL, and use this solution as the test solution. Perform the test with 20 μL of the test solution as directed under the Liquid Chromatography according to the following conditions. The retention time of dextrocloperastine fendizoate and Levocloperastine Fendizoeate exhibit 6.5 minutes and 7.1 minutes, respectively. Determine the ratio of dextrocloperastine fendizoate by obtaining each peak area value; the amount of dextrocloperastine relative to the total cloperastine fendizoate should be NMT 4.0%.

Operating conditions

Detector: An ultraviolet absorption spectrophotometer (wavelength: 226 nm).

Column: A stainless steel column with an internal diameter of about 4.0 mm and a length of about 25 cm, packed with octadecylsilanized silica gel for chiral separationliquid chromatography.

Mobile phase: A mixture of hexane and isopropanol (98 : 2).

Flow rate: 0.8 mL/min

(4) ***β-hydroxyethylpiperidine***—Weigh 0.5 g of Levocloperastine Fendizoeate, put it into a 25 mL volumetric flask, add 2 drops of dimethylamine, and add methanol to make 25 mL. Use this solution as the test solution. Separately, weigh 10 mg of *β*-hydroxyethylpiperidine, add methanol to make exactly 100 mL, and use it as the standard solution. Perform the test with these solutions as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of methanol, acetone and water (98.5 : 1 : 0.5) to a distance of about 15 cm, and air-dry the plate. Apply iodine vapor to the plate; the spots other than the main spots obtained from the test solution are not darker than the spots from the standard

solution.

(5) ***Other Related Substances I***—Weigh accurately 200 mg of Levocloperastine Fendizoeate, add 2 drops of dimethylamine, add methanol to make 10 mL, and use this solution as the test solution. Separately, weigh accurately 20 mg of levocloperastine fendizoeate RS, add 2 drops of dimethylamine, and add methanol to make 10 mL. Pipet 1 mL of this solution, add methanol to make 20 mL, and use this solution as the standard solution. Spot 10 μL each of the test solution and the standard solution on a thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography, develop the plate with a mixture of ethyl acetate, methanol, 30% ammonia water and water (30 : 10 : 10 : 2) to a distance of 10 cim, and air-dry the plate. Apply ultraviolet light (main wavelength: 254 nm); the spots other than the main spots obtained from the test solution are not larger or darker than the spots from the standard solution (NMT 0.5%).

(6) ***Other Related Substances II***—Weigh accurately about 200 mg of Levocloperastine Fendizoeate, add 2 drops of dimethylamine, add methanol to make 10 mL, and use this solution as the test solution. Separately, weigh accurately 20 mg of levocloperastine fendizoate RS, add 2 drops of dimethylamine, and add methanol to make 10 mL. Pipet 1 mL of this solution, add methanol to make 20 mL, and use this solution as the standard solution. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography, develop the plate with a mixture of toluene, ethyl acetate, methanol, and 30% ammonia water (75 : 15 : 10 : 0.5) to a distance of about 10 cm, and air-dry the plate. Apply iodine vapor to the plate; spots other than the main spots obtained from the test solution are not larger or darker than those from the standard solution (NMT 0.5%).

Water NMT 1% (1 g, volumetric titration, direct titration).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 1 g of Levocloperastine Fendizoeate, add 100 mL of acetic acid(100) for nonaqueous titration, warm to dissolve, and cool. Then titrate with 0.1 mol/L perchloric acid (indicator: 3 drops of methylrosaniline chloride TS). However, the endpoint of the titration is when the bluish purple color of the solution changes to blue. Perform a blank test in the same manner and make any necessary correction. Calculate the contents of Levocloperastine Fendizoeate by correcting for the purity of the isomer.

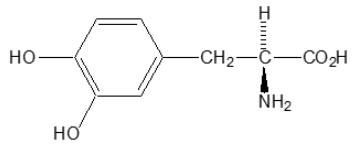
Each mL of 0.1 mol/L perchloric acid VS
= 64.82 mg of $C_{20}H_{24}ClNO \cdot C_{20}H_{14}O_4$

Amount of levocloperastine fendizoate ($C_{20}H_{24}ClNO \cdot C_{20}H_{14}O_4$) (%)
= 64.82 × 0.1 mol/L perchloric acid consumption (mL) × *F* / sampled amount (g)

F: Amount of Levocloperastine Fendizoeate relative to the total amount of cloperastine fendizoate (%)

Packaging and storage Preserve in tight containers.

Levodopa
레보도파



$C_9H_{11}NO_4$: 197.19

(2*S*)-2-Amino-3-(3,4-dihydroxyphenyl)propanoic acid [*59-92-7*]

Levodopa, when dried, contains NLT 98.5% and NMT 101.0% of levodopa ($C_9H_{11}NO_4$).

Description Levodopa occurs as white or pale gray crystals or a crystalline powder, and is odorless.
It is freely soluble in formic acid, slightly soluble in water and practically insoluble in ethanol(95) or ether.
It is soluble in dilute hydrochloric acid.
The pH of the saturated solution of Levodopa is between 5.0 and 6.5.

Melting point—About 275 °C (with decomposition).

Identification (1) To 5 mL of the aqueous solution of Levodopa (1 in 1000), add 1 mL of ninhydrin TS and heat on a steam bath for 3 minutes; the resulting solution exhibits a purple color.

(2) To 2 mL of the aqueous solution of Levodopa (1 in 5000), add 10 mL of 4-Aminoantipyrine TS, and shake well to mix; the resulting solution exhibits a red color.

(3) With the solutions prepared by dissolving 3 mg of Levodopa and Levodopa RS in 0.001 mol/L hydrochloric acid TS to make 100 mL, determine the absorption spectra as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

Optical rotation $[\alpha]_D^{20}$: Between -11.5° and -13.0° (after drying, 2.5 g, 1 mol/L hydrochloric acid TS, 50 mL, 100 mm).

Absorbance $E_{1cm}^{1\%}$ (280 nm): Between 136 and 146 (after drying, 30 mg, 0.001 mol/L hydrochloric acid TS, 1000 mL).

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Levodopa in 20 mL of 1 mol/L hydrochloric acid TS; the resulting solution is clear and colorless.

(2) ***Chloride***—Dissolve 0.5 g of Levodopa in 6 mL of dilute nitric acid and add water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 0.30 mL of 0.01 mol/L

hydrochloric acid (NMT 0.021%).

(3) ***Sulfate***—Dissolve about 0.40 g of Levodopa in 1 mL of dilute hydrochloric acid and 30 mL of water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 0.25 mL of 0.005 mol/L sulfuric acid (NMT 0.030%).

(4) ***Heavy metals***—Proceed with 1.0 g of Levodopa according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(5) ***Arsenic***—Dissolve about 1.0 g of Levodopa in 5 mL of dilute hydrochloric acid, use this solution as the test solution, and perform the test (NMT 2 ppm).

(6) ***Related substances***—Dissolve about 0.10 g of Levodopa in 10 mL of sodium metabisulfite TS and use this solution as the test solution. Pipet 1 mL of this solution and add sodium metabisulfite TS to make exactly 25 mL. Pipet 1 mL of this solution and add sodium metabisulfite TS to make exactly 20 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on a plate made of cellulose for thin-layer chromatography. Next, develop the plate with a mixture of *1*-butanol, water, acetic acid(100) and methanol (10 : 5 : 5 : 1) as a developing solvent to a distance of about 10 cm, and air-dry the plate. Spray evenly a solution of ninhydrin in acetone solution (1 in 50) on the plate and heat at 90 ℃ for 10 minutes; the spots other than the principal spot from the test solution are not more intense than the spot from the standard solution.

Loss on drying NMT 0.3% (1 g, 105 °C, 3 hours).

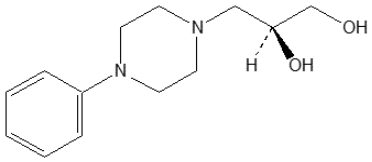
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately 0.3 g of Levodopa, previously dried, dissolve in 3 mL of formic acid, add 80 mL of acetic acid(100), and titrate with 0.1 mol/L perchloric acid VS (indicator: 3 drops of methylrosaniline chloride TS). However, the endpoint of the titration is when the purple color of the solution turns to bluish green and then finally to green. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 19.719 mg of $C_9H_{11}NO_4$

Packaging and storage Preserve in light-resistant, tight containers.

Levodropropizine
레보드로프로피진



$C_{13}H_{20}N_2O_2$: 236.31
(2*S*)-3-(4-Phenylpiperazin-1-yl)propane-1,2-diol [*99291-25-5*]

Levodropropizine, when dried, contains NLT 98.5% and NMT 101.0% of levodropropizine ($C_{13}H_{20}N_2O_2$).

Description Levodropropizine occurs as a white powder. It is freely soluble in dilute acetic acid and methanol and slightly soluble in water or ethanol(95).

Identification Determine the infrared spectra of Levodropropizine and Levodropropizine RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

pH Dissolve 2.5 g of Levodropropizine in 100 mL of water by warming, and cool; the pH of the solution is NLT 9.2 and NMT 10.2.

Optical rotation $[\alpha]_D^{20}$: Between -30.0° and -33.5° (after drying, 1.5 g, 50 mL of 21 mg/mL hydrochloric acid, 100 mm).

Purity (1) ***Related substance I and related substances***—Dissolve 24.0 mg of Levodropropizine in the mobile phase to make 100 mL, and use this solution as the test solution. Separately, dissolve 12.0 mg of Levodropropizine related substance I (1-phenylpiperazine) in methanol to make exactly 100 mL, add the mobile phase to 1.0 mL of this solution to make exactly 100 mL, and use this solution as the standard solution (1). Pipet 0.5 mL of the test solution and 1.0 mL of the standard solution (1), add the mobile phase to make exactly 100 mL, and use this solution as the standard solution (2). Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions; the amount of related substance I obtained from the test solution is not greater than the peak area obtained from the standard solution (1) (0.5%), and the area of other individual peaks is not greater than 0.2 times the peak of related substances I obtained from the standard solution (1) (0.1%). However, exclude any peak areas that are NMT 0.02 times the peak area of related substance I obtained from the standard solution (1).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 10 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of phosphate buffer solution and methanol (88 : 12).

Flow rate: 1.5 mL/minute

System suitability

System performance: Proceed with 20 μL of the standard solution (2) according to the above operating conditions; the resolution between peaks of levodropropizine and related substance I is NLT 2.0.

Phosphate buffer solution—Dissolve 6.81 g of potassium dihydrogen phosphate in water to make 1000 mL, add phosphoric acid, and adjust the pH to 3.0.

(2) ***Related substance II*** —Prepare before use. Dissolve 50.0 mg of Levodropropizine in dichloromethane to make exactly 2.5 mL, and use this solution as the test solution. Separately, dissolve 0.20 g of levodropropizine related substance II {[2Rs)-oxirane-2-yl] methanol (glycidol)} in dichloromethane to make exactly 100 mL, add dichloromethane to 0.5 mL of this solution to make exactly 100 mL, and use this solution as the standard solution (1). Dissolve about 0.50 g of Levodropropizine in dichloromethane, add 0.5 mL of the standard solution (1), add dichloromethane to make exactly 2.5 mL, and use this solution as the standard solution (2). Perform the test as directed under the Gas Chromatography with 1 μL each of the test solution and the standard solution (2); the amount of related substance II obtained from the test solution is not greater than 0.5 times the peak area of related substance II obtained from the standard solution.

Operating conditions

Detector: A hydrogen flame-ionization detector

Column: A glass column about 0.53 mm in internal diameter and about 30 cm in length, packed with silica gel covered with for poly [(cyanopropyl)(phenyl)] [demethyl] siloxane for liquid chromatography (3 μm in particle diameter).

Sample injection port temperature: 170 ℃

Detector temperature: 250 °C

Carrier gas: Helium

Flow rate: 2.5 mL/minute

Split ratio: About 1 : 8.

(3) ***Isomer***—Dissolve 10.0 mg of Levodropropizine in 10.0 mL of a mixture of hexane and ethanol (6 : 4), add 1.0 mL of a mixture of hexane and ethanol (6 : 4) to this solution to make exactly 50 mL, and use this solution as the test solution. Separately, dissolve 10.0 mL of Levodropropizine RS in 10.0 mL of a mixture of hexane and ethanol (6 : 4), add a mixture of hexane and ethanol (6 : 4) to 1.0 mL of this solution to make exactly 50 mL, and use this solution as the standard solution (1). Dissolve 10.0 mg of levodropropizine related substance III [(2R)-3-(4-phenylpiperazin-1-yl)propane-1,2-diol (dextrodropropizine)] RS in 10.0 mL of a mixture of hexane and ethanol (6 : 4). To 1.0 mL of this solution, add a mixture of hexane and ethanol (6 : 4) to make exactly 50 mL, and use this solution as the standard solution (2). Pipet 1.0 mL of the standard solution (2), dissolve in a mixture of hexane and ethanol (6 : 4) to make exactly 50 mL, and use this solution as the standard solution (3). Mix 1 mL of the standard solution (1) and 1 mL of the standard solution (2), and use the solution as the standard solution (4). Perform the test with 20 μL each of the test solution, the standard solution (1), the standard solution (3) and the standard solution (4) according to the following conditions as directed under the Liquid Chromatography; the amount of related substance III obtained from the test solution is not greater than the peak area of related substance III obtained from the standard solution (3) (NMT 2%).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with optical separation silica gel OD for liquid chromatography.

Mobile phase: A mixture of hexane, ethanol, and diethylamine (95 : 5 : 0.2).

Flow rate: 0.8 mL/minute

System suitability

System performance: Proceed with 20 μL of the standard solution (4) according to the above operation conditions; related substance III and levodropropizine are eluted in this order with the resolution between their peaks being NLT 2.0.

Loss on drying NMT 0.5% (0.5 g, 0.15-0.25 kPa, 60 ℃, oxidated (V), 4 hours).

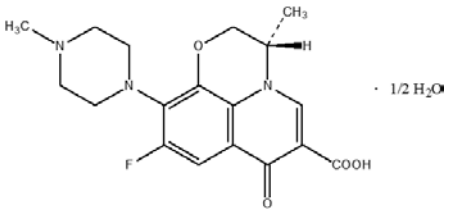
Residue on ignition NMT 0.2% (1 g).

Assay Weigh accurately 0.2 g of Levodropropizine, previously dried, dissolve in 50 mL of acetic acid(100), titrate with 0.1 mol/L perchloric acid VS, and determine the consumed volume in the second inflection point (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 11.82 mg of $C_{13}H_{20}N_2O_2$

Packaging and storage Preserve in light-resistant, well-closed containers.

Levofloxacin Hydrate
레보플록사신수화물



$C_{18}H_{20}FN_3O_4 \cdot 1/2H_2O$: 370.38

(3S)-9-Fluoro-3-methyl-10-(4-methylpiperazin-1-yl)-7-oxo-2,3-dihydro-7H-pyrido[1,2,3-de][1,4]benzoxazine-6-carboxylic acid hemihydrate. [*138199-71-0*]

Levofloxacin Hydrate contains NLT 99.0% and NMT 101.0% of levofloxacin ($C_{18}H_{20}FN_3O_4$), calculated on the anhydrous basis.

Description Levofloxacin Hydrate occurs as pale yellowish white to yellowish white crystals or a crystalline powder. It is odorless and has a bitter taste.

It is soluble in acetic acid(100), sparingly soluble in water or methanol, slightly soluble in ethanol, and practically insoluble in ether.

It is affected by light.

Melting point—Between 222 and 230 °C (with decomposition).

Identification (1) Proceed with about 10 mg of Levofloxacin Hydrate as directed under the Oxygen Flask Combustion, using a mixture of 0.5 mL of 0.01 mol/L sodium hydroxide TS and 20 mL of water as the absorbent; the obtained test solution responds to the Qualitative Analysis (2) for fluoride.

(2) Weigh about 10 mg of Levofloxacin Hydrate to powder, dissolve in 2 to 3 drops of dilute hydrochloric acid and 5 mL of water, and add 1 mL of reinecke salt TS; a pale red precipitate develops.

(3) Determine the infrared spectra of Levofloxacin Hydrate as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; it exhibits absorption at the wavenumbers of about 3,430 cm^{-1}, 3,040 cm^{-1}, 2,800 cm^{-1}, 1,724 cm^{-1}, 1,622 cm^{-1}, 1,521 cm^{-1}, 1,471 cm^{-1}, 1,051 cm^{-1} and 803 cm^{-1}.

Optical rotation $[\alpha]_D^{20}$: Between -92° and -100° (calculated on the anhydrous basis, 0.1 g, methanol, 10 mL, 100 mm).

pH The pH of the aqueous solution of Levofloxacin Hydrate (1 in 100) is between 6.8 and 7.6.

Purity (1) ***Clarity and color of solution***—Dissolve 0.1 g of Levofloxacin Hydrate in 10 mL of water; the solution is clear and exhibits a pale yellow to yellow color.

(2) ***Heavy metals***—Proceed with 2.0 g of Levofloxacin Hydrate according to Method 4 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Arsenic***—Proceed with 2.0 g of Levofloxacin Hydrate according to Method 3 under Arsenic and perform the test (NMT 1 ppm).

(4) ***Related substances***—Perform the test using a light-resistant container. Weigh accurately 50 mg of Levofloxacin Hydrate, dissolve in 10 mL of a mixture of water and methanol (1 : 1), and use this solution as the test solution. Pipet 1 mL of this solution, and add a mixture of water and methanol (1 : 1) to make exactly 10 mL. Pipet 1 mL of this solution, add a mixture of water and methanol (1 : 1) to make exactly 10 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak area of each of the solutions according to the automatic integration method; the peak area with the relative retention time to the peak of levofloxacin of about 1.2 in the test solution is not greater than 2/5 times the peak area of levofloxacin in the standard solution, and the peak areas other than the peak of levofloxacin and the peak with the relative retention time to levofloxacin of about 1.2 in the test solution are not greater than 1/5 of the peak area of levofloxacin in the standard solution. Also, the sum of peak areas other than levofloxacin and other than the peak with the relative retention time to levofloxacin of about 1.2 in the test solution is not greater than 3/10 of the peak area of levofloxacin in the standard solution.

Operating conditions

Detector: An ultraviolet absorption spectrophotometer (wavelength: 340 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 45 °C.

Mobile phase: Dissolve 1.76 g of L-valine, 7.71 g of ammonium acetate and 1.25 g of copper(II) sulfate pentahydrate in water, add water to make 1000 mL, and add 250 mL of methanol.

Flow rate: Adjust the flow rate so that the retention time of levofloxacin is about 22 minutes.

Time span of measurement: About 2 times the retention time of levofloxacin after the solvent peak.

System suitability

Test for required detectability: Pipet 1 mL of the standard solution, and add a mixture of water and methanol (1 : 1) to make exactly 20 mL. Confirm that the peak area of levofloxacin obtained from 10 μL of this solution is equivalent to 4 to 6% of that of levofloxacin from the standard solution.

System performance: Weigh accurately 10 mg of Ofloxacin, and add a mixture of water and methanol (1 : 1) to make exactly 20 mL. Pipet 1 mL of this solution, and add a mixture of water and methanol (1 : 1) to make exactly 10 mL. Proceed with 10 μL of this solution according to the above conditions; the resolution between levofloxacin and the peak with the relative retention time to levofloxacin of about 1.2 is NLT 3.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution according to the

above conditions; the relative standard deviation of the peak areas of levofloxacin is NMT 3.0%.

Water Between 2.1% and 2.7% (0.5 g, volumetric titration, direct titration).

Residue on ignition NMT 0.10% (1.0 g).

Assay Weigh accurately about 0.25 g of Levofloxacin Hydrate, dissolve in 50 mL of acetic acid(100), and titrate with 0.05 mol/L of perchloric acid VS (potentiometric titration). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.05 mol/L perchloric acid VS
= 18.069 mg of $C_{18}H_{20}FN_3O_4$

Packaging and storage Preserve in light-resistant, tight containers.

Levofloxacin Ophthalmic Solution
레보플록사신 점안액

Levofloxacin Ophthalmic Solution is an aqueous ophthalmic solution.

Levofloxacin Ophthalmic Solution contains NLT 95.0% and NMT 107.0% of the labeled amount of levofloxacin hydrate ($C_{18}H_{20}FN_3O_4 \cdot 1/2H_2O$: 370.38).

Method of preparation Prepare as directed under Ophthalmic Solutions, with Levofloxacin Hydrate.

Description Levofloxacin Ophthalmic Solution occurs as a pale yellow to yellow, clear liquid.

Identification (1) Weigh an amount of Levofloxacin Ophthalmic Solution, equivalent to 5 mg of levofloxacin hydrate, according to the labeled amount, and add 0.1 mol/L hydrochloric acid TS to make 100 mL. Take 2 mL of this solution, add 0.01 mol/L hydrochloric acid TS to make 20 mL, and use this solution as the test solution. Determine the absorption spectra of this solution as directed under the Ultraviolet-visible Spectroscopy; it exhibits maxima between 225 and 229 nm and 292 and 296 nm.

(2) Weigh an amount of Levofloxacin Ophthalmic Solution, equivalent to 5 mg of levofloxacin hydrate, according to the labeled amount, dissolve in 5 mL of a mixture of water and methanol (1 : 1), and use this solution as the test solution. Separately, dissolve 10 mg of levofloxacin RS in 10 mL of a mixture of water and methanol (1 : 1), and use this solution as the standard solution. Take 10 μL each of the test solution and the standard solution, and perform the test as directed under the Liquid Chromatography according to the following conditions; the retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

Operating conditions

Detector: An ultraviolet absorption spectrophotometer (wavelength: 340 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 45 °C.

Mobile phase: Dissolve 1.25 g of copper(II) sulfate pentahydrate, 1.76 g of L-valine, and 7.71 g of ammonium acetate in water, add water to make 1000 mL, and add 250 mL of methanol.

Flow rate: Adjust the flow rate so that the retention time of levofloxacin is about 22 minutes.

System suitability

System performance: Weigh 10 mg of ofloxacin, dissolve in 20 mL of a mixture of water and methanol (1 : 1), and add a mixture of water and methanol (1 : 1) to 1 mL of this solution to make 10 mL. Proceed with 10 μL of this solution according to the above conditions; the resolution between levofloxacin and the peak with the relative retention time to levofloxacin of about 1.2 is NLT 3.

Sterility It meets the requirements when tested as directed under the membrane filtration method.

Particulate contamination: Visible particles Meets the requirements.

Particulate matter in Ophthalmic Solutions Meets the requirements.

Assay Weigh accurately an amount of Levofloxacin Ophthalmic Solution equivalent to about 5 mg of levofloxacin hydrate ($C_{18}H_{20}FN_3O_4 \cdot 1/2H_2O$) according to the labeled amount, and add exactly 2 mL of the internal standard solution, then add the mobile phase to make exactly 100 mL, and use this solution as the test solution. Separately, determine water for levofloxacin RS in advance. Weigh accurately about 25 mg of levofloxacin RS, dissolve in water to make exactly 50 mL, and take exactly 10 mL of this solution. Add exactly 2 mL of the internal standard solution, then add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of these solutions as directed under the Liquid Chromatography according to the following conditions, and determine the ratios, QT and QS, of the peak area of levofloxacin to that of each solution internal standard.

Amount (mg) of levofloxacin hydrate ($C_{18}H_{20}FN_3O_4 \cdot 1/2H_2O$)
$= W_S \times Q_T / Q_S \times 1 / 5 \times 1.025$

WS: Amount (mg) of levofloxacin RS, calculated on the anhydrous basis

1.025: Conversion factor from levofloxacin hydrate

($C_{18}H_{20}FN_3O_4.1/2H_2O$) to levofloxacin anhydrous ($C_{18}H_{20}FN_3O_4$)

Internal standard solution—Naphazoline hydrochloride in the mobile phase (3 in 500).

Operating conditions

Detector: An ultraviolet absorption spectrophotometer (wavelength: 280 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 15 cm in length, packed with 5 μm octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: Dissolve 13.61 g of potassium dihydrogen phosphate and 0.77 g of ammonium acetate in 900 mL of water, add 1 mol/L hydrochloric acid to adjust the pH to 3.0, and then add water to make 1000 mL. To 900 mL of this solution, add 100 mL of acetonitrile.

Flow rate: Adjust the flow rate so that the retention time of levofloxacin is about 17 minutes.

System suitability

System performance: Proceed with 10 μL of the standard solution under the above operating conditions; levofloxacin and the internal standard are eluted in this order with the resolution between these peaks being NLT 5.

System repeatability: Repeat the test 6 times with 10 μL of the standard solution according to the above conditions; the relative standard deviation of the ratios of the peak area of levofloxacin to that of the internal standard is NMT 1.0%.

Packaging and storage Preserve in light-resistant, tight containers.

Levofloxacin Tablets
레보플록사신 정

Levofloxacin Tablets contains NLT 95.0% and NMT 105.0% of the labeled amount of levofloxacin ($C_{18}H_{20}FN_3O_4 \cdot 1/2H_2O$: 370.38).

Method of preparation Prepare as directed under Tablets, with Levofloxacin.

Identification The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

Dissolution Perform the test with 1 tablet of Levofloxacin Tablets at 50 revolutions per minute according to Method 1 under the Dissolution, using 900 mL of the first solution as the dissolution solution. Take the dissolved solution after 30 minutes from the start of the test, and filter. Discard the first 10 mL of the filtrate, take exactly V mL of the next filtrate, add the first solution in the Dissolution so that 1 mL contains about 40 μg of levofloxacin according to the labeled amount to make exactly V' mL, and use this solution as the test solution. Separately, weigh accurately about 40 mg of levofloxacin RS, and dissolve in the first solution in the Dissolution to make 100 mL. Pipet 10 mL of this solution, add the first solution in the Dissolution to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 5 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the peak areas, A_T and A_S of levofloxacin ($C_{18}H_{20}FN_3O_4 \cdot 1/2H_2O$) in each solution, respectively. Meets the requirements if the dissolution rate of Levofloxacin Tablets in 30 minutes is NLT 70%.

$$\text{The dissolution rate (\%) of the labeled amount of levofloxacin } (C_{18}H_{20}FN_3O_4 \cdot 1/2H_2O) = W_S \times V'/V \times A_T/A_S \times 1/C \times 90$$

*W*s: Amount (mg) of levofloxacin RS

C: Labeled amount (mg) of levofloxacin ($C_{18}H_{20}FN_3O_4 \cdot 1/2H_2O$) per tablet

Operating conditions

Detector: An ultraviolet absorption spectrophotometer (wavelength: 294 nm).

Column: A stainless-steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: Dissolve 0.87 g of sodium 1-pentane sulfonate in 1000 mL of a mixture of 0.02 mol/L phosphate buffer solution, pH 2.4, and acetonitrile (8 : 2).

Flow rate: 1.0 mL/min

0.02 mol/L phosphate buffer solution, pH 2.4—Dissolve 3.1 g of sodium dihydrogen phosphate dihydrate in 1000 mL of water, and add diluted phosphoric acid (1 in 10) to adjust the pH to 2.4.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 tables of Levofloxacin Tablets, and powder them. Weigh accurately an amount, equivalent to about 50 mg of levofloxacin ($C_{18}H_{20}FN_3O_4 \cdot 1/2H_2O$), and add the mobile phase to make 100 mL. After filtering this solution, take 10 mL of the filtrate, add the mobile phase to make 100 mL, and use this solution as the test solution. Separately, weigh accurately about 50 mg of levofloxacin RS, and put it in the mobile phase to make 100 mL. Take 10 mL of this solution, add the mobile phase to make 100 mL, and use this solution as the standard solution. Perform the test as directed under the Liquid Chromatography with 10 μL each of the test and standard solutions under the following conditions, and determine the peak areas A_T and A of levofloxacin.

The amount (mg) of levofloxacin ($C_{18}H_{20}FN_3O_4 \cdot 1/2H_2O$)
= Amount (mg) of levofloxacin × $\frac{A_T}{A_S}$

Operating conditions

Detector: An ultraviolet absorption spectrophotometer (wavelength: 294 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: Dissolve 0.87 g of sodium 1-pentane sulfonate in 1000 mL of a mixture of 0.02 mol/L phosphate buffer solution, pH 2.4, and acetonitrile (8 : 2).

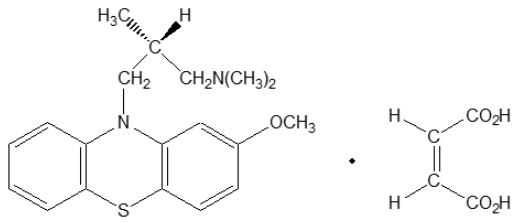
Flow rate: 1.0 mL/min

System suitability

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak areas of levofloxacin is NMT 2.0%.

Packaging and storage Preserve in tight containers.

Levomepromazine Maleate
레보메프로마진말레산염



$C_{19}H_{24}N_2OS \cdot C_4H_4O_4$: 444.54

(*Z*)-But-2-enedioic acid;(2*R*)-3-(2-methoxy phenothiazin-10-yl)-*N*,*N*,2-trimethylpropan-1-amine [*7104-38-3*]

Levomepromazine Maleate, when dried, contains NLT 98.0% and NMT 101.0% of levomepromazine maleate ($C_{19}H_{24}N_2OS \cdot C_4H_4O_4$).

Description Levomepromazine Maleate occurs as white crystals or a crystalline powder. It is odorless and has a bitter taste.

It is freely soluble in acetic acid(100), soluble in chloroform, sparingly soluble in methanol, slightly soluble in ethanol(95) or acetone, very slightly soluble in water, and practically insoluble in ether.

Melting point—Between 184 and 190 ℃ (with decomposition).

Identification (1) Dissolve 5 mg of Levomepromazine Maleate in 5 mL of sulfuric acid; the resulting solution exhibits a purple color and gradually turns to a dark purple color. To this solution, add 1 drop of potassium dichromate TS; the resulting solution exhibits a brownish orange color.

(2) Add 5 mL of sodium hydroxide TS and 20 mL of ether to 0.2 g of Levomepromazine Maleate, shake well to mix, take the ether layer, wash 2 times with 10 mL each of water, and add 0.5 g of anhydrous sodium sulfate. After filtering, evaporate ether in the filtration on a steam bath, and dry at 105 ℃ for 2 hours; the melting point is between 124 and 128 ℃.

(3) Add 5 mL of water and 2 L of ammonia water(28) to 0.5 g of Levomepromazine Maleate, extract 3 times with 5 mL of chloroform each, take the water layer, and evaporate to dryness. Add 2 to 3 drops of dilute sulfuric acid to the residue, add 5 mL of water, and extract 4 times with 25 mL of ether. Add all the ether extractions and evaporate the ether on a steam bath at 35 ℃ passing through air; the melting point of the residue is between 128 and 136 ℃.

Optical rotation $[\alpha]_D^{20}$: Between -13.5° and -16.5° (after drying, 0.5 g, chloroform, 20 mL, 200 mm).

Purity (1) ***Clarity and color of solution***—Dissolve 0.5 g of Levomepromazine Maleate in 10 mL of methanol; the resulting solution is clear and exhibits colorless to pale yellow.

(2) ***Chloride*** —Dissolve 0.5 g of Levomepromazine Maleate in 40 mL of methanol, add 6 mL of dilute nitric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution by adding 40 mL of methanol, 6 mL of dilute nitric acid and water to 0.40 mL of 0.01 mol/L hydrochloric acid to make 50 mL (NMT 0.028%).

(3) ***Heavy metals*** —Proceed with 2.0 g of Levomepromazine Maleate according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

Loss on drying NMT 0.5% (2 g, 105 °C, 3 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 1 g of Levomepromazine Maleate, previously dried, dissolve in 40 mL of acetic acid(100) and 20 mL of acetone and titrate with 0.1 mol/L perchloric acid VS (indicator: 5 drops of bromocresol green and methylrosaniline chloride TS). However, the endpoint of the titration is when the purple color of this solution turns to bluish purple and then finally to blue. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 44.45 mg of $C_{19}H_{24}N_2OS \cdot C_4H_4O_4$

Packaging and storage Preserve in light-resistant, tight containers.

Levomepromazine Maleate Tablets
레보메프로마진말레산염 정

Levomepromazine Maleate Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of levomepromazine maleate ($C_{19}H_{24}N_2OS \cdot C_4H_4O_4$: 444.55).

Method of preparation Prepare as directed under Tablets, with Levomepromazine Maleate.

Identification (1) Weigh an amount of Levomepromazine Maleate Tablets, equivalent to 40 mg of levomepromazine maleate, previously powdered, add 10 mL of water, shake vigorously to mix, and filter.

(i) Add 2 mL of the filtrate to 0.5 mL of nitric acid; the resulting solution exhibits a dark, purple color.

(ii) Add 1 drop of 2% ferric chloride TS to 2 mL of the filtrate; the solution exhibits a reddish purple color.

(2) Weigh an amount of Levomepromazine Maleate Tablets, equivalent to 25 mg of levomepromazine maleate, previously powdered, add 10 mL of ethanol, shake to dissolve, and filter. Use the filtrate as the test solution. Separately, weigh 25 mg of levomepromazine maleate RS, dissolve in 10 mL of ethanol, and use this solution as the standard solution. Perform the test with these solutions as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of ethanol and triethylamine (95 : 5) as a developing solvent to a distance of about 15 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the colors and the R_f values of the spots obtained from the test solution and the standard solution are the same.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

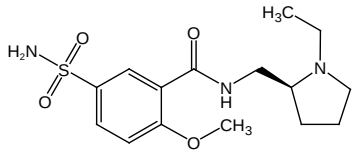
Assay Weigh accurately the mass of NLT 20 Levomepromazine Maleate Tablets, and powder them. Weigh accurately an amount, equivalent to 0.350 g of levomepromazine maleate ($C_{19}H_{24}N_2OS \cdot {}_4H_4O_4$), dissolve in 50 mL of acetic acid(100), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under Titrimetry). Perform a blank test in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 4.4455 mg of $C_{19}H_{24}N_2OS \cdot C_4H_4O_4$

Indicator—Add 50 mL of 1.75 mol/L sulfuric acid to 10 mL of 0.01% methyl yellowish ethanol solution to mix.

Packaging and storage Preserve in tight containers.

Levosulpiride
레보설피리드



$C_{15}H_{23}N_3O_4S$: 341.43

5-(Aminosulfonyl)-*N*-[[(2*S*)-1-ethyl-2-pyrrolidinyl]methyl]-2-methoxy-benzamide, [*23672-07-3*]

Levosulpiride, when dried, contains NLT 98.0% and NMT 102.0% of levosulfiride ($C_{15}H_{23}N_3O_4S$: 341.43).

Description Levosulpiride occurs as a white or almost white crystalline powder. It is odorless.
It is freely soluble in dilute acetic acid or 0.5 mol/L sulfuric acid, sparingly soluble in methanol, and very slightly soluble in water.

Identification (1) Weigh 50 mg of Levosulpiride and levosulfiride RS, dissolve in methanol to make 10 mL, respectively, use these solutions as the test and standard solution, and perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and standard solution on a silica gel with fluorescent indicator for thin-layer chromatographic plate. Develop the thin-layer chromatographic plate with a mixture of isopropanol, methanol, and 30% ammonia water (8 : 1 : 1) to a distance of about 15 cm and dry at 100 ℃ for 5 minutes. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots from the test solution and the standard solution are the same in R_f value.

(2) Dry Levosulpiride and levosulfiride RS and perform the test as directed in the potassium bromide purification method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

pH The pH of the solution obtained by suspending 2.5 g of Levosulpiride in 50 mL of freshly boiled and cooled water is between 9.0 and 10.0.

Melting point Between 185 and 189 ℃.

Optical rotation $[\alpha]_D^{20}$: -69° to -66° (after drying, 1.0 g, dimethylformamide, 50 mL, 100 mm).

Purity (1) ***Chloride***—Suspend 0.4 g of Levosulpiride in 20 mL of water by stirring, and filter. Take 10 mL of the filtrate, add 6 mL of dilute nitric acid and water to make 50 mL, and use this solution as the test solution. Prepare the control solution by adding 6 mL of dilute nitric acid and water to 0.2 mL of 0.01 mol/L hydrochloric acid VS to make 50 mL (NMT 0.035%).

(2) ***Heavy metals***—Weigh 1.0 g of Levosulpiride and perform the test according to Method 2. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***N-Ethyl-2-Aminomethylpyrrolidine***—Weigh accurately about 25 mg of Levosulpiride, add 1 mL of 5% sodium hydroxide solution, and shake lightly. Then, add 2 mL of chloroform accurately, shake well for 5 minutes, and take the chloroform layer to use as the test solution. Separately, weigh accurately about 25 mg of *N*-ethyl-2-aminomethylpyrrolidine RS and dissolve in exactly 10 mL of sodium hydroxide solution. Pipet 30 μL of this solution, add 1 mL of 5% sodium hydroxide solution, and shake lightly. Then, add exactly 2 mL of chloroform, shake well for 5 minutes, and take the chloroform layer to use as the standard solution. With 2.5 μL each of the test solution and the standard solution, perform the test as directed under the Gas Chromatography according to the following operating conditions (NMT 0.3%).

Operating conditions

Detector: A flame-ionization detector

Column: A glass hollow capillary column about 0.32 mm in internal diameter and about 15 m in length, the inside coated with methyl silicone polymer for gas chromatography in 0.25 μm thickness.

Column temperature: A constant temperature of about 85 ℃.

Injector temperature: 250 ℃

Carrier gas: Helium

Flow rate: 1.4 mL/min

(4) ***Related Substances***—Weigh accurately about 25 mg of Levosulpiride, add the mobile phase, dissolve it to make exactly 10 mL. Use this solution as the test solution. Separately, weigh accurately about 25 mg each of pyroglutamic acid, 2-methoxy-5-sulfamoylbenzoic acid methyl ester, and levosulfiride RS, add the mobile phase, and dissolve to make exactly 50 mL. Pipet 1 mL of this drug and add the mobile phase to make exactly 100 mL. Use this solution as the standard solution. Perform the test with 10 μL each of the test and standard solutions according to the following operating conditions under the Liquid Chromatography; the contents of pyroglutamic acid and 2-methoxy-5-sulfamoylbenzoic acid methyl ester are NMT 0.2% respectively, the peak area of each unknown related substance relative to the total peak area is NMT 0.2%, and the total peak area of the unknown related material is NMT 0.5%.

Operating conditions

Detector: Ultraviolet absorption photometer (measurement wavelength: 220 nm).

Column: A stainless steel column with an internal diameter of about 5 mm and a length of about 30 cm is filled with 5 to 10 μm octylsilanized silica gel for liquid chromatography.

Column temperature: 45 °C

Mobile phase: A mixture of 0.05 mol/L potassium dihydrogen phosphate solution (pH 6.2), acetonitrile and methanol (6 : 3 : 1).

Flow rate: 1.0 mL/min

Loss on drying NMT 0.5% (1 g, 105 ℃, 4 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.4 g of Levosulpiride, previously dried, dissolve it in 30 mL of acetic acid for nonaqueous titration, and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration method under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 34.143 mg of $C_{15}H_{23}N_3O_4S$

Packaging and storage Preserve in light-resistant, tight containers.

Levosulpiride Tablets
레보설피리드 정

Levosulpiride Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of levosulpiride ($C_{15}H_{23}N_3O_4S$: 341.43).

Method of preparation Prepare as directed under Tablets, with Levosulpiride.

Identification Weigh an amount of Levosulpiride Tablets, equivalent to 50 mg of levosulpiride, previously powdered, add 10 mL of methanol, shake well to mix, and filter. Use the filtrate as the test solution. Separately, weigh 50 mg of levosulpiride RS, dissolve in methanol to make exactly 10 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and standard solution on a silica gel with fluorescent indicator for thin-layer chromatographic plate. Develop the thin-layer chromatographic plate with a mixture of isopropanol, methanol, and 30% ammonia water (8 : 1 : 1) to a distance of about 15 cm, and dry at 100 ℃ for 5 minutes. Examine the plate under ultraviolet light (main wavelength: 254 nm); the R_f values of the spots obtained from the test solution and the standard solution are the same.

Dissolution Take 1 tablet of Levosulpiride Tablets, and perform the test at 100 revolutions per minute according to Method 2 under the Dissolution, using 900 mL of Solution 1 for the Disintegration as the test solution. Take 20 mL of the solution 20 minutes after starting the test to filter, and use this solution as the test solution. Separately, weigh accurately about 30 mg of levosulpiride RS, and dissolve in the test solution to make 100mL. Pipet 5 mL of this solution, add the test solution to make 50 mL, and use this solution as the standard solution. Perform the

test using the test solution and the standard solution according to the Ultraviolet-visible Spectroscopy, and determine the absorbance A_T and A_S at a wavelength of 291 nm. The acceptable dissolution criterion is NLT 80% of Levosulpiride Tablets dissolved in 20 minutes.

Dissolution rate (%) with respect to the labeled amount of levosulpiride ($C_{15}H_{23}N_3O_4S$)
$= W_S \times (A_T / A_S) / C \times 90$

W_S: Amount of levosulpiride RS (mg)
C: Labeled amount (mg) of levosulpiride in 1 tablet

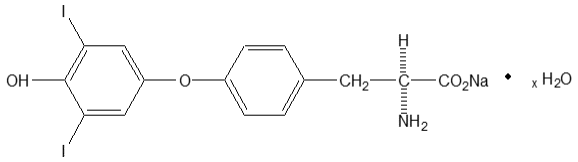
Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 tables of Levosulpiride Tablets, and powder them. Weigh accurately an amount equivalent to about 0.1 g of levosulpiride ($C_{15}H_{23}N_3O_4$), and add 0.05 mol/L sulfuric acid to make exactly100 mL. Sonicate for 10 minutes to filter, pipet 5 mL of the filtrate, add 0.05 mol/L sulfuric acid to make exactly 50 mL, and use this solution as the test solution. Separately, weigh accurately about 0.1 g of levosulpiride RS, proceed in the same manner as in the preparation of the test solution with levosulpiride RS, and use this solution as the standard solution. Perform the test using the test solution and the standard solution according to the Ultraviolet-visible Spectroscopy, and measure the absorbance A_T and A_S at a wavelength of 291 nm.

Amount (mg) of levosulpiride ($C_{15}H_{23}N_3O_4S$)
= Amount (mg) of levosulpiride RS $\times$ (A_T / A_S)

Packaging and storage Preserve in tight containers.

Levothyroxine Sodium Hydrate
레보티록신나트륨수화물



Levothyroxine Sodium $C_{15}H_{10}I_4NNaO_4 \cdot \chi H_2O$
Sodium (2*S*)-2-amino-3-[4-(4-hydroxy-3,5-diiodophenoxy)-3,5-diiodophenyl]propanoate hydrate
[*25416-65-3*]

Levothyroxine Sodium Hydrate contains NLT 97.0% and NMT 101.0% of levothyroxine sodium hydrate ($C_{15}H_{10}I_4NNaO_4$: 798.85), calculated on the dried basis.

Description Levothyroxine Sodium Hydrate occurs as a pale yellow to pale yellowish brown powder. It is odorless.
It is slightly soluble in ethanol(95) and practically insoluble in water or ether.
It is soluble in sodium hydroxide TS.
It is gradually colored by light.

Identification (1) Heat 0.1 g of Levothyroxine Sodium Hydrate by direct firing; a violet-colored gas is produced.

(2) To 0.5 mg of Levothyroxine Sodium Hydrate, add 8 mL of a mixture of water, ethanol, hydrochloric acid and sodium hydroxide TS (6 : 5 : 2 : 2), and heat on a steam bath for 2 minutes. After cooling, add 0.1 mL of sodium nitrite TS and allow to stand in the dark for 20 minutes. Add 1.5 mL of ammonia water(28) to this solution; the resulting solution exhibits a yellowish red color.

(3) Determine the absorption spectra of the respective solutions of Levothyroxine Sodium Hydrate and Levothyroxine Sodium Hydrate RS in dilute sodium hydroxide TS (1 in 10,000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(4) Wet Levothyroxine Sodium Hydrate with sulfuric acid and incinerate; the obtained residue responds to the Qualitative Analysis (1) and (2) for sodium salt.

Optical rotation $[\alpha]_D^{20}$: Between -5° and -6° [(0.3 g, calculated on the dried basis, a mixture of ethanol(95) and sodium hydroxide TS (2 : 1), 10 mL, 100 mm].

Purity (1) ***Clarity and color of solution*—**Dissolve 0.3 g of Levothyroxine Sodium Hydrate in 10 mL of a mixture of ethanol(95) and sodium hydroxide TS (2 : 1) by warming; the resulting solution is clear and exhibits pale yellow to pale yellowish brown color.

(2) ***Soluble halide*—**Dissolve 10 mg of Levothyroxine Sodium Hydrate in 10 mL of water and 1 drop of dilute nitric acid, shake for 5 minutes to mix, and filter. Add water to the filtrate to make 10 mL and mix with 3 drops of silver nitrate TS; the resulting solution exhibits no more turbidity than the following control solution.

Control solution—Add 10 mL of water and 1 drop of dilute nitric acid to 0.20 mL of 0.01 mol/L hydrochloric acid and proceed in the same way as below.

(3) ***Related substances*—**Dissolve 20 mg of Levothyroxine Sodium Hydrate in 2 mL of a mixture of ethanol(95) and ammonia water(28) (14 : 1), and use this solution as the test solution. Pipet 1 mL of this solution, add a mixture of ethanol(95) and ammonia water(28) (14 : 1) to make exactly 50 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of *t*-butyl alcohol, *t*-amyl alcohol, water, ammonia water(28) and 2-butanone (59 : 32 : 17 : 15 : 7) as the developing solvent to a distance of about 12 cm, and air-dry the plate. Spray evenly a solution of 0.3 g of ninhydrin dissolved in 100 mL of a mixture of 1-butanol and acetic acid(100) (97 : 3) on the plate, and heat the plate at 100 ℃ for 3 minutes; the spots other than the

principal spot obtained from the test solution are not more intense than the spots from the standard solution.

Loss on drying Between 7.0% and 11.0% (0.5 g, in vacuum, phosphorus pentoxide, 60 ℃, 4 hours).

Assay Weigh accurately about 25 mg of Levothyroxine Sodium Hydrate and perform the test as directed under the Assay of Liothyronine sodium.

Each mL of 0.02 mol/L sodium thiosulfate VS
= 0.6657 mg of $C_{15}H_{10}I_4NNaO_4$

Packaging and storage Preserve in light-resistant, tight containers.

Levothyroxine Sodium Tablets
레보티록신나트륨 정

Levothyroxine Sodium Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of Levothyroxine Sodium ($C_{15}H_{10}I_4NNaO_4$: 798.85).

Method of preparation Prepare Levothyroxine Sodium Tablets as directed under Tablets, with Levothyroxine Sodium Hydrate.

Identification (1) Weigh an amount of Levothyroxine Sodium Tablets, equivalent to 0.5 g of Levothyroxine Sodium, according to the labeled amount, previously powdered. Add 8 mL of a mixture of water, ethanol, hydrochloric acid and sodium hydroxide VS (6 : 5 : 2 : 2), heat in the water bath for 2 minutes, cool, and filter. To 10 mL of the filtrate, add 0.1 mL of sodium nitrate TS, and allow to stand in the dark for 20 minutes. Add 1.5 mL of ammonia water(28) to this solution; the resulting solution exhibits a yellowish red color.

(2) Weigh an amount of Levothyroxine Sodium Tablets, equivalent to 1 mg of levothyroxine sodium, previously powdered. Add 10 mL of ethanol(95), shake well to mix, filter, and use this solution as the test solution. Separately, weigh 10 mg of Levothyroxine Sodium RS, dissolve in 100 mL of ethanol (100), and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 20 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of *t*-butyl alcohol, *t*-amyl alcohol, water, ammonia water(28) and 2-butanone (59 : 32 : 17 : 15 : 7) as the developing solvent to a distance of about 12 cm, and air-dry the plate. Spray evenly a solution of 0.3 g of ninhydrin in 100 mL of a mixture of *1*-butanol and acetic acid (97:3) on the plate, and heat the plate at 100 ℃ for 3 minutes; the spots obtained from the test solution and the standard solution exhibit a reddish purple color, and have the same R_f value.

Purity ***Soluble halides***—Weigh an amount of Levothyroxine Sodium Tablets, equivalent to 2.5 mg of Levothyroxine sodium, previously powdered. Add 25 mL of water, warm at 40 ℃, shake to mix for 5 minutes, add 3 drops of dilute nitric acid, and filter. Add 3 drops of silver nitrate TS to the filtrate; the turbidity of the resulting solution is not more intense than that of the following control solution.

Control solution—Add 25 mL of water and 3 drops of dilute nitric acid to 0.25 mL of 0.01 mol/L hydrochloric acid, and proceed in the same manner as below.

Dissolution Perform the test with 1 tablet of Levothyroxine Sodium Tablets at 50 revolutions per minute according to Method 2 under the Dissolution, using 500 mL of 0.01 mol/L hydrochloric acid TS containing 0.2% sodium lauryl sulfate with the dissolution medium. Take the dissolved solution after 45 minutes from the start of the test and filter. Discard the first 10 mL of the filtrate, and use the subsequent filtrate as the test solution. Separately, weigh an appropriate amount of Levothyroxine Sodium RS, dissolve in methanol to obtain a solution containing 0.1 mg per mL, dilute with the dissolution medium to make it the same concentration as the test solution, and use this solution as the test solution. Perform the test with 800 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of levothyroxine. It meets the requirements when the dissolution rate in 45 minutes is NLT 70% (Q).

The dissolution rate (%) of the labeled amount of Levothyroxine Sodium ($C_{15}H_{10}I_4NNaO_4$)

$$= C_S \times \frac{A_T}{A_S} \times \frac{1}{C} \times 50000$$

C_S: Concentration (mg/mL) of the standard solution
C: Labeled amount (mg) of Levothyroxine Sodium ($C_{15}H_{10}I_4NNaO_4$) in 1 tablet

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 225 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (1.5 μm to 10 μm in particle diameter).

Mobile phase: A mixture of methanol and 0.1% phosphoric acid (60 : 40).

Flow rate: 2 mL/min

System suitability

System performance: Proceed with 800 μL of the standard solution according to the above conditions; the symmetry factor is NMT 1.5.

System repeatability: Repeat the test 5 times with 800 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area of levothyroxine is NMT 4.0%.

Uniformity of dosage units It meets the requirements when the procedure for content uniformity is performed according to the following method. Take 1 tablet of Levothyroxine Sodium Tablets, transfer into a glass-stoppered centrifuge tube, add exactly 10 mL of 0.01 mol/L sodium hydroxide VS, warm at 50 ℃ for 15 minutes, and shake vigorously for 20 minutes to mix. Centrifuge this solution, pipet 5 mL of the clear supernatant, add 1 mL of the internal standard solution, and use it as the standard solution. Perform the test with 20 μL of the test solution as directed under Liquid Chromatography according to the following conditions, and calculate the ratio of the peak area of Levothyroxine Sodium to that of the internal standard.

Internal standard solution—A solution (3 in 40000) of ethinylestradiol in a mixture of acetonitrile and diluted phosphoric acid (1 in 10) (9:1).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 220 to 230 nm).

Column: A stainless steel column about 4 to 6 mm in internal diameter and 10 to 25 cm in length, packed with octadecyl-silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: A mixture of methanol, water and phosphoric acid (6700 : 3300 : 5).

Flow rate: Adjust the flow rate so that the retention time of Levothyroxine Sodium is about 9 minutes.

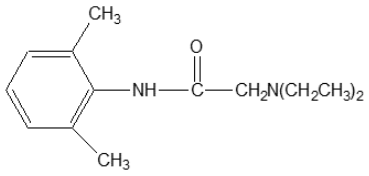
Selection of column: Add 1 mL of the internal standard solution to Levothyroxine Sodium in 5 mL of 0.01 mol/L sodium hydroxide TS (1 in 200000). Proceed with 20 μL of this solution according to the above operating conditions; levothyroxine sodium and the internal standard are eluted in this order with the resolution being NLT 2.

Assay Weigh accurately the mass of NLT 20 Levothyroxine Sodium Tablets, and powder them. Weigh accurately an amount, equivalent to about 3 mg of Levothyroxine Sodium ($C_{15}H_{10}I_4NNaO_4$), add twice the amount of potassium carbonate put and taken in a crucible, and mix well. However, the amount taken is NMT 4 g; add 8 g of potassium carbonate, and mix well. Next, compact the contents by gently tapping the crucible on a table, add 10 g of potassium carbonate to the top again, and tap again to compact it. Ignite the combined mixture in the crucible between 675 and 700 ℃ for 25 minutes and cool. Add 30 mL of water to the crucible, heat gently to boil, and filter it through a flask. Add 30 mL of water to the residue, filter through the flask above, and then wash the carbide on the crucible and funnel with boiling water until the total amount of filtrate reaches 300 mL. Slowly add 7 mL of freshly prepared bromine TS and diluted phosphoric acid (1 in 2) to this solution at a ratio of 3.5 mL per g of potassium carbonate, boil the potassium iodate-starch paper soaked with the generated gas until it doesn't change to blue, wash the inner wall of the flask with water, and boil again for 5 minutes. When boiling, replenish water from time to time to maintain NLT 250 mL of the solution. After cooling, add 5 mL of phenol, wash the inner wall of the flask with water, allow to stand for 5 minutes. and add 2 mL of diluted phosphoric acid (1 in 2) and 5 mL of potassium iodide solution. Immediately titrate the released iodine with 0.01 mol/L sodium thiosulfate VS (indicator: 3 mL of starch TS). Perform a blank test in the same manner, and make any necessary correction.

Each mL of 0.01 mol/L sodium thiosulfate VS
= 0.33286 mg of $C_{15}H_{10}I_4NNaO_4$

Packaging and storage Preserve in light-resistant, tight containers.

Lidocaine
리도카인



$C_{14}H_{22}N_2O$: 234.34

2-(Diethylamino)-*N*-(2,6-dimethylphenyl) acetamide [*137-58-6*]

Lidocaine, when dried, contains NLT 99.0% and NMT 101.0% of lidocaine ($C_{14}H_{22}N_2O$).

Description Lidocaine occurs as white to pale yellow crystals or crystalline powder.
It is very soluble in methanol or ethanol(95), freely soluble in acetic acid(100) or ether and practically insoluble in water.
It dissolves in dilute hydrochloric acid.

Identification (1) Dissolve 40 mg each of Lidocaine and lidocaine RS in 10 mL of 1 mol/L hydrochloric acid TS, add water to make 100 mL, and determine the absorption spectra of these solutions as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Lidocaine and lidocaine RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Melting point Between 66 and 69 ℃.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Lidocaine in 2 mL of dilute hydrochloric acid and add water to make 10 mL; the solution is clear and colorless to pale yellow.

(2) ***Chloride*—**Dissolve 0.6 g of Lidocaine in 6 mL of dilute nitric acid and water to make 50 mL, and perform the test, using this solution as the test solution. Prepare the control solution with 0.70 mL of 0.01 mol/L hydrochloric acid (NMT 0.041%).

(3) ***Sulfate*—**Dissolve 0.5 g of Lidocaine in 5 mL of dilute hydrochloric acid and water to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution with 1.0 mL of 0.005 mol/L sulfuric acid, 5 mL of dilute hydrochloric acid and water to make 50 mL (NMT 0.096%).

(4) ***Heavy metals*—**Carbonize 2.0 g of Lidocaine by gentle heating. After cooling, add 10 mL of a solution of magnesium nitrate in ethanol(95) (1 in 10) and burn by firing the ethanol. After cooling, add 1 mL of sulfuric acid, proceed according to Method 4 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(5) ***Related substances*—**Dissolve 0.10 g of Lidocaine in 2 mL of methanol and use this solution as the test solution. Pipet 1 mL of this solution, add methanol to make exactly 100 mL, and use it as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, 2-butanone, water and formic acid (5 : 3 : 1: 1) to a distance of about 10 cm, air-dry the plate. And dry the plate again at 80 ℃ for 30 minutes. After cooling, examine under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot from the test solution are not more intense than the spot from the standard solution.

(6) ***2,6-dimethylaniline*—**Weigh accurately about 50.0 mg of Lidocaine, dissolve in the mobile phase to make exactly 10.0 mL, and use this solution as the test solution. Separately, weigh accurately about 50.0 mg of 2,6-dimethylaniline and dissolve in the mobile phase to make exactly 100.0 mL. Pipet 10.0 mL of this solution and add the mobile phase to make exactly 100.0 mL. Again, pipet 1.0 mL of this solution, add the mobile phase to make exactly 100.0 mL and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. The amount of 2,6-dimethylaniline with the relative retention time to Lidocaine of about 0.40 is NMT 100 ppm.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 230 nm).

Column: A stainless steel column about 3.9 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized amorphous organic silica polymer for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 30 °C.

Mobile phase: A mixture of phosphate buffer (pH 8.0) and acetonitrile (70 : 30).

Flow rate: 1.0 mL/min

Time span of measurement: About 3.5 times the retention time of lidocaine after the solvent peak.

Phosphate buffer (pH 8.0)—Dissolve 4.85 g of potassium dihydrogen phosphate in 1000 mL of water and adjust the pH to 8.0 with sodium hydroxide solution.

Loss on drying NMT 0.5% (1 g, in vacuum, silica gel, 24 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.5 g of Lidocaine, previously dried, dissolve in 20 mL of acetic acid(100), and titrate with 0.1 mol/L perchloric acid VS (indicator: 1 drop of methylrosanilinium chloride TS). The endpoint is when the solution in the purple color changes through the blue color to the bluish green color. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 23.434 mg of $C_{14}H_{22}N_2O$

Packaging and storage Preserve in tight containers.

Lidocaine Injection
리도카인 주사액

Lidocaine Injection is an aqueous solution for injection. Lidocaine Injection contains NLT 95.0% and NMT 105.0% of the labeled amount of Lidocaine Hydrochloride ($C_{14}H_{22}N_2O \cdot HCl$: 270.80).

Method of preparation Prepare as directed under Injections, with Lidocaine and an equivalent amount of Hydrochloric Acid.
No preservative is added in the case of intravenous injections.

Description Lidocaine Injection occurs as a clear, colorless liquid.

pH—Between 5.0 and 7.0.

Identification To Lidocaine Injection, equivalent to 20 mg of lidocaine hydrochloride according to the labeled amount, add 1 mL of sodium hydroxide TS, and extract with 20 mL of hexane. To 10 mL of the hexane extract, add 20 mL of 1 mol/L hydrochloric acid TS and shake vigorously to mix. Determine the absorption spectrum of the water layer as directed under Ultraviolet-visible Spectroscopy; it exhibits a maximum between 261 nm and 265 nm.

Sterility Meets the requirements.

Bacterial endotoxins Less than 1.1 EU per mg of lido-

caine hydrochloride.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Extractable volume of injections Meets the requirements.

Assay Take exactly an amount of Lidocaine Injection, equivalent to about 0.1 g of Lidocaine Hydrochloride ($C_{14}H_{22}N_2O \cdot HCl$), add exactly 10.0 mL of the internal standard solution and 0.001 mol/L hydrochloric acid TS to make exactly 50 mL, and use this solution as the test solution. Separately, weigh accurately about 85 mg of lidocaine RS, previously dried in a desiccator (in vacuum, silica gel) for 24 hours, dissolve in 0.5 mL of 1 mol/L hydrochloric acid TS and a suitable volume of 0.001 mol/L hydrochloric acid TS and add exactly 10.0 mL of the internal standard solution. Then, add 0.001 mol/L hydrochloric acid TS to make exactly 50 mL and use this solution as the standard solution. Perform the test with 5 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions, and calculate the ratios, Q_T and Q_S, of the peak area of lidocaine to that of the internal standard for the test solution and the standard solution, respectively.

$$\text{Amount (mg) of Lidocine Hydrochloride } (C_{14}H_{22}N_2O \cdot HCl) = \text{Amount (mg) of lidocaine RS} \times \frac{Q_T}{Q_S} \times 1.1556$$

Internal standard solution—A solution of benzophenone in methanol (1 in 4000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless-steel column about 4 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: Dissolve 2.88 g of sodium lauryl sulfate in 1000 mL of a mixture of 0.02 mol/L phosphate buffer solution, pH 3.0, and acetonitrile (11 : 9).

Flow rate: Adjust the flow rate so that the retention time of lidocaine is about 6 minutes.

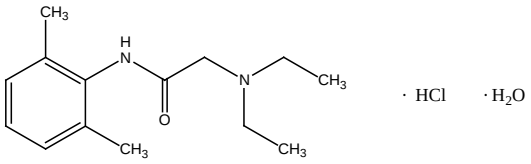
System suitability

System performance: Proceed with 5 μL of the standard solution under the above operating conditions; Lidocaine and the internal standard are eluted in this order with the resolution being NLT 6.0.

System repeatability: Repeat the test 6 times with 5 μL each of the standard solution under the above operating conditions; the relative standard deviation of the ratios of peak area of Lidocaine to that of the internal standard is NMT 1.0%.

Packaging and storage Preserve in hermetic containers.

Lidocaine Hydrochloride Hydrate
리도카인염산염수화물



Lidocaine Hydrochloride $C_{14}H_{22}N_2O \cdot HCl \cdot H2O$: 288.81
2-(Diethylamino)-*N*-(2,6-dimethylphenyl)
acetamide hydrate hydrochloride [*6108-05-0*]

Lidocaine Hydrochloride Hydrate contains NLT 97.5% and NMT 102.5% of lidocaine hydrochloride ($C_{14}H_{22}N_2O \cdot HCl$: 270.80), calculated on the anhydrous basis.

Description Lidocaine Hydrochloride Hydrate occurs as a white crystalline powder. It is odorless and has a slightly bitter taste.
It is very soluble in water or ethanol(95), freely soluble in chloroform, and practically insoluble in ether.

Identification (1) Put 0.3 g of Lidocaine Hydrochloride Hydrate in a separatory funnel, dissolve in 5 to 10 mL of water, add 4 mL of 6 mol/L ammonium hydroxide TS, and extract 4 times with 15 mL each of chloroform. Combine the extracts, evaporate to concentration, and dry the residue in a silica gel desiccator in vacuum for 24 hours. Determine the infrared spectra of the obtained crystalline precipitate and Lidocaine Hydrochloride Hydrate RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) The retention time of the major peak obtained from the test solution corresponds to that from the standard solution, as obtained in the Assay.

(3) An aqueous solution of Lidocaine Hydrochloride Hydrate responds to the Qualitative Analysis (2) for chloride.

Melting point Between 74 and 79 °C.

Purity (1) ***Sulfate***—Dissolve 0.1 g of Lidocaine Hydrochloride Hydrate in 10 mL of water, and use this solution as the test solution. Add 0.10 mL of 0.020 mol/L sulfuric acid to 10 mL of water, and use this solution as the control solution. To each of the test solution and control solution, add 1 mL of 3 mol/L hydrochloric acid and 1 mL of barium chloride TS. The turbidity of the test solution is not more turbid than that of the control solution (NMT 0.1%).

(2) ***Heavy metals***—Proceed with 1.0 g of Lidocaine Hydrochloride Hydrate according to Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (20 ppm).

Water Between 5.0% and 7.0% (0.2 g, volumetric titration, direct titration).

Residue on ignition NMT 0.1%.

Assay Weigh accurately about 0.1 of Lidocaine Hydrochloride Hydrate, dissolve in the mobile phase to make 50 mL, and use the solution as the test solution. Separately, weigh accurately about 85 mg of Lidocaine RS, dissolve in 0.5 mL of 1 mol/L hydrochloric acid by warming, if necessary, add the mobile phase to make 50 mL, and use this solution as the standard solution. Perform the test with 20 µL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak areas from the solutions, A_T and A_S, according to the automatic integration method.

$$\text{Amount (mg) of LidicaineHydrochloride } (C_{14}H_{22}N_2O\cdot HCl) = \text{Amount (mg) of lidocaine RS} \times \frac{A_T}{A_S} \times \frac{270.80}{234.34}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 3.9 mm in internal diameter and 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 µm in particle diameter).

Column temperature: Between 20 and 25 ℃.

Mobile phase: Mix 50 mL of acetic acid(100) and 930 mL of water, and adjust the pH to 3.4 with 1 mol/L sodium hydroxide solution. Mix about 4 volumes of this solution with 1 part of acetonitrile so that the retention time of Lidocaine is about 4 to 6 minutes.

Flow rate: 1.5 mL/min

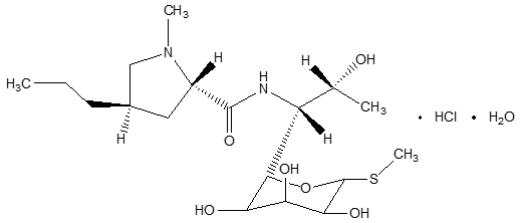
System suitability

System performance: Dissolve 22 mg of methyl *p*-hydroxybenzoate in 100 mL of the mobile phase. Mix 2 mL of this solution with 20 mL of the standard solution. Proceed with 20 µL of this solution under the above operating conditions; the resolution between the peaks of lidocaine and methyl *p*-hydroxybenzoate is NLT 3.

System repeatability: Repeat the test 5 times with 20 µL of the standard solution under the above operating conditions; the relative standard deviation of the peak area of lidocaine is NMT 1.5%.

Packaging and storage Preserve in well-closed containers.

Lincomycin Hydrochloride Hydrate
린코마이신염산염수화물



Lincomycin Hydrochloride

$C_{18}H_{34}N_2O_6S\cdot HCl\cdot H_2O$: 461.01

(2*S*,4*R*)-*N*-[(1*R*,2*R*)-2-Hydroxy-1-[(2*R*,3*R*,4*S*,5*R*,6*R*)-3,4,5-trihydroxy-6-methylsulfanyloxan-2-yl]propyl]-1-methyl-4-propylpyrrolidine-2-carboxamide hydrate hydrochloride [*7179-49-9*]

Lincomycin Hydrochloride Hydrate is the hydrochloride of a substance having antibacterial activity produced by the growth of *Streptomyces lincolnensis var. lincolnensis*.

Lincomycin Hydrochloride Hydrate contains NLT 825 µg (potency) of lincomycin ($C_{18}H_{34}N_2O_6S$: 406.54) per mg, calculated on the anhydrous basis.

Description Lincomycin Hydrochloride Hydrate occurs as white crystals or a crystalline powder.
It is freely soluble in water or methanol, sparingly soluble in ethanol(95), and very slightly soluble in acetonitrile.

Identification (1) Determine the infrared spectra of Lincomycin Hydrochloride Hydrate and lincomycin hydrochloride hydrate RS as directed in the paste method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) An aqueous solution of Lincomycin Hydrochloride Hydrate (1 in 100) responds to the Qualitative Analysis (2) for chloride.

Crystallinity Meets the requirements.

Optical rotation $[\alpha]_D^{25}$: Between +135° and +150° (0.5 g calculated on the anhydrous basis, water, 25 mL, 100 mm).

pH Dissolve 0.1 g of Lincomycin Hydrochloride Hydrate in 1 mL of water; the pH of the solution is between 3.0 and 5.5.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Lincomycin Hydrochloride Hydrate in 10 mL of water; the solution is colorless and clear.

(2) ***Heavy metal***—Proceed with 2.0 g of Lincomycin Hydrochloride Hydrate according to Method 4 and perform the test. Prepare the control solution with 1.0 mL of lead standard solution (NMT 5 ppm).

(3) ***Lincomycin B content***—Perform the test with 20 µL each of the test solution, the standard solution (1) and the standard solution (2) as directed under the Liquid

Chromatography according to the following conditions, and determine the peak area of lincomycin and lincomycin B with a relative retention time of about 0.5 with respect to lincomycin; the peak area of lincomycin B is NMT 5.0% of the sum of the peak areas of lincomycin and lincomycin B.

Operating conditions

Proceed as directed under the operating conditions under the Assay.

System suitability

System performance and repeatability: Proceed as directed under the system suitability under the Assay.

Test for required detectability: Pipet 1 mL of the test solution and add the mobile phase to make exactly 20 mL. Confirm that the peak area of lincomycin obtained from 20 μL of this solution is between 3.5% and 6.5% of the peak area of lincomycin obtained from 20 μL of the test solution.

Water Between 3.0% and 6.0% (0.5 g, volumetric titration, direct titration).

Sterility It meets the requirements when used in sterile preparations. However, it is exempt from the requirements where there is a final sterilization process in the manufacturing process of sterile preparations.

Bacterial endotoxins Less than 0.5 EU per mg (potency) of lincomycin hydrochloride when used for the manufacturing of sterile preparations.

Histamine It meets the requirements when used in sterile preparations. Weigh an appropriate amount of Lincomycin Hydrochloride Hydrate, dissolve in isotonic sodium chloride injection to prepare a solution containing 3.0 mg (potency) per mL, and use the solution as the test solution.

Assay Weigh accurately about 10 mg (potency) each of Lincomycin Hydrochloride Hydrate and lincomycin hydrochloride RS, dissolve each in the mobile phase, add the mobile phase to make exactly 10 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of lincomycin.

$$\text{Potency (μg) of lincomycin } (C_{18}H_{34}N_2O_6S) = \text{Potency of lincomycin hydrochloride RS (μg)} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 210 nm).

Column: A stainless steel column about 4 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 46 °C.

Mobile phase: Add 13.5 mL of phosphoric acid in water to make 1000 mL, and adjust the pH to 6.0 with ammonia TS. To 780 mL of this solution, add 150 mL of acetonitrile and 150 mL of methanol.

Flow rate: Adjust the flow rate so that the retention time of lincomycin is about 9 minutes.

System suitability

System performance: Proceed with 20 μL of the standard solution according to the above conditions; the number of theoretical plates of lincomycin is NLT 4000, and the symmetry factor is NMT 1.3.

System repeatability: Repeat the test 6 times with 20 μL each of the standard solutions according to the above conditions; the relative standard deviation of the peak areas for lincomycin is NMT 2.0%.

Packaging and storage Preserve in tight containers.

Lincomycin Hydrochloride Capsules
린코마이신염산염 캡슐

Lincomycin Hydrochloride Capsules contain NLT 90.0% and NMT 120.0% the labeled amount of lincomycin ($C_{18}H_{34}N_2O_6S$: 406.54).

Method of preparation Prepare as directed under Capsules, with Lincomycin Hydrochloride Hydrate.

Identification (1) Weigh an amount equivalent to 50 mg (potency) of lincomycin hydrochloride and 50 mg (potency) of lincomycin hydrochloride RS according to the labeled amount, and dissolve in 10 mL of methanol, and use this solution as the test solution and the standard solution. Perform the test with these solutions as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Develop the plate with a mixture of 2-butanone, acetone, and water (8 : 4 : 1) to a distance of about 10 cm and air-dry the plate. Spray 0.5% potassium permanganate, and spray 0.2% bromophenol blue solution after 10 minutes; the R_f values and colors of the blue spots from the test solution and the standard solution are the same.

(2) In the chromatogram obtained by performing the test as directed under the Assay, the ratio of the retention time of the internal standard from the test solution and the standard solution to that of lincomycin are the same.

Water NMT 7.0% (0.2 g, volumetric titration, direct titration).

Dissolution Perform the test with 1 capsule of Lincomycin Hydrochloride Capsules at 100 revolutions per minute according to Method 1, using 500 mL of water as the dissolution medium. Take the dissolved solution after 45

minutes from the start of the test and filter. Discard the first 10 mL of the filtrate, pipet *V* mL of the subsequent filtrate, add the dissolution medium to make exactly *V′* mL, and use this solution as the test solution. Separately, weigh accurately an appropriate amount of lincomycin RS, dissolve it in the dissolution medium to make it the same concentration as the test solution, and use this solution as the standard solution. Perform the test as directed under the Assay under Lincomycin Hydrochloride Hydrate with the test solution and the standard solution. It meets the requirements if the dissolution rate in 45 minutes is NLT 75% (Q).

Dissolution rate (%) with respect to the labeled amount of lincomycin ($C_{18}H_{34}N_2O_6S$)

$$= C_S \times \frac{A_T}{A_S} \times \frac{V'}{V} \times \frac{1}{C} \times 50000$$

Cs: Concentration [mg (potency)/mL] of the standard solution

C: Labeled amount [mg (potency)] of lincomycin ($C_{18}H_{34}N_2O_6$) in 1 capsule

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately an amount equivalent to about 0.1 g (potency) according to the marked potency of Lincomycin Hydrochloride Capsules, and use the mobile phase to make exactly 100 mL, and perform the test in the Assay under Lincomycin Hydrochloride Hydrate.

Potency (μg) of lincomycin ($C_{18}H_{34}N_2O_6S$)
= Potency (μg) of lincomycin hydrochloride hydrate RS

$$\times \frac{A_T}{A_S} \times 10$$

Packaging and storage Preserve in tight containers.

Lincomycin Hydrochloride Injection
린코마이신염산염 주사액

Lincomycin Hydrochloride Injection is an aqueous injection and contains NLT 93.0% and NMT 107.0% of the labeled amount of lincomycin ($C_{18}H_{34}N_2O_6S$: 406.54).

Method of preparation Prepare as directed under Injections, with Lincomycin Hydrochloride Hydrate.

Description Lincomycin Hydrochloride Injection occurs as a colorless and clear liquid.

Identification (1) Weigh an amount equivalent to 30 mg (potency) of Lincomycin Hydrochloride Hydrate according to the labeled amount of Lincomycin Hydrochloride Injection, add 30 mL of water, and use this solution as the test solution. Separately, dissolve 10 mg (potency) of lincomycin hydrochloride RS in 10 mL of water, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, dissolve 150 g of ammonium acetate in 800 mL of water, adjust the pH to 9.6 with ammonia water(28), and add water to make 1000 mL. To 80 mL of this solution, add 40 mL of 2-propanol and 90 mL of ethyl acetate, shake to mix, develop the plate with the upper layer as the developing solvent to a distance of about 15 cm, and air-dry the plate. Spray evenly potassium permanganate solution (1 in 1000) on the plate; the R_f values of the principal spot obtained from the test solution and the spot obtained from the standard solution are the same.

(2) Both the test solution and the standard solution exhibit the same retention times in the chromatograms obtained by the test under the Assay.

pH Between 3.0 and 5.5.

Sterility Meets the requirements.

Bacterial endotoxins Lincomycin Hydrochloride Injection is NMT 0.5 EU per mg (potency) of lincomycin.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

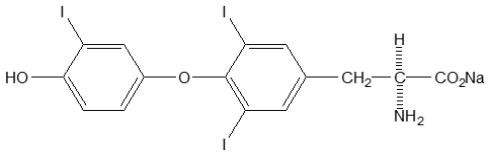
Extractable volume of injections Meets the requirements.

Assay Take exactly an amount of Lincomycin Hydrochloride Injection, equivalent to about 0.1 g (potency) according to the labeled potency, dilute it with the mobile phase to make exactly 100 mL, and perform the test as directed under the Assay of Lincomycin Hydrochloride Hydrate.

Potency (μg) of lincomycin ($C_{18}H_{34}N_2O_6S$)
= Potency (μg) of lincomycin hydrochloride RS $\times \frac{A_T}{A_S} \times 10$

Packaging and storage Preserve in hermetic containers.

Liothyronine Sodium
리오티로닌나트륨



$C_{15}H_{11}I_3NNaO_4$: 672.96

Sodium (2*S*)-2-amino-3-[4-(4-hydroxy-3-iodophenoxy)-

3,5-diiodophenyl]propanoate [*55-06-1*]

Liothyronine Sodium contains NLT 95.0% and NMT 101.0% of Liothyronine Sodium ($C_{15}H_{11}I_3NNaO_4$), calculated on the dried basis.

Description Liothyronine Sodium occurs as a white to pale brown powder, which is odorless.
It is slightly soluble in ethanol(95) and practically insoluble in water or ether.
It dissolves in sodium hydroxide TS or ammonia TS.

Identification (1) To 5 mL of a solution of Liothyronine Sodium in ethanol(95) (1 in 1000), add 1 mL of ninhydrin TS and warm on a steam bath for 5 minutes; the resulting solution exhibits a violet color.

(2) Weigh 20 mg of Liothryonine Sodium, add 2 to 3 drops of sulfuric acid, heat over a flame; it produces violet gas.

(3) Determine the absorption spectra of Liothyronine Sodium and a solution of Liothyronine Sodium RS in ethanol(95) (1 in 10000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(4) Ignite 20 mg of Liothyronine Sodium to carbonize. After cooling, add 5 mL of water to the residue, shake to mix, and filter; the filtrate responds to the Qualitative Analysis (1) for sodium salt.

Optical rotation $[\alpha]_D^{20}$: Between +18° and +22° (0.2 g, calculated on the dried basis, a mixture of ethanol(95) and 1 mol/L hydrochloric acid TS (4 : 1), 10 mL, 100 mm).

Purity (1) ***Chloride***—Transfer 0.1 g of Liothyronine Sodium, previously dried, to a platinum dish and incinerate while preventing the dish from the contact of air currents. When carbonized, allow it to cool, coat with 2 drops of water, and break up with a glass rod. Add 10 mL of water and 5 mL of ammonia water(28) to mix and transfer to a 50-mL flask. Wash the residue on the platinum dish with water and transfer to the flask to make a total volume of 25 mL. Add 10 mL of silver chloride solution (1 in 20), shake, then filter, and transfer to a Nessler cylinder. Wash the flask and filter paper with 10 mL of water and add the washings to the Nessler cylinder to combine. Put nitric acid to oxidize and dilute with 50 mL of water. Separately, mix 5 mL of ammonia water(28), 20 mL of water and 10 mL of silver nitrate solution (1 in 20), filter the mixture, and transfer the filtrate to a Nessler cylinder. Wash the filter paper with 10 mL of water and add the washings to the Nessler cylinder to combine. Oxidize with nitric acid, dilute with water to make 50 mL, and use this solution as the control solution. Add sodium chloride solution (1 in 1000) to the control solution until the turbidity of the control solution becomes identical to that of the test solution; the volume consumed is NMT 2.0 mL (NMT 1.2%).

(2) ***Soluble halide***—To 10 mg of Liothyronine Sodium, add 10 mL of water and 1 drop of dilute nitric acid, shake for 5 minutes, and filter. Add water to the filtrate to make 10 mL and add 3 drops of silver nitrate TS to mix; the resulting solution is not more turbid than the following control solution.

Control solution—To 0.35 mL of 0.01 mol/L hydrochloric acid, add 1 drop of dilute nitric acid and water to make 10 mL and add 3 drops of silver nitrate TS.

(3) ***Iodine and iodide***—Dissolve 0.1 g of Liothryonine Sodium in 10 mL of dilute sodium hydroxide TS and 15 mL of water, add 5 mL of dilute sulfuric acid, shake occasionally to mix, and allow to stand for 10 minutes. Next, filter the mixture, transfer the filtrate into a Nessler cylinder, and add 10 mL of chloroform and 3 drops of potassium iodide solution (1 in 100). After shaking to mix for 30 seconds, allow to stand; the color of the chloroform solution is not more intense than that of the following control solution.

Control solution—Weigh exactly 0.111 g of potassium iodide and dissolve in water to make 1000 mL. Pipet 1 mL of this solution and add 10 mL of dilute sodium hydroxide TS, 14 mL of water and 5 mL of dilute sulfuric acid. After shaking to mix, filter the mixture, transfer the filtrate into a Nessler cylinder, and perform the test in the same manner as below.

(4) ***Related substances***—Dissolve 0.15 g of Liothyronine Sodium in 5 mL of diluted ammonia TS (1 in 3) and use this solution as the test solution. Pipet 1 mL of this solution, add diluted ammonia TS (1 in 3) to make exactly 50 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 1 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of t-butyl alcohol, t-amyl alcohol, water, ammonia water(28) and 2-butanone (59 : 32 : 17 : 15 : 7) as the developing solvent to a distance of about 12 cm, and air-dry the plate. Spray evenly a solution, made by dissolving 0.3 g of ninhydrin in 100 mL of a mixture of *1*-butanol and acetic acid(100) (97 : 3), on the plate and heat at 100 °C for 3 minutes; the spots other than the principal spot from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 4.0% (0.2 g, 105 °C, 2 hours).

Assay Weigh accurately about 25 mg of Liothyronine Sodium and prepare the test solution as directed under the Oxygen Flask Combustion, using a mixture of 10 mL of sodium hydroxide (1 in 100) and 1 mL of a freshly prepared solution of sodium bisulfate (1 in 100) as the absorbent. Put a small amount of water in the upper part of apparatus A, take out C with caution, and wash C, B and the inner wall of A with 40 mL of water. To this solution, add 1 mL of bromine-acetic acid TS, insert the stopper C, and shake vigorously for 1 minute, and wash C, B and the inner wall of A with 40 mL of water and add 0.5 mL of

formic acid. Stopper the flask with C again, shake vigorously for 1 minute, and wash C, B and the inner wall of A with 40 mL of water. Bubble the solution with enough nitrogen gas in the flask to remove the oxygen and excess bromine, and dissolve in 0.5 g of potassium iodide. Add 3 mL of dilute sulfuric acid immediately, shake to mix, allow to stand for 2 minutes, and titrate with 0.02 mol/L sodium thiosulfate VS (indicator: 3 mL of starch TS). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.02 mol/L sodium thiosulfate VS
= 0.7477 mg of $C_{15}H_{11}I_3NNaO_4$

Packaging and storage Preserve in light-resistant, tight containers.

Liothyronine Sodium Tablets
리오티로닌나트륨 정

Liothyronine Sodium Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of liothyronine sodium ($C_{15}H_{11}I_3NNaO_4$: 672.96).

Method of preparation Prepare Levothyroxine Sodium Tablets as directed under Tablets, with Levothyroxine Sodium.

Identification (1) To a glass-stoppered centrifuge tube, add a portion of finely powdered Liothyronine Sodium Tablets, equivalent to 0.1 mg of Liothyronine Sodium, according to the labeled amount, add 30 mL of dilute sodium hydroxide TS, shake vigorously, and centrifuge. Put the clear supernatant in a separatory funnel, add 10 mL of diluted hydrochloric acid, and extract twice with 20 mL of ethyl acetate. Filter sequentially each extract using cotton wool with 8 g of anhydrous sodium sulfate placed on the funnel. Evaporate the filtrate on a steam bath to dryness with the aid of a current of nitrogen. Dissolve the residue in 0.5 mL of methanol, and use this solution as the test solution. Separately, weigh 10 mg of liothyronine sodium for thin-layer chromatography, dissolve in methanol to make 50 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 20 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of t-butyl alcohol, t-amyl alcohol, water, ammonia water(28) and 2-butanone (59 : 32 : 17 : 15 : 7) as the developing solvent to a distance of about 12 cm, and air-dry the plate. Spray evenly a solution of 0.3 g of ninhydrin in 100 mL of a mixture of *1*-butanol and acetic acid (97:3) on the plate, and heat the plate at 100 ℃ for 3 minutes; the spots obtained from the test solution and the standard solution exhibit a reddish purple color, and have the same R_f value.

(2) The colored solution obtained in the Assay exhibits a blue color.

Disintegration Meets the requirements.

Uniformity of dosage units It meets the requirements when tested according to the following procedure. Put 1 tablet of Liothyronine Sodium Tablets in a glass-stoppered centrifuge tube, add exactly 10 mL of 0.01 mol/L sodium hydroxide TS, warm at 50 ℃ for 15 minutes, and shake vigorously to mix for 20 minutes. Centrifuge Liothyronine Sodium Tablets for 5 minutes, and filter the clear supernatant, if necessary. Take exactly an appropriate amount of this solution, and add 0.01 mol/L sodium hydroxide VS to make a solution containing about 0.5 μg of Liothyronine Sodium ($C_{15}H_{11}I_3NNaO_4$) per mL. Pipet 5 mL of this solution, add exactly 1 mL of the internal standard solution, and use this solution as the test solution. Perform the test with 200 μL of the test solution as directed under the Liquid Chromatography according to the following conditions, and determine the ratio of the peak area of the liothyronine to that of the internal standard.

Internal standard solution—A solution of propylparahydroxybenzoate in a mixture of methanol and diluted phosphoric acid (9 : 1) (1 in 250000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 225 nm).

Column: A stainless steel column 4.6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: A mixture of methanol and water (57 : 43).

Flow rate: Adjust the flow rate so that the retention time of liothyronine is about 9 minutes.

System suitability

System performance: Add 1 mL of the internal standard solution to liothyronine sodium in 5 mL of 0.01 mol/L sodium hydroxide TS (1 in 200000), and use this solution as the system suitability solution. Proceed with 200 μL of this solution as directed under the above operating conditions; the internal standard and liothyronine are eluted in this order with the resolution being NLT 2.0.

System repeatability: Repeat the test 6 times with 200 μL each of the system suitability solution according to the above conditions; the relative standard deviation of the ratios of the peak area of liothyronine to that of the internal standard is NMT 1.0%.

Assay Weigh accurately NLT 20 Losartan Potassium Tablets, and powder them. Put a portion of the powder accurately weighed, equivalent to about 50 mg of liothyronine sodium ($C_{15}H_{11}I_3NNaO_4$), in an agate mortar, add 1 g of powdered potassium carbonate, and mix well. Transfer the mixture cautiously to a porcelain crucible,

and compact the contents by gently tapping the crucible on a table. Add an additional 1.5 g of powdered potassium carbonate to the same agate mortar, mix well with any content adhering to the mortar, cautiously overlay the mixture on the top of the same porcelain crucible, and compact the contents again in the same manner. Ignite the combined mixture between 675 and 700 ℃ for 30 minutes. Add water after cooling, heat gently to boil, and filter the contents through a glass filter (G4) into a 20-mL volumetric flask. Wash the residue with water and combine the washings with the filtrate. Add water after cooling to make 20 mL, and use this solution as the test solution. Separately, weigh accurately about 75 mg of potassium Iodide RS, previously dried at 105 ℃ for 4 hours, and dissolve in water to make exactly 200 mL. Take exactly 5 mL of the solution, add a solution of potassium carbonate (1 in 8) to make exactly 100 mL, pipet 2 mL of this solution, add a solution of potassium carbonate (1 in 8) to make exactly 20 mL, and use this solution as the standard solution. Pipet 5 mL each of the test solution and the standard solution into glass-stoppered test tubes, add 3.0 mL of diluted sulfuric acid (4 in 25) and 2.0 mL of potassium permanganate TS, and heat on a steam bath for 15 minutes. Add 1.0 mL of diluted sodium nitrite TS (1 in 10) after cooling, shake to mix, and add 1.0 mL of a solution of ammonium sulfate (1 in 10). Allow to stand at room temperature for 10 minutes with occasional shaking. Next, add 1.0 mL of potato starch TS and 1.0 mL of a freshly prepared diluted potassium iodide TS (1 in 40), shake to mix, and transfer each solution to a 20-mL volumetric flask. Wash the glass-stoppered test tube with water, combine the washings, add water to make 20 mL, and allow to stand for 10 minutes. Perform the test with these solutions as directed under the Ultraviolet-visible Spectroscopy, using a solution prepared with 5 mL of potassium carbonate (1 in 8) in the same manner as the test solution as a control solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution at the absorbance maximum wavelength of about 600 nm, respectively.

$$\text{Amount (mg) of Liothyronine Sodium } (C_{15}H_{11}I_3NNaO_4) = \text{Amount (mg) of potassium iodide RS} \times \frac{A_T}{A_S} \times \frac{1}{2000} \times 1.3513$$

Packaging and storage Preserve in light-resistant, tight containers.

Lipase
리파제

Lipase is an enzyme with fat digestion activity, prepared from a useful strain in *Rhizopus japonicus* or Aspergillus; and contains NLT 90.0% of the digestive power unit.

Description Lipase occurs as a white to grayish white or pale yellowish brown powder and has a characteristic odor.

Identification Lipase shows positive when tested according to the Assay.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Lipase according to Method 2 under the Heavy Metals and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Arsenic***—Proceed with 1.0 g of Lipase according to Method 3 under the Arsenic and perform the test (NMT 2 ppm).

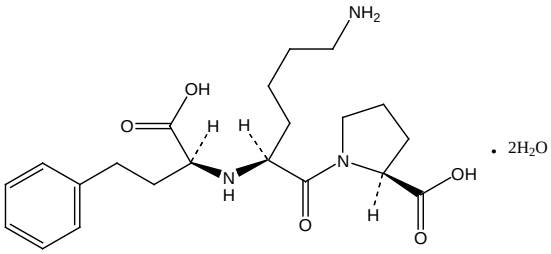
Loss on drying NMT 8.0% (1 g, 105 ℃, 4 hours).

Residue on ignition NMT 20.0% (1 g, constant weight).

Assay Dissolve Lipase in water to make 1 to 5 fat digestion activity unit/mL, and use this solution as the test solution. Weigh 20 g of polyvinyl alcohol (average degree of polymerization 1725 ± 25, content 95.0 ± 1.0%) to prepare the emulsifier according to the Fat digestion activity under the Digestive Power. Prepare the substrate solution according to the Fat digestion activity under the Digestive Power. Prepare the buffer using phosphate buffer of pH 6.0 and perform the test according to the Fat digestion activity under the Digestive Power.

Packaging and storage Preserve in tight containers.

Lisinopril Hydrate
리시노프릴수화물



$C_{21}H_{31}N_3O_5 \cdot 2H_2O$: 441.52

(2*S*)-1-[(2*S*)-6-Amino-2-[[(1*S*)-1-carboxy-3-phenylpropyl]amino]hexanoyl]pyrrolidine-2-carboxylic acid dihydrate [*83915-83-7*]

Lisinopril Hydrate contains NLT 98.0% and NMT 101.0% of lisinopril ($C_{21}H_{31}N_3O_5$: 405.49), calculated on the anhydrous basis.

Description Lisinopril Hydrate occurs as a white crystalline powder and has a slightly distinctive odor.
It is soluble in water, sparingly soluble in methanol and practically insoluble in ethanol(95).

Melting point—About 160℃ (with decomposition).

Identification (1) Determine the absorption spectra of

solutions of Lisinopril Hydrate and Lisinopril Hydrate RS in methanol (1 in 1000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Lisinopril Hydrate and Lisinopril Hydrate RS as directed in the paste method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Optical rotation $[\alpha]_D^{20}$: Between -43.0° and -47.0° (0.25 g calculated on the anhydrous basis, zinc acetate buffer solution, 0.25 mol/L, pH 6.4, 25 mL, 100 mm).

0.25 mol/L zinc acetate buffer solution—To 600 mL of water, add 150 mL of acetic acid(100) and 54.9 g of zinc acetate dihydrate, mix to dissolve, and add 150 mL of ammonia water(28) while stirring. After cooling at room temperature, add ammonia water(28) to adjust the pH to 6.4, and add water to make 1000 mL.

Purity (1) ***Heavy metals***—Proceed with 2.0 g of Lisinopril Hydrate as directed under Method 4 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Related substances***—Dissolve 0.10 g of Lisinopril Hydrate in 50 mL of water and use this solution as the test solution. Pipet 3 mL of the test solution, add water to make exactly 200 mL, and use this solution as the standard solution. Perform the test with 15 μL of the test solution and the standard solution as directed under Liquid Chromatography according to the following conditions, and determine each peak area of each solution by the automatic integration method; the peak area with a relative retention time of about 1.2 to Lisinopril in the test solution is not greater than 1/5 of the peak area of Lisinopril in the standard solution, and the peak areas other than those of Lisinopril and the peaks mentioned above are not greater than 2/15 of the peak area of Lisinopril in the standard solution. The total area of related substances other than Lisinopril is not greater than the peak area of Lisinopril from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 215 nm).

Column: A stainless steel column about 4.0 mm in internal diameter and about 20 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (7 μm in particle diameter).

Column temperature: A constant temperature of about 60 °C.

Mobile phase: Control the stepwise or gradient elution by mixing the mobile phases A and B as follows.

Mobile phase A: Diluted 0.05 mol/L sodium dihydrogen phosphate TS (1 in 2).

Mobile phase B: A mixture of diluted 0.05 mol/L sodium dihydrogen phosphate TS (1 in 2) and acetonitrile (3 : 2).

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 - 10	90 → 50	10 → 50
10 - 25	50	50

Flow rate: 1.5 mL/min

System suitability

Test for required detectability: Take 2.5 mL of the standard solution and add water to make 50 mL. Confirm that the peak area of Lisinopril obtained from 15 μL of this solution is within the range of 3.5% to 6.5% of that of Lisinopril obtained from the standard solution.

System performance: Take 10 mg of Lisinopril Hydrate and 2 mL of a solution of anhydrous caffeine (1 in 1000) and add water to make 200 mL. Proceed with 15 μL of this solution according to the conditions; lisinopril and caffeine are eluted in this order with the resolution being NLT 6.

System repeatability: Repeat the test 6 times with 15 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area of Lisinopril is NMT 2.0%.

Time span of measurement: About 2.5 times the retention time of Lisinopril after the solvent peak.

Water Between 8.0% and 9.5% (0.3 g, volumetric titration, back titration).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.66 g of Lisinopril Hydrate, dissolve in 80 mL of water, and titrate with 0.1 mol/L sodium hydroxide VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS
= 40.55 mg of $C_{21}H_{31}N_3O_5$

Packaging and storage Preserve in well-closed containers.

Lithium Carbonate
탄산리튬

Li_2CO_3: 73.89

Dilithium carbonate [*554-13-2*]

Lithium Carbonate, when dried, contains NLT 99.5% and NMT 101.0% of lithium carbonate (Li_2CO_3).

Description Lithium Carbonate occurs as a white crystalline powder and is odorless.

It is sparingly soluble in water, slightly soluble in hot water, and practically insoluble in ethanol(95) or in ether. It dissolves in dilute acetic acid.

Dissolve 1.0 g of Lithium Carbonate in 100 mL of water; the pH of the solution is between 10.9 and 11.5.

Identification (1) Dissolve 0.2 g of Lithium Carbonate in 3 mL of dilute hydrochloric acid, add 4 mL of sodium hydroxide TS and 2 mL of sodium monohydrogen phosphate TS; a white precipitate is formed. Add another 2 mL of dilute hydrochloric acid; this precipitate dissolves.

(2) An aqueous solution of Lithium Carbonate (1 in 100) responds to the Qualitative Analysis for carbonate.

(3) Perform the test with Lithium Carbonate as directed under the Flame Coloration (1); the resulting solution exhibits a persistent red color.

Purity (1) ***Clarity and color of solution***—Dissolve 0.10 g of Lithium Carbonate in 10 mL of water by warming; the solution is clear and colorless.

(2) ***Acetic acid-insoluble substances***—Dissolve 1.0 g of Lithium Carbonate in 40 mL of dilute acetic acid, filter the insoluble substances using filter paper for quantitative analysis, wash 5 times each with 10 mL of water, and ignite with the filter paper to incinerate; the amount is NMT 1.5 mg.

(3) ***Chloride***—Weigh 0.40 g of Lithium Carbonate, add 10 mL of water and 7 mL of dilute nitric acid, and dissolve by heating to boiling. After cooling, add 6 mL of dilute nitric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 0.25 mL of 0.01 mol/L hydrochloric acid VS (NMT 0.022%).

(4) ***Sulfate***—Weigh 0.40g of Lithium Carbonate, add 10 mL of water and 4 mL of dilute hydrochloric acid, and dissolve by heating to boiling. After cooling, add 1 mL of dilute hydrochloric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 0.40 mL of 0.005 mol/L sulfuric acid VS (NMT 0.048%).

(5) ***Heavy metals***—Weigh 4.0 g of Lithium Carbonate, add 5 mL of water, dissolve by slowly adding 10 mL of hydrochloric acid while stirring, and evaporate to dryness on a steam bath. To the residue, add 10 mL of water, transfer into the Nessler tube, add 1 drop of phenolphthalein TS, and add ammonia TS until the color of the solution turns slightly red. To this solution, add 2 mL of dilute acetic acid and water to make 50 mL. Use this solution as the test solution and perform the test. When preparing the control solution, evaporate 10 mL of hydrochloric acid to dryness, dissolve the residue in 10 mL of water, transfer into the Nessler tube, and add 1 drop of phenolphthalein TS. Add ammonia TS until the solution exhibits a slightly red color, and add 2.0 mL of lead standard solution, 2 mL of dilute acetic acid, and water to make 50 mL (NMT 5 ppm).

(6) ***Sodium***—Weigh accurately about 0.8 g of Lithium Carbonate, dissolve in water to make exactly 100 mL, and use this solution as the sample stock solution. Pipet 25 mL of the sample stock solution, add water to make exactly 100 mL, and use this solution as the test solution. Separately, weigh exactly 25.4 mg of sodium chloride, dissolve in water to make exactly 1000 mL, and use this solution as the standard solution. Pipet 25 mL of the sample stock solution, add exactly 20 mL of the standard solution, add water to make exactly 100 mL, and use this solution as the standard addition solution. Determine the sodium emission intensity under the following conditions using a flame photometer with the test solution and the standard addition solution. Set the wavelength scale to 589 nm, spray the standard addition solution into the flame while it is burning, adjust the sensitivity to make the emission intensity L_S read around 100 on the scale, and determine the emission intensity L_T of the test solution. Next, under the same conditions as before, change the wavelength to 580 nm, determine the emission intensity L_B of the test solution, and calculate the amount of sodium using the following equation; the amount is NMT 0.05%.

$$\text{Content (\%) of sodium (Na)} = \frac{L_T - L_B}{L_S - L_T} \times \frac{W'}{W} \times 100$$

W: Amount (mg) of the sample in 25 mL of the sample stock solution

W': Amount (mg) of the sample in 20 mL of the standard solution

(7) ***Magnesium***—Weigh 5.0 g of Lithium Carbonate, add 20 mL of water, dissolve by slowly adding 15 mL of hydrochloric acid while stirring, and evaporate to dryness on a steam bath. Dissolve the residue in 50 mL of water, filter it if necessary, and use the filtrate as solution A. Separately, evaporate 15 mL of hydrochloric acid to dryness on a steam bath. Proceed in the same manner to obtain the solution, and use this solution as solution B. To 3.0 mL of solution A, add 0.2 mL of titan yellow solution (1 in 1000) and water to make 20 mL, add 5 mL of sodium hydroxide solution (3 in 20), and allow to stand for 10 minutes; the color of the solution is not more intense than the following control solution.

Control solution—Dry magnesium sulfate heptahydrate at 105 ℃ for 2 hours, heat at 450 ℃ for 3 hours, and dissolve 49.5 mg of this substance in water to make 1000 mL. To 6 mL of this solution, add 3 mL of solution B and 0.2 mL of titan yellow solution (1 in 1000) and water to make 20 mL, and proceed in the same manner.

(8) ***Valium***—To 20 mL of solution A of (7), add 6 mL of water, 0.5 mL of dilute hydrochloric acid, 3 mL of ethanol(95), and 2 mL of potassium sulfate TS, and allow to stand for 1 hour; the turbidity of the solution is not more intense than the following control solution.

Control solution—Dissolve 17.8 mg of barium chloride dihydrate in water to make 1000 mL. To 6 mL of this solution, add 20 mL of solution B of (7) and 0.5 mL of dilute hydrochloric acid, and proceed in the same manner.

(9) ***Aluminum***—To 10 mL of solution A of (7), add 10 mL of water and 5 mL of pH 4.5 acetic acid-sodium acetate buffer solution, shake to mix, add 1 mL of L-

ascorbic acid solution (1 in 100), 2 mL of aluminon TS, and water to make 50 mL, and shake well to mix. Allow to stand for 10 minutes; the color of the solution is not more intense than the following control solution.

Control solution—Dissolve 0.1758 g of aluminum potassium sulfate hydrate in water to make 1000 mL. To 1.0 mL of this solution, add 10 mL of solution B of (7) and water to make 20 mL, add 5 mL of pH 4.5 acetic acid-sodium acetate buffer solution, and proceed in the same manner.

(10) ***Iron***—Proceed with 1.0 g of Lithium Carbonate according to Method 2 and perform the test under Method B. However, use 11 mL of dilute hydrochloric acid to make the test solution. Prepare the control solution with 1.0 mL of iron standard solution (NMT 10 ppm).

(11) ***Potassium***—Dissolve 1.0 g of Lithium Carbonate in water to make 100 mL, and use this solution as the test solution. To 5 mL of the test solution, add 1.0 mL of dilute acetic acid, shake well to mix, add 5 mL of sodium tetraphenylborate solution (1 in 30), and shake immediately to mix. Allow to stand for 10 minutes; the turbidity of the solution is not more intense than the following control solution.

Control solution—Dissolve 9.5 mg of potassium chloride in water to make 1000 mL. To 5 mL of this solution, add 1.0 mL of dilute acetic acid, shake well to mix, and proceed in the same manner.

(12) ***Calcium***—Weigh accurately about 5 g of Lithium Carbonate, add 50 mL of water and 15 mL of hydrochloric acid, remove carbon dioxide by boiling, and add 5 mL of ammonium oxalate TS. Add ammonia TS to alkalify the solution. Allow to stand for 4 hours. Filter the precipitate using the glass filter, wash with hot water until the washings is no longer turbid within 1 minute when adding calcium chloride TS, transfer the precipitate with the glass filter into a beaker, and add water to submerge the glass filter. Add 3 mL of sulfuric acid, warm at 70 to 80 ℃, and titrate with 0.02 mol/L potassium permanganate VS until a pale red color persists for 30 seconds; the amount of calcium (Ca: 40.08) is NMT 0.05%.

Each mL of 0.02 mol/L potassium permanganate VS
= 2.0039 mg of Ca

(13) ***Arsenic***—Dissolve 1.0 g of Lithium Carbonate in 2 mL of water and 3 mL of hydrochloric acid, use this solution as the test solution, and perform the test (NMT 2 ppm).

Loss on drying NMT 0.5% (1 g, 105 ℃, 3 hours).

Assay Weigh accurately 1 g of Lithium Carbonate, previously dried, add exactly 100 mL of water and 50 mL of 0.5 mol/L sulfuric acid, and remove carbon dioxide by gently boiling. After cooling, titrate excess sulfuric acid with 0.5 mol/L sodium hydroxide VS. However, the endpoint of the titration is when the red color of this solution turns yellow (indicator: 3 drops of methyl red TS). Perform a blank test in the same manner.

Each mL of 0.5 mol/L sulfuric acid VS
= 36.945 mg of Li_2CO_3

Packaging and storage Preserve in well-closed containers.

Lithium Carbonate Capsules
탄산리튬 캡슐

Lithium Carbonate Capsules contain NLT 95.0% and NMT 105.0% of the labeled amount of lithium carbonate (Li_2CO_3 : 73.89).

Method of preparation Prepare as directed under Capsules, with Lithium Carbonate.

Identification Weigh the contents of Lithium Carbonate Capsules as directed under the Identification (2) of Lithium Carbonate.

Dissolution Perform the test with 1 capsule of Pentobarbital Sodium Capsules at 100 revolutions per minute according to Method 1, using 900 mL of water as the dissolution medium. Take 900 mL of the dissolved solution 30 minutes after starting the test, add water to make 1000 mL, and filter. Transfer 20 mL of the filtrates to a volumetric flask, add 500 mL of water, 1 drop of hydrochlroric acid and 20 mL of a suitable surfactant solution and mix. Add water to this solution to make exactly 1000 mL and use this solution as the test solution. Perform the test as directed under the Assay.

It meets the requirements if the dissolution rate of Lithium Carbonate Capsules in 30 minutes is NLT 80%.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the contents in NLT 20 capsules of Lithium Carbonate Capsules. Weigh accurately a portion of the content, equivalent to about 0.6 g of lithium carbonate (Li_2CO_3) in a volumetric flask, add 40 mL of water and 5 mL of hydrochloric acid and shake until the solid is well disintegrated. Dilute with water to make exactly 1000 mL and filter. Pipet 10 mL of the filtrates, add 800 mL of water, 20 mL of the surfactant solution, and water to make exactly 1000 mL, and use this solution as the test solution. Perform the test as directed under the Assay of Lithium Carbonate Tablets.

$$\text{Amount (mg) of lithium carbonate } (Li_2CO_3) = \text{Amount (mg) of lithium carbonate RS} \times \frac{P_T}{P_S} \times 20$$

Packaging and storage Preserve in well-closed containers.

Lithium Carbonate Tablets
탄산리튬 정

Lithium Carbonate Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of lithium carbonate (Li_2CO_3 : 73.89).

Method of preparation Prepare as directed under Tablets, with Lithium Carbonate.

Identification Perform the test according to the Identification of Lithium Carbonate.

Dissolution Perform the test with 1 tablet of Lithium Carbonate Tablets at 100 revolutions per minute according to Method 1 under the Dissolution, using 900 mL of water as the dissolution medium. Take 900 mL of the dissolved solution 30 minutes after starting the test, add water to make 1000 mL, and filter. Pipet 10 mL of the filtrate, add 500 mL of water, 1 drop of hydrochloric acid and 20 mL of an appropriate surfactant solution, mix, and add water to make exactly 1000 mL. Use this solution as the test solution. Perform the test as directed under the Assay below.
Meets the requirements if the dissolution rate of Lithium Carbonate Tablets in 30 minutes is NLT 80%.

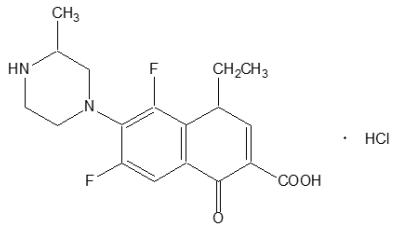
Uniformity of dosage units It has to Meets the requirements.

Assay Weigh accurately NLT 20 Lithium Carbonate Tablets and powder them. Weigh accurately an amount, equivalent to about 0.6 g of lithium carbonate (Li_2CO_3), add 40 mL of water and 5 mL of hydrochloric acid, shake to dissolve, and add water to make exactly 1000 mL. Filter, pipet 10 mL of the filtrate, add 800 mL of water and 20 mL of an appropriate surfactant solution, add water to make exactly 1000 mL, and use this solution as the test solution. Separately, weigh accurately 30 mg of lithium carbonate RS, previously dried at 200 ℃ for 4 hour, add 20 mL of water and 0.5 mL of hydrochloric acid, shake to dissolve, and add water to make exactly 100 mL. Pipet 20 mL of this solution, add 800 mL of water and 20 mL of an appropriate surfactant solution, add water to make exactly 1000 mL and use this solution as the standard solution. Determine the luminescence intensities, P_T and P_S, of the test solution and the standard solution, respectively, at the wavelength of 671 nm, using a flame photometer.

$$\text{Amount (mg) of lithium carbonate } (Li_2CO_3) = \text{Amount (mg) of lithium carbonate RS} \times \frac{P_T}{P_S} \times 20$$

Packaging and storage Preserve in well-closed containers.

Lomefloxacin Hydrochloride
로메플록사신염산염



$C_{17}H_{19}F_2N_3O_3 \cdot HCl$: 387.81
1-Ethyl-6,8-difluoro-1,4-dihydro-7-(3-methyl-1-piperazinyl)-4-oxo-3-quinolinecarboxylic acid hydrochloride (1:1), [*98079-52-8*]

Lomefloxacin Hydrochloride, when dried, contains NLT 98.5% and NMT 101.0% of lomefloxacin hydrochloride ($C_{17}H_{19}F_2N_3O_3 \cdot HCl$).

Description Lomefloxacin Hydrochloride occurs as a white to light yellowish white crystalline powder.
It is slightly soluble in water or ethylene glycol, very slightly soluble in methanol and practically insoluble in ethanol(95).
It dissolves in sodium hydroxide TS.
A solution of sodium hydroxide TS of Lomefloxacin Hydrochloride (1 in 40) shows no optical rotation.

Melting point—About 310 ℃ (with decomposition, after drying)

Identification (1) Add 20 mg of Lomefloxacin Hydrochloride in 2 mL of water, heat on a steam bath to dissolve, cool, and add 1 drop of ferric chloride TS; the resulting solution exhibits a red color.

(2) Take 5 mL of an aqueous solution of Lomefloxacin Hydrochloride (1 in 500) and add 1 mL of reinecke salt TS; a pale red precipitate is formed.

(3) Weigh 10 mg of Lomefloxacin Hydrochloride, decompose as directed under the Oxygen Flask Combustion using a mixture of 0.5 mL of 0.01 mol/L sodium hydroxide TS and 20 mL of water as an absorbent, shake well to mix, and absorb the combustion gas; the resulting solution responds to the Qualitative Analysis for fluoride.

(4) Dissolve 10 mg of Lomefloxacin Hydrochloride in 10 mL of sodium hydroxide TS and add water to make 100 mL. Pipet 2.0 mL of this solution and add water to make 20 mL. Determine the absorption spectrum of this solution as directed under the Ultraviolet-visible Spectroscopy; it exhibits maxima between 281 nm and 285 nm and between 325 nm and 329 nm, a minimum between 305 nm and 309 nm and absorption at the wavelengths between 330 nm and 340 nm.

(5) Determine the infrared spectra of Lomefloxacin Hydrochloride, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; it exhibits absorption at the wavenumbers of about 3060 cm^{-1}, 2700 cm^{-1}, 2460 cm^{-1}, 1725 cm^{-1}, 1615 cm^{-1} and 808 cm^{-1}.

(6) Dissolve 1 g of Lomefloxacin Hydrochloride in 10 mL of sodium hydroxide TS, add dilute nitric acid to make it acidic, and filter. The filtrate responds to the Qualitative Analysis for chloride.

pH Dissolve 50 mg of Lomefloxacin Hydrochloride in 10 mL of water; the pH of this solution is between 3.0 and 5.0.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Lomefloxacin Hydrochloride under Method 4 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Arsenic***—Proceed with 1.0 g of Lomefloxacin Hydrochloride under Method 4 and perform the test. However, dissolve the residue after incineration in 10 mL of dilute hydrochloric acid and use this solution as the test solution (NMT 2 ppm).

(3) ***Related substances***—Dissolve 10 mg of Lomefloxacin Hydrochloride in 50 mL of a mixture of phosphate buffer solution, pH 2.5 and methanol (3 : 2), and use this solution as the test solution. Pipet 1 mL of this solution, add a mixture of phosphate buffer solution, pH 2.5 and methanol (3 : 2) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 7 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak area of each solution as directed in the automatic integration; the sum of peak area other than lomefloxacin obtained from the test solution is not greater than 1/10 times of the peak area of lomefloxacin from the standard solution.

Operating conditions

Detector: An ultraviolet absorption spectrophotometer (wavelength: 280 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 ℃.

Mobile phase: Add the phosphate buffer solution, pH 2.5 to a certain amount of methanol to make 1000 mL, add 0.87 g of sodium 1-pentanesulfonate, and shake to mix. However, select the amount of methanol between 370 mL and 420 mL.

Flow rate: Adjust the flow rate so that the retention time of lomefloxacin is about 6 minutes.

Time span of measurement: About 2 times the retention time of lomefloxacin after the solvent peak.

System suitability

System performance: Dissolve 50 mg of Lomefloxacin Hydrochloride, previously dried, in 0.01 mol/L sodium hydroxide TS to make 50 mL. Pipet 5 mL of this solution and add a mixture of phosphate buffer solution, pH 2.5 and methanol (3 : 2) to make 50 mL. Pipet 10 mL of this solution, add 10 mL of a mixture of theophylline phosphate buffer solution, pH 2.5 and methanol (3 : 2) (3 in 20,000), and add the mixture of phosphate buffer solution, pH 2.5 and methanol (3 : 2) to make exactly 50 mL. Proceed with 7 μL of this solution under the above operating conditions; theophylline and lomefloxacin are eluted in this order with the resolution between these peaks being NLT 9.

Detection sensitivity: Adjust so that the peak height of lomefloxacin obtained from 7 μL of the standard solution is between 5 mm and 15 mm.

Loss on drying NMT 0.3% (0.5 g, 105 ℃, 2 hours).

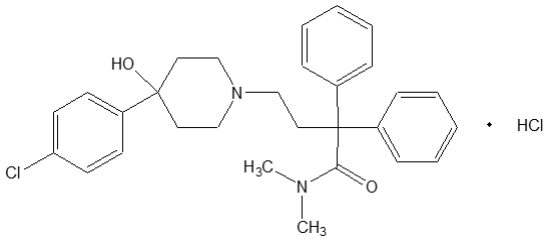
Residue on ignition NMT 0.2% (1 g, platinum crucible).

Assay Weigh accurately about 0.3 g of Lomefloxacin Hydrochloride, previously dried, add 20 mL of a mixture of methanol and ethylene glycol (1 : 1), shake well to mix, add exactly 15 mL of 0.1 mol/L perchloric acid, and heat at 100 ℃ in an oil bath for 90 minutes. After cooling, add 10 mL of methanol and 50 mL of acetonitrile, and titrate with excess perchloric acid with 0.1 mol/L sodium acetate VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 38.781 mg of $C_{17}H_{19}F_2N_3O_3 \cdot HCl$

Packaging and storage Preserve in tight containers.

Loperamide Hydrochloride
로페라미드염산염



$C_{29}H_{33}ClN_2O_2 \cdot HCl$: 513.50

4-[4-(4-Chlorophenyl)-4-hydroxypiperidin-1-yl]-*N*,*N*-dimethyl-2,2-diphenylbutanamide hydrochloride [*34552-83-5*]

Loperamide Hydrochloride contains NLT 98.0% and NMT 102.0% of loperamide hydrochloride ($C_{29}H_{33}ClN_2O_2 \cdot HCl$), calculated on the dried basis.

Description Loperamide Hydrochloride occurs as a white to pale yellow powder.
It is freely soluble in methanol, 2-propanol and chloroform, and slightly soluble in water or dilute acid.

Melting point—About 225 °C (with decomposition).

Identification (1) Weigh accurately about 40 mg each of Loperamide Hydrochloride and Loperamide Hydrochlo-

ride RS, put each into 100-mL volumetric flasks, dissolve in about 50 mL of 2-propanol, and add 0.1 mol/L hydrochloric acid. And then add 2-propanol to fill to the height of the gauge line. Determine the absorption spectra of these solutions as directed under the Ultraviolet-visible Spectroscopy: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Loperamide Hydrochloride and Loperamide Hydrochloride RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy: both spectra exhibit similar intensities of absorption at the same wavenumbers.

Purity (1) ***Chloride content***—Weigh accurately about 13 mg of Loperamide Hydrochloride and perform the test as directed under the Oxygen Flask Combustion. Use a mixture of 10 mL of 0.02 mol/L sodium hydroxide and 2 drops of 30% hydrogen peroxide as an absorbent. When the combustion is complete, wash the inner wall etc. with 50 mL of 2-propanol. Add 4 mL of 0.1 mol/L nitric acid and titrate with 0.01 mol/L mercuric nitrate VS (indicator: diphenylcarbazone TS). The chloride content is NLT 13.52% and NMT 14.20%.

Each mL of 0.01 mol/L mercuric nitrate VS
= 0.3545 mg of Cl

(2) ***Related Substances***—Dissolve Loperamide Hydrochloride and Loperamide Hydrochloride RS in chloroform to make solutions containing 10 mg per mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with these solutions as directed under the Thin Layer Chromatography. Spot 10 μL each of these solutions to the thin-layer chromatographic plate made of silica gel for thin-layer chromatography, develop the plate with a mixture of chloroform, methanol and formic acid (85 : 10 : 5) to a distance of about 15 cm, and air-dry the plate. Examine the plate under iodine steam; R_f value, color and intensity of the principal spot obtained from the test solution are the same as those from the standard solution and no other spots are observed.

(3) ***Heavy metals***—Proceed with 1.0 g of Loperamide Hydrochloride according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

Loss on drying NMT 0.5% (1 g, in vacuum, 80 ℃, 4 hours).

Residue on ignition NMT 0.2% (1 g).

Assay Weigh accurately about 0.4 g of Loperamide Hydrochloride, previously dried, dissolve in 50 mL of ethanol, add 5.0 mL of hydrochloric acid TS, and titrate with 0.1 mol/L sodium hydroxide VS (potentiometric titration under the Titrimetry). Read the consumption between the equivalence point I and the equivalence point 2.

Each mL of 0.1 mol/L sodium hydroxide VS
= 51.35 mg of $C_{29}H_{33}ClN_2O_2 \cdot HCl$

Packaging and storage Preserve in tight containers.

Loperamide Hydrochloride Capsules
로페라미드염산염 캡슐

Loperamide Hydrochloride Capsules contain NLT 90.0% and NMT 110.0% of the labeled amount of Loperamide Hydrochloride ($C_{29}H_{33}ClN_2O_2 \cdot HCl$: 513.51).

Method of preparation Prepare as directed under Capsules, with Loperamide Hydrochloride.

Identification (1) Weigh an amount of Loperamide Hydrochloride Capsules equivalent to about 10 mg of Loperamide Hydrochloride according to the labeled amount, dissolve in 10 mL of methanol, shake for 5 minutes, and filter. Use this solution as the test solution Separately, dissolve Loperamide Hydrochloride RS in methanol to obtain a solution having known concentration of 10 mg per mL and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL of the test solution and 1 μL of the standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate using a mixture of chloroform, methanol and formic acid (85 : 10 : 5) as the developing solvent to a distance of about 15 cm, dry at 40 to 60 ℃ and expose to fumes of iodine. Examine the plate under the iodine fume; the R_f values of the spots obtained from the test solution and the standard solution are the same.

(2) The retention times of the major peaks obtained from the test solution and the standard solution obtained under the Assay are the same.

Dissolution Perform the test with 1 capsule of Loperamide Hydrochloride Capsules at 100 revolutions per minute according to Method 1 under the Dissolution test. Mix 200 mL of 1 mol/L acetic acid TS and 600 mL of water, adjust the pH to 4.70 ± 0.05 with 1 mol/L sodium hydroxide TS and dilute with water to make 1000 mL. Take the dissolved solution after 30 minutes from the start of the dissolution test and use the filtrate as the test solution. Separately, weigh Loperamide Hydrochloride RS, previously dried at 80 ℃ for 4 hours in vacuum and dissolve at the same concentration as the test solution and use this solution as the standard solution. Perform the test with 50 μL each of the test solution and the standard solution as directed under the Assay.
It meets the requirements if the dissolution rate of Loperamide Hydrochloride Capsules in 30 minutes is NLT 80%.

Uniformity of dosage units It meets the requirements when the procedure for content uniformity is performed as directed under the Assay.

Assay Weigh accurately the contents of NLT 20 capsules of Loperamide Hydrochloride Capsules. Weigh accurately an amount equivalent to about 10 mg of Loperamide Hydrochloride in diluted methanol (7 in 10) to make exactly 50 mL and treat under the supersonic wave for 15 minutes and filter. Discard the first 10 mL of the filtrate and pipet 10.0 mL of the filtrate, add 4.0 mL of the internal standard solution and diluted methanol (7 in 10) to make exactly 50 mL and use this solution as the test solution. Separately, take accurately about 10 mg of Loperamide Hydrochloride RS, previously dried for 4 hours at 80 ℃ in vacuum and dissolve in diluted methanol (7 in 10) to make exactly 50 mL. Pipet 10.0 mL of this solution, add 4.0 mL of the internal standard solution and diluted methanol (7 in 10) to make exactly 50 mL and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography.

$$\text{Amount (mg) of Loperamide Hydrochloride } (C_{29}H_{33}ClN_2O_2 \cdot HCl) = \text{Amount (mg) of loperamide Hydrochloride RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—Weigh 15 mg of propyl p-hydroxybenzoate, add the diluted methanol (7 in 10), and dissolve to make 50 mL.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 214 nm).

Column: A stainless steel column about 4 mm internal diameter and 15 to 30 cm length, packed with octadecylsilanized silica gel for liquid chromatography (5 to 10 μm in particle diameter).

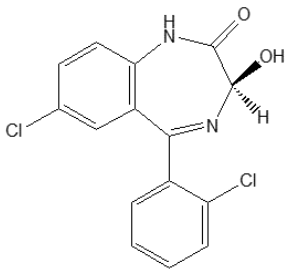
Mobile phase: Dissolve about 1.8 g of anhydrous monosodium phosphate in 300 mL of water, add 700 mL of methanol and adjust the pH to 7.0 by adding phosphoric acid (1 in 100).

Flow rate: Adjust the flow rate so that the retention time of loperamide is about 9 minutes.

Column selection: Proceed with 10 μL of the standard solution according to the above conditions; the internal standard and loperamide are eluted in this order with the resolution being NLT 3.0.

Packaging and storage Preserve in tight containers.

Lorazepam
로라제팜



and enantiomer

$C_{15}H_{10}Cl_2N_2O_2$: 321.16

(*RS*)-7-Chloro-5-(2-chlorophenyl)-3-hydroxy-1,3-dihydro-1,4-benzodiazepin-2-one [*846-49-1*]

Lorazepam, when dried, contains NLT 98.5% and NMT 101.0% of lorazepam ($C_{15}H_{10}Cl_2N_2O_2$).

Description Lorazepam occurs as a white crystalline powder and is odorless.
It is sparingly soluble in ethanol(95) or in acetone, slightly soluble in ether and practically insoluble in water.
It is gradually colored by light.

Identification (1) Take 20 mg of Lorazepam, add 15 mL of dilute hydrochloric acid, boil for 5 minutes and cool; the resulting solution responds to the Qualitative Analysis for primary aromatic amines.

(2) Determine the absorption spectra of ethanol(95) solutions of Lorazepam and Lorazepam RS (1 in 200000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared spectra of Lorazepam and Lorazepam RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(4) Perform the Flame Coloration 2) with Lorazepam; it exhibits a green color.

Absorbance $E_{1cm}^{1\%}$ (229 nm): Between 1080 and 1126 (1 mg after drying, ethanol(95), 200 mL).

Purity (1) ***Chloride***—Take 1.0 g of Lorazepam, add 50 mL of water, and allow to stand for 1 hour with occasional shaking, and filter. Pipet 25 mL of the filtrate, add 6 mL of dilute nitric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 0.20 mL of 0.01 mol/L hydrochloric acid (NMT 0.014%).

(2) ***Heavy metals***—Proceed with about 1.0 g of Lorazepam as directed under Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Arsenic***—Proceed with 1.0 g of Lorazepam as directed under Method 3 and perform the test (NMT 2

ppm).

(4) ***Related substances***—Dissolve about 0.10 g of Lorazepam in 20 mL of ethanol(95) and use this solution as the test solution. Pipet 1 mL of this solution, add ethanol(95) to make exactly 100 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of chloroform, 1,4-Dioxane and acetic acid(100) (91 : 51 : 4) as the developing solvent to a distance of about 15 cm, and air-dry the plate. Observe the plate under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 0.5% (1 g, in vacuum, 105 ℃, 3 hours).

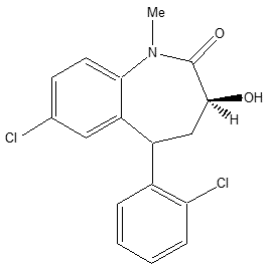
Residue on ignition NMT 0.3% (1 g).

Assay Weigh accurately about 0.4 g of Lorazepam, previously dried, dissolve in 50 mL of acetone, and titrate with 0.1 mol/L tetrabutylammonium hydroxide VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L tetrabutylammonium hydroxide VS
= 32.116 mg of $C_{15}H_{10}Cl_2N_2O_2$

Packaging and storage Preserve in light-resistant, tight containers.

Lormetazepam
로르메타제팜



and enantiomer

$C_{16}H_{12}Cl_2N_2O_2$: 335.19

7-Chloro-5-(2-chlorophenyl)-3-hydroxy-1-methyl-1*H*-benzo[1,4]diazepin-2(3*H*)-one [*848-75-9*]

Lormetazepam contains NLT 99.0% and NMT 101.0% of lometrazepam ($C_{16}H_{12}Cl_2N_2O_2$: 335.19), calculated on the dried basis.

Description Lormetazepam occurs as a white crystalline powder.

It is soluble in methanol or in ethanol and practically insoluble in water.

Identification (1) Determine the infrared spectra of Lormetazepam and Lormetazepam RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) The retention time of the peak obtained from the test solution (2) corresponds to that from the standard solution in the test for related substances.

Purity ***Related substances***—Weigh accurately about 0.250 g of Lormetazepam, add 70% methanol to make exactly 100 mL, and use this solution as the test solution (1). Pipet 1 mL of this solution, add 70% methanol to make exactly 100 mL, pipet 10 mL of this solution again to make 50 mL, and use this solution as the test solution (2). Pipet 25 mL of the test solution (2), add 70% methanol to make exactly 50 mL, and use this solution as the test solution (3). Separately, weigh exactly 5 mg of Lormetazepam RS and dissolve in 70% methanol to make exactly 100 mL. Pipet 5 mL of this solution, add 70% methanol to make 50 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions and determine the area of the peaks from these solutions by the automatic integration method; the peak area other than the major peak obtained from the test solution (1) is not greater than the area of the major peak obtained from the test solution (2) (0.2%), the number of peaks having the area greater than the area of the major peak from the test solution (3) is NMT 2. The total area of these peaks is not greater than 2.5 times the area of the major peak area from the test solution (2) (0.5%).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 230 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 20 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of phosphate buffer solution and methanol (52 : 48).

Flow rate: 2 mL/min

System suitability

System performance: Weigh 5 mg of Lormetazepam RS, dissolve in 70% methanol to make 100 mL, pipet 5 mL of this solution and add 70% methanol to make 50 mL. Dissolve 25 mL of this solution and lorazepam in 70% methanol, take 25 mL of a solution containing 5 μg per mL, and mix. Proceed with 10 μL of this solution according to the above conditions; the resolution between two major peaks is NLT 4.

Phosphate buffer solution—Weigh 4.91 g of sodium

dihydrogen phosphate and 0.633 g of sodium monohydrogen phosphate in water to make 1000 mL.

Loss on drying NMT 1.0% (1 g, 105 ℃, 3 hours).

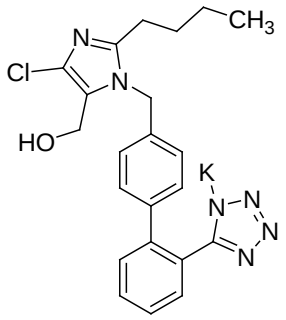
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.5 g of Lormetazepam, dissolve in 50 mL of nitroethane and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 33.52 mg of $C_{16}H_{12}Cl_2N_2O_2$

Packaging and storage Preserve in light-resistant, tight containers.

Losartan Potassium
로사르탄칼륨



$C_{22}H_{22}ClKN_6O$: 461.00
Potassium [2-butyl-5-chloro-3-[[4-[2-(1,2,3-triaza-4-azanidacyclopenta-2,5-dien-5-yl) phenyl]phenyl]methyl]imidazol-4-yl]methanol [*124750-99-8*]

Losartan Potassium contains NLT 98.5% and NMT 101.0% of losartan potassium ($C_{22}H_{22}ClKN_6O$), calculated on the anhydrous basis.

Description Losartan Potassium occurs as a white crystalline powder.
It is very soluble in water and freely soluble in methanol or ethanol(99.5).

Identification (1) Determine the infrared spectra of Losartan Potassium and Losartan Potassium RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers. If any difference appears between the two spectra, dissolve each solution in methanol, evaporate to dryness, and perform the test in the same manner.
Losartan Potassium responds to the Qualitative Analysis (1) for potassium salt.

Purity (1) ***Heavy metals***—Proceed with 2.0 g of Losartan Potassium according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Related substances***—Dissolve 30 mg of Losartan Potassium in 100 mL of methanol and use this solution as the test solution. Pipet 1 mL of this solution, add methanol to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak area of each solution as directed in the automatic integration; the peak area other than the solvent peak and losartan in the test solution is not greater than 1/10 of the peak area of losartan in the standard solution. Also, the total area of the peaks other than losartan in the test solution is not greater than 3/ 10 of the peak area of losartan in the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

Column: A stainless steel column 4.0 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: Control the mixing ratio of mobile phase A and mobile phase B in stages or gradient elution as follows.

Mobile phase A: Diluted phosphoric acid (1 in 1000)

Mobile phase B: Acetonitrile

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 - 25	75 → 10	25 → 90
25 - 35	10	90

Flow rate: 1.0 mL/min

System suitability

Test for required detectability: Pipet 1 mL of the standard solution and add methanol to make exactly 10 mL. Confirm that the peak area of losartan obtained from 10 μL of this solution is equivalent to 7% to 13% of peak area of losartan in the standard solution.

System performance: Proceed with 10 μL of the standard solution according to the above operating conditions; the number of theoretical plate of losartan peak are NLT 10000 plates with the symmetry factor being NMT 1.3.

System repeatability: Perform the test six times with 10 μL of the standard solution according to the above operating conditions; the relative standard deviation of the peak area of losartan is NMT 2.0%.

Time span of measurement: For 35 minutes after injecting the test solution.

Water NMT 0.5% (0.25 g, volumetric titration, direct titration).

Assay Weigh accurately about 25 mg each of Losartan Potassium and Losartan Potassium RS (water previously measured), dissolve in methanol to make exactly 100 mL, and use these solutions as the test solution and the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions, determine the peak areas, A_T and A_S, of losartan in the test solution and the standard solution, respectively.

Amount (mg) of losartan potassium ($C_{22}H_{22}ClKN_6O$)
= Amount (mg) of losartan Potassium RS, calculated on the anhydrous basis $\times \frac{A_T}{A_S}$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.0 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 35 °C.

Mobile phase: A mixture of diluted phosphoric acid (1 in 1000) and acetonitrile (3 : 2).

Flow rate: Adjust the flow rate so that the retention time of losartan is about 6 minutes.

System suitability

System performance: Proceed with 10 μL of the standard solution according to the above operating conditions; the number of theoretical plates of losartan peak is NLT 5500 plates with the symmetry factor being NMT 1.4.

System repeatability: Repeat the test six times with 10 μL of the standard solution according to the above operating conditions; the relative standard deviation of the peak area of losartan is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Losartan Potassium Tablets
로사르탄칼륨 정

Losartan Potassium Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of losartan potassium ($C_{22}H_{22}ClKN_6O$: 461.01).

Method of preparation Prepare as directed under Tablets, with Losartan Potassium.

Identification Proceed as directed under the Assay described; the test solution shows the peak at the same retention time as the standard solution.

Dissolution Perform the test with 1 tablet of Losartan Potassium Tablets at 50 revolutions per minute according to Method 2 under the Dissolution, using 900 mL of water as the dissolution medium. Take the dissolved solution after 45 minutes from the start of the test, and filter. Discard the first 10 mL of the filtrate, take exactly V mL of the next filtrate, add water so that 1 mL contains about 25 μg of losartan potassium according to the labeled amount to make exactly V' mL, and use this solution as the test solution. Separately, weigh accurately about 50 mg of losartan potassium RS, dissolve in water to make 100 mL, and pipet 5 mL of this solution. Add water to make 100 mL, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at the wavelength of 256 nm as directed under the Ultraviolet-visible Spectroscopy. Meets the requirements if the dissolution rate of Losartan Potassium Tablets in 45 minutes is NLT 85%.

Dissolution rate (%) with respect to the labeled amount of losartan potassium ($C_{22}H_{22}ClKN_6O$)

$$= W_S \times \frac{A_T}{A_S} \times \frac{V'}{V} \times \frac{1}{C} \times 45$$

W_S: Amount of losartan potassium RS (mg)

C: Labeled amount (mg) of losartan potassium ($C_{22}H_{22}ClKN_6O$) in 1 tablet

Purity ***Related substances*—**Weigh accurately the mass of NLT 20 tablets of Losartan Potassium Tablets, and powder them. Weigh an amount equivalent to 10 tablets of Losartan Potassium Tablets, transfer to a 2000-mL volumetric flask, and add 0.01 mol/L phosphate buffer solution, pH 8.0. Shake until completely dispersed, fill 0.01 mol/L phosphate buffer solution, pH 8.0, to the gauge line, and filter. Pipet 25.0 mL of this solution, add 0.01 mol/L phosphate buffer solution, pH 8.0, to make 50 mL, and use this solution as the test solution. Separately, weigh accurately about 40 mg of losartan potassium RS, and add 0.01 mol/L phosphate buffer solution, pH 8.0, to make exactly 100 mL; pipet 25.0 mL of this solution, and add 0.01 mol/L phosphate buffer solution, pH 8.0, to make exactly 200 mL; pipet 5.0 mL of this solution, and add 0.01 mol/L phosphate buffer solution, pH 8.0, to make exactly 100 mL. Perform the test with exactly 20 μL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas A_T and A_S of the related substances and the standard solution from the test solution; the amount of each related substance is NMT 0.2%, and the total amount of related substances is NMT 1.0%.

Operating conditions

Detector: An ultraviolet absorption spectrophotometer (wavelength: 230 nm).

Column: A stainless steel column of about 4 mm in internal diameter and 15 cm in length, packed with octa-

decylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 35 °C.

Mobile phase: Flow solution B from 0% to 100% from the beginning to 35 minutes, flow solution B at 0% for 5 minutes, and maintain solution B at 0% for at least 10 minutes before injection.

Solution A: A mixture of acetonitrile, water and phosphoric acid (50 : 950 : 1).

Solution B: A mixture of acetonitrile, water and phosphoric acid (900 : 100 : 1).

Flow rate: 1.0 mL/min

Time span of measurement: About 3 times the retention time of losartan potassium after the solvent peak.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 tables of Losartan Potassium Tablets, and powder them. Weigh accurately an amount equivalent to about 25 mg of losartan potassium, transfer to a 500-mL volumetric flask, and dissolve in 0.01 mol/L phosphate buffer solution, pH 8.0 to make 500 mL. Centrifuge this solution, and use the clear supernatant as the test solution. Separately, weigh accurately about 25 mg of losartan potassium RS, dissolve in 0.01 mol/L phosphate buffer solution, pH 8.0 to make 500 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas of losartan potassium from each solution, A_T and A_S, respectively.

$$\text{Amount (mg) of losartan potassium } (C_{22}H_{22}ClKN_6O) = \text{Amount (mg) of losartan potassium RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption spectrophotometer (wavelength: 230 nm).

Column: A stainless steel column about 4 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 35 °C.

Mobile phase: A mixture of acetonitrile and 0.01 mol/L phosphate buffer solution, pH 2.5 (40 : 60).

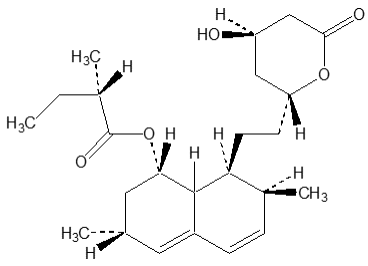
Flow rate: 1.0 mL/min

0.01 mol/L phosphate buffer solution, pH 8.0—Dilute phosphate buffer solution, pH 8.0, 5 times, and add 0.2 mol/L sodium hydroxide to adjust pH to 8.0.

0.01 mol/L phosphate buffer solution, pH 2.5—Dissolve 1.65 g of sodium dihydrogen phosphate dihydrate in 1000 mL of water, and add diluted phosphoric acid (1 in 10) to adjust the pH to 2.5.

Packaging and storage Preserve in tight containers.

Lovastatin
로바스타틴



$C_{24}H_{36}O_5$: 404.54

[(1*S*,3*R*,7*S*,8*S*,8a*R*)-8-[2-[(2*R*,4*R*)-4-Hydroxy-6-oxooxan-2-yl]ethyl]-3,7-dimethyl-1,2,3,7,8,8a-hexahydronaphthalen-1-yl](2*S*)-2-methyl butanoate [*75330-75-5*]

Lovastatin contains NLT 98.5% and NMT 101.0% of lovastatin ($C_{24}H_{36}O_5$), calculated on the dried basis.

Description Lovastatin occurs as a white crystalline powder.
It is soluble in acetone, sparingly soluble in ethanol(95) and practically insoluble in water.

Identification (1) Dissolve 10 mg each of Lovastatin and Lovastatin RS in acetonitrile to make 100 mL. Pipet 5 mL of these solutions, add acetonitrile to make exactly 50 mL, and use these solutions as the test solution and the standard solution. Determine the absorption spectra of these solutions as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Lovastatin and Lovastatin RS as directed in the paste method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Optical rotation $[\alpha]_D^{25}$: Between +324° and +338° (0.125 g, after drying, acetonitrile, 25 mL, 100 mm).

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Lovastatin and perform the test according to Method 2. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Lovastatin related substance I***—Weigh accurately about 25 mg of Lovastatin, dissolve in acetonitrile to make exactly 25 mL, and use this solution as the test solution. Separately, weigh accurately about 10.0 mg of Lovastatin RS and dissolve in acetonitrile to make 100 mL. Pipet 2.0 mL of this solution, add acetonitrile to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, determine the peak area of Lovastatin and lovastatin related substance I (dihydrolovastatin), and calculate the amount of lovastatin related substances I (NMT

1.0%).

$$\text{Content (\%) of lovastatin related substance I} = 2.5 \times F \times \frac{C}{W} \times \frac{A_T}{A_S}$$

F: Correction factor for lovastatin related substance I (1.6).

C: Concentration (μg/mL) of lovastatin RS in the standard solution

W: Amount (mg) of lovastatin in the test solution

A_T: Peak area of lovastatin related substance I obtained from the test solution

A_S: Peak area of lovastatin obtained from the standard solution

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 200 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octylsilane silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 ℃.

Flow rate: 1.5 mL/min

Mobile phase: A mixture of acetonitrile and 0.01 mol/L phosphoric acid (13 : 7).

System suitability

System performance: Dissolve 10 mg each of Lovastatin RS and lovastatin related substance I RS in acetonitrile to make 100 mL. Pipet 2.0 mL of this solution and add acetonitrile to make 100 mL. Proceed with 10 μL of this solution according to the above operating conditions; the relative retention times are about 1.0 for lovastatin and 1.3 for lovastatin related substance I with the resolution between these peaks being NLT 6.0.

System repeatability: Perform the test six times with 10 μL each of the standard solution according to the above operating conditions, the relative standard deviation of the peak area for lovastatin is NMT 5.0%.

(3) ***Other related substances***—Weigh accurately about 25 mg of Lovastatin, dissolve in acetonitrile to make exactly 25 mL, and use this solution as the test solution. Separately, weigh accurately about 10 mg of Lovastatin RS and dissolve in acetonitrile to make exactly 100 mL. Pipet 2 mL of this solution, add acetonitrile to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, determine all the peak areas by automatic integration method, and calculate the amount of related substances;. The amount of each related substance is NMT 0.2%, and the total amount of related substances is NMT 1.0%. Exclude any related substances with the amount NMT 0.04%.

$$\text{Content (\%) of related substances} = 2.5 \times F \times \frac{C}{W} \times \frac{A_T}{A_S}$$

F: Correction factor for each related substance (1.4 for related substances with the relative retention time of 0.73; 1.0 for any other related substances)

C: Concentration (μg/mL) of lovastatin RS in the standard solution

W: Amount (mg) of lovastatin in the test solution

A_T: Peak area of each related substance obtained from the test solution

A_S: Peak area of lovastatin obtained from the standard solution

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 238 nm).

Column: A stainless steel column about 4.0 mm in internal diameter and about 12.5 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (4 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Flow rate: 1.5 mL/min

Mobile phase: Use mobile phases A and B to control the step or gradient elution as follows.

Mobile phase A: Adjust the pH to 4.0 by adding 1 mol/L sodium hydroxide TS to 0.001 mol/L phosphoric acid.

Mobile phase B: Acetonitrile

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 - 2	60	40
2 - 5	60 → 45	40 → 55
5 - 8	45	55
8 - 16	45 → 10	55 → 90
16 - 25	10	90
25 - 27	10 → 60	90 → 40
27 - 35	60	40

System suitability

System performance: Weigh 10.0 mg each of Lovastatin RS and compactin, dissolve in acetonitrile to make 100 mL, take 2.0 mL of this solution, and add acetonitrile to make 100 mL. Proceed with 10 μL of this solution according to the above operating conditions; the relative retention times are about 1.0 for lovastatin and 0.85 for compactin with the resolution between these peaks being NLT 3.5.

System repeatability: Repeat the test six times with 10 μL each of the standard solution according to the above operating conditions; the relative standard deviation of the peak area for lovastatin is NMT 5.0%

Loss on drying NMT 0.3% (1 g, vacuum, 60 ℃, 6 hours).

Residue on ignition NMT 0.2% (1 g).

Assay Weigh accurately about 30 mg each of Lovastatin and lovastatin RS, dissolve in acetonitrile to make exactly 100 mL, and use these solutions as the test solution and the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the major peak areas A_T and A_S, from the test solution and the standard solution.

$$\text{Amount (mg) of lovastatin } (C_{24}H_{36}O_5) = \text{Amount (mg) of lovastatin RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 238 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octylsilane silica gel for liquid chromatography (5 μm in particle diameter).

Flow rate: 1.5 mL/min

Mobile phase: A mixture of acetonitrile and 0.1% phosphoric acid (65 : 35).

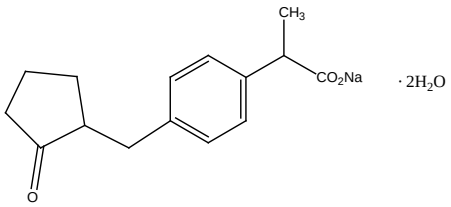
System suitability

System performance: Proceed with 10 μL of the standard solution according to the above operating conditions; the number of theoretical plate is NLT 3000 with the symmetry factor being NMT 1.4.

System repeatability: Repeat the test five times with 10 μL each of the standard solution according to the above operating conditions; the relative standard deviation of the peak areas is NMT 1.0%.

Packaging and storage Preserve in tight containers under nitrogen in a cold place.

Loxoprofen Sodium Hydrate
록소프로펜나트륨수화물



$C_{15}H_{17}NaO_3 \cdot 2H_2O$: 304.31

Sodium (*RS*)-2-[4-[(2-oxocyclopentyl)methyl]phenyl] propanoate dihydrate [*80382-23-6*]

Loxoprofen Sodium Hydrate contains NLT 98.5% and NMT 101.0% of loxoprofen sodium ($C_{15}H_{17}NaO_3$: 268.28), calculated on the anhydrous basis.

Description Loxoprofen Sodium Hydrate occurs as white to yellow crystals or a crystalline powder.

It is very soluble in water or methanol, soluble in ethanol(95) and practically insoluble in ether.

An aqueous solution of Loxoprofen Sodium Hydrate (1 in 20) shows no optical rotation.

Dissolve 1.0 g of Loxoprofen Sodium Hydrate in 20 mL of freshly boiled and cooled water; the pH of this solution is between 6.5 and 8.5.

Identification (1) Determine the absorption spectra of Loxoprofen Sodium Hydrate and Loxoprofen Sodium Hydrate RS (1 in 55000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Loxoprofen Sodium Hydrate and Loxoprofen Sodium Hydrate RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) An aqueous solution of Loxoprofen Sodium Hydrate (1 in 10) responds to the Qualitative Analysis for sodium salt.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Loxoprofen Sodium Hydrate in 10 mL of water; the solution is clear and is colorless to pale yellow color. The color is not more intense than that of the diluted Matching Fluids A (1 in 2).

(2) ***Heavy metals***—Proceed with about 2.0 g of Loxoprofen Sodium Hydrate according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Related substances***—Dissolve about 1.0 g of Loxoprofen Sodium Hydrate in 10 mL of methanol and use this solution as the test solution. Pipet1 mL of this solution, add methanol to make exactly 200 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of 1,2-dichloroethane and acetic acid(100) (9 : 1) to a distance of about 15 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot obtained from the test solution are not more intense than the spot from the standard solution.

Water Between 11.0% and 13.0% (0.2 g, volumetric titration, direct titration).

Assay Weigh accurately about 60 mg of Loxoprofen Sodium Hydrate and dissolve in diluted methanol (3 in 5) to make exactly 100 mL. Pipet 5 mL of this solution, add exactly 10 mL of the internal standard solution, add again diluted methanol (3 in 5) to make 100 mL, and use this solution as the standard solution. Separately, weigh accurately about 50 mg of Loxoprofen RS, previously dried in a desiccator (in vacuum, 60 ℃) for 3 hours, and dissolve in diluted methanol (3 in 5) to make exactly 100 mL. Pipet 5 mL of this solution, proceed in the same manner

as in the test solution, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the ratios, Q_T and Q_S, of the peak area of loxoprofen to that of the internal standard.

$$\text{Amount (mg) of loxoprofen } (C_{15}H_{17}NaO_3) = \text{Amount (mg) of loxoprofen RS (mg)} \times \frac{Q_T}{Q_S} \times 1.0892$$

Internal standard solution—A solution of ethyl benzoate in diluted methanol (3 in 5) (1 in 50000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 222 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: A mixture of methanol, water, acetic acid(100) and triethylamine (600 : 400 : 1 : 1).

Flow rate: Adjust the flow rate so that the retention time of loxoprofen is about 7 minutes.

System suitability

System performance: Proceed with 10 μL of the standard solution according to the above operating conditions; loxoprofen and the internal standard are eluted in this order with the resolution being NLT 10.

System repeatability: Perform the test five times with 10 μL each of the standard solution according to the above operating conditions; the relative standard deviation of the ratio of the peak area of loxoprofen to that of the internal standard is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Loxoprofen Sodium Tablets
록소프로펜나트륨 정

Loxoprofen Sodium Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of loxoprofen sodium ($C_{15}H_{17}NaO_3$: 268.29).

Method of preparation Prepare as directed under Tablets, with Loxoprofen Sodium Hydrate.

Identification Proceed as directed under the Assay described; the test solution shows the peak at the same retention time as the standard solution.

Dissolution Perform the test with 1 tablet of Loxoprofen Sodium Tablets at 100 revolutions per minute according to Method 2 under the Dissolution Test, using 900 mL of water as the dissolution solution. Take the dissolved solution 30 minutes after the start of the Dissolution and filter it. Discard the first 10 mL of the filtrate, take exactly V mL of the next filtrate, add the first solution in the Dissolution so that 1 mL contains about 60 μg of loxoprofen sodium according to the labeled amount to make exactly V' mL, and use this solution as the test solution. Separately, weigh accurately about 20 mg of loxoprofen sodium RS, and dissolve in water to make 200 mL. Perform the test with 20 μL each of the test and standard solutions as directed under the Liquid Chromatography according to the following conditions. Determine the peak areas A_T and A_S of loxoprofen sodium ($C_{15}H_{17}NaO_3$) for each solution. Meets the requirements if the dissolution rate of Loxoprofen Sodium Tablets in 30 minutes is NLT 75%.

$$\text{Dissolution rate (\%) of the labeled amount of loxoprofen sodium } (C_{15}H_{17}NaO_3) = W_S \times \frac{V'}{V} \times \frac{A_T}{A_S} \times \frac{1}{C} \times 450$$

W_S: Amount (mg) of loxoprofen sodium RS

C: Labeled amount (mg) of loxoprofen sodium ($C_{15}H_{17}NaO_3$) in 1 tablet

Operating conditions

Detector: An ultraviolet absorption spectrophotometer (wavelength: 220 nm).

Column: A stainless-steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: A mixture of 0.02 mol/L potassium dihydrogen phosphate TS, pH 3.0, and acetonitrile (65 : 35).

Flow rate: 1.0 mL/min

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 Loxoprofen Sodium Tablets, and powder them. Weigh accurately an amount equivalent to about 30 mg of loxoprofen sodium, dissolve in 60% methanol to make 100 mL, and use this solution as the test solution. Separately, weigh accurately about 30 mg of loxoprofen sodium RS, dissolve in 60% methanol to make 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas of loxoprofen from each solution, A_T and A_S, respectively.

$$\text{Amount (mg) of loxoprofen } (C_{15}H_{17}NaO_3) = \text{Amount (mg) of loxoprofen RS (mg)} \times \frac{A_T}{A_S} \times 1.089$$

1.089: Molecular weight of loxoprofen sodium / Molecular weight of loxoprofen.

Operating conditions

Detector: An ultraviolet absorption spectrophotome-

ter (wavelength: 220 nm).

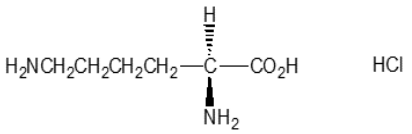
Column: A stainless steel column about 4 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of 0.02 mol/L potassium dihydrogen phosphate TS, pH 3.0, and acetonitrile (13 : 7).

Flow rate: 1.0 mL/min

Packaging and storage Preserve in tight containers.

L-Lysine Hydrochloride
L-리신염산염



Lysine Hydrochloride $C_6H_{14}N_2O_2 \cdot HCl$: 182.65
(2*S*)-2,6-Diaminohexanoic acid hydrochloride [*657-27-2*]

L-Lysine Hydrochloride, when dried, contains NLT 98.5% and NMT 101.0% of L-Lysine Hydrochloride ($C_6H_{14}N_2O_2 \cdot HCl$).

Description L-Lysine Hydrochloride occurs as a white powder, which is odorless but has a slightly distinctive taste.
It is freely soluble in water or formic acid and very slightly soluble in ethanol(95).

Optical rotation $[\alpha]_D^{20}$: Between +19.0° and +21.5° (2 g after drying, 6 mol/L hydrochloric acid TS, 25 mL, 100 mm).

Identification (1) Determine the infrared spectra of L-Lysine Hydrochloride and L-Lysine Hydrochloride RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers. If any difference appears between the spectra, dissolve L-Lysine Hydrochloride in water, evaporate the water to dryness at 60 °C, and repeat the test with the residue.

(2) An aqueous solution of L-Lysine Hydrochloride (1 in 10) responds to the Qualitative Analysis for chloride.

pH Dissolve 1.0 g of L-Lysine Hydrochloride in 10 mL of water; the pH is between 5.0 and 6.0.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of L-Lysine Hydrochloride in 10 mL of water; the solution is clear and colorless.

(2) ***Sulfate***—Weigh 0.6 g of L-Lysine Hydrochloride and perform the test. Prepare the control solution with 0.35 mL of 0.005 mol/L sulfuric acid (NMT 0.028%).

(3) ***Ammonium***—Weigh 0.25 g of L-Lysine Hydrochloride and perform the test. Prepare the control solution with 5.0 mL of ammonium standard solution (NMT 0.02%).

(4) ***Heavy metals***—Proceed with 2.0 g of L-Lysine Hydrochloride according to Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(5) ***Iron***—Dissolve 0.333 g of L-Lysine Hydrochloride in water to make 45 mL, add 2 mL of hydrochloric acid, and use this solution as the test solution. To 1.0 mL of iron standard solution, add water to make 45 mL, add 2 mL of hydrochloric acid, and use this solution as the standard solution. Add 50 mg of ammonium peroxydisulfate and 3 mL of 30% ammonium thiocyanate to the test solution and the standard solution and mix; the color obtained from the test solution is not more intense than that from the standard solution (NMT 30 ppm).

(6) ***Arsenic***—Proceed with 1.0 g of L-Lysine Hydrochloride according to Method 1 and perform the test (NMT 2 ppm).

(7) ***Related substances***—Weigh 0.10 g of L-Lysine Hydrochloride, dissolve in 25 mL of water, and use this solution as the test solution. Pipet 1 mL of this solution and add water to make exactly 50 mL. Pipet 5 mL of this solution, add water to make exactly 20 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of 1-propanol and ammonia water(28) (67 : 33) as the developing solvent to a distance of about 10 cm, and dry the plate at 100 °C for 30 minutes. Spray evenly the plate with a solution of ninhydrin in acetone (1 in 50) and heat at 80 °C for 5 minutes; the spots other than the principal spot from the test solution are not more intense than the spot from the standard solution.

Loss on drying NMT 1.0% (1 g, 105 °C, 3 hours).

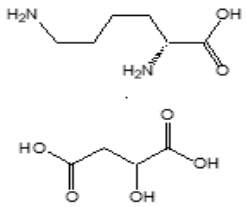
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately 0.1 g of L-Lysine Hydrochloride, previously dried, dissolve in 2 mL of formic acid, add exactly 15 mL of 0.1 mol/L perchloric acid, and heat on a steam bath for 30 minutes. After cooling, add 45 mL of acetic acid(100) and titrate the excess perchloric acid with 0.1 mol/L sodium acetate VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner.

Each mL of 0.1 mol/L perchloric acid VS
= 9.132 mg of $C_6H_{14}N_2O_2 \cdot HCl$

Packaging and storage Preserve in tight containers.

L-Lysine Malate
L-리신말산염



$C_{10}H_{20}N_2O_7$: 280.28
L-Lysine (2*S*)-2-hydroxybutanedioate, [*71555-10-7*]

L-Lysine Malate, when dried, contains NLT 98.5% and NMT 101.0% of L-lysine malate ($C_{10}H_{20}N_2O_7$: 280.28).

Description L-Lysine Malate occurs as a white crystalline powder.

Identification (1) Take 20 mL of an aqueous solution of L-Lysine Malate (1 in 20), transfer into a test tube, add 1 mL of acetone, 0.2 mL of 2.5% sodium pentacyanonitrosylferrate(III) solution and 1 g of borax, and shake for a few minutes; the resulting solution exhibits a reddish purple color.

(2) To 2 drops of an aqueous solution of L-Lysine Malate (1 in 10), add 2 mL of 0.1% α-naphthol TS and heat on a steam bath for 4 minutes. Add 5 mL of water and 7 mL of 10 mol/L sodium hydroxide TS while cooling; the resulting solution exhibits a yellowish dark red color.

Optical rotation $[\alpha]_D^{20}$: Between +2.5° and +4.5° (after drying, 10 g, 100 mL).

Purity (1) ***Chloride***—Weigh 0.5 g of L-Lysine Malate and perform the test as directed under the Chloride. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid (NMT 0.021%).

(2) ***Sulfate***—Weigh 0.6 g of L-Lysine Malate and perform the test as directed under the Sulfate. Prepare the control solution with 0.35 mL of 0.005 mol/L sulfuric acid (NMT 0.028%).

(3) ***Ammonium***—Weigh 1.0 g of L-Lysine Malate and perform the test as directed under the Ammonium. Prepare the control solution with 2.0 mL of ammonium standard solution (NMT 0.002%).

(4) ***Heavy metals***—Proceed with 2.0 g of L-Lysine Malate according to Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(5) ***Iron***—Weigh 1.0 g of L-Lysine Malate, incinerate, then add 1 mL of hydrochloric acid (2 in 3) and 0.6 mL of nitric acid (1 in 3), and evaporate to dryness on a steam bath. Dissolve the residue in 2 mL of hydrochloric acid and 10 mL of water, transfer the solution to a Nessler cylinder, and use this solution as the test solution. Prepare the control solution with 1.0 mL of the iron standard solution. To the test and standard solutions, put 30 mg of ammonium persulfate to mix and add 2 mL of 10% ammonium thiocyanate TS, respectively. Add water to make 25 mL and compare the test solution with the standard solution; the color of the test solution is not more intense than that of the standard solution (NMT 10 ppm).

(6) ***Arsenic***—Proceed with 2.0 g of L-Lysine Malate according to Method 1 and perform the test. Prepare the control solution with 2.0 mL of arsenic standard solution (NMT 1 ppm).

Pyrogens Weigh accurately 20.0 g of L-Lysine Malate, dissolve in 0.9% isotonic sodium chloride injection to make 1000 mL, and inject 10 mL per kilogram.

Other amino acids Weigh 0.1 g of L-Lysine Malate, add water, dissolve to make 10 mL, and use this solution as the test solution. Perform the test with this solution as directed under the Paper Chromatography. Spot 5 μL of the test solution on a filter paper, develop the filter paper with a mixture of n-butanol, water and acetic acid(100) (5 : 2 : 1) as the developing solvent to a distance of about 30 cm, and air-dry the filter paper. Spray evenly a solution of ninhydrin in acetone (1 in 50) on the filter paper and heat at 90 °C for 10 minutes; no purple spots appear other than the principal spot.

Loss on drying NMT 0.05% (1 g, 105 °C, 3 hours).

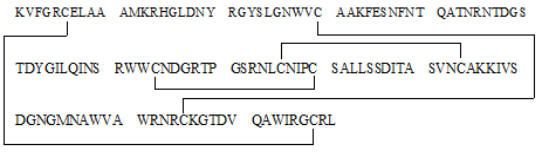
Residue on ignition NMT 0.10% (2 g).

Assay Weigh accurately about 0.2 g of L-Lysine Malate, previously dried, dissolve in 3 mL of formic acid, add 50 mL of acetic acid(100) for non-aqueous titration, and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 14.014 mg of $C_{10}H_{20}N_2O_7$

Packaging and storage Preserve in tight containers.

Lysozyme Hydrochloride
리소짐염산염



$C_{616}H_{963}N_{193}O_{182}S_{10}\cdot xHCl$
[12650-88-3, egg white lysozyme]

Lysozyme Hydrochloride is an alkaline polypeptide obtained from the albumen of a hen and has a decomposi-

tion reaction of mucopolysaccharides.

Lysozyme Hydrochloride contains NLT 0.8 mg (potency) of lysozyme per mg, calculated on the dried basis.

Description Lysozyme Hydrochloride occurs as a white crystal, or crystalline or amorphous powder, which is odorless. It is soluble in water or normal saline solution and practically insoluble in ethanol or ether. The pH of an aqueous solution of Lysozyme Hydrochloride (3 in 200) is between 3.0 and 5.0.

Identification (1) Dissolve 0.2 g of Lysozyme Hydrochloride in 100 mL of acetate buffer solution, pH 5.4. To 5 mL of this solution, add 1 mL of ninhydrin TS and heat for 10 minutes; the resulting solution exhibits a bluish purple color.

(2) Determine the absorption spectrum of a solution, prepared by dissolving Lysozyme Hydrochloride in acetate buffer solution, pH 5.4 (1 in 10000); it exhibits a maximum at between 279 nm and 281 nm.

Purity (1) ***Clarity and color of solution***—To 5 mL of an aqueous solution of Lysozyme Hydrochloride (3 in 200), add dilute hydrochloric acid, if necessary, to adjust the pH to 3; the resulting solution is clear.

(2) ***Heavy metals***—Proceed with 1.0 g of Lysozyme Hydrochloride as directed under Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Arsenic***—Proceed with 1.0 g of Lysozyme Hydrochloride according to Method 3 under the Arsenic and perform the test (NMT 2 ppm).

(4) ***Nitrogen***—Perform the test with Lysozyme Hydrochloride as directed under the Nitrogen Determination; the amount of nitrogen (N : 14.007) is 16.5% to 19.0%, calculated on the dried basis.

Loss on drying NMT 8.0% (1 g, 105 ℃, 2 hours).

Residue on ignition NMT 2.0% (0.5 g).

Assay Weigh accurately about 50 mg (potency) each of Lysozyme Hydrochloride and lysozyme RS (previously determined for loss on drying in the same manner as Lysozyme Hydrochloride). Add phosphate buffer solution, pH 6.2 to each to make exactly 100.0 mL. Take 2.0 mL of these solutions and add phosphate buffer solution, pH 6.2 to make 100.0 mL. Take again 2.0 mL of the resulting solutions, add phosphate buffer solution, pH 6.2 to make 50.0 mL, and use these solutions as the test solution and the standard solution, respectively. Take 3.0 mL each of substrate solutions, transfer into 3 test tubes, and warm at 35℃ for 3 minutes. Separately, warm the standard solution, the test solution and phosphate buffer solution, pH 6.2 at 35 ℃ for 3 minutes, take 3.0 mL, and transfer into the previous test tubes. After allowing to stand at 35 ℃ for 10 ± 0.1 minutes, determine each absorbance, A_S, A_T, and A_0, at 640 nm, using water as the control solution. Repeat the test 3 times and calculate according to the following equation with the mean value obtained.

$$\begin{aligned}&\text{Amount [mg (potency)] of lysozyme per mg,}\\&\text{calculated on the dried basis of lysozyme Hydrochloride}\\&=\frac{\text{Amount [mg (potency)]of lysozyme RS per mg,}\\\text{calculated on the dried basis)}}{\text{Amount (mg)of Lysozyme Hydrochloride,}\\\text{calculated on the dried basis}}-\frac{A_0-A_T}{A_0-A_S}\end{aligned}$$

Substrate solution—To about 50 mg of dried mycelium of *Micrococcus lysodeikticus*, put 60 mL of phosphate buffer solution, pH 6.2 to make the solution turbid. Using phosphate buffer solution, pH 6.2 as the control solution, adjust the solution by adding phosphate buffer solution, pH 6.2 so that the transmittance becomes 10% at the layer length of 10 mm and the wavelength of 640 nm.

Packaging and storage Preserve in tight containers.

Magnesium Aluminometasilicate
메타규산알루민산마그네슘

Magnesium Aluminometasilicate contains NLT 29.1% and NMT 35.5% of aluminum oxide (Al_2O_3 : 101.96) and NLT 11.4% and NMT 14.0% of magnesium oxide (MgO : 40.30), calculated on the dried basis.

Description Magnesium Aluminometasilicate occurs as a white powder or grains.
It is odorless and tasteless.
It is practically insoluble in water or ethanol(95).
To 1 g of Magnesium Aluminometasilicate, add 10 mL of dilute hydrochloric acid, and heat; most of Magnesium Aluminometasilicate is soluble.

Identification (1) To 0.5 g of Magnesium Aluminometasilicate, add 5 mL of dilute sulfuric acid (1 in 3), heat until white fumes are evolved, cool, add 20 mL of water, and filter. Use the residue in the Identification (3). Neutralize the filtrate with ammonia TS, and filter the produced precipitate. Use the filtrate in the Identification (2). Dissolve the residue in dilute hydrochloric acid; the solution responds to the Qualitative Analysis for aluminum salt.

(2) The filtrate obtained in (1) responds to the Qualitative Analysis for magnesium salt.

(3) Wash the residue obtained in (1) with 30 mL of water, add 2 mL of methylene blue solution (1 in 10000), and wash again with 30 mL of water; the precipitate exhibits a blue color.

Purity (1) ***Soluble salts***—To 10 g of Magnesium Aluminometasilicate, add 150 mL of water, and boil gently for 15 minutes while shaking well to mix. After cooling, add water to make 150 mL, centrifuge, and take 75 mL of the clear supernatant. To this liquid, add water to make 100 mL, and use this solution as the test solution. Take

25 mL of the test solution, evaporate it to dryness on a steam bath, and ignite at 700 ℃ for 2 hours; the amount of the residue is NMT 20 mg.

(2) ***Alkali***—Take 20 mL of the test solution obtained in (1), and add 2 drops of phenolphthalein TS and 0.5 mL of 0.1 mol/L hydrochloric acid; the solution is colorless.

(3) ***Chloride***—Take 10 mL of the test solution obtained in (1), add 6 mL of dilute nitric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 0.75 mL of 0.01 mol/L hydrochloric acid VS (NMT 0.053%).

(4) ***Sulfate***—Take 1 mL of the test solution obtained in (1), add 1 mL of dilute hydrochloric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 1.0 mL of 0.005 mol/L sulfuric acid VS (NMT 0.480%).

(5) ***Heavy metals***—To 1.0 g of Magnesium Aluminometasilicate, add 20 mL of water and 3 mL of hydrochloric acid, evaporate it to dryness on a steam bath. To the residue, add 2 mL of dilute acetic acid and 20 mL of water, boil for 2 minutes, filter, and wash the residue with two 5 mL portions of water. Combine the filtrate and washings, add 0.15 g of hydroxylamine hydrochloride, and heat to boiling. After cooling, add 0.15 g of sodium acetate and water to make 50 mL. Use this solution as the test solution and perform the test as directed under the Heavy Metals. Evaporate 3 mL of hydrochloric acid to dryness on a steam bath, add 3.0 mL of lead standard solution, 0.15 g of hydroxylamine hydrochloride, 0.15 g of sodium acetate, 2 mL of dilute acetic acid and water to make 50 mL, and use this solution as the control solution (NMT 30 ppm).

(6) ***Iron***—Weigh 0.2 g of Magnesium Aluminometasilicate, add 8 mL of dilute hydrochloric acid, and boil for 1 minute. After cooling, add acetate-sodium acetate buffer solution, pH 4.5, for Iron to make 50 mL, and centrifuge. Take 25 mL of the clear supernatant, add acetate-sodium acetate buffer solution, pH 4.5, for Iron to make 30 mL, and use this solution as the test solution. Perform the test as directed in Method A under the Iron.

Control solution—Add 4 mL of dilute hydrochloric acid to 3.0 mL of the iron standard solution, and add acetate-sodium acetate buffer solution, pH 4.5, for Iron to make 30 mL. Use this solution as the standard solution and proceed in the same manner as the test solution.

(7) ***Arsenic***—To 0.4 g of Magnesium Aluminometasilicate, add 10 mL of water and 1 mL of sulfuric acid, and shake well to mix. After cooling, use this solution as the test solution and perform the test (NMT 5 ppm).

Loss on drying NMT 20.0% (1 g, 110 ℃, 7 hours).

Acid-neutralizing capacity Weigh accurately about 0.2 g of Magnesium Aluminometasilicate, transfer to a stoppered flask, add 100.0 mL of 0.1 mol/L hydrochloric acid, close the flask with a stopper, shake to mix for 1 hour at 37 ± 2 ℃, and then filter. Take 50.0 mL of the filtrate, and titrate the excess of hydrochloric acid with 0.1 mol/L sodium hydroxide VS while shaking well to mix until the pH becomes 3.5. Each g of Magnesium Aluminometasilicate, calculated on the dried basis, should consume NLT 210 mL of 0.1 mol/L hydrochloric acid.

Assay (1) ***Aluminum oxide***—Weigh accurately about 0.5 g of Magnesium Aluminometasilicate, transfer to an Erlenmeyer flask, add 3.5 mL of dilute hydrochloric acid and 30 mL of water, and heat on a steam bath for 15 minutes. Then, add 3.5 mL of hydrochloric acid and heat on a steam bath for 10 minutes. After cooling, transfer to a 250-mL volumetric flask. Wash the Erlenmeyer flask with water, and combine the washings with water to make 250.0 mL. Centrifuge this solution and use the clear supernatant as the test solution. Pipet 20.0 mL of the test solution, add 20.0 mL of 0.02 mol/L ethylenediaminetetraacetic acid disodium salt VS, and add 8 mL of acetate-sodium acetate buffer solution, pH 4.8 and 20 mL of water. Boil for 5 minutes, cool, add 50 mL of ethanol(95), and titrate with 0.02 mol/L zinc sulfate VS until a pale dark green color changes to a pale red color (indicator: dithizone TS 2 mL). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.02 mol/L ethylenediaminetetraacetic acid disodium salt VS
= 1.0196 mg of Al_2O_3

(2) ***Magnesium oxide***—Take 50.0 mL of the test solution obtained in Assay (1), add 50 mL of water and 10 mL of triethanolamine (1 in 2), and shake well to mix. Add 5 mL of ammonia-ammonium chloride buffer solution, pH 10.7, and titrate with 0.02 mol/L ethylenediaminetetraacetic acid disodium salt VS (indicator: 40 mg of eryochrome black T-sodium chloride indicator). The endpoint of the titration is when the reddish purple color of the solution changes to a blue color lasting for 30 seconds. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.02 mol/L ethylenediaminetetraacetic acid disodium salt VS
= 0.8060 mg of MgO

Packaging and storage Preserve in tight containers.

Magnesium Aluminosilicate Suspension
규산알루민산마그네슘 현탁액

Magnesium Aluminosilicate Suspension contains aluminum oxide (Al_2O_3 : 101.96) equivalent to NLT 27.0% and NMT 34.3% of the labeled amount of magnesium aluminosilicate, calculated on the dried basis, and NLT 20.5% and NMT 27.7% of magnesium oxide

(MgO : 40.30).

Method of preparation Prepare as directed under Suspension, with Magnesium Aluminosilicate.

Identification (1) ***Aluminum oxide in magnesium aluminosilicate***—Weigh an amount of Magnesium Aluminosilicate Suspension, equivalent to about 0.5 g of magnesium aluminosilicate, according to the labeled amount, add 5 mL of diluted sulfuric acid (1 in 3), and heat until white smoke generates. After cooling, add 20 mL of water to filter. Neutralize the filtrate with strong ammonia water, filter again, and dissolve the precipitate with dilute hydrochloric acid; the weakly acidic solution responds to the Qualitative Analysis for aluminum.

(2) ***Magnesium oxide in magnesium silicate***—Weigh an amount of Magnesium Aluminosilicate Suspension, equivalent to 0.5 g of magnesium aluminosilicate, according to the labeled amount, add 5 mL of diluted sulfuric acid (1 in 3), and heat until white smoke generates. After cooling, add 20 mL of water to filter. Neutralize the filtrate with strong ammonia water and filter again. The filtrate responds to the Qualitative Analysis for magnesium salt.

pH Between 7.5 and 9.5.

Acid-neutralizing capacity Take exactly an amount of Magnesium Aluminosilicate Suspension, equivalent to 0.1 g of magnesium aluminosilicate (83 mg of magnesium aluminosilicate, Previously dried), according to the labeled amount, transfer to a flask with a glass stopper, add exactly 50 mL of 0.1 mol/L hydrochloric acid VS, and shake to mix at about 37 ± 2 ℃ for 1 hour. If necessary, filter and wash with water. Combine the filtrate and the washings and titrate excess hydrochloric acid with 0.1 mol/L sodium hydroxide VS (indicator: 5 drops of bromophenol blue TS).
1 g of magnesium aluminosilicate of Magnesium Aluminosilicate Suspension (previously dried) is NLT 250 mL of 0.1 mol/L hydrochloric acid.

Assay (1) ***Aluminum oxide***—Pipet an amount of Magnesium Aluminosilicate Suspension, equivalent to 1 g of magnesium aluminosilicate (830 mg of magnesium aluminosilicate, previously dried), according to the labeled amount, add 40 mL of dilute hydrochloric acid, and evaporate to dryness on a steam bath. Dry the residue on evaporation in the dryer at a 110 ℃ for 1 hour, add 80 mL of hydrochloric acid TS to the residue, shake well to mix, and extract in hot water by shaking. Wash the residue with hot water and combine with the washings. Repeat the same procedure twice. Add water to the filtrate and washings to make exactly 250 mL, and use this solution as the test solution. Pipet 10 mL of the test solution and adjust the pH to 3.0 by adding 30 mL of water, 5 mL of acetic acid-ammonium acetate buffer solution, pH 3.0, and 2 to 3 drops of strong ammonia water. Add 0.5 mL of Cu-PAN TS and heat. While boiling titrate with 0.01 mol/L ethylenediaminetetraacetic acid disodium salt VS. The endpoint is when the color of the solution changes from red to yellow persisting for NLT 1 minute. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.01 mol/L ethylenediaminetetraacetic acid disodium salt VS
= 0.5098 mg of Al_2O_3

(2) ***Magnesium oxide***—Take exactly an amount of Magnesium Aluminosilicate Suspension, equivalent to 1 g of magnesium aluminosilicate, according to the labeled amount (830 mg of magnesium aluminosilicate on the dried basis), add 40 mL of dilute hydrochloric acid, and evaporate to dryness on a steam bath. Dry the residue on evaporation in the dryer at a 110 ℃ for 1 hour, add 80 mL of hydrochloric acid TS to the residue, shake well to mix, and extract in hot water by shaking. Wash the residue with hot water and combine with the washings. Repeat the same procedure twice. Add water to the filtrate and washings to make exactly 250 mL, and use this solution as the test solution. Pipet 10 mL of the test solution, add 20 mL of water, and add 2 g of ammonium chloride and 1 drop of methyl red TS. Heat until it boils, add ammonia TS carefully until the color of the solution turns yellow, boil for 2 minutes, and filter. Wash well the precipitate with hot ammonium chloride solution (1 in 50), and combine the filtrate and the washings. Add 3 mL of triethanolamine, 1 mL of potassium cyanide TS, and 5 mL of strong ammonia water to adjust the pH to 10.0, and titrate with 0.01 mol/L ethylenediaminetetraacetic acid disodium salt VS (indicator: 4 drops of eriochrome black T TS). The endpoint is when the red color of the solution disappears completely and appears light bluish green. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.01 mol/L ethylenediaminetetraacetic acid disodium salt VS
= 0.4030 mg of MgO

Packaging and storage Preserve in tight containers.

Magnesium Aluminosilicate Tablets
규산알루민산마그네슘 정

Magnesium Aluminosilicate Tablets contain aluminum oxide (Al_2O_3 : 101.96) equivalent to NLT 27.0% and NMT 34.3% of the labeled amount of magnesium aluminosilicate and NLT 20.5% and NMT 27.7% of magnesium oxide (MgO : 40.30).

Method of preparation Prepare as directed under Tablets, with Magnesium Aluminosilicate.

Identification (1) Weigh an amount of Magnesium Aluminosilicate Tablets, equivalent to 0.5 g of magnesi-

um aluminosilicate according to the labeled amount, add 5 mL of dilute sulfuric acid (1 in 3), and heat until white smoke generates. After cooling, add 20 mL of water to filter. Use the residue in Identification (3). Add ammonia TS to the filtrate to neutralize, and filter the obtained precipitate. Use the filtrate in Identification (2). The solution obtained by adding dilute hydrochloric acid to the residue responds to the Qualitative Analysis for aluminum salt.

(2) The filtrate obtained in Identification (1) responds to the Qualitative Analysis for magnesium salt.

(3) Wash the residue obtained in Identification (1) with 30 mL of water, add 2 mL of methylene blue solution (1 in 10,000), and wash with 30 mL of water again; the blue precipitate is produced.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Acid-neutralizing capacity Weigh accurately the mass of NLT 20 Magnesium Aluminosilicate Tablets, and powder. Weigh accurately an amount, equivalent to about 20 mg of magnesium aluminosilicate, transfer into a volumetric flask with a stopper, add exactly 100 mL of 0.1 mol/L hydrochloric acid VS. With the stopper closed, mix by shaking at 37 ± 2 ℃ for 1 hour and then filter. Pipet 50 mL of the filtrate, and titrate the excess hydrochloric acid while stirring well, with 0.1 mol/L sodium hydroxide VS until the pH becomes 3.5. Perform a blank test in the same manner and make any necessary correction. The volume of 0.1 mol/L hydrochloric acid VS consumed for 1 g of magnesium aluminosilicate, calculated on the dried basis, is NLT 250 mL.

Assay (1) ***Aluminum oxide***—Weigh accurately the mass of NLT 20 Magnesium Aluminosilicate Tablets, and power. Weigh accurately an amount, equivalent to about 0.5 g of magnesium aluminosilicate, transfer into a 100-mL Erlenmeyer flask, add 3.5 mL of dilute hydrochloric acid, and heat on a steam bath for 15 minutes. After cooling, transfer to a 250-mL volumetric flask, wash the Erlenmeyer flask with water, and add the washings and water to make exactly 250 mL. Centrifuge the solution and use the supernatant clear solution as the test solution. Pipet 20 mL of the test solution, add exactly 20 mL of 0.02 mol/L ethylenediaminetetraacetic acid disodium salt VS, add 8 mL of acetic acid-ammonium acetate buffer solution, pH 4.8 and 20 mL of water, and then boil for 5 minutes. After cooling, add 50 mL of ethanol(95) and titrate with 0.02 mol/L zinc sulfate VS (indicator: 2 mL of dithizone TS). The endpoint is when the solution changes from the light dark green to light red. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.02 mol/L ethylenediaminetetraacetic acid disodium salt VS
= 1.020 mg of Al_2O_3

(2) ***Magnesium oxide***—Pipet 50 mL of the test solution obtained in Assay (1), add 50 mL of water and 10 mL of triethanolamine solution (1 in 2), and shake well to mix, and then add 5 mL of ammonia-ammonium chloride buffer solution, pH 10.7. Titrate with 0.02 mol/L ethylenediaminetetraacetic acid disodium salt VS (indicator: 0.04 g of eriochrome black T-sodium chloride indicator). The endpoint is when the reddish purple color of the solution appears with the blue color persisting for 30 seconds. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.02 mol/L ethylenediaminetetraacetic acid disodium salt VS
= 0.8061 mg of MgO

Packaging and storage Preserve in tight containers.

Magnesium Aluminum Hydrate
수산화알루민산마그네슘

AlH_5MgO_5 : 136.32

[*39366-43-3*]

Magnesium Aluminum Hydrate contains NLT 25.0% and NMT 35.0% of aluminum oxide (Al_2O_3: 101.96) and NLT 25.0% and NMT 35.0% of magnesium oxide (MgO: 40.30).

Description Magnesium Aluminum Hydrate occurs as a white powder and is odorless and tasteless.

Identification Dissolve 0.5 g of Magnesium Aluminum Hydrate in 10 mL of dilute hydrochloric acid by warming; the resulting solution responds to the Qualitative Analysis for aluminum salt and magnesium salt.

Purity (1) ***Chloride***—Weigh 1.0 g of Magnesium Aluminum Hydrate, add 30 mL of dilute nitric acid, heat slowly to boiling while shaking well to mix, cool, add water to make 100 mL, and centrifuge. To 5 mL of the clear supernatant, add 6 mL of dilute nitric acid and water to make 50 mL, and perform the test. Prepare the control solution with 0.4 mL of 0.01 mol/L hydrochloric acid (NMT 0.284%).

(2) ***Sulfate***—Weigh 1.0 g of Magnesium Aluminum Hydrate, add 15 mL of dilute hydrochloric acid, heat gently while shaking well to, cool, add water to make 250 mL, and centrifuge. To 25 mL of the clear supernatant, add 1 mL of dilute nitric acid and water to make 50 mL, and perform the test. Prepare the control solution with 1.0 mL of 0.005 mol/L sulfuric acid (NMT 0.480%).

(3) ***Heavy metals***—Weigh 0.5 g of Magnesium Aluminum Hydrate, add 8 mL of hydrochloric acid and 5 mL of water, heat gently to boiling while shaking well to mix, and evaporate to dryness on a steam bath. To the residue, add 30 mL of water, warm while shaking well to mix, and filter. To the filtrate, add 2 mL of dilute acetic acid and 5 drops of ammonia TS, warm with shaking to mix until the solution is clear. After cooling, add water to

make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution by adding 2 mL of dilute acetic acid and water to 2.0 mL of lead standard solution to make 50 mL (NMT 40 ppm).

(4) ***Arsenic***—To 0.8 g of Magnesium Aluminum Hydrate, add 10 mL of dilute sulfuric acid, heat slowly to boiling while shaking well to mix, cool, and filter. To 2.5 mL of the filtrate, add water to make 5 mL (NMT 10 ppm), and perform the test.

Acid-neutralizing capacity Weigh accurately 20 mg of Magnesium Aluminum Hydrate, transfer to a stoppered Erlenmeyer flask, add exactly 100 mL of 0.1 mol/L hydrochloric acid, stopper, shake to mix at 37 ± 2 ℃ for 1 hour, and filter. Take exactly 50 mL of the filtrate, and titrate the excess hydrochloric acid with 0.1 mol/L sodium hydroxide VS (indicator: 5 drops of bromophenol blue TS). 1.0 g of Magnesium Aluminum Hydrate consumes NLT 250 mL of 0.1 mol/L hydrochloric acid.

Loss on ignition Between 35% and 45% (1 g, 800 ℃, constant mass).

Assay (1) ***Aluminum oxide***—Weigh accurately about 1.0 g of Magnesium Aluminum Hydrate, dissolve in 30 mL of dilute hydrochloric acid by heating, add water to make exactly 250 mL, and use this solution as the test solution. Pipet 15 mL of the test solution, add exactly 25 mL of 0.05 mol./L ethylenediaminetetraacetic acid disodium salt and 20 mL of acetic acid-ammonium acetate buffer solution, pH 4.8, and boil for five minutes. After cooling, add 55 mL of ethanol(95), and titrate with 0.05 mol/L zinc sulfate VS (indicator: 2 mL of dithizone TS). The endpoint of titration is when the solution changes from the pale dark green to pale violet. Perform a blank test in the same manner and make any necessary correction.

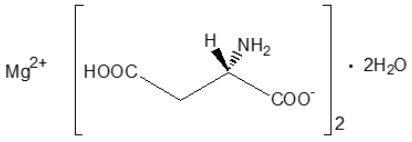
Each mL of 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS
= 2.549 mg of Al_2O_3

(2) ***Magnesium oxide***—Pipet 10 mL of the test solution obtained in (1), add a small amount of water, and add 5 mL of diluted triethanolamine solution (1 in 2), shake to mix, adjust the pH to 10.0 with ammonia water, and titrate with 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS (indicator: 40 mg of eriochrome black T-sodium chloride indicator). The endpoint of titration is when the reddish purple color of the solution turns into the blue color. Perform a blank test in the same manner and make any necessary correction.

Each mL of ethylenediaminetetraacetic acid disodium salt VS
= 2.015 mg of MgO

Packaging and storage Preserve in well-closed containers.

Magnesium Aspartate Hydrate
아스파르트산마그네슘수화물



$C_8H_{12}O_8N_2Mg \cdot 2H2O$: 324.53
Magnesium (2S)-2-amino-4-hydroxy-4-oxo-butanoate dihydrate

Magnesium Aspartate Hydrate contains NLT 98.0% and NMT 102.0% of magnesium aspartate ($C_8H_{12}O_8N_2Mg$: 288.49), calculated on the anhydrous basis.

Description Magnesium Aspartate Hydrate occurs as a white crystalline powder or colorless crystals.
It is freely soluble in water.

Identification (1) Incinerate 15 mg of Magnesium Aspartate Hydrate until white residue is obtained. Dissolve the residue in 1 mL of dilute hydrochloric acid, neutralize with dilute sodium hydroxide TS using a litmus paper, and if necessary, filter. To this solution, add 6 mol/L ammonia water; a white precipitate is formed. To the precipitate, add 10.7 w/v% ammonium chloride solution; the precipitate dissolves. To this, add 9 w/v% dibasic sodium phosphate solution; a white crystalline precipitate is formed.

(2) Dissolve 0.10 g of Magnesium Aspartate Hydrate in water to make 10 mL. To 1 mL of this solution, add water to make 50 mL, and use the resulting solution as the test solution. Separately, dissolve 10 mg of magnesium aspartate hydrate RS in water to make 50 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of 1-butanol, water and acetic acid(100) (60 : 20 : 20) as the developing solvent to a distance of about 15 cm, and air-dry the plate. Spray evenly ninhydrin TS on the plate, and dry the plate at 105 ℃ for 15 minutes; the colors and R_f values of the principal spots obtained from the test solution and the standard solution are the same.

Optical rotation $[\alpha]_D^{20}$: Between +20.5° and +23.0° (0.5 g, calculated on the anhydrous basis, a solution prepared by mixing 51.5 g of hydrochloric acid with water to make 100 mL, 25 mL, 100 mm).

pH Dissolve 2.5 g of Magnesium Aspartate Hydrate in water to make 100 mL. The pH of this solution is between 6.0 and 8.0.

Purity (1) ***Clarity and color of solution*—**Dissolve 2.5 g of Magnesium Aspartate Hydrate in water to make 100 mL. The solution is colorless and clear.

(2) ***Chloride*—**Perform the test with 1.0 g of Magnesium Aspartate Hydrate. Prepare the control solution with 0.564 mL of 0.01 mol/L hydrochloric acid (NMT 0.02%).

(3) ***Sulfate*—**Perform the test with 0.5 g of Magnesium Aspartate Hydrate. Prepare the control solution with 0.52 mL of 0.005 mol/L sulfuric acid (NMT 0.05%).

(4) ***Ammonium*—**Perform the test with 0.25 g of Magnesium Aspartate Hydrate. Prepare the control solution with 5 mL of ammonium standard solution (NMT 0.02%).

(5) ***Heavy metals*—**Proceed with 2.0 g of Magnesium Aspartate Hydrate as directed under Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(6) ***Iron*—**Place 0.20 g of Magnesium Aspartate Hydrate in a separatory funnel, and dissolve in 10 mL of dilute hydrochloric acid. To this, add 10 mL of 4-methyl-2-pentanone each and shake to mix for 3 minutes three times. Combine the obtained organic layers. To the organic solvent layer, add 10 mL of water, and shake to mix for 3 minutes. Place the water layer in a Nessler tube, add 2 mL of 20 w/v% citric acid and 0.1 mL of mercaptoacetic acid to mix, and add 10 mol/L of ammonia water to alkalify. To this, add water to make 20 mL, and allow to stand for 5 minutes; the color of the resulting solution is not more intense than the color of the control solution prepared by proceeding 10 mL of diluted iron standard solution (1 in 10) in the same manner (NMT 50 ppm).

(7) ***Ninhydrin-positive substances*—**Dissolve 0.10 g of Magnesium Aspartate Hydrate in water to make 10 mL. To 1 mL of this solution, add water to make 50 mL, and use the resulting solution as the test solution (1). To 1 mL of the test solution (1), add water to make 50 mL, and use this solution as the test solution (2). To 5 mL of the test solution (2), add water to make 20 mL, and use this solution as the standard solution (1). Separately, dissolve 10 mg of magnesium aspartate dihydrate RS and 10 mg of glutamic acid RS together in water to make 25 mL, and use this solution as the standard solution (2). With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution (1), the standard solution (1) and the standard solution (2) on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of 1-butanol, water and acetic acid(100) (60 : 20 : 20) as the developing solvent to a distance of about 15 cm, and air-dry the plate. Spray evenly ninhydrin TS on the plate, and dry the plate at 105 ℃ for 15 minutes; the spots other than the principal spot obtained from the test solution (1) are not more intense than the spots from the standard solution (1) (0.5%). This test is valid when the two principal spots obtained from the standard solution (2) are clearly separated.

Water Between 10.0% and 14.0% (0.1 g, volumetric titration, direct titration).

Assay Weigh accurately about 0.26 g of Magnesium Aspartate Hydrate, dissolve in 10 mL of water, add 10 mL of ammonia-ammonium chloride buffer solution (pH 10.0), and titrate with 0.1 mol/L ethylenediaminetetraacetic acid disodium salt VS until the violet color of the resulting solution turns to a blue color (indicator: about 50 mg of eryochrome black T-sodium chloride indicator).

Each mL of 0.1 mol/L ethylenediaminetetraacetic acid disodium salt VS
= 28.853 mg of $C_8H_{12}O_8N_2Mg$

Packaging and storage Preserve in well-closed container.

Magnesium Carbonate
탄산마그네슘

[*546-93-0*]

Magnesium Carbonate is salt water-alkali magnesium carbonate. Magnesium Carbonate contains NLT 40.0% and NMT 44.0% of magnesium oxide (MgO: 40.30).

Perform the sedimentation test; substances with volumes NMT 12.0 mL scale can be labeled informally as heavy magnesium carbonate.

Description Magnesium Carbonate occurs as easily breakable white masses or a powder and is odorless.
It is practically insoluble in water, ethanol(95), ether, or 1-propanol.
It dissolves in dilute hydrochloric acid with effervescence.
A saturated solution of Magnesium Carbonate is alkaline.

Identification (1) Dissolve 1 g of Magnesium Carbonate in 10 mL of dilute hydrochloric acid, and boil. After cooling, add sodium hydroxide TS to neutralize, and filter if necessary. Magnesium Carbonate responds to the Qualitative Analysis for magnesium salt.

(2) Magnesium Carbonate responds to the Qualitative Analysis (1) for carbonate.

Purity (1) ***Soluble salts***—Weigh 2.0 g of Magnesium Carbonate, add 40 mL of 1-propanol and 40 mL of water, and heat to boiling while stirring continuously. After cooling and filtering, wash with water, combine filtrate and washings, and add water to make exactly 100 mL. Pipet 50 mL of this solution, evaporate on a steam bath to dryness, and dry the residue at 105 ℃ for 1 hour; the amount of the residue is NMT 10.0 mg.

(2) ***Heavy metals***—Moisten 1.0 g of Magnesium Carbonate with 4 mL of water, dissolve in 10 mL of dilute hydrochloric acid, evaporate to dryness on a steam bath, and dissolve the residue in 35 mL of water, 2 mL of

dilute acetic acid, and 1 drop of ammonia TS. Filter if necessary, wash the filter paper, combine washings with the filtrate, and add water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution by evaporating 10 mL of dilute hydrochloric acid to dryness on a steam bath and adding 2 mL of dilute acetic acid, 3.0 mL of lead standard solution, and water to make 50 mL (NMT 30 ppm).

(3) ***Iron***—Proceed with 0.10 g of Magnesium Carbonate according to Method 1 and perform the test as directed under Method A. Prepare the control solution with 2.0 mL of iron standard solution (NMT 200 ppm).

(4) ***Arsenic***—Moisten 0.40 g of Magnesium Carbonate with 1.5 mL of water, dissolve in 3.5 mL of dilute hydrochloric acid, use this solution as the test solution, and perform the test (NMT 5 ppm).

(5) ***Calcium oxide***—Weigh accurately about 0.6 g of Magnesium Carbonate, and dissolve in 35 mL of water and 6 mL of dilute hydrochloric acid. Add 250 mL of water and 5 mL of L-tartaric acid solution (1 in 5), add 10 mL of 2,2',2″-nitrilotriethanol (3 in 10) and 10 mL of 8 mol/L potassium hydroxide TS, allow to stand for 5 minutes, and titrate with 0.01 mol/L ethylenediaminetetraacetic acid disodium salt VS (indicator: 0.1 g of NN indicator). The endpoint of titration is reached when the purple color of the solution turns blue. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.01 mol/L ethylenediaminetetraacetic acid disodium salt VS
= 0.5608 mg of CaO

The amount of calcium oxide (CaO: 56.08) is NMT 0.6%.

(6) ***Acid-insoluble substances***—Weigh 5.0 g of Magnesium Carbonate, add 75 mL of water, add 10 mL of hydrochloric acid in small portions while stirring for mixing, and boil for 5 minutes. After cooling, filter insoluble substances using a filter paper for qualitative analysis, and wash the insoluble substances. Wash the washings until no turbidity forms when silver nitrate TS is added, and ignite the residue with the filter paper to incinerate; the amount of the residue is NMT 2.5 mg.

Sedimentation test Weigh 1.0 g of Magnesium Carbonate that has passed through a No. 100 sieve, transfer into the measuring cylinder with a stopper and a scale of 50 mL at a place where it is 15 cm from the bottom, add water to make 50 mL, and mix exactly for 1 minute by shaking vigorously. Allow to stand for 15 minutes, and determine the height of the sediment (mL scale).

Microbiological examination of non-sterile products The total aerobic microbial count is NMT 1000 CFU, and the total combined yeasts/molds count is NMT 100 CFU per g of Magnesium Carbonate. Also, *Escherichia coli*, *Salmonella*, *Pseudomonas aeruginosa* and *Staphylococcus aureus* are not detected.

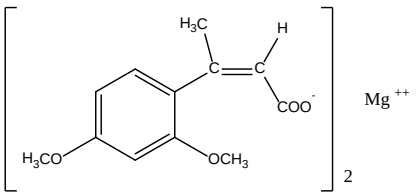
Assay Weigh accurately about 0.4 g of Magnesium Carbonate, dissolve in 10 mL of water and 3.5 mL of dilute hydrochloric acid, and add water to make exactly 100 mL. Pipet 25 mL of this solution, add 50 mL of water and 5 mL of pH 10.7 ammonia-ammonium chloride buffer solution, and titrate with 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS (indicator: 40 mg of eryochrome black T-sodium chloride indicator). Perform a blank test in the same manner and make any necessary correction. From the consumed amount of the 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS, subtract the amount of 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS that is equivalent to calcium oxide (CaO) obtained as directed in Purity (5).

Each mL of 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS
= 2.0152 mg of MgO

Each mg of calcium oxide (CaO)
= 0.36 mL of 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS

Packaging and storage Preserve in well-closed containers.

Magnesium Dimecrotate
디메크로트산마그네슘



$C_{24}H_{26}O_8Mg$: 466.75

(2*Z*)-3-(2,4-Dimethoxyphenyl)-2-butenoic acid, magnesium salt (2:1), [*54283-65-7*]

Magnesium Dimecrotate contains NLT 97.0% and NMT 103.0% of magnesium dimecrotate ($C_{24}H_{26}O_8Mg$) and NLT 4.95% and NMT 5.47% of magnesium (Mg), calculated on the anhydrous basis.

Description Magnesium Dimecrotate occurs as a white powder with no odor and has a salty taste of magnesium salt. It is soluble in methanol and hot acetic acid, sparingly soluble in ethanol, water, chloroform, and practically insoluble in ether.

Identification (1) Dissolve an appropriate amount of Magnesium Dimecrotate in water and add 2 drops of bromine water; the resulting solution exhibits a pink color and then is decolorized.

(2) Dissolve 1 g of Magnesium Dimecrotate in 100 mL of ethanol, and use this solution as the test solution. Separately, weigh 1 g of dimecrotic acid RS, dissolve in

ethanol to make 100 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 50 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography (with a fluorescent indicator). Develop the plate with a mixture of toluene, ethyl formate and anhydrous formic acid (5 : 4 : 1) to a distance of about 13 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the R_f values of the spots obtained from the test solution and the standard solution are the same.

(3) Weigh 1 mg of Magnesium Dimecrotate and dissolve in 100 mL of methanolic hydrochloric acid. Pipet 1 mL of this solution, add methanolic hydrochloric acid to make 100 mL, and determine absorption spectrum of the solution as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum at 216 nm and 283 nm.

(4) Dissolve 0.1 g of Magnesium Dimecrotate in 4 mL of ethanol, and use this solution as the test solution. Separately, weigh 0.84 g of magnesium chloride, dissolve in water to make 100 mL, and use this solution as the standard solution (0.1% as magnesium). With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 2 μL each of the test solution and the standard solution on the thin-layer chromatographic plate of cellulose with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of methanol, water and hydrochloric acid (8 : 1 : 1) to a distance of about 12 cm, and air-dry the plate. Spray evenly a solution of 8-hydroxyquinoline in methanol (1 in 100) on the plate, expose the plate to ammonia, and examine under ultraviolet light (wavelength 365 nm); the R_f values of the spots obtained from the test solution and the standard solution are the same.

Melting point Between 120 and 135 ℃.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Magnesium Dimecrotate according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of the lead standard solution (NMT 20 ppm).

(2) ***Arsenic***—Proceed with 0.25 g of Magnesium Dimecrotate according to Method 3 and perform the test. Prepare the control solution with 1 mL of the arsenic standard solution (NMT 4 ppm).

(3) ***Related substances*** —Weigh accurately about 10 mg of Magnesium Dimecrotate, dissolve in the mobile phase to make exactly 50 mL, and use this solution as the test solution. Separately, weigh accurately 1 g of dimecrotic acid RS, 10 mg of resorcinol RS, 10 mg of 4-methyl-7-methoxycoumarin RS and 10 mg of 4-methyl-7-hydroxycoumarin RS, dissolve in the mobile phase to make exactly 50 mL, and use this solution as the standard solution (1). Weigh accurately 15 mg of dimecrotic acid E-isomer RS, dissolve in the mobile phase to make exactly 50 mL, and use this solution as the standard solution (2). Pipet 10 mL each of the standard solution (1) and the standard solution (2), add the mobile phase to make exactly 50 mL, and use these solutions as the standard solution (3). Perform the test with 20 μL each of the test solution and the standard solution (3) as directed under the Liquid Chromatography according to the following conditions, and determine the amount of each related substance according to the following equation; resorcinol, 4-methyl-7-methoxycoumarin and 4-methyl-7-hydroxycoumarin are NMT 0.15% respectively, each related substance is NMT 0.10%, dimecrotate E-isomer is NMT 1.5%, and the total amount of related substances is NMT 2.0%.

$$\text{Content (\%) of each related substance} = 100 \times \frac{C_S}{C_T} \times \frac{A_T}{A_S}$$

*C*s: Concentration (mg/mL) of each related substance in the standard solution

C_T: Concentration (mg/mL) of dimecrotic acid in the test solution

A_T: Peak area of each related substance in the test solution

*A*s: Peak area of each related substance in the standard solution

$$\text{Content (\%) of each related substance} = 100 \times \frac{C_S}{C_T} \times \frac{A_T}{A_S} \times \frac{100}{94.79}$$

*C*s: Concentration (mg/mL) of dimecrotic acid in the standard solution

C_T: Concentration (mg/mL) of dimecrotic in the test solution

A_T: Peak area of each related substance in the test solution

*A*s: Peak area of each related substance in the standard solution

Operating conditions

Detector: An UV-vis spectrophotometer (wavelength: 210 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 30 ℃.

Mobile phase: A mixture of pH 3.0 sodium phosphate monobasic buffer and acetonitrile (7 : 3).

Flow rate: 1.0 mL/min

System suitability

System performance: Proceed with 20 μL of the standard solution (3) according to the above conditions; the resolution between the peaks of resorcinol, 4-methyl-7-methoxycoumarin, 4-methyl-7-hydroxycoumarin, dimecrotic acid and dimecrotic acid E-isomer is NLT 2.0.

Water NMT 15.0% (0.05 g, volumetric titration, direct titration).

Assay (1) ***Dimecrotic acid***—Weigh accurately about 10 mg of Magnesium Dimecrotate, dissolve in the mobile phase to make exactly 50 mL, and use this solution as the test solution. Separately, weigh accurately 10 mg of dimecrotic acid RS, dissolve in the mobile phase to make exactly 50 mL, and use this solution as the test solution. Proceed with 20 μL each of the test solution and the standard solution, and perform the test as directed under the Liquid Chromatography according to the operating conditions for related substances to determine the peak areas of dimecrotic acid in each solution, A_T and A_S.

$$\text{Content (\%) of magnesium dimecrotate } (C_{24}H_{26}O_8Mg) = 100 \times \frac{C_S}{C_T} \times \frac{A_T}{A_S} \times \frac{100}{94.79}$$

C_S: Concentration (mg/mL) of dimecrotic acid in the standard solution

C_T: Concentration (mg/mL) of dimecrotic acid in the test solution.

(2) ***Magnesium***—Weigh accurately about 0.15 g of Magnesium Dimecrotate, dissolve in 50 mL of water, and heat at 80 ℃. After cooling, add 15 mL of ammonia buffer solution and 2 mL of strong ammonia water, and titrate with 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS until reddish purple changes to bluish purple (Indicator: 40 mg of eriochrome black T-sodium chloride indicator).

Each of 0.05 mol/L Ethylenediaminetetraacetic acid disodium salt VS
= 1.21 mg of Mg

Packaging and storage Preserve in well-closed containers.

Magnesium Dimecrotate Tablets
디메크로트산마그네슘 정

Magnesium Dimecrotate Tablets contains NLT 90.0% and NMT 110.0% of the labeled amount of magnesium dimecrotate ($C_{24}H_{26}O_8Mg$: 466.75).

Method of preparation Prepare Magnesium Dimecrotate Tablets as directed under Tablets, with Magnesium Dimecrotate.

Identification (1) Powder 5 Magnesium Dimecrotate Tablets, add 25 mL of water, and dissolve until fully disintegrated; the pH of the resulting solution is between 6.0 and 8.5.

(2) Powder 1 tablet of Magnesium Dimecrotate Tablets, dissolve in water, and add 2 drops of bromine water; the resulting solution exhibits a pink color and then is decolorized. In the case of sugar-coated tablets, remove the sugar coating by previously washing the coated sugar with water.

(3) Powder 2 tablets of Magnesium Dimecrotate Tablets, extract with ethanol(95), and evaporate ethanol(95). Dissolve the residue in 10 mL of ethanol(95) and use this solution as the test solution. In the case of sugar-coated tablets, remove the sugar coating by previously washing the coated sugar with water. Separately, weigh 1 g of dimecrotic acid RS, add ethanol(95) to make 100 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 50 μL each of the test solution and the standard solution on a plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of toluene, ethyl formate and anhydrous formic acid (5 : 4 : 1) as the developing solvent to a distance of about 13 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the R_f values of the spots obtained from the test solution and the standard solution are the same.

(4) Powder 2 Magnesium Dimecrotate Tablets, extract with ethanol(95), and evaporate ethanol(95). Dissolve the residue in 4 mL of ethanol(95) and use this solution as the test solution. In the case of sugar-coated tablets, remove the sugar coating by previously washing the coated sugar with water. Separately, weigh 6 g of magnesium chloride, dissolve in water to make 100 mL, and use this solution as the standard solution (0.5% as magnesium). With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 2 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of cellulose with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of water, hydrochloric acid and methanol (1 : 1 : 1) to a distance of about 12 cm, and air-dry the plate. Spray evenly a solution of 8-hydroxyquinoline in methanol (1 in 100) on the plate, expose the plate to ammonia, and examine under ultraviolet light (wavelength 365 nm); the R_f values of the spots obtained from the test solution and the standard solution are the same.

Dissolution Perform the test with 1 tablet of Magnesium Dimecrotate Tablets at 100 revolutions per minute according to Method 1 under the Dissolution, using 900 mL of water as the dissolution medium. Take 20 mL of the dissolved solution 60 minutes after starting the Dissolution, filter through a membrane filter with a pore size not exceeding 0.45 μm, discard the first 10 mL of the filtrate, and use the subsequent filtrate as the test solution. Separately, weigh accurately about 75 mg of dimecrotic acid RS and add methanolic hydrochloric acid solution to make exactly 50 mL. Pipet 1 mL of this solution, add methanolic hydrochloric acid solution to make exactly 100 mL, and use this solution as the standard solution. Perform the test using the test solution and the standard solution as directed under the Ultraviolet-visible Spectroscopy, and measure the absorbance A_T and A_S at a wavelength of 280 nm. Meets the requirements if the dissolution rate in 60 minutes is NLT 60%.

Dissolution rate (%) of the labeled amount of Magnesium dimecrotate ($C_{24}H_{26}O_8Mg$)
$= W_S \times (A_T / A_S) \times (1 / C) \times 18 \times (100 / 94.79)$

W_S: Amount (mg) of dimecrotic acid RS
C: Labeled amount (mg) of magnesium dimecrotate ($C_{24}H_{26}O_8Mg$) in 1 tablet

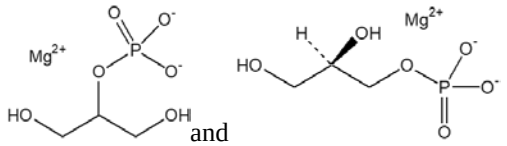
Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 tables of Magnesium Dimecrotate Tablets and powder. In the case of sugar-coated tablets, remove the sugar coating by previously washing the coated sugar with water. Weigh accurately an amount, equivalent to 75 mg of magnesium dimecrotate ($C_{24}H_{26}O_8Mg$), add 20 mL of methanolic hydrochloric acid solution, shake carefully to mix with a glass rod, and decant in a volumetric flask. Add the methanolic hydrochloric acid solution in the residue, repeat the procedure, and add methanolic hydrochloric acid solution to make exactly 50 mL. Filter this solution, discard the first filtrate, pipet 1 mL of the subsequent filtrate, add the methanolic hydrochloric acid solution to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 75 mg of dimecrotic acid RS and add methanolic hydrochloric acid solution to make exactly 50 mL. Pipet 1 mL of this solution, add methanolic hydrochloric acid solution to make 100 mL, and use this solution as the standard solution. Perform the test using the test solution and the standard solution as directed under the Ultraviolet-visible Spectroscopy, and measure the absorbance, A_T and A_S at a wavelength of 280 nm.

Amount (mg) of magnesium dimecrotate($C_{24}H_{26}O_8Mg$)
= Amount (mg) of dimecrotic acid RS × (A_T / A_S) × 1.055

Packaging and storage Preserve in light-resistant, well-closed containers.

Magnesium Glycerophosphate
글리세로인산마그네슘



and
and enantiomer

$C_3H_7MgO_6P$: 194.36
Magnesium 2,3-dihydroxypropyl phosphate

Magnesium Glycerophosphate contains NLT 11.0% and NMT 12.5% of Mg, calculated on the dried basis.

Description Magnesium Glycerophosphate occurs as a white powder.
It is practically insoluble in ethanol(95).
It dissolves in dilute solutions of acids.
It is hygroscopic.

Identification (1) Weigh 1 g of Magnesium Glycerophosphate into a test tube connected to a glass column, add 1 g of potassium hydrogen sulfate, mix, and then heat strongly to produce white vapors. Pass the vapors into a newly prepared 1% w/v solution of pentacyanonitrosyl iron(III) acid sodium dihydrate, and drop piperidine onto the filter paper; the filter paper develops a blue color in contact with piperidine.

(2) Incinerate 0.1 g of Magnesium Glycerophosphate in a crucible, add 5 mL of nitric acid to the residue, and heat it for 1 min on a steam bath and filter it. The filtrate responds to the Qualitative test 2) for phosphate.

(3) Magnesium Glycerophosphate responds to the Qualitative tests for magnesium.

Purity (1) ***Clarity and color of solution***—Dissolve 2.5 g of Magnesium Glycerophosphate in water and make 50 mL; the resulting solution is not more turbid than the reference turbidity solution.

Reference turbidity solution—Add 70 mL of water to 30 mL of standard turbidity solution. Prepare when use and shake well for use.

Prepare as directed under the Reagents of Pharmaceutical plastic container test.

(2) ***Acid***—Dissolve 1.0 g of Magnesium Glycerophosphate in 100 mL of water and titrate with 0.1 mol/L sodium hydroxide solution (indicator: 2 drops of phenolphthalein TS); the consumption is NMT 1.5 mL.

(3) ***Chloride***—Proceed with 0.20 g of Magnesium Glycerophosphate and perform the test. Prepare the control solution with 0.84 mL of 0.01 mol/L hydrochloric acid solution (NMT 0.15%).

(4) ***Sulfate***—Proceed with 0.20 g of Magnesium Glycerophosphate and perform the test. Prepare the control solution with 0.42 mL of 0.005 mol/L sulfuric acid VS (NMT 0.1%).

(5) ***Phosphate***—Dissolve 2.5 g of Magnesium Glycerophosphate in water to make 50mL. To 4.0 mL of this solution, add water to make 100 mL. And, to 1.0 mL of this solution, add water to make 100 mL and use this solution as the test solution. Add 4 mL of sulfomolybdic acid TS and 0.1 mL of tin(II) chloride solution to the test solution and allow to stand for 10 minutes; the color obtained is not darker than the color obtained by preparing the mixture of 2 mL of phosphate standard solution and 98 mL of water as described above (NMT 0.5%).

(6) ***Heavy metals***—Dissolve 1.0 g of Magnesium Glycerophosphate in 20 mL of water, add 15 mL of hydrochloric acid, and then add 25 mL of 4-methyl-2-pentanone. Shake the mixture for 1 minute. After standing, take the aqueous layer and evaporate to dryness. Dissolve the residue in 2 mL of dilute acetic acid, add 50 mL of water, and use this solution as the test solution. Prepare the control solution with 2.0 mL of the lead standard solution (NMT 20 ppm).

(7) ***Iron*—**Put 67 mg of Magnesium Glycerophosphate into a Nestler tube and dissolve it in water to make 10 mL, add 2 mL of 20% w/v citric acid solution and 0.1 mL of mercaptoacetic acid, and mix, and then, make the solution alkaline by adding 10 mol/L ammonia water and make 20 mL with water. Allow it to stand for 5 minutes; the color of this solution is less intense than that obtained by taking 1.0 mL of the iron standard solution and adjusting the volume to 10 mL with water, using the same procedure described above (NMT 150 ppm).

(8) ***Glycerin and ethanol solution*—**Dissolve 1.0 g of Magnesium Glycerophosphate in 25 mL of ethanol(95) and shake for 2 minutes, filter the mixture and wash the residue with 5 mL of ethanol(95). Combine the filtrate and the washed liquid, then evaporate it to dryness. Next, dry the residue at 70 ℃ for 1 hour and weigh the mass (NMT 1.5%).

Loss on drying NMT 12.0% (1 g, 150 ℃, 4 h.).

Assay Weigh accurately about 0.2 g of Magnesium Glycerophosphate, dissolve it in 40 mL of water, and then add 10 mL of ammonia-ammonium chloride buffer solution (pH 10.0). Titrate the solution with 0.1 mol/L ethylenediaminetetraacetic acid disodium salt solution. The endpoint of the titration is when the purple color turns blue (indicator: Eriochrome Black T-sodium chloride indicator, 50 mg).

Each mL of 0.1 mol/L
ethylenediaminetetraacetic acid disodium salt VS
= 2.431 of mg

Packaging and storage Preserve in tight containers.

Magnesium Hydroxide
수산화마그네슘

$Mg(OH)_2$: 58.32

[*1309-42-8*]

Magnesium Hydroxide, when dried, contains NLT 95.0% and NMT 100.5% magnesium hydroxide [$Mg(OH)_2$].

Description Magnesium Hydroxide occurs as a white, massive powder.
It is practically insoluble in water or ethanol(95).
It dissolves in dilute hydrochloric acid.

Identification A solution of Magnesium Hydroxide in 3 mol/L hydrochloric acid TS (1 in 20) responds to the Qualitative Analysis (1) for magnesium.

Purity (1) ***Soluble salts*—**Weigh accurately 2.0 g of Magnesium Hydroxide, place in a beaker, add 100 mL of water, and cover with a watch glass. Heat on a steam bath for 5 minutes, and filter while it is still hot. After cooling, add water to the filtrate to make 100 mL. To 50 mL of this solution, add 2 drops of methyl red TS, and titrate with 0.1 mol/L sulfuric acid VS until the resulting solution exhibits a red color; the consumed amount is NMT 2.0 mL. Also, from the solution made to 100 mL above, evaporate 25 mL to dryness, and dry the residue at 105 ℃ for 3 hours; the amount is NMT 10 mg.

(2) ***Carbonate*—**To 0.10 g of Magnesium Hydroxide, add 5 mL of water and boil. After cooling, add 5 mL of 6 mol/L acetic acid; the resulting solution hardly exhibits bubbles.

(3) ***Calcium*—**Place 0.25 g of Magnesium Hydroxide, previously dried, in a beaker, add 30 mL of diluted hydrochloric acid (1 in 10), and stir to dissolve, with heating if necessary, Place 200 mL of this solution in a volumetric flask, add 4 mL of lanthanum TS, add water to make 200 mL, and use this solution as the test solution. Separately, weigh accurately 249.7 mg of calcium carbonate, previously dried at 300 ℃ for 3 hours and cooled in a silica gel desiccator for 2 hours, dissolve in a small amount of hydrochloric acid, and add water to make exactly 100 mL. Place 5.0, 10.0 and 15.0 mL each of this solution in respective 1000-mL volumetric flasks, add 20 mL of lanthanum TS and 40 mL of diluted hydrochloric acid (1 in 10) to each, fill each flask to the gauge line, and use each of these solutions as the standard solution. Each of these standard solutions contains 5.0, 10.0 and 15.0 μg of calcium per mL, respectively. Place 4 mL of lanthanum TS and 10 mL of diluted hydrochloric acid (1 in 10) in a 200-mL volumetric flask, add water to the gauge line, and use this solution as the blank test solution. Perform the test with the blank test solution, the test solution, and the standard solutions as directed under the calibration curve under the Atomic Absorption Spectroscopy, and determine the amount of calcium; the amount is NMT 1.5%.

Gas: Air–acetylene
Lamp: Calcium hollow cathode lamp
Wavelength: 422.7 nm

(4) ***Heavy metals*—**Dissolve 1.0 g of Magnesium Hydroxide in 15 mL of 3 mol/L hydrochloric acid TS, and evaporate to dryness on a steam bath. Dissolve the residue in 20 mL of water, and filter. To the filtrate, add 2 mL of 1 mol/L acetic acid, neutralize with a Litmus paper, add water to make 50 mL, and use this solution as the test solution. Separately, proceed with 15 mL of 3 mol/L hydrochloric acid TS in the same manner as the preparation of test solution, and use the resulting solution as the control solution. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(5) ***Lead*—**Dissolve 1.0 g of Magnesium Hydroxide in 20 mL of 3 mol/L hydrochloric acid TS, and use this solution as the test solution. Place the test solution in a separatory funnel and wash it with 10 mL of water. Add 6 mL of diammonium hydrogen citrate solution, 2 mL of hydroxylamine hydrochloride TS and 2 drops of phenol red TS, and add strong ammonia water until the solution becomes alkaline. If necessary, cool the solution, add 2 mL of potassium cyanide solution, and perform extrac-

tion with every 5 mL of extracting dithizone solution until the extract exhibits a green color. Combine the resulting extracts in another separatory funnel. To the combined extracts, add 20 mL of diluted nitric acid (1 in 100), shake to mix for 30 seconds, and discard the chloroform layer. To the nitric acid layer, add 5.0 mL of standard dithizone solution and 4 mL of ammonia-cyanide TS, and shake to mix for 30 seconds; the violet color of the chloroform layer is not more intense than the color of a solution prepared by proceeding with 1.5 mL of diluted lead standard solution (1 in 10) in the same manner as the preparation of the test solution (NMT 1.5 ppm).

Ammonia-cyanide TS—Dissolve 2 g of potassium cyanide in 15 mL of ammonia water(28), and dilute with water to make 100 mL.

(6) ***Arsenic***—To 0.5 g of Magnesium Hydroxide, add 10 mL of dilute hydrochloric acid, and warm to dissolve. After cooling, use this solution as the test solution and perform the test (NMT 4 ppm).

Loss on drying NMT 2.0% (1 g, 105 ℃, 2 hours).

Loss on ignition Between 30.0% and 33.0% 1 g, 800 ℃).

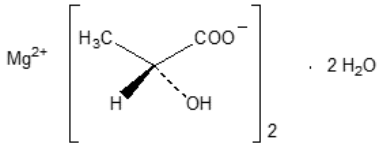
Microbiological examination of non-sterile products No colon bacterium is detected when tested.

Assay Weigh accurately about 75 mg of Magnesium Hydroxide, previously dried, place in an Erlenmeyer flask, add 2 mL of 3 mol/L hydrochloric acid TS, and stir to dissolve. To this solution, add 100 mL of water, and add 1 mol/L sodium hydroxide TS to adjust the pH to 7. To this, add 5 mL of pH 10.7 ammonia-ammonium chloride buffer solution, and titrate with 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS until the resulting solution exhibits a blue color (indicator: 0.15 mL of eriochrome black T TS).

Each mL of 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS
= 2.916 mg of $Mg(OH)_2$

Packaging and storage Preserve in tight containers.

Magnesium Lactate Hydrate
락트산마그네슘수화물



and enantiomer

$C_6H_{10}MgO_6 \cdot 2H_2O$: 238.48

Magnesium bis(2-hydroxypropanoate); Mixtures of magnesium (2*R*)-,(2*S*)-and (2*RS*)-2-hydroxy propanoate dihydrate

Magnesium Lactate Hydrate, when dried, contains NLT 98.0% and NMT 102.0% of magnesium lactate ($C_6H_{10}MgO_6$: 202.44).

Description Magnesium Lactate Hydrate occurs as a white powder and is odorless.
It is soluble in hot water and slightly soluble in cold water.

Identification Weigh about 1 g of Magnesium Lactate Hydrate, add 10 mL of dilute hydrochloric acid, dissolve by heating the solution on a steam bath, and filter. The filtrate responds to the Qualitative Analysis for magnesium salt and lactate.

pH Dissolve about 4.0 g of Magnesium Lactate Hydrate in 100 mL of water by heating, and cool; the pH of this solution is between 4.5 and 6.5.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Magnesium Lactate Hydrate in 50 mL of water by heating on a steam bath; the resulting solution is colorless and clear.

(2) ***Heavy metals***—Proceed with 2.0 g of Magnesium Lactate Hydrate according to Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Chloride***—Dissolve 0.35 g of Magnesium Lactate Hydrate in 30 mL of water by heating on a steam bath and add 6 mL of nitric acid (1 in 10) and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 1.0 mL of 0.01 mol/L hydrochloric acid VS (NMT 0.1%).

Loss on drying Between 11.9% and 18.2% (1 g, 130 ℃, 3 hours).

Assay Weigh accurately about 1.0 g of Magnesium Lactate Hydrate, previously dried, add water, and dissolve by heating on a steam bath. Add water to make 200.0 mL and filter. Add 90 mL of water to 10.0 mL of the filtrate, put 10 mL of triethanolamine (1 in 2) and 5 mL of ammonia-ammonium chloride buffer solution (pH 10.7), and titrate with 0.01 mol/L ethylenediaminetetraacetic acid disodium salt VS (indicator: 1 drop of eriochrome black T TS).

Each mL of 0.01 mol/L ethylenediaminetetraacetic acid disodium salt VS
= 2.0244 mg of $C_6H_{10}MgO_6$

Packaging and storage Preserve in tight containers.

Magnesium Lactate and Pyridoxine Hydrochloride Tablets
락트산마그네슘·피리독신염산염 정

Magnesium Lactate and Pyridoxine Hydrochloride Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of magnesium lactate hydrate ($C_6H_{10}MgO_6 \cdot 2H_2O$: 238.48) and NLT 90.0% and NMT 150.0% of the labeled amount of pyridoxine hydrochloride.

Method of preparation Prepare as directed under Tablets, with Magnesium Lactate Hydrate and Pyridoxine Hydrochloride.

Identification (1) ***Magnesium lactate hydrate***—(i) Magnesium: Weigh an amount of Magnesium Lactate and Pyridoxine Hydrochloride Tablets, equivalent to 1 g of magnesium lactate hydrate, add 10 mL of dilute hydrochloric acid and dissolve it by warming on a steam bath and filter. Use this filtrate as the test solution. This test solution responds to the Qualitative Analysis for magnesium.

(ii) Lactic acid: Add potassium permanganate TS to the test solution and heat it; the odor of acetaldehyde is evolved.

(2) ***Pyridoxine hydrochloride***—Take Magnesium Lactate and Pyridoxine Hydrochloride Tablets and perform the test as directed under the Identification of pyridoxine hydrochloride under Analysis for Vitamins

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay (1) ***Magnesium lactate hydrate***—Weigh accurately the mass of NLT 20 tablets of Magnesium Lactate and Pyridoxine Hydrochloride Tablets, and powder. Weigh accurately about 1.0 g of magnesium lactate hydrate ($C_6H_{10}MgO_6 \cdot 2H_2O$), add water, and dissolve by heating on a steam bath. After cooling, add water to make 200 mL, and filter. Add 90 mL of water to 10.0 mL of the filtrate, put 10 mL of triethanolamine (1 in 2) and 5 mL of ammonia-ammonium chloride buffer solution (pH 10.7), and titrate with 0.01 mol/L ethylenediaminetetraacetic acid disodium salt VS (indicator: 1 drop of eriochrome black T TS). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.01 mol/L ethylenediaminetetraacetic acid disodium salt VS
= 2.3848 mg of $C_6H_{10}MgO_6 \cdot 2H_2O$

(2) ***Pyridoxine hydrochloride***—Weigh accurately the mass of over 20 tablets of Magnesium Lactate and Pyridoxine Hydrochloride Tablets and powder. Perform the test as directed under the Analysis for Vitamins.

Packaging and storage Preserve in tight containers.

Magnesium Oxide
산화마그네슘

MgO : 40.30

[*1309-48-4*]

Magnesium Oxide, when ignited, contains NLT 96.0% and NMT 101.0% of magnesium oxide (MgO).

5 g of Magnesium Oxide of which the volume is NMT 30 mL can be referred to as heavy magnesium oxide by the nickname.

Description Magnesium Oxide occurs as white powder or grains. It is odorless.
It is practically insoluble in water, ethanol(95) or ether.
It dissolves in dilute hydrochloric acid.
It absorbs moisture and carbon dioxide in the air.

Identification A solution of Magnesium Oxide in dilute hydrochloric acid (1 in 50) responds to the Qualitative Analysis for magnesium salt.

Purity (1) ***Alkali and soluble salts***—Place 2.0 g of Magnesium Oxide in a beaker, add 100 mL of water, cover with a watch glass, and heat on a steam bath for 5 minutes. Immediately filter, cool, take 50 mL of the filtrate, and add 2 drops of methyl red TS and 2.0 mL of 0.05 mol/L sulfuric acid VS. The solution exhibits a red color. Also, evaporate 25 mL of the filtrate to dryness and dry the residue at 105 ℃ for 1 hour. The obtained amount is NMT 10 mg.

(2) ***Carbonate***—To 0.10 g of Magnesium Oxide, add 5 mL of water and boil. After cooling, add 5 mL of acetic acid(31). The solution hardly exhibits bubbles.

(3) ***Heavy metals***—Dissolve 1.0 g of Magnesium Oxide in 20 mL of dilute hydrochloric acid, evaporate to dryness on a steam bath, and dissolve the residue in 35 mL of water. Add 1 drop of phenolphthalein TS, neutralize with ammonia TS, and add 2 mL of dilute hydrochloric acid. If necessary, filter, wash the filter paper, combine the washings with the filtrate, and add water to make 50 mL. Use this as the test solution and perform the test. Prepare the control solution by adding 1 drop of phenolphthalein TS to 20 mL of dilute hydrochloric acid, neutralizing with ammonia TS, and adding 2 mL of dilute hydrochloric acid, 2.0 mL of lead standard solution, and water to make 50 mL (NMT 20 ppm).

(4) ***Iron***—Prepare the test solution with 40 mg of Magnesium Oxide according to Method 1 and perform the test according to Method A. Prepare the control solution with 2.0 mL of iron standard solution (NMT 500 ppm).

(5) ***Calcium oxide***—Weigh accurately 0.25 g of Magnesium Oxide, previously ignited, add 6 mL of dilute hydrochloric acid and heat to dissolve. After cooling, add 300 mL of water, 3 mL of L-tartaric acid solution (1 in 5), 10 mL of 2,2',2″-nitrilotriethanol solution (3 in 10), and 10 mL of 8 mol/L potassium hydroxide TS, allow to

stand for 5 minutes, and titrate with 0.01 mol/L ethylenediaminetetraacetic acid disodium salt VS (indicator: 0.1 g of NN indicator). However, the endpoint of titration is when the purple color of the solution turns to the blue color. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.01 mol/L ethylenediaminetetraacetic acid disodium salt VS
= 0.5608 mg of CaO

The amount of calcium oxide (CaO : 56.08) is NMT 1.5%.

(6) ***Arsenic*—**Dissolve 0.5 g of Magnesium Oxide in 5 mL of dilute hydrochloric acid. Use this as the test solution and perform the test (NMT 4 ppm).

(7) ***Acid insolubles*—**To 2.0 g of Magnesium Oxide, add 75 mL of water. While shaking for mixing, add 12 mL of hydrochloric acid dropwise, and boil for 5 minutes. Filter with a filter paper for qualitative analysis and take the insolubles. Wash the insolubles with water until no turbidity is observed even after adding silver nitrate TS to the washings. Ignite the residue together with the filter paper to ash. The obtained amount is NMT 2.0 mg.

(8) ***Fluoride*—**Perform the test as directed in Purity (7) under Natural Aluminum Silicate. The amount of fluorine (F : 19.00) is NMT 0.08%.

Loss on ignition NMT 10% (0.25 g, 900 ℃, constant mass).

Assay Weigh accurately about 0.2 g of Magnesium Oxide, previously ignited at 900 ℃ to a constant mass, dissolve in 10 mL of water and 4.0 mL of dilute hydrochloric acid, and add water to make exactly 100 mL. Pipet 25 mL of this solution, add 50 mL of water and 5 mL of pH 10.7 ammonia-ammonium chloride buffer solution, and titrate with 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS (indicator: 40 mg of eryochrome black T-sodium chloride indicator). Perform a blank test in the same manner and make any necessary correction.
From the consumed amount of the 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS, subtract the amount of 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS that is equivalent to calcium oxide (CaO) obtained as directed in Purity (5).

Each mL of 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS
= 2.0152 mg of MgO

Each mg of calcium oxide (CaO)
= 0.36 mL of 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS

Packaging and storage Preserve in tight containers.

Magnesium Silicate
규산마그네슘

Magnesium Silicate contains NLT 45.0% of silicon dioxide (SiO_2: 60.08) and NLT 20.0% of magnesium oxide (MgO: 40.30) and the ratio of percentages (%) of silicon dioxide to magnesium oxide is NLT 2.2 and NMT 2.5.

Description Magnesium Silicate occurs as a white fine powder. It is odorless and tasteless.
It is practically insoluble in water, ethanol(95) or ether.

Identification (1) Weigh about 0.5 g of Magnesium Silicate and dissolve in 10 mL of dilute hydrochloric acid, and shake to mix and filter the solution. Add ammonia TS to the filtrate to neutralize. The resulting solution responds to the Qualitative Analysis for magnesium salt.

(2) Prepare the bead by fusing sodium ammonium hydrogen phosphate tetrahydrate and place the bead on a platinum loop. Coast Magnesium Silicate to fuse again: infusible masses appear in the bead, which changes to an opaque bead with clear strips upon cooling.

Purity (1) ***Soluble salts*—**Weigh 10.0 g of Magnesium Silicate and dissolve in 150 mL of water, and shake to mix on a steam bath for 60 minutes. After cooling it down, add water to make 150 mL. Pipet 75 mL of the resulting transparent solution from centrifugation, add water to make 100 mL, and use this solution as the test solution. Pipet 25 mL of the test solution to evaporate to dryness on a steam bath and ignite at 700 ℃ for 2 hours; the resulting solution is NMT 20 mg.

(2) ***Alkali*—**Pipet 20 mL of the test solution from (1) and add 2 drops of phenolphthalein TS and 1.0 mL of 0.1 mol/L hydrochloric acid solution; the resulting solution is colorless.

(3) ***Chloride*—**Pipet 10 mL of the test solution from (1) and add 6 mL of dilute nitric acid and water to make 50 mL. Use the resulting solution as the test solution and perform the test. Prepare the control solution with 0.75 mL of 0.01 mol/L hydrochloric acid solution (NMT 0.053%).

(4) ***Fluoride*—**Weigh 5.0 g of Magnesium Silicate, add 45 mL of 0.1 mol/L hydrochloric acid TS, shake to mix at room temperature for 15 minutes, and filter with a 0.45 μm membrane filter. Wash the filter with 1 mL of 0.1 mol/L hydrochloric acid TS repeat this procedure for 5 times, transfer the washings in a flask, and add 0.1 mol/L hydrochloric acid TS to make exactly 50 mL. Use this solution as the test solution. Separately dissolve alizarin complexone in 60% 2-propanol so that each mL contains 0.1 g, and if necessary, filter and use this solution as the indicator. Pipet 5.0 mL of the test solution and transfer to a 25 mL volumetric flask. Add 5.0 mL of indicator and water to make 25 mL, and allow it to stand at room temperature for 1 hour. With this solution, determine the absorbance of the test solution, as directed under Ultraviolet-visible Spectroscopy, using the blank test solution

made by adding 5.0 mL of indicator and 15.0 mL of water to 5.0 mL of 0.1 mol/L hydrochloric acid TS; the absorbance of the test solution at 620 nm is not greater than that of 5 mL of the following control solution (NMT 10 ppm).

Control solution—Dissolve sodium fluoride in 0.1 mol/L hydrochloric acid TS so that each mL contains 2.21 μg.

(5) ***Sulfate***—Add 3 mL of dilute hydrochloric acid to the residue from (1) and heat on a steam bath for 10 minutes, add 30 mL of water, and filter it. Wash with water, and combine the filtrate and the washings to make 50 mL. Pipet 4 mL of this solution, and add 1 mL of dilute hydrochloric acid and water to make 50 mL. Use the resulting solution as the test solution and perform the test. Prepare the control solution with 1.0 mL of 0.005 mol/L sulfuric acid (NMT 0.480%).

(6) ***Heavy metals***—Weigh 1.0 g of Magnesium Silicate, add 20 mL of water and 3 mL of hydrochloric acid, boil for 2 minutes, filter, and wash twice with 5 mL of water, respectively. Combine the filtrate and the washings, evaporate to dryness on a steam bath, add 2 mL of dilute acetic acid to the residue, and warm to dissolve. If necessary, filter and add water to make 50 mL. Use the resulting solution as the test solution and perform the test. Prepare the control solution by adding 2 mL of dilute acetic acid and water to 2.0 mL of lead standard solution to make 50 mL (NMT 20 ppm).

(7) ***Arsenic***—Weigh 0.4 g of Magnesium Silicate in 5 mL of dilute hydrochloric acid, shake well to mix, and heat gently until it boils. Cool it down quickly, and then centrifuge. Add 5 mL of dilute hydrochloric acid to the residue, shake well to mix, and centrifuge. Add 10 mL of water again to perform the same procedure, add all the extracts, and heat to concentrate on a steam bath to make 5 mL. Use this solution as the test solution (NMT 5 ppm).

Loss on ignition NMT 34.0% (0.5 g, 850 ℃, 3 hours).

Acid-neutralizing capacity Weigh accurately about 0.2 g of Magnesium Silicate, transfer to a flask with a stopper, add exactly 30 mL of 0.1 mol/L hydrochloric acid and 20 mL of water, and shake to mix at 37 ± 2 ℃ for 1 hour. Cool, pipet 25 mL of the clear supernatant, and titrate excess hydrochloric acid with 0.1 mol/L sodium hydroxide solution by shaking well to mix until the pH becomes 3.5. The volume of 0.1 mol/L hydrochloric acid consumed, calculated on a residue basis from loss on ignition of Magnesium Silicate, is between 140 mL and 160 mL to per g of Magnesium Silicate.

Assay (1) ***Silicon dioxide***—Weigh accurately about 0.7 g of Magnesium Silicate, add 10 mL of 0.5 mol/L sulfuric acid TS, and evaporate to dryness on a steam bath. Add 25 mL of water to the residue, and heat on a steam bath for 15 minutes with occasional stirring. Filter the clear supernatant through a filter paper, add 25 mL of hot water to the residue, stir to mix, and decant the clear supernatant on the filter paper to filter. Wash the residue in the same manner twice with 25 mL of hot water respectively, transfer the residue onto the filter paper, and wash with hot water until the washings do not respond to the Qualitative Analysis (1) for sulfate. Transfer the residue to a platinum crucible with the filter paper, ignite to incinerate, and ignite again at 775 to 825 ℃ for 30 minutes. Cool and weigh the residue as a (g). Moisten the residue with water, and add 6 mL of hydrofluoric acid and 3 drops of sulfuric acid. Evaporate to dryness, ignite for 5 minutes, cool, and weigh the residue as b (g).

$$\text{Amount of silicon dioxide } (SiO_2)\ (\%) = \frac{a - b}{\text{Amount of sample (g)}} \times 100$$

(2) ***Magnesium oxide***—Weigh accurately about 0.3 g of Magnesium Silicate, transfer to a Erlenmeyer flask, add 10 mL of 0.5 mol/L sulfuric acid TS, and heat on a steam bath for 15 minutes. Transfer to a 100-mL volumetric flask after cooling, wash the Erlenmeyer flask with water, and add the washings and water to make 100 mL. Filter this solution, pipet 50 mL of the filtrate, add 50 mL of water and 5 mL of diluted 2,2′,2″-nitrilotriethanol (1 in 2), and shake well to mix. Add 2.0 mL of ammonia TS and 10 mL of ammonia-ammonium chloride buffer solution, pH 10.7, and titrate with 0.05 mol/L ethylenediaminetetraacetic acid (EDTA) disodium salt solution (indicator: 40 mg of Eryochrome black T-sodium chloride indicator).

Each mL of 0.05 mol/L
ethylenediaminetetraacetic acid disodium salt VS
= 2.0152 mg of MgO

(3) ***Ratio of percentages (%) of silicon dioxide (SiO_2) to magnesium oxide (MgO)***—Calculate from the results obtained by the Assay (1) and (2).

Packaging and storage Preserve in well-closed containers.

Magnesium Sulfate Hydrate
황산마그네슘수화물

$MgSO_4 \cdot 7H_2O$: 246.48
Magnesium Sulfate Heptahydrate [10034-99-8]

Magnesium Sulfate Hydrate, when ignited, contains NLT 99.0% and NMT 101.0% of magnesium sulfate ($MgSO_4$: 120.37).

Description Magnesium Sulfate Hydrate occurs as a colorless or white crystalline. It has a bitter, cool, and salty taste.
It is very soluble in water, and practically insoluble in ethanol(95) or ether.

Identification An aqueous solution of Magnesium Sul-

fate Hydrate (1 in 40) changes blue litmus paper to red and responds to the Qualitative Analysis for magnesium salt and sulfate.

pH Dissolve 1.0 g of Magnesium Sulfate Hydrate in 20 mL of water; the pH of this solution is between 5.0 and 8.2.

Purity (1) ***Clarity and color of solution*—**Dissolve 1.0 g of Magnesium Sulfate Hydrate in 20 mL of water; the resulting solution is colorless and clear.

(2) ***Chloride*—**Perform the test with 1.0 g of Magnesium Sulfate Hydrate. Prepare the control solution with 0.40 mL of 0.01 mol/L hydrochloric acid (NMT 0.014%).

(3) ***Heavy metals***—Proceed with 2.0 g of Magnesium Sulfate Hydrate according to Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(4) ***Mercapto compounds***—Dissolve 2.0 g of Magnesium Sulfate Hydrate in 20 mL of water, and add 1 mL of acetic acid(31) and 5 drops of potassium hexacyanoferrate(II) TS; the resulting solution does not become turbid.

(5) ***Iron*—** (i) Perform the test when used in the manufacturing of oral preparations. Weigh accurately 0.5 g of Magnesium Sulfate Hydrate, dissolve in water to make 40 mL, dilute with water to make 45 mL if necessary, and add 2 mL of hydrochloric acid. Use this solution as the test solution. Add water to 1.0 mL of iron standard solution to make 45 mL, add 2 mL of hydrochloric acid, and use this solution as the standard solution. Add 50 mg of ammonium peroxydisulfate and 3 mL of 30% ammonium thiocyanate to the test solution and the standard solution and mix; the color obtained from the test solution is not more intense than that from the standard solution (NMT 20 ppm).

(ii) Perform the test when used in the manufacturing of parenteral preparations. However, wash all the glass containers used in this test with dilute hydrochloric acid before use. Weigh accurately 10.0 g of Magnesium Sulfate Hydrate, dissolve in 35 mL of hydrochloric acid (1 in 1000) by sonication, and use this solution as the test solution. Pipet 5.0 mL of iron standard solution, add hydrochloric acid (1 in 1000) to make exactly 50 mL, and use this solution as the iron standard solution. Separately, to each of three 50-mL volumetric flasks, add 2.0, 5.0, and 10.0 mL of iron standard solution, and add hydrochloric acid (1 in 1000) to make 35 mL of standard solutions containing 2.0, 5.0, and 10.0 μg of iron. Separately, transfer 35 mL of hydrochloric acid (1 in 1000) in a 50-mL volumetric flask, and use this solution as the blank test solution. To each of the test solution, the standard solution, and the blank test solution, add 5 mL of ascorbic acid and 5 mL of coloring agent, add hydrochloric acid (1 in 1000) to make 50 mL, allow to stand for 10 minutes, and perform the test with the test solution and the standard solution as directed under the Ultraviolet-visible Spectroscopy using the blank test solution as the control solution. Measure the absorbance at the absorption maximum wavelength around 594 nm, and determine the iron content in the test solution using the calibration curve obtained from the absorbance of the standard solution; it is NMT 0.5 ppm.

Ascorbic acid TS—Dissolve 1.34 g of L-ascorbic acid in water to make 100 mL. This preparation is prepared before use.

Coloring agent—Dissolve 0.38 g of the color reagent 3-(2-pyridyl)-5,6-di-(2-furyl)-1,2,4-triazine-5',5"-disulfonic acid sodium salt in ammonium acetate solution (1 in 2) to make 100 mL. This preparation is prepared before use.

(6) ***Calcium*—**Dissolve 1.0 g of Magnesium Sulfate Hydrate in 5.0 mL of dilute hydrochloric acid and water to make 100 mL, and use this solution as the test solution. Separately, dissolve 1.0 g of Magnesium Sulfate Hydrate, 5 mL of dilute hydrochloric acid, and water to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbance, A_T and A_S, of the test solution and the standard solution as directed under the Atomic Absorption Spectroscopy according to the following conditions; A_T is less than (A_S - A_T) (NMT 0.02%).

Gas: Air–acetylene or hydrogen
Lamp: Calcium hollow cathode lamp
Wavelength: 422.7 nm

(7) ***Arsenic*—**Prepare the test solution with 1.0 g of Magnesium Sulfate Hydrate according to Method 1 and perform the test (NMT 2 ppm).

(8) ***Selenium*—**Weigh accurately 0.2 g of Magnesium Sulfate Hydrate, and burn as directed under the Oxygen Flask Combustion, using 50 mL of 0.25 mol/L nitric acid TS as the absorbent. Use a combustion flask with a volume of 1000 mL, combust, wash the stopper and the inner wall of the flask with 10 mL of water, and use 20 mL of water to move the solution in the combustion flask into a 150-mL beaker. Heat gently until it boils, boil for 10 minutes, cool to room temperature, and use this solution as the test solution. Separately, pipet 6.0 mL of standard selenium stock solution, add 25 mL of diluted nitric acid (1 in 30) and 25 mL of water, and use this solution as the standard solution. Add diluted ammonia water(28) (1 in 2) to each of the test and standard solutions, adjust the pH to 2.0 ± 0.2, dilute with water to make exactly 60 mL, and add 10 mL of water to move to a separatory funnel. Wash the separatory funnel with 10 mL of water. Add 0.2 g of hydroxylamine hydrochloride, dissolve by stirring, add 5.0 mL of 2,3-diaminonaphthalene TS, and put a stopper. Mix by stirring and allow to stand at room temperature for 100 minutes. To the resulting mixture, add 5.0 mL of cyclohexane, shake vigorously for two minutes, and allow to stand. If the layer is separated, remove the water layer, centrifuge cyclohexane extracts to remove water, and take the cyclohexane layer. With these solutions, perform the test as directed under the Ultraviolet-visible Spectros-

copy, using a solution obtained by proceeding with a solution of 25 mL of water in 25 mL of diluted nitric acid (1 in 30) in the same manner. Determine the absorption at absorption maximum wavelength of around 380 nm; the absorption of the solution from the test solution is not greater than the absorption from the standard solution (NMT 30 ppm).

Loss on ignition Between 45.0% and 52.0% (1 g, previously dried at 105 ℃ for 2 hours and ignited at 450 ℃ for 3 hours).

Assay Weigh accurately 0.6 g of Magnesium Sulfate Hydrate, previously dried at 105 ℃ for 2 hours and ignited at 450 ℃ for 3 hours, and dissolve in 2 mL of dilute hydrochloric acid and water to make exactly 100 mL. Pipet 25 mL of this solution, and perform the test as directed under the Assay of Magnesium Oxide.

Each mL of 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS
= 6.018 mg of $MgSO_4$

Packaging and storage Preserve in well-closed containers.

Magnesium Sulfate Injection
황산마그네슘 주사액

Magnesium Sulfate Injection, as an aqueous injection, contains NLT 95.0% and NMT 105.0% of the labeled amount of magnesium sulfate hydrate ($MgSO_4 \cdot 7H_2O$: 246.48).

Method of preparation Prepare as directed under Injections, with Magnesium Sulfate Hydrate.

Description Magnesium Sulfate Injection occurs as a colorless and clear liquid.

Identification Take Magnesium Sulfate Injection in the amount equivalent to 0.5 g of magnesium sulfate hydrate according to the labeled amount, and add water to make 20 mL; the solution responds to the Qualitative Analysis for magnesium salt and sulfate.

pH Between 5.5 and 7.0. When the labeled concentration is higher than 5%, use water to make a 5% solution and perform the test with this solution.

Sterility Meets the requirements.

Bacterial endotoxins Less than 0.09 EU per mg of Chlorpheniramine Maleate Injection. Use water for bacterial endotoxins test to dilute to 5 w/v% and perform the test.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

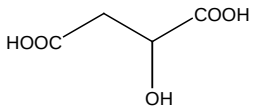
Extractable volume of injections Meets the requirements.

Assay Pipet Magnesium Sulfate Injection in the amount equivalent to about 0.3 g of magnesium sulfate hydrate ($MgSO_4 \cdot 7H_2O$), add water to make 75 mL, and add 5 mL of ammonia-ammonium chloride buffer solution, pH 10.7. Perform the test with this solution as directed under the Assay under Magnesium Sulfate.

Each mL of 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS
= 12.32 mg of $MgSO_4 \cdot 7H_2O$

Packaging and storage Preserve in hermetic containers. A plastic container for drugs may be used.

L-Malic Acid
L-말산



$C_4H_6O_5$: 134.09

2-Hydroxybutanedioic acid, [*97-67-6*]

L-Malic Acid, when dried, contains NLT 99.0% and NMT 101.0% of L-malic acid ($C_4H_6O_5$).

Description L-Malic Acid occurs as white or pale yellow crystals or a crystalline powder.
It is odorless.
It is freely soluble in water or in ethanol(95) and practically insoluble in chloroform.

Melting point—About 100 ℃.

Identification (1) An aqueous solution of L-Malic Acid (1 in 50) turns blue litmus test paper moistened with water to red.

(2) Put 0.1 g of L-Malic Acid and 0.1 g of resorcin in a test tube, shake well to mix, add 0.3 mL of sulfuric acid, heat until bubbles form. Then, carefully add 2 mL of cooled water and 15 mL of sodium hydroxide TS; the solution turns red and shows blue fluorescence when observed under UV light.

Optical rotation $[\alpha]_D^{20}$: Between -1.8° and -2.6° (after drying, 2 g, water 50 mL, 100 mm).

Purity (1) ***Clarity and color of solution***—Dissolve 0.1 g of L-Malic Acid in 10 mL of water; the solution is colorless and clear.

(2) ***Chloride***—Proceed with 0.5 g of L-Malic Acid and perform the test. Prepare the control solution with 0.3 mL of 0.01 mol/L hydrochloric acid VS (NMT 0.02%).

(3) ***Sulfate***—Proceed with about 1.0 g of L-Malic Acid and perform the test. Prepare the control solution with 0.4 mL of 0.005 mol/L sulfuric acid VS (NMT 0.019%).

(4) ***Heavy metals***—Proceed with 2.0 g of L-Malic Acid according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(5) ***Arsenic***—Prepare the test solution with 2.0 g of L-Malic Acid according to Method 1 and perform the test (NMT 1 ppm).

(6) ***Readily carbonizable substances***—Proceed with 0.5 g of L-Malic Acid and perform the test; the color of the test solution is not more intense than that of the matching fluid for color K.

Loss on drying NMT 10% (1 g, in vacuum, 60 ℃, 3 hours).

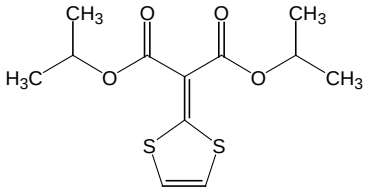
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.1 g of L-Malic Acid, previously dried, dissolve in 50 mL water, and titrate with 0.1 mol/L sodium hydroxide VS (indicator: 2 drops of phenolphthalein TS). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS
= 6.704 mg of $C_4H_6O_5$

Packaging and storage Preserve in tight containers.

Malotilate
말로틸레이트



$C_{12}H_{16}O_4S_2$: 288.39
1,3-Dithiol-2-ylidenepropanedioic acid bis(1-methylethyl) ester; 1,3-bis(1-Methylethyl) 2-(1,3-dithiol-2-ylidene)-propanedioic acid ester, [*59937-28-9*]

Malotilate, when dried, contains NLT 98.5% and NMT 101.0% of malotilate ($C_{12}H_{16}O_4S_2$).

Description Malotilate occurs as white or pale yellow crystals or a crystalline powder.
It is freely soluble in methanol, in chloroform, or in ethyl acetate, soluble in ethanol(95) or in hexane and practically insoluble in water.
It is gradually colored by light.

Melting point—Between 60 and 63 ℃.

Identification (1) To 2 mL of a solution of Malotilate in chloroform (1 in 20), add 2 mL of 2,4,7-trinitro-9-fluorenone TS; the solution turns red.

(2) To 0.1 g of Malotilate, add 0.5 g of sodium hydroxide, heat slowly to melt, carbonize, cool, and add 10 mL of dilute hydrochloric acid; the gas generated turns lead acetate paper to black.

(3) Determine the absorption spectrum of a solution of Malotilate in methanol (1 in 200000) as directed under the Ultraviolet-visible Spectroscopy; it exhibits maxima between 221 nm and 225 nm and between 359 nm and 363 nm.

Absorption $E_{1cm}^{1\%}$ (361 nm): Between 830 and 870 (after drying, 5 mg, methanol, 100 mL).

Purity (1) ***Clarity and color of solution***—To 0.5 g of Malotilate, add 50 mL of methanol; the solution is colorless to pale yellow.

(2) ***Heavy metals***—Proceed with 2.0 g of Malotilate according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Arsenic***—Prepare the test solution with 1.0 g of Malotilate according to Method 3 and perform the test (NMT 2 ppm).

Loss on drying NMT 0.5% (0.5 g, phosphorus pentoxide, 4 hours).

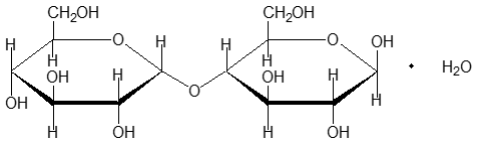
Residue on ignition NMT 0.1% (1 g, platinum crucible, 450 - 550 ℃).

Assay Weigh accurately about 0.1 g of Malotilate, previously dried, and dissolve in methanol to make exactly 200 mL. Pipet 1 mL of this solution, add methanol to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 0.1 g of malotilate RS, proceed in the same way as in the test solution, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at 361 nm as directed under the Ultraviolet-visible Spectroscopy, using methanol as the blank.

Amount (mg) of malotilate ($C_{12}H_{16}O_4S_2$)
= Amount (mg) of malotilate RS × (A_T / A_S)

Packaging and storage Preserve in well-closed containers.

Maltose Hydrate
말토오스수화물



Maltose $C_{12}H_{22}O_{11}\cdot H_2O$: 360.31
(2*R*,3*S*,4*S*,5*R*,6*R*)-2-(Hydroxymethyl)-6-[(2*R*,3*S*,4*R*,5*R*)-4,5,6-trihydroxy-2-(hydroxymethyl)oxan-3-yl]oxyoxane-3,4,5-triol hydrate [*6363-53-7*]

Maltose Hydrate, when dried, contains NLT 98.0% and NMT 101.0% of maltose ($C_{12}H_{22}O_{11}\cdot H_2O$).

Description Maltose Hydrate occurs as white crystals or a crystalline powder and has a sweet taste.
It is freely soluble in water, very slightly solution in ethanol(95) and practically insoluble in ether.

Identification (1) Dissolve 0.5 g of Maltose Hydrate in 5 mL of water, add 5 mL of ammonia TS, and heat on a steam bath for 5 minutes; an orange color appears.

(2) Add 2 to 3 drops of an aqueous solution of Maltose Hydrate (1 in 50) to 5 mL of boiling Fehling's TS; a red precipitate is formed.

Optical rotation $[\alpha]_D^{20}$: Between +126° and +131°. Weigh accurately about 10 g of Maltose Hydrate, previously dried, and dissolve in 0.2 mL of ammonia TS and water to make exactly 100 mL. Proceed with this solution to measure the specific optical rotation in a cell, 100-mm in path length.

pH The pH of an aqueous solution of Maltose Hydrate (1 in 10) is between 4.5 and 6.5.

Purity (1) ***Clarity and color of solution***—Weigh 10 g of Maltose Hydrate, put into a Nessler tube containing 30 mL of water, and dissolve it by heating on a steam bath at 60 ℃. After cooling, add water to make 50 mL; the solution is clear and the color of the solution is not more intense than the following control solution.

Control solution—To a mixture of 1.0 mL of cobalt(II) chloride hexahydrate colorimetric stock solution, 3.0 mL of iron(III) chloride hexahydrate colorimetric stock solution and 2.0 mL of copper(II) sulfate pentahydrate colorimetric stock solution, add water to make 10mL. Pipet 1.0 mL of this solution and add water to make 50 mL.

(2) ***Chloride***—Proceed with 2.0 g of Maltose Hydrate and perform the test. Prepare the control solution with 1.0 mL of 0.01 mol/L hydrochloric acid (NMT 0.018%).

(3) ***Sulfate***—Proceed with 2.0 g of Maltose Hydrate and perform the test. Prepare the control solution with 1.0 mL of 0.005 mol/L sulfuric acid (NMT 0.024%).

(4) ***Heavy metals***—Proceed with 5.0 g of Maltose Hydrate according to Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 4 ppm).

(5) ***Arsenic***—Dissolve 1.5 g of Maltose Hydrate in 5 mL of water, add 5 mL of dilute sulfuric acid and 1 mL of bromine TS, heat on a steam bath for 5 minutes, and concentrate further to reduce to 5 mL. After cooling, perform the test using the resulting solution as the test solution (NMT 1.3 ppm).

(6) ***Dextrin, soluble starch and sulfite***—Dissolve 1.0 g of Maltose Hydrate in 10 mL of water and add 1 drop of iodine TS; the solution turns yellow. Thereto add 1 drop of starch TS; the solution turns blue.

(7) ***Nitrogen***—Weigh accurately about 2.0 g of Maltose Hydrate and perform the test as directed under the Assay of nitrogen; the amount of nitrogen (N : 14.01) is NMT 0.01%. For decomposition, use 10 mL of sulfuric acid and add 45 mL of sodium hydroxide solution (2 in 5).

(8) ***Related substances***—Dissolve 0.5 g of Maltose Hydrate in 10 mL of water, and use this solution as the test solution. Pipet 1 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak areas from the test solution and the standard solution by the automatic integration method; the sum of areas of the peaks which appear before the peak of Maltose Hydrate obtained from the test solution is not larger than 1.5 times the peak area of Maltose Hydrate obtained from the standard solution. Also, the sum of areas of the peaks which appear after the peak of Maltose Hydrate obtained from the test solution is not larger than half the peak area of Maltose Hydrate obtained from the standard solution.

Operating conditions

For the detector, column, column temperature, mobile phase, flow rate and selection of column, proceed as directed in the operating conditions under the Assay.

Detection sensitivity: Adjust the sensitivity so that the peak height of maltose obtained from 20 μL of the standard solution is about 30 mm.

Time span of measurement: About 2 times the retention time of maltose.

Loss on drying NMT 0.5% (1 g, 80 ℃, 4 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.1 g each of Maltose Hydrate and maltose hydrate RS, dissolve each in the internal standard solution to make exactly 10 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the ratio of the peak area of maltose to that of the internal standard, Q_T and Q_S.

$$\text{Amount (mg) maltose hydrate } (C_{12}H_{22}O_{11}\cdot H_2O) = \text{Amount (mg) of maltose hydrate RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of ethylene glycol (1 in 50).

Operating conditions

Detector: A differential refractometer

Column: A stainless steel column about 8 mm in internal diameter and about 55 cm in length, packed with gel-typed strongly acidic cation exchange resin for liquid chromatography (10 μm in particle diameter) (cross-linking rate: 8%).

Column temperature: A constant temperature about 50 °C.

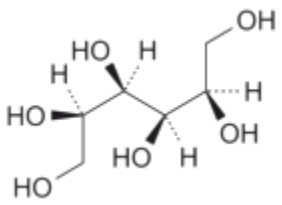
Mobile phase: Water

Flow rate: Adjust the flow rate so that the retention time of maltose is about 18 minutes.

Column selection: Dissolve 0.25 g of maltose, 0.25 g of glucose and 0.4 g of ethylene glycol in water to make 100 mL. Proceed with 20 μL of this solution under the above operating conditions. At this time, use a column from which maltose, glucose and ethylene glycol are eluted in this order with the resolution between the peaks of maltose and glucose being NLT 4.

Packaging and storage Preserve in tight containers.

D-Mannitol
D-만니톨



$C_6H_{14}O_6$: 182.17

(2*R*,3*R*,4*R*,5*R*)-Hexane-1,2,3,4,5,6-hexol [69-65-8]

D-Mannitol contains NLT 97.0% and NMT 102.0% of D-mannitol ($C_6H_{14}O_6$), calculated on the dried basis.

The label states, where applicable, the maximum concentration of bacterial endotoxins.

The label states, where applicable, that the substance is suitable for use in the manufacture of parenteral dosage forms.

Description D-Mannitol occurs as a white crystalline powder or grain. It is odorless, and has a sweet taste with a cold sensation.

It is freely soluble in water, and practically insoluble in ethanol(99.5).

It dissolves in sodium hydroxide TS.

It shows crystal polymorphism.

Identification Determine the infrared spectra of D-Mannitol and D-mannitol RS as directed in the potassium bromide disk method under Mid-infrared Spectrophotometry; both spectra exhibit similar intensities of absorption at the same wavenumbers. If any difference appears between the spectra, transfer 25 mg each of D-Mannitol and D-mannitol RS into glass vessels, dissolve in 0.25 mL of water without heating, dry the solutions in a 600 – 700 W microwave oven for 20 minutes or dry in vacuum in a dryer at 100℃ for 1 hour, and then cool. Perform the test in the same manner with white to pale yellow powders; both spectra exhibit similar intensities of absorption at the same wavenumbers. Repeat the test with this dried matter.

Melting point Between 165 and 170 ℃.

Purity (1) ***Clarity and color of solution***—Dissolve 5.0 g of D-Mannitol in 50 mL of water; the resulting solution is clear like water and colorless, and is not more intense than the control solution and not more turbid than the control suspension. The test tubes containing the test solution and the control solution should be identical, colorless and transparent, and made of glass with 15 to 25 mm in diameter and 40 mm in depth.

Control solution—To 3.0 mL of iron(III) chloride hexahydrate CS, 3.0 mL of cobalt(II) chloride hexahydrate CS and 2.4 mL of copper(II) sulfate pentahydrate CS, add hydrochloric acid solution (1 in 100) to make exactly 1000 mL.

Control suspension—Dissolve 2.5 g of hexamethylenetetramine in 25 mL of water, add 25 mL of hydrazinium sulfate TS that has been left for 4 to 6 hours, and allow to stand for 24 hours. Store in a glass container and use within 2 months. Take exactly 15 mL of this suspension and add water to make 1000-mL before use, and use this solution as the stock suspension. To 5.0 mL of this stock suspension, add 95 mL of water shake to mix well before use, and use this solution as the control suspension.

(2) ***Nickel***—Perform this procedure using a light-resistance container, protected from direct sunlight. Weigh 10.0 g of D-Mannitol, add 30 mL of 2 mol/L acetic acid, and add water to make 100 mL. Add 2.0 mL of a saturated solution of ammonium pyrrolidinedithiocarbamate (about 10 g/L) and 10.0 mL of water-saturated 4-methyl-2-pentanone, and shake for 30 seconds without exposure to light. Allow the layers to separate, and take the 4-methyl-2-pentanone layer, and use it as the test solution. Separately, put 10.0 g each of D-Mannitol in three containers, add exactly 0.5 mL, 1.0 mL and 1.5 mL of nickel standard solution for atomic absorption spectroscopy, respectively, and add 30 mL of 2 mol/L acetic acid and then water to make 100 mL. Then, proceed in the same manner as the test solution, and use the resulting solution as the standard solution. Additionally, take a 4-methyl-2-pentanone layer by proceeding in the same manner as the test solution without adding D-Mannitol, and use it as the blank test solution. Perform the test with the test solution, standard solution and blank test solution as directed under the standard addition method under the

Atomic Absorption Spectroscopy according to the following conditions. The concentration of nickel in the test solution is NMT 1 ppm.

Carrier Gas: Air–acetylen
Lamp: Nickel hollow-cathode lamp
Wavelength: 232.0 nm

(3) ***Related substances***—Dissolve 0.50 g of D-Mannitol in water to make 10 mL, and use this solution as the test solution. Pipet 2 mL of the test solution, dissolve in water to make exactly 100 mL, and use this solution as the standard solution (1). Pipet 0.5 mL of the standard solution (1), add water to make exactly 20 mL, and use this solution as the standard solution (2). Perform the test with exactly 20 μL each of the test solution and standard solutions (1) and (2) as directed under the Liquid Chromatography according to the following conditions. Determine each peak area by the automatic integration method; the peak area of D-sorbitol, having the relative retention time of about 1.2 to D-mannitol, obtained from the test solution is not larger than that of D-mannitol from the standard solution (1) (NMT 2.0%), the sum of peak area of maltitol, having the relative retention time of about 0.69, and isomalt, having the relative retention times of about 0.6 and about 0.73, is not larger than the peak area of D-mannitol from the standard solution (1) (NMT 2.0%), and each peak area other than D-mannitol from the test solution and the above related substance is not larger than 2 times the peak area of D-mannitol from the standard solution (2) (NMT 0.1%). In addition, the total peak area other than D-mannitol from the test solution is not larger than the peak area of D-mannitol from the standard solution (1) (NMT 2.0%). However, the peak of which area is not larger than the peak area of D-mannitol from the standard solution (2) is excluded (NMT 0.05%).

Operating conditions

For the detector, column, column temperature, mobile phase and flow rate, proceed as directed in the operating conditions under the Assay.

Time span of measurement: About 1.5 times the retention time of D-mannitol.

System suitability

System performance: Proceed as directed under the Assay.

(4) ***Reducing sugars***—To 7.0 g of D-Mannitol, add 13 mL of water and 40 mL of Fehling's TS, boil gently for 3 minutes, allow to stand for 2 minutes, and filter the formed precipitate of copper oxide(I) through a glass filter (10 − 16 μm). Wash the precipitate with 50 to 60 ℃ hot water until the washing is no longer alkaline, pass the washings through the glass filter described above, and discard all the filtrate at this step. Immediately, dissolve the precipitate in 20 mL of iron(III) sulfate TS, pass through the glass filter, and wash the filtrate with 15 to 20 mL of water. Combine the washings and the filtrate, heat to 80 ℃, and titrate with 0.002 mol/L potassium permanganate VS; NMT 3.2 mL is required to change the color of the solution (NMT 0.1% expressed as glucose). The endpoint of titration is when the green color turns to pale red, and the color persists at least 10s.

Conductivity Dissolve 20.0 g of D-Mannitol in a fleshly boiled and cooled water by heating to 40 to 50℃ to make 100 mL, and use this solution as the test solution. After cooling, adjust the temperature to 25 ± 1 ℃, and measure the conductivity of test solution every 5 minutes while gently shaking. When the change in conductivity is NMT 0.1 μS cm-1, the conductivity of D-Mannitol is NMT 20 $\mu s \cdot cm^{-1}$.

Loss on drying NMT 0.5% (1 g, 105%, 4 hours).

Microbiological examination of non-sterile products The acceptance criteria of the total aerobic microbial count (TAMC) is NMT 10^3 CFU/g and the total combined yeasts/molds count (TYMC) is NMT 10^2 CFU/g, respectively. Also, *Escherichia coli* and *Salmonella* are not detected. If intended for use in the manufacture of parenteral preparations, the acceptance criteria of TAMC is NMT 10^2 CFU/g.

Bacterial endotoxins This test is applicable if intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins. Parenteral preparations having a concentration of 100 g/L or less of mannitol is less than 4 IU/g, and parenteral preparations having a concentration of more than 100 g/L of mannitol is less than 2.5 IU/g.

Assay Weigh accurately about 0.5 g each of D-Mannitol and D-mannitol RS (separately determine the loss on drying), dissolve separately in water to make exactly 10 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with exactly 20 μL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of D-mannitol in each solution.

$$\text{Amount (g) of D-mannitol } (C_6H_{14}O_6) = W_S \times A_T/A_S$$

W_S: Amount (g) of D-mannitol RS, calculated on the dried basis.

Operating conditions

Detector: Differential refractometer (A constant temperature of about 40 °C).

Column: A stainless steel column 7.8 mm in internal diameter and 30 cm in length, packed with strongly acidic ion-exchange resin for liquid chromatography (calcium type) composed with a sulfonated polystyrene cross-linked with 8% of divinylbenzene (9 μm in particle diameter).

Column temperature: 85 ± 2℃

Mobile phase: water

Flow rate: 0.5 mL per minute (the retention time of D-mannitol is about 20 minutes).

System suitability

System performance: Dissolve 0.25 g each of D-Mannitol and D-Sorbitol in water to make 10 mL, and use this solution as the system suitability solution (1). Separately, dissolve 0.5 g each of maltitol and isomalt in water to make 100 mL. To 2 mL of this solution, add water to make 10 mL, and use this solution as the system suitability solution (2). Proceed with 20 μL each of the system suitability solution (1) and the system suitability solution (2) according to the above operating conditions; isomalt (first peak), maltitol, isomalt (second peak), D-mannitol and D-sorbitol are eluted in this order. The relative retention time of isomalt (first peak), maltitol, isomalt (second peak) and D-sorbitol to D-mannitol is about 0.6, about 0.69, about 0.73 and about 1.2, respectively with the resolution between the peaks of D-mannitol and D-sorbitol being NLT 2.0. Coelution of maltitol and the second peak of isomalt may be observed.

Packaging and storage Preserve in well-closed containers.

D-Mannitol Injection
D-만니톨 주사액

D-Mannitol Injection is an aqueous injection and contains NLT 95.0% and NMT 105.0% of the labeled amount of D-mannitol ($C_6H_{14}O_6$: 182.17).

Method of preparation Prepare as directed under Injections, with D-Mannitol.
No preservative is added.

Description D-Mannitol Injection occurs a clear, colorless liquid and has a sweet taste.
It may precipitate crystals.

Identification Take 5 drops of a saturated solution of D-Mannitol Injection, previously concentrated on a steam bath, and add 1 mL of iron(III) chloride TS and 5 drops of a solution of sodium hydroxide (1 in 5); a yellow precipitate is produced, and the solution becomes clear when vigorously shaken to mix. On addition of a solution of sodium hydroxide (1 in 5), no precipitate is produced.

pH Between 4.5 and 7.0.

Residue on ignition Take exactly an amount of D-Mannitol Injection, equivalent to 1.0 g of D-mannitol, according to the labeled amount, evaporate to dryness on a steam bath, and perform the test; the residue is NMT 1.0 mg.

Sterility Meets the requirements.

Bacterial endotoxins Less than 0.5 EU per mL of D-Mannitol Injection.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

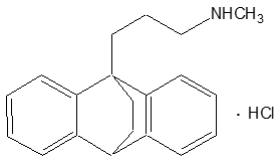
Extractable volume of injections Meets the requirements.

Assay Take exactly an amount of D-Mannitol Injection, equivalent to about 5 g of D-mannitol ($C_6H_{14}O_6$), add water to make exactly 250 mL. Take exactly 10 mL of this solution, add water to make exactly 100 mL, take exactly 10 mL of this solution into an iodine bottle, add exactly 50 mL of potassium periodate TS, and heat on a steam bath for 15 minutes. After cooling, add 2.5 g of potassium iodide, stopper, shake well to mix, allow to stand for 5 minutes in a dark place, and titrate the liberated iodine with 0.1 mol/L sodium thiosulfate VS (indicator: 1 mL of starch TS). Perform a blank test in the same manner.

Each mL of 0.1 mol/L sodium thiosulfate VS
= 1.822 mg of $C_6H_{14}O6$

Packaging and storage Preserve in hermetic containers.

Maprotiline Hydrochloride
마프로틸린염산염



$C_{20}H_{23}N·HCl$: 313.86
N-Methyl-9,10-ethanoanthracene-9(10*H*)-propanamine monohydrochloride [*10347-81-6*]

Maprotiline Hydrochloride, when dried, contains NLT 99.0% and NMT 101.0% of maprotiline hydrochloride ($C_{20}H_{23}N·HCl$).

Description Maprotiline Hydrochloride occurs as a white crystalline powder.
It is soluble in methanol or acetic acid(100), sparingly soluble in ethanol(99.5) and slightly soluble in water.

Melting point—About 244 ℃ (with decomposition).

Identification (1) Determine the absorption spectra of solutions of Maprotiline Hydrochloride and maprotiline hydrochloride RS in methanol (1 in 10000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Maprotiline

Hydrochloride and maprotiline hydrochloride RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers. If there is any difference between the two spectra, dissolve Maprotiline Hydrochloride and maprotiline hydrochloride RS in ethanol(99.5) respectively, evaporate ethanol(99.5) to dryness, and repeat the test in the same way with the residues.

(3) To 5 mL of an aqueous solution of Maprotiline Hydrochloride (1 in 200), add 2 mL of ammonia TS, heat on a steam bath for 5 minutes, cool, and filter. Acidify the filtrate with dilute nitric acid; the solution responds to the Qualitative Analysis for chloride.

Purity (1) ***Heavy metals***—Proceed with 2.0 g of Maprotiline Hydrochloride according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Related substances***—Dissolve 0.10 g of Maprotiline Hydrochloride in 5 mL of methanol, and use this solution as the test solution. Pipet 1.0 mL of this solution, add methanol to make exactly 200 mL, and use this solution as the standard solution. Perform the test with the test solution and the standard solution as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on a thin-layer chromatographic plate made of silica gel (with a fluorescent indicator) for thin-layer chromatography. Next, develop the plate using a mixture of 2-butanol, diluted ammonia water(28) (1 in 3) and ethyl acetate (14 : 5 : 4) as a developing solvent to a distance of about 10 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the number of spots other than the principal spot obtained from the test solution is NMT 2, and those spots are not more intense than the spots obtained from the standard solution.

Loss on drying NMT 0.5% (1 g, 105 ℃, 3 hours).

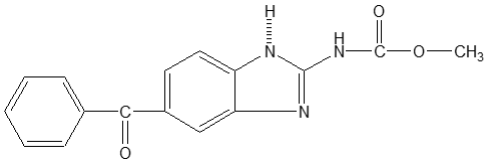
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.25 g of Maprotiline Hydrochloride, previously dried, dissolve in 180 mL of acetic acid(100), add 8 mL of a solution of bismuth nitrate pentahydrate in acetic acid(100) (1 in 50), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 31.386 mg of $C_{20}H_{23}N \cdot HCl$

Packaging and storage Preserve in well-closed containers.

Mebendazole
메벤다졸



$C_{16}H_{13}N_3O_3$: 295.29
Methyl (5-benzoyl-1*H*-benzimidazol-2-yl)carbamate
[*31431-39-7*]

Mebendazole contains NLT 98.0% and NMT 102.0% of mebendazole ($C_{16}H_{13}N_3O_3$), calculated on the dried basis.

Description Mebendazole occurs as a white to pale yellow crystalline powder.
It is practically insoluble in water, dilute hydrochloric acid, ethanol(95), chloroform and ether, and freely soluble in formic acid.

Melting point—About 290 °C.

Identification Determine the infrared spectra of Mebendazole and mebendazole RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit the similar intensities of absorption at the same wavenumbers.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Mebendazole according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Related substances***—Dissolve 50 mg of Mebendazole in 1.0 mL of 96% formic acid, add chloroform to make exactly 10 mL, and use this solution as the test solution. Weigh accurately a suitable amount of mebendazole RS, proceed in the same manner as in the preparation of the test solution to make the concentration 5 mg per mL, and use this solution as the standard solution. To 1.0 mL of the standard solution, add a mixture of chloroform and 96% formic acid (9 : 1) to make exactly 200 mL, and use this solution as the standard dilution solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution, standard solution and standard dilution solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of chloroform, formic acid and methanol (90 : 5 : 5) as the developing solvent to a distance of about 15 cm and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the R_f value of the principal spot from the test solution and the R_f value of the principal spot from the standard solution are the same, and the spot other than the principal spot from the test solution is not larger and not more intense than the spot from the standard dilution solution.

Loss on drying NMT 0.5% (1 g, 105 ℃, 4 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.225 g of Mebendazole, dissolve in 30 mL of acetic acid(100) and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 29.529 mg of $C_{16}H_{13}N_3O_3$

Packaging and storage Preserve in well-closed containers.

Mebendazole Syrup
메벤다졸 시럽

Mebendazole Syrup contains NLT 95.0% and NMT 105.0% of the labeled amount of mebendazole ($C_{16}H_{13}N_3O_3$: 295.29).

Method of preparation Prepare as directed under Syrups, with Mebendazole.

Identification (1) Weigh an amount of Mebendazole Syrup, equivalent to 0.2 g of mebendazole, evaporate to dryness on a steam bath, and dissolve in 20 mL of a mixture of formic acid and chloroform (1 : 9). Filter and use the filtrate as the test solution. Weigh 0.2 g of mebendazole RS and proceed in the same manner as for the preparation of the test solution, and use the solution as the standard solution. Spot each 10 μL of the test solution and the standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography as directed under the Thin Layer Chromatography, develop the plate with a mixture of chloroform, ethanol(95) and formic acid (198 : 1 : 1) as the developing solvent, and air-dry the plate. Expose the plate to ultraviolet rays (main wavelength: 254 nm); the R_f values and the colors of the spots obtained from the test solution and the standard solution are the same.

(2) Determine the absorption spectrum of the test solution prepared as directed under the Assay; it exhibits maxima at about 310 nm and 236 nm, respectively.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately an amount of Mebendazole Syrup, equivalent to 25 mg of mebendazole, dissolve in 10 mL of formic acid, and add isopropanol to make exactly 100 mL. Shake well to mix and filter. Discard the first 10 mL of the filtrate, take exactly 3 mL of the subsequent filtrate, add isopropanol to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately 25 mg of mebendazole RS, dissolve in 10 mL of formic acid, and add isopropanol to make exactly 100 mL. Pipet 3 mL of this solution, add isopropanol to make exactly 100 mL, and use the solution as the standard solution. Using 0.3% formic acid-isopropanol solution as a control solution, determine the absorbance, A_S and A_T, of the test solution and the standard solution at 310 nm.

Amount (mg) of mebendazole ($C_{16}H_{13}N_3O_3$)
= Amount (mg) of mebendazole RS × (A_T / A_S)

Packaging and storage Preserve in light-resistant, tight containers.

Mebendazole Tablets
메벤다졸 정

Mebendazole, when dried, contains NLT 90.0% and NMT 110.0% of mebendazole ($C_{16}H_{13}N_3O_3$: 295.29).

Method of preparation Prepare as directed under Tablets, with Mebendazole.

Identification Weigh the specific amount of Mebendazole Tablets, previously powdered and equivalent to 0.2 g of mebendazole RS, according to the labeled amount, add 20 mL of a mixture of chloroform and formic acid (19 : 1), and shake to mix. Warm the suspension on a steam bath for a few minutes, cool and filter through a glass filter and use this solution as the test solution. Dissolve mebendazole RS in a mixture of chloroform and formic acid (19 : 1) to obtain a solution having known concentration of 10 mg per mL and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Develop the plate with a mixture of chloroform, formic acid and methanol (90 : 5 : 5) as the developing solvent to a distance of about 15 cm and air-dry the plate. Observe the plate under ultraviolet light (main wavelength: 254 nm); the R_f values of the spots obtained from the test solution and the standard solution are the same.

Dissolution Perform the test with 1 tablet of Mebendazole Tablets at 75 revolutions per minute according to the Method 2 under the Dissolution Test, using 900 mL of 0.1 mol/L hydrochloric acid containing sodium lauryl sulfate as the dissolution solution. Filter the dissolved solution 120 minutes after staring the dissolution test, and use this solution as the test solution. Separately, weigh accurately about 25 mg of mebendazole RS, add 10.0 mL of formic acid and add methanol to make exactly 50 ml. Pipet an appreciate amount of this solution, make the same concentration of the test solution and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions.

It meets the requirements if the dissolution rate of Mebendazole Tablets in 120 minutes is NLT 75%.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column, about 4.6 mm in internal diameter and about 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 to 10 μm in particle diameter).

Mobile phase: A mixture of the buffer solution and acetonitrile mixture (3 : 7) For the buffer solution, 8.0 g of sodium hydroxide in 2000 mL of water, add 3.0 g of sodium lauryl sulfate phosphoric acid, and adjust the pH to 2.5.

Flow rate: 1 mL/min

System suitability

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area of mebendazole is NMT 2.0%.

Uniformity of dosage units It meets the requirements when the procedure for content uniformity is performed according to the following method.

Put 1 tablet of Mebendazole Tablets and 20 mL of 96% formic acid in a seam bath, heat and cool the steam bath for 15 minutes, and add 2-propanol to make 100 mL. Filter this solution, pipet 1 mg of mebendazole, add 2-propanol to make 100 mL, and use this solution as the test solution. Separately, weigh accurately about 20 mg of mebendazole RS, dissolve in 4 mL of 96% formic acid, put 2-propanol to make exactly 10 mL. Pipet 0.5 mL of the resulting solution, dilute with 2-propanol to make 100 mL, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution at the absorbance maximum wavelength (λmax) around 310 nm as directed under the Ultraviolet-visible Spectroscopy, using the formic acid (1 in 500) diluted with the test solution and the standard solution.

$$\text{Amount of mebendazole } (C_{16}H_{13}N_3O_3) \text{ in 1 tablet} = \frac{TC}{D} \times \frac{A_T}{A_S}$$

T: Labeled amount (mg) of mebendazole in 1 Tablet

C: Concentration (mg/mL) of mebendazole in the standard solution

D: Concentration (mg/mL) of mebendazole in the test solution, calculated on the labeled amount basis

Assay Weigh accurately the mass of NLT 20 tables of Mebendazole Tablets, and powder. Weigh accurately a portion of the powder, equivalent to about 500 mg of mebendazole ($C_{16}H_{13}N_3O_3$), add 50 mL of formic acid and warm at 50 ℃ for 15 minutes on a steam bath. Shake and mix the solution for 1 hour with a mechanical shaker, add water to make 100 mL, and filter the resulting solution. Pipet 5.0 mL of this solution, add a mixture of methanol and formic acid (9 : 1) to make 100 mL. Pipet 5.0 mL of the resulting solution, add the mobile phase to make 25 mL, shake to mix, filter, and use this solution as the test solution. Separately, weigh exactly 25 mg of mebendazole RS, add 10 mL of formic acid, warm 50 ℃ for 15 minutes on a steam bath. Shake and mix the solution for 5 minutes with a mechanical shaker, and add methanol to make 100 mL. Pipet 5.0 mL of this solution, add 25 mL of mobile phase, shake well and filter. Use this solution as the test solution. Perform the test with 15 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions and determine the peak areas, A_T and A_S, of mebendazole, respectively.

$$\text{Amount (mg) of mebendazole } (C_{16}H_{13}N_3O_3) = \text{Amount (mg) of mebendazole RS} \times \frac{A_T}{A_S} \times 20$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 247 nm).

Column: A stainless steel column about 3.9 mm in internal diameter and 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 μm to 10 μm in particle diameter).

Column temperature: A constant temperature of about 30 °C.

Mobile phase: Add 0.1 mol/L hosphoric acid TS or 1 mol/L sodium hydroxide TS to a mixture of methanol and 0.05 mol/L of potassium dihydrogenphosphate TS (60 : 40) to adjust the pH to 5.5.

Flow rate: 1.5 mL/min

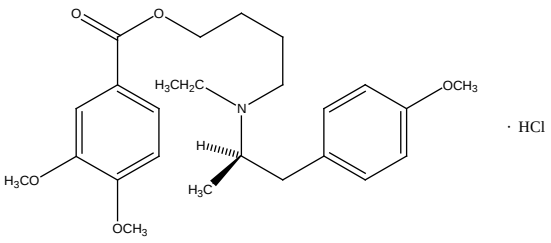
System suitability

System performance: Proceed with 15 μL of the standard solution under the above operating conditions; the symmetry factor is NMT 2.0.

System repeatability: Repeat the test 6 times with 15 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area of mebendazole is NMT 1.0%.

Packaging and storage Preserve in well-closed containers.

Mebeverin Hydrochloride
메베베린염산염



and enantiomer

$C_{25}H_{35}NO_5 \cdot HCl$: 466.01

(*RS*)-4-[Ethyl-[1-(4-methoxyphenyl)propan-2-

yl]amino]butyl-3,4-dimethoxybenzoate hydrochloride [*14664-75-6*]

Mebeverin Hydrochloride contains NLT 99.0% and NMT 101.0% of mebeverin hydrochloride ($C_{25}H_{35}NO_5 \cdot HCl$), calculated on the dried basis.

Description Mebeverin Hydrochloride occurs as white crystals or a crystalline powder.
It is very soluble in water, freely soluble in ethanol(95), and practically insoluble in ether.

Identification (1) Determine the infrared spectra of Mebeverin Hydrochloride and mebeverin hydrochloride RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) Dissolve 25 mg of Mebeverin Hydrochloride in 25 mL of water, add 2 mol/L nitric acid to acidify, and centrifuge. The clear supernatant responds to the Qualitative Analysis (2) for chloride.

pH Dissolve 2 g of Mebeverin Hydrochloride in 100 mL of water; the pH of this solution is between 4.5 and 6.5.

Purity (1) ***Ether extract*—**Dissolve 40 mg of Mebeverin Hydrochloride in 25 mL of 2 mol/L hydrochloric acid TS, add 50 mL of ether, and mix by shaking for 1 minute. Wash the ether layer 3 times with 25 mL of water each time, evaporate to dryness, and dissolve the residue in methanol to make 20 mL. Determine the absorbance of this solution at 260 nm, using methanol as the control solution, as directed under the Ultraviolet-visible Spectroscopy; the absorbance is NMT 0.23.

(2) ***Non-tertiary amine*—**Dissolve 0.5 g of Mebeverin Hydrochloride in 5 mL of pyridine, add 5 mL of copper chloride-pyridine TS, and heat at 50 ℃ for 30 minutes. After cooling, add acetone to make 50 mL, and use this solution as the test solution. Separately, proceed in the same manner as in the preparation of the test solution with 5 mL of a solution of 0.0060 w/v% di-*n*-butylamine in pyridine, and use this solution as the control solution. Proceed in the same manner as in the preparation of the test solution with 5 mL of pyridine, and use this solution as the blank test solution. Perform the test with the test solution and the control solution, using the blank test solution as the control solution, as directed under the Ultraviolet-visible Spectroscopy and determine the absorbance of these solutions at 405 nm; the absorbance of the test solution is not greater than that of the control solution.

(3) ***Related substances*—**Dissolve 20 mg of Mebeverin Hydrochloride in acetone to make exactly 10 mL and use this solution as the test solution. Separately, dissolve 10 mg of Mebeverin Hydrochloride in acetone to make exactly 100 mL and use this solution as the standard solution (1). Dissolve 2.0 mg of veratric acid in acetone to make exactly 100 mL and use this solution as the standard solution (2). With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution, standard solution (1) and standard solution (2) on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of ethanol(99.5), chloroform and ammonia water(28) (50 : 50 : 1) as the developing solvent to a distance of about 15 cm, and air-dry the plate. Expose the plate under ultraviolet light (main wavelength: 254 nm) and allow the plate to stand in iodine vapor for 1 hour. The spot corresponding to the veratric acid from the test solution is not more intense than that from the standard solution (2) and the spots other than the principal spot from the test solution are not more intense than the spot from the standard solution (1).

Loss on drying NMT 0.5% (1 g, 105 ℃, 1 hour).

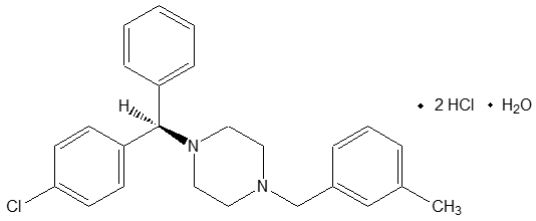
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.4 g of Mebeverin Hydrochloride, dissolve in 50 mL of acetic acid(100), add 7 mL of mercury(II) acetate TS for non-aqueous titration, and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 46.60 mg of $C_{25}H_{35}NO_5 \cdot HCl$

Packaging and storage Preserve in light-resistant, tight containers at NMT 30 ℃.

Meclizine Hydrochloride Hydrate
메클리진염산염수화물



and enantiomer

Meclizine Hydrochloride
$C_{25}H_{27}ClN_2 \cdot 2HCl \cdot H_2O$: 481.89
(*RS*)-1-[(4-Chlorophenyl)(phenyl)methyl]-4-(3-methylbenzyl)piperazine hydrate dihydrochloride [*31884-77-2*]

Meclizine Hydrochloride Hydrate, when dried, contains NLT 97.0% and NMT 100.5% of meclizine hydrochloride ($C_{25}H_{27}ClN_2 \cdot 2HCl$: 463.87), calculated on the anhydrous basis.

Description Meclizine Hydrochloride Hydrate occurs as a white or pale yellow crystalline powder, and has a slight odor and no taste.
It is practically insoluble in water or ether, freely soluble in pyridine, chloroform or a mixture of acid, ethanol(95)

and water, and slightly soluble in dilute acid or ethanol(95).

Identification (1) Determine the absorption spectra of solutions of Meclizine Hydrochloride Hydrate and meclizine hydrochloride RS in diluted hydrochloric acid (1 in 100) (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit absorption maxima at the same wavelengths.

(2) Determine the infrared spectra of Meclizine Hydrochloride Hydrate and meclizine hydrochloride RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) Dissolve 25 mg of Meclizine Hydrochloride Hydrate in a mixture of 2 mol/L nitric acid and ethanol (3 : 5); the solution responds to the Qualitative Analysis for chloride.

Purity ***Related substances***—Weigh an appropriate amount of Meclizine Hydrochloride Hydrate, dissolve in the mobile phase to prepare a solution containing 0.5 mg per mL, and use this solution as the test solution. Separately, weigh accurately an appropriate amount of meclizine hydrochloride RS (previously determine the content of water), dissolve in the mobile phase to make a solution containing 2.5 μ*g* per mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine peak areas of both solutions; the total area of the peaks other than the major peak of the test solution is NMT 2 times the peak area of the standard solution (NMT 1.0%) and each peak area is not larger than the major peak area of the standard solution (NMT 0.5%).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 230 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 μm in particle diameter).

Mobile phase: Dissolve 1.5 g of sodium 1-heptanesulfonate in 300 mL of water, add 700 mL of acetonitrile, and adjust the pH to 4 with 0.05 mol/L of sulfuric acid.

Flow rate: 1.3 mL/min

System suitability

System performance: Weigh an appropriate amount of meclizine hydrochloride RS and 4-chlorobenzophenone, and dissolve in the mobile phase to make a solution containing 10 μg per mL. Proceed with 20 μL of this solution according to the above conditions; meclizine hydrochloride and 4-chlorobenzophenone are eluted in this order with the resolution between the peaks being NLT 2.0.

System repeatability: Perform the test 6 times with 20 mL each of the standard solution according to the above conditions; the relative standard deviation of the peak areas is NMT 1.5%.

Water NMT 5.0% (0.5 g, volumetric titration, direct titration).

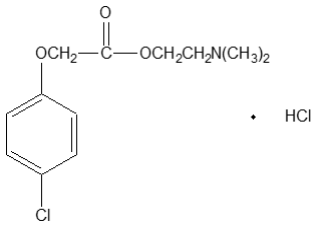
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.35 g of Meclizine Hydrochloride Hydrate, dissolve in 50 mL of chloroform, add 5 ml of acetic anhydride, and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 23.195 mg of $C_{25}H_{27}ClN_2 \cdot 2HCl$

Packaging and storage Preserve in tight containers.

Meclofenoxate Hydrochloride
메클로페녹세이트염산염



$C_{12}H_{16}ClNO_3 \cdot HCl$: 294.17

2-Dimethylaminoethyl (4-chlorophenoxy)acetate hydrochloride [*3685-84-5*]

Meclofenoxate Hydrochloride contains NLT 98.0% and NMT 101.0% of meclofenoxate hydrochloride ($C_{12}H_{16}ClNO_3 \cdot HCl$), calculated on the anhydrous basis.

Description Meclofenoxate Hydrochloride occurs as white crystals or a crystalline powder and has a slight, distinctive odor and a bitter taste.

It is freely soluble in water or ethanol(95), sparingly soluble in acetic anhydride, and practically insoluble in ether.

Dissolve 1 g of Meclofenoxate Hydrochloride in 20 mL of water; the pH of this solution is between 3.5 and 4.5.

Identification (1) To 10 mg of Meclofenoxate Hydrochloride, add 2 mL of ethanol(95), dissolve by warming, if necessary, allow to cool, add 2 drops of a saturated ethanol solution of hydroxylamine hydrochloride and 2 drops of a saturated ethanol solution of potassium hydroxide, and heat on a steam bath for 2 minutes. After cooling, render the solution weakly acidic with dilute hydrochloric acid and add 3 drops of iron(III) chloride TS; the resulting solution exhibits a purple to dark violet color.

(2) Dissolve 50 mg of Meclofenoxate Hydrochlo-

ride in 5 mL of water, and add 2 drops of Reinecke salt TS; a pale red precipitate is produced.

(3) Determine the absorption spectra of the solutions of Meclofenoxate Hydrochloride and meclofenoxate hydrochloride RS (1 in 10000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(4) An aqueous solution of Meclofenoxate Hydrochloride (1 in 100) responds to the Qualitative Analysis for chloride.

Melting point Between 139 and 143 ℃.

Purity (1) ***Clarity and color of solution***—Dissolve 0.5 g of Meclofenoxate Hydrochloride in 10 mL of water; the solution is clear and colorless.

(2) ***Sulfate***—Proceed with 1.0 g of Meclofenoxate Hydrochloride and perform the test. Prepare the control solution with 1.0 mL of 0.005 mol/L sulfuric acid (NMT 0.048%).

(3) ***Heavy metals***—Proceed with 1.0 g of Meclofenoxate Hydrochloride according to Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(4) ***Arsenic***—Proceed with 1.0 g of Meclofenoxate Hydrochloride according to Method 3 and perform the test (NMT 2 ppm).

(5) ***Organic acids***—Weigh 2.0 g of Meclofenoxate Hydrochloride, add 50 mL of ether to it, shake to mix for 10 minutes, and then filter through a glass filter. Wash the residue with 5 mL of ether twice, and combine the washings with the filtrate. To this solution, add 50 mL of neutralized ethanol and 5 drops of phenolphthalein TS, and neutralize with 0.1 mol/L sodium hydroxide; the volume of sodium hydroxide consumed is NMT 0.54 mL.

Water NMT 0.5% (1 g, volumetric titration, direct titration).

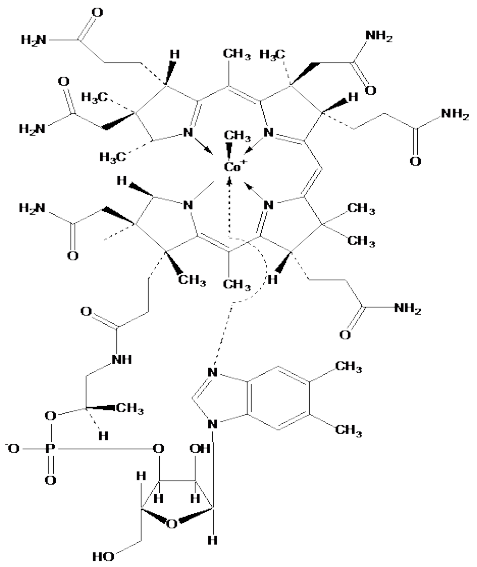
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.4 g of Meclofenoxate Hydrochloride, dissolve in 70 mL of acetic acid(100), and titrate with 0.1 mol/L perchloric acid VS [indicator: 3 drops of a solution of malachite green in acetic acid(100) (1 in 100)]. The endpoint of the titration is when the solution changes from bluish green, through yellowish green, to greenish pale yellow. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 29.417 mg of $C_{12}H_{16}ClNO_3 \cdot HCl$

Packaging and storage Preserve in tight containers.

Mecobalamin
메코발라민



$C_{63}H_{91}CoN_{13}O_{14}P$: 1344.38

Carbanide;Cobalt(3+);[5-(5,6-Dimethylbenzimidazol-1-yl)-4-hydroxy-2-(hydroxymethyl)oxolan-3-yl]-1-[3-[(4*Z*,9*Z*,14*Z*)-2,13,18-*tris*(2-amino-2-oxoethyl)-7,12,17-*tris*(3-amino-3-oxopropyl)-3,5,8,8,13,15,18,19-octamethyl-2,7,12,17-tetrahydro-1*H*-corrin-21-id-3-yl]propanoylamino]propan-2-ylphosphate [*13422-55-4*]

Mecobalamin contains NLT 98.0% and NMT 101.0% of mecobalamin ($C_{63}H_{91}CoN_{13}O_{14}P$), calculated on the anhydrous basis.

Description Mecobalamin occurs as dark red crystals or a crystalline powder.
It is sparingly soluble in water, slightly soluble in ethanol(99.5) and practically insoluble in acetonitrile.
It is affected by light.

Identification (1) Perform this procedure using light-resistant vessels. Determine the absorption spectra of the solutions of Mecobalamin and mecobalamin RS in hydrochloric acid-potassium chloride buffer solution, pH 2.0 (1 in 20000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths. Separately, determine the absorption spectra of the solutions of Mecobalamin and mecobalamin RS in phosphate buffer solution, pH 7.0 (1 in 20000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Add 50 mg of potassium hydrogen sulfate to 1 mg of Mecobalamin to mix and fuse by igniting. After cooling, break up the fused mass with a glass rod, add 3 mL of water, and heat to dissolve. Add 1 drop of phenolphthalein TS, then add sodium hydroxide TS in drops until a pale red color develops. Add 0.5 g of sodium acetate trihydrate, 0.5 mL of dilute acetic acid and 0.5 mL of a solution of 1-nitroso-2-naphthol-3,6-disulfonic acid

disodium salt (1 in 500); a red to orange color is immediately produced. And the red color does not disappear when adding 0.5 mL of hydrochloric acid and boiling for 1 minute.

Purity (1) ***Clarity and color of solution***—Dissolve 20 mg of Mecobalamin in 10 mL of water; the resulting solution is clear and exhibits a red color.

(2) ***Related substances***—Perform the test with 10 μL of the test solution obtained in the Assay, as directed under the Liquid Chromatography according to the following conditions. Determine each peak area of the test solution by the automatic integration method; each area of the peaks other than mecobalamin is NMT 0.5% and the total area is NMT 2.0%.

Operating conditions

For the detector, column, column temperature, mobile phase and flow rate, proceed as directed in the operating conditions under the Assay.

System suitability

Test for required detectability: Pipet 1 mL of the test solution, add the mobile phase to make 100 mL, and use this solution as the system suitability solution. Pipet 1 mL of this solution and add the mobile phase to make exactly 100 mL. Confirm that the peak area of mecobalamin from 10 μL of this solution is equivalent to 7% to 13% of that of mecobalamin from 10 μL of the system suitability solution.

System performance: Proceed as directed under the Assay.

System repeatability: Repeat the test 6 times with 10 μL each of the system suitability solution according to the conditions above; the relative standard deviation of the peak area of mecobalamin is NMT 3.0%.

Time span of measurement: About 2.5 times the retention time of mecobalamin.

Water NMT 12% (0.1 g, volumetric titration, direct titration).

Assay Perform this procedure, using light-resistant vessels. Weigh accurately about 50 mg each of Mecobalamin and mecobalamin RS (previously measure water), dissolve in the mobile phase to make exactly 50 mL respectively, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of mecobalamin in each solution.

$$\text{Amount (mg) of mecobalamin } (C_{63}H_{91}CoN_{13}O_{14}P) = \text{Amount (mg) of mecobalamin RS, calculated on the anhydrous basis} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 266 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silical gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature at about 40 °C.

Mobile phase: Add 800 mL of 0.02 mol/L phosphate buffer solution, pH 3.5 to 200 mL acetonitrile and dissolve in 3.76 g of sodium 1-hexanesulfonate.

Flow rate: Adjust the flow rate so that the retention time of mecobalamin is about 12 minutes.

System suitability

System performance: Dissolve 5 mg each of cyanocobalamin and hydroxocobalamin acetate in the mobile phase to make 100 mL. Proceed with 10 μL of this solution under the conditions specified above; cyanocobalamin and hydroxocobalamin acetate are eluted in this order with the resolution being NLT 3. In addition, proceed with 10 μL of the standard solution according to the conditions above; the number of theoretical plates of the peak of mecobalamin is NLT 6000.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution according to the conditions above; the relative standard deviation of the peak area of mecobalamin is NMT 1.0%.

Packaging and storage Preserve in light-resistant, tight containers.

Mecobalamin Capsules
메코발라민 캡슐

Mecobalamin Capsules contain NLT 90.0% and NMT 130.0% of the labeled amount of mecobalamin ($C_{63}H_{91}CoN_{13}O_{14}P$: 1344.40).

Method of preparation Prepare as directed under Capsules, with Mecobalamin.

Identification (1) Weigh an amount of Mecobalamin Capsules equivalent to 0.5 mg of mecobalamin ($C_{63}H_{91}CoN_{13}O_{14}P$: 1344.40), add 10 mL of phosphate buffer solution, pH 7.0, shake to mix, and filter. Determine the absorption spectrum of the solution as directed under the Ultraviolet-visible Spectroscopy; it exhibits maxima between 266 nm and 269 nm, 289 nm and 292 nm, 316 nm and 319 nm, 341 nm and 344 nm, 374 nm and 377 nm and 520 and 524 nm. Perform this procedure with protection from light.

(2) Weigh an amount of Mecobalamin Capsules equivalent to about 1 mg of mecobalamin ($C_{63}H_{91}CoN_{13}O_{14}P$: 1344.40), add 50 mL of potassium cyanide solution (1 in 200), shake to mix, and filter. Discard the first filtrate, take 20 mL of the next filtrate, and use this solution as the test solution. Shake occasionally to mix, allow to stand under 20 W fluorescent light in a distance of 30 cm for 90 minutes, and determine the absorption spectrum of the solution as directed under the Ultraviolet-visible Spectroscopy; it exhibits maxima between 277 nm and 279 nm, 288 nm and 290 nm, 309 nm

and 311 nm, 367 nm and 369 nm, 540 nm and 543 nm and 579 nm and 584 nm.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT about 20 capsules of Mecobalamin Capsules. Weigh accurately about 1 mg of mecobalamin ($C_{63}H_{91}CoN_{13}O_{14}P$), dissolve in 100 mL of the mobile phase, filter, and use the filtrate as the test solution. Separately, weigh accurately about 10 mg of mecobalamin RS and dissolve in the mobile phase to make 50.0 mL. Pipet 2.0 mL of this solution, add the mobile phase to make 20 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions and determine the peak areas, A_T and A_S, for the test solution and the standard solution, respectively.

$$\text{Amount (mg) of mecobalamin } (C_{63}H_{91}CoN_{13}O_{14}P) = \text{Amount (mg) of mecobalamin RS} \times \frac{A_T}{A_S} \times \frac{1}{2}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 266 nm).

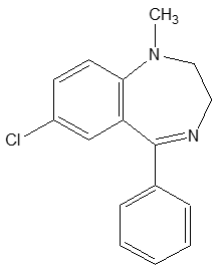
Column: A stainless steel column 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of 200 mL of acetonitrile, 800 mL of 0.02 mol/L phosphoric buffer solution, pH 3.5 and 3.76 g of sodium 1-hexanesulfonate.

Flow rate: 1.0 mL/min

Packaging and storage Preserve in light-resistant, tight containers.

Medazepam
메다제팜



$C_{16}H_{15}ClN_2$: 270.76

7-Chloro-1-methyl-5-phenyl-2,3-dihydro-1*H*-benzo[1,4]diazepine [*2898-12-6*]

Medazepam, when dried, contains NLT 98.5% and NMT 101.0% of medazepam ($C_{16}H_{15}ClN_2$).

Description Medazepam occurs as white or pale yellow crystals or a crystalline powder and is odorless.
It is freely soluble in methanol, ethanol, acetic acid(100) or in ether and practically insoluble in water.
It is gradually colored by light.

Identification (1) Dissolve 10 mg of Medazepam in 3 mL of citric acid-acetic acid TS; the solution turns deep orange color. Heat the solution on a steam bath for 3 minutes; it turns dark red.

(2) Determine the absorption spectra of solutions of Medazepam and medazepam RS in methanol (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared spectra of Medazepam and medazepam RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(4) Perform the test with Medazepam as directed under the Flame Coloration (2); a green color is observed.

Melting point Between 101 and 104 °C.

Purity (1) ***Clarity and color of solution***—Dissolve 0.1 g of Medazepam in 10 mL of methanol; the solution is pale yellow to yellow and clear.

(2) ***Chloride***—Dissolve 1.5 g of Medazepam in 50 mL of ether, add 46 mL of water and 4 mL of sodium carbonate TS, shake to mix, and collect the water layer. Wash the water layer twice each time with 20 mL of ether and filter the water layer. To 20 mL of the filtrate, add diluted nitric acid to neutralize, add another 6 mL of diluted nitric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid (NMT 0.018%).

(3) ***Heavy metals***—Proceed with 1.0 g of Medazepam according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(4) ***Arsenic***—Prepare the test solution with 1.0 g of Medazepam according to Method 3 and perform the test (NMT 2 ppm).

(5) ***Related substances***—Dissolve 0.25 g of Medazepam in 10 mL of methanol, and use this solution as the test solution. Pipet 1 mL of this solution and add methanol to make exactly 20 mL. Pipet 2 mL of this solution, add methanol to make exactly 50 mL, and use this solution as the standard solution. Perform the test with the test solution and standard solution as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on a plate made of silica gel (with a fluorescent indicator) for thin-layer chromatography. Develop the plate using a mixture of cyclohexane, acetone and strong ammonia water (60 : 40 : 1) as a developing solvent to a distance of about 10 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots other

than the principal spot obtained from the test solution are not more intense than those obtained from the standard solution.

Loss on drying NMT 0.5% (1 g, in vacuum, 60 ℃, 4 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.4 g of Medazepam, previously dried, dissolve in 50 mL of acetic acid(100), and titrate with 0.1 mol/L hydrochloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 27.076 mg of $C_{16}H_{15}ClN_2$

Packaging and storage Preserve in light-resistant, tight containers.

Medicinal Carbon
약용탄

Description Medicinal Carbon occurs as a black power, and is odorless and tasteless.

Identification Transfer 0.5 g of Medicinal Carbon into a test tube and heat by direct application of flame with the aid of a current of air; it burns without any flame. Pass the evolved gas through calcium hydroxide TS; a white turbidity is produced.

Purity (1) ***Acid or alkali***—Boil about 3.0 g of Medicinal Carbon with 60 mL of water for 5 minutes, allow to cool, dilute to 60 mL with water, and filter; the filtrate is colorless and neutral.

(2) ***Chloride***—Take 4.0 mL of the filtrate obtained in (1) in a Nessler tube, add 6 mL of dilute nitric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 0.80 mL of 0.01 mol/L hydrochloric acid (NMT 0.142%).

(3) ***Sulfate***—Take 5 mL of the filtrate obtained in (1) in a Nessler tube, add 1 mL of dilute hydrochloric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 1.0 mL of 0.005 mol/L sulfuric acid (NMT 0.192%).

(4) ***Sulfide***—Boil 0.5 g of Medicinal Carbon with a mixture of 15 mL of dilute hydrochloric acid and 10 mL of water; lead acetate paper does not become brown when held in the evolved gas within 5 minutes.

(5) ***Cyanogen compounds***—Weigh 5 g of Medicinal Carbon, put into a distilling flask, add 2 g of L-tartaric acid and 50 mL of water, and connect the flask to a distilling device. Add 2 mL of sodium hydroxide TS and 10 mL of water into the receiver, dip the end of the cooling device to this solution, cool the receiver in the iced water and distill until the volume of the solution becomes 25 mL. Add water to make 50 mL, take 25 mL of the diluted distillate, add 1 mL of iron(II) sulfate hexahydrate solution (1 in 20), heat the mixture almost to boiling, cool and filter. To the filtrate, add 1 mL of hydrochloric acid and 0.5 mL of dilute iron(III) chloride TS; no blue color is produced.

(6) ***Acid soluble substances***—Take about 1 g of Medicinal Carbon, accurately weighed, add 20 mL of water and 5 mL of hydrochloric acid, boil for 5 minutes, filter, wash the residue with 10 mL of hot water and add the washings to the filtrate. Add 5 drops of sulfuric acid to the filtrate, evaporate, and ignite the residue; the amount of residue is NMT 3.0%.

(7) ***Heavy metals***—Proceed with 0.5 g of Medicinal Carbon according to Method 2 and perform the test. Prepare the control solution with 2.5 mL of lead standard solution (NMT 50 ppm).

(8) ***Zinc***—Ignite 0.5 g of Medicinal Carbon to ash, add 5 mL of dilute nitric acid to the residue, boil gently for 5 minutes, filter, wash with 10 mL of water, and combine the washings and the filtrate. Add 3 mL of ammonia TS to the combined solution, filter again, wash with water, combine the washings and the filtrate to make 25 mL, add 1 drop of sodium sulfide TS, and allow to stand for 3 minutes; the solution produces no turbidity.

(9) ***Arsenic***—Proceed 1.0 g of Medicinal Carbon according to Method 3, and perform the test (NMT 2 ppm).

Loss on drying NMT 15.0% (1 g, 105 °C, 4 hours).

Residue on ignition NMT 4.0% (1 g).

Adsorptive power (1) To 1.0 g of Medicinal Carbon, previously dried, add a solution of 0.12g of quinine sulfate dissolved in 100 mL of water, shake the mixture vigorously for 5 minutes, filter immediately, and discard the first 20 mL of the filtrate. Take 10 mL of the subsequent filtrate; add 5 drops of iodine TS; no turbidity is produced.

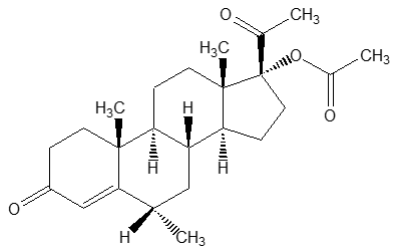
(2) Dissolve 0.25 g of methylene blue, exactly weighed, in water to make exactly 250 mL. Transfer two 50 mL volumes of this solution into each of two glass-stoppered flasks. To one flask, add exactly 0.25 g of Medicinal Carbon, previously dried and weighed accurately, and shake vigorously for 5 minutes for mixing. Filter the contents of each flask, discard the first 20 mL of each filtrate. Pipet 25 mL of the subsequent filtrate into two 250-mL volumetric flasks. To each volumetric flask, add 50 mL of a solution of sodium acetate (1 in 10), then add exactly 35 mL of 0.05 mol/L iodine solution. Allow them to stand for 50 minutes while shaking vigorously from time to time. Dilute each mixture to 250 mL with water. Allow to stand for 10 minutes, filter each solution at below 20 °C, discard the first 30 mL of each filtrate. Pipet accurately 100mL each of the subsequent filtrate, and titrate the excess iodine with 0.1 mol/L sodium thiosul-

fate VS. The difference between the amounts of 0.1 mol/L sodium thiosulfate VS consumed for the titration of each solution is NLT 1.2 mL.

Microbiological examination of non-sterile products The total aerobic microbial count is NMT 1000 CFU per g of Medicinal Carbon, and the total combined yeasts/molds count is NMT 100 CFU per g of Medicinal Carbon.

Packaging and storage Preserve in well-closed containers.

Medroxyprogesterone Acetate
메드록시프로게스테론아세테이트



$C_{24}H_{34}O_4$: 386.52

[(6*S*,8*R*,9*S*,10*R*,13*S*,14*S*,17*R*)-17-Acetyl-6,10,13-trimethyl-3-oxo-2,6,7,8,9,11,12,14,15,16-decahydro-1*H*-cyclopenta[a]phenanthren-17-yl] acetate [*71-58-9*]

Medroxyprogesterone Acetate contains NLT 97.0% and NMT 103.0% of medroxyprogesterone acetate ($C_{24}H_{34}O_4$), calculated on the dried basis.

Description Medroxyprogesterone Acetate occurs as a white, crystalline powder and is odorless.

It is freely soluble in chloroform, soluble in acetone or 1.4-dioxane, sparingly soluble in ethanol(95) or methanol, slightly soluble in ether, and practically insoluble in water.

It is stable in air.

Melting point—About 205 °C.

Identification (1) Determine the absorption spectra of solutions of Medroxyprogesterone Acetate and medroxyprogesterone acetate RS in ethanol(95) (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit the same intensities of absorption at the same wavelengths. The difference in absorbances of the solutions, calculated on the dried basis, at the absorption maximum wavelength around 241 nm is NMT 2.0%.

(2) Determine the infrared spectra of Medroxyprogesterone Acetate and medroxyprogesterone acetate RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit maxima at the same wavenumber.

Optical rotation $[\alpha]_D^{20}$: Between +47° and + 53° (0.250 g after drying, acetone, 25 mL, 100 mm).

Purity (1) ***Related substances I***—Weigh accurately 0.20 g of Medroxyprogesterone Acetate, dissolve in dichloromethane to make exactly 10 mL, and use this solution as the test solution. Separately, weigh accurately 0.20 g of medroxyprogesterone acetate RS and 1.0 mg of medroxyprogesterone acetate related substances I RS, dissolve in dichloromethane to make 10 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test and standard solutions on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Develop the plate with a mixture of hexane, *tert*-butylmethyl ether and tetrahydrofuran (45 : 45 : 10) to a distance of 10 cm, and air-dry the plate. Put the plate again in the developing solvent, develop to a distance of 10 cm, and air-dry the plate. Heat the plate at 120 ℃ for 10 minutes to dry, spray evenly a solution of p-toluenesulfonic acid monohydrate in ethanol(95) (1 in 5), and further heat at 120 ℃ for 10 minutes. Examine the plate under ultraviolet light (main wavelength 365 nm); a large blue fluorescent spot whose R_f value is larger than that of the principal spot from the test solution is not more intense than the fluorescent spot obtained from the standard solution (NMT 0.5%).

(2) ***Related substances***—Weigh accurately 62.5 mg of Medroxyprogesterone Acetate, dissolve in the mobile phase to make exactly 25 mL, and use this solution as the test solution. Separately, weigh accurately an appropriate amount of medroxyprogesterone acetate RS, dissolve in the mobile phase to make a solution containing 50 μg per mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test and standard solutions as directed under the Liquid Chromatography according to the following conditions and determine the peak areas of these solutions; the peak area other than the major peak from the test solution and the peak area from the standard solution are NMT 1%, and the total area of the peaks is NMT 1.5%.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (about 3 μm to 10 μm in particle diameter).

Mobile phase: A mixture of acetonitrile and water (3 : 2).

Flow rate: 1.0 mL/min

System suitability

System performance: Weigh an appropriate amount of megesterol acetate RS and medroxyprogesterone acetate RS and dissolve in the mobile phase to make a solution containing 40 μg each per mL. Proceed with 20 μL of the solution according to the above operating conditions; the resolution between megesterol acetate and medroxyprogesterone acetate is NLT 1.5.

System reproducibility: Perform the test six times with 20 μL each of the standard solution according to the

above operating conditions; the relative standard deviation of the peak areas of medroxyprogesterone acetate is NMT 3.0%.

Loss on drying NMT 1.0% (1 g, 105 ℃, 3 hours).

Assay Weigh accurately about 25 mg of Medroxyprogesterone Acetate, dissolve in 25 mL of acetonitrile, and use this solution as the test solution. Separately, weigh accurately an appropriate amount of medroxyprogesterone acetate RS, previously dried at 105℃ for 3 hours, dissolve in acetonitrile to make a solution containing 1 mg per mL, and use this solution as the standard solution. Perform the test with 10 mL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions, and determine the peak areas, A_T and A_S, of medroxyprogesterone acetate for the test solution and the standard solution, respectively.

Amount (mg) of medroxyprogesterone acetate ($C_{24}H_{34}O_4$)

$$= 25\times C \times \frac{A_T}{A_S}$$

C: Concentration of the standard solution (mg/mL)

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (about 3 μm to 10 μm in particle diameter).

Mobile phase: A mixture of water and acetonitrile (60 : 40).

Flow rate: 2.0 mL/min

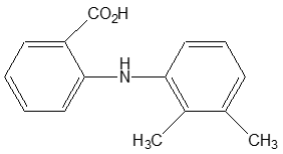
System suitability

System performance: Proceed with 10 μL of the standard solution according to the above operating conditions; the symmetry factor is NMT 2.

System reproducibility: Perform the test six times with 10 μL each of the standard solution according to the above operating conditions; the relative standard deviation of the peak areas of medroxyprogesterone acetate is NMT 2.0%.

Packaging and storage Preserve in light-resistant, tight containers.

Mefenamic Acid
메페남산



$C_{15}H_{15}NO_2$: 241.29

2-((2,3-Dimethylphenyl)amino)benzoic acid [*61-68-7*]

Mefenamic Acid, when dried, contains NLT 99.0% and NMT 101.0% of mefenamic acid ($C_{15}H_{15}NO_2$).

Description Mefenamic Acid occurs as a white to pale yellow powder and is odorless. It is tasteless initially but has a slight bitter taste.

It is sparingly soluble in ether, slightly soluble in methanol, ethanol(95) or chloroform, and practically insoluble in water.

It dissolves in sodium hydroxide TS.

Melting point—About 225 ℃ (with decomposition).

Identification (1) Dissolve 10 mg of Mefenamic Acid in 1 mL of methanol by warming. After cooling, add 1 mL of 4-nitrobenzendiazonium fluoroborate solution (1 in 1000), add 1 mL of sodium hydroxide TS, and shake for mixing. The resulting solution exhibits an orange color.

(2) Dissolve 10 mg of Mefenamic Acid in 2 mL of sulfuric acid and heat; the resulting solution exhibits a yellow color with green fluorescence.

(3) Dissolve 7 mg each of Mefenamic Acid and mefenamic acid RS in a solution of hydrochloric acid in methanol (1 in 1000) to make 500 mL each. Determine the absorption spectra of each solution as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

Purity (1) ***Chloride***—To 1.0 g of Mefenamic Acid, add 20 mL of sodium hydroxide TS and heat to dissolve. After cooling, add 2 mL of acetic acid(100), add water to make 100 mL, and shake to mix. Filter the precipitate produced and discard the first 10 mL of the filtrate. To 25 mL of the subsequent filtrate, add 6 mL of dilute nitric acid, and add water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution by adding 5 mL of sodium hydroxide TS, 0.5 mL of acetic acid(100), 6 mL of dilute nitric acid, and water to 0.50 mL of 0.01 mol/L hydrochloric acid to make 50 mL (NMT 0.071%).

(2) ***Heavy metals***—Proceed with 2.0 g of Mefenamic Acid according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Arsenic***—Prepare the test solution with 1.0 g of Mefenamic Acid according to Method 3 and perform the test (NMT 2 ppm).

(4) ***Related substances***—Dissolve 0.10 g of Mefenamic Acid in 5 mL of a mixture of chloroform and

methanol (3 : 1) and use this solution as the test solution. Pipet 1 mL of this solution and add a mixture of chloroform and methanol (3 : 1) to make exactly 200 mL. Pipet 10 mL of this solution, add a mixture of chloroform and methanol (3 : 1) to make exactly 50 mL, and use the resulting solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 25 μL each of the test solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of 2-methyl-1-propanol and ammonia water(28) (3 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot obtained from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 0.5% (1 g, in vacuum, phosphorus (V) oxide, 4 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.5 g of Mefenamic Acid, previously dried, add 100 mL of neutralized ethanol, and warm at a low heat to dissolve. After cooling, titrate with 0.1 mol/L sodium hydroxide VS (indicator: 2 to 3 drops of phenol red TS). The endpoint of the titration is when the yellow color of this solution turns orange and then finally to purple. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS
= 24.129 mg of $C_{15}H_{15}NO_2$

Packaging and storage Preserve in well-closed containers.

Mefenamic Acid Capsules
메페남산 캡슐

Mefenamic Acid Capsules contain equivalent to NLT 90.0% and NMT 110.0% the labeled amount of mefenamic acid ($C_{15}H_{15}NO_2$: 241.29).

Method of preparation Prepare as directed under Capsules, with Mefenamic Acid.

Identification (1) Take out the contents of Mefenamic Acid Capsules, mix well, weigh an amount equivalent to 0.25 g of mefenamic acid according to the labeled amount, and add 100 mL of a mixture of chloroform and methanol (3 : 1). Shake strongly to dissolve, add a mixture of chloroform and methanol (3 : 1) to make 250 mL, filter, and use the filtrate as the test solution. Separately, weigh 25 mg of mefenamic acid RS, dissolve in a mixture of chloroform and methanol (3 : 1) to make 25 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of chloroform, ethyl acetate and acetic acid(100) (75 : 25 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Examine the plate under the iodine steam; the test solution and the standard solution exhibit the same spots at the same R_f value.

(2) Perform the test as directed under the Assay; the test solution and the standard solution exhibit peaks at the same retention time.

Dissolution Perform the test with 1 tablet of Mefenamic Acid Capsules at 100 revolutions per minute according to Method 1 under the Dissolution, using 900 mL of 0.05 mol/L tris buffer solution as the test solution. Take the dissolved solution 45 minutes after starting the test and filter. Take an appropriate amount of the filtrate to obtain a solution having known concentration of 0.2 mg per mL, and use this solution as the test solution. Separately, weigh accurately an appropriate amount of mefenamic acid RS, dissolve in the test solution to make the same concentration with the test solution, and use this solution as the standard solution. Perform the test with the test solution and the standard solution as directed under the Assay.
Meets the requirements if the dissolution rate in 45 minutes is NLT 75%.

0.05 mol /L Tris buffer solution—Dissolve 60.5 g of 2-amino-2-hydroxymethyl-1,3-propanediol in 6 L of water, add water to make 10 mL, add phosphoric acid to adjust the pH to 9.0 ± 0.05. Take 6 L of this solution, dissolve 100 mg of sodium lauryl sulfate, and add this solution again in the first solution.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the contents of NLT 20 capsules of Mefenamic Acid Capsules, weigh accurately an amount equivalent to about 50 mg of mefenamic acid ($C_{15}H_{15}NO_2$), add 5.0 mL of tetrahydrofuran, and dissolve by sonicating for 5 minutes. To this, add the mobile phase to make exactly 250 mL, filter, and use the filtrate as the test solution. Separately, weigh accurately about 50 mg of mefenamic acid RS, add 5.0 mL of tetrahydrofuran, shake, and dissolve. Add the mobile phase to make exactly 250 mL and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak area of mefenamic acid, A_T and A_S, respectively.

Amount (mg) of mefenamic acid ($C_{15}H_{15}NO_2$)
= Amount (mg) of mefenamic acid RS × $\frac{A_T}{A_S}$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 to 10 μm in particle diameter).

Mobile phase: A mixture of acetonitrile, buffer solution and tetrahydrofuran (23 : 20 : 7).

Flow rate: 1 mL/min

System suitability

System performance: Proceed with 10 μL of the standard solution according to the above conditions; the symmetry factor is NMT 1.6.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area of mefenamic acid is NMT 1.0%.

Buffer solution—To 5.7 g of ammonium dihydrogen phosphate, add 1000 mL of water, dissolve, and adjust the pH to 5.0 by adding 3 mol/L ammonia water.

Packaging and storage Preserve in well-closed containers.

Mefenamic Acid Tablets
메페남산 정

Mefenamic Acid Tablets contain NLT 92.5% and NMT 107.5% of the labeled amount of mefenamic acid ($C_{15}H_{15}NO_2$: 241.29).

Method of preparation Prepare as directed under Tablets, with Mefenamic Acid.

Identification The retention time of the major peaks obtained from the test solution and standard solution under the Assay are the same.

Dissolution Take 1 tablet of Mefenamic Acid Tablets, and perform the test according to Method 1 using 900 mL of 0.05 mol/mL tris buffer solution as the dissolution medium at 100 revolutions per minute. Take the dissolved solution 45 minutes after starting the dissolution test and filter it. Discard the first 10 mL of the filtrate, pipet *V* mL of the subsequent filtrate, add the dissolution medium to make exactly *V'* mL so that each mL contains about 200 μg of mefenamic acid ($C_{15}H_{15}NO_2$) according to the labeled amount, and use this solution as the test solution. Separately, weigh accurately about 20 mg of mefenamic acid RS, dissolve in methanol to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the operating conditions under the Assay, and determine the peak areas, A_T and A_S, of mefenamic acid. It meets the requirements when the dissolution ratio of Mefenamic Acid Tablets in 45 minutes is NLT 75%.

Dissolution rate (%) of the labeled amount of mefenamic acid ($C_{15}H_{15}NO_2$)

$$= W_S \times \frac{V'}{V} \times \frac{A_T}{A_S} \times \frac{1}{C} \times 900$$

W_S: Amount (mg) of mefenamic acid RS

C: Labeled amount (mg) of mefenamic acid ($C_{15}H_{15}NO_2$) in 1 tablet

0.05 mol/L tris buffer solution—Dissolve 60.5 g of 2-Amino-2-hydroxymethyl-1,3-propanediol in 6 L of water, add water to make 10 L, and adjust the pH to 9.0 ± 0.05 with phosphoric acid. Pipet 6 L of the resulting solution, dissolve with 100 g of sodium lauryl sulfate, and add this resulting solution to the original solution again.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately and powder NLT 20 tablets of Mefenamic Acid Tablets. Weigh accurately a portion of this powder, equivalent to about 50 mg of mefenamic acid ($C_{15}H_{15}NO_2$), add 5.0 mL of tetrahydrofuran, and sonicate for 5 minutes to dissolve. Add the mobile phase to make 250.0 mL, filter, and use the filtrate as the test solution. Separately, weigh accurately about 50 mg of mefenamic acid RS, add 5.0 mL of tetrahydrofuran, and shake to dissolve. Add the mobile phase to make 250.0 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of mefenamic acid from each solution.

Amount (mg) of mefenamic acid ($C_{15}H_{15}NO_2$)

$$= \text{Amount (mg) of mefenamic acid RS} \times \frac{A_T}{A_S}$$

Buffer solution—Dissolve 5.7 g of ammonium dihydrogen phosphate in 1000 mL of water, and add 3 mol/L ammonia water to adjust the pH to 5.0.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 μm - 10 μm in particle diameter).

Mobile phase: A mixture of acetonitrile, buffer solution and tetrahydrofuran (23 : 20 : 7).

Flow rate: 1.0 mL/min

System suitability

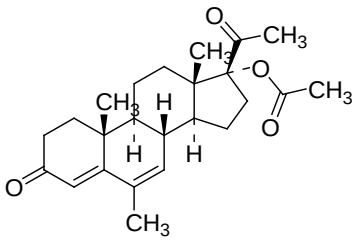
System performance: Proceed with 10 μL of the standard solution according to the above conditions; the symmetry factor is NMT 1.6.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution under the above operating conditions, the relative standard deviation of the

peak areas of mefenamic acid is NMT 1.0%.

Packaging and storage Preserve in well-closed containers.

Megestrol Acetate
메게스트롤아세테이트



$C_{24}H_{32}O_4$: 384.51

[(8*R*,9*S*,10*R*,13*S*,14*S*,17*R*)-17-Acetyl-6,10,13-trimethyl-3-oxo-2,8,9,11,12,14,15,16-octa-hydro-1*H*-cyclopenta[a]phenanthren-17-yl]acetate [*595-33-5*]

Megestrol Acetate contains NLT 97.0% and NMT 103.0% of megestrol acetate ($C_{24}H_{32}O_4$), calculated on the anhydrous basis.

Description Megestrol Acetate occurs as a white or almost white crystalline powder.
It is soluble in acetone, sparingly soluble in ethanol(95) and practically insoluble in water.

Identification Determine the infrared spectra of Megestrol Acetate and megestrol acetate RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Optical rotation $[\alpha]_D^{20}$: Between +8.8° and + 12.0° (0.2 g, calculated on the anhydrous basis, chloroform, 10 mL, 100 mm).

Melting point Between 213 and 220 °C.

Purity ***Heavy metals***—Proceed with 1.0 g of Megestrol Acetate according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

Water NMT 0.5% (0.25 g, volumetric titration, direct titration).

Residue on ignition NMT 0.2% (1 g, 600 ℃).

Assay Weigh accurately about 0.1 g of Megestrol Acetate and add acetonitrile to make 100 mL. Pipet 4 mL of this solution, add 5 mL of the internal standard solution, add the mobile phase to make exactly 50 mL, and use this solution as the test solution. Separately, weigh accurately about 0.1 g of megestrol acetate RS and add acetonitrile to make 100 mL. Pipet 4 mL of this solution, add 5 mL of the internal standard solution, add the mobile phase to make exactly 50 mL, and use this solution as the standard solution. Perform the test with 25 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the ratio of the peak area of megestrol acetate to that of the internal standard, Q_T and Q_S.

$$\text{Amount (mg) megestrol acetate } (C_{24}H_{32}O_4) = \text{Amount (mg) of megestrol acetate RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of propylparaben in acetonitrile (8 in 10000).

Operating conditions

Detector: An ultraviolet absorption spectrophotometer (wavelength: 280 nm).

Column: A stainless steel column 3.9 mm in internal diameter and 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of acetonitrile and water (55 : 45).

Flow rate: 1 mL/minute

System suitability

System performance: Proceed with 25 μL of the standard solution as directed under the above operating conditions; the relative retention time of propylparaben with respect to megestrol acetate is about 0.4 with the resolution between their peaks being NLT 8.0.

System repeatability: Repeat the test 6 times with 25 μL each of the standard solution under the above operating conditions; the relative standard deviation of the peak areas is NMT 2.0%.

Packaging and storage Preserve in light-resistant, tight containers.

Megestrol Acetate Oral Suspension
메게스트롤아세테이트 현탁액

Megestrol Acetate Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of megestrol acetate ($C_{24}H_{32}O_4$: 384.51) per mg.

Method of preparation Prepare as directed under Suspensions, with Megestrol Acetate.

Identification Take an amount of Megestrol Acetate, equivalent to 160 mg of megestrol acetate, according to the labeled amount, put in a separatory funnel, add 50 mL of water and 40 mL of chloroform, and shake to mix. Take the chloroform layer and use it as the test solution. Separately, weigh accurately about 40 mg of megestrol acetate RS, dissolve in chloroform to make 10 mL, and use this solution as the standard solution. With these solu-

tions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on a thin-layer chromatographic plate made of silica gel with fluorescence indicator for thin-layer chromatography, develop the plate with a mixture of chloroform and ethyl acetate (4 : 1) as the developing solvent, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the R_f values of the principal spots obtained from the test solution and the standard solution are the same.

pH Between 3.0 and 4.7,

Dissolution Take an amount (V mL), equivalent to 160 mg of megestrol acetate according to the labeled amount of Megestrol Acetate Oral Suspension, and perform the test with it at 25 revolutions per minute according to Method 2, using 900 mL of 0.5% sodium lauryl sulfate solution as a dissolution medium. Take the dissolved solution 30 minutes after starting the test, filter through a membrane filter with the pore size of NMT 0.45 μm, and use the filtrate as the test solution. Separately, weigh accurately about 45 mg of megestrol acetate RS, add 12 mL of methanol, and allow to stand on a steam bath to dissolve. Add the dissolution medium to make exactly 250 mL and use this solution as the standard solution. If necessary, dilute the test solution and the standard solution to a suitable concentration using the dissolution medium. Perform the test with the test solution and the standard solution as directed under the Ultraviolet-visible Spectroscopy, using the dissolution medium as the control solution, and determine the absorbances, A_T and A_S, respectively, at the wavelength of 292 nm. It meets the requirements when the dissolution rate of Megestrol Acetate Oral Suspension in 30 minutes is NLT 80% (Q).

Dissolution rate (%) of the labeled amount of megestrol acetate ($C_{24}H_{32}O_4$)

$$= C \times \frac{A_T}{A_S} \times \frac{V_D}{V} \times \frac{100}{L}$$

C: Concentration (mg/mL) of the standard solution

V: Volume (mL) of Megestrol Acetate Oral Suspension

V_D: Volume of the solvent, 900 mL

L: Labeled amount (mg/mL) of Megestrol Acetate Oral Suspension

Microbiological examination of non-sterile products Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Take an amount of Megestrol Acetate Oral Suspension equivalent to 160 mg of megestrol acetate according to the labeled amount and add the mobile phase to make exactly 1000 mL. Pipet 5 mL of this solution, add the mobile phase to make exactly 10 mL, and use this solution as the test solution. Separately, weigh accurately 80 mg of megestrol acetate RS, dissolve in the mobile phase to make 1000 mL, and use this solution as the standard solution. Perform the test with 25 μL each of the test solution and the standard solution as directed under the Liquid Chromatography and determine the peak areas, A_T and A_S, of megestrol acetate in each solution.

Amount (mg) of megestrol acetate ($C_{24}H_{32}O_4$)

$$= \text{Amount (mg) of megestrol acetate RS} \times \frac{A_T}{A_S} \times 2$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 280 nm).

Column: A stainless steel column 3.9 mm in internal diameter and 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of acetonitrile and water (11 : 9).

Flow rate: 1.5 mL/min

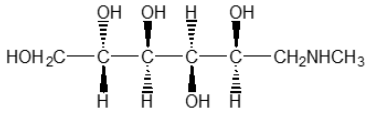
System suitability

System performance: Proceed with 25 μL of the standard solution according to the above conditions; the number of theoretical plate of the megestrol acetate peak is NLT 2500.

System repeatability: Repeat the test 6 times with 25 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area of megestrol acetate is NMT 2.0%.

Packaging and storage Preserve in light-resistant, well-closed containers.

Meglumine
메글루민



$C_7H_{17}NO_5$: 195.21

(2*R*,3*R*,4*R*,5*S*)-6-(Methylamino)hexane-1,2,3,4,5-pentol [*6284-40-8*]

Meglumine, when dried, contains NLT 99.0% and NMT 101.0% of meglumine ($C_7H_{17}NO_5$).

Description Meglumine occurs as a white crystalline powder, is odorless and has a slightly bitter taste.
It is freely soluble in water, slightly solution in ethanol(95) and practically insoluble in ether.
The pH of an aqueous solution of Meglumine (1 in 10) is between 11.0 and 12.0.

Identification (1) To 1 mL of an aqueous solution of Meglumine (1 in 10), add 1 mL of potassium 1,2-naphthoquinone-4-sulfonate TS; the solution turns deep red.

(2) To 2 mL of an aqueous solution of Meglumine

(1 in 10), add 1 drop of methyl red TS, add 0.5 mol/L sulfuric acid TS to neutralize, and add 0.5 mL of dilute sodium hydroxide TS and 0.5 g of boric acid; the solution turns deep red.

(3) Dissolve 0.5 g of Meglumine in 1 mL of diluted hydrochloric acid (1 in 3) and add 10 mL of ethanol(99.5); a white precipitate is produced. Then, while rubbing the inside wall with a glass rod, cool the solution with ice to produce more precipitate, filter the precipitate by suction through a glass filter (G3), wash the precipitate with a small volume of ethanol(99.5), and dry at 105 °C for 1 hour; the resulting residue melts at between 149 and 152 °C.

Specific optical rotation $[\alpha]_D^{20}$: Between -16.0° and -17.0° (after drying, 1 g, water, 10 mL, 100 mm).

Melting point Between 128 and 131 °C.

Purity (1) ***Clarity and color of solution***—Dissolve 0.1 g of Meglumine in 10 mL of water; the solution is colorless and clear.

(2) ***Chloride***—Dissolve 1.0 g of Meglumine in 30 mL of water, add 10 mL of nitric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 0.25 mL of 0.01 mol/L hydrochloric acid (NMT 0.009%).

(3) ***Sulfate***—Dissolve 1.0 g of Meglumine in 30 mL of water and add 5 mL of dilute hydrochloric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 0.40 mL of 0.005 mol/L sulfuric acid (NMT 0.019%).

(4) ***Heavy metals***—Proceed with 2.0 g of Meglumine according to Method 4 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(5) ***Arsenic***—Prepare the test solution with 2.0 g of Meglumine according to Method 3 and perform the test (NMT 1 ppm).

(6) ***Reducing agents***—To 5 mL of an aqueous solution of Meglumine (1 in 20), add 5 mL of Fehling's TS, and boil for 2 minutes; no reddish brown precipitate is produced.

Loss on drying NMT 0.5% (1 g, 105 °C, 4 hours).

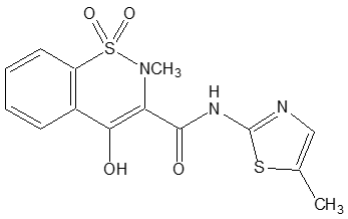
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.4 g of Meglumine, previously dried, dissolve in 25 mL water, and titrate with 0.1 mol/L hydrochloric acid VS (indicator: 2 drops of methyl red TS).

Each mL of 0.1 mol/L hydrochloric acid VS
= 19.521 mg of $C_7H_{17}NO_5$

Packaging and storage Preserve in tight containers.

Meloxicam
멜록시캄



$C_{14}H_{13}N_3O_4S_2$: 351.40

4-Hydroxy-2-methyl-*N*-(5-methyl-1,3-thiazol-2-yl)-1,1-dioxo-1λ6,2-benzothiazine-3-carboxamide [*71125-38-7*]

Meloxicam contains NLT 99.0% and NMT 100.5% of meloxicam ($C_{14}H_{13}N_3O_4S_2$), calculated on the dried basis.

Description Meloxicam occurs as a pale yellow powder. It is soluble in *N*,*N*-dimethylformamide, slightly soluble in acetone, very slightly soluble in ethanol(95) or methanol, and practically insoluble in water.

Identification (1) Determine the absorption spectra of solutions of Meloxicam and meloxicam RS in methanol (1.5 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Meloxicam and meloxicam RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Purity (1) ***Clarity and color of solution***—Dissolve 0.5 g of Meloxicam in 10 mL of *N*,*N*-dimethylformamide; the resulting solution is clear.

(2) ***Heavy metals***—Proceed with 2.0 g of Meloxicam according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Related substances***—Dissolve 80 mg of Meloxicam in 5 mL of a mixture of methanol and 1 mol/L sodium hydroxide TS (50:3), add methanol to make exactly 20 mL, and use this solution as the test solution. Dissolve 12 mg of meloxicam RS in 5 mL of a mixture of methanol and 1 mol/L sodium hydroxide TS (50:3) and add methanol to make exactly 20 mL. To 2 mL of this solution, add methanol to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 5 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak area of each solution by the automatic integration method and determine the amount of related substances in the test solution at the wavelength of 350 nm; meloxicam related substances I {ethyl 4-hydroxy-2-methyl-*2H*-1,2-benzothiazine-3-carboxylate 1,1-dioxide} is NMT 0.1%, and meloxicam related substances III {*N*-(3,5-

dimethylthiazole -2(*3H*)-ylidene)-4-hydroxy-2-methyl-2H-benzo[e][1,2]thiazine-3-carboxamide 1,1-dioxide} and meloxicam related substances IV {*N*-(3-ethyl-5-methylthiazol-2(*3H*)-ylidene)-4-hydroxy-2-methyl-*2H*-benzo[e][1,2]thiazine-3-carboxamide 1,1-dioxide} are NMT 0.05%, respectively. But the peak area of meloxicam related substances I is obtained by dividing the area determined with the automatic integration method by the correction factor 0.5. Meloxicam related substances II {5-methylthiazole-2-ylamine} detected at the wavelength of 260 nm is NMT 0.1%. Any related substance other than the above related substances including meloxicam, detected at the wavelengths of 350 nm and 260 nm, are NMT 0.1% and the sum of all related substances is NMT 0.3%.

$$\text{Content (\%) of related substances} = 100 \times \frac{A_\text{i}}{A_\text{S}} \times \frac{C_\text{S}}{C_\text{T}}$$

A_i: Peak area of each related substance in the test solution

A_S: Peak area of meloxicam from the standard solution at the wavelength of 350 nm

C_S: Concentration (mg/mL) of meloxicam RS in the standard solution

C_T: Concentration (mg/mL) of meloxicam in the test solution

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 260 nm and 350 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silical gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 45 °C.

Mobile phase: Use mobile phases A and B to control a step or gradient elution as follows.

Mobile phase A: Dissolve 1 g of potassium dihydrogen phosphate in 1000 mL of water and adjust the pH to 6.0 with 1 mol/L sodium hydroxide TS.

Mobile phase B: Methanol

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 - 2	60	40
2 - 10	60 → 30	40 → 70
10 - 15	30	70
15 - 15.1	30 → 60	70 → 40
15.1 - 18	60	40

Flow rate: 1.0 mL/min

System suitability

System performance: Dissolve 4 mg each of meloxicam RS, meloxicam related substances I RS and meloxicam related substances II RS in 5 mL of a mixture of methanol and 1 mol/L sodium hydroxide TS (50:3), add methanol to make 50 mL, and use this solution as the system suitability solution. Proceed with 5 μL of this solution according to the above conditions; the resolution between meloxicam and related substances I detected at the wavelength of 350 nm is NLT 3.0, and the resolution between meloxicam and related substances II detected at the wavelength of 260 nm is NLT 3.0. The relative retention times of the related substances I, II, III, and IV to meloxicam are 1.4, 0.4, 1.7 and 1.9, respectively.

System repeatability: Perform the test 6 times with 5 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak areas of meloxicam is NMT 10%.

Loss on drying NMT 0.5% (3.0 g, 105 ℃, constant mass).

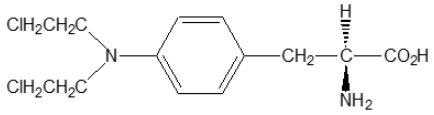
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.25 g of Meloxicam, dissolve in 50 mL of acetic acid(100) and 5 mL of anhydrous formic acid, and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Separately, perform a blank test and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 35.14 mg of $C_{14}H_{13}N_3O_4S_2$

Packaging and storage Preserve in well-closed containers.

Melphalan
멜팔란



$C_{13}H_{18}Cl_2N_2O_2$: 305.20

(2*S*)-2-Amino-3-[4-[bis(2-chloroethyl)amino]phenyl]propanoic acid [*148-82-3*]

Melphalan contains NLT 93.0% and NMT 101.0% of melphalan ($C_{13}H_{18}Cl_2N_2O_2$), calculated on the dried basis.

Description Melphalan occurs as a white to pale yellowish white crystalline powder.

It is slightly soluble in water, methanol or ethanol(95) and practically insoluble in ether.

It is soluble in dilute hydrochloric acid or dilute sodium hydroxide TS.

It is gradually colored by light.

Optical rotation $[\alpha]_\text{D}^{20}$: About –32° (0.50 g, calculated on the dried basis, methanol, 100 mL, 100 mm).

Identification (1) Dissolve 20 mg of Melphalan in 50 mL of methanol by warming, add 1 mL of a solution of 4-(4-nitrobenzyl)pyridine in acetone (1 in 20), and evaporate to dryness on a steam bath. Dissolve the residue in 1 mL of warmed methanol and add 2 drops of ammonia water(28); the resulting solution exhibits a violet color.

(2) Dissolve 0.1 g of Melphalan in 10 mL of dilute sodium hydroxide TS and heat on a steam bath for 10 minutes. After cooling, add dilute nitric acid to acidify and filter. The filtrate responds to the Qualitative Analysis for chloride.

(3) Determine the absorption spectra of solutions of Melphalan and melphalan RS in methanol (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

Purity (1) ***Ionizable chloride***—Weigh accurately about 0.5 g of Melphalan, dissolve in 80 mL of diluted nitric acid (1 in 40), stir for 2 minutes to mix, and titrate with 0.1 mol/L silver nitrate VS (potentiometric titration under the Titrimetry); the volume consumed is NMT 1.0 mL per 0.50 g of Melphalan.

(2) ***Heavy metals***—Proceed with 1.0 g of Melphalan as directed under Method 4 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Arsenic***—Prepare the test solution with 1.0 g of Melphalan according to Method 3 and perform the test (NMT 2 ppm).

Loss on drying NMT 7.0% (1 g, NMT 0.67 kPa, 105 °C, 2 hours).

Residue on ignition NMT 0.3% (1 g).

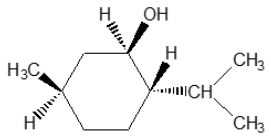
Nitrogen content Weigh accurately about 325 mg of Melphalan, dissolve in 0.1 mol/L sulfuric acid TS, and perform the test as directed under the Nitrogen Determination; the content of nitrogen (N:14.01) is NLT 8.90% and NMT 9.45%, calculated on the dried basis.

Assay Weigh accurately about 0.25 g of Melphalan, add 20 mL of potassium hydroxide solution (1 in 5), and heat under a reflux condenser on a steam bath for 2 hours. After cooling, add 75 mL of water and 5 mL of nitric acid. After cooling, titrate with 0.1 mol/L silver nitrate VS (potentiometric titration under the Titrimetry). Make any necessary correction by using the results obtained in Purity (1).

Each mL of 0.1 mol/L silver nitrate VS
= 15.260 mg of $C_{13}H_{18}Cl_2N_2O_2$

Packaging and storage Preserve in light-resistant, tight containers.

dl-Menthol
dl-멘톨



and enantiomer

$C_{10}H_{20}O$: 156.27
(1*R*,2*S*,5*R*)-and (1*S*,2*R*,5*S*)-5-Methyl-2-(propan-2-yl)cyclohexan-1-ol [*89-78-1*]

dl-Menthol contains NLT 98.0% and NMT 101.0% of *dl*-menthol ($C_{10}H_{20}O$).

Description *dl*-Menthol occurs as a colorless crystal, has a characteristic and refreshing odor, and has a stinging taste followed by a cool taste.
It is very soluble in ethanol(95) or ether, and very slightly soluble in water.
It sublimes gradually in room temperature.

Identification Perform the test according to the identification test of *l*-menthol.

Optical rotation $[\alpha]_D^{20}$: Between -2.0° and +2.0° (2.5 g, ethanol(95), 25 mL, 100 mm).

Congealing temperature Between 27 and 28 °C.

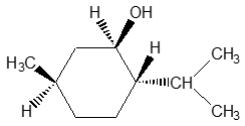
Purity Perform the test according to the Purity of *l*-menthol.

Assay Perform the test according to the Assay of *l*-menthol.

Each mL of 1 mol/L sodium hydroxide TS
= 156.27 mg of $C_{10}H_{20}O$

Packaging and storage Preserve in tight containers and store in a cool place.

l-Menthol
l-멘톨



$C_{10}H_{20}O$: 156.27
(1*R*,2*S*,5*R*)-5-Methyl-2-(propan-2-yl)cyclohexan-1-ol [*2216-51-5*]

l-Menthol contains NLT 98.0% and NMT 101.0% of *l*-menthol ($C_{10}H_{20}O$).

Description *l*-Menthol occurs as a colorless crystal, has

a characteristic and refreshing odor, and has a stinging taste followed by a cool taste.
It is very soluble in ethanol(95) or ether, and very slightly soluble in water.
It sublimes gradually in room temperature.

Identification (1) *l*-Menthol liquefies when mixed with an equal amount of camphor, chloral hydrate, or thymol.

(2) Add 1 g of *l*-Menthol in 20 mL of sulfuric acid and shake to mix; the resulting solution is turbid with a yellowish red color. Allow to stand for 3 hours; clear oil layer with no odor of menthol is separated.

Optical rotation $[\alpha]_D^{20}$: Between –45.0° and –51.0° (2.5 g, ethanol(95), 25 mL, 100 mm).

Melting point Between 42 and 44 ℃.

Purity (1) ***Residue on evaporation***—Evaporate 2.0 g of *l*-Menthol on a steam bath and dry the residue at 105 ℃ for 2 hours; the residue is NMT 1.0 mg.

(2) ***Thymol***—Dissolve 0.20 g of *l*-Menthol in a cold mixture of 2 mL of acetic acid(100), 6 drops of sulfuric acid and 2 drops of nitric acid; the resulting solution does not exhibit a green to bluish green color.

(3) ***Nitromethane or nitroethane***—Transfer 0.5 g of *l*-Menthol to a flask, add 2 mL of sodium hydroxide TS (1 in 2) and 1 mL of hydrogen peroxide(30), boil gently under a reflux condenser for 10 minutes. After cooling, add water to make exactly 20 mL, and filter. Transfer 1 mL of the filtrate to a Nessler tube, add water to make 10 mL, neutralize by adding dilute hydrochloric acid, and add 1 mL of dilute hydrochloric acid again. Cool, add 1 mL of sulfanilic acid (1 in 100), allow to stand for 2 minutes, add 1 mL of *N*-(1-Naphthyl)-*N'*-diethylethylenediamine oxalate (1 in 1000) and water to make 25 mL; the resulting solution does not exhibit a purple color.

Assay Weigh accurately about 1 g of *l*-Menthol, add the internal standard solution to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 100 mg of menthol RS, add the internal standard solution to make exactly 10 mL, and use this solution as the standard solution. Perform the test with 0.5 μL each of the test solution and standard solution as directed under the Gas Chromatography according to the following conditions, and calculate the peak area ratios, Q_T and Q_S, of menthol to internal standard for the test solution and the standard solution, respectively.

$$\text{Amount (mg) of menthol } (C_{10}H_{20}O) = \text{Amount (mg) of menthol RS} \times (Q_T / Q_S) \times 10$$

Internal standard solution—A solution of 1-butanol in hexane (1 in 100).

Operating conditions

Detector: A flame ionization detector

Column: A fused silica column about 0.18 mm in internal diameter and 20 m in length, coated with polyethylene glycol 15000 for gas chromatography in 0.18 μm thickness.

Injection port temperature: A constant temperature of about 250 ℃.

Detector temperature: A constant temperature of about 260 ℃.

Column temperature: Start 60 ℃, raise the temperature to 110 ℃ at a rate of 20 ℃ per minute, and maintain at 110 ℃ for 10 minutes.

Carrier gas: Hydrogen

Flow rate: 0.9 mL/min

Split ratio: 50 : 1

System suitability

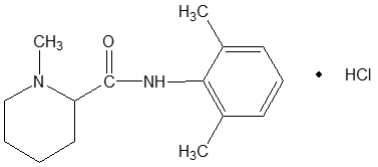
System performance: Proceed with 0.5 μL of the standard solution according to the above conditions; the relative retention time of the internal standard solution is 0.27 and the relative retention time of menthol is 1.0.

System repeatability: Perform the test 6 times with 0.5 μL each of the standard solution according to the above conditions; the relative standard deviation of the ratio peak area of menthol to the internal standard is NMT 2.0%.

Each mL of 1 mol/L sodium hydroxide VS
= 156.27 mg of $C_{10}H_{20}O$

Packaging and storage Preserve in tight containers and store in a cool place.

Mepivacaine Hydrochloride
메피바카인염산염



$C_{15}H_{22}N_2O \cdot HCl$: 282.81

N-(2,6-Dimethylphenyl)-1-methylpiperidine-2-carboxamide hydrochloride [*1722-62-9*]

Mepivacaine Hydrochloride, when dried, contains NLT 98.5% and NMT 101.0% of mepivacaine hydrochloride ($C_{15}H_{22}N_2O \cdot HCl$).

Description Mepivacaine Hydrochloride occurs as white crystals or a crystalline powder.
It is freely soluble in water or methanol, soluble in acetic acid(100), and sparingly soluble in ethanol(99.5).
An aqueous solution of Mepivacaine Hydrochloride (1 in 10) shows no optical rotation.

Melting point—About 256 ℃ (with decomposition).

Identification (1) Determine the absorption spectra of solutions (1 in 2500) of Mepivacaine Hydrochloride and mepivacaine hydrochloride RS as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit simi-

lar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Mepivacaine Hydrochloride and mepivacaine hydrochloride RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) An aqueous solution of Mepivacaine Hydrochloride (1 in 50) responds to the Qualitative Analysis for chloride.

pH Dissolve 0.2 g of Mepivacaine Hydrochloride in 10 mL of water; the pH of this solution is between 4.0 and 5.0.

Purity (1) ***Clarity and color of solution*—**Dissolve 1.0 g of Mepivacaine Hydrochloride in 10 mL of water; the solution is colorless and clear.

(2) ***Sulfate*—**Perform the test with 0.5 g of Mepivacaine Hydrochloride. Prepare the control solution with 0.40 mL of 0.005 mol/L sulfuric acid (NMT 0.038%).

(3) ***Heavy metals*—**Proceed with 2.0 g of Mepivacaine Hydrochloride according to Method 1 and perform the test. Prepare the control solution with 1.0 mL of lead standard solution (NMT 5 ppm).

(4) ***Related substances*—**Dissolve 0.10 g of Mepivacaine Hydrochloride in 5 mL of methanol and use this solution as the test solution. Pipet 1 mL of this solution and add methanol to make exactly 20 mL. Pipet 2 mL of this solution, add methanol to make exactly 50 mL, and use the resulting solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of ether, methanol and aqueous ammonia (28) (100 : 5 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Spray the bismuth nitrate-potassium iodide TS evenly onto the plate; the spots other than the principal spot from the test solution are not more intense than the spots from the standard solution.

(5) ***2,6-Dimethylaniline*—**Weigh accurately about 5.0 g of Mepivacaine Hydrochloride, and dissolve in methanol to make exactly 10 mL. Pipet 2 mL of this solution, add 1 mL of a solution of 4-dimethylaminobenzaldehyde in methanol (1 in 100) and 2 mL of acetic acid(100), allow the mixture to stand for 10 minutes, and use the resulting solution as the test solution. Separately, weigh accurately about 5.0 mg of 2,6-dimethylaniline and dissolve in methanol to make exactly 10 mL. Pipet 1 mL of this solution and add methanol to make exactly 100 mL. Proceed in the same manner as in the preparation of the test solution with 2 mL of this solution and use this solution as the standard solution. The color of the test solution is not more intense than that of the standard solution, as exhibited at the same time (NMT 100 ppm).

Loss on drying NMT 1.0% (1 g, 105 ℃, 3 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.4 g of Mepivacaine Hydrochloride, previously dried, dissolve in 10 mL of acetic acid(100), add 70 mL of acetic anhydride, and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 28.281 mg of $C_{15}H_{22}N_2O \cdot HCl$

Packaging and storage Preserve in tight containers.

Mepivacaine Hydrochloride Injection
메피바카인염산염 주사액

Mepivacaine Hydrochloride Injection is an aqueous solution for injection. Mepivacaine Hydrochloride Injection contains NLT 95.0% and NMT 105.0% of the labeled amount of mepivacaine hydrochloride ($C_{15}H_{22}N_2O \cdot HCl$: 282.81).

Method of preparation Prepare as directed under Injections, with Mepivacaine Hydrochloride.

Description Mepivacaine Hydrochloride Injection occurs as a colorless and clear liquid.

pH—Between 4.5 and 6.8.

Identification Weigh an amount of Mepivacaine Hydrochloride Injection, equivalent to 20 mg of mepivacaine hydrochloride according to the labeled amount, add 1 mL of sodium hydroxide TS, and extract with 20 mL of hexane. To 8 mL of the hexane extract, add 20 mL of 1 mol/L hydrochloric acid TS, shake vigorously and determine the absorption spectrum of the water layer as directed under Ultraviolet-visible Spectrophotometry: it exhibits maxima between 261 nm and 265 nm and between 270 nm and 273 nm.

Sterility Meets the requirements.

Bacterial endotoxins Less than 0.6 EU per mg of mepivacaine hydrochloride.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Extractable volume of injections Meets the requirements.

Assay Take exactly an amount of Mepivacaine Hydrochloride Injection, equivalent to about 40 mg of mepivacaine hydrochloride ($C_{15}H_{22}N_2O \cdot HCl$) according to the

labeled amount, add exactly 4 mL of the internal standard solution, add 0.001 mol/L hydrochloric acid TS to make 20 mL, and use this solution as the test solution. Separately, weigh accurately about 40 mg of mepivacaine hydrochloride RS, previously dried at 105 ℃ for 3 hours, dissolve in hydrochloric acid TS, add exactly 4 mL of the internal standard solution, add 0.001 mol/L hydrochloric acid TS to make 20 mL, and use this solution as the standard solution. Perform the test with 5 μL each of the test solution and the standard solution as directed under Liquid Chromatography according to the following conditions and calculate the ratios, Q_T and Q_S, of the peak area of mepivacaine hydrochloride to that of the internal standard for the test solution and the standard solution, respectively.

$$\text{Amount (mg) of mepivacaine hydrochloride } (C_{15}H_{22}N_2O\cdot HCl) = \text{Amount (mg) of mepivacaine hydrochloride RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of benzophenone in methanol (1 in 4000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

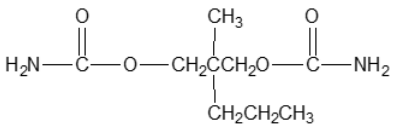
Mobile phase: Dissolve 2.88 g of sodium lauryl sulfate in a mixture of 550 mL of 0.02 mol/L phosphate buffer solution, pH 3.0 and 450 mL of acetonitrile, for a total volume of 1000 mL.

Flow rate: Adjust the flow rate so that the retention time of mepivacaine is about 6 minutes.

Selection of column: Proceed with 5 μL of a standard solution under the above operating conditions; mepivacaine and benzophenone are eluted in this order with the resolution being NLT 6.0.

Packaging and storage Preserve in hermetic containers.

Meprobamate
메프로바메이트



$C_9H_{18}N_2O_4$: 218.25

[2-(Carbamoyloxymethyl)-2-methylpentyl] carbamate [*57-53-4*]

Meprobamate contains NLT 97.0% and NMT 101.0% of meprobamate ($C_9H_{18}N_2O_4$), calculated on the dried basis.

Description Meprobamate occurs as a white powder. It has a characteristic odor and a bitter taste.
It is slightly soluble in water, freely soluble in acetone or ethanol(95), and sparingly soluble in ether.

Identification (1) Determine the infrared spectra of Meprobamate and meprobamate RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers. If the two spectra show a difference, use the steps as follows: dissolve each in acetone to make a solution containing 8 mg per mL, add 0.1 mL each of these solutions to 1 mL of n-heptane for mixing, evaporate the solvent in the nitrogen air flow at NMT 30 ℃, and dry the residue for 30 minutes at room temperature in vacuum. Perform the test with each resulting material.

(2) Perform the test as directed under the related substance test method; the R_f values and colors of the principal spots from the test solution and standard solution A are the same.

Melting point Between 103 and 107 ℃. The difference in the temperature between the start of melting and the completion of melting should be NMT 2 ℃.

Purity (1) ***Heavy metals***—Dissolve 2.0 g of Meprobamate in a mixture of water and acetone (15 : 85) to make 20 mL. Use this solution as the test solution and perform the test. Separately, add a mixture of water and acetone (15 : 85) to make 20 mL to 2.0 mL of lead standard solution. To 10 mL of this solution, add 2 mL of the test solution, and use the resulting solution as the control solution. Separately, add 2 mL of the test solution to 10 mL of a mixture of water and acetone (15 : 85), and use the resulting solution as the blank test solution. To 12 mL each of the test solution, control solution and blank test solution, add 2 mL of acetate buffer solution, pH 3.5, mix, add 1.2 mL of thioacetamide TS, and immediately mix. Allow the mixture to stand for 2 minutes; the color of the test solution is not more intense than that of the control solution (NMT 10 ppm).

System suitability: The control solution is slightly brown compared to the blank test solution.

(2) ***Related substances***—Weigh accurately a suitable amount of Meprobamate, dissolve in ethanol(95) to make a solution containing 0.1 g per mL, and use this solution as the test solution. To the test solution, add ethanol(95) for quantitative dilution to make a verification solution containing 1.0 mg per mL. Separately, weigh accurately a suitable amount of meprobamate RS, previously dried at 60 ℃ for 3 hours in vacuum, and dissolve in ethanol(95) to make a solution containing 1.0 mg per mL. To this solution, add ethanol(95) for quantitative dilution to make standard solutions as below.

Standard solution	Dilution ratio	Concentration (mg/mL)	Percentage (%) versus sample
A	(0)	1.0	1.0
B	(4 in 5)	0.8	0.8
C	(3 in 5)	0.6	0.6
D	(2 in 5)	0.4	0.4
E	(1 in 5)	0.2	0.2

With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 2 μL each of the test solution, verification solution and standard solutions on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of hexane, acetone and pyridine (7 : 3 : 1) as the developing solvent to a distance of about 15 cm, air-dry the plate for 15 minutes, heat at 100 ℃ for 15 minutes, and cool. Spray a solution prepared by dissolving 1 g of vanillin in a mixture of sulfuric acid and ethanol (160 : 40) evenly on this plate, heat at 110 ℃ for 15 to 20 minutes and cool. Allow it to stand at room temperature until a bluish-purple spot appears. It usually takes about 30 to 60 minutes for the color reaction. The R_f value of the principal spot from the test solution is the same as the R_f value of the principal spot from the standard solution, the spots other than the principal spot from the test solution are not larger or more intense than the spots from the standard solution A (1.0%), and the sum of all spots other than the principal spot from the test solution are NMT 2.0%.

(3) ***Methyl carbamate***—Powder Meprobamate into fine powder, weigh accurately about 1.0 g of the powder, put it in a beaker, add 5.0 mL of water, and shake well for wetting. Filter using a funnel with glass wool, and use the filtrate as the test solution. Separately, weigh accurately a suitable amount of methyl carbamate RS, previously dried at 60 ℃ for 3 hours in vacuum, dissolve in water to obtain a solution containing 1.0 mg per mL, and use this solution as the standard solution. Perform the test with exactly 50 μL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak areas in the solutions; the peak area of methyl carbamate in the test solution is not greater than that in the standard solution (0.5%).

Operating conditions

Detector: An ultraviolet absorption spectrophotometer (wavelength: 200 nm).

Column: A stainless steel column about 3.9 mm to 4.6 mm in internal diameter and 25 to 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 μm to 10 μm in particle diameter).

Mobile phase: Water

Flow rate: 1 mL/min

System suitability

System repeatability: Repeat the test 6 times with 20 μL of the standard solution each time according to the above operating conditions; the relative standard deviation of the peak area of methyl carbamate is NMT 2.0%.

Loss on drying NMT 0.5% (1.0 g, 60 ℃, in vacuum, 3 hours).

Assay Weigh accurately about 0.4 g of Meprobamate, put it into an Erlenmeyer flask, add 40 mL of hydrochloric acid and some boiling stones, and boil for 90 minutes with a reflux condenser attached. Detach the reflux condenser, keep boiling until the solution reaches the volume of 5 to 10 mL, and cool. Add 50 mL of water and 1 drop of methyl red TS, and carefully neutralize with 10 mol/L sodium hydroxide TS until the indicator changes in color. If necessary, add 1 mol/L hydrochloric acid VS until the solution turns red and carefully neutralize with 0.1 mol/L sodium hydroxide VS again. To this solution, add a mixture of 15 mL of formaldehyde solution TS, previously neutralized with phenolphthalein TS, and 15 mL of water, and titrate with 0.1 mol/L sodium hydroxide VS until the solution turns yellow. Again, add 0.2 mL of phenolphthalein TS and titrate with 0.1 mol/L sodium hydroxide VS until the solution turns red. Perform a blank test in the same manner and make any necessary correction. Regarding the consumed amount of 0.1 mol/L sodium hydroxide VS, only the consumed amount after adding the formaldehyde solution TS is considered.

Each mL of 0.1 mol/L sodium hydroxide VS
= 10.91 mg of $C_9H_{18}N_2O_4$

Packaging and storage Preserve in tight containers.

Meprobamate Tablets
메프로바메이트 정

Meprobamate Tablets contain NLT 90.0% and NMT 110.0% of labeled amount of meprobamate ($C_9H_{18}N_2O_4$: 218.25).

Method of preparation Prepare as directed under Tablets, with Meprobamate.

Identification (1) Weigh an amount of powdered Meprobamate Tablets, equivalent to about 0.8 g of meprobamate according to the labeled amount, add 5 mL of anhydrous alcohol, and heat for 5 minutes, shaking occasionally, until just before boiling. After cooling, filter through 15 mL of hexane, and shake to mix. Filter the resulting precipitates by suction, and dry at 60 ℃. With the dry matter, perform the test as directed under the Identification (1) of Meprobamate.

(2) The retention times of the major peaks obtained from the test solution and the standard solution in the Assay are the same.

Dissolution Perform the test with 1 tablet of Meprobamate Tablets according to Method 1 under the Dissolution at 100 revolutions per minute, using 900 mL of water as the dissolution medium. After 30 minutes into the dis-

solution test, take 30 mL of the dissolved solution, filter, and perform the test with the filtrate according to the Assay.
Meets the requirements if the dissolution rate of Meprobamate Tablets for 30 minutes is NLT 75%.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately NLT 20 tablets of Meprobamate Tablets, and powder finely. Weigh accurately a portion of this powder, equivalent to about 0.25 g of meprobamate ($C_9H_{18}N_2O_4$), add 15 mL of acetonitrile, shake to dissolve, add water to make exactly 50 mL, and filter. Discard the first 10 mL of the filtrate and use the subsequent filtrate as the test solution. Separately, weigh accurately about 50 mg of meprobamate RS, add 3 mL of acetonitrile, shake to dissolve, add water to make exactly 10 mL; and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions, and determine the peak areas, A_T and A_S, of meprobamate from the test solution and the standard solution, respectively.

$$\text{Amount (mg) of meprobamate } (C_9H_{18}N_2O_4) = \text{Amount (mg) of meprobamate RS} \times \frac{A_T}{A_S} \times 5$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 200 nm).

Column: A stainless steel column about 3.9 mm to 4.6 mm in internal diameter and 25 cm to 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 μm to 10 μm in particle diameter).

Mobile phase: A mixture of water and acetonitrile (7 : 3).

Flow rate: 1 mL/min

System suitability

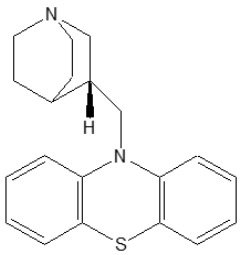
System performance: To 25 mg of meprobamate, add 1 mL of acetonitrile, shake to dissolve, add 1 mL of phenacetin solution, and add water to make 5 mL. Proceed with 20 μL of this solution according to the above conditions; meprobamate and phenacetin are eluted in this order with the resolution being NLT 2.0, and the peak area of phenacetin is 65% to 100% of that of meprobamate.

System repeatability: Repeat the test 6 times according to the above conditions with 20 μL each of the standard solution; the relative standard deviation of the peak areas is NMT 2.0%.

Phenacetin solution—Weigh 25 mg of phenacetin, and dissolve in acetonitrile to make exactly 200 mL. Take exactly 20 mL of this solution, add 30 mL of acetonitrile, and add water to make exactly 100 mL.

Packaging and storage Preserve in well-closed containers.

Mequitazine
메퀴타진



and enantiomer

$C_{20}H_{22}N_2S$: 322.47

(*RS*)-10-(1-Azabicyclo[2.2.2]octan-3-ylmethyl) phenothiazine [*29216-28-2*]

Mequitazine, when dried, contains NLT 98.5% and NMT 101.0% of mequitazine ($C_{20}H_{22}N_2S$).

Description Mequitazine occurs as a white crystalline powder.
It is freely soluble in methanol or acetic acid(100), soluble in ethanol(95) and practically insoluble in water.
A solution of Mequitazine in methanol (1 in 50) shows no optical rotation.
It is gradually colored by light.

Identification (1) Determine the absorption spectra of solutions of Mequitazine and mequitazine RS in ethanol(95) (1 in 250000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Mequitazine and mequitazine RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Melting point Between 146 and 150 ℃.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Mequitazine as directed under Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Related substances***—Perform the test, using light-resistant vessels. Dissolve 50 mg of Mequitazine in 5 mL of methanol and use this solution as the test solution. Pipet 1.0 mL of this solution and add methanol to make exactly 50 mL. Pipet 5.0 mL of this resulting solution, add methanol to make exactly 50 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 mL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of ethyl acetate, methanol and diethylamine (7 : 2 : 2) to as the developing solvent a distance of about 10 cm, and air-dry the plate. Examine the plate under ultraviolet light

(main wavelength: 254 nm); the number of spots other than the principal spot from the test solution is NMT 3 and they are not more intense than the spot from the standard solution.

Loss on drying NMT 0.5% (1 g, in vacuum, phosphorus pentoxide, 60 ℃, 3 hours).

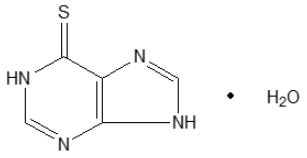
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.25 g of Mequitazine, dissolve in 50 mL of acetic acid(100), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same way and make necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 32.247 mg of $C_{20}H_{22}N_2S$

Packaging and storage Preserve in light-resistant, tight containers.

Mercaptopurine Hydrate
메르캅토푸린수화물



Mercaptopurine $C_5H_4N_4S \cdot H_2O$: 170.19
3,7-Dihydropurine-6-thione hydrate [*6112-76-1*]

Mercaptopurine Hydrate contains NLT 98.0% and NMT 101.0% of mercaptopurine ($C_5H_4N_4S$: 152.18), calculated on the anhydrous basis.

Description Mercaptopurine Hydrate occurs as pale yellow to yellow crystals or a crystalline powder and is odorless.
It is practically insoluble in water, acetone or ether.
It dissolves in sodium hydroxide TS or ammonia TS.

Identification (1) Dissolve 0.6 g of mercaptopurine hydrate in 6 mL of sodium hydroxide (3 in 100), add slowly 0.5 mL of iodomethane with vigorous stirring, and shake well to mix for 10 minutes. Cool with ice and adjust pH to about 5 by adding acetic acid drop by drop. Collect the separated crystals by filtration, recrystallize from water, and dry at 120 ℃ for 30 minutes; the melting point is between 218 and 222 ℃ (with decomposition).

(2) Determine the absorption spectra of the solutions of Mercaptopurine Hydrate and mercaptopurine hydrate RS in 0.1 mol/L hydrochloric acid (1 in 200000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit the same intensities of absorption at the same wavelengths.

Purity (1) ***Clarity and color of solution***—Dissolve 0.20 g of Mercaptopurine Hydrate in 10 mL of ammonia TS; the solution is clear.

(2) ***Sulfate***—Dissolve 50 mg of Mercaptopurine Hydrate in 10 mL of dilute hydrochloric acid, add 5 drops of barium chloride TS, and allow to stand for 5 minutes; the solution does not become turbid.

(3) ***Heavy metals***—Proceed with 1.0 g of Mercaptopurine Hydrate according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(4) ***Hypoxanthine***—Weigh 50 mg of Mercaptopurine Hydrate, dissolve in exactly 10 mL of the ammonia water(28) in methanol (1 in 10), and use this solution as the test solution. Weigh 5.0 mg of hypoxantine, dissolve in the ammonia water(28) in methanol (1 in 10) to make exactly 100 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of methanol, chloroform, *n*-butyl formate and ammonia water(28) (8 : 6 : 4 : 1) to a distance of 10 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spot obtained from the test solution, of which location corresponds to that of the spot from the standard solution, is neither larger nor more intense than the spot from the standard solution.

(5) ***Phosphorus***—Weigh 0.20 g of Mercaptopurine Hydrate, put in a crucible, and add 2 mL of diluted sulfuric acid (3 in 7). Heat at a low temperature and add slowly 0.5 mL portions of nitric acid dropwise until the liquid becomes colorless. Continue to heat until most of the liquid has evaporated. Cool, dissolve the residue in 10 mL of water, and transfer the solution into a 25 mL volumetric flask. Wash the crucible twice with 4 mL portions of water, combine the washings with the solution in the flask, and use this solution as the test solution. Dissolve 0.4396 g of potassium dihydrogen phosphate in water to make exactly 200 mL. Pipet 2.0 mL of this solution and add water to make 100 mL. Take another 2.0 mL of this solution, transfer into a 25 mL volumetric flask, add 16 mL of water, and use this solution as the standard solution. To the test solution and the standard solution, add 1 mL of diluted sulfuric acid (3 in 7), 0.5 mL of nitric acid, 0.75 mL of ammonium molybdate TS, 1 mL of 1-amino-2-naphthol-4-sulfonic acid TS, put water to make 25 mL, and allow to stand for 5 minutes. Perform the test with the test and standard solutions as directed under the Ultraviolet-visible Spectroscopy using water as the control solution; the absorbance obtained from the test solution at the wavelength of 750 nm is not larger than the absorbance from the standard solution.

Water Between 10.0% and 12.0% (0.2 g, volumetric titration, back titration).

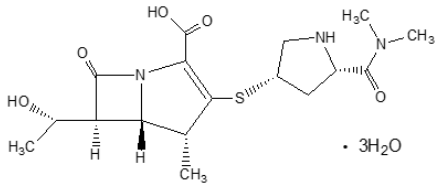
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately 0.25 g of Mercaptopurine Hydrate, dissolve in 90 mL of *N*,*N*-dimethylformamide, and titrate with 0.1 mol/L tetramethylammonium hydroxide VS (potentiometric titration under the Titrimetry). Perform a blank test with a solution of 90 mL of *N*,*N*-dimethylformamide and 15 mL of water and make any necessary correction.

Each mL of 0.1 mol/L tetramethyl ammonium hydroxide VS
= 15.218 mg of $C_5H_4N_4S$

Packaging and storage Preserve in well-closed containers.

Meropenem Hydrate
메로페넴수화물



$C_{17}H_{25}N_3O_5S \cdot 3H_2O$: 437.51

(4*R*,5*S*,6*S*)-3-[(3*S*,5*S*)-5-(Dimethylcarbamoyl)pyrrolidin-3-yl]sulfanyl-6-[(1*S*)-1-hydroxy-ethyl]-4-methyl-7-oxo-1-azabicyclo[3.2.0]hept-2-ene-2-carboxylic acid trihydrate [*119478-56-7*]

Meropenem Hydrate contains NLT 980 μg (potency) and NMT 1010 μg (potency) of meropenem ($C_{17}H_{25}N_3O_5$: 383.47 S) per mg, calculated on the anhydrous basis.

Description Meropenem Hydrate occurs as a white to pale yellow crystalline powder.
It is sparingly soluble in water and practically insoluble in ethanol(95) or ether.
It is soluble in sodium bicarbonate TS.

Identification (1) Dissolve 10 mg (potency) of Meropenem Hydrate in 2 mL of water, add 3 mL of hydroxylamine hydrochloride-ethanol TS, and allow to stand for 5 minutes. Add 1 mL of acidic ammonium iron(III) sulfate TS and shake to mix; the resulting solution exhibits a reddish brown color.

(2) Determine the absorption spectra of aqueous solutions of Meropenem Hydrate and meropenem RS (3 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared spectra of Meropenem Hydrate and meropenem RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Optical rotation $[\alpha]_D^{20}$: Between -17° and -21° (0.220 g, calculated on the anhydrous basis, water, 50 mL, 100 mm).

pH Dissolve 0.1 g (potency) of Meropenem Hydrate in 10 mL of water; the pH of this solution is between 4.0 and 6.0.

Purity (1) ***Clarity and color of solution***—Dissolve 0.5 g of Meropenem Hydrate in 10 mL of sodium bicarbonate TS; the solution is clear and its color is not more intense than the following control solution.

Control solution—Take accurately 0.3 mL of cobalt(II) chloride hexahydrate colorimetric stock solution and 1.2 mL of iron(III) chloride colorimetric stock solution, and add 18.5 mL of diluted hydrochloric acid (1 in 40).

(2) ***Heavy metals***—Proceed with 2.0 g of Meropenem Hydrate and perform the test according to Method 2. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Related substances***—Weigh accurately 50 mg (potency) of Meropenem Hydrate, dissolve in triethylamine-phosphate buffer solution, pH 5.0 to make exactly 10 mL, and use this solution as the test solution. Prepare the test solution before use. Pipet 1 mL of this solution and add triethylamine-phosphate buffer solution, pH 5.0 to make exactly 100 mL. Pipet 3 mL of this solution, add triethylamine-phosphate buffer solution, pH 5.0 to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test and standard solutions as directed under the Liquid Chromatography according to the following conditions. Determine the peak areas of these solutions by the automatic integration method; the peak area of ring-opened meropenem, having the relative retention time about 0.5 to meropenem, and the peak area of the dimmer, having the relative retention time about 2.2 to meropenem, obtained from the test solution are not larger than the peak area of meropenem from the standard solution, the area of the peak other than meropenem and the peaks mentioned above from the test solution is not larger than 1/3 times the peak area of meropenem from the standard solution. The total area of the peaks other than neropenem from the test solution is not larger than 3 times the peak area of neropenem from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

Column: A stainless steel column about 6.0 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: A mixture of 1000 mL of triethyla-

mine-phosphate buffer solution, pH 5.0 and 70 mL of acetonitrile.

Flow rate: Adjust so that the retention time of meropenem is about 6 minutes.

System suitability

Test for required detectability: Pipet 5 mL of the standard solution and add triethylamine-phosphate buffer solution, pH 5.0 to make exactly 25 mL. Confirm that the peak area of meropenem obtained from 10 μL of this solution is equivalent to 16% to 24% of the peak area of meropenem from the standard solution.

System performance: Proceed with 10 μL of the test solution, previously warmed at 60 ℃ for 30 minutes, according to the above conditions; the ring-opened, meropenem and dimer are eluted in this order with the resolution between the ring-opened and meropenem being NLT 1.5.

System reproducibility: Perform the test six times with 10 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak areas of meropenem is NMT 1.5%.

Time span of measurement: About 7 times the retention time of meropenem.

Water NLT 11.4% and NMT 13.4% (0.1 g, volumetric titration, direct titration).

Residue on ignition NMT 0.10% (1 g).

Sterility It meets the requirements when used in sterile preparations.

Bacterial endotoxins Less than 0.12 EU per mg (potency) of meropenem when used in sterile preparations.

Assay Weigh accurately 50 mg (potency) each of Meropenem Hydrate and meropenem RS, add 10 mL of internal standard solution, dissolve in triethylamine-phosphate buffer solution, pH 5.0 to make 100 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 5 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the ratios, Q_T and Q_S, of the peak area of meropenem to those of the internal standard from the test solution and the standard solution.

$$\text{Potency (μg) of meropenem } (C_{17}H_{25}N_3O_5S) = \text{Potency (μg) of meropenem RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—Dissolve 1.0 mL of benzyl alcohol in triethylamine-phosphate buffer solution, pH 5.0 to make 300 mL.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

Column: A stainless steel column about 6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: A mixture of triethylamine-phosphate buffer solution, pH 5.0 and methanol (5 : 1).

Flow rate: Adjust so that the retention time of meropenem RS is about 7 minutes.

System suitability

System performance: Proceed with 5 μL of the standard solution according to the above conditions; meropenem and the internal standard are eluted in this order with the resolution between these peaks being NLT 20.

System reproducibility: Perform the test 6 times with 5 μL each of the standard solutions according to the above conditions; the relative standard deviation of the ratios of the peak area of meropenem to that of the internal standard is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Meropenem for injection
주사용 메로페넴

Meropenem for injection is an injection to be dissolved before use and contains NLT 93.0% and NMT 107.0% of the labeled amount of meropenem ($C_{17}H_{25}N_3O_5S$: 383.47).

Method of preparation Prepare as directed under Injections, with Meropenem Hydrate and Sodium Carbonate.

Description Meropenem for injection occurs as a white to pale yellow crystalline powder.

Identification Determine the infrared spectra of Meropenem for injection as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; it exhibits absorption at the wavenumbers of about 3410 cm^{-1}, 1750 cm^{-1}, 1655 cm^{-1}, 1583 cm^{-1} and 1391 cm^{-1}.

pH Dissolve an amount of Meropenem for injection, equivalent to 0.25 g (potency) of meropenem, in 5 mL of water; the pH of the solution is between 7.3 and 8.3.

Purity (1) ***Clarity and color of solution***—Weigh an amount of Meropenem for injection, equivalent to 1.0 g (potency) of Meropenem Hydrate, according to the labeled amount, and dissolve in 20 mL of water; the color of the solution is not more intense than that of the following control solution.

Control solution—To 0.3 mL of cobalt(II) chloride hexahydrate colorimetric stock solution and 1.2 mL of Iron(III) chloride hexahydrate colorimetric stock solution, add 18.5 mL of diluted hydrochloric acid (1 in 40).

(2) ***Related substances***—Weigh accurately about 0.125 g (potency) of Meropenem for injection, dissolve in triethylamine-phosphate buffer solution, pH 5.0 to make exactly 25 mL, and use this solution as the test solution (prepared before use). Separately, weigh accurately about 25 mg (potency) of meropenem RS, dissolve in triethylamine-phosphate buffer solution, pH 5.0, and make exactly 10 mL. Pipet 1 mL of this solution, add triethylamine-phosphate buffer solution, pH 5.0, to make exactly 200 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Purity (2) of Meropenem. Determine the peak areas of ring-opened and dimer from the test solution and the peak area of meropenem from the standard solution, and calculate the amounts of ring-opened and dimer according to the following equation (NMT 0.5% for ring-opened and dimer, respectively).

$$\text{Content (\%) of ring-opened compound} = \frac{A_{\mathrm{Ta}}}{A_{\mathrm{S}}} \times \frac{Potency\ (mg)\ of\ \text{meropenem RS}}{Amount\ (mg)\ of\ \text{Meropenem for injection}} \times \frac{5}{4}$$

$$\text{Content (\%) of dimers} = \frac{A_{\mathrm{Tb}}}{A_{\mathrm{S}}} \times \frac{Potency\ (mg)\ of\ \text{meropenem RS}}{Amount\ (mg)\ of\ \text{Meropenem for injection}} \times \frac{5}{4}$$

A_{Ta}: Peak area of ring-opened in the test solution
A_{Tb}: Peak area of dimer in the test solution
A_{S}: Peak area of meropenem in the standard solution

Loss on drying Between 9.5% and 12.0% (0.1 g, 0.7 kPa, 60 ℃, 3 hours).

Sterility Meets the requirements.

Bacterial endotoxins Less than 0.12 EU per mg (potency) of meropenem.

Particulate contamination: Visible particles Meets the requirements.

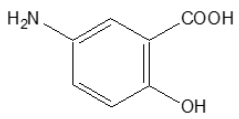
Insoluble particulate matter in injections Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Perform the test according to the Assay under Meropenem Hydrate. However, weigh accurately the amount equivalent to about 50 mg (potency) of Meropenem for injection, according to the labeled potency, add exactly 10 mL of the internal standard solution, add triethylamine-phosphate buffer solution, pH 5.0 to make 100 mL, and use this solution as the test solution.

Packaging and storage Preserve in hermetic containers.

Mesalazine
메살라진



$C_7H_7NO_3$: 153.14
5-Amino-2-hydroxybenzoic acid [*89-57-6*]

Mesalazine, when dried, contains NLT 98.5% and NMT 101.0% of mesalazine ($C_7H_7NO_3$).

Description Mesalazine occurs as a white, light grey or light red powder or crystals.
It is very slightly soluble in water and practically insoluble in ethanol(95).
It dissolves in dilute sodium hydroxide TS and in dilute hydrochloric acid.

Identification (1) Dissolve 50.0 mg each of Mesalazine and mesalazine RS in 1.03 w/v% hydrochloric acid to make 100 mL. To 5.0 mL each of these solutions, add 1.03 w/v% hydrochloric acid to make 200 mL, respectively. Determine the absorption spectra of the resulting solutions as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Mesalazine and mesalazine RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) Dissolve 50 mg each of Mesalazine and mesalazine RS in 10 mL of a mixture of water and acetic acid(100) (1 : 1), respectively, add methanol to make 20 mL each, and use each of the resulting solutions as the test solution and the standard solution, respectively. Perform the test with the test solution and standard solution as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of 4-methyl-2-pentanone, methanol and acetic acid(100) (50 : 40 : 10) as the developing solvent to a distance of about 10 cm and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 365 nm). The colors and R_f values of the principal spots from the test solution and standard solution are the same.

Purity (1) ***Clarity and color of solution***—Dissolve 0.5 g of Mesalazine in 1 mol/L hydrochloric acid TS to make 20 mL, and maintain the solution at 40 ℃; the solution is clear. While maintaining the solution at 40 ℃, determine the absorption spectrum of this solution as directed under the Ultraviolet-visible Spectroscopy. The absorbance at 440 nm is NMT 0.15 and the absorbance at 650 nm is NMT 0.10.

(2) ***Reducing substances***—Dissolve 0.10 g of Mesalazine in dilute hydrochloric acid to make 25 mL,

add 0.2 mL of starch TS and 0.25 mL of 0.01 mol/L iodine TS, and allow to stand for 2 minutes; the solution exhibit a blue or purple-brown color.

(3) ***Chloride*—**Dissolve 1.50 g of Mesalazine in 50 mL of formic acid, add 100 mL of water and 5 mL of 2 mol/L nitric acid TS, and titrate with 0.005 mol/L silver nitrate VS (potentiometric titration under the Titrimetry) (NMT 0.1%).

Each mL of 0.005 mol/L silver nitrate VS
= 0.1773 mg of Cl

(4) ***Sulfate*—**To 1.0 g of Mesalazine, add 20 mL of water, shake for 1 minute to filter, and wash the filter paper and residue with a suitable amount of water. Combine the filtrate and washings, add water to make 40 mL, and use this solution as the test solution. Prepare the control solution with 0.42 mL of 0.005 mol/L sulfuric acid (NMT 0.02%).

(5) ***Heavy metals*—**Proceed with 1.0 g of Mesalazine according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(6) ***Related substances I and II*—**Dissolve 50.0 mg of Mesalazine in the mobile phase A to make exactly 50 mL, and use this solution as the test solution. Dissolve 5.0 mg of mesalazine related substance I (2-aminophenol) in the mobile phase A to make exactly 100 mL. To 10.0 mL of this solution, add the mobile phase A to make exactly 100 mL, and use the resulting solution as the standard solution (1). Dissolve 5.0 mg of mesalazine related substance II (4-aminophenol) in the mobile phase A to make exactly 250 mL. To 1.0 mL of this solution, add 1.0 mL of the standard solution (1), add the mobile phase A to make exactly 100 mL, and use the resulting solution as the standard solution (2). To 1.0 mL of the test solution, add the mobile phase A to make exactly 200 mL. To 5.0 mL of this solution, add 5.0 mL of the standard solution (1), and use the resulting solution as the standard solution (3). Perform the test with 20 µL each of the test solution, standard solution (2) and standard solution (3) as directed under the Liquid Chromatography according to the following conditions. Determine the peak area from each solution according to the automatic integration method; the peak area of the related substance II from the test solution is not greater than that from the standard solution (2) (NMT 0.02%), and the peak area of the related substance I from the test solution is not greater than 4 times that from the standard solution (2) (NMT 0.02%).

Operating conditions

Detector: An ultraviolet absorption spectrophotometer (wavelength: 220 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 µm in particle diameter).

Mobile phase: Use mobile phases A and B to control stepwise or based on the gradient elution as follows.

Mobile phase A: Dissolve 2.2 g of perchloric acid and 1.0 g of phosphoric acid in water to make 1000 mL.

Mobile phase B: Dissolve 1.7 g of perchloric acid and 1.0 g of phosphoric acid in acetonitrile to make 1000 mL.

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 - 8	100	0
8 - 25	100 → 40	0 → 60
25 - 30	40 → 100	60 → 0
30 - 40	100	0

Flow rate: 1.0 mL/min

System suitability

System performance: Proceed with 20 µL of the standard solution (3) under the above operating conditions; the relative retention times are about 0.5, 0.9 and 1.0 for the related substance II, related substance I and mesalazine, respectively, and the resolution between the peaks of the related substance I and mesalazine is NLT 3.0.

(7) ***Related substance IV*—**Dissolve 40.0 mg of Mesalazine in the mobile phase to make exactly 20 mL, and use this solution as the test solution. Dissolve 27.8 mg of aniline hydrochloride in the mobile phase to make exactly 100 mL. To 0.2 mL of this solution, add the mobile phase to make exactly 20 mL. To 0.2 mL of this solution, add the mobile phase to make exactly 20 mL, and use the resulting solution as the standard solution. Perform the test with 50 µL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak area of each solution according to the automatic integration method; the peak area of the mesalazine related substance IV (aniline) from the test solution is not greater than that from the standard solution (0.001%).

Operating conditions

Detector: An ultraviolet absorption spectrophotometer (wavelength: 205 nm).

Column: A stainless steel column about 4.0 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 µm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: A mixture of pH 8.0 phosphate buffer and methanol (85 : 15).

Flow rate: 1.0 mL/min

System suitability

System performance: Proceed with 50 µL of the standard solution under the above operating conditions; the retention time of the related substance IV is about 15 minutes and the signal-to-noise ratio of the major peak is NLT 10.

Phosphate buffer solution, pH 8.0—Dissolve 1.41 g

of potassium dihydrogen phosphate and 0.47 g of sodium dihydrogen phosphate dihydrate in water to make 1000 mL, and adjust the pH to 8.0 with 1 mol/L sodium oxide TS.

(8) ***Related substances*—**Use freshly prepared test solution, standard solution and mobile phases. Dissolve 50.0 mg of Mesalazine in the mobile phase A to make exactly 50 mL, and use this solution as the test solution. To 1.0 mL of the test solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution (1). Dissolve 5.0 mg of mesalazine related substance V (3-aminobenzoic acid) in the mobile phase A to make exactly 100 mL. To 1.0 mL of this solution, add the test solution to make exactly 25 mL, and use the resulting solution as the standard solution (2). Dissolve 5.0 mg of related substance V in the mobile phase A to make exactly 100 mL. To 1.0 mL of this solution, add the mobile phase A to make exactly 50 mL, and use the resulting solution as the standard solution (3). Dissolve 10.0 mg of related substance III (3-aminophenol) in the mobile phase A to make exactly 100 mL. To 1.0 mL of this solution, add the mobile phase to make exactly 50 mL, and use the resulting solution as the standard solution (4). Dissolve 5.0 mg of mesalazine related substance VI (2,5-dihydroxybenzoic acid) in the mobile phase A to make exactly 100 mL. To 1.0 mL of this solution, add the mobile phase A to make exactly 50 mL, and use the resulting solution as the standard solution (5). Dissolve 15.0 mg of mesalazine related substance VII (salicylic acid) in the mobile phase A to make exactly 100 mL. To 1.0 mL of this solution, add the mobile phase A to make exactly 50 mL, and use the resulting solution as the standard solution (6). Use the mobile phase A as the blank test solution. Perform the test with 10 μL each of the blank test solution, test solution and standard solutions (1), (3), (4), (5) and (6) as directed under the Liquid Chromatography according to the following conditions. Determine the peak area of each solution according to the automatic integration method. The peak area of the related substance III from the test solution is not greater than the peak area of the major peak from the standard solution (4) (0.2%), the peak area of the related substance V is not greater than the peak area of the major peak from the standard solution (3) (0.1%), the peak area of the related substance VI is not greater than the peak area of the major peak from the standard solution (5) (0.1%), and the peak area of the related substance VII is not greater than the peak area of the major peak from the standard solution (6) (0.3%). The peak area of other related substance is not greater than 0.1 times the peak area of the major peak from the standard solution (1) (NMT 0.1%), and the sum of peak areas of all related substances is not greater than the peak area of the major peak from the standard solution (1) (1.0%). Exclude the peak whose area is not greater than 0.05 times the peak area of the major peak from the standard solution (1) and the peak from the blank test solution.

Operating conditions

Detector: An ultraviolet absorption spectrophotometer (wavelength: 220 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: Use mobile phases A and B to control stepwise or based on the gradient elution as follows.

Mobile phase A: Dissolve 2.2 g of perchloric acid and 1.0 g of phosphoric acid in water to make exactly 1000 mL.

Mobile phase B: Dissolve 1.7 g of perchloric acid and 1.0 g of phosphoric acid in acetonitrile to make exactly 1000 mL.

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 - 7	100	0
7 - 25	100 → 40	0 → 60
25 - 30	40 → 100	60 → 0
30 - 40	100	0

Flow rate: 1.25 mL/min

System suitability

System performance: Proceed with 10 μL each of the standard solutions (2), (3), (4), (5) and (6) under the above operating conditions; the relative retention times to the mesalazine peak are about 0.8, 1.2, 3.1 and 3.9 for the peaks of the related substances III, V, VI and VII, respectively, and the ratio of the height to the peak top of the related substance V versus the height of valley between the mesalazine peak and related substance V peak is NLT 1.5.

Loss on drying NMT 0.5% (1.0 g, 105 ℃, constant mass).

Residue on ignition NMT 0.2% (1.0 g).

Assay Weigh accurately about 50 mg of Mesalazine, previously dried, dissolve in 100 mL of boiling water, cool it to room temperature, and titrate with 0.1 mol/L sodium hydroxide VS (potentiometric titration under the Titrimetry).

Each mL of 0.1 mol/L sodium hydroxide VS
= 15.31 mg of $C_7H_7NO_3$

Packaging and storage Preserve in light-resistant, tight containers.

Mesna
메스나

$C_2H_5NaO_3S_2$: 164.18

2-Mercaptoethanesulfonic acid sodium salt, [19767-45-4]

Mesna contains NMT 96.0% and NLT 102.2% of mesna ($C_2H_5NaO_3S_2$), calculated on the dried basis.

Description Mesna occurs as a white to pale yellow fine crystalline powder.
It is freely soluble in water, slightly soluble in methanol or ethanol(95), and practically insoluble in ether.

Identification (1) Put 5 mL of 5% lead acetate TS to 1 mL of an aqueous solution of Mesna (1 in 5); a pale yellow precipitate is formed.

(2) Determine the infrared spectra of Mesna and mesna RS, previously dried, as directed in the potassium bromide disk method as directed under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers. However, due to the hygroscopic property of Mesna's fine powder, in some cases, there may be significant differences in the spectrum, compared to dried powder, resulting in strong absorptions at around 3,571 cm^{-1} to 3,509 cm^{-1} and 1,613 cm^{-1} wavenumbers.

Sodium content Between 13.44% and 14.28%. Weigh accurately about 1.0 g of Mesna, transfer into a quartz crucible, add a small amount of 50% sulfuric acid to moisten, and warm gently to dry. Then, incinerate at NMT 800 °C. Add 5 drops of 50% sulfuric acid to the residue, incinerate again, cool in a desiccator (silica gel), and weight the mass.

$$= \frac{\text{Amount (mg) of sodium (Na)}}{\text{Amount } (g) \text{ of ash x } 0.3238} \times 100$$

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Mesna as directed under Method 2 and perform the test. Prepare the control solution with 1.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Nitrogen content***—Weigh accurately about 0.5 g of Mesna and perform the test as directed under the Nitrogen Determination.

Each mL of 0.005 mol/L sulfuric acid VS
= 0.14007 mg of N

The amount of nitrogen in Mesna is NMT 0.1%.

(3) ***Ethylenediaminetetraacetic acid disodium salt***—Weigh accurately about 4.0 g of Mesna, dissolve in 90 mL of water, adjust the pH to 4.5 with 0.1 mol/L hydrochloric acid VS, and put 10 mL of acetic acid-ammonium acetate buffer solution, pH 4.5, and 2 mL of isopropyl alcohol. Titrate with 0.01 mol/L zinc sulfate VS until the color of the solution changes from gray to blue (indicator: dithizone TS 2 mL).

Each mL of 0.01 mol/L zinc sulfate VS
= 3.7224 mg of ethylenediaminetetraacetic acid disodium salt

The amount of ethylenediaminetetraacetic acid disodium salt in Mesna is NMT 0.05%.

Loss on drying NMT 1.0% (1 g, 60℃, in vacuum, 2 hours).

Assay Weigh accurately about 0.1 g of Mesna, dissolve in 10 mL of water, and titrate with 0.1 mol/L sodium hydroxide VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS
= 16.418 mg of $C_2H_5NaO_3S_2$

Packaging and storage Preserve in tight containers.

Mesna Injection
메스나 주사액

Mesna Injection contains NLT 95.0% and NMT 105.0% of the labeled amount of mesna ($C_2H_5NaO_3S_2$: 164.18).

Method of preparation Prepare as directed under Injections, with Mesna.

Identification Take an amount of Mesna Injection equivalent to 0.1 g of mesna ($C_2H_5NaO_3S_2$: 164.18), add water to make 20 mL, and use this solution as the test solution. Separately, weigh 0.1 g of mesna RS, dissolve in 20 mL of water, and use this solution as the standard solution. Perform the test with the test solution and the standard solution as directed under Thin-layer Chromatography. Spot 10 μL each of the test solution and the standard solution on a thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography, develop the plate with a mixture of ethyl acetate, methanol and acetic acid(100) (5 : 2 : 2) as a developing solvent to a distance of about 10 cm, and air-dry the plate. Apply iodine vapor to the plate; the R_f value and color of the spots obtained from the test solution and the standard solution are the same.

pH Between 6.5 and 8.5.

Sterility Meets the requirements.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

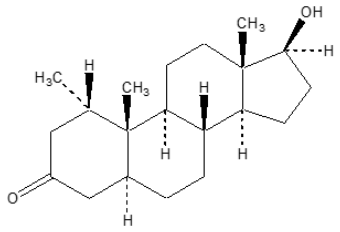
Extractable volume of injections Meets the requirements.

Assay Pipet an amount of Mesna Injection equivalent to about 0.1 g of mesna ($C_2H_5NaO_3S_2$), add 20 mL of water, add 10 mL of 0.5 mol/L sulfuric acid and 10 mL of 0.1 mol/L iodine solution, and titrate the excess iodine with 0.1 mol/L sodium thiosulfate VS (indicator: starch TS). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L sodium thiosulfate VS
= 16.42 mg of $C_2H_5NaO_3S_2$

Packaging and storage Preserve in hermetic containers.

Mesterolone
메스테롤론



$C_{20}H_{32}O_2$: 304.47
(1*S*,5*S*,8*R*,9*S*,10*S*,13*S*,14*S*,17*S*)-17-Hydroxy-1,10,13-trimethyltetradecahydro-1*H*-cyclopenta[a]phenanthren-3(2*H*)-one [*1424-00-6*]

Mesterolone contains NLT 98.0% and NMT 102.0% of mesterolone ($C_{20}H_{32}O_2$), calculated on the dried basis.

Description Mesterolone occurs as a white or pale yellow crystalline powder.
It is sparingly soluble in acetone, ethyl acetate, and methanol and practically insoluble in water.

Identification Determine the infrared spectra of Mesterolone and mesterolone RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Melting point Between 206 and 211 ℃.

Optical rotation $[\alpha]_D^{20}$: Between +20° and +24° (0.2 g after drying, dichloromethane, 10 mL, 100 mm).

Purity (1) ***Related substances I***—Dissolve 0.1 g of Mesterolone in a mixture of methanol and dichloromethane (1 : 1) to make 10 mL, and use this solution as the test solution. Pipet 1 mL of the test solution, add the mixture of methanol and dichloromethane (1 : 1) to make 200 mL, and use this solution as the standard solution (1). Dissolve 5 mg of mesterolone-related substance I (1α-methyl-5α-androstan-3β,17β-diol) in the standard solution (1) to make 100 mL, and use this solution as the standard solution (2). With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution, the standard solution (1), and the standard solution (2) on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of toluene, acetone and methanol (85 : 15 : 2) as a developing solvent to a distance of about 15 cm, and air-dry the plate. Examine the plate under ultraviolet light (366 nm), or spray evenly with a solution of 20% toluenesulphonic acid in ethanol, and heat the plate at 120 ℃ for 10 minutes; the blue spots other than the principal spot obtained from the test solution are not more intense than the spots from the standard solution (1) (0.5%).

(2) ***Other related substances***—Dissolve 50.0 mg of Mesterolone in a mixture of acetonitrile and water (4 : 1) to make 25 mL, and use this solution as the test solution. Separately, dissolve 50.0 mg of mesterolone RS in a mixture of acetonitrile and water (4 : 1) to make 25 mL, and use this solution as the standard solution (1). Dissolve 10.0 mg of mesterolone-related substance II (17*β*-hydroxy-1*α*-methylandrost-4-en-3-one) in a mixture of acetonitrile and water (4 : 1) to make 5.0 mL, and use this solution as the standard solution (2). Put a mixture of acetonitrile and water (4 : 1) to 0.5 mL of the standard solution (1) and 0.5 mL of the standard solution (2) to make 100 mL, and use this solution as the standard solution (3). Perform the test with 50 μL each of the test solution and the standard solution (3) as directed under the Liquid Chromatography according to the following conditions, and calculate the peak area of each solution by the automatic integration method; the peak area of related substance II other than the major peak obtained from the test solution is NMT the peak area of related substance II obtained from the standard solution (3) (0.5%). Additionally, the peak areas of all other related substances are NMT 0.5 times that of mesterolone, and the total area of these peaks is not greater than 1.5 times that of mesterolone obtained from the standard solution (3) (0.75%). However, exclude any peaks with peak areas being NMT 0.1 times that of mesterolone obtained from the standard solution (3).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 200 nm).

Column: A stainless steel column with 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 μm in particle diameter).

Mobile phase: A mixture of methanol, water, and acetonitrile (3 : 2 : 1).

Flow rate: 0.9 mL/min

System suitability

System performance: Add a mixture of acetonitrile and water (4 : 1) to 0.5 mL of the standard solution (1) and 0.5 mL of the standard solution (2) to make 100 mL. Proceed with 50 μL of this solution according to the conditions above; the resolution between the peaks of mesterolone and the related substance II is NLT 6.0.

Loss on drying NMT 0.5% (1 g, 105 ℃, constant mass).

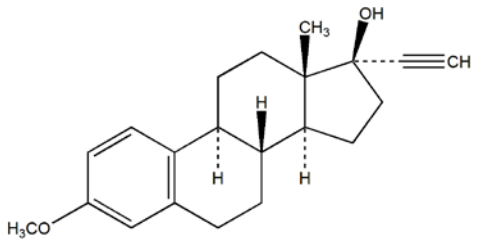
Residue on ignition NMT 0.1% (0.1 g).

Assay Weigh accurately about 50.0 mg each of Mesterolone and mesterolone RS, dissolve in a mixture of acetonitril and water (4 : 1) to make them exactly 25 mL, and use these solutions as the test solution and the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed in Liquid Chromatography according to the assay of related substances, and calculate the peak areas, A_T and A_S, of the test solution and the standard solution by the automatic integration method.

$$\text{Amount (mg) of mesterolone } (C_{20}H_{32}O_2) = \text{Amount (mg) of mesterolone RS} \times \frac{A_T}{A_S}$$

Packaging and storage Preserve in tight containers.

Mestranol
메스트라놀



$C_{21}H_{26}O_2$: 310.43
(8*R*,9*S*,13*S*,14*S*,17*R*)-17-Ethynyl-3-methoxy-13-methyl-7,8,9,11,12,13,14,15,16,17-decahydro-6*H*-cyclopenta[a]phenanthren-17-ol [*72-33-3*]

Mestranol, when dried, contains NLT 97.0% and NMT 102.0% of mestranol ($C_{21}H_{26}O_2$).

Description Mestranol occurs as a white to pale yellow crystalline powder, which is odorless.
It is freely soluble in chloroform, soluble in 1,4-dioxane, sparingly soluble in ethanol(99.5) or ether and practically insoluble in water.

Identification (1) Determine the absorption spectra of aqueous solutions of Mestranol and mestranol RS in ethanol(99.5) (1 in 10000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Mestranol and mestranol RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Optical rotation $[\alpha]_D^{20}$: Between +1° and +7° (0.1 g after drying, ethanol(95), 10 mL, 100 mm).

Melting point Between 148 and 154 ℃.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Mestranol as directed under Method 2 and perform the test. Prepare the control solution with 2.0 mL of the lead standard solution (NMT 20 ppm).

(2) ***Arsenic***—Proceed with 1.0 g of Mestranol as directed under Method 3 and perform the test (NMT 2 ppm).

(3) ***Related substances***—Dissolve 0.10 g of Mestranol in 20 mL of chloroform and use this solution as the test solution. Pipet 1.0 mL of this solution, add chloroform to make exactly 200 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of chloroform and ethanol(99.5) (29 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Spray evenly diluted sulfuric acid (1 in 5) on the plate and heat at 105 ℃ for 15 minutes; the spots other than the principal spot from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 0.5% (0.5 g, 105 ℃, 3 hours).

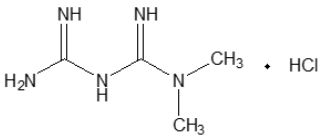
Residue on ignition NMT 0.1% (0.5 g).

Assay Weigh accurately about 10 mg each of Mestranol and mestranol RS, previously dried, dissolve in ethanol(99.5) to make them exactly 100 mL, and use these solutions as the standard solution and the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution as directed under Ultraviolet-visible Spectroscopy at 279 nm wavelengths.

$$\text{Amount (mg) of mestranol } (C_{21}H_{26}O_2) = \text{Amount (mg) of mestranol RS} \times \frac{A_T}{A_S}$$

Packaging and storage Preserve in light-resistant, tight containers.

Metformin Hydrochloride
메트포르민염산염



$C_4H_{11}N_5 \cdot HCl$: 165.63
3-(Diaminomethylidene)-1,1-dimethylguanidine hydrochloride [*1115-70-4*]

Metformin Hydrochloride, when dried, contains NLT 98.5% and NMT 101.0% of metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$).

Description Metformin Hydrochloride occurs as white crystals.
It is freely soluble in water, slightly soluble in ethanol(95) and practically insoluble in acetone or dichloromethane.

Identification (1) Dissolve 20 mg each of Metformin Hydrochloride and metformin hydrochloride RS in water to make 5 mL, and use these solutions as the test solution and the standard solution, respectively. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on a thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of water, 1-butanol and acetic acid(100) (50 : 40 : 10) as a developing solvent to a distance of about 15 cm, and dry the plate at 100 to 105 °C for 15 minutes. Spray a mixture of sodium nitroprusside solution (1 in 10), potassium hexacyanoferrate(II) TS and sodium hydroxide solution (1 in 10) (1 : 1 : 1) evenly on the dried plate (prepare this solution before use); the R_f value and the color of the principal spot obtained from the test solution is the same as those obtained from the standard solution.

(2) Determine the infrared spectra of Metformin Hydrochloride and metformin hydrochloride RS, as directed in the potassium chloride disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) A solution of Metformin Hydrochloride (1 in 200) responds to the Qualitative Analysis for chloride.

Melting point Between 222 and 226 ℃.

Purity (1) ***Clarity and color of solution***—Dissolve 2.0 g of Metformin Hydrochloride in 20 mL of water; the solution is colorless and clear.

(2) ***Heavy metals***—Proceed with 1.0 g of Metformin Hydrochloride according to Method 1 and perform the test. Prepare the control solution with 1.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Related substances***—Dissolve 0.5 g of Metformin Hydrochloride in the mobile phase to make exactly 100 mL, and use this solution as the test solution. Separately, dissolve 20.0 mg of cyanoguanidine in water to make exactly 100 mL. Pipet 1 mL of this solution, add the mobile phase to make exactly 200 mL, and use this solution as the standard solution (1). Pipet 1 mL of the test solution, add the mobile phase to make exactly 50 mL, pipet 1 mL of this solution, add the mobile phase to make exactly 20 mL, and use this solution as the standard solution (2). Dissolve 10.0 mg of melamine in 90 mL of water, add 5 mL of the test solution, and add water to make exactly 100 mL. Pipet 1 mL of this solution, add the mobile phase to make exactly 50 mL, and use this solution as the standard solution (3). Perform the test with 20 μL each of the test solution, the standard solution (1) and the standard solution (2) as directed under the Liquid Chromatography according to the following conditions. The area of the peak corresponding to cyanoguanidine obtained from the test solution is not larger than that obtained from the standard solution (1) (0.02%), and the peak area other than the major peak and the peak corresponding to cyanoguanidine is not larger than that obtained from the standard solution (2) (0.1%).

Operating conditions

Detector: An ultraviolet absorption spectrophotometer (wavelength: 218 nm).

Column: A stainless steel column about 4.7 mm in internal diameter and about 25 cm in length, packed with benzenesulphonic acid silica gel for liquid-chromatography (5 μm in particle diameter).

Mobile phase: Dissolve 17 g of ammonium dihydrogen phosphate in water to make 1000 mL, and adjust the pH to 3.0 with phosphoric acid.

Flow rate: 1 mL/minute

System suitability

Detection sensitivity: Adjust the detection sensitivity so that the peak height of metformin hydrochloride obtained from 20 μL of the standard solution (2) is at least 50% of the full scale.

System performance: Proceed with 20 μL of the standard solution (3) under the above operating conditions; the resolution between the peaks of melamine and metformin hydrochloride is NLT 10.

Time span of measurement: About twice the retention time of Metformin Hydrochloride.

Loss on drying NMT 0.5% (1 g, 105 ℃, 5 hours).

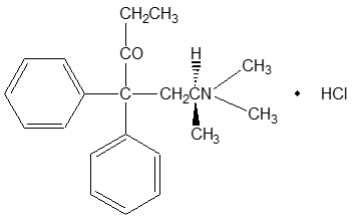
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 60 mg of Metformin Hydrochloride, dissolve in 4 mL of anhydrous formic acid, add 50 mL of acetic anhydride, and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry).

Each mL of 0.1 mol/L perchloric acid VS
= 8.281 mg of $C_4H_{11}N_5 \cdot HCl$

Packaging and storage Preserve in well-closed containers.

Methadone Hydrochloride
메타돈염산염



and enantiomer

$C_{21}H_{27}NO \cdot HCl$: 345.91

6-(Dimethylamino)-4,4-diphenyl-3-heptanone hydrochloride [*1095-90-5*]

Methadone Hydrochloride contains NLT 98.5% and NMT 100.5% of methadone hydrochloride ($C_{21}H_{27}NO \cdot HCl$), calculated on the dried basis.

Description Methadone Hydrochloride occurs as a colorless or white crystalline powder and is odorless.
It is freely soluble in ethanol or chloroform, soluble in water, and practically insoluble in ether or glycerin.

Identification (1) Determine the infrared spectra of Methadone Hydrochloride and methadone hydrochloride RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) An aqueous solution of Methadone Hydrochloride responds to the Qualitative Analysis for chloride.

pH Dissolve 1.0 g of Methadone Hydrochloride in 100 mL of water; the pH of this solution is between 4.5 and 6.5.

Purity ***Related substances***—Weigh 0.1 g of Methadone Hydrochloride, dissolve in 10 mL of ethanol, and use this solution as the test solution. Separately, weigh 10 mg of methadone hydrochloride RS, previously dried at 105℃ for 1 hour, and dissolve in ethanol to make 10 mL. Pipet 0.1 mL, 0.5 mL, 1.0 mL and 2.0 mL each of the test solution, add ethanol to make 10 mL respectively, and use these solutions as the standard solutions (1), (2), (3) and (4). With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 20 μL each of the test solution and standard solutions (1), (2), (3) and (4) on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Develop the plate with a mixture of methanol and ammonia TS (200 : 3) as a developing solvent to a distance of 15 cm, and air-dry the plate. Spray evenly a coloring agent on the plate; the sum of intensities of all spots other than the principal spot is NMT 1.0%.

Coloring agent—Dissolve 0.85 g of bismuth subnitrate in 40 mL of water and 10 mL of acetic acid(100), and use this solution as the solution A. Dissolve 8 g of potassium iodide in 20 mL of water and use this solution as the solution B. To 10 mL of a mixture of the solution A and the solution B, add 20 mL of acetic acid(100) and water to make 100 mL.

Loss on drying NMT 0.3% (0.5 g, 105 ℃, 1 hour).

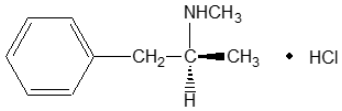
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.5 g of Methadone Hydrochloride, dissolve in a mixture of 10 mL of acetic acid(100) and 10 mL of mercury(II) acetate TS for nonaqueous titration while warming slightly, if necessary. Allow to cool the solution to room temperature, add 10 mL of dioxane, and titrate rapidly with 0.1 mol/L perchloric acid VS (indicator: methylrosaniline chloride TS). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 34.591 mg of $C_{21}H_{27}NO \cdot HCl$

Packaging and storage Preserve in light-resistant, tight containers.

Methamphetamine Hydrochloride
메탐페타민염산염



$C_{10}H_{15}N \cdot HCl$: 185.69

(*S*)-*N*-Methyl-1-phenylpropan-2-amine hydrochloride [*51-57-0*]

Methamphetamine Hydrochloride, when dried, contains NLT 98.5% and NMT 101.0% of methamphetamine hydrochloride ($C_{10}H_{15}N \cdot HCl$).

Description Methamphetamine Hydrochloride occurs as colorless crystals or a white crystalline powder and is odorless.
It is freely soluble in water, ethanol or chloroform, and practically insoluble in ether.
Dissolve 1.0 g of Methamphetamine Hydrochloride in 10 mL of water; the pH of the solution is between 5.0 and 6.0.

Identification (1) To 5 mL of an aqueous solution of Methamphetamine Hydrochloride (1 in 100), add 0.5 mL of hexachloroplatinic acid TS; an orange crystalline precipitate is produced.

(2) To 5 mL of an aqueous solution of Methamphetamine Hydrochloride (1 in 100), add 0.5 mL of iodine TS; a brown precipitate is produced.

(3) To 5 mL of an aqueous solution of Methamphetamine Hydrochloride (1 in 100), add 0.5 mL of trinitrophenol TS; a yellow crystalline precipitate is produced.

(4) An aqueous solution of Methamphetamine Hydrochloride (1 in 20) responds to the Qualitative Analysis for chloride.

Optical rotation $[\alpha]_D^{20}$: Between +16° and +19° (0.2 g after drying, water, 10 mL, 100 mm).

Melting point Between 171 and 175 ℃.

Purity (1) ***Acid or alkali***—Dissolve 2.0 g of Methamphetamine Hydrochloride in 40 mL of freshly boiled and cooled water, add 2 drops of methyl red TS, and use this solution as the test solution.

(i) To 20 mL of the test solution, add 0.20 mL of 0.01 mol/L sulfuric acid; the resulting solution exhibits a red color.

(ii) To 20 mL of the test solution, add 0.20 mL of 0.02 mol/L sodium hydroxide TS; the resulting solution exhibits a yellow color.

(2) ***Sulfate***—Dissolve 50 mg of Methamphetamine Hydrochloride in 40 mL of water, add 1 mL of dilute hydrochloric acid and 1 mL of barium chloride TS, and allow to stand for 10 minutes; the solution remains unchanged.

Loss on drying NMT 0.5% (1 g, 105 ℃, 2 hours).

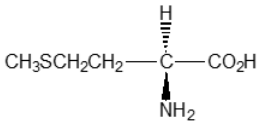
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately 0.4 g of Methamphetamine Hydrochloride, previously dried, dissolve in 50 mL of a mixture of acetic anhydride and acetic acid(100) (7 : 3), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 18.569 mg of $C_{10}H_{15}N \cdot HCl$

Packaging and storage Preserve in light-resistant, tight containers.

DL-Methionine
DL-메티오닌



and enantiomer

$C_5H_{11}NO_2S$: 149.21
(*RS*)-2-Amino-4-methylsulfanylbutanoic acid [*59-51-8*]

DL-Methionine contains NLT 99.0% and not than 101.0% of DL-methionine ($C_5H_{11}NO_2S$), calculated on the dried basis.

Description DL-Methionine occurs as white crystals or small flakes.
It is sparingly soluble in water, very slightly soluble in ethanol(95) and practically insoluble in ether.
It dissolves in dilute hydrochloric acid or in dilute sodium hydroxide TS.

Melting point—About 270 °C.

Identification (1) Dissolve about 0.1 g of DL-Methionine and 0.1 g of glycine in 4.5 mL of 2 mol/L sodium hydroxide TS, add 1 mL of 2.5% sodium pentacyanonitrosylferrate(III) dihydrate solution, and heat at 40 °C for 10 minutes. After cooling, add 2 mL of a mixture of hydrochloric acid and phosphoric acid (9 : 1); the solution turns deep red.

(2) Determine the infrared spectra of DL-Methionine and DL-methionine RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) Perform the test as directed under the section of Related substances under the Purity, the R_f value and the color of the principal spot obtained from the test solution (2) are the same as those obtained from the standard solution (1).

Optical rotation $[\alpha]_D^{20}$: Between -0.05° and +0.05° (2.5 g, 1 mol/L hydrochloric acid TS, 50 mL, 100 mm).

pH Dissolve 1.0 g of DL-Methionine in 50 mL of water; the pH of this solution is between 5.4 and 6.1.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of DL-Methionine in 50 mL of water; the solution is colorless and clear.

(2) ***Chloride***—Dissolve 0.5 g of DL-Methionine in 20 mL of water and add 6 mL of dilute nitric acid and water to make 40 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid VS, 6 mL of dilute nitric acid and water to make 40 mL. To each of the test solution and the control solution, add 10 mL of silver nitrate TS (NMT 0.021%).

(3) ***Sulfate***—Proceed with 1.0 g of DL-Methionine in 20 mL of water, dissolve it by heating at 60 ℃, then cool down to 10 ℃, filtrate, and add water to the filtrate to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.4 mL of 0.005 mol/L sulfuric acid (NMT 0.02%).

(4) ***Heavy metals***—Proceed with 1.0 g of DL-Methionine according to Method 4 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(5) ***Related substances***—Weigh 0.5 g of DL-Methionine, dissolve in water to make exactly 10 mL, and use this solution as the test solution (1). Pipet 1 mL of this solution, add water to make exactly 50 mL, and use this solution as the test solution (2). Separately, dissolve 20 mg of DL-Methionine in water to make exactly 50 mL, and use this solution as the standard solution (1). Pipet 1 mL of this solution, add water to make exactly 10

mL, and use this solution as the standard solution (2). With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution (1), test solution (2), standard solution (1) and standard solution (2) on a thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Then, develop the plate with a mixture of 1-butanol, water and acetic acid(100) (60 : 20 : 20) to a distance of about 10 cm, and air-dry the plate. Spray ninhydrin TS evenly on the plate and heat the plate at 100 to 105 ℃ for 15 minutes; any spot other than the principal spot obtained from the test solution (1) is not more intense than that obtained from the standard solution (2) (NMT 0.2%).

Loss on drying NMT 0.5% (1 g, 105 ºC).

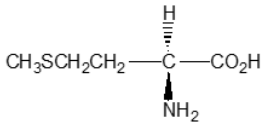
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.14 mg of DL-Methionine, dissolve in 3 mL of anhydrous formic acid, add 30 mL of acetic acid(100), and then immediately titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Separately, perform a blank test and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 14.921 mg of $C_5H_{11}NO_2S$

Packaging and storage Preserve in light-resistant, tight containers.

L-Methionine
L-메티오닌



$C_5H_{11}NO_2S$: 149.21
(2*S*)-2-Amino-4-methylsulfanylbutanoic acid [*63-68-3*]

L-Methionine, when dried, contains NLT 98.5% and NMT 101.0% of L-methionine ($C_5H_{11}NO_2S$).

Description L-Methionine occurs as white crystals or a crystalline powder and has a distinctive odor.
It is freely soluble in formic acid, soluble in water and very slightly soluble in ethanol(95).
It dissolves in dilute hydrochloric acid.

Identification (1) Weigh 25 mg of L-Methionine, put in 1 mL of sulfuric acid saturated with anhydrous copper(II) sulfate; the resulting solution exhibits a yellow color.

(2) Add 1 mL of ninhydrin TS to 5 mL of the aqueous solution of L-Methionine (1 in 5000) and heat on a steam bath for 2 minutes; the resulting solution exhibits a bluish purple color.

(3) Dissolve 0.3 g of L-Methionine in 10 mL of water and add 10 drops of dilute hydrochloric acid and 2 mL of sodium nitrate TS; a colorless gas is evolved with effervescence.

Optical rotation $[\alpha]_D^{20}$: Between +21.0° and +25.0° (0.5 g after drying, 6 mol/L hydrochloric acid TS, 25 mL, 100 mm).

pH Dissolve 0.5 g of L-Methionine in 20 mL of water; the pH is between 5.2 and 6.2.

Purity (1) ***Clarity and color of solution***—Dissolve 0.5 g of L-Methionine in 20 mL of water; the resulting solution is clear and colorless.

(2) ***Chloride***—Dissolve 0.5 g of L-Methionine in 20 mL of water and add 6 mL of dilute nitric acid, and water to make 40 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid, 6 mL of dilute nitric acid and water to make 40 mL. However, add 10 mL each of silver nitrate TS to the test solution and the control solution (NMT 0.021%).

(3) ***Sulfate***—Weigh 0.6 g of L-Methionine and perform the test. Prepare the control solution with 0.35 mL of 0.005 mol/L sulfuric acid (NMT 0.028%).

(4) ***Ammonium***—Weigh 0.25 g of L-Methionine and perform the test. Prepare the control solution with 5.0 mL of the ammonium standard solution (NMT 0.02%).

(5) ***Heavy metals***—Weigh 1.0 g of L-Methionine, add 40 mL of water and 2 mL of dilute acetic acid, warm to dissolve, after cooling, and add water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with a solution prepared by adding 2 mL of dilute acetic acid and water to 2.0 mL of lead standard solution to make 50 mL (NMT 20 ppm).

(6) ***Iron***—Dissolve 0.333 g of L-Methionine in water to make 45 mL, add 2 mL of hydrochloric acid, and use this solution as the test solution. Add water to 1.0 mL of the iron standard solution to make 45 mL, add 2 mL of hydrochloric acid, and use this solution as the standard solution. To the test solution and the standard solution, add 50 mg of ammonium peroxydisulfate and 3 mL of 30% ammonium thiocyanate and mix; the color obtained from the test solution is not more intense than that from the standard solution (NMT 30 ppm).

(7) ***Arsenic***—Put 1.0 g of L-Methionine into a 100-mL decomposition flask, add 5 mL of nitric acid and 2 mL of sulfuric acid, put a small funnel into the opening of the flask, and heat gently until white smoke is evolved. After cooling, add 2 mL each of nitric acid twice and heat. Next, add 2 mL each of hydrogen peroxide solution (30) multiple times and heat until the solution exhibits colorless to pale yellow color. After cooling, add 2 mL of a saturated solution of ammonium oxalate, and then heat again until white smoke is generated. After cooling, add water to make 5 mL and perform the test by using this solution as the test solution (NMT 2 ppm).

(8) ***Related substances***—Dissolve 0.10 g of L-Methionin in 10 mL of water and use this solution as the test solution. Pipet 1 mL of the test solution and add wa-

ter to make exactly 50 mL. Pipet 5 mL of this resulting solution, add water to make exactly 20 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. After air-drying the plate, develop the plate with a mixture of 1-butanol, water and acetic acid(100) (3 : 1 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Spray evenly a solution of ninhydrin in acetone (1 in 50) on the plate and heat at 80℃ for 5 minutes; the spots other than the principal spot from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 0.3% (1 g, 105 ℃, 4 h.).

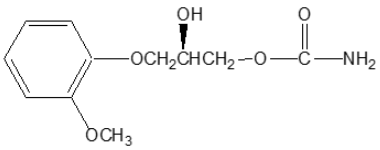
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.15 g of L-Methionine, previously dried, and dissolve in 3 mL of formic acid, add 50 mL of acetic acid(100), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 14.921 mg of $C_5H_{11}NO_2S$

Packaging and storage Preserve in tight containers.

Methocarbamol
메토카르바몰



and enantiomer

$C_{11}H_{15}NO_5$: 241.24
2-Hydroxy-3-(2-methoxyphenoxy)propyl carbamate
[*532-03-6*]

Methocarbamol contains NLT 98.5% and NMT 101.5% of methocarbamol ($C_{11}H_{15}NO_5$), calculated on the dried basis.

Description Methocarbamol occurs as a white powder and is odorless or has a characteristic odor.
It is soluble in heated ethanol, sparingly soluble in chloroform and practically insoluble in benzene or in *n*-hexane.

Identification (1) Determine the absorption spectra of solutions of Methocarbamol and methocarbamol RS in ethanol(95) (1 in 25000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Methocarbamol and methocarbamol RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Purity (1) ***Heavy metals***—Dissolve 1.0 g of Methocarbamol in a mixture of 7 mL of methanol and 3 mL of 1 mol/L acetic acid, add water to make 25 mL, and perform the test according to Method 1. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Related substances***—Dissolve 0.1 g of Methocarbamol in 13 mL of methanol, add pH 4.5 buffer solution to make exactly 50 mL, and use this solution as the test solution. Use this solution within 24 hours. Separately, weigh 20 mg of methocarbamol RS, put into a 10-mL volumetric flask, dissolve in 1.0 mL of a solution prepared by dissolving 20.0 mg of guaifenesin RS in methanol to make exactly 50 mL and 2.0 mL of methanol, and fill the pH 4.5 buffer solution up to the gauge line. Use this solution as the standard solution. Use this solution within 24 hours. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Measure the peak area of methocarbamol and the areas of all peaks of which relative retention times with respect to methocarbamol are greater than 0.5 (NMT 2.0%).

$$\text{Content (\%) of related substances} = 100 \times \frac{2.4}{A_S} \times \frac{A_i}{A_T}$$

A_S: Peak area (%) of guaifenesin in the standard solution

A_i: Peak areas of all related substances in the test solution

A_T: Sum of peak areas of all related substances and methocarbamol in the test solution

Operating conditions

Detector: An ultraviolet absorption spectrophotometer (wavelength: 274 nm).

Column: A stainless steel column about 4 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid-chromatography (about 3 μm to 10 μm in particle diameter).

Mobile phase: A mixture of pH 4.5 buffer solution and methanol (75 : 25).

System suitability

System performance: Proceed with 20 μL of the standard solution under the above operating conditions; the ratio of the peak area of guaifenesin is 2.4 ± 1.0%, and guaifenesin and methocarbamol are eluted in this order with the resolution between their peaks being NLT 2.0.

System repeatability: Repeat the test 6 times with

20 μL each of the standard solution under the above operating conditions; the relative standard deviation of the peak area percentage is NMT 4.0%.

pH 4.5 buffer solution—Dissolve 6.8 g of potassium dihydrogen phosphate in 1000 mL of water, and add 6 mol/L phosphoric acid or 10 mol/L potassium hydroxide solution to adjust the pH to 4.5 ± 0.05.

Loss on drying NMT 0.5% (1 g, 60 °C, 2 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.1 g of Methocarbamol, transfer it to a 100-mL volumetric flask, add methanol to the gauge line, and mix. Pipet 4.0 mL of this solution, transfer it to a 100-mL volumetric flask, add methanol to the gauge line, and use this solution as the test solution. Separately, weigh accurately about 0.1 g of methocarbamol RS, dissolve in methanol, proceed in the same way as in the test solution, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at the absorbance maximum wavelength at about 274 nm as directed under the Ultraviolet-visible Spectroscopy, using methanol as the control solution.

$$\text{Amount (mg) of methocarbamol } (C_{11}H_{15}NO_5) = \text{Amount (mg) of methocarbamol RS} \times \frac{A_T}{A_S}$$

Packaging and storage Preserve in tight containers.

Methocarbamol Injection
메토카르바몰 주사액

Methocarbamol Injection is an aqueous injection, and contains NLT 95.0% and NMT 105.0% of the labeled amount of methocarbamol ($C_{11}H_{15}NO_5$: 241.24).

Method of preparation Prepare as directed under Injections, with Methocarbamol.

Description Methocarbamol Injection occurs as a colorless and clear liquid.

Identification Take an amount of Methocarbamol Injection equivalent to about 0.5 g of methocarbamol according to the labeled amount, transfer to a separating funnel with 40 mL of water, and extract with 10 mL of ethyl acetate. Dry the ethyl acetate layer with sodium sulfate anhydrous, evaporate to dryness in a 40 °C water bath with nitrogen gas, and perform the test with the residue as directed under the Identification (1) of Methocarbamol.

pH Between 3.5 and 6.0.

Purity ***Aldehydes***—Take an amount of Methocarbamol Injection equivalent to about 0.4 g of methocarbamol according to the labeled amount, add 2.0 mL of the filtrate of phenylhydrazinum hydrochloride (1 in 100) in diluted ethanol (1 in 5), and allow to stand for 10 minutes. Add 1 mL of potassium hexacyanoferrate(III) solution (1 in 100), allow to stand for 5 minutes, add 4 mL of hydrochloric acid, add ethanol(95) to make exactly 25 mL, and use this solution as the test solution. Separately, take 4 mL of formaldehyde solution (1 in 100000) to prepare under the same conditions as for the test solution, and use this solution as the control solution. Perform the test with the test solution and the control solution as directed under Ultraviolet-visible Spectroscopy to determine the absorbance at the absorbance maximum wavelength at about 515 nm; the absorbance of the test solution is not greater than that of the control solution (NMT 0.01%).

Sterility Meets the requirements.

Bacterial endotoxins Methocarbamol Injection contains less than 0.2 EU/mg of methocarbamol.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Extractable volume of injections Meets the requirements.

Assay Take exactly an amount of Methocarbamol Injection, equivalent to about 0.1 g of methocarbamol ($C_{11}H_{15}NO_5$), add the mobile phase to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 0.1 g of methocarbamol RS, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of methocarbamol, respectively.

$$\text{Amount (mg) of methocarbamol } (C_{11}H_{15}NO_5) = \text{Amount (mg) of methocarbamol RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 274 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 10 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 μm to 5 μm in particle diameter).

Column temperature: 30 °C

Mobile phase: A mixture of pH 4.5 buffer solution and methanol (70 : 30).

Flow rate: 1 mL/min

System suitability

System repeatability: Repeat the test 6 times with 20 μL of the standard solution according to the above

operating conditions; the relative standard deviation of the peak area for methocarbamol is NMT 2.0%.

pH 4.5 buffer solution—Dissolve 6.8 g of potassium dihydrogen phosphate in 1000 mL of water, and add 6 mol/L phosphoric acid or 10 mol/L potassium hydroxide solution to adjust the pH to 4.5 ± 0.05.

Packaging and storage Preserve in hermetic containers.

Methocarbamol Tablets
메토카르바몰 정

Methocarbamol Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of methocarbamol ($C_{11}H_{15}NO_5$: 241.24).

Method of preparation Prepare as directed under tablets, with Methocarbamol.

Identification Weigh an amount of Methocarbamol Tablets, previously powdered, equivalent to 1 g of methocarbamol according to the labeled amount, add to 25 mL of water in a separatory flask, and extract with 25 mL of chloroform. Filter the extract and evaporate to dryness, and perform the test with the residue as directed under the Identification (1) of methocarbamol.

Dissolution Take 1 tablet of Methocarbamol Tablets, proceed with 900 mL of water as the test solution at 50 revolutions per minute according to Method 2, and perform the test. After 45 minutes from starting the test, proceed with the dissolved solution as the test solution according to in the Assay, and perform the test.
It meets the requirements if the dissolution rate of Methocarbamol Tablets after 45 minutes is NLT 75%.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 tablets of Methocarbamol Tablets, and powder. Weigh accurately an amount equivalent to about 0.1 g of methocarbamol ($C_{11}H_{15}NO_5$), add about 50 mL of the buffer solution (pH 4.5), 25 mL of methanol and 5.0 mL of the internal standard solution, shake vigorously for 10 minutes, and add the buffer solution (pH 4.5) to make exactly 100 mL. Filter this solution, discard the first 20 mL of the filtrate, and use the subsequent filtrate as the test solution. Separately, weigh accurately about 0.1 g of methocarbamol RS, dissolve in about 50 mL of the buffer solution, pH 4.5, and 25 mL of methanol, add 5.0 mL of the internal standard solution and the buffer solution, pH 4.5, to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following solution, and determine the peak area ratios of methocarbamol, Q_T and Q_S, to the internal standard solution in each solution.

$$\text{Amount (mg) of methocarbamol } (C_{11}H_{15}NO_5) = \text{Amount (mg) of methocarbamol RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of 3 mg/mL caffeine in methanol.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 274 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 10 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 to 5 μm in particle diameter).

Column temperature: 30 °C

Mobile phase: A mixture of pH 4.5 buffer solution and methanol (70 : 30).

Flow rate: 1 mL/min

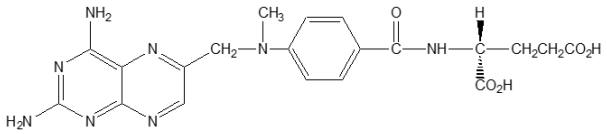
System suitability

System repeatability: Repeat the test 6 times with 20 μL of the standard solution according to the above operating conditions; the relative standard deviation of the peak area for methocarbamol is NMT 2.0%.

Buffer solution, pH 4.5—Dissolve 6.8 g of potassium dihydrogen phosphate in 1000 mL of water, and add 6 mol/L phosphoric acid or 10 mol/L potassium hydroxide solution to adjust the pH to 4.5 ± 0.05.

Packaging and storage Preserve in tight containers.

Methotrexate
메토트렉세이트



$C_{20}H_{22}N_8O_5$: 454.44

(2*S*)-2-[[4-[(2,4-Diaminopteridin-6-yl)methyl-methylamino]benzoyl]amino]pentanedioic acid [*59-05-2*]

Methotrexate is a mixture of 4-amino-10-methylfolic acid and the closely related compounds. Methotrexate contains NLT 94.0% and NMT 102.0% of methotrexate ($C_{20}H_{22}N_8O_5$), calculated on the anhydrous basis.

Description Methotrexate occurs as a yellowish brown, crystalline powder.
It is slightly soluble in pyridine and practically insoluble in water, ethanol(95), acetonitrile or ether.
It dissolves in dilute sodium hydroxide TS or in dilute sodium carbonate TS.
It is gradually changed by light.

Identification (1) Determine the absorption spectra of

solutions of 1 mg each of Methotrexate and methotrexate RS in 100 mL of 0.1 mol/L hydrochloric acid TS as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Methotrexate and methotrexate RS, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Purity (1) ***Heavy metals***—Weigh 0.1 g of Methotrexate, add 4 mL of a solution of magnesium sulfate heptahydrate in dilute sulfuric acid (1 in 4), mix, heat on a steam bath, and evaporate to dryness. Ignite the residue at the temperature not exceeding 800 °C to incinerate. Allow to cool and moisten the residue with a small amount of dilute sulfuric acid. Evaporate to dryness and ignite to incinerate within 2 hours. Allow to cool, take two portions of the residue and to each, add 5 mL of 2 mol/L hydrochloric acid TS. Add 0.1 mL of phenolphthalein TS and add ammonia water(28) dropwise until the solution turns pale red. After cooling, add acetic acid(100) until the color disappears, and add another 0.5 mL. Filter and wash, if necessary. Add water to make 20 mL and use this solution as the test solution. Separately, proceed in the same manner as in the test solution using 5.0 mL of lead standard solution instead of Methotrexate. To 10 mL of this solution, add 2 mL of the test solution, and use this solution as the control solution. Separately, add 2 mL of the test solution to 10 mL of water and use this solution as the blank test solution. To 12 mL each of the test solution, the control solution and the blank test solution, add 2 mL of pH 3.5 acetate buffer solution, mix, add 1.2 mL of thioacetamide TS, and mix immediately. Allow to stand for 2 minutes; the color of the test solution is no more intense than that of the control solution (NMT 50 ppm).

System suitability: The color of the control solution is faint brown compared to that of the blank test solution. To the test solution, add 5.0 mL of lead standard solution. Then, to 10 mL of this solution, add 2 mL of the test solution, and use this solution as the system suitability solution. The color of the system suitability solution is the same as or more intense than that of the control solution.

(2) ***Related substances***—Weigh accurately about 100 mg of Methotrexate, dissolve in the mobile phase to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately an amount each of methotrexate RS, methotrexate related substance I {[(S)-2-{4-[(2,4-diaminopteridin-6-yl)methylamino]benzamido}pentanedioic acid} RS, methotrexate related substance II {(S)-2(4-{[(2-amino-4-oxo-1,4-dihydropteridin-6-yl)methyl(methyl)amino}benzamido)pentanedioic acid} RS and methotrexate related substance III {4-{[(2,4-diaminopteridin-6-yl)methyl]methylamino}benzoic acid 1/2 hydrochloride} RS, dissolve in the mobile phase to make a solution containing 0.003 mg each per mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions, and determine the amount of each related substances according to equation (1); the amount of methotrexate related substance I is NMT 0.3% and the amount of methotrexate related substance II is NMT 0.5%. Determine the amount of 4-[[(2,4-diaminopteridin-6-yl)methyl]methylamino]benzoic acid according to equation (2); it is NMT 0.3%. Determine the amount of each related substance according to equation (3); it is NMT 0.1%, and the total amount of related substances is NMT 0.5%. However, exclude any peak having an area smaller than 0.1 times the peak area of methotrexate obtained from the standard solution.

$$\text{Content (\%) of related substances} = 100 \times \frac{C_S}{C_T} \times \frac{A_T}{A_S} \quad (1)$$

C_S: Concentration (mg/mL) of each related substance in the standard solution

C_T: Concentration (mg/mL) of methotrexate in the test solution

A_T: Peak area of each related substance obtained from the test solution

A_S: Peak area of each related substance obtained from the standard solution

$$\text{Content (\%) of 4-[[(2,4-diaminopteridin-6-yl)methyl]methylamino]benzoic acid} = 100 \times \frac{325.33}{343.56} \times \frac{C_S}{C_T} \times \frac{A_T}{A_S} \quad (2)$$

325.33: Molecular weight of 4-[[(2,4-diaminopteridin-6-yl)methyl]methylamino]benzoic acid

343.56: Molecular weight of methotrexate related substance III {4-{[(2,4-diaminopteridin-6-yl)methyl]methyl-amino}benzoic acid 1/2 hydrochloride}

C_S: Concentration (mg/mL) of methotrexate related substance III in the standard solution

C_T: Concentration (mg/mL) of methotrexate in the test solution

A_T: Peak area of 4-[[(2,4-diaminopteridin-6-yl)methyl]methylamino]benzoic acid obtained from the test solution

A_S: Peak area of 4-[[(2,4-diaminopteridin-6-yl)methyl]methylamino]benzoic acid obtained from the standard solution

$$\text{Content (\%) of each related substance} = 100 \times \frac{C_S}{C_T} \times \frac{A_T}{A_S} \quad (3)$$

C_S: Concentration (mg/mL) of methotrexate in the standard solution

C_T: Concentration (mg/mL) of methotrexate in the test solution

A_i: Peak area of each related substance obtained from the test solution

A_S: Peak area of methotrexate obtained from the standard solution

Operating conditions

For the detector and column, proceed as directed in the operating conditions under the Assay.

Mobile phase: To 900 mL of pH 6.0 disodium hydrogen phosphate-citric acid buffer solution, add 100 mL of acetonitrile, and mix.

Flow rate: 1.2 mL/min

Relative retention time: The relative retention times of methotrexate related substance I, methotrexate related substance II and methotrexate related substance III with respect to methotrexate are about 0.59, 0.52 and 2.16, respectively.

System suitability

System performance: Dissolve 10 mg each of Methotrexate and folic acid in 100 mL of the mobile phase. Proceed with 10 μL of this solution under the above operating conditions; the relative retention time of folic acid with respect to the retention time of methotrexate is 0.35 with the resolution between their peaks being NLT 8.0.

Time span of measurement: About 3 times the retention time of methotrexate.

Water Take 5 mL of pyridine for water determination and 20 mL of methanol for water determination in a dried titration flask and titrate with a test solution for water determination until the endpoint is reached. Next, weigh accurately about 0.2 g of Methotrexate, transfer it immediately into a titration flask, and add a known excess volume of test solution for water determination. After mixing well by stirring for 30 minutes, perform the test; the water content is NMT 12.0%.

Residue on ignition NMT 0.1% (0.5 g).

Assay Weigh accurately 20 mg each of Methotrexate and methotrexate RS, dissolve each in the mobile phase to make exactly 250 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions, and measure the peak areas, A_T and A_S, of methotrexate for the test solution and the standard solution, respectively.

$$\text{Content (\%) of methotrexate } (C_{20}H_{22}N_8O_5) = \text{Amount (mg) of methotrexate RS, calculated on the anhydrous basis} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption spectrophotometer (wavelength: 302 nm).

Column: A stainless steel column about 4 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (about 5 - 10 μm in particle diameter).

Mobile phase: A mixture of 890 mL of potassium monohydrogen phosphate-citric acid buffer solution, pH 6.0 and 110 mL of acetonitrile.

Flow rate: Adjust the flow rate so that the retention time of methotrexate is about 8 minutes.

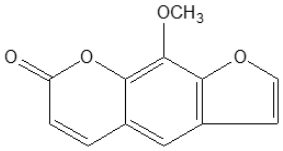
System suitability

System performance: Dissolve 10 mg each of Methotrexate and folic acid in 100 mL of the mobile phase. Proceed with 10 μL of this solution under the above operating conditions; folic acid and methotrexate are eluted in this order with the resolution between their peaks being NLT 8.0.

System repeatability: Repeat the test 6 times with 10 μL of the standard solution under the above operating conditions; the relative standard deviation of the peak areas of methotrexate is NMT 2.5%.

Packaging and storage Preserve in light-resistant, tight containers.

Methoxsalen
메톡살렌



$C_{12}H_8O_4$: 216.19

9-Methoxyfuro[3,2-g]chromen-7-one [*298-81-7*]

Methoxsalen contains NLT 98.0% and NMT 102.0% of methoxsalen ($C_{12}H_8O_4$), calculated on the anhydrous basis.

Description Methoxsalen occurs as white to pale yellow crystals or a crystalline powder, and is odorless and tasteless.

It is freely soluble in chloroform, slightly soluble in methanol, in ethanol(95) or in ether and practically insoluble in water.

Identification (1) To 10 mg of Methoxsalen, add 5 mL of dilute nitric acid and heat; the solution turns yellow. Make this solution alkaline with a sodium hydroxide solution (2 in 5); the color of the solution changes to reddish brown.

(2) To 10 mg of Methoxsalen, add 5 mL of dilute sulfuric acid and shake to mix; the solution turns yellow.

(3) Determine the absorption spectra of solutions of Methoxsalen and methoxsalen RS in ethanol(95) (1 in 200000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

Melting point Between 145 and 149 °C.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Methoxsalen as directed under Method 4 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Arsenic***—Prepare the test solution with 1.0 g of Methoxsalen according to Method 3 and perform the test (NMT 2 ppm).

(3) ***Related substances***—Dissolve 10 mg of Methoxsalen in 10 mL of chloroform and use this solution as the test solution. Pipet 2 mL of this solution and add chloroform to make exactly 50 mL. Pipet 1 mL of this solution, add chloroform to make exactly 10 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on a thin-layer chromatographic plate made of silica gel (with a fluorescent indicator) for thin-layer chromatography. Next, develop the plate with a mixture of chloroform, hexane and ethyl acetate (40 : 10 : 3) as a developing solvent to a distance of about 10 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot obtained from the test solution are not more intense than those obtained from the standard solution.

Water NMT 0.5% (1, volumetric titration, direct titration).

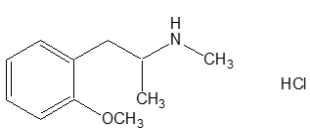
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 50 mg each of Methoxsalen and methoxsalen RS and dissolve each in ethanol(95) to make exactly 100 mL. Pipet 2 mL each of these solutions and dilute each with ethanol(95) to make exactly 25 mL. Pipet 10 mL each of these solutions and dilute each again with ethanol(95) to make exactly 50 mL, and use these solutions as the test solution and the standard solution, respectively. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at 300 nm as directed under the Ultraviolet-visible Spectroscopy.

Amount (mg) of methoxsalen ($C_{12}H_8O_4$)
=Amount (mg) of methoxsalen RS, calculated on the anhydrous basis$\times \frac{A_T}{A_S}$

Packaging and storage Preserve in light-resistant, well-closed containers.

Methoxyphenamine Hydrochloride
메톡시페나민염산염



$C_{11}H_{17}NO \cdot HCl$: 215.72
2-Methoxy-*N*,α-dimethyl-benzeneethanamine hydrochloride (1:1), [*5588-10-3*]

Methoxyphenamine Hydrochloride, when dried, contains NLT 98.5% and NMT 101.0% of methoxyphenamine hydrochloride ($C_{11}H_{17}NO \cdot HCl$: 215.72).

Description Methoxyphenamine Hydrochloride occurs as white crystals or a crystalline powder and is odorless.
It is very soluble in water, soluble in acetic acid(100), in methanol, in ethanol(95) or in chloroform, sparingly soluble in acetic anhydride and practically insoluble in ethyl acetate or in ether.

Identification (1) Weigh 0.5 g of Methoxyphenamine Hydrochloride, transfer it into a small distillation flask, add 5 mL of hydroiodic acid, and distill by slightly heating. Immersed the receptacle in cold water and allow the tip of the condenser line to reach the bottom of the receptacle so that the distillate drops are formed at the bottom of the distillate.

(2) Add 5 mL of water to the residue in the distillation flask of (1), cool at 10 °C, add 0.3 mL of 4-nitrobenzenediazonium chloride TS, and add sodium carbonate TS to make the solution alkaline; An orange-red precipitate is formed.

(3) Determine the absorption spectrum of a solution of Methoxyphenamine Hydrochloride in methanol (1 in 20000) as directed under the Ultraviolet-visible Spectroscopy; it exhibits maxima between 271 nm and 273 nm and between 278 nm and 279 nm.

(4) An aqueous solution of Methoxyphenamine Hydrochloride (1 in 50) responds to the Qualitative Analysis for chloride.

pH Dissolve 4.0 g of Methoxyphenamine Hydrochloride in 20 mL of water; the pH of this solution is between 4.0 and 6.5.

Purity (1) ***Clarity and color of solution***—Dissolve 0.1 g of Methoxyphenamine Hydrochloride in 5 mL of water; the solution is colorless and clear.

(2) ***Sulfate***—Proceed with 1.0 g of Methoxyphenamine Hydrochloride as directed under the Sulfate and perform the test. Prepare the control solution with 0.35 mL of 0.005 mol/L sulfuric acid VS (NMT 0.017%).

(3) ***Heavy metals***—Proceed with 2.0 g of Methoxyphenamine Hydrochloride according to Method 1 of the Heavy Metals and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(4) ***Arsenic***—Prepare the test solution with 1.0 g of Methoxyphenamine Hydrochloride according to Method 1 of the Arsenic and perform the test (NMT 2 ppm).

(5) ***Related substances***—Weigh 0.10 g of Methoxyphenamine Hydrochloride, dissolve in methanol to make exactly 10 mL, and use this solution as the test solution. Pipet 0.1 mL of this solution, add methanol to make 10 mL, and use it as the standard solution. Perform the test

with these solutions as directed under the Thin Layer Chromatography. Spot 30 μL each of the test solution and the standard solution on a plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of ethyl acetate, ethanol and strong ammonia water (50 : 30 : 1) as a developing solvent to a distance of about 10 cm, and air-dry the plate. Spray Dragendorff TS on the dried plate; the spots other than the principal spot obtained from the test solution are not more intense than those obtained from the standard solution.

Loss on drying NMT 0.5% (1 g, in vacuum, P_2O_5, 24 hours).

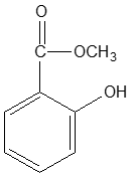
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.35 g of Methoxyphenamine Hydrochloride, previously dried, dissolve in 30 mL of acetic acid(100), add 30 mL of acetic anhydride, and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 1 mol/L perchloric acid VS
= 21.57 mg of $C_{11}H_{17}NO \cdot HCl$

Packaging and storage Preserve in tight containers.

Methyl Salicylate
살리실산메틸



$C_8H_8O_3$: 152.15
Methyl 2-hydroxybenzoate [*119-36-8*]

Methyl Salicylate contains NLT 98.0% and NMT 101.9% of methyl salicylate ($C_8H_8O_3$), calculated on the dried basis.

Description Methyl Salicylate occurs as a colorless to pale yellow liquid and has a strong, characteristic odor.
Miscible with ethanol(95) or ether.
It is very slightly soluble in water.

Specific gravity—d_{20}^{20}: Between 1.182 and 1.192.
Boiling point—Between 219 and 224 ℃.

Identification Add a drop of Methyl Salicylate to 5 mL of water, shake well to mix for 1 minute, and add a drop of iron(III) chloride TS; the resulting solution shows a purple color.

Purity (1) ***Acidity***—To 5.0 mL of Methyl Salicylate, add 25 mL of freshly boiled and cooled water and 1.0 mL of 0.1 mol/L sodium hydroxide solution, shake well to mix for 1 minute, and add 2 drops of phenol red TS. Titrate the resulting solution with 0.1 mol/L hydrochloric acid VS until the red color of the solution disappears; NMT 0.45 mL of 0.1 mol/L sodium hydroxide solution is consumed.

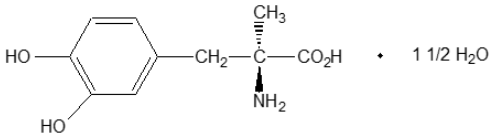
(2) ***Heavy metals***—Proceed with 1.0 g of Methyl Salicylate according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

Assay Weigh accurately about 2 g of Methyl Salicylate, add exactly 50 mL of 0.5 mol/L potassium hydroxide-ethanol solution, and heat on a steam bath for 2 hour under a reflux condenser. After cooling, titrate the resulting solution with 0.5 mol/L hydrochloric acid VS (indicator: 3 drops of phenolphthalein TS). Perform a blank test in the same manner.

Each mL of 0.5 mol/L potassium hydroxide-ethanol VS
= 76.07 mg of $C_8H_8O_3$

Packaging and storage Preserve in tight containers.

Methyldopa Hydrate
메틸도파수화물



Methyldopa $C_{10}H_{13}NO_4 \cdot 1½H_2O$: 238.24
(2*S*)-2-Amino-3-(3,4-dihydroxyphenyl)-2-methylpropanoic acid sesquihydrate [*41372-08-1*]

Methyldopa Hydrate contains NLT 98.0% and NMT 101.0% of methyldopa ($C_{10}H_{13}NO_4$: 211.22), calculated on the anhydrous basis.

Description Methyldopa Hydrate occurs as a white or slightly grayish white crystalline powder.
It is slightly soluble in water, methanol or acetic acid(100), very slightly soluble in ethanol(95) and practically insoluble in ether.
It dissolves in dilute hydrochloric acid.

Identification (1) Add 3 drops of ninhydrin TS to 10 mg of Methyldopa Hydrate and heat on a steam bath for 3 minutes; the resulting solution exhibits a violet color.

(2) Determine the absorption spectra of solutions of Methyldopa Hydrate and methyldopa RS in 0.1 mol/L hydrochloric acid TS (1 in 25000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared spectra of Methyldopa Hydrate and methyldopa RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Optical rotation $[\alpha]_D^{20}$: Between -25° and -28° (1 g, calculated on the anhydrous basis, aluminum chloride TS, 20 mL, 100 mm).

Purity (1) ***Acid***—Add 100 mL of freshly boiled and cooled water to 1.0 g of Methyldopa Hydrate, shake to mix, and then add 0.20 mL of 0.1 mol/L sodium hydroxide and 2 drops of methyl red TS; the resulting solution exhibits a yellow color.

(2) ***Chloride***—Weigh 0.5 g of Methyldopa Hydrate and perform the test. Prepare the control solution with 0.40 mL of 0.01 mol/L hydrochloric acid (NMT 0.028%).

(3) ***Heavy metals***—Proceed with 2.0 g of Methyldopa Hydrate as directed under Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(4) ***Arsenic***—Dissolve 1.0 g of Methyldopa Hydrate in 5 mL of dilute hydrochloric acid and use this solution as the test solution (NMT 2 ppm).

(5) ***3-O-Methylmethyldopa***—Weigh 0.10 g of Methyldopa Hydrate, dissolve in methanol to make exactly 10 mL, and use this solution as the test solution. Separately, weigh 5 mg of 3-*o*-methylmethyldopa RS, dissolve in methanol to make exactly 100 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 20 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of cellulose for thin-layer chromatography. Next, develop the plate with a mixture of 1-butanol, water and acetic acid(100) (13 : 5 : 3) as a developing solvent to a distance of about 10 cm, and air-dry the plate. Spray evenly 4-nitroaniline-sodium nitrite TS on the plate and air-dry the plate. Then, spray again a solution of sodium carbonate (1 in 4) on the plate; the spots obtained from the test solution at the positions of the spots obtained from the standard solution are not more intense than the spots obtained from the standard solution.

Water Between 10.0% and 13.0% (0.2 g, Volumetric titration, direct titration).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.3 g of Methyldopa Hydrate, dissolve in 80 mL of acetic acid(100), and titrate with 0.1 mol/L perchloric acid VS (indicator: 2 - 3 drops of methylrosaniline chloride TS). The endpoint of the titration is when the color of the solution changes from violet through blue to bluish green. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 21.121 mg of $C_{10}H_{13}NO_4$

Packaging and storage Preserve in light-resistant, well-closed containers.

Methyldopa Tablets
메틸도파 정

Methyldopa Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of methyldopa ($C_{10}H_{13}NO_4$: 211.21).

Method of preparation Prepare as directed under Tablets, with Methyldopa.

Identification (1) Weigh an amount of Methyldopa Tablets, previously powdered, equivalent to 0.1 g of methyldopa according to the labeled amount, add 10 mL of water, and heat on a steam bath for 5 minutes with occasional shaking. After cooling, centrifuge the resulting solution for 5 minutes at 2000 rotations per minute, apply 1 drop of the supernatant to a filter paper and dry with warm air. Put 1 drop of ninhydrin TS on the filter again and heat for 5 minutes at 100 ℃; it exhibits a purple color.

(2) Pipet 0.5 mL of the supernatant obtained from (1) of the Identification, add 2 mL of 0.05 mol/L sulfuric acid TS, 2 mL of iron(II) tartrate TS and 4 drops of ammonia TS, and shake well; it exhibits a dark purple color.

(3) Pipet 0.7 mL of the supernatant obtained from (1) of the Identification, and add 0.1 mol/L hydrochloric acid TS to make 20 mL. Pipet 10 mL of the resulting solution, add 0.1 mol/L hydrochloric acid TS to make 100 mL, and determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectroscopy; it exhibits a maximum between 277 nm and 283 nm.

Dissolution Perform the test with 1 tablet of Methyldopa Tablets at 50 revolutions per minute according to Method 2 under the Dissolution Test, using 900 mL of water as the dissolution solution. Take NLT 30 mL of the dissolved solution after 60 minutes from the start of the test, and filter through a membrane filter with a pore size of NMT 0.8 μm. Discard the first 10 mL of the filtrate, pipet the subsequent V mL, add water to make exactly V' mL so that each mL contains about 25 μg of methyldopa ($C_{10}H_{13}NO_4$) according to the labeled amount and use this solution as the test solution. Separately, weigh accurately about 56 mg of Methyldopa RS (separately, determine its loss after dried at 125 ℃ for 2 hours) Weigh accurately about 56 g of Methyldopa Tablets, and add water to make exactly 200 mL. Pipet 10 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at the wavelength of 280 nm as directed under Ultraviolet-visible Spectroscopy.
Meets the requirements if the dissolution rate of Methyldopa Tablets after 60 minutes is NLT 75%.

Dissolution rate (%) of the labeled amount of methyldopa ($C_{10}H_{13}NO_4$)

$$= W_S \times \frac{V'}{V} \times \frac{A_T}{A_S} \times \frac{1}{C} \times 45$$

WS: Amount (mg) of methyldopa RS, calculated on the dried basis

C: Labeled amount (mg) of methyldopa RS ($C_{10}H_{13}NO_4$) in 1 tablet

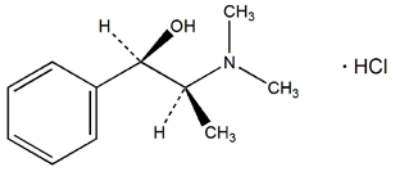
Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 tables of Methyldopa Tablets, and powder. Weigh accurately an amount, equivalent to about 0.1 g of methyldopa (C10H13NO4), add 50 mL of 0.05 mol/L sulfuric acid TS, shake thoroughly for 15 minutes, add 0.05 mol/L sulfuric acid TS to make exactly 100 mL and filter through a dry filter paper. Discard the first 20 mL of the filtrate and use the subsequent filtrate as the test solution. Separately, weigh accurately about 0.11 g of methyldopa RS (separately determine its loss after dried at 125 ℃ for 2 hours), dissolve in 0.05 mol/L sulfuric acid TS to make exactly 100 mL and use this solution as the standard solution. Pipet 5.0 mL each of the test solution and the standard solution, add exactly 5 mL of iron(II) tartrate TS, and add ammonia-ammonium acetate buffer solution (pH 8.5) to make exactly 100 mL. Perform the test with the test solution and the standard solution as directed under Ultraviolet-visible Spectroscopy, using a solution prepared with 5 mL of 0.05 mol/L sulfuric acid TS in the same manner as the control solution. Determine the absorbances, A_T and A_S, obtained from the test solution and the standard solution at the wavelength of 520 nm, respectively.

Amount (mg) of methyldopa ($C_{10}H_{13}NO_4$)
= Amount (mg) of methyldopa RS, calculated on the anhydrous basis$\times \frac{A_T}{A_S}$

Packaging and storage Preserve in well-closed containers.

dl-Methylephedrine Hydrochloride
dl-메틸에페드린염산염



and enantiomer

$C_{11}H_{17}NO \cdot HCl$: 215.72

(*RS*)-2-(Dimethylamino)-1-phenylpropan-1-ol hydrochloride [*18760-80-0*]

dl-Methylephedrine Hydrochloride, when dried, contains NLT 99.0% and NMT 101.0% of *dl*-methylephedrine hydrochloride ($C_{11}H_{17}NO \cdot HCl$).

Description *dl*-Methylephedrine Hydrochloride occurs as colorless crystals or a white crystalline powder and it has no odor but a bitter taste.
It is freely soluble in water, soluble in ethanol(95), slightly soluble in acetic acid(100) and practically insoluble in acetic anhydride or ether.
An aqueous solution of *dl*-Methylephedrine Hydrochloride (1 in 20) has no optical rotation.

Identification (1) Determine the absorption spectra of *dl*-Methylephedrine Hydrochloride and *dl*-methylephedrine hydrochloride RS (1 in 2000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of *dl*-Methylephedrine Hydrochloride and *dl*-methylephedrine hydrochloride RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) An aqueous solution of dl-Methylephedrine Hydrochloride (1 in 10) responds to the Qualitative Analysis for chloride.

Melting point Between 207 and 211 ℃.

pH Dissolve 1.0 g of *dl*-Methylephedrine Hydrochloride in 20 mL of water; the pH is between 4.5 and 6.0.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of *dl*-Methylephedrine Hydrochloride in 10 mL of water; the solution is clear and colorless.

(2) Proceed with 1.0 g of *dl*-Methylephedrine Hydrochloride as directed under Method 4 and perform the test. Prepare the control solution with 1.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Related substances***—Dissolve 50 mg of *dl*-Methylephedrine Hydrochloride in 20 mL of water and use this solution as the test solution. Pipet 1 mL of this solution, add water to make exactly 100 mL, and use this resulting solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution according to the following conditions as directed under the Liquid Chromatography. Determine each peak area by the automatic integration method; the total area of the peaks other than the peak of methylephedrine is not greater than the peak area of methylephedrine from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 257 nm).

Column: A stainless steel column about 4 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: Dissolve 13.6 g of potassium dihydrogen phosphate and 3 g of sodium 1-heptane sulfonate in 1000 mL of water, and adjust the pH to 2.5 with phos-

phoric acid. To 900 mL of this solution, add 200 mL of acetonitrile.

Flow rate: Adjust the flow rate so that the retention time of methylephedrine is about 10 minutes.

System suitability

Test for required detectability: Pipet 2 mL of the standard solution, add water to make exactly 20 mL. Confirm that the peak area of methylephedrine obtained from 20 μL of this solution is equivalent to 7% to 13% of that of methylephedrine obtained from the standard solution.

System performance: Dissolve 50 mg of *dl*-Methylephedrine Hydrochloride and 0.4 mg of methyl *p*-hydroxybenzoate in 50 mL of water. Proceed with 20 μL of this resulting solution according to the above conditions; methylephedrine and methyl *p*-hydroxybenzoate are eluted in this order with the resolution being NLT 3.0.

System repeatability: Perform the test six times with 20 μL each of the standard solutions under the above conditions; the relative standard deviation (RSD) of the peak area of methylephedrine is NMT 2.0%.

Time span of measurement: About 2 times the retention time of methylephedrine beginning after the solvent peak.

Loss on drying NMT 0.5% (1 g, 105 ℃, 3 hours).

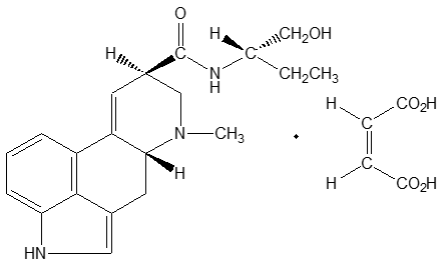
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately 0.4 g of *dl*-Methylephedrine Hydrochloride, previously dried, and dissolve in 80 mL of a mixture of acetic anhydride and acetic acid(100) (7 : 3), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 1 mol/L perchloric acid VS
= 21.572 mg of $C_{11}H_{17}NO \cdot HCl$

Packaging and storage Preserve in light-resistant, well-closed containers.

Methylergometrine Maleate
메틸에르고메트린말레산염



Methylergonovine Maleate

$C_{20}H_{25}N_3O_2 \cdot C_4H_4O_4$: 455.50

(6a*R*,9*R*)-*N*-[(2*S*)-1-Hydroxybutan-2-yl]-7-methyl-6,6a,8,9-tetrahydro-4*H*-indolo[4,3-fg] quinoline-9-carboxamide;(*Z*)-but-2-enedioic acid [*57432-61-8*]

Methylergometrine Maleate, when dried, contains NLT 95.0% and NMT 105.0% of methylergometrine maleate ($C_{20}H_{25}N_3O_2 \cdot C_4H_4O_4$).

Description Methylergometrine Maleate occurs as a white to pale yellow crystalline powder, which is odorless.

It is slightly soluble in water, methanol, or ethanol(95) and practically insoluble in ether.

It is gradually colored to yellow by light.

Melting point—About 190 °C (with decomposition).

Identification (1) The aqueous solution of Methylergometrine Maleate (1 in 200) exhibits a blue fluorescence.

(2) The coloring solution obtained in the Assay shows a dark blue color. Determine the absorption spectrum of this solution as directed under the Ultraviolet-visible Spectroscopy; it exhibits a similar intensity of absorption at the same wavelengths with that of methylergometrine maleate RS prepared in the same procedure.

(3) Add 1 drop of potassium permanganate TS to 5 mL of an aqueous solution of Methylergometrine Maleate (1 in 500); the red color of the test solution disappears immediately.

Optical rotation $[\alpha]_D^{20}$: Between +44° and +50° (0.1 g after drying, water, 20 mL, 100 mm).

Purity ***Related substances***—Perform this procedure without exposure to direct sunlight, using light-resistant containers. Weigh 8 mg of Methylergometrine Maleate, dissolve in exactly 2 mL of a mixture of ethanol(95) and ammonia water(28) (9 : 1), and use this solution as the test solution. Pipet 1.0 mL of this solution, add a mixture of ethanol(95) and ammonia water(28) (9 : 1) to make exactly 100 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Immediately develop the plate with a mixture of chloroform, methanol and water (75 : 25 : 3) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 365 nm); the spots other than the principal spot from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 2.0% (0.2 g, in vacuum, phosphorus pentoxide, 4 hours).

Assay Dry Methylergometrine Maleate and separately dry methylergometrine maleate RS in a desiccator (with silica gel) for 4 hours. Weigh accurately 10 mg each, dissolve in water to make exactly 250 mL, and use these

solutions as the test solution and the standard solution, respectively. Pipet 2 mL each of the test solution and the standard solution, transfer into separate test tubes with brown stoppers, and add exactly 4 mL of 4-dimethylaminobenzaldehyde-iron(III) chloride TS while cooling with ice. After warming the tubes at 45 °C for 10 minutes, allow to stand at room temperature for 20 minutes. With these solutions, perform the test as directed under the Ultraviolet-visible Spectroscopy and determine the absorption spectra of each solution obtained from the test solution and the standard solution, A_T and A_S, at the wavelength of 545 nm, using a solution, prepared with 2.0 mL of water in the same procedure as the control.

Amount (mg) of methylergometrine maleate ($C_{20}H_{25}N_3O_2 \cdot C_4H_4O_4$)
= Amount (mg) of methylergometrine maleate RS $\times \frac{A_T}{A_S}$

Packaging and storage Preserve in light-resistant, tight containers.

Methylergometrine Maleate Tablets
메틸에르고메트린말레산염 정

Methylergonovine Maleate Tablets

Methylergometrine Maleate Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of methylergometrine maleate ($C_{20}H_{25}N_3O_2$-$C_4H_4O_4$).

Method of preparation Prepare as directed under Tablets, with Methylergometrine Maleate.

Identification (1) The test solution obtained in the Assay shows a blue fluorescence.

(2) The coloring solution obtained in the Assay shows a deep blue color. Determine the absorption spectrum of this coloring solution as directed under the Ultraviolet-visible Spectroscopy; it exhibits maxima between 543 nm and 547 nm and between 620 nm and 630 nm.

Dissolution Take 1 tablet of Methylergometrine Maleate Tablets, and perform the test with 900 mL of water as the dissolution medium at 100 revolutions per minute according to Method 2. Take NLT 20 mL of the dissolution medium 30 minutes after starting the dissolution test, and filter through a membrane filter with a pore size of NMT 0.8 μm. Discard the first 10 mL of the filtrate, and use the subsequent filtrate as the test solution. Alternatively, pipet *V* mL of this filtrate, add water to make exactly *V* mL so that each mL contains about 0.13 μg of methylergometrine maleate ($C_{20}H_{25}N_3O_2C_4H_4O_4$) according to the labeled amount, and use this solution as the test solution. Separately, weigh accurately about 25 mg of methylergometrine maleate RS, previously dried in a desiccator for 4 hours (in vacuum, phosphorus pentoxide), and dissolve in water to make exactly 100 mL. Pipet 5 mL of this solution, add water to make exactly 100 mL, pipet 1 mL of this solution again, add water to make exactly 100 mL, and use this solution as the standard solution. Determine the fluorescence intensities, F_T and F_S, of the test solution and the standard solution, respectively, at the excitation wavelength of 338 nm and the fluorescence wavelength of 427 nm as directed under the Fluorescence Spectroscopy.

Meets the requirements if the dissolution rate of Methylergometrine Maleate Tablets for 30 minutes is NLT 70%.

Dissolution rate (%) with respect to the labeled amount of methylergometrine maleate ($C_{20}H_{25}N_3O_2$-$C_4H_4O_4$)

$$= W_S \times \frac{V'}{V} \times \frac{F_T}{F_S} \times \frac{1}{C} \times 0.45$$

WS: Amount (mg) of methylergometrine maleate RS

C: Labeled amount (mg) of methylergometrine maleate in 1 tablet

Uniformity of dosage units It meets the requirements when the Content uniformity test is performed according to the following procedure.

Put 1 tablet of Methylergometrine Maleate Tablets in a light-resistant glass-stoppered centrifuge tube, add 10 mL of water, shake for 10 minutes vigorously to disintegrate, and add 3 g of sodium chloride and 2 mL of ammonia water(28). Add exactly 25 mL of chloroform, shake vigorously to mix for 10 minutes, centrifuge for 5 minutes, and discard the aqueous layer. Take the extract of the chloroform, separately, add chloroform to make exactly *V* mL so that each mL contains about 5 μg of methylergometrine maleate ($C_{20}H_{25}N_3O_2$ $C_4H_4O_4$) according to the labeled amount, and use this solution as the test solution. Separately, weigh accurately about 1.25 mg of methylergometrine maleate RS, previously dried in a desiccator (silica gel) for 4 hours, dissolve in water to make exactly 100 mL. Pipet 10 mL of the resulting solution, put in a light-resistant stoppered centrifuge tube, add 3 g of sodium chloride and 2 mL of ammonia water(28). Add exactly 25 mL of chloroform, shake vigorously to mix for 10 minutes, centrifuge for 5 minutes. Discard the aqueous layer and take the extract of chloroform separately, and use this solution as the standard solution. Pipet 20 mL each of the test solution and the standard solution, put in a light-resistant stoppered centrifuge tube, immediately add exactly 10 mL of dilute 4-dimethylaminobenzaldehyde-iron(III) chloride TS, and shake vigorously to mix for 5 minutes. Centrifuge these solutions for 5 minutes, take the water layers and allow to stand for 1 hour. Perform the test with these solutions as directed under the Ultraviolet-visible Spectroscopy, using dilute 4-dimethylaminobenzaldehyde-iron(III) chloride TS as the control solution, and determine the absorbances, A_T and A_S, at the wavelength of 545 nm of each solution obtained from the test solution and the standard solution.

Amount (mg) of methylergometrine maleate ($C_{20}H_{25}N_3O_2 \cdot C_4H_4O_4$)

= Amount (mg) of methylergometrine maleate RS

$$\times \frac{A_T}{A_\Sigma} \times \frac{V}{250}$$

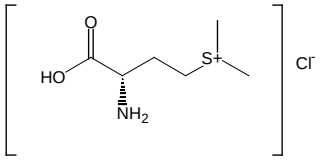
Assay Weigh accurately and powder NLT 20 tables of Methylergometrine Maleate Tablets. Weigh accurately a portion of this powder, equivalent to about 0.3 mg of methylergometrine maleate ($C_{20}H_{25}N_3O_2 \cdot C_4H_4O_4$), transfer to a light-resistant separatory funnel, add 15 mL of sodium bicarbonate solution (1 in 20), and extract 4 times with 20 mL each of chloroform. Filter each volume of the chloroform extracts through a absorbent cotton, previously moistened with chloroform, into another dried and light resistant separatory funnel in turn, combine all the filtrates, and use this combined filtrate as the test solution. Separately, weigh accurately about 10 mg of methylergometrine maleate RS, previously dried in a desiccator (silica gel) for 4 hours, dissolve in water to make exactly 100 mL. Pipet 3.0 mL of this solution and transfer to a light-resistant separatory funnel, proceed in the same manner as the preparation of the test solution, and use this filtrate as the standard solution. Add exactly 25.0 mL each of dilute 4-dimethylaminobenzaldehyde-iron(III) chloride TS to each total volume of the test solution and the standard solution, shake vigorously to mix for 5 minutes, and allow to stand for 30 minutes. Draw off the water layer, centrifuge and allow to stand for 1 hour. Perform the test with these solutions as directed under the Ultraviolet-visible Spectroscopy, using dilute 4-dimethylaminobenzaldehyde-iron(III) chloride TS as the control solution, and determine the absorbances, A_T and A_S, at the wavelength of 545 nm of each solution obtained from the test solution and the standard solution.

Amount (mg) of methylergometrine maleate ($C_{20}H_{25}N_3O_2 \cdot C_4H_4O_4$)
= Amount (mg) of methylergometrine maleate RS

$$\times \frac{A_T}{A_S} \times \frac{3}{100}$$

Packaging and storage Preserve in light-resistant, well-closed containers.

Methylmethioninesulfonium Chloride
메틸메티오닌설포늄염화물



$C_6H_{14}ClNO_2S$: 199.70

(*S*)-(3-Amino-3-carboxypropyl)dimethyl-sulfonium chloride, [*1115-84-0*]

Methylmethioninesulfonium Chloride, when dried, contains NLT 98.5% and NMT 102.0% of methylmethioninesulfonium chloride ($C_6H_{14}ClNO_2S$).

Description Methylmethioninesulfonium Chloride occurs as white crystals or a crystalline powder, which has a slightly distinctive odor.
It is freely soluble in water and practically insoluble in ethanol(99.5), acetone, or ether.
The pH of the aqueous solution of Methylmethioninesulfonium Chloride (1 in 20) is between 4.0 and 5.0.
The aqueous solution of Methylmethioninesulfonium Chloride (1 in 50) has no optical rotation.
It is hygroscopic.

Identification (1) The aqueous solution of Methylmethioninesulfonium Chloride (1 in 50) responds to the Qualitative Analysis (2) for chloride.

(2) Add 1 mL of ninhydrin TS to 5 mL of the aqueous solution of Methylmethioninesulfonium Chloride (1 in 1000) and heat for 1 minute; the resulting solution exhibits a bluish purple color.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Methylmethioninesulfonium Chloride in 10 mL of water; the resulting solution is clear and colorless.

(2) ***Sulfate***—Weigh 0.6 g of Methylmethioninesulfonium Chloride as directed under the Sulfate and perform the test. Prepare the control solution with 0.35 mL of 0.005 mol/L sulfuric acid (NMT 0.028%).

(3) ***Heavy metals***—Proceed with 1.0 g of Methylmethioninesulfonium Chloride as directed under Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(4) ***Arsenic***—Proceed with 1.0 g of Methylmethioninesulfonium Chloride as directed under Method 1 and perform the test (NMT 2 ppm).

(5) ***Methionine***—Dissolve 0.1 g of Methylmethioninesulfonium Chloride in 5 mL of water, add 2 mL of sodium hydroxide TS, shake well to mix, and add 0.3 mL of sodium nitroprusside TS. After shaking well to mix, allow to stand on a steam bath at 35 to 40 °C for 10 minutes and cool in cold water for 2 minutes. Add 2 mL of dilute hydrochloric acid to this solution and shake well to mix; the resulting solution does not exhibit a yellow orange color.

Loss on drying NMT 1.0% (1 g, in vacuum, silica gel, 3 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.3 g of Methylmethioninesulfonium Chloride, previously dried, dissolve in 70 mL of water and 1 mL of 0.1 mol/L hydrochloric acid, and titrate with 0.1 mol/L sodium hydroxide VS (potentiometric titration under the Titrimetry). Calculate the difference in consumption of 0.1 mol/L sodium hydroxide between the first and second inflection points.

Each mL of 0.1 mol/L sodium hydroxide VS
= 19.97 mg of $C_6H_{14}ClNO_2S$

Packaging and storage Preserve in tight containers.

Methyl-*N*,*S*-diacetylcysteine
메틸-*N*,*S*-디아세틸시스테인

$C_8H_{13}NO_4S$: 219.26

Methyl *N*,*S*-diacetyl-L-cysteinate ester, [*19547-88-7*]

Methyl-*N*,*S*-diacetylcysteine, when dried, contains NLT 98.0% and NMT 102.0% of methyl-*N*,*S*-diacetylcysteine ($C_8H_{13}NO_4S$: 219.26).

Description Methyl-*N*,*S*-diacetylcysteine occurs as a white crystalline powder and has a distinctive odor. It is soluble in water and ethanol, freely soluble in chloroform, and slightly soluble in ether.

Identification (1) Weigh 20 mg each of Methyl-*N*,*S*-diacetylcysteine and methyl-*N*,*S*-diacetylcysteine RS, dissolve in 1 mL of water respectively, and use the resulting solutions as the test solution and the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography, develop the plate with a mixture of *n*-butanol, water and acetic acid (8 : 2 : 2) as the developing solvent to a distance of about 15 cm, and air-dry the plate at 100℃ for 10 minutes. Spray 0.1 mol/L sodium hydroxide on the plate and immediately spray 2% sodium nitroprusside TS; the R_f values and colors of the spots obtained from the test solution and the standard solution are the same.

(2) Determine the absorption spectrum with a 0.002% solution of Methyl-*N*,*S*-diacetylcysteine in ethanol as directed under the Ultraviolet-visible Spectroscopy; the spectrum exhibits absorption maximum at 228 nm to 232 nm and no absorption at over 260 nm.

Melting point Between 96 and 100℃.

pH The pH of 1% aqueous solution of Methyl-*N*,*S*-diacetylcysteine is between pH 3.5 and pH 5.5.

Purity (1) ***Clarity and color of solution***—Determine the absorption spectrum of the solution, prepared by dissolving 0.5 g of Methyl-*N*,*S*-diacetylcysteine in 10 mL of ethanol, as directed under the Ultraviolet-visible Spectroscopy; the absorbance is NMT 0.02 at 400 nm.

(2) ***Heavy metals***—Proceed with 1.0 g of Methyl-*N*,*S*-diacetylcysteine as directed under Method 2 of the Heavy Metals and perform the test. Prepare the control solution with 2 mL of lead standard solution (NMT 20 ppm).

(3) ***Related substances***—Weigh 200 mg of Methyl-*N*,*S*-diacetylcysteine, dissolve in 10 mL of water, and use this solution as the test solution. Pipet 1 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Separately, dissolve 10 mg each of L-cysteine and L-methylcysteine hydrochloride RS in water to make a 50 mL solution respectively. Use these solutions as the standard solutions for L-cysteine and the L-methylcysteine hydrochloride. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of *n*-propanol, water and 27% ammonia (70 : 30 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Spray a 0.01% solution of fluorescamine in acetone as a coloring solution, and after 5 minutes, examine the plate under ultraviolet light (main wavelength: 365 nm); the spots of L-cysteine and L-methylcysteine hydrochloride obtained from the test solution are not more intense than the spots obtained from each standard solution (NMT 1.0% respectively). In addition, the spots other than the principal constituent obtained from the test solution, L-cysteine and L-methylcysteine hydrochloride are not more intense than the spots obtained from the standard methyl-*N*,*S*-diacetylcysteine solution (NMT 1.0% for the others).

Optical rotation $[\alpha]_D^{20}$: Between -38° and -47° (2 g after drying, ethanol, 100 mL, 100 mm).

Loss on drying NMT 2.0% (1.0 g, 60℃, in vacuum, 6 hours).

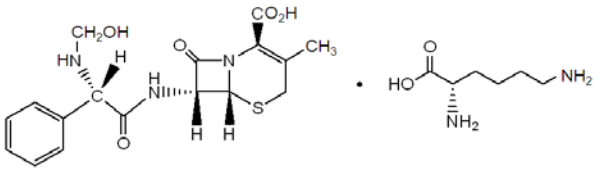
Residue on ignition NMT 0.2% (1.0 g).

Assay Weigh accurately about 100 mg each of Methyl-*N*,*S*-diacetylcysteine and methyl-*N*,*S*-diacetylcysteine RS, previously dried, and add 96% ethanol to make exactly 100 mL. Pipet 1 mL each of these solutions, add 96% ethanol to make exactly 50 mL, and use these solutions as the test solution and the standard solution. Determine the absorption spectra of the test solution and the standard solution, A_T and A_S, at the absorbance maximum wavelength around 230 nm, as directed under the Ultraviolet-visible Spectroscopy, using 96% ethanol as the control solution.

$$\text{Amount (mg) of methyl-}N,S\text{-diacetylcysteine } (C_8H_{13}NO_4S) = \text{Amount (mg) of methyl-}N,S\text{-diacetylcysteine RS (mg)} \times \frac{A_T}{A_S}$$

Packaging and storage Preserve in tight containers.

Methylolcefalexin Lysinate
메틸올세팔렉신리시네이트



$C_{17}H_{19}N_3O_5S \cdot C_6H_{14}N_2O_2$: 523.60

L-Lysine (6*R*,7*R*)-7-[[(2*R*)-2-amino-2-phenylacetyl]amino]-3-methyl-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylate (1:1)

Methylolcefalexin Lysinate contains NLT 630 μg and NMT 696 μg (potency) per mg of cefalexin ($C_{16}H_{17}N_3O_4S$: 363.39), calculated on the anhydrous basis.

Description Methylolcefalexin Lysinate occurs as a yellowish white crystalline powder and has a slight, characteristic odor.
It is soluble in water and practically insoluble in ethanol.

Identification (1) Dissolve about 2 mg (potency) of Methylolcefalexin Lysinate in the ninhydrin saturated solution; the resulting solution exhibits a purple color.

(2) Weight about 4 mg (potency) of Methylolcefalexin Lysinate, dissolve in water to make 100mL, and determine the absorption spectrum as directed under the Ultraviolet-visible Spectroscopy; it exhibits absorption maximum between 259 nm and 263 nm.

(3) Weigh about 0.1 g (potency) of Methylolcefalexin Lysinate, dissolve in water to make 100 mL, and use this solution as the test solution. Separately, dissolve about 0.1 g (potency) of cefalexin RS in water to make 100 mL and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot the test solution and the standard solution each on a plate made of silica gel for thin-layer chromatography and develop the plate with the mixture of butanol, water and acetic acid (60 : 25 : 15) as the developing solvent. Air-dry the plate and examine it under ultraviolet rays (main wavelength: 254 nm); the R_f value of the spot from the test and the standard solutions are the same.

(4) Perform the test with Methylolcefalexin Lysinate as directed in the paste method under the Mid-infrared Spectroscopy; it exhibits absorption at the wavenumbers of about 2950 cm^{-1}, 1750 cm^{-1}, 1630 cm^{-1}, 1580 cm^{-1} and 1500 cm^{-1}.

pH Dissolve 0.1 g of Methylolcefalexin Lysinate (potency)/mL in water; the pH of the solution is between 6.5 and 8.5.

Absorbance $E_{1cm}^{1\%}$ (261 nm): Between 156 and 176 (4.0 mg, water, 100 mL).

Purity ***Heavy metals***—Proceed with about 1.0 g of Methylolcefalexin Lysinate according to Method 2 of the Heavy Metals and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

Sterility It meets the requirements when Methylolcefalexin Lysinate is used in a sterile preparation. However, it is excluded in cases where there is a final sterilization process in the manufacturing of a sterile preparation.

Pyrogen It meets the requirements when Methylolcefalexin Lysinate is used in a sterile preparation. With a solution of isotonic sodium chloride injection made so that 1 mL of Methylolcefalexin Lysinate contains 7.0 mg (potency), inject 1 mL per kg of a rabbit's weight to perform the test.

Water NMT 2.5% (0.5 g, volumetric titration, direct titration).

Assay Perform the test as directed under the Assay of Cefalexin Lysinate. Weigh accurately 0.1 g of Methylolcefalexin Lysinate and cefalexin RS, add 0.1 mol/L phosphate buffer (pH 7.0) each to make exactly 100 mL, and use these solutions as the test solution and the standard solution, respectively.

Packaging and storage Preserve in light-resistant, tight containers.

Methylolcefalexin Lysinate Capsules
메틸올세팔렉신리시네이트 캡슐

Methylolcefalexin Lysinate Capsules contain NLT 90.0% and NMT 120.0% the labeled amount of cefalexin ($C_{16}H_{17}N_3O_4S$: 347.39).

Method of preparation Prepare as directed under Capsules, with Methylolcefalexin Lysinate.

Identification Perform the test as directed under the Identification (1) and (2) of Methylolcefalexin Lysinate Tablets.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Water NMT 5.0% (0.2 g, volumetric titration, direct titration)

Assay Proceed as directed in the Assay of Methylolcefalexin Lysinate. Weigh accurately the contents of NLT 20 capsules of Methylolcefalexin Lysinate Capsules. According to the marked potency, weigh accurately about 0.1 g (potency) and dissolve in 0.1 mol/L phos-

phate buffer solution (pH 7.0) to make exactly 100 mL, and use this solution as the solution.

Packaging and storage Preserve in tight containers.

Methylolcefalexin Lysinate Tablets
메틸올세팔렉신리시네이트 정

Methylolcefalexin Lysinate Tablets contain NLT 90.0% and NMT 120.0% of the labeled amount of cefalexin ($C_{16}H_{17}N_3O_4S$: 363.39).

Method of preparation Prepare as directed under Tablets, with Methylolcefalexin Lysinate.

Identification (1) Perform the test according to (2) and (3) under the Identification for Methylolcefalexin Lysinate.

(2) Weigh about 0.1 g (potency) of Methylolcefalexin Lysinate according to the labeled amount, add water, shake vigorously to mix, and add water to make 1000 mL. To 0.5 mL of this solution, add 0.1 mL of 1.6% stannic chloride-citric acid buffer solution, pH 5.0, and 2.0 mL of ninhydrin TS, and heat at 100 ℃ for 20 minutes; the resulting solution exhibits a violet color.

Disintegration Meets the requirements.

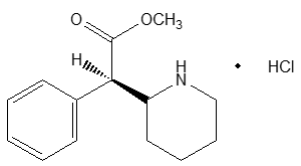
Uniformity of dosage units Meets the requirements.

Water NMT 5.0% (0.2 g, volumetric titration, direct titration)

Assay Perform the test according to the Assay for Methylolcefalexin Lysinate. Weigh accurately the mass of NLT 20 tablets of Methylolcefalexin Lysinate, and powder. Weigh accurately about 0.1 g (potency) of this powder according to the labeled potency, add water, shake vigorously to mix, add again water to make exactly 100 mL, and use this solution as the test solution.

Packaging and storage Preserve in light-resistant, tight containers.

Methylphenidate Hydrochloride
메틸페니데이트염산염



$C_{14}H_{19}NO_2 \cdot HCl$: 269.77

Methyl 2-phenyl-2-piperidin-2-ylacetate hydrochloride [*298-59-9*]

Methylphenidate Hydrochloride contains NLT 98.0% and NMT 102.0% of methylphenidate hydrochloride ($C_{14}H_{19}NO_2 \cdot HCl$), calculated on the dried basis.

Description Methylphenidate Hydrochloride occurs as a white fine crystalline powder and is odorless.
It is freely soluble in water or methanol, soluble in ethanol(95), and slightly soluble in acetone or chloroform.
An aqueous solution of Methylphenidate Hydrochloride changes the litmus paper into a red color.

Identification (1) Determine the infrared spectra of Methylphenidate Hydrochloride and methylphenidate hydrochloride RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) An aqueous solution of Methylphenidate Hydrochloride (1 in 50) responds to the Qualitative Analysis (2) for chloride.

Purity (1) ***Erythro [(R*, S*)] isomer***—Dissolve Methylphenidate Hydrochloride and methylphenidate hydrochloride erythro isomer in methanol so that each solution contains 50 mg per mL and 0.5 mg per mL, and use these solutions as the test solution and the standard solution, respectively. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 20 μL each of the test solution and the standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of chloroform, methanol, aqueous ammonia (28) (190 : 10 : 1) as the developing solvent to a distance of about 15 cm and air-dry the plate. Spray evenly the color former on the plate and spray 0.5 mol/L sulfuric acid; the spot from the test solution shown in the same R_f value of the standard solution is not more intense or larger than the spot from the standard solution (NMT 1%).

Coloring agent—Weigh 0.7 g of bismuth subnitrate, dissolve in 40 mL of a mixture of water and acetic acid(100) (4 : 1), add 40 mL of potassium iodide solution (2 in 5), and add 120 mL of acetic acid(100) and 250 mL of water.

(2) ***α-phenyl-2-piperidine acetate***—Weigh accurately about 0.4 g of Methylphenidate Hydrochloride, add sodium hydroxide in methanol solution (1 in 2500) to make 10 mL, and use this solution as the test solution (prepared before use). Weigh a suitable amount of α-phenyl-2-piperidine acetate RS, dissolve in sodium hydroxide in methanol solution (1 in 2500), make a solution where 1 mL contains about 0.24 mg, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on a plate of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of chloroform, methanol, and acetic acid(31) (65 : 25 : 5) as the developing solvent to a distance of about 15 cm and air-

dry the plate. Spray evenly the color former to this and spray hydrogen peroxide solution; the spot from the test solution shown in the same R_f value of the standard solution is not more intense or larger than the spot from the standard solution (NMT 0.6%).

Coloring agent—Dissolve 0.85 g of bismuth subnitrate in 40 mL of water and 10 mL of acetic acid(100) and use this solution as the solution A. Dissolve 8 g of potassium iodide in 20mL of water and use this solution as the solution B To 10 mL of the mixture of solution A and solution B, add 20 mL of acetic acid(100) and water to make 100 mL.

(3) ***Heavy metals***—Proceed with 1.0 g of Methylphenidate Hydrochloride according to Method 2 and perform the test. Prepare the control solution with 1.0 mL of lead standard solution (NMT 10 ppm).

Loss on drying NMT 0.5% (1 g, in vacuum, 60 ℃, 4 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 50 mg each of Methylphenidate Hydrochloride and methylphenidate hydrochloride RS, dissolve in the mobile phase to make exactly 100 mL and use these solutions as the test solution and the standard solution, respectively. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak areas, A_T and A_S, for the test solution and the standard solution, respectively.

$$\text{Amount (mg) of methylphenidate hydrochloride } (C_{14}H_{19}NO_2 \cdot HCl) = \text{Amount (mg) of methylphenidate hydrochloride RS} \times (A_T / A_S)$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 209 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: Add phosphoric acid in methanol and 0.02 mol/L potassium dihydrogen phosphate RS (1 : 2) and adjust the pH to 4.6 ± 0.1.

Flow rate: 1.0 mL/min

System suitability

System performance: Weigh accurately 5 mg of α-phenyl-2-piperidine acetate RS and 0.5 g of methylphenidate hydrochloride RS and dissolve in 1000 mL of the mobile phase. Proceed with 10 μL of this solution according to the above conditions; the resolution between the peak of α-phenyl-2-piperidine acetate RS and that of methylphenidate peak is NLT 2.5.

System repeatability: Repeat the test 6 times with 10 μL of the standard solution according to the above operating conditions; the relative standard deviation of the peak area of methylphenidate is NMT 2.0%.

Time span of measurement: About 2 times the retention time of methylphenidate.

Packaging and storage Preserve in well-closed containers.

Methylphenidate Hydrochloride Tablets
메틸페니데이트염산염 정

Methylphenidate Hydrochloride Tablets contains NLT 93.0% and NMT 107.0% of the labeled amount of methylphenidate hydrochloride ($C_{14}H_{19}NO_2 \cdot HCl$: 269.77).

Method of preparation Prepare as directed under Tablets, with Methylphenidate Hydrochloride.

Identification Weigh the amount of Methylphenidate Hydrochloride Tablets, previously powdered, equivalent to 50 mg of methylphenidate hydrochloride, put in a 40-mL centrifuge tube, add 10 mL of chloroform, shake well, and centrifuge. Filter the clear supernatant through a glass filter to a beaker, and repeat this procedure with 10 mL of chloroform. Combine the extracts, evaporate on a steam bath to dryness. To the residue, add 2 mL of acetonitril, stir, and filter through a small glass filter. Wash the crystals obtained from the above step with 2 mL of acetonitrile, and then dry the crystals in vacuum. Determine the infrared spectra of the resulting crystals and methylphenidate hydrochloride RS as directed in the paste method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Dissolution Take 1 tablet of Methylphenidate Hydrochloride, and perform the test according to Method 1 using 900 mL of water as the dissolution medium at 100 revolutions per minute. After 45 minutes from the start of the dissolution test, take the dissolution medium, filter, and perform the test as directed under the Assay using this solution as the test solution.
It meets the requirements if the dissolution rate of Methylphenidate Hydrochloride Tablets for 45 minutes is NLT 75%.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately and powder NLT 20 tables of Methylphenidate Hydrochloride. Weigh accurately a portion of this powder, equivalent to about 20 mg of methylphenidate hydrochloride ($C_{14}H_{19}NO_2 \cdot HCl$), add 70 mL of the mobile phase, shake vigorously to mix for 15 minutes, cool to room temperature, and add the mobile phase to make exactly 100 mL. Filter the resulting solution, discard the first 10 mL of the filtrate, take exactly 10

mL of the subsequent filtrate, and add exactly 5 mL of the internal standard solution, shake to mix, and use this solution as the test solution. Separately, weigh accurately 20 mg of methylphenidate hydrochloride RS and dissolve in the mobile phase to make exactly 100 mL. Pipet 10 mL of this solution, add 5 mL of the internal standard solution, shake to mix, and use this solution as the standard solution. Perform the test with 50 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions, and determine the ratios, Q_T and Q_S of the peak area of methylphenidate to that of the internal standard.

Amount (mg) of methylphenidate hydrochloride ($C_{14}H_{19}NO_2 \cdot HCl$) = Amount (mg) of methylphenidate hydrochloride RS $\times \frac{Q_T}{Q_S}$

Internal standard solution—Weigh accurately 10 mg of Phenylephrine Hydrochloride, and dissolve in the mobile phase to make 25 mL.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 210 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm to 10 μm in particle diameter).

Mobile phase: Dissolve 1.64 g of anhydrous sodium acetate in 900 mL of water, adjust the pH to 4.0 with acetic acid, and add water to make 1000 mL. To 300 mL of the resulting solution, add 300 mL of acetonitrile and 400 mL of methanol, and mix them.

Flow rate: 1.5 mL/min

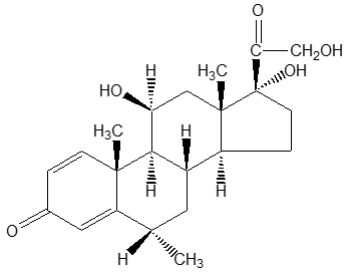
System suitability

System performance: Proceed with 50 μL of the standard solution according to the above conditions; phenylephrine and methylphenidate are eluted in this order with the resolution between their peaks being NLT 2.0.

System repeatability: Repeat the test 6 times with 50 μL of the standard solution according to the above conditions; the relative standard deviation of the peak area ratios is NMT 2.0%.

Packaging and storage Preserve in tight containers.

Methylprednisolone
메틸프레드니솔론



$C_{22}H_{30}O_5$: 374.47

(6*S*,8*S*,9*S*,10*R*,11*S*,13*S*,14*S*,17*R*)-11,17-Dihydroxy-17-(2-hydroxyacetyl)-6,10,13-trimethyl-6,7,8,9,10,11,12,13,14,15,16,17-dodecahydro-3*H*-cyclopenta[a]phenanthren-3-one [*83-43-2*]

Methylprednisolone, when dried, contains NLT 96.0% and NMT 104.0% of methylprednisolone ($C_{22}H_{30}O_5$).

Description Methylprednisolone occurs as a white, crystalline powder and is odorless.

It is sparingly soluble in methanol or 1.4-dioxane, slightly soluble in ethanol(95) or chloroform, and practically insoluble in water or ether.

Melting point—Between 232 and 260 ℃ (with decomposition).

Identification (1) Add 2 mL of sulfuric acid in about 2 mg of Methylprednisolone; the resulting solution exhibits a red color with no fluorescence. Add 10 mL of water to this solution; the resulting solution bleaches and a gray cotton-shaped precipitate is produced.

(2) Dissolve about 10 mg of Methylprednisolone in 1 mL of methanol, add 1 mL of Fehling's TS, and heat; the resulting solution exhibits a red color and precipitate.

(3) Determine the absorption spectra of Methylprednisolone and methylprednisolone RS in methanol (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

Optical rotation $[\alpha]_D^{20}$: Between +96° and +101° (0.1 g, after drying, methanol, 10 mL, 100 mm).

Purity ***Related substances***—Weigh about 50 mg of Methylprednisolone, dissolve in 5 mL of the mixture of chloroform and methanol (9 : 1), and use this solution as the test solution. Pipet 1 mL of this solution, add the mixture of chloroform and methanol (9 : 1) to make exactly 200 mL and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with the mixture of dichloromethane, ether, methanol, and water (385 : 75 : 40 : 6) as the developing solvent to a

distance of about 12 cm and air-dry the plate. Heat the plate at 105 ℃ for 10 minutes, cool, and spray evenly the alkaline blue tetrazolium TS on the plate; the spots other than the principal spot from the test solution are not more intense than the spot from the standard solution.

Loss on drying NMT 1.0% (0.5 g, 105 ℃, 3 hours).

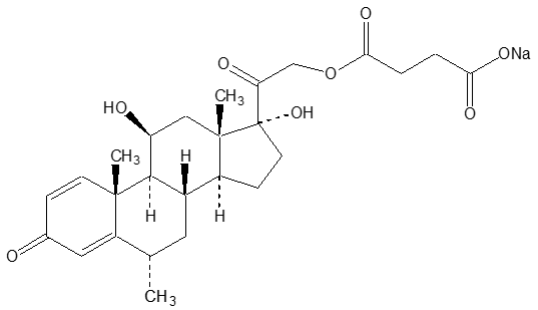
Residue on ignition NMT 0.2% (0.2 g).

Assay Weigh accurately about 10 mg of Methylprednisolone, previously dried, and dissolve in methanol to make exactly 100 mL. Pipet 5 mL of this solution, add methanol to make exactly 50 mL, and determine the absorbance of this solution, at the absorbance maximum wavelength at about 350 nm, as directed under the Ultraviolet-visible Spectroscopy.

$$\text{Amount (mg) of methylprednisolone } (C_{22}H_{30}O_5) = \frac{A}{400} \times 10000$$

Packaging and storage Preserve in tight containers.

Methylprednisolone Sodium Succinate
메틸프레드니솔론숙시네이트나트륨



$C_{26}H_{33}NaO_8$: 496.53

Sodium 4-(2-((6*S*,8*S*,9*S*,10*R*,11*S*,13*S*,14*S*,17*R*)-11,17-dihydroxy-6,10,13-trimethyl-3-oxo-6,7,8,9,10,11,12,13,14,15,16,17-dodecahydro-3*H*-cyclopenta[a]phenanthren-17-yl)-2-oxoethoxy)-4-oxobutanoate [*2375-03-3*]

Methylprednisolone Sodium Succinate, contains NLT 97.0% and NMT 103.0% of methylprednisolone sodium succinate ($C_{26}H_{33}NaO_8$), calculated on the dried basis.

Description Methylprednisolone Sodium Succinate occurs as a white amorphous solid material.
It is very soluble in water or ethanol(95), very slightly soluble in acetone, and practically insoluble in chloroform.
It is hygroscopic.

Identification (1) Dissolve Methylprednisolone Sodium Succinate and methylprednisolone sodium RS, previously dried, in methanol and prepare a solution in which each mL contains 20 μg. Determine the absorption spectra of this solution as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Dissolve 0.1 g each of Methylprednisolone Sodium Succinate and methylprednisolone sodium succinate RS in water to make 10 mL. Add 1 mL of 3 mol/L hydrochloric acid and extract immediately with 50 mL of chloroform. Filter the chloroform extraction using absorbent cotton, evaporate to dryness on a steam bath, and dry at 60 ℃ for 3 hours in vacuum. Determine the infrared spectra of the residue as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) Methylprednisolone Sodium Succinate responds to the Qualitative Analysis (1) for sodium salt.

Optical rotation $[\alpha]_D^{25}$: Between +96° and +104° (0.1 g, after drying, ethanol(95), 10 mL, 100 mm).

Purity ***Sodium***—Weigh accurately 1.0 g of Methylprednisolone Sodium Succinate, previously dried, add 75 mL of acetic acid(100), heat lightly, and dissolve. Add 20 mL of 1,4-dioxane and titrate with 0.1 mol/L perchloric acid VS until the solution exhibits a bluish green color (indicator: 1 drop of methylrosaniline chloride TS). Perform a blank test in the same manner and make any necessary correction (between 4.49% and 4.77%).

$$\text{Each mL of 0.1 mol/L perchloric acid VS} = 2.299 \text{ mg of Na}$$

Loss on drying NMT 3.0% (1 g, 105 ℃, 3 hours).

Assay Weigh accurately about 0.1 g of Methylprednisolone Sodium Succinate and dissolve in ethanol(95) to make exactly 200 mL. Pipet 5.0 mL of this solution, add ethanol(95) to make exactly 200 mL, and use this solution as the test solution. Separately, weigh accurately about 12.5 mg of methylprednisolone sodium succinate RS, dissolve in ethanol(95) to make exactly 100 mL. To 0.5 mL of this solution, add ethanol(95) to make exactly 50 mL, and use this solution as the standard solution. Prepare ethanol(95) as the blank test solution. Transfer 20.0 mL each of the blank test solution, the test solution, and the standard solution in a Erlenmeyer flask with a stopper, add 2.0 mL of solution where 50 mg of blue tetrazolium and 10 mL of methanol are dissolved in, add 4.0 mL each of the mixture of ethanol(95) and tetramethylammonium hydroxide (9 : 1), and allow it to stand in the dark for 90 minutes. Add 1.0 mL of acetic acid(100) and determine the absorbance, A_T and A_S, at 525 nm with the solution from the test solution and the standard solution as directed under the Ultraviolet-visible Spectroscopy using the blank test solution as the control solution.

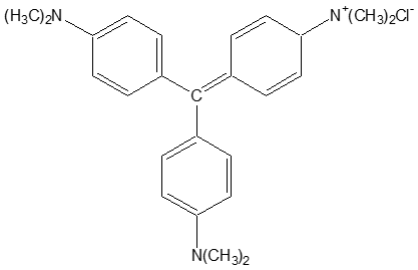
$$\text{Amount (mg) of methylprednisolone sodium succinate } (C_{26}H_{33}NaO_8)$$

$$= 8.37 \times C \times \frac{A_T}{A_S}$$

C: Concentration (μg/mL) of methylprednisolone succinate in the standard solution

Packaging and storage Preserve in light-resistant, tight containers.

Methylrosanilinium Chloride
메틸로사닐린염화물



Crystal Violet
Methylrosaniline Chloride $C_{25}H_{30}ClN_3$: 407.98
[4-[*bis*[4-(Dimethylamino)phenyl]methylidene]cyclohexa-2,5-dien-1-ylidene]-dimethylazanium chloride [*548-62-9*]

Methylrosanilinium Chloride is hexamethyl pararosaniline chloride and usually contains pentamethyl pararosaniline chloride and tetramethyl pararosaniline chloride.

Methylrosanilinium Chloride contains NLT 96.0% and NMT 101.0% of methylrosanilinium chloride [hexamethyl pararosaniline chloride ($C_{25}H_{30}ClN_3$)], calculated on the dried basis.

Description Methylrosanilinium Chloride occurs as a fragment with a green metallic luster or a dark green powder, which has no odor or a slight odor. It is soluble in ethanol(95), sparingly soluble in water and practically insoluble in ether.

Identification (1) Put 1 mg of Methylrosanilinium Chloride in 1 mL of sulfuric acid; Methylrosanilinium Chloride dissolves while the solution exhibits an orange to reddish brown color. To this solution, drop water; the color of the solution changes from brown through green to blue.

(2) Dissolve 20 mg of Methylrosanilinium Chloride in 10 mL of water, add 5 drops of hydrochloric acid, and use this solution as the test solution. To 5 mL of this solution, add tannic acid TS in drops; an dark blue precipitate is produced.

(3) Add 0.5 g of zinc powder to 5 mL of the test solution obtained in (2) and shake to mix; the solution is decolorized. Put 1 drop of this solution into filter paper and add 1 drop of ammonia TS right next to it; a blue color is observed at the parts where two solutions meet.

Purity (1) ***Ethanol-insoluble substances***—Weigh accurately about 1 g of Methylrosanilinium Chloride, previously dried, add 50 mL of ethanol(95), heat on a steam bath for 15 minutes under a reflux condenser, and filter the precipitate through a tared glass filter to collect. Wash with warm ethanol until the washings does not show a violet color and dry at 105 ℃ for 2 hours; the amount is NMT 1.0%.

(2) ***Heavy metals***—Proceed with 1.0 g of Methylrosanilinium Chloride as directed under Method 2 and perform the test. Prepare the control solution with 3.0 mL of lead standard solution (NMT 30 ppm).

(3) ***Zinc***—Add 0.1 mL of sulfuric acid to 0.10 g of Methylrosanilinium Chloride and incinerate by ignition. After cooling, add 5 mL of dilute hydrochloric acid, 0.5 mL of dilute nitric acid and 4 mL of water, boil, and then add 5 mL of ammonia TS. Boil again, filter, and add 2 to 3 drops of sodium sulfide TS to the filtrate; the resulting is not turbid.

(4) ***Arsenic***—Proceed with 0.40 g of Methylrosanilinium Chloride as directed under Method 3 and perform the test (NMT 5 ppm).

Loss on drying NMT 7.5% (1 g, 105 ℃, 4 hours).

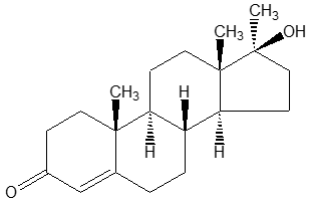
Residue on ignition NMT 1.5% (0.5 g).

Assay Weigh accurately about 0.4 g of Methylrosanilinium Chloride, transfer into a wide-mouth Erlenmeyer flask, and dissolve in 25 mL of water and 10 mL of hydrochloric acid. Then, add 50 mL of 0.1 mol/L titanium(III) chloride, passing through carbon dioxide, and heat to boiling. Boil again over a low heat for 15 minutes with occasionally shaking. Cooling while passing through carbon dioxide, and titrate the excess titanium(III) chloride with 0.1 mol/L ammonium ferric sulfate VS (indicator: 5 mL of ammonium thiocyanate TS). The endpoint of the titration is when the solution slightly exhibits a red color. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L titanium(III) chloride VS
= 20.399 mg of $C_{25}H_{30}ClN_3$

Packaging and storage Preserve in tight containers.

Methyltestosterone
메틸테스토스테론



$C_{20}H_{30}O_2$: 302.45
(8*R*,9*S*,10*R*,13*S*,14*S*,17*S*)-17-Hydroxy-10,13,17-

trimethyl-6,7,8,9,10,11,12,13,14,15,16,17-dodecahydro-1*H*-cyclopenta[a]phenanthren-3(2*H*)-one [*58-18-4*]

Methyltestosterone, when dried, contains NLT 98.0% and NMT 102.0% of methyltestosterone ($C_{20}H_{30}O_2$).

Description Methyltestosterone occurs as white to pale yellow crystals or a crystalline powder and is odorless.
It is freely soluble in methanol or ethanol(95), soluble in acetic acid, sparingly soluble in ether, and practically insoluble in water.

Identification (1) Determine the absorption spectra of Methyltestosterone and methyltestosterone RS in ethanol(95) (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Methyltestosterone and methyltestosterone RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Optical rotation $[\alpha]_D^{20}$: Between +79° and +85° (0.1 g, after drying, ethanol(95), 10 mL, 100 mm).

Melting point Between 163 and 168 ℃.

Purity ***Related substances***—Weigh about 40 mg of Methyltestosterone, dissolve in 2 mL of ethanol, and use this solution as the test solution. Pipet 1 mL of the test solution, add ethanol(95) to make exactly 100 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on a thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with the mixture of chloroform and diethylamine (19 : 1) as the developing solvent to a distance of 15 cm and air-dry the plate. Examine the plate under ultraviolet rays (main wavelength: 366 nm); the spots other than the principal spot obtained from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 1.0% (0.5 g, in vacuum, phosphorus (V) oxide, 10 hours).

Residue on ignition NMT 0.1% (0.5 g).

Assay Weigh accurately about 20 mg of Methyltestosterone and methyltestosterone RS, previously dried in a desiccator (in vacuum, phosphorous (V) oxide) for 10 hours, and dissolve each in methanol to make exactly 200 mL. Pipet 5 mL each of this solution, add exactly 5 mL of the internal standard solution to each, add methanol to make 50 mL, and use these solutions as the test solution and the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions, and calculate the ratios, Q_T and Q_S, of the peak area of methyltestosterone to that of the internal standard for the test solution and the standard solution, respectively.

$$\text{Amount (mg) of methyltestosterone } (C_{20}H_{30}O_2) = \text{Amount of (mg) methyltestosterone RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of propyl paraoxybenzoiate in methanol (1 in 10000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 241 nm).

Column: A stainless steel column 6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 35 °C.

Mobile phase: A mixture of acetonitrile and water (11 : 9).

Flow rate: Adjust the flow rate so that the retention time of methyltestosterone is about 10 minutes.

System suitability

System performance: Proceed with 10 μL of the standard solution under the above operating conditions; the internal standard and methyltestosterone are eluted in this order with the resolution between their peaks being NLT 9.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution according to the above operating conditions; the relative standard deviation of the peak area of methyltestosterone to that of the internal standard is NMT 1.0%.

Packaging and storage Preserve in light-resistant, tight containers.

Methyltestosterone Tablets
메틸테스토스테론 정

Methyltestosterone Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of methyltestosterone ($C_{20}H_{30}O_2$: 302.45).

Method of preparation Prepare as directed under tablets, with Methyltestosterone.

Identification (1) Weigh a portion of Methyltestosterone Tablets, previously powdered, equivalent to 10 mg of methyltestosterone according to the labeled amount, add 50 mL of chloroform, shake for 30 minutes, and filter. Evaporate the filtrate to dryness, dissolve the residue in 10 mL of acetone, and use this solution as the test solution. Separately, dissolve 10 mg of methyltestosterone RS in 10 mL of acetone and use this solution as the standard solution. With these solutions, perform the test as di-

rected under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Develop the plate with a mixture of chloroform and ethanol (9:1) to a distance of about 12 cm and air-dry the plate. Spray evenly dilute sulfuric acid on the plate, and heat it at 110 ℃ for 10 minutes; the R_f values of the spots obtained from the test and standard solutions are the same.

Disintegration Meets the requirements.

Uniformity of dosage units It meets the requirements when the Content uniformity test is performed according to the following method.

Take 1 tablet of Methyltestosterone Tablets, add 5 mL of water to disintegrate, add 50 mL of methanol, and shake to mix for 30 minutes. Add methanol to exactly 100 mL and centrifuge the solution. Pipet *V* mL of the clear supernatant, add methanol to make exactly *V'* mL so that each mL contains 10 μg of methyltestosterone ($C_{20}H_{30}O_2$), and use this solution as the test solution. Separately, weigh accurately about 10 mg of methyltestosterone RS, previously dried in a desiccator (in vacuum, phosphorus pentoxide) for 10 hours, dissolve in 5 mL of water and 50 mL of methanol, and then add methanol to make exactly 100 mL. Pipet 5 mL of this solution, add methanol to make exactly 50 mL, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at the absorbance maximum wavelength of about 241 nm as directed under the Ultraviolet-visible Spectroscopy.

$$\text{Amount (mg) of methyltestosterone } (C_{20}H_{30}O_2) = \text{Amount of (mg) methyltestosterone RS} \times \frac{A_T}{A_S} \times \frac{V'}{V} \times \frac{1}{10}$$

Assay Weigh accurately and powder NLT 20 tables of Methyltestosterone Tablets. Weigh accurately a portion of this powder, equivalent to about 25 mg of methyltestosterone ($C_{20}H_{30}O_2$), add about 70 mL of methanol, shake to mix for about 30 minutes, and add methanol to make exactly 100 mL. Pipet 2 mL of this solution, add exactly 5 mL of the internal standard solution, add methanol to make exactly 50 mL, filter through a membrane filter (not exceeding 0.45 μm in pore size), and use this solution as the test solution. Separately, weigh accurately about 20 mg of methyltestosterone RS, previously dried in a desiccator (in vacuum, phosphorus pentoxide) for 10 hours, and dissolve in methanol to make exactly 200 mL. Pipet 5 mL of this solution, add exactly 5 mL of the internal standard solution, add methanol to make exactly 50 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions, and calculate the ratios, Q_T and Q_S, of the peak area of methyltestosterone to that of the internal standard from the test solution and the standard solution, respectively.

$$\text{Amount (mg) of methyltestosterone } (C_{20}H_{30}O_2) = \text{Amount of (mg) methyltestosterone RS} \times \frac{Q_T}{Q_S} \times \frac{5}{4}$$

Internal standard solution—A solution of propyl p-hydroxybenzoate in methanol (1 in 10000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 241 nm).

Column: A stainless steel column about 6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 35 °C.

Mobile phase: A mixture of acetonitrile and water (11 : 9).

Flow rate: Adjust the flow rate so that the retention time of methyltestosterone is about 10 minutes.

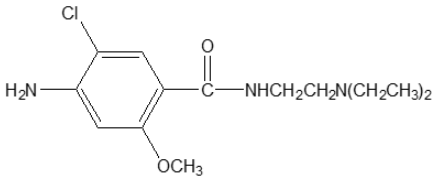
System suitability

System performance: Proceed with 10 μL of the standard solution under the above operating conditions; the internal standard solution and methyltestosterone are eluted in this order with the resolution between their peaks being NLT 9.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution according to the above operating conditions; the relative standard deviation of the peak areas of methyltestosterone to those of the internal standard is NMT 1.0%.

Packaging and storage Preserve in well-closed containers.

Metoclopramide
메토클로프라미드



$C_{14}H_{22}ClN_3O_2$: 299.80

4-Amino-5-chloro-*N*-[2-(diethylamino)ethyl]-2-methoxybenzamide [*364-62-5*]

Metoclopramide, when dried, contains NLT 99.0% and NMT 101.0% of metoclopramide ($C_{14}H_{22}ClN_3O_2$).

Description Metoclopramide occurs as white crystals or a crystalline powder and is odorless.

It is freely soluble in acetic acid(100), soluble in methanol or in chloroform, sparingly soluble in ethanol(95), acetic anhydride or acetone, very slightly soluble in ether and practically insoluble in water.

It dissolves in dilute hydrochloric acid.

Identification (1) Dissolve 10 mg of Metoclopramide in 1 mL of dilute hydrochloric acid and 4 mL of water; the solution responds to the Qualitative Analysis for primary aromatic amines.

(2) Dissolve 10 mg of Metoclopramide in 5 mL of dilute hydrochloric acid and 20 mL of water, and to 5 mL of this solution, add 1 mL of Dragendorff's TS; an orange precipitate is formed.

(3) Dissolve 0.1 g each of Metoclopramide and metoclopramide RS in 1 mL of 1 mol/L hydrochloric acid TS and add water to make 100 mL. To 1 mL each of these solutions, add water to make 100 mL. Determine the absorption spectra of the resulting solutions as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

Melting point Between 146 and 149 ℃.

Purity (1) ***Clarity and color of solution***—Dissolve 0.1 g of Metoclopramide in 10 mL of 1 mol/L hydrochloric acid TS; the solution is colorless and clear.

(2) ***Heavy metals***—Proceed with 1.0 g of Metoclopramide as directed under Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Arsenic***—Dissolve 1.0 g of Metoclopramide in 5 mL of 1 mol/L hydrochloric acid TS and performed the test using this solution as the test solution (NMT 2 ppm).

(4) ***Related substances***—Dissolve 0.10 g of Metoclopramide in 10 mL of methanol and use this solution as the test solution. Pipet 1 mL of this solution, add methanol to make exactly 200 mL, and use it as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on a thin-layer chromatographic plate made of silica gel (with a fluorescent indicator) for thin-layer chromatography. Next, develop the plate with a mixture of 1-butanol and ammonia water(28) (19 : 1) as a developing solvent to a distance of about 10 cm, and air-dry the plate. Dry the plate further at 80 ℃ for 30 minutes. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot obtained from the test solution are not more intense than those obtained from the standard solution.

Loss on drying NMT 0.5% (1 g, 105 ℃, 3 hours).

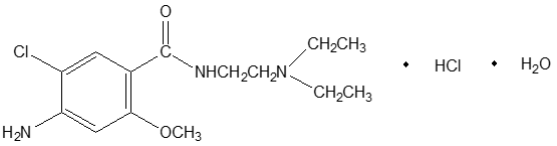
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.4 g of Metoclopramide, previously dried, dissolve in 50 mL of acetic acid(100), add 5 mL of acetic anhydride, and warm for 5 minutes. After cooling, titrate with 0.1 mol/L perchloric acid VS (indicator: 2 drops of methylrosaniline chloride TS). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 29.980 mg of $C_{14}H_{22}ClN_3O_2$

Packaging and storage Preserve in well-closed containers.

Metoclopramide Hydrochloride Hydrate
메토클로프라미드염산염수화물



Metoclopramide Hydrochloride
$C_{14}H_{22}ClN_3O_2 \cdot HCl \cdot H_2O$: 354.27
4-Amino-5-chloro-*N*-[2-(diethylamino)ethyl]-2-methoxybenzamide hydrate hydrochloride [*54143-57-6*]

Metoclopramide Hydrochloride Hydrate contains NLT 98.0% and NMT 101.0% of metoclopramide hydrochloride ($C_{14}H_{22}ClN_3O_2 \cdot HCl$: 336.26), calculated on the anhydrous basis.

Description Metoclopramide Hydrochloride Hydrate occurs as a white crystalline powder and is odorless or has a faint odor.
It is very soluble in water, freely soluble in ethanol(95), sparingly soluble in chloroform and practically insoluble in ether.

Identification (1) Dissolve 50 mg of Metoclopramide Hydrochloride Hydrate in 5 mL of water and add 5 mL of 1% 4-dimethylaminobenzaldehyde in 1 mol/L hydrochloric acid; the solution turns orange.

(2) Perform the test as directed under the section of Related substances under the Purity; the R_f value of the principal spot in the identification solution corresponds to that of the standard solution (1).

(3) Determine the infrared spectra of Metoclopramide Hydrochloride Hydrate and metoclopramide hydrochloride hydrate RS, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Purity (1) ***Heavy metals***—Dissolve 2.5 g of Metoclopramide Hydrochloride Hydrate in 25 mL of freshly boiled and cooled water, and use 12 mL of this solution as the test solution. Separately, prepare 2 mL of lead standard solution in the same manner as the test solution. To 10 mL of this solution, add 2 mL of the test solution, and use this solution as the control solution. Separately, add 2 mL of the test solution to 10 mL of water and use this solution as the blank test solution. To 12 mL each of the test solution, the control solution and the blank test solution, add 2 mL of pH 3.5 acetate buffer solution, mix, add 1.2 mL of thioacetamide TS, and mix immediately.

Allow them to stand for 2 minutes; the color of the test solution is no more intense than that of the control solution (NMT 20 ppm).

System suitability—The color of the control solution is faint brown compared to that of the blank test solution.

(2) ***Related substances***—Weigh accurately an appropriate amount of Metoclopramide Hydrochloride Hydrate and dissolve in methanol to make a solution containing 50 mg per mL, and use this solution as the test solution. Take an appropriate amount of the test solution, dissolve in methanol to make a solution containing 0.5 mg per mL, and use this solution as the identification solution. Separately, weigh an appropriate amount of metoclopramide hydrochloride hydrate RS and dissolve in methanol to make a solution containing 1 mg per mL. Add methanol to this solution to dilute quantitatively to make solutions with the concentrations indicated in the table below, and use these solutions as the standard solutions.

Standard solutions	Dilution	Concentration (μg/mL)	Percentage (%) with respect to the test solution
Standard solution (1)	(1 in 4)	250	0.5
Standard solution (2)	(3 in 20)	150	0.3
Standard solution (3)	(1 in 20)	50	0.1

With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution, the identification solution and the standard solutions on a thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of chloroform, methanol, toluene and ammonia water (140 : 60 : 20 : 1) to a distance of about 15 cm, and air-dry the plate. Examine the plate under ultraviolet light; any spot other than the principal spot obtained from the test solution is not larger and is not more intense than the principal spot obtained from the standard solution (1) (NMT 0.5%), and the sum of the intensities of all spots other than the principal spot obtained from the test solution is NMT 1.0%.

Water NLT 4.5% and NMT 6.0% (0.5 g, volumetric titration, direct titration).

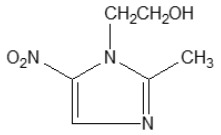
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.25 g of Metoclopramide Hydrochloride Hydrate, add 5 mL of 0.01 mol/L hydrochloric acid TS and 50 mL of ethanol(95), and titrate with 0.1 mol/L sodium hydroxide VS (potentiometric titration under the Titrimetry; determine the volume consumed between the two endpoints). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS
= 33.63 mg of $C_{14}H_{22}ClN_3O_2 \cdot HCl$

Packaging and storage Preserve in light-resistant, tight containers.

Metronidazole
메트로니다졸



$C_6H_9N_3O_3$: 171.15
2-(2-Methyl-5-nitroimidazol-1-yl)ethanol [*443-48-1*]

Metronidazole, when dried, contains NLT 99.0% and NMT 101.0% of metronidazole ($C_6H_9N_3O_3$).

Description Metronidazole occurs as white to pale yellow crystals or a crystalline powder, and is odorless and has a slightly bitter taste.
It is freely soluble in acetic acid(100), sparingly soluble in methanol, in ethanol(95) or in acetone, slightly soluble in water and very slightly soluble in ether.
It dissolves in dilute hydrochloric acid.
It is changed by light.

Identification (1) Determine the absorption spectra of solutions of Metronidazole and metronidazole RS in 0.1 mol/L hydrochloric acid TS as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Metronidazole and metronidazole RS, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Melting point Between 159 and 163 °C.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Metronidazole as directed under Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***2-Methyl-5-nitroimidazole***—Dissolve 0.10 g of Metronidazole in acetate to make exactly 10 mL and use this solution as the test solution. Separately, dissolve 20 mg of 2-methyl-5-nitroimidazole RS in acetone to make exactly 20 mL, then pipet 5.0 mL of this solution, add acetone to make exactly 100 mL and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 20 μL each of the test solution and the standard solution on a thin-layer chromatographic plate made of silica gel for thin-layer chromatography (with a fluorescent

indicator). Next, develop the plate with a mixture of acetone, water, and ethyl acetate (8 : 1 : 1) as a developing solvent to a distance of about 15 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot obtained from the test solution are not more intense than those obtained from the standard solution.

Loss on drying NMT 0.5% (1 g, in vacuum, silica gel, 24 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.2 g of Metronidazole, previously dried, dissolve in 30 mL of acetic acid(100), and titrate with 0.1 mol/L perchloric acid VS (indicator: 0.5 mL of 1-naphtholbenzein TS). However, the endpoint of titration is when the orange color of the solution turns into a green color. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 17.115 mg of $C_6H_9N_3O_3$

Packaging and storage Preserve in light-resistant, tight containers.

Metronidazole Tablets
메트로니다졸 정

Metronidazole Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of metronidazole ($C_6H_9N_3O_3$: 171.15).

Method of preparation Prepare as directed under Tablets, with Metronidazole.

Identification (1) Powder Metronidazole Tablets, weigh an amount equivalent to 0.1 g of metronidazole according to the labeled amount, add 0.1 mol/L hydrochloric acid TS to make exactly 100 mL. Shake this solution vigorously to mix, allow to stand for 30 minutes, and centrifuge. Pipet 1 mL of the clear supernatant, and add 0.1 mol/L hydrochloric acid TS to make 100 mL. Determine the absorption spectrum of this solution as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum between 275 nm and 279 nm.

(2) Weigh an amount of Metronidazole Tablets, previously powdered, equivalent to 0.20 g of Metronidazole according to the labeled amount, add 20 mL of acetone, shake and mix for 10 minutes, centrifuge the solution, and use the clear supernatant as the test solution. Separately, dissolve 0.10 g of metronidazole RS in 10 mL of acetone, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of acetone, water, and ethyl acetate (8 : 1 :1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm), and the R_f values of the principal spots obtained from the test solution and the standard solution are the same.

Dissolution Take 1 tablet of Metronidazole Tablets, proceed with 900 mL of water as the test solution at 50 revolutions per minute according to Method 2, and perform the test. Take NLT 20 mL of the dissolved solution after 90 minutes from the start of the dissolution test and filter the solution through a membrane filter with a pore size of NMT 0.45 μm. Discard the first 10 mL of the filtrate, pipet *V* mL of the subsequent filtrate, add water to obtain a solution having known concentration of about11 μg of metronidazole per mL according to the labeled amount. Make it exactly *V′* mL and use this solution as the test solution. Separately, dry and decompress metronidazole RS with silica gels as a desiccating agent for 24 hours, weigh accurately 22 mg of Metronidazole Tablets, dissolve in water to make exactly 100 mL. Pipet 5 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at 320 nm as directed under Ultraviolet-visible Spectroscopy. Meets the requirements if the dissolution rate of Metronidazole Tablets in 90 minutes is NLT 70%.

The dissolution rate (%) to the labeled amount of metronidazole ($C_6H_9N_3O_3$)

$$= W_S \times \frac{V'}{V} \times \frac{A_T}{A_S} \times \frac{1}{C} \times 45$$

WS: Amount (mg) of metronidazole RS
C: Labeled amount (mg) of metronidazole in 1 tablet

Uniformity of dosage units It meets the requirements when the procedure for content uniformity is performed according to the following method.
Take a table of Metronidazole Tablets, add 25 mL of a mixture of water and methanol (1 : 1), shake vigorously for 25 minutes to mix, and add the mixture of water and methanol (1 : 1) to make exactly 50 mL. Pipet 5 mL of this solution, and add a mixture of water and methanol (1 : 1) to make exactly 100 mL. Filter the solution through a membrane filter with a pore size of 0.45 μm, discard the first 3 mL of the filtrate, and use the subsequent filtrate as the test solution. Perform the test as directed under the Assay below.

Amount (mg) of metronidazole ($C_6H_9N_3O_3$)

$$= \text{Amount (mg) of metronidazole RS} \times \frac{A_T}{A_S} \times 10$$

Assay Weigh accurately the mass of NLT 20 tables of Metronidazole Tablets, and reduce to powder. Weigh an amount equivalent to about 0.25 g of metronidazole

($C_3H_9N_3O_3$), add 25 mL of a mixture of water and methanol (1 : 1), shake vigorously to mix for 10 minutes, and add a mixture of water and methanol (1 : 1) to make exactly 50 mL. Pipet 5 mL of this solution, and add a mixture of water and methanol (4 : 1) to make exactly 100 mL. Filter the resulting solution through a membrane filter with a pore size of NMT 0.45 μm, discard the first 3 mL of the filtrate, and use the subsequent filtrate as the test solution. Separately, dry and decompress metronidazole RS with silica gels as a desiccating agent for 24 hours, weigh accurately 22 mg of Metronidazole Tablets, dissolve in a solution of water and methanol (4 : 1) to make exactly 100 mL, and use this solution as the standard solution. Pipet 10 μL each of the test solution and the standard solution, and perform the test as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S of metronidazole in each solution.

$$\text{Amount (mg) of metronidazole } (C_6H_9N_3O_3) = \text{Amount (mg) of metronidazole RS} \times \frac{A_T}{A_S} \times 10$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 320 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: A mixture of water and methanol (80 : 20).

Flow rate: Adjust the flow rate so that the retention time of metronidazole is about 5 minutes.

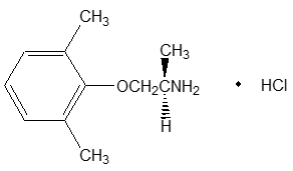
System suitability

System performance: Proceed with 10 μL of the standard solution according to the above conditions; the number of theoretical plates and the symmetry factor for the metronidazole peak is NLT 3000 and NMT 1.5, respectively.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area of metronidazole is NMT 2.0%.

Packaging and storage Preserve in tight containers.

Mexiletine Hydrochloride
멕실레틴염산염



and enantiomer

$C_{11}H_{17}NO \cdot HCl$: 215.72

(*RS*)-1-(2,6-Dimethylphenoxy)propan-2-amine hydrochloride [*5370-01-4*]

Mexiletine Hydrochloride, when dried, contains NLT 98.0% and NMT 102.0% of mexiletine hydrochloride ($C_{11}H_{17}NO \cdot HCl$).

Description Mexiletine Hydrochloride occurs as a white powder.

It is freely soluble in water or ethanol(95), slightly soluble in acetonitrile, and practically insoluble in ether.

An aqueous solution of Mexiletine Hydrochloride (1 in 20) shows no optical rotation.

Identification (1) Determine the absorption spectra of the solutions of Mexiletine Hydrochloride and mexiletine hydrochloride RS in 0.01 mol/L hydrochloric acid TS (1 in 2000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Mexiletine Hydrochloride and mexiletine hydrochloride RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers. If any difference appears between the two spectra, dissolve each in ethanol(95), evaporate, and perform the test with the residue in the same manner.

(3) An aqueous solution of Mexiletine Hydrochloride (1 in 100) responds to the Qualitative Analysis (2) for chloride.

Melting point Between 200 and 204 °C.

pH Dissolve 1.0 g of Mexiletine Hydrochloride in 10 mL of water; the pH of this solution is between 3.8 and 5.8.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Mexiletine Hydrochloride in 10 mL of water; the resulting solution is clear and colorless.

(2) ***Heavy metals***—Proceed with 2.0 g of Mexiletine Hydrochloride according to Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Related substances***—Dissolve 20 mg of Mexiletine Hydrochloride in 20 mL of the mobile phase and use this solution as the test solution. Pipet 1 mL of the test solution, add the mobile phase to make exactly 250 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak area of each solution by the automatic integration method; each peak area other than the major peak obtained from the test solution is not greater than the major peak area from the standard solution.

Operating conditions

For the detector, column, column temperature, mobile phase and flow rate, proceed as directed in the operating conditions under the Assay.

Detection sensitivity: Adjust the sensitivity so that the peak height of mexiletine obtained from 20 μL of the standard solution is 5 mm to 10 mm.

Time span of measurement: About 3 times the retention time of mexiletine. However, exclude solvent peaks.

Loss on drying NMT 0.5% (1 g, 105 °C, 3 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 20 mg each of Mexiletine Hydrochloride and mexiletine hydrochloride RS, previously dried, and dissolve in the mobile phase to make exactly 20 mL. Pipet 5 mL each of these solutions, add exactly 5 mL of the internal standard solution, add the mobile phase to make exactly 100 mL, and use these solutions as the test solution and the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the peak area ratios, Q_T and Q_S, of mexiletine to internal standard.

$$\text{Amount (mg) of mexiletine hydrochloride } (C_{11}H_{17}NO\cdot HCl) = \text{Amount (mg) of mexiletine hydrochloride RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of phenethylamine hydrochloride in the mobile phase (3 in 5000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 210 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (about 7 μm in particle diameter).

Column temperature: A constant temperature of about 30 °C.

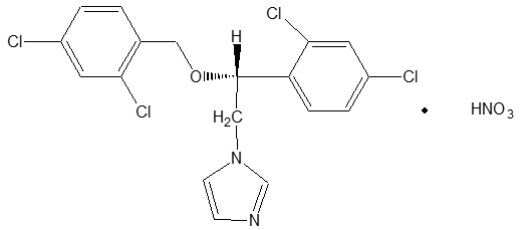
Mobile phase: Dissolve 2.5 g of sodium lauryl sulfate and 3 g of sodium dihydrogen phosphate dihydrate in 600 mL of water and add 420 mL of acetonitrile.

Flow rate: Adjust the flow rate so that the retention time of mexiletine is about 6 minutes.

Selection of column: Proceed with 20 μL of the standard solution according to the above conditions; internal standard and mexiletine are eluted in this order with the resolution being NLT 9.

Packaging and storage Preserve in light-resistant, tight containers.

Miconazole Nitrate
미코나졸질산염



and enantiomer

$C_{18}H_{14}Cl_4N_2O\cdot HNO_3$: 479.14

(*RS*)-1-[2-(2,4-Dichlorophenyl)-2-[(2,4-dichlorophenyl)methoxy]ethyl]imidazole; nitric acid [*22832-87-7*]

Miconazole Nitrate, when dried, contains NLT 98.5% and NMT 101.0% of miconazole nitrate ($C_{18}H_{14}Cl_4N_2O\cdot HNO_3$).

Description Miconazole Nitrate occurs as a white crystalline powder.

It is freely soluble in *N*,*N*-dimethylformamide, sparingly soluble in methanol, slightly soluble in ethanol(95), acetone, or acetic acid(100), and very slightly soluble in water or ether.

Melting point—About 180 °C (with decomposition).

Identification (1) Add 2 mL of Reinecke salt TS to 2 mL of Miconazole Nitrate in methanol (1 in 100); a pale red precipitate is formed.

(2) Determine the absorption spectra of Miconazole Nitrate and miconazole nitrate RS in methanol (1 in 2500) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Perform the Flame Coloration (2) with Miconazole Nitrate in methanol (1 in 100); it exhibits a green color.

(4) A Miconazole Nitrate in methanol (1 in 100) responds to the Qualitative Analysis for nitrate.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Miconazole Nitrate in 100 mL of methanol; the solution is clear and colorless.

(2) ***Chloride***—Weigh 0.10 g of Miconazole Nitrate, dissolve in 6 mL of dilute nitric acid and *N*,*N*-dimethylformamide to make 50 mL, and perform the test using this solution as the test solution. Separately, add 6 mL of dilute nitric acid and *N*,*N*-dimethylformamide to 0.25 mL of 0.01 mol/L hydrochloric acid to make 50 mL, and use this solution as the control solution (NMT 0.09%).

(3) ***Heavy metals***—Proceed with 1.0 g of Miconazole Nitrate as directed under Method 2 and perform the test. Prepare the control solution with 1.0 mL of the lead standard solution (NMT 10 ppm).

(4) ***Arsenic***—Proceed with 1.0 g of Miconazole Nitrate as directed under Method 3 and perform the test

(NMT 2 ppm).

(5) ***Related substances***—Dissolve 0.10 g of Miconazole Nitrate in 10 mL of methanol and use this solution as the test solution. Pipet 1 mL of this solution and add methanol to make exactly 20 mL. Pipet 1 mL of this solution and add methanol to make exactly 20 mL. Use this solution as the standard solution. Perform the test with the test solution and the standard solution as directed under the Thin Layer Chromatography. Spot 50 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of *n*-hexane, chloroform, methanol, and ammonia water(28) (60 : 30 : 10 : 1) (as the developing solvent) to a distance of about 12 cm, and air-dry the plate. Allow the plate to stand for 20 minutes in iodine steam; the spots other than the principal spot from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 0.5% (1 g, in vacuum, silica gel, 60 ℃, 3 hours).

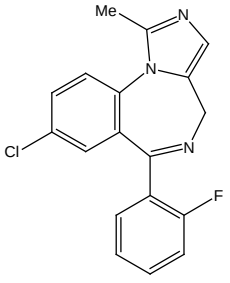
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.35 g of Miconazole Nitrate, previously dried, and add 50 mL of acetic acid(100), warm to dissolve. After cooling, titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 47.91 mg of $C_{18}H_{14}Cl_4N_2O \cdot HNO_3$

Packaging and storage Preserve in light-resistant, tight containers.

Midazolam
미다졸람



$C_{18}H_{13}ClFN_3$: 325.77

8-Chloro-6-(2-fluorophenyl)-1-methyl-4*H*-imidazo[1,5-a][1,4]benzodiazepine [*59467-70-8*]

Midazolam contains NLT 98.5% and NMT 101.5% of midazolam ($C_{18}H_{13}ClFN_3$), calculated on the dried basis.

Description Midazolam occurs as a white or yellow crystalline powder.
It is freely soluble in acetone or ethanol(95), soluble in methanol and practically insoluble in water.

Identification (1) Determine the infrared spectra of Midazolam and midazolam RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) The R_f values of the principal spots obtained from the standard solution (2) and the test solution (2) in Related Substances are the same.

(3) Take 90 mg of Midazolam in a porcelain crucible, add 0.3 g of anhydrous sodium carbonate, mix, and ignite for NMT 5 minutes. After cooling, add 5 mL of dilute nitric acid to the residue, shake to mix, and filter. Add 1.0 mL of the filtrate to a mixture of 0.1 mL of alizarin S TS and 0.1 mL of zirconyl nitrate TS, mix, and allow to stand for 5 minutes; the resulting solution turns yellow and the blank test solution prepared in the same manner tunes red.

(4) Add 1 mL of water to 1 mL of the filtrate in (3); the solution responds to the Qualitative Analysis (2) for chloride.

Melting point Between 161 and 164 ℃.

Purity (1) ***Clarity and color of solution***—Dissolve 0.1 g of Midazolam in 0.1 mol/L hydrochloric acid TS to make 10 mL; the solution is clear.

(2) ***Related substances***—(i) Dissolve 0.2 g of Midazolam in ethanol(95) to make 5 mL, and use this solution as the test solution (1). Add ethanol(95) to 1.0 mL of this solution (the test solution (1)) to make 50 mL and use this solution as the test solution (2). Add ethanol(95) to 1.0 mL of the test solution (1) to make exactly 10 mL, then add ethanol(95) to 1.0 mL of this solution to make exactly 100 mL, and use this solution as the standard solution (1). Dissolve 8 mg of midazolam RS in ethanol(95) to make 10 mL and use this solution as the standard solution (2). Additionally, dissolve 8 mg of midazolam RS and 8 mg of chlordiazepoxide in ethanol(95) to make 10 mL and use this solution as the standard solution (3). With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solutions and the standard solutions on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of ethyl acetate, methanol, water, and acetic acid(100) (80 : 20 : 15 : 2) (as the developing solvent) to a distance of about 12 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot from the test solution (1) are not more intense than the spots from the standard solution (1) (NMT 0.1%). This test is valid when two spots from the standard solution (3) are distinctly separated.

(ii) Dissolve 50 mg of Midazolam in methanol to make 50 mL and use this solution as the test solution.

Add methanol to 1 mL of this solution to make 100 mL. Add methanol to 1 mL of this solution to make 10 mL and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine each peak area by the automatic integration method; the peak areas of related substance I {(6*RS*)-8-chloro-6-(2-fluorophenyl)-1-methyl-5,6-dihydro-4*H*-imidazo[1.5-α][1,4]benzodiazepine} and related substance II {8-chloro-1-methyl-6-phenyl-4*H*-imidazo[1.5-α][1,4]benzodiazepine} obtained from the test solution are not greater than the area of the major peak from the standard solution (0.1%), and the peak area of related substance III {(6*RS*)-8-chloro-6-(2-fluorophenyl)-1-methyl-6*H*-imidazo[1.5-α][1,4]benzodiazepine} is not greater than 2 times the area of the major peak from the standard solution (0.2%). The peak area of related substances other than related substances I, II and III obtained from the test solution is not greater than the area of the major peak from the standard solution (0.1%). The total area of related substances is not greater than 3 times the area of the major peak obtained from the standard solution (0.3%). Exclude any peaks with an area not greater than 0.5 times the area of the major peak from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.0 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 μm in particle diameter).

Mobile phase: Dissolve 7.7 g of ammonium acetate in 1000 mL of water and dissolve 4 g of tetrabutylammonium hydroxide in 1000 mL of water, respectively. Mix these solutions and adjust the pH to 5.3 with acetic acid. Add 560 mL of methanol to 440 mL of this solution.

Flow rate: 1.0 mL/min

Time span of measurement: About 2.5 times the retention time of midazolam.

Relative retention time: Proceed with 5 μL each of the test solution and the standard solution according to the above conditions; the relative retention times of the peaks of the related substances I, II and III to that of the peak of midazolam are about 0.9, 1.2, and 2.2, respectively.

Loss on drying NMT 0.5% (1 g, 105 ℃, 2 hours).

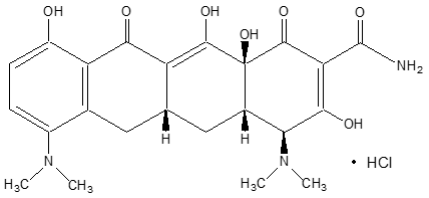
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.12 g of Midazolam, dissolve in 30 mL of acetic acid(100), add 20 mL of acetic anhydride, and mix. Titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 16.29 mg of $C_{18}H_{13}ClFN_3$

Packaging and storage Preserve in light-resistant, well-closed containers.

Minocycline Hydrochloride
미노사이클린염산염



$C_{23}H_{27}N_3O_7 \cdot HCl$: 493.94

(4*S*,4*aS*,5*aR*,12*aS*)-4,7-Bis(dimethylamino)-3,10,12,12a-tetrahydroxy-1,11-dioxo-1,4,4a,5,5a,6,11,12a-octahydrotetracene-2-carboxamide hydrochloride [*13614-98-7*]

Minocycline Hydrochloride is the hydrochloride of a derivative of tetracycline.

Minocycline Hydrochloride contains NLT 890 μg (potency) and NMT 950 μg (potency) per mg of minocycline ($C_{23}H_{27}N_3O_7$: 457.48), calculated on the anhydrous basis.

Description Minocycline Hydrochloride occurs as a yellow crystalline powder.
It is freely soluble in *N*,*N*-dimethylformamide, soluble in methanol, sparingly soluble in water and slightly soluble in ethanol(95).

Identification (1) Determine the absorption spectra of solutions (1 in 62500) of Minocycline Hydrochloride and minocycline hydrochloride RS dissolved in hydrochloric acid in methanol (19 in 20000), as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the absorption spectra of solutions of Minocycline Hydrochloride and minocycline hydrochloride RS as directed in the potassium chloride disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) An aqueous solution of Minocycline Hydrochloride (1 in 100) responds to the Qualitative Analysis (2) for chloride.

Crystallinity Meets the requirements.

pH Dissolve 1.0 g of Minocycline Hydrochloride in 100 mL of water; the pH of this solution is between 3.5 and 4.5.

Absorbance $E_{1cm}^{1\%}$ (358 nm): Between 296 and 328 (8 mg, 0.01 mol/L hydrochloride methanol TS, 500 mL).

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Minocycline Hydrochloride in 100 mL of water; the solution is clear. Perform the test as directed under the Ultraviolet-visible Spectroscopy; the absorbance of the solution at 560 nm is NMT 0.06. However, perform the test within 1 hour after preparing this solution.

(2) ***Heavy metals***—Proceed with 0.5 g of Minocycline Hydrochloride and perform the test as directed under Method 2. Prepare the control solution with 2.5 mL of lead standard solution (NMT 50 ppm).

(3) ***Related substances***—Weigh 50 mg of Minocycline Hydrochloride, dissolve it in 100 mL of the mobile phase, and use this solution as the test solution. Perform the test immediately after preparing the test solution. Perform the test with 20 μL of the test solution as directed under the Liquid Chromatography according to the following operating conditions and determine each peak area of each solution by the automatic integration method, and calculate the peak area percentage of each solution by the percentage peak area method; the peak area percentage of epiminocycline is NMT 1.2%, and the peak area percentage of each peak, other than minocycline and epiminocycline, is NMT 1.0%. Additionally, the sum of each peak area, other than minocycline and epiminocycline, is NMT 2.0%.

Operating conditions

For the detector, column, column temperature and mobile phase, comply with the operating conditions under the Assay.

Flow rate: Adjust the flow rate so that the retention time of minocycline is about 12 minutes. The retention time of epiminocycline is about 10 minutes under these conditions.

System suitability

System performance: Proceed as directed under the system suitability under the Assay.

Test for required detectability: Pipet 2 mL of the test solution, add the mobile phase to make exactly 100 mL, and use this solution as the system suitability solution. Pipet 5 mL of the system suitability solution and add the mobile phase to make exactly 100 mL. Confirm that the peak area of minocycline obtained from 20 μL of this solution is equivalent to 3.5% to 6.5% of that from 20 μL of the minocycline suitability solution.

System repeatability: Repeat the test 6 times with 20 μL each of the system suitability solutions according to the above conditions; the relative standard deviation of the ratios of the peak area of minocycline is NMT 2.0%.

Time span of measurement: About 2.5 times the retention time of minocycline beginning after the solvent peak.

Loss on drying NMT 10.0% (1.0 g, in vacuum, 100 ℃, 5 h.).

Water Between 4.3% and 8.0% (0.3 g, volumetric titration, direct titration).

Residue on ignition NMT 0.5% (1.0 g).

Sterility It meets the requirements when Minocycline Hydrochloride is used in a sterile preparation. However, it is excluded in cases where there is a final sterilization process in the manufacturing of a sterile preparation.

Bacterial endotoxins Less than 1.25 EU/mg (potency) when Minocycline Hydrochloride is used in a sterile preparation.

Histamine It meets the requirements when Minocycline Hydrochloride is used in a sterile preparation. Weigh an appropriate amount of Minocycline Hydrochloride, dissolve it in Isotonic Sodium Chloride Injection to prepare a solution containing 5.0 mg (potency) per mL, and use this solution as the test solution. Use 0.6 mL of the solution for the test.

Assay Weigh accurately about 50 mg (potency) each of Minocycline Hydrochloride and minocycline hydrochloride RS, dissolve in the mobile phase to make exactly 50 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 10 μL each of the test solution and the standard solution under the following conditions as directed under the Liquid Chromatography, and determine the peak areas, A_T and A_S of minocycline in the test solution and the standard solution.

$$\text{Potency (μg) of minocycline } (C_{23}H_{27}N_3O_7) = \text{Potency (μg) of minocycline hydrochloride RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 280 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: Adjust the pH of a mixture of ammonium oxalate TS, *N*,*N*-dimethylformamide, and disodium dihydrogen ethylenediaminetetraacetate TS (11 : 5 : 4) to 6.5 by adding tetrabutylammonium hydroxide TS.

Flow rate: 1 mL/min

System suitability

System performance: Dissolve 50 mg of Minocycline Hydrochloride in 25 mL of the mobile phase. Heat 5 mL of this solution on a steam bath for 60 minutes and add the mobile phase to make 25 mL. Proceed with 10 μL of this solution according to the above conditions; epiminocycline and minocycline are eluted in this order with the resolution being NLT 2.0.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solutions under the above conditions; the relative standard deviation of the peak areas of minocycline is NMT 1.0%.

Ammonium oxalate TS—Dissolve a mixture of water and acetonitrile (13 : 2) in 0.98 g of ammonium oxalate monohydrate to make 100 mL.

Disodium dihydrogen ethylenediaminetetraacetate TS—Dissolve a mixture of water and acetonitrile (13 : 2) in 18.6 g of disodium dihydrogen ethylenediaminetetraacetate hydrate to make 1000 mL.

Packaging and storage Preserve in light-resistant, tight containers.

Minocycline Hydrochloride Capsules
미노사이클린염산염 캡슐

Minocycline Hydrochloride Capsules contain NLT 90.0% and NMT 120.0% of the labeled amount of minocycline ($C_{23}H_{27}N_3O_7$: 457.48).

Method of preparation Prepare Minocycline Hydrochloride Capsules as directed under Capsules, with Minocycline.

Identification Weigh amounts of Minocycline Hydrochloride Capsules equivalent to 50 mg (potency) of minocycline and about 50 mg (potency) of minocycline RS according to the labeled amount, and dissolve in 20 mL of ethanol, respectively, and use each solution as the test solution and the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution to the thin-layer chromatographic plate made of silica gel for thin-layer chromatography (with fluorescence indicator), and develop the plate with a mixture of 1-butanol, methanol and 10% citric acid (4 : 1 : 2) as the developing solvent to a distance of about 10 cm. Examine the plate under ultraviolet rays (main wavelength: 254 nm); the R_f values of the spots from the test solution and the standard solution are the same.

Loss on drying NMT 12.0% (1.0 g, NMT 0.7 kPa, 100 ℃, 5 hours)

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Proceed as directed under the Assay under Minocycline Hydrochloride Hydrate. Weigh accurately the contents with 20 capsules of Minocycline Hydrochloride Capsules, powder, weigh accurately about 50 mg (potency) of Minocycline Hydrochloride Capsules according to the marked potency, and dissolve in the mobile phase to make exactly 50 mL. Use this solution as the test solution. Weigh about 50 mg (potency) of minocycline hydrochloride hydrate RS, dissolve in the mobile phase to make exactly 50 mL, and use this solution as the standard solution.

Packaging and storage Preserve in tight containers.

Minocycline Hydrochloride Dental Ointment
미노사이클린염산염 치과용 연고

Minocycline Hydrochloride Dental Ointment is a dental ointment and contains NLT 90.0% and NMT 120.0% of the labeled amount of minocycline ($C_{23}H_{27}N_3O_7$: 457.48).

Method of preparation Prepare as directed under Ointments, with Minocycline Hydrochloride.

Identification The major peaks obtained from the test solution and the standard solution under the Assay are the same in the retention time.

Water NMT 3.0% (0.3 g, volumetric titration, direct titration)

Assay Weigh accurately about 10 mg (potency) of Minocycline Hydrochloride Dental Ointment according to the labeled potency, dissolve with 10 mL each of dimethylformamide, extract 3 times, and combine the extracts. Add water to make exactly 100 mL, then pipet 10 mL of the resulting solution, add the mobile phase to make exactly 25 mL, and use this solution as the test solution. Separately, weigh accurately about 10 mg (potency) of minocycline hydrochloride RS, dissolve in 30 mL of dimethylformamide, and add water to make exactly 100 mL. Pipet 10 mL of this solution, add the mobile phase to make exactly 25 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak area of minocycline, A_T and A_S, in each solution.

$$\text{Potency (μg) of minocycline } (C_{23}H_{27}N_3O_7) = \text{Potency (μg) of minocycline hydrochloride RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 344 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silical gel for liquid chromatography (5 μm in particle diameter).

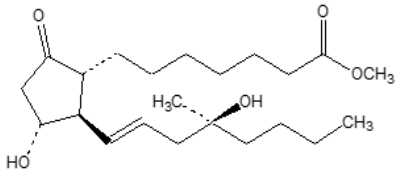
Column temperature: A constant temperature of about 25 °C.

Mobile phase: Adjust the pH of a mixture of 0.2 mol/L ammonium oxalate solution, dimethylformamide and 0.1 mol/L ethylenediaminetetraacetic acid disodium salt solution (11 : 5 : 4) to 6.2 with 0.4 mol/L tetra-*n*-butylammonium hydroxide solution.

Flow rate: Adjust the flow rate so that the retention time of minocycline is about 12 minutes.

Packaging and storage Preserve in tight containers.

Misoprostol
미소프로스톨



$C_{22}H_{38}O_5$: 382.54
(11α,13*E*)-11,16-Dihydroxy-16-methyl -9-oxoprost-13-en-1-oic acid methyl ester

Misoprostol contains NLT 97.0% and NMT 102.0% of misoprostol ($C_{22}H_{38}O_5$), calculated on the anhydrous basis.

Description Misoprostol occurs as a colorless to light yellow viscous oil.
It is freely soluble in ethanol, ether, chloroform or ethyl acetate and very slightly soluble in water or hexane.

Identification Determine the infrared spectra of Misoprostol and misoprostol RS as directed under the liquid film method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers. However, the concentration of the test solution should be 30 mg/mL of chloroform.

Purity (1) ***Clarity and color of solution***—Dissolve about 50 mg of Misoprostol in 2.5 mL of methanol; the solution is clear. Perform the test as directed under the Ultraviolet-visible Spectroscopy using methanol as a control solution, and determine the absorbance at a wavelength of 440 nm; the absorbance is NMT 0.1.

(2) ***Related substances (A, B, C, D)***—Weigh accurately about 50 mg of Misoprostol and dissolve it in the mobile phase to make 10.0 mL. Use this solution as the test solution. Separately, weigh accurately 2 mg each of reference standards A, B, C and D, and dissolve in the mobile phase to make 100.0 mL. Use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions; Related substance A is NMT 1.0%, related substance B is NMT 0.2%, related substance C is NMT 0.3%, and related substance D is NMT 0.5%. The total of impurities is NMT 2.5%.

$$\text{X}\,(\%) = \frac{\text{A}_\text{X}}{\text{A}_\text{S}} \times \frac{\text{C}_\text{S}}{\text{C}_\text{X}} \times 100$$

X: A, B, C, D
A_X: Peak area of test solution
A_S: Peak area of standard solution
C_S: Concentration of standard solution (mg/mL)
C_X: Concentration of test solution (mg/mL)

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 213 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm to 10 μm in particle diameter).

Flow rate: 1.0 mL/min

Water NMT 1.0%.

Assay Weigh accurately about 10 mg of Misoprostol, add 40 mL of the mobile phase, and extract by shaking in an orbital shaker for 45 minutes. Then, add the mobile phase to make 50 mL, filter this solution, and use the resulting solution as the test solution. Separately, weigh accurately about 10 mg of misoprostol RS and dissolve it in the mobile phase to make 50 mL. Use this solution as the standard solution. Perform the test with 50 μL each of the test solution and the standard solution according to the following conditions as directed under the Liquid Chromatography, and determine the peak areas, A_T and A_S, of misoprostol.

$$\text{Amount of misoprostol } (C_{22}H_{38}O_5)\text{ (mg)} = \text{Amount of misoprostol RS (mg)} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 200 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography.

Column temperature: 55 ℃

Mobile phase: A mixture of water, methanol and acetonitrile (35 : 40 : 25).

Packaging and storage Preserve in tight containers.

1% Misoprostol Powder
미소프로스톨 100배산

1% Misoprostol Powder contain NLT 90.0% and NMT 110.0% of the labeled amount of misoprostol ($C_{22}H_{38}O_5$: 382.54).

Method of preparation Prepare as directed under Powders, with 1 g of Misoprostol and 99 g of Hypromellose.

Identification (1) Weigh 40 mg of 1% Misoprostol Powder, add 80% methanol to make 25 mL, and use this solution as the test solution. Separately, weigh 40 mg of hypromellose RS, add 80% methanol to make 25 mL, and use this solution as a control solution. Determine the absorption spectrum of this solution as directed under the Ultraviolet-visible Spectroscopy; it does not exhibit a

maximum at a wavelength of about 280 nm. Pipet 10 mL each of the test solution and the control solution, add 10 mL of a mixture of methanol and 1 mol/L sodium hydroxide (4 :1) to each, allow to stand at room temperature for 30 minutes, and determine the absorption spectra as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit maxima near 280 nm.

(2) Weigh 0.1 g of 1% Misoprostol Powder, add 5 mL of ethanol, shake for 10 minutes to mix, then centrifuge. Filter the clear supernatant and use the filtrate as the test solution. Pipet 0.5 mL of the test solution, add 1.5 mL of 1% m-dinitrobenzene, and cool. Add 1.5 mL of 10% sodium hydroxide, and allow to stand under ice solution in the dark for 20 minutes; a reddish purple color is exhibited.

(3) Weigh 0.1 g of 1% Misoprostol Powder, place in 100 mL of hot water, and cool at room temperature while agitating. To 5 mL of this solution, carefully add 5 mL of a solution, prepared by dissolving 35 mg anthrone in 35% sulfuric acid to make 100 mL, and allow to stand; the lower layer exhibits a blue to bluish green color.

Viscosity Between 2.4 cps and 3.6 cps.

Purity (1) ***Clarity and color of solution***—Add 1 g of hypromellose to 100 mL of boiling water and mix; a suspension is formed, and the residue does not dissolve. Cool the suspension to 20 ℃ and mix; the liquid becomes a clear or milky, sticky colloid mixture.

(2) ***Arsenic***—Proceed with 2.0 g of 1% Misoprostol Powder according to Method 3 and perform the test (NMT 1 ppm).

(3) ***Heavy metals***—Proceed with 2.0 g of 1% Misoprostol Powder according to Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

Water NMT 1.5%.

Residue on ignition NMT 3.0% (1 g).

Assay Weigh accurately about 0.2 g of 1% Misoprostol Powder, dissolve in the mobile phase to make 10 mL, and use this solution as the test solution. Separately, weigh accurately about 10 mg of misoprostol RS, dissolve in the mobile phase to make 50 mL, and use this solution as the standard solution. Perform the test with 50 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak area of misoprostol, A_T and A_S, in each solution.

$$\text{Amount (mg) of misoprostol } (C_{22}H_{38}O_5) = \text{Amount (mg) of misoprostol RS} \times \frac{A_T}{A_S} \times \frac{1}{5}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 200 nm).

Column: A stainless steel column about 4.0 mm in internal diameter and about 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 μm - 10 μm in particle diameter).

Mobile phase: A mixture of methanol, water and acetonitrile (40 : 35 : 25).

Flow rate: 2.0 mL/min

Packaging and storage Preserve in tight containers.

1% Misoprostol Powder Tablets
미소프로스톨배산 정

1% Misoprostol Powder Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of misoprostol ($C_{22}H_{38}O_5$: 382.54).

Method of preparation Prepare as directed under Tablets, with 1% Misoprostol Powder.

Identification The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

Uniformity of dosage units Perform the Content uniformity test with 1% Misoprostol Powder Tablets as directed under the Assay; it meets the requirements.

Dissolution Take 1 tablet of 1% Misoprostol Powder Tablets and perform the test at 50 revolutions per minute according to Method 2 under the Dissolution, using 500 mL of water as the dissolution medium. Take the medium 20 minutes after starting the test, filter through a membrane filter, and use this solution as the test solution. Separately, weigh accurately about 6 mg of misoprostol RS, and add acetonitrile to make 100 mL. Take 2.0 mL of this solution, add water to make 250 mL, and use this solution as the standard solution. Perform the test with 50 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions; NLT 75% of the labeled amount of misoprostol ($C_{22}H_{38}O_5$) is dissolved in 20 minutes.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 200 nm).

Column: A stainless steel column about 4.0 mm in internal diameter and about 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 μm to 10 μm in particle diameter).

Mobile phase: 52% acetonitrile solution

Flow rate: 1.5 mL/min

Assay Weigh accurately the mass of NLT 20 tablets of 1% Misoprostol Powder Tablets, and powder. Weigh accurately an amount, equivalent to about 2 mg of misoprostol ($C_{22}H_{38}O_5$), add 80 mL of 50% acetonitrile solution, shake to mix, add 50% acetonitrile solution to make 100 mL, and use this solution as the test solution. Separately, weigh accurately about10 mg of misoprostol RS,

and dissolve in 50% acetonitrile solution to make 50 mL. Take 5.0 mL of this solution, add 50% acetonitrile solution to make 50 mL, and use this solution as the standard solution. Perform the test with 50 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions, and determine the peak areas, A_T and A_S, of misoprostol for each solution.

$$\text{Amount (mg) of misoprostol } (C_{22}H_{38}O_5) = \text{Amount (mg) of misoprostol RS} \times \frac{A_T}{A_S} \times \frac{1}{5}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 200 nm).

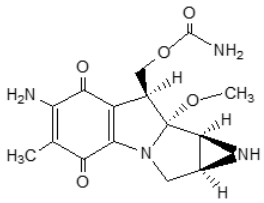
Column: A stainless steel column about 4.0 mm in internal diameter and about 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 μm to 10 μm in particle diameter).

Mobile phase: A mixture of methanol, water and acetonitrile (40 : 35 : 25).

Flow rate: 1.5 mL/min

Packaging and storage Preserve in tight containers.

Mitomycin C
미토마이신C



$C_{15}H_{18}N_4O_5$: 334.33

(1a*S*,8*S*,8a*R*,8b*S*)-6-Amino-4,7-dioxo-8a-methoxy-5-methyl-1,1a,2,8,8a,8bhexahydroazirino[2 ′, 3 ′: 3,4]pyrrolo[1,2-*a*]indol-8-ylmethyl carbamate [*50-07-7*]

Mitomycin C is a compound with antitumor activity obtained by culturing *Streptomyces caespitosus*.

Mitomycin C contains NLT 970 μg and NMT 1030 μg (potency) of mitomycin C ($C_{15}H_{18}N_4O_5$: 334.33) per mg, calculated on the dried basis.

Description Mitomycin C occurs as bluish purple crystals or a crystalline powder.

It is freely soluble in *N*,*N*-dimethylacetamide, slightly soluble in water or methanol and very slightly soluble in ethanol(99.5).

Identification (1) Determine the absorption spectra of aqueous solutions of Mitomycin C and mitomycin C RS (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Mitomycin C and mitomycin C RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Crystallinity Meets the requirements.

pH Dissolve 1.0 g of Mitomycin C in 10 mL of water; the pH of this solution is between 5.5 and 7.5.

Absorbance $E_{1cm}^{1\%}$ (362 nm): Between 650 and 750 (1.0 mg, water, 100 mL).

Purity ***Related substances***—Perform this test rapidly after the test solution and the standard solution are prepared. Dissolve 50 mg of Mitomycin C in 10 mL of methanol and use this solution as the test solution. Pipet 1 mL of this solution and add methanol to make exactly 100 mL. Use this solution as the standard solution. Pipet 10 μL each of the test solution and the standard solution and perform the test as directed under the Liquid Chromatography according to the following conditions, and determine peak areas of each solution by the automatic integration method; each area of the peak other than that of mitomycin C obtained from the test solution is not greater than the peak area of mitomycin C from the standard solution. In addition, the total area of the peaks other than that of mitomycin C from the test solution is not greater than 3 times the peak area of mitomycin C from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 30 ℃.

Mobile phase: Adjust the mixing ratio of mobile phases A and B to control the gradient elution as follows.

Mobile phase A: Add water to 20 mL of 0.5 mol/L ammonium acetate TS to make 1000 mL. Add 200 mL of methanol to 800 mL of this solution.

Mobile phase B: Add water to 20 mL of 0.5 mol/L ammonium acetate TS to make 1000 mL. Add 1000 mL of methanol to this solution.

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 - 10	100	0
10 - 30	100 → 0	0 → 100
30 - 45	0	100

Flow rate: 1.0 mL/min

System suitability

Test for required detectability: Pipet 10 mL of the standard solution and add methanol to make exactly 100 mL. Confirm that the peak area of mitomycin C obtained

from 10 μL of this solution is equivalent to 7% to 13% of the peak area of mitomycin C from 10 μL of the standard solution.

System performance: Dissolve 25 mg of Mitomycin C and 40 mg of 3-ethoxy-4-hydroxybenzaldehyde in 50 mL of methanol. Proceed with 10 μL of this solution under the above conditions, mitomycin C and 3-ethoxy-4-hydroxybenzaldehyde are eluted in this order with the resolution between these peaks being NLT 15.

System repeatability: Repeat the test 3 times with 10 μL each of the standard solutions according to the above conditions; the relative standard deviation of the peak areas of mitomycin C is NMT 3.0%.

Time span of measurement: About 2 times the retention time of mitomycin C after the solvent peak.

Loss on drying NMT 1.0% (0.1 g, NMT 0.67 kPa, 60 ℃, 3 h.).

Sterility It meets the requirements when used in a sterile preparation.

Bacterial endotoxins Less than 50 EU per mg (potency) of mitomycin C when used in a sterile preparation.

Assay Weigh accurately about 25 mg (potency) each of Mitomycin C and mitomycin C RS, dissolve in *N*,*N*-Dimethylacetamide to make exactly 50 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 10 μL each of the test solution and the standard solution according to the following conditions as directed under the Liquid Chromatography, and determine the peak areas, A_T and A_S, of mitomycin C.

$$\text{Potency (μg) of mitomycin C } (C_{15}H_{18}N_4O_5) = \text{Potency (μg) of mitomycin C RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 365 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 30 cm in length, packed with phenyl silica gel for liquid chromatography (10 μm in particle diameter).

Column temperature: A constant temperature of about 25 ℃.

Mobile phase: Add 5 mL of diluted acetic acid(100) (1 in 20) to 40 mL of 0.5 mol/L ammonium acetate TS, and then add water to make 1000 mL. Add 200 mL of methanol to 600 mL of this solution.

Flow rate: Adjust the flow rate so that the retention time of mitomycin C is about 7 minutes.

System suitability

System performance: Dissolve about 25 mg of mitomycin C RS and 0.375 g of 3-ethoxy-4-hydroxybenzaldehyde in 50 mL of *N*,*N*-dimethylacetamide. Proceed with 10 μL of this solution according to the above conditions; mitomycin C and 3-ethoxy-4-hydroxybenzaldehyde are eluted in this order with the resolution of the two peaks being NLT 5.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solutions according to the above conditions; the relative standard deviation of the peak area of mitomycin C is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Mitomycin C for Injection
주사용 미토마이신C

Mitomycin C for Injection is an injection to be dissolved before use, and contains NLT 90.0% and NMT 110.0% of the labeled amount of mitomycin C. ($C_{15}H_{18}N_4O_5$: 334.33).

Method of preparation Prepare as directed under Injections, with Mitomycin C.

Description Mitomycin C for Injection occurs as a bluish purple powder.

Identification Weigh an amount equivalent to 2 mg (potency) of mitomycin C according to the labeled amount of Mitomycin C for Injection, and dissolve in 200 mL of water. Determine the absorption spectra of this solution as directed under the Ultraviolet-visible Spectroscopy; it exhibits maxima between 216 and 220 nm and between 362 and 366 nm.

pH Take exactly an amount of Mitomycin C for Injection, equivalent to 0.25 g (potency) of mitomycin C, and dissolve in 20 mL of water; the pH of the solution is 5.5 to 8.5.

Loss on drying NMT 1.0% (0.4 g, in vacuum, NMT 0.67 kPa, phosphorus pentoxide, 60 °C, 3 hours).

Sterility Meets the requirements.

Bacterial endotoxins Less than 10 EU per mg (potency) of mitomycin C.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Uniformity of dosage units It meets the requirements when the Content uniformity test is performed according to the following procedure. Add exactly *V* mL of *N*,*N*-dimethylacetamide to 1 unit of Mitomycin C for Injection to contain about 0.5 mg (potency) of mitomycin C per mL, shake well to mix, centrifuge, and use the clear supernatant as the test solution. Separately, weigh accurately an amount equivalent to about 25 mg (potency) of mitomycin C RS, add *N*,*N*-dimethylacetamide to make ex-

actly 50 mL, and use this solution as the standard solution. Perform the test as directed in under the Assay of Mitomycin C as follows.

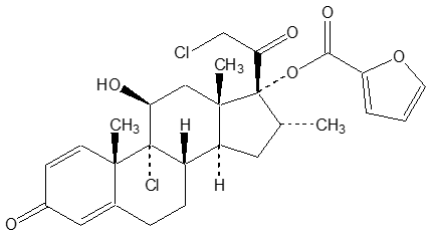
$$\text{Potency (mg) of mitomycin C } (C_{15}H_{18}N_4O_5) = \text{Potency (mg) of mitomycin C RS} \times \frac{A_T}{A_S} \times \frac{V}{50}$$

Assay Perform the test as directed under the Assay of Mitomycin C. However, take NLT 10 units of Mitomycin C for Injection, weigh accurately the mass of the contents; weigh accurately an amount equivalent to about 10 mg (potency) according to the labeled potency of Mitomycin C for Injection, and add exactly 20 mL of *N*,*N*-dimethylacetamide, shake well to mix, centrifuge, and use the clear supernatant as the test solution. Separately, weigh accurately an amount equivalent to about 25 mg (potency) of mitomycin C RS, dissolve in *N*,*N*-dimethylacetamide to make exactly 50 mL, and use this solution as the standard solution.

$$\text{Potency (mg) of mitomycin C } (C_{15}H_{18}N_4O_5) = \text{Potency (mg) of mitomycin C RS} \times \frac{A_T}{A_S} \times \frac{2}{5}$$

Packaging and storage Preserve in hermetic containers.

Mometasone Furoate
모메타손푸로에이트



$C_{27}H_{30}Cl_2O_6$: 521.43

(8*S*,9*R*,10*S*,11*S*,13*S*,14*S*,16*R*,17*R*)-9-Chloro-17-(2-chloroacetyl)-11-hydroxy-10,13,16-trimethyl-3-oxo-6,7,8,9,10,11,12,13,14,15,16,17-dodecahydro-3*H*-cyclopenta[a]phenanthren-17-yl furan-2-carboxylate [*83919-23-7*]

Mometasone Furoate contains NLT 97.0% and NMT 102.0% of mometasone furoate ($C_{27}H_{30}Cl_2O_6$), calculated on the dried basis.

Description Mometasone Furoate occurs as a white powder.
It is freely soluble in acetone or dichloromethane, slightly soluble in ethanol(95) and practically insoluble in water.

Identification (1) Determine the infrared spectra of Mometasone Furoate and mometasone furoate RS as directed in the paste method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) Proceed as directed under the Assay; the retention time of the major peak obtained from the test solution corresponds to that from the standard solution.

Optical rotation $[\alpha]_D^{25}$: Between +50° and +55° (50 mg, previously dried, ethanol(95), 10 mL, 100 mm).

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Mometasone Furoate according to Method 2 and perform the test. Prepare the control solution with 3.0 mL of lead standard solution (NMT 30 ppm).

(2) ***Related substances***—Weigh accurately 0.10 g of Mometasone Furoate, dissolve in dichloromethane to make exactly 10 mL, and use this solution as the test solution. Separately, weigh accurately 0.1 g of mometasone furoate RS and dissolve in dichloromethane to make exactly 10 mL. Dilute portions of this solution with dichloromethane to obtain solutions having known concentrations of 0.5, 0.2, 0.1, 0.02 and 0.01 mg of mometasone furoate per mL, and use these solutions as the standard solutions of (1), (2), (3), (4) and (5), respectively. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 40 μL each of the test solution and the standard solutions of (1), (2), (3), (4) and (5) on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate using a mixture of chloroform and ethyl acetate (3 : 1) (as the developing solvent) to a distance of about 15 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot obtained from the test solution are not more intense than the principal spot obtained from the standard solution (3) (NMT 0.1%), and the sum of the intensities of the spots other than the principal spot obtained from the test solution is NMT 2.0%.

Loss on drying NMT 0.5% (1 g, 105 ℃, 3 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 50 mg each of Mometasone Furoate and mometasone furoate RS and dissolve each in ethanol(95) to make exactly 50 mL. Pipet 5.0 mL each of these solutions and add a mixture of methanol, water and acetic acid(31) (65 : 35 : 0.2) to make exactly 50 mL. Pipet 10 mL each of these solutions and 10 mL of the internal standard solution into a 50 mL-volumetric flask, add a mixture of methanol, water and acetic acid(31) (65 : 35 : 0.2) to make exactly 50 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the peak area ratios, Q_T and Q_S, of mometasone furoate to the internal standard, respectively.

$$\text{Amount (mg) of mometasone furoate } (C_{27}H_{30}Cl_2O_6) = \text{Amount (mg) of mometasone furoate RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—Weigh 40 mg of beclomethasone dipropionate and dissolve in a mixture of methanol, water and acetic acid(31) (65 : 35 : 0.2) to make 100 mL.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of methanol and water (65 : 35).

Flow rate: 1.7 mL/min

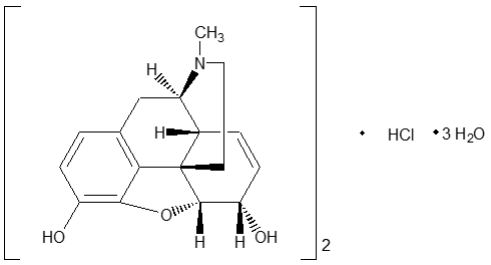
System suitability

System performance: Proceed with 20 μL of the standard solution according to the above conditions; the relative retention times are about 1.6 for beclomethasone dipropionate and 1.0 for mometasone furoate with the resolution between these peaks being NLT 4.0, and the symmetry factor for the mometasone furoate peak is NMT 1.8.

System repeatability: Repeat the test 5 times with 20 μL each of the standard solution according to the above conditions; the relative standard deviation of the ratios of the peak area of mometasone furoate to that of the internal standard is NMT 2.0%.

Packaging and storage Preserve in well-closed containers.

Morphine Hydrochloride Hydrate
모르핀염산염수화물



Morphine Hydrochloride

$C_{17}H_{19}NO_3 \cdot HCl \cdot 3H_2O$: 375.84

(4*R*,4*aR*,7*S*,7*aR*,12*bS*)-3-Methyl-2,3,4,4a,7,7a-hexahydro-1*H*-4,12-methanobenzofuro[3,2-e]-isoquinoline-7,9-diol trihydrate hydrochloride [*6055-06-7*]

Morphine Hydrochloride Hydrate contains NLT 98.0% and NMT 102.0% of morphine hydrochloride ($C_{17}H_{19}NO_3 \cdot HCl$: 321.80), calculated on the anhydrous basis.

Description Morphine Hydrochloride Hydrate occurs as white crystals or a crystalline powder.

It is freely soluble in formic acid, soluble in water, sparingly soluble in methanol, and slightly soluble in ethanol(95).

It gradually turns yellowish brown by light.

Identification (1) Determine the absorption spectra of solutions of Morphine Hydrochloride Hydrate and morphine hydrochloride hydrate RS (1 in 10000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths. Also, determine the absorption spectra of solutions of Morphine Hydrochloride Hydrate and morphine hydrochloride hydrate RS in dilute sodium hydroxide TS (1 in 10000); both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Morphine Hydrochloride Hydrate and morphine hydrochloride hydrate RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) The aqueous solution of Morphine Hydrochloride Hydrate (1 in 50) responds to the Qualitative Analysis (2) for chloride.

Optical rotation $[\alpha]_D^{20}$: Between –111° and –116° (0.5 g, calculated on the anhydrous basis, water, 25 mL, 100 mm).

pH Dissolve 0.1 g of Morphine Hydrochloride Hydrate in water; the pH of this solution is between 4.0 and 6.0.

Purity (1) ***Clarity and color of solution***—Dissolve 0.40 g of Morphine Hydrochloride Hydrate in 10 mL of water; the resulting solution is clear. Perform the test with this solution as directed under the Ultraviolet-visible Spectroscopy; the absorbance at 420 nm is NMT 0.12.

(2) ***Sulfate***—Dissolve 0.20 g of Morphine Hydrochloride Hydrate in 5 mL of water and add 2 to 3 drops of barium chloride TS; the solution has no turbidity.

(3) ***Meconic acid***—Dissolve 0.20 g of Morphine Hydrochloride Hydrate in 5 mL of water, add 5 mL of dilute hydrochloric acid, and 2 drops of iron(III) chloride TS; the resulting solution does not exhibit a red color.

(4) ***Related substances***—Dissolve 0.1 g of Morphine Hydrochloride Hydrate in 10 mL of diluted ethanol(99.5) (1 in 2) and use this solution as the test solution. Pipet 1 mL of this solution, add diluted ethanol(99.5) (1 in 2) to make exactly 200 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel (with a fluorescent indicator) for thin-layer chromatography. Next, develop the plate with a mixture of ethanol(99.5), toluene, acetone and ammonia water(28) (14 : 14 : 7 : 1) (as the developing solvent) to a distance of about 15 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot obtained from the test solution are not more intense than the spots from

the standard solution.

Water Between 13.0% and 15.0% (0.1 g, volumetric titration, direct titration).

Residue on ignition NMT 0.1% (0.5 g).

Assay Weigh accurately about 0.5 g of Morphine Hydrochloride Hydrate, dissolve in 3.0 mL of formic acid, add 100 mL of a mixture of acetic anhydride and acetic acid(100) (7 : 3), mix, and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 32.180 mg of $C_{17}H_{19}NO_3 \cdot HCl$

Packaging and storage Preserve in light-resistant, tight containers.

Morphine Hydrochloride Injection
모르핀염산염 주사액

Morphine Hydrochloride Injection is an aqueous solution for injection. Morphine Hydrochloride Injection contains NLT 93.0% and NMT 107.0% of the labeled amount of morphine hydrochloride hydrate ($C_{17}H_{19}NO_3 \cdot HCl \cdot 3H_2O$: 375.84).

Method of preparation Prepare as directed under Injections, with Morphine Hydrochloride Hydrate.

Description Morphine Hydrochloride Injection occurs as a colorless to pale yellowish brown and clear liquid.
It gradually turns yellowish brown by light.
pH—Between 2.5 and 5.0.

Identification According to the labeled amount of Morphine Hydrochloride Injection, take an amount equivalent to 40 mg of Morphine Hydrochloride Hydrate, add water to make 20 mL, and use this solution as the test solution. Add water to 5 mL of the test solution to make 100 mL and determine the absorption spectrum as directed under Ultraviolet-visible Spectrophotometry: it exhibits a maximum between 283 nm and 287 nm. Add dilute sodium hydroxide TS to 5 mL of the test solution to make 100 mL and determine the absorption spectrum: it exhibits a maximum between 296 nm and 300 nm.

Sterility Meets the requirements.

Bacterial endotoxins Less than 1.5 EU per mg of morphine hydrochloride.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements

Extractable volume of injections Meets the requirements.

Assay Take exactly an amount of Morphine Hydrochloride Injection equivalent to about 20 mg of morphine hydrochloride hydrate ($C_{17}H_{19}NO_3 \cdot HCl \cdot 3H_2O$) according to the labeled amount, add the mobile phase to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 20 mg of morphine hydrochloride hydrate RS, dissolve in the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 25 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of the test solution and the standard solution, respectively.

Amount (mg) of morphine hydrochloride hydrate ($C_{17}H_{19}NO_3 \cdot HCl \cdot 3H_2O$)
= Amount (mg) of morphine hydrochloride hydrate RS $\times \frac{A_T}{A_S}$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 284 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: Dissolve 0.73 g of sodium 1-heptanesulfonate in 720 mL of water, add 280 mL of methanol and 10 mL of acetic acid(100), mix, and filter.

Flow rate: 1.5 mL/min

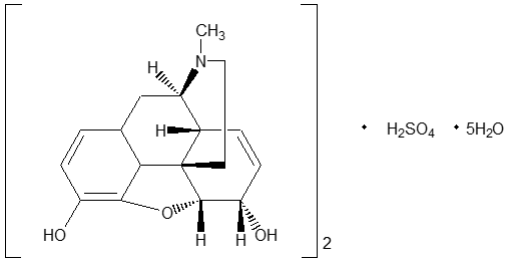
System suitability

System performance: Proceed with 25 μL of the standard solution under the above operating conditions; the symmetry factor is NMT 2.0.

System repeatability: Repeat the test 6 times according to the above conditions with 25 μL each of the standard solution; the relative standard deviation of the peak area is NMT 2.0%.

Packaging and storage Preserve in light-resistant, hermetic containers.

Morphine Sulfate Hydrate
모르핀황산염수화물



Morphine Sulfate $(C_{17}H_{19}NO_3)_2 \cdot H_2SO_4 \cdot 5H_2O$: 758.83
(4*R*,4*aR*,7*S*,7*aR*,12*bS*)-3-Methyl-2,3,4,4a,7,7a-hexahydro-1*H*-4,12-methanobenzofuro[3,2-e]-isoquinoline-7,9-diol pentahydrate sulfuric acid [*6211 -15 -0*]

Morphine Sulfate Hydrate contains NLT 98.0% and NMT 102.0% of morphine sulfate [$(C_{17}H_{19}NO_3)_2 \cdot H_2SO_4$: 668.75], calculated on the anhydrous basis.

Description Morphine Sulfate Hydrate occurs as white lustrous crystals like hair or silk, columnar crystals, or a white crystalline powder. It is odorless and gradually loses its water of crystallization when left in the air.
It is freely soluble in hot water, soluble in water, sparingly soluble in ethanol(95) or warmed ethanol and practically insoluble in chloroform or ether.
It turns dark by light.

Identification (1) Take 1 mg of Morphine Sulfate Hydrate in a porcelain crucible or a watch glass, add 0.5 mL of sulfuric acid containing 1 drop of formaldehyde solution TS per mL of sulfuric acid; the resulting solution exhibits a deep violet color at once, which quickly changes to a deep bluish purple color (distinction from codeine, which turns deep purplish blue right away, and from hydromorphone, which turns at first yellowish brown, changing to reddish purple, and then to purple).

(2) Dissolve 5 mg of Morphine Sulfate Hydrate in 5 mL of sulfuric acid, add 1 drop of iron(III) chloride TS, mix, and heat in boiling water for 2 minutes; the resulting solution exhibits a blue color. Thereto, add 1 drop of nitric acid; the solution turns dark reddish brown (codeine and ethylmorphine give the same color reactions, while hydromorphone and papaverine do not produce the same color reactions).

(3) Determine the infrared spectra of Morphine Sulfate Hydrate and morphine sulfate hydrate RS, previously dried 1 hour at 145 ℃, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit maxima at the same wavenumbers.

(4) The aqueous solution of Morphine Sulfate Hydrate (1 in 50) responds to the Qualitative Analysis for sulfate.

Optical rotation $[\alpha]_D^{25}$: Between –107° and –109.5° (0.2 g, calculated on the anhydrous basis, water, 10 mL, 100 mm).

Purity (1) ***Acid***—Dissolve 0.5 g of Morphine Sulfate Hydrate in 15 mL of water, add 1 drop of methyl red TS, and titrate with 0.02 mol/L sodium hydroxide VS until a yellow color appears; the volume consumed is NMT 0.50 mL.

(2) ***Chloride***—Add 1 mL of 2 mol/L nitric acid TS or 1 mL of silver nitrate TS to 10 mL of the aqueous solution (1 in 100) of Morphine Sulfate Hydrate; no precipitate or turbidity is formed immediately.

(3) ***Ammonium salt***—Transfer 0.2 g of Morphine Sulfate Hydrate in 5 mL of 1 mol/L sodium hydroxide TS and heat on a steam bath for 1 minute; no odor of ammonia is perceptible.

(4) ***Related substances***—Transfer 1.0 g of Morphine Sulfate Hydrate into a separatory funnel containing 10 mL of 1 mol/L sodium hydroxide TS, shake well with three successive portions of 15 mL, 10 mL and 10 mL of chloroform for extraction, and filter the chloroform layer through a filter paper previously moistened with chloroform. Add 5 mL of water to this chloroform extract, shake to mix, and evaporate the chloroform layer to dryness on a steam bath. To the residue, add 10.0 mL of 0.01 mol/L sulfuric acid and heat gently until it is dissolved. After cooling, add 2 drops of methyl red TS and titrate excess acid with 0.02 mol/L sodium hydroxide VS; the volume consumed is NLT 7.5 mL (1.5%).

Water Between 10.4% and 13.4% (0.2 g, volumetric titration, direct titration).

Residue on ignition NMT 0.1% (0.5 g).

Assay Weigh accurately about 24 mg of Morphine Sulfate Hydrate, dissolve in the mobile phase to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately a suitable amount of morphine sulfate hydrate RS (measure the water content in advance), dissolve in the mobile phase to obtain a solution having a known concentration of 0.24 mg of anhydrous morphine sulfate per mL, and use this solution as the standard solution. Prepare the standard solution immediately before use. Perform the test with 25 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions and determine the peak areas, A_T and A_S, of morphine sulfate for the test solution and the standard solution, respectively.

$$\text{Amount (mg) of morphine sulfate } [(C_{17}H_{19}NO_3)_2 \cdot H_2SO_4] = 100 \times C \times \frac{A_T}{A_S}$$

C: Concentration (mg/mL) of anhydrous morphine sulfate in the standard solution

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 284 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 30 cm in length, packed with

octadecylsilanized silica gel for liquid chromatography (3 μm to 10 μm in particle diameter).

Mobile phase: Dissolve 0.73 g of sodium 1-heptanesulfonate in 720 mL of water, add 280 mL of methanol and 10 mL of acetic acid(100), mix, and filter.

Flow rate: 1.5 mL/min

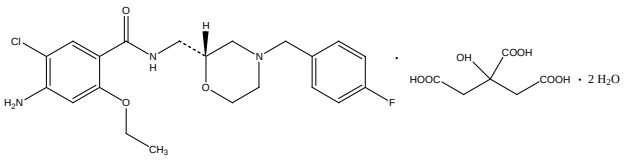
System suitability

System performance: Proceed with 25 μL of the standard solution according to the above conditions; the symmetry factor is NMT 2.0.

System repeatability: Repeat the test 6 times with 25 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak areas is NMT 2.0%.

Packaging and storage Preserve in light-resistant, tight containers.

Mosapride Citrate Hydrate
모사프리드시트르산염수화물



and enantiomer

$C_{21}H_{25}ClFN_3O_3 \cdot C_6H_8O_7 \cdot 2H_2O$: 650.05

4-Amino-5-chloro-2-ethoxy-*N*-{[(2*RS*)-4-(4-fluorobenzyl)morpholin-2-yl]methyl}-benzamide monocitrate dihydrate [*636582-62-2*]

Mosapride Citrate Hydrate contains NLT 98.5% and NMT 101.0% of mosapride citrate ($C_{21}H_{25}ClFN_3O_3 \cdot C_6H_8O_7$: 614.02), calculated on the anhydrous basis.

Description Mosapride Citrate Hydrate occurs as a white to yellowish white crystalline powder.

It is freely soluble in *N*,*N*-dimethylformamide or acetic acid(100), sparingly soluble in methanol, slightly soluble in ethanol(99.5) and practically insoluble in water.

A solution of Mosapride Citrate Hydrate in *N*,*N*-dimethylformamide (1 in 20) shows no optical rotation.

Identification (1) Determine the absorption spectra of solutions of Mosapride Citrate Hydrate and mosapride citrate hydrate RS in methanol (1 in 50000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Mosapride Citrate Hydrate and mosapride citrate hydrate RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) A solution of Morphine Hydrochloride Hydrate in *N*,*N*-dimethylformamide (1 in 10) responds to the Qualitative Analysis (1) for citrate.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Mosapride Citrate Hydrate in a platinum crucible according to Method 4 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Related substances***—Dissolve 0.10 g of Mosapride Citrate Hydrate in 50 mL of methanol and use this solution as the test solution. Pipet 1 mL of this solution and add methanol to make exactly 50 mL. Pipet 1 mL of this solution, add methanol to make exactly 20 mL, and use this solution as the standard solution. Perform the test with 5 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine each peak area from each solution by the automatic integration method; the peak area of the relative retention time of about 0.47 for mosapride in the test solution is not greater than 3 times the peak area of mosapride in the standard solution, and each peak area other than that of mosapride and mentioned above is not greater than the peak area of mosapride in the standard solution. Also, the total peak areas other than that of mosapride in the test solution is not greater than 5 times the peak area of mosapride in the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 274 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: Use mobile phases A and B to control a step or gradient elution as follows.

Mobile phase A: Dissolve 8.82 g of trisodium citrate dihydrate in 800 mL of water, adjust the pH to 4.0 with dilute hydrochloric acid, and add water to make 1000 mL.

Mobile phase B: Acetonitrile

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 - 35	80 → 45	20 → 55

Flow rate: 1.0 mL/min

System suitability

Test for required detectability: Pipet 4 mL of the standard solution and add methanol to make exactly 20 mL. Confirm that the peak area of mosapride obtained from 5 μL of this solution is equivalent to 15% to 25% of the peak area of mosapride from the standard solution.

System performance: Proceed with 5 μL of the standard solution according to the above conditions; the number of theoretical plates and the symmetry factor of the peak of mosapride are NLT 40000 and NMT 1.5, respectively.

System repeatability: Repeat the test 6 times with 5 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area of mosapride is NMT 5.0%.

Time span of measurement: For 35 minutes beginning after the solvent peak.

Water Between 5.0% and 6.5% (0.5 g, volumetric titration, back titration).

Residue on ignition NMT 0.1% (1 g, platinum crucible).

Assay Weigh accurately about 0.5 g of Mosapride Citrate Hydrate, dissolve it in 70 mL of acetic acid(100), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 61.40 mg of $C_{21}H_{25}ClFN_3O_3 \cdot C_6H_8O_7$

Packaging and storage Preserve in well-closed containers.

Mosapride Citrate Tablets
모사프리드시트르산염 정

Mosapride Citrate Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of mosapride citrate ($C_{21}H_{25}ClFN_3O_3 \cdot C_6H_8O_7$: 614.02).

Method of preparation Prepare as directed under Tablets, with Mosapride Citrate Hydrate.

Identification (1) Weigh an amount of powdered Mosapride Citrate Tablets, equivalent to 10 mg of mosapride citrate ($C_{21}H_{25}ClFN_3O_3 \cdot C_6H_8O_7$) according to the labeled amount, and add 10 mL of dilute acetic acid, shake to mix for 10 minutes, and filter. To 5 mL of the filtrate, add 0.3 mL of Dragendorff's TS; orange precipitates are formed.

(2) Determine the absorption spectrum of the test solution obtained from the Assay as directed under the Ultraviolet-visible Spectroscopy; it exhibits maxima at wavelengths of 271 nm to 275 nm and 306 nm to 310 nm.

Purity ***Related substances*—**Powder NLT 20 tablets of Mosapride Citrate Tablets. Weigh an amount of this powder, equivalent to 10 mg of mosapride citrate ($C_{21}H_{25}ClFN_3O_3 \cdot C_6H_8O_7$) according to the labeled amount, wet with 1 mL of water. Add 9 mL of methanol, shake to mix for 20 minutes, centrifuge, and use the clear supernatant as the test solution. Pipet 1 mL of this solution and add methanol to make exactly 20 mL. Take 2 mL of this solution, add methanol to make exactly 20 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine each peak area of each solution as directed in the automatic integration method; the peak area having the relative retention time of about 0.60 and 0.85 with respect to mosapride obtained from the test solution is not larger than the peak area of mosapride obtained from the standard solution, and the peak areas other than mosapride peak and the above mentioned peaks from the test solution are not larger than 2/5 of the peak area of mosapride from the standard solution. Also, the total area of the peaks other than the peak of mosapride obtained from the test solution is not larger than 2 times the peak area of mosapride from the standard solution.

Operating conditions

For the detector, column, column temperature, mobile phase A, mobile phase B and flow rate, proceed according to the operating conditions under the Purity (2) of Mosapride Citrate Hydrate.

Mobile phase: Control the mixing ratio of mobile phase A and mobile phase B stepwise or via the gradient elution as follows.

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 - 40	85 → 45	15 → 55

System suitability

Test for required detectability: Pipet 1 mL of the standard solution, and add methanol to make exactly 25 mL. Confirm that the peak area of mosapride obtained from 10 μL of this solution is equivalent to 3.0% to 5.0% of the peak area of mosapride from the standard solution.

System performance: Proceed with 10 μL of the standard solution according to the above conditions; the number of theoretical plates and the symmetry factor of the peak of mosapride are NLT 40000 plates and NMT 1.5, respectively.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution according to the above operating conditions; the relative standard deviation of the peak areas of mosapride is NMT 3.0%.

Time span of measurement: For 40 minutes beginning after the solvent peak.

Dissolution Perform the test with 1 tablet of Mosapride Citrate Tablets at 50 revolutions per minute according to Method 2 under the Dissolution, using 900 mL of Solution 2 as the dissolution medium. Take NLT 20 mL of the dissolved solution after 45 minutes from the start of the dissolution test, and filter through a membrane filter with a pore size of NMT 0.45 μm. Discard the first 10 mL of the filtrate, take exactly V mL of the subsequent filtrate, add the dissolution medium to make exactly V' mL so that the solution contains about 2.8 μg of mosapride citrate ($C_{21}H_{25}ClFN_3O_3 \cdot C_6H_8O_7$), according to the labeled amount, per mL, and use this solution as the test solution. Separately, weigh accurately about 30 mg of the mosapride citrate RS (previously determined the water content in the same manner as for Mosapride Citrate Hydrate),

and dissolve in the mobile phase to make exactly 100 mL. Pipet 2 mL of this solution, add the mobile phase to it make exactly 200 mL, and use this solution as the standard solution. Take exactly 50 μL each of the test solution and the standard solution, perform the test as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas A_T and A_S of mosapride for each solution. The dissolution rate of Mosapride Citrate Tablets for 45 minutes is NLT 80%.

$$\text{Dissolution rate (\%) for the labeled amount of mosapride citrate } (C_{21}H_{25}ClFN_3O_3\cdot C_6H_8O_7) = W_S \times \frac{A_T}{A_S} \times \frac{V'}{V} \times \frac{1}{C} \times 9$$

W_S: Amount (mg) of mosapride citrate RS, calculated on the anhydrous basis

C: Labeled amount (mg) of mosapride citrate ($C_{21}H_{25}ClFN_3O_3\cdot C_6H_8O_7$) per tablet

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 274 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: Dissolve 8.82 g of trisodium citrate dihydrate in 800 mL of water, adjust the pH to 3.3 with dilute hydrochloric acid, and add water to make 1000 mL. To 240 mL of this solution. add 90 mL of methanol and 70 mL of acetonitrile.

Flow rate: Adjust the flow rate so that the retention time of mosapride is about 9 minutes.

System suitability

System performance: Proceed with 50 μL of the standard solution according to the above conditions; the number of theoretical plates and the symmetry factor of the peak of mosapride are NLT 4000 plates and NMT 2.0, respectively.

System repeatability: Repeat the test 6 times with 50 μL each of the standard solution according to the above operating conditions; the relative standard deviation of the peak areas of mosapride is NMT 2.0%.

Uniformity of dosage units Meets the requirements.

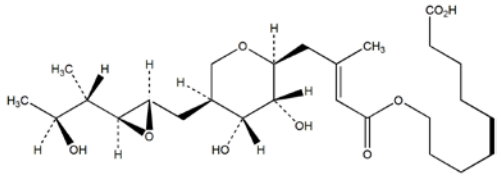
Assay Weigh exactly and powder NLT 20 tablets of Mosapride Citrate Tablets. Weigh accurately a portion of this powder, equivalent to about 10 mg of mosapride citrate ($C_{21}H_{25}ClFN_3O_3\cdot C_6H_8O_7$), and wet with 2 mL of water. Next, add 70 mL of methanol, shake to mix for 20 minutes, add methanol to make exactly 100 mL, and centrifuge. Pipet 10 mL of the clear supernatant, add methanol to make exactly 50 mL, and use this solution as the test solution. Separately, weigh accurately about 53 mg of mosapride citrate RS (previously determined the water content in the same manner as for Mosapride Citrate Tablets), dissolve in methanol to make exactly 100 mL. Pipet 2 mL of this solution, add methanol to make exactly 50 mL, and use this solution as the standard solution. Determine the absorbances of the test solution and the standard solution, A_T and A_S, at the wavelength of 273 nm as directed under the Ultraviolet-visible Spectroscopy.

$$\text{Amount (mg) of mosapride citrate } (C_{21}H_{25}ClFN_3O_3\cdot C_6H_8O_7) = W_S \times \frac{A_T}{A_S} \times \frac{1}{5}$$

W_S: Amount (mg) of mosapride citrate RS, calculated on the dried basis

Packaging and storage Preserve in tight containers.

Mupirocin
무피로신



$C_{26}H_{44}O_9$: 500.62

9-[(*E*)-4-[(2*S*,3*R*,4*R*,5*S*)-3,4-Dihydroxy-5-[[(2*S*,3*S*)-3-[(2*S*,3*S*)-3-hydroxybutan-2-yl]-oxiran-2-yl]methyl]oxan-2-yl]-3-methylbut-2-enoyl]oxynonanoic acid [*12650-69-0*]

Mupirocin is a compound prepared by culturing *Peudomonas fluorescens* and has an antibacterial activity. Mupirocin contains NLT 920 μg (potency) and NMT 1020 μg ($C_{26}H_{44}O_9$: 500.62), calculated on the anhydrous basis.

Description Mupirocin occurs as a white powder.
It is freely soluble in methanol, in ethanol(95), in acetone or in chloroform, slightly soluble in ether and very slightly soluble in water.

Identification Determine the infrared spectra of Mupirocin and mupirocin RS as directed in the paste method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

pH The pH of a saturated solution of Mupirocin is between 3.5 and 4.5.

Purity ***Total related substances***—Weigh accurately about 0.1 g of Mupirocin, dissolve in a mixture of 0.1 mol/L sodium acetate buffer (pH 4.0) and methanol (1 : 1), make exactly 10 mL, and use this solution as the test solution A. Then, pipet 5 mL of the test solution A, add the mixture of 0.1 mol/L sodium acetate buffer (pH 4.0)

and methanol (1 : 1) to make exactly 200 mL, and use this solution as the test solution B. Perform the test with 20 μL of the test solution B as directed under the Liquid Chromatography according to the following conditions and calculate the peak area of mupirocin. Separately, perform the test with 20 μL of the test solution A as directed under the Liquid Chromatography according to the following conditions and calculate the areas of peaks for each related substance other than the peak of the solvent. (NMT 8.0%)

$$\text{Total content (\%) of related substances} = \frac{A_2}{A_1 + A_2} \times 100$$

$$A_1: \frac{Peak\ area\ of\ mupirocin}{Amount\ (mg) of\ mupirocin\ in\ 1\ mL\ of\ test\ solution\ B}$$

$$A_2: \frac{Total\ area\ of\ peaks\ of\ related\ substances - total\ area\ of\ peak\ of\ solvent}{Amount\ (mg) of\ mupirocin\ in\ 1\ mL\ of\ test\ solution\ A}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 240 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (6 μm in particle diameter).

Mobile phase: A mixture of 0.1 mol/L ammonium acetate buffer solution (pH 5.7) and tetrahydrofuran (75 : 25).

Flow rate: 2.0 mL/min

Water NMT 1.0% (1.0 g, volumetric titration, direct titration).

Assay Weigh accurately about 11 mg (potency) each of Mupirocin and mupirocin lithium RS, dissolve each in 25 mL of acetonitrile, add phosphate buffer (pH 6.3) to make exactly 100 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions and determine the peak areas, A_T and A_S, of mupirocin from each solution.

$$\text{Potency (μg) of mupirocin } (C_{26}H_{44}O_9) = \text{Potency (μg) of mupirocin lithium RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 229 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (about 5 μm to 10 μm in particle diameter).

Mobile phase: A mixture of phosphate buffer (pH 6.3) and acetonitrile (3 : 1).

Flow rate: 2.0 mL/min

System suitability

System performance: Pipet 10 mL of the standard solution, adjust the pH to 2.0 with 6 mol/L hydrochloric acid, allow to stand for 2 hours, adjust the pH to 6.3 ± 0.2 with 5 mol/L sodium hydroxide, and use this solution as the system suitability solution. Proceed with this solution according to the above conditions; the relative retention times of the mupirocin acid hydrolysate and mupirocin are 0.7 and 1.0, respectively, with the resolution between these peaks being NLT 2.0. Proceed with the standard solution according to the above conditions; the number of theoretical plates and the symmetry factor of the peak of mupirocin are NLT 1500 and NMT 2.0, respectively.

System repeatability: Repeat the test 5 times with the standard solution according to the above conditions; the relative standard deviation of the mupirocin peak area is NMT 2.0%.

Phosphate buffer solution, pH 6.3—Adjust the pH of solution containing 0.05 mol/L sodium dihydrogen phosphate monohydrate to 6.3 ± 0.2 with 10 mol/L sodium hydroxide.

Packaging and storage Preserve in tight containers.

Mupirocin Ointment
무피로신 연고

Mupirocin Ointment contains NLT 90.0% and NMT 120.0% of the labeled amount of mupirocin ($C_{26}H_{44}O_9$: 500.62).

Method of preparation Prepare as directed under Ointments, with Mupirocin.

Identification Perform the test as directed under the Assay; the retention time of the major peak from the test solution is the same as that of the major peak from the standard solution in the obtained chromatogram.

Assay Perform the test according to the Assay under Mupirocin. However, weigh accurately an amount of Mupirocin Ointment, equivalent to about 10 mg (potency) according to the labeled potency, dissolve in 25 mL of acetonitrile, add phosphate buffer solution, pH 6.3, to make exactly 100 mL, and use this solution as the test solution.

Packaging and storage Preserve in tight containers.

Mupirocin Calcium Cream
무피로신칼슘 크림

Mupirocin Calcium Cream contains NLT 90.0% and NMT 120.0% of the labeled amount of mupirocin

($C_{26}H_{44}O_9$: 500.62).

Method of preparation Prepare as directed under Creams, with Mupirocin Calcium Hydrate.

Identification The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

pH Dissolve an amount of Mupirocin Calcium Cream, equivalent to 0.1 g (potency) of mupirocin, in 10 mL of water; the pH of this solution is between 6.0 and 8.0.

Purity ***Related substances*****—**Perform the test as directed under the Assay. However, weigh accurately an amount of Mupirocin Calcium Cream, equivalent to about 50 mg (potency), add 5 mL of tetrahydrofuran, and mix well. Add 5 mL of 0.1 mol/L sodium acetate TS, centrifuge, filter the lower layer, and use this filtrate as the test solution. If a preservative is included, prepare a standard solution of the preservative and determine the position of the preservative peak in the test solution (NMT 8.5%).

$$\text{Content (\%) of related substances} = \frac{A_R}{A_T} \times (100)$$

A_T: Sum of all peak areas other than the preservative peak from the test solution

A_R: Sum of peak areas of all related substances

Assay Weigh accurately an amount of Mupirocin Calcium Cream, equivalent to about 20 mg (potency) according to the labeled potency, dissolve in 75 mL of a mixture of 0.5 mol/L sodium phosphate buffer solution, pH 6.3, and tetrahydrofuran (2 : 1), add 0.5 mol/L phosphate buffer solution, pH 6.3, to make exactly 200 mL, and use this solution as the test solution. Separately, weigh accurately about 20 mg of mupirocin RS, dissolve in 75 mL of a mixture of 0.5 mol/L sodium phosphate buffer solution, pH 6.3, and tetrahydrofuran (2 : 1), add 0.5 mol/L phosphate buffer solution, pH 6.3, to make exactly 200 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions, and determine the peak areas, A_T and A_S of mupirocin.

$$\text{Potency (μg) of mupirocin } (C_{26}H_{44}O_9) = \text{Potency (μg) of mupirocin RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 240 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octylsilane silica gel for liquid chromatography (10 μm in particle diameter).

Flow rate: 1.0 mL/min

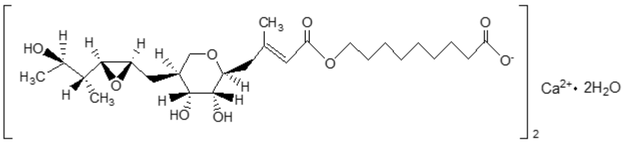
Mobile phase: Maintain for 10 minutes with solution A, then increase solution B concentration linearly to 100% in 35 minutes, and maintain solution B for 20 minutes.

Solution A: A mixture of 0.1 mol/L ammonium acetate buffer solution, pH 5.7, and tetrahydrofuran (3 : 1).

Solution B: A mixture of 0.1 mol/L ammonium acetate buffer solution, pH 5.7, and tetrahydrofuran (7 : 2).

Packaging and storage Preserve in tight containers.

Mupirocin Calcium Hydrate
무피로신칼슘수화물



$C_{52}H_{86}O_{18}Ca \cdot 2H_2O$: 1075.34

Calcium 9-[(*E*)-4-[(2*S*,3*R*,4*R*,5*S*)-3,4-dihydroxy-5-[[(2*S*,3*S*)-3-[(2*S*,3*S*)-3-hydroxybutan-2-yl]oxiran-2-yl]methyl]oxan-2-yl]-3-methylbut-2-enoyl]oxynonanoate dihydrate [*115074-43-6*]

Mupirocin Calcium Hydrate is the calcium salt of a compound prepared by culturing *Pseudomonas fluorescens*, which has an antibacterial activity.

Mupirocin Calcium Hydrate contains NLT 895 μg (potency) and NMT 970 μg (potency) per mg of mupirocin ($C_{26}H_{44}O_9$: 500.62), calculated on the anhydrous basis.

Description Mupirocin Calcium Hydrate occurs as a white powder and has a bitter taste.

It is freely soluble in methanol and slightly soluble in water or ethanol(95).

Identification (1) To 1 mL of a solution of Mupirocin Calcium Hydrate in methanol (1 in 200), add 4 mL of hydroxylamine perchlorate-ethanol (99.5) TS and 1 mL of *N*,*N'*-dicyclohexylcarbodiimide-ethanol (99.5) TS, shake well to mix, and allow to stand in lukewarm water for 20 minutes. After cooling, add 1 mL of iron(III) perchlorate-ethanol (99.5) TS and shake to mix; the resulting solution exhibits a deep violet color.

(2) Determine the absorption spectrum of a solution of Mupirocin Calcium Hydrate (1 in 50000) as directed under the Ultraviolet-visible Spectroscopy; it exhibits maxima between 219 nm and 224 nm.

(3) Determine the absorption spectrum of Mupirocin Calcium Hydrate as directed in the paste method under the Mid-infrared Spectroscopy; it exhibits absorption at the wavenumbers about 1708 cm^{-1}, 1648 cm^{-1}, 1558 cm^{-1}, 1231 cm^{-1}, 1151 cm^{-1} and 894 cm^{-1}.

(4) A solution of Mupirocin Calcium Hydrate (3 in

1000) responds to the Qualitative Analysis (3) for calcium salt.

Optical rotation $[\alpha]_D^{20}$: Between -16° and -20° (1 g, calculated on the anhydrous basis, methanol, 20 mL, 100 mm).

Purity (1) ***Chloride***—Weigh accurately about 50 mg of Mupirocin Calcium Hydrate, dissolve in a mixture of 1 mL of 2 mol/L nitric acid and 15 mL of methanol, use this solution as the test solution, and perform the test. Prepare the control solution by adding a mixture of 1 mL of 2 mol/L nitric acid and 15 mL of methanol to 0.7 mL of 0.02 mol/L hydrochloric acid (NMT 0.5%).

(2) ***Related substances***—Dissolve about 50 mg of Mupirocin Calcium Hydrate in a mixture of 0.1 mol/L acetic acid-sodium acetate buffer (pH 4.0) and tetrahydrofuran solution (3 in 4) (1 : 1) to make 10 mL and use this solution as the test solution (1). Pipet 2 mL of this solution, add a mixture of 0.1 mol/L acetic acid-sodium acetate buffer (pH 4.0) and tetrahydrofuran solution (3 in 4) (1 : 1) to make exactly 100 mL and use this solution as the test solution (2). Preserve these test solutions at a temperature between 4 and 8 °C. Perform the test with exactly 20 μL each of the test solutions (1) and (2) as directed under the Liquid Chromatography according to the following conditions. Determine the areas of each peak obtained from the test solutions (1) and (2) by the automatic integration method; the amount of the principal related substance having a relative retention time of about 0.7 with respect to mupirocin is NMT 4.0%, and the total amount of related substances other than the solvent and mupirocin is NMT 6.0%.

$$\text{Content (\%) of the principal related substance} = \frac{A_\mathrm{i}}{A + A_\mathrm{m}} \times 100 \times \frac{\mathrm{P} \times 100}{100 - \dfrac{A \times 100}{A + A_\mathrm{m}}}$$

$$\text{Total content (\%) of related substances} = \frac{A}{A + A_\mathrm{m}} \times 100 \times \frac{\mathrm{P} \times 100}{100 - \dfrac{A \times 100}{A + A_\mathrm{m}}}$$

A: Total area of peaks other than the peaks for the solvent and mupirocin obtained from the test solution (1)

A_i: Area of the peak having the relative retention time of about 0.7 with respect to mupirocin obtained from the test solution (1)

A_m: A value obtained by multiplying the peak area of mupirocin obtained from the test solution (2) by 50

P: Potency of mupirocin ($C_{26}H_{44}O_9$) per mg of Mupirocin Calcium Hydrate, obtained as directed under the Assay

Operating conditions

Detector, column, column temperature, mobile phase and flow rate: Proceed as directed under the operating conditions under the Assay.

System suitability

System performance: Proceed as directed under the system suitability under the Assay.

Test for required detectability: Pipet 1 mL of the test solution (2) and add a mixture of 0.1 mol/L acetic acid-sodium acetate buffer (pH 4.0) and tetrahydrofuran solution (3 in 4) (1 : 1) to make exactly 20 mL. Confirm that the peak area of mupirocin obtained from 20 μL of this solution is equivalent to 4% to 6% of the peak area of mupirocin obtained from 20 μL of the test solution (2).

System repeatability: Repeat the test 6 times with 20 μL each of the test solutions (2) according to the above conditions; the relative standard deviation of the peak areas of mupirocin is NMT 2.0%.

Time span of measurement: About 3 times the retention time of mupirocin beginning after the solvent peak.

0.1 mol/L acetic acid-sodium acetate buffer solution (pH 4.0)—Dissolve 13.61 g of sodium acetate trihydrate in about 750 mL of water, adjust the pH to 4.0 with acetic acid(100), and add water to make 1000 mL.

Water Between 3.0% and 4.5% (0.5 g, volumetric titration, direct titration).

Assay Weigh accurately about 20 mg (potency) each of Mupirocin and mupirocin lithium RS, dissolve each in a mixture of 0.1 mol/L acetic acid-sodium acetate buffer (pH 4.0) and tetrahydrofuran solution (3 in 4) (1 : 1) to make exactly 200 mL, and use these solutions as the test solution and the standard solution, respectively. Preserve these solutions at a temperature between 4 and 8 °C. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions and determine the peak areas, A_T and A_S, of mupirocin from each solution.

$$\text{Potency (μg) of mupirocin } (C_{26}H_{44}O_9) = \text{Potency (μg) of mupirocin lithium RS} \times \frac{A_\mathrm{T}}{A_\mathrm{S}}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 240 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase A: Dissolve 7.71 g of ammonium acetate in 750 mL of water, adjust the pH to 5.7 with acetic acid(100), and add water to make 1000 mL. To 300 mL of this solution, add 100 mL of tetrahydrofuran.

Flow rate: Adjust the flow rate so that the retention time of mupirocin is about 12.5 minutes.

System suitability

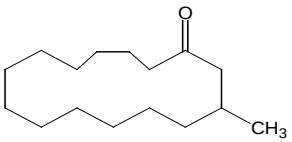
System performance: Dissolve about 20 mg of mupirocin lithium RS and about 5 mg of ethyl p-hydroxybenzoate in a mixture of 0.1 mol/L acetic acid-sodium acetate buffer (pH 4.0) and tetrahydrofuran solu-

tion (3 in 4) (1 : 1) to make 200 mL. Proceed with 20 μL of this solution according to the above conditions; mupirocin and ethyl p-hydroxybenzoate eluted in this order with the resolution between these peaks being NLT 12.

System repeatability: Repeat the test 6 times with 20 μL each of the standard solutions according to the above conditions; the relative standard deviation of the peak areas of mupirocin is NMT 1.0%.

Packaging and storage Preserve in tight containers.

l-Muscone
l-무스콘



$C_{16}H_{30}O$: 238.41

(3*R*)-3-Methyl-cyclopentadecanone, [*10403-00-6*]

l-Muscone contains NLT 98.0% of *l*-muscone ($C_{16}H_{30}O$).

Description *l*-Muscone occurs as a colorless to pale yellow oily liquid and has a slight characteristic odor.
It is very soluble in chloroform, in ether, in *n*-hexane or in ethanol(95) and very slightly soluble in water.

Identification (1) Determine the infrared spectrum of *l*-Muscone as directed under the liquid film method under the Mid-infrared Spectroscopy; it exhibits absorption at the wavenumbers of about 2928 cm^{-1}, 1713 cm^{-1}, 1460 cm^{-1} and 1368 cm^{-1}.

(2) The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

Optical rotation $[\alpha]_D^{20}$: Between -11° and -14° (110 mg, methanol, 10 mL, 100 mm).

Purity (1) ***Clarity and color of solution***—Dissolve 50 mg of *l*-Muscone in 10 mL of ethanol(95); the resulting solution is colorless to pale yellow and clear.

(2) ***Heavy metals***—Proceed with 1.0 g of *l*-Muscone according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Related substances***—Dissolve 50 mg of *l*-Muscone in 5 mL of ethanol(95) and use this solution as the test solution. Pipet 2 mL of this solution, add ethanol(95) to make exactly 100 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of petroleum ether and ether (19 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Spray evenly *p*-anisaldehyde-sulfuric acid TS on the dried plate and heat it at 110 ℃ for 5 minutes; the spots other than the principal spot obtained from the test solution are not more intense than the spots from the standard solution.

Assay Weigh accurately about 20 mg of *l*-Muscone, add 10.0 mL of the internal standard solution, dissolve in chloroform to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 20 mg of *l*-muscone RS, add 10.0 mL of the internal standard solution, dissolve in chloroform to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 3 μL each of the test solution and the standard solution as directed under the Gas Chromatography according to the following conditions, and calculate the peak area ratios, Q_T and Q_S, of *l*-muscone to that of the internal standard, respectively.

$$\text{Amount of } l\text{-muscone } (C_{16}H_{30}O) \text{ (mg)} = \text{Amount of } l\text{-muscone RS (mg)} \times (Q_T / Q_S)$$

Internal standard solution—A solution of cyclopentadecanone in chloroform (1 in 500).

Operating conditions

Detector: A hydrogen flame-ionization detector

Column: A fused silica column about 0.32 mm in internal diameter and about 30 m in length, coated inside with dimethylpolysiloxane for gas chromatography, 0.25 μm in thickness.

Column temperature: A constant temperature of about 180 °C.

Sample injection port temperature: 250 ℃

Detector temperature: 260 ℃

Carrier gas: Nitrogen

Flow rate: 1.0 mL/min

Split ratio: 10 : 1

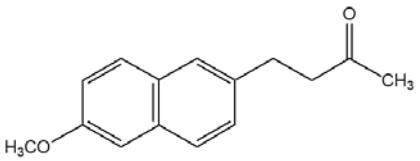
System suitability

System performance: Proceed with 3 μL of the standard solution according to the above conditions; the internal standard and *l*-muscone are eluted in this order with the resolution between these peaks being NLT 1.5.

System repeatability: Repeat the test 6 times with 3 μL each of the standard solution according to the above conditions; the relative standard deviation of the ratios of the peak area of *l*-muscone to that of the internal standard is NMT 1.0%.

Packaging and storage Preserve in light-resistant, tight containers.

Nabumetone
나부메톤



$C_{15}H_{16}O_2$: 228.29

4-(6-Methoxynaphthalen-2-yl)butan-2-one [*42924-53-8*]

Nabumetone contains NLT 98.0% and NMT 101.0% of nabumetone ($C_{15}H_{16}O_2$), calculated on the anhydrous basis.

Description Nabumetone occurs as white to pale yellow crystals or a crystalline powder.

It is freely soluble in acetone, sparingly soluble in methanol and ethanol(95) and practically insoluble in water.

Melting point—Between 79 and 84 ℃.

Identification (1) Determine the infrared spectra of Nabumetone and nabumetone RS, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Nabumetone as directed under Method 2 and perform the test. Prepare the control solution with 1.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Related substances***—Weigh accurately about 0.1 g of Nabumetone, dissolve in acetonitrile to make exactly 100 mL, and use this solution as the test solution. Perform the test with 10 μL of the test solution as directed under the Liquid Chromatography according to the following conditions, and calculate the amount of related substances; the related substances with the relative retention time of 2.7 is NMT 0.3%, the amount of the other individual related substances is NMT 0.1%, and the amount of the total related substances is NMT 0.8%.

$$\text{Amount of related substances (\%)} = 100FA_i/(A_N+\sum FA_i)$$

F: Relative correction factor (related substances with the relative retention time of 0.73 is 0.12, related substances with the relative retention time of 2.7 is 0.10, related substances with the relative retention time of 0.93 is 0.25, related substances with the relative retention time of 1.2 is 0.42, related substances with the relative retention time of 0.85 is 0.94, related substances with the relative retention time of 1.9 is 1.02, and related substances with the relative retention time of 2.6 is 0.91.)

A_i: Peak area of each related substance

A_N: Peak area of Nabumetone

Operating conditions

Follow the operating conditions in Assay for the detector, column, mobile phase and flow rate.

System suitability

System performance: Weigh each of Nabumetone RS and nabumetone related substance I RS, dissolve in acetonitrile, and dilute suitably to make the concentration of the solution of about 1 mg/mL and 1 μg/mL, respectively. Use this solution as the test solution for system suitability. Proceed with 10 μL of this solution according to the above conditions; the relative retention time of the peaks of nabumetone and related substances I are 1.0 and about 0.9, respectively, and the resolution between the two peaks is NLT 1.5.

System repeatability: Repeat the test 5 times with each 10 μL of the system suitability solution; the relative standard deviation of the peak area of nabumetone is NMT 2.0%.

Water NMT 0.2% (1 g, volumetric titration, direct titration).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.1 g of Nabumetone, dissolve in acetonitrile to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 0.1 g of nabumetone RS, dissolve in acetonitrile to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 10 μL of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the peak areas, A_T and A_S, of nabumetone.

$$\text{Amount of nabumetone } (C_{15}H_{16}O_2) \text{ (mg)} = \text{Amount of nabumetone RS (mg)} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (4 μm in particle diameter).

Mobile phase: Control the step or gradient elution by mixing the mobile phases A and B as directed under the following table.

Mobile phase A: A mixture of water and acetic acid(100) (999 : 1).

Mobile phase B: A mixture of acetonitrile and tetrahydrofuran (7 : 3).

Time (min)	Mobile Phase A (vol%)	Mobile Phase B (vol%)
0	60	40
0 - 12	60	40
12 - 28	60 → 20	40 → 80
28 - 29	20 → 60	80 → 40
29 - 30	60	40

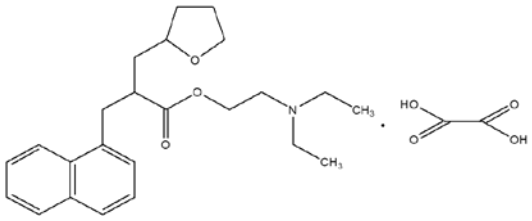
Flow rate: 1.3 mL/min

System suitability

System repeatability: Repeat the test 5 times according to the above conditions with 10 μL each of the standard solution; the relative standard deviation of the peak area of nabumetone is NMT 2.0%.

Packaging and storage Preserve in light-resistant, tight containers.

Nafronyl Oxalate
나프로닐옥살산염



$C_{24}H_{33}NO_3 \cdot C_2H_2O_4$: 473.56

Tetrahydro-α-(1-naphthylmethyl)-2-furanpropionic acid 2-(diethylamino)ethyl ester oxalate (1 : 1), [*3200-06-4*]

Nafronyl Oxalate, when dried, contains NLT 98.0% and NMT 100.5% of nafronyl oxalate ($C_{24}H_{33}NO_3 \cdot C_2H_2O_4$).

Description Nafronyl Oxalate occurs as a white crystalline powder, and it is odorless.

It is freely soluble in water, methanol and chloroform, sparingly soluble in acetone and practically insoluble in ether.

Melting point—Between 107 and 109 ℃.

Identification (1) Add calcium chloride TS to the aqueous solution of Nafronyl Oxalate; a white precipitate is produced and it is insoluble in acetic acid but soluble in hydrochloric acid. The oxalate dissolved in the hydrochloric acid bleaches potassium permanganate TS.

(2) Determine the infrared spectra of Nafronyl Oxalate and nafronyl oxalate RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Purity (1) ***Sulfate***—Proceed with about 10 g of Nafronyl Oxalate as directed under the Sulfate. Prepare the control solution with 0.4 mL of 0.005 mol/L sulfuric acid (NMT 0.002%).

(2) ***Heavy metals***—Weigh about 4 g of Nafronyl Oxalate, add 2 mL of 0.1 mol/L hydrochloric acid and 25 mL of water to make 25 mL, and perform the test according to Method 1. Prepare the control solution with 2.0 mL of lead standard solution (NMT 5 ppm).

(3) ***Arsenic***—Proceed with about 1.3 g of Nafronyl Oxalate after dissolving in 35 mL of water according to Method 1 and perform the test (NMT 1.5 ppm).

Loss on drying NMT 0.5% (1 g, 80 ℃, in vacuum, 5 hours).

Residue on ignition NMT 0.05% (4 g).

Assay Weigh accurately about 1 g of Nafronyl Oxalate, previously dried, dissolve in 50 mL of acetic acid(100) for non-aqueous titration, add 1 drop of methylrosaniline chloride TS, and titrate with 0.1 mol/L perchloric acid VS. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 47.35 mg of $C_{24}H_{33}NO_3 \cdot C_2H_2O_4$

Packaging and storage Preserve in tight containers.

Nafronyl Oxalate Capsules
나프로닐옥살산염 캡슐

Nafronyl Oxalate Capsules contains NLT 95.0% and NMT 105.0% of the labeled amount of nafronyl oxalate ($C_{24}H_{33}NO_3 \cdot C_2H_2O_4$: 473.56).

Method of preparation Prepare as directed under Capsules, with Nafronyl Oxalate.

Identification Weigh the amount equivalent to 0.1 g of nafronyl oxalate according to the labeled amount of Nafronyl Oxalate Capsules, dissolve in 10 mL of ethanol, and use this solution as the test solution. Weigh 0.1 g of nafronyl oxalate RS, dissolve in 10 mL of methanol, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot the test solution and the standard solution on a plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of 1-butanol, acetic acid(100) and water (50 : 25 : 10) as the developing solvent, and air-dry the plate. Spray Dragendorff's TS onto the plate; the R_f value and color from the spots of the test solution and the standard solution are the same.

Dissolution Perform the test with 1 capsule of Nafronyl Oxalate Capsules at 100 revolutions per minute according to Method 2 under the Dissolution, using 900 mL of the second solution as the dissolution solution. Take the dissolved solution 45 minutes after the start of the Dissolution and filter it. Discard the first 10 mL of the filtrate, take exactly *V mL* of the next filtrate, add the second solution in the Dissolution so that 1 mL contains about 100 μg of nafronyl oxalate according to the labeled amount to make exactly *V' mL*, and use this solution as the test solution. Separately, weigh accurately about 20 mg of nafronyl oxalate RS, dissolve in the second solution in the Dissolution to make 200 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test and standard solutions as directed under the Liq-

uid Chromatography according to the following conditions. Calculate the peak areas A_T and A_S of nafronyl oxalate ($C_{24}H_{33}NO_3$) for each solution. It is suitable when the dissolution rate of Nafronyl Oxalate Capsules in 45 minutes is NLT 80%.

$$\text{Dissolution rate for the labeled amount of Nafronyl Oxalate } (C_{24}H_{33}NO_2)\ (\%) = W_S \times \frac{V'}{V} \times \frac{A_T}{A_S} \times \frac{1}{C} \times 45$$

W_S: Amount (mg) of nafronyl oxalate RS

C: Labeled amount of nafronyl oxalate ($C_{24}H_{33}NO_3$) in 1 capsule (mg)

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 283 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with 5 μm of octadecylsilanized silica gel for liquid chromatography.

Column temperature: A constant temperature of about 30 °C.

Mobile phase: A mixture of Acetonitrile, tetrabutylammonium buffer (pH 7.0) and methanol (790 : 150 : 60).

Flow rate: 1.0 mL/min

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT about 20 Nafronyl Oxalate Capsules. Weigh accurately an amount, equivalent to about 20 mg of nafronyl oxalate ($C_{24}H_{33}NO_3 \cdot C_2H_2O_4$), transfer to a 100-mL volumetric flask, dissolve it by putting water, and add water to the gauge line. Filter it, and use the filtrate as the test solution. Separately, weigh accurately about 200 mg of nafronyl oxalate RS, dissolve in water to make exactly 100 mL. Take exactly 10 mL of the solution, add water to make 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography, and calculate the peak areas A_T and A_S from the test solution and the standard solution.

$$\text{Amount of Nafronyl Oxalate } (C_{24}H_{33}NO_3 \cdot C_2H_2O_4)\ (\text{mg}) = \text{Amount of nafronyl oxalate RS (mg)} \times \frac{A_T}{A_S} \times \frac{1}{10}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 283 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with 5 μm of octadecylsilanized silica gel for liquid chromatography.

Column temperature: A constant temperature of about 35 °C.

Mobile phase: A mixture of acetonitrile, tetrabutylammonium buffer (pH 7.0) and methanol (790 : 150 : 60).

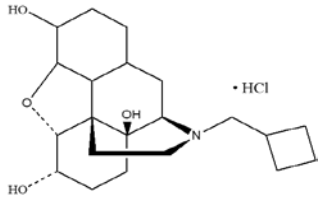
Flow rate: 1.0 mL/min

System suitability

System repeatability: Repeat the test 6 times with 10 μL of the standard solution according to the above conditions; the relative standard deviation of the peak area of nafronyl oxalate is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Nalbuphine Hydrochloride
날부핀염산염



$C_{21}H_{27}NO_4 \cdot HCl$: 393.90

(5α,6α)-17-(Cyclobutylmethyl)-4,5-epoxymorphinan-3,6,14-triol hydrochloride, [23277-43-2]

Nalbuphine Hydrochloride contains NLT 98.0% and NMT 102.0% of nalbuphine hydrochloride ($C_{21}H_{27}NO_4 \cdot HCl$: 393.90), calculated on the anhydrous basis.

Description Nalbuphine Hydrochloride occurs as a white powder.

Identification (1) Add iron(III) chloride TS to an aqueous solution of Nalbuphine Hydrochloride; the resulting solution exhibits a bluish purple color.

(2) Weigh about 0.1 g each of Nalbuphine Hydrochloride and nalbuphine hydrochloride RS, dissolve each in 5 mL of ethanol, and use these solutions as the test solution and the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 L each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for Thin-layer chromatography (fluorescent indicator added). Develop the plate with a mixture of saturated ammonia butanol and methanol (100 : 5) to a distance of about 15 cm, and air-dry the plate. Examine the plate under ultraviolet light(main wavelength 254 nm); the color and the R_f value of the spots obtained from the test solution and the standard solution are the same.

(3) Dissolve about 0.15 g of Nalbuphine Hydrochloride in 25 mL of water and transfer to a separatory funnel. Add 2 to 3 drops of ammonia TS and extract the precipitate 3 times with three 5 mL portions of chloroform. Filter the extract each time through a glass wool layer previously wet with chloroform, evaporate the filtrate to dryness, and dry at 105 ℃ for 1 hour. Dissolve 0.15 g of Nalbuphine Hydrochloride, previously dried, 0.15 g of nalbuphine hydrochloride RS in 5 mL of chloroform.

Determine the infrared spectra, using the chloroform layer as the control solution, as directed under the solution method under the Mid-infrared Spectroscopy; the spectra exhibit similar intensity of absorption at the same wavenumber as nalbuphine RS.

Melting point Dissolve about 0.15 g of Nalbuphine Hydrochloride in 25 mL of water, transfer to a separatory funnel, add 2 to 3 drops of ammonia TS, and extract the precipitate 3 times with 5 mL of chloroform each. Filter the extract each time through a glass wool layer previously wet with chloroform, evaporate the filtrate to dryness, dry at 105 ℃ for 1 hour, and determine the melting point; the melting point is between 227 and 232 ℃.

Purity (1) ***Clarity and color of solution***—Dissolve about 1.0 g of Nalbuphine Hydrochloride in 30 mL of water; the resulting solution is clear and the absorbance at 460 nm is NMT 0.1.

(2) ***Noroxymorphine hydrochloride and oxymorphine hydrochloride***—Dissolve about 0.1 g of Nalbuphine Hydrochloride in methanol to make 5 mL and use this solution as the test solution. Separately, dissolve noroxymorphine and oxymorphine RS in methanol to make the concentration 20 mg/100 mL each and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution onto a plate made of silica gel for thin-layer chromatography. Develop the plate with a mixture of saturated ammonia butanol and methanol (100 : 5) to a distance of about 15 cm in the darkroom, and air dry the plate. Spray a detecting agent on the plate; the spots other than the principal spot obtained from the test solution are not more intense than the spot from the standard solution (NMT 1.0%).

(3) ***Ketone***—Dissolve about 0.1 g of Nalbuphine Hydrochloride in 1 mL of low carbonyl methanol and use this solution as the test solution (1). Separately, transfer N,O-bis (cyclobutyl carbonyl) noroxymorphine into a 50-mL volumetric flask and add low carbonyl methanol to make the concentration 1.0 mg/mL (correspond to 1.0% of ketone content in the sample). With this solution, make the standard solution for calibration curve with the concentration in the following table.

Ketone content in the sample (%)	mL/pith of 1.0% standard solution	final volume mL	Factor
1.0	-	0	1.0
0.7	7.0	10.0	0.7
0.5	5.0	10.0	0.5
0.3	15.0	50.0	0.3
0.	5.0	50.0	0.1

Take 1 mL each of the test solution (1) and the standard solution for calibration curve, transfer to a 50-mL volumetric flask, add 1 mL of low carbonyl methanol 2,4-dinitrophenylhydrazine solution, saturated, TS and 1 drop of hydrochloric acid, and cover the 10-mL beaker. Heat on a steam bath at between 70 and 80 ℃ for 15 minutes and allow it to cool for 15 minutes. Add 4 mL of 20% potassium hydroxide solution and 4 mL of water, stir well, and add 80% low carbonyl methanol solution to the gauge line. Use this solution as the test solution and the standard solution. Separately, take 1 mL of low carbonyl methanol, proceed in the same manner as in preparation of the test solution, and use this solution as the blank test solution. With the test solution, the standard solution, and the blank test solution, perform the test using 1 cm cell and air as the control solution as directed under the Ultraviolet-visible Spectroscopy, and determine the absorbance at the wavelength of maximum between 360 nm and 680 nm. When determining with the standard solution, the test solution and the blank test solution, the times required for determining the absorbances after adding 20% sodium hydroxide solution should be same. Plot a calibration curve from the absorbance of the standard solution and determine the content of ketone in the sample (NMT 1.0%).

$$\text{Total ketone (\%) in standard solution} = \frac{\text{Amount (mg) of standard solution}}{50} \times \text{Factor of standard solution}$$

$$\text{Total ketone (\%) in sample} = \frac{\text{Ketone (\%) in calibration curve} \times 100}{\text{Amount of sample (mg)} \times \text{factor of solvent}}$$

If it is difficult to purchase low carbonyl methanol, prepare as follows. To 500 mL of methanol, add 5 g of 2,4-Dinitrophenylhydrazine and 2 to 3 drops of hydrochloric acid. Reflux for 2 hours, pass through a short vigreux column, and distill. It can be used between 2 and 3 months if stored in hermetic containers.

(4) ***Non-amine***—Put about 1 g of Nalbuphine Hydrochloride to a 125 mL separatory funnel, add 50 mL of 0.1 mol/L hydrochloric acid, and shake hard to mix until completely dissolved. Extract 3 times with 10 mL of chloroform each, filter the extract each time through a wool layer previously wet with chloroform, transfer the combined filtrate to a 50-mL volumetric flask, and add chloroform to make 50 mL. Use this solution as the control solution and determine the absorbance at around wavelength of 280 nm as directed under the Ultraviolet-visible Spectroscopy; the absorbance is NMT 0.80 (NMT 1%).

(5) ***β-nalbuphine hydrochloride***—Dissolve about 0.1 g of Nalbuphine Hydrochloride in methanol to make 10 mL and use this solution as the test solution. Separately, dissolve 50 mg of β-nalbuphine hydrochloride RS in methanol to make 50 mL and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution onto a plate made of silica gel for thin-layer chromatog-

raphy. Develop the plate with a mixture of acetone and trimethylamine (70 : 30) to a distance of about 15 cm in the darkroom and air dry the plate. Spray iron(III) chloride-potassium ferricyanide TS on the plate; the spots other than the principal spot obtained from the test solution is not more intense than the spot from the standard solution (NMT 10%).

Water NMT 5.0% (0.5 g, volumetric titration, direct titration).

Residue on ignition NMT 0.25% (1 g).

Assay Weigh accurately an amount of Nalbuphine Hydrochloride, equivalent to 10 mg of nalbuphine hydrochloride ($C_{21}H_{27}NO_4 \cdot HCl$) and add the mobile phase to make exactly 100 mL. Take 2.0 mL of this solution and add the mobile phase to make 10 mL and use this solution as the test solution. Separately, weigh accurately about 10 mg of nalbuphine hydrochloride RS and add the mobile phase to make exactly 100 mL. Take about 2.0 mL of this solution, add the mobile phase to make 10 mL, and use this solution as the standard solution. With 10 μL each of the test solution and the standard solution, perform the test as directed under the Liquid Chromatography, and determine nalbuphine hydrochloride peak areas A_T and A_S of each solution.

Amount of nalbuphine hydrochloride ($C_{21}H_{27}NO_4 \cdot HCl$)
= Amount (mg) of nalbuphine hydrochloride RS $\times \frac{A_T}{A_S}$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25cm in length, packed with cyano silyl silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 30 °C.

Mobile phase: Dissolve 6.80 g of potassium dihydrogen phosphate in 980 mL of water, adjust the pH to 2.5 by adding phosphoric acid, and add water to make 1000 mL. To 800 mL of this solution add 200 mL of methanol.

Flow rate: 1.0 mL/min

System suitability

System repeatability: Repeat the test 6 times with 10 μL of the test solution according to the above conditions; the relative standard deviation of peak areas of nalbuphine hydrochloric acid is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Nalbuphine Hydrochloride Injection
날부핀염산염 주사액

Nalbuphine Hydrochloride Injection contains NLT 95.0% and NMT 105.0% of the labeled amount of nalbuphine hydrochloride ($C_{21}H_{27}NO_4 \cdot HCl$: 393.90).

Method of preparation Prepare as directed under injections, with Nalbuphine Hydrochloride.

Identification Use Nalbuphine Hydrochloride Injection as the test solution. Separately, weigh 20 mg of nalbuphine hydrochloride RS, dissolve in 2 mL of water, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of heptane, tetrahydrofuran, ethanol and ammonia water (50 : 40 : 15 : 3) to a distance of about 15 cm and air-dry the plate. Examine under ultraviolet light (main wavelength 254 nm); the spots obtained from the test solution and the standard solution have the same color and the same R_f value.

pH Between 3.0 and 4.2.

Safety With 5 healthy and well-nourished white mice weighing about 20 g, inject intraperitoneally about 0.4 mL of Nalbuphine Hydrochloride Injection to each mouth, and observe; the mice do not die within 72 hours. If even 1 mouse dies within 72 hours after the injection, perform the test again with 10 white mice weighing between 19.5 g and 20.5 g; all the mice are alive within 72 hours.

Sterility Meets the requirements.

Pyrogen Meets the requirements. However, to 5 mL of Nalbuphine Hydrochloride Injection, add 75 mL of isotonic sodium chloride injection and about 1 mL of 1 mol/L sodium hydroxide solution to adjust the pH to 7.0, add isotonic sodium chloride injection to make 100 mL, and use the solution as the test solution. Inject the test solution to a rabbit by 5 mL per kg of the rabbit weight.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Extractable volume of injections Meets the requirements.

Assay Weigh accurately an amount of Nalbuphine Hydrochloride Injection, equivalent to 10 mg of nalbuphine hydrochloride ($C_{21}H_{27}NO_4 \cdot HCl$), and add the mobile phase to make exactly 100 mL. Take 2.0 mL of this solution, add the mobile phase to make 10 mL, and use this solution as the test solution Separately, weigh accurately 10 mg of nalbuphine hydrochloride RS and add the mobile phase to make exactly 100 mL. Take 2.0 mL of this

solution, add the mobile phase to make 10 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography, and determine the peak areas A_T and A_S of nalbuphine hydrochloride for each solution.

$$\text{Amount of nalbuphine hydrochloride } (C_{21}H_{27}NO_4 \cdot HCl) = \text{Amount (mg) of nalbuphine hydrochloride RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with cyano silyl silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 30 °C.

Mobile phase: Dissolve 6.80 g of potassium dihydrogen phosphate in 980 mL of water, adjust the pH to 2.5 by adding phosphoric acid, and add water to make 1000 mL. To 800 mL of this solution, add 200 mL of methanol.

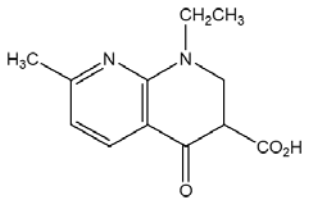
Flow rate: 1.0 mL/min

System suitability

System repeatability: Perform the test 6 times according to the above conditions with 10 μL of the test solution; the relative standard deviation of the peak areas of nalbuphine hydrochloride is NMT 1.0%.

Packaging and storage Preserve in well-closed containers.

Nalidixic Acid
날리딕스산



$C_{12}H_{12}N_2O_3$: 232.24

1-Ethyl-7-methyl-4-oxo-1,8-naphthyridine-3-carboxylic acid [*389-08-2*]

Nalidixic Acid, when dried, contains NLT 99.0% and NMT 101.0% of nalidixic acid ($C_{12}H_{12}N_2O_3$).

Description Nalidixic Acid occurs as white to pale yellow crystals or a crystalline powder.

It is sparingly soluble in *N,N*-Dimethylformamide, very slightly soluble in ethanol(99.5), and practically insoluble in water.

It is soluble in sodium hydroxide TS.

Identification (1) Determine the absorption spectra of Nalidixic Acid and 0.01 mol/L sodium hydroxide TS (1 in 200000) of nalidixic acid RS as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Nalidixic Acid and nalidixic acid RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Melting point Between 225 and 231 °C.

Purity (1) ***Chloride***—To 2.0 g of Nalidixic Acid add 50 mL of water, warm at 70 °C for 5 minutes, cool quickly, and filter. To 25 mL of the filtrate, add 6 mL of dilute nitric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 0.35 mL of 0.01 mol/L hydrochloric acid VS (NMT 0.012%).

(2) ***Heavy metals***—Proceed with 1.0 g of Nalidixic Acid according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Related substances***—Dissolve about 20 mg of Nalidixic Acid in 20 mL of 0.01 mol/L sodium hydroxide TS. Pipet 5 mL of this solution, add water to make exactly 10 mL, and use this solution as the test solution. Pipet 2 mL of the test solution, add water to make exactly 1000 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak area of each solution as directed in the automatic integration method; the peak area other than the peak of nalidixic acid from the test solution is not greater than the peak area of nalidixic acid from the standard solution. The total area of the peaks other than the peak of nalidixic acid from the test solution is not greater than 2.5 times the peak area of nalidixic acid from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 260 nm).

Column: A stainless steel column 4.6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: Dissolve 6.24 g of sodium dihydrogen phosphate dihydrate in 950 mL of water, adjust the pH to 2.8 using phosphoric acid, and add water to make 1000 mL. To 300 mL of this solution add 200 mL of methanol.

Flow rate: Adjust so the retention time of nalidixic acid is about 19 minutes.

System suitability

Test for required detectability: Pipet 5 mL of the

standard solution and add water to make exactly 10 mL. Confirm that the peak area of nalidixic acid from 10 μL of this solution is NLT 40% and NMT 60% of the peak area of nalidixic acid from the standard solution.

System performance: Dissolve 25 mg of methyl *p*-hydroxybenzoate in a mixture of water and methanol (1 : 1). To 1 mL of this solution, add water to make 10 mL. To 5 mL of this solution, add 5 mL of the standard solution. Proceed 10 μL of this solution according to the above conditions; methyl *p*-hydroxybenzoate and nalidixic acid are eluted in this order with the resolution being NLT 13.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area of nalidixic acid is NMT 2.0%.

Loss on drying NMT 0.2% (1 g, 105 ℃, 3 hours).

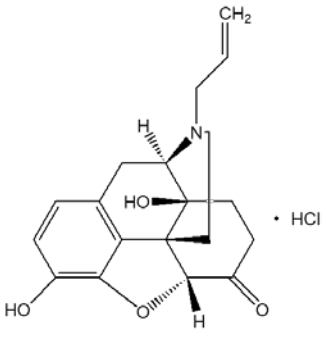
Residue on ignition NMT 0.2% (1 g).

Assay Weigh accurately about 0.3 g of Nalidixic Acid, previously dried, dissolve in 50 mL of *N*,*N*-Dimethylformamide, and titrate with 0.1 mol/L tetramethylammonium hydroxide VS (potentiometric titration under the Titrimetry). Separately, add 13 mL of a mixture of water and methanol (89 : 11) to 50 mL of *N*,*N*-Dimethylformamide, perform a blank test in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L tetramethylammonium hydroxide VS
= 23.22 mg of $C_{12}H_{12}N_2O_3$

Packaging and storage Preserve in tight containers.

Naloxone Hydrochloride
날록손염산염



$C_{19}H_{21}NO_4 \cdot HCl$: 363.84

(1*S*,5*R*,13*R*,17*S*)-10,17-Dihydroxy-4-(prop-2-en-1-yl)-12-oxa-4-azapentacyclo[9.6.1.01,13.05,17.07,18]octadeca-7(18),8,10-trien-14-one hydrochloride [*357-08-4*]

Naloxone Hydrochloride contains NLT 98.5% and NMT 101.0% of naloxone hydrochloride ($C_{19}H_{21}NO_4 \cdot HCl$), calculated on the dried basis.

Description Naloxone Hydrochloride occurs as white to yellow crystals or a crystalline powder.
It is freely soluble in water, soluble in methanol, slightly soluble in ethanol(99.5) and acetic acid(100), and very slightly soluble in acetic anhydride.
It is hygroscopic.
It is colored by light.

Identification (1) Determine the absorption spectra of Naloxone Hydrochloride and aqueous solution (1 in 10000) of naloxone hydrochloride RS as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Naloxone Hydrochloride and naloxone hydrochloride RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) An aqueous of Naloxone Hydrochloride (1 in 50) responds to the Qualitative Analysis (2) for chloride.

Optical rotation $[\alpha]_D^{25}$: Between -170° and -181° (0.25 g, calculated on the dried basis, water, 10 mL, 100 mm).

pH Dissolve 0.10 g of Naloxone Hydrochloride in 10 mL of newly boiled and cooled water; the pH of the solution is between 4.5 and 5.5.

Purity ***Related substances***—Perform the test as rapidly as possible without exposure to light, using a light-resistant container. Dissolve 80 mg of Naloxone Hydrochloride in 10 mL of methanol, and use this solution as the test solution. Pipet 1 mL of the test solution, add methanol to make exactly 200 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the plate made of silica gel for thin-layer chromatography. Develop the plate with a mixture of ammonia*1*-butanol and methanol (20 : 1) to a distance of about 12 cm, and air dry the plate. Spray evenly iron(III) chloride-potassium hexacyanoferrate(III) TS on the plate; the number of the spots other than the principal spot obtained from the test solution are NMT 1 and they are not more intense than the spots from the standard solution.

Ammonia1-butanol—To 100 mL of 1-butanol, add 60 mL of ammonia water (1 in 100), shake well to mix, and use *1*-butanol layer.

Loss on drying NMT 2.0% (0.1 g, 105 ℃, 5 hours, cool in a desiccator (phosphorus pentoxide)).

Residue on ignition NMT 0.2% (0.1 g).

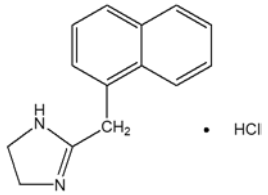
Assay Weigh accurately about 0.3 g of Naloxone Hydrochloride, and dissolve in 80 mL of acetic acid(100) by

warming. After cooling, add 80 mL of acetic anhydride, and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each 1 mL of 0.1 mol/L perchloric acid VS
= 36.384 mg of $C_{19}H_{21}NO_4 \cdot HCl$

Packaging and storage Preserve in light-resistant, tight containers.

Naphazoline Hydrochloride
나파졸린염산염



$C_{14}H_{14}N_2 \cdot HCl$: 246.74
2-(Naphthalen-1-ylmethyl)-4,5-dihydro-1*H*-imidazole hydrochloride [*550-99-2*]

Naphazoline Hydrochloride, when dried, contains NLT 98.5% and NMT 101.0% of naphazoline hydrochloride ($C_{14}H_{14}N_2 \cdot HCl$).

Description Naphazoline Hydrochloride occurs as a white crystalline powder. It is odorless and tastes bitter.
It is freely soluble in water, soluble in ethanol(95) and acetic acid(100), very slightly soluble in acetic anhydride and practically insoluble in ether.

Melting point—Between 255 and 260 ℃ (with decomposition).

Identification (1) Add 5 mL of bromine TS to the aqueous solution (1 in 100) of Naphazoline Hydrochloride and boil; the resulting solution exhibits an intense violet color.

(2) Add 2 mL of sodium hydroxide TS to 30 mL of the aqueous solution (1 in 100) of Naphazoline Hydrochloride, and extract twice with 25 mL of ether. Add the extracts of ether and evaporate to dryness with the aid of a current of air. Dry the residue at 80 ℃ for 1 hour; the residue melts between 117 and 120 ℃.

(3) Dissolve the residue of (2) by adding 2 to 3 drops of dilute hydrochloric acid and 5 mL of water, and add 2 mL of Reinecke salt TS; a purple crystalline precipitate is produced.

(4) An aqueous solution of Naphazoline Hydrochloride (1 in 10) responds to the Qualitative Analysis for chloride.

pH Dissolve about 0.10 g of Naphazoline Hydrochloride in 10 mL of newly boiled and cooled water; the pH of the resulting solution is NLT 5.0 and NMT 7.0.

Purity (1) ***Clarity and color of solution***—Dissolve about 1.0 g of Naphazoline Hydrochloride in 10 mL of water; the resulting solution is colorless and clear.

(2) ***Heavy metals***—Proceed with about 1.0 g of Naphazoline Hydrochloride according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

Loss on drying NMT 0.5% (1 g, 105 °C, 2 hours).

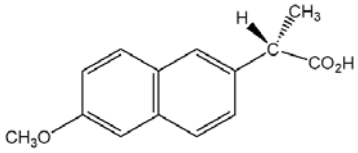
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.4 g of Naphazoline Hydrochloride, previously dried, dissolve in 50 mL of a mixture of acetic anhydride and acetic acid(100) (7 : 3), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 24.674 mg of $C_{14}H_{14}N_2 \cdot HCl$

Packaging and storage Preserve in light-resistant, tight containers.

Naproxen
나프록센



$C_{14}H_{14}O_3$: 230.26
(*S*)-2-(6-Methoxynaphthalen-2-yl) propanoic acid [*22204-53-1*]

Naproxen, when dried, contains NLT 98.5% and NMT 101.0% of naproxen ($C_{14}H_{14}O_3$).

Description Naproxen occurs as white crystals or a crystalline powder, and it is odorless.
It is freely soluble in acetone, soluble in methanol, ethanol(99.5) or chloroform, sparingly soluble in ether and practically insoluble in water.
It dissolves in sodium hydroxide TS.

Identification (1) Dissolve 10 mg of Naproxen in 5 mL of methanol, put 5 mL of water, add 2 mL of potassium iodide TS and 5 mL of potassium iodate solution (1 in 100), and shake to mix; the resulting solution exhibits a yellow to pale brown color. Add 5 mL of chloroform to this solution and shake to mix; the chloroform layer exhibits a pale purple color.

(2) Pipet 1 mL of the ethanol(99.5) solution (1 in 300) of Naproxen, add 4 mL of perchloric acid hydroxylamine-ethanol (99.5) TS and 1 mL of *N,N'*-Dicyclohexylcarbodiimide-ethanol (99.5) TS, shake well

to mix, and allow to stand in lukewarm water for 20 minutes. After cooling, add 1 mL of iron(III) perchlorate hexahydrate-ethanol (99.5) TS and shake to mix; the resulting solution exhibits a purple color.

(3) Determine the absorption spectra of solutions of Naproxen and ethanol(99.5) solution (1 in 50000) of naproxen RS, as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(4) Determine the infrared spectra of Naproxen and Naproxen RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Optical rotation $[\alpha]_D^{25}$: Between +63.0° and +68.5° (after drying, 0.1 g, chloroform, 10 mL, 100 mm).

Melting point Between 154 and 158 °C.

Purity (1) ***Clarity and color of solution***—Dissolve 2.0 g of Naproxen in 20 mL of acetone; the resulting solution is clear. Perform the test with this solution as directed under the Ultraviolet-visible Spectroscopy; the absorbance at 400 nm is NMT 0.070.

(2) ***Heavy metals***—Proceed with 2.0 g of Naproxen according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Arsenic***—Proceed with 2.0 g of Naproxen according to Method 3 and perform the test (NMT 1 ppm).

(4) ***Related substances***—Perform this test without exposure to daylight, using a light-resistant container. Dissolve about 0.10 g of Naproxen in 10 mL of a mixture of ethanol(95) and chloroform (1 : 1), and use this solution as the test solution. Pipet 2 mL of this solution and add a mixture of ethanol(95) and chloroform (1 : 1) to make exactly 100 mL. Pipet 5 mL of this solution, add a mixture of ethanol(95) and chloroform (1 : 1) to make exactly 50 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Develop the plate with a mixture of hexane, dichloromethane, tetrahydrofuran, and acetic acid(100) (50 : 30 : 17 : 3) as the developing solvent to a distance of about 12 cm, and air-dry the plate. Examine under ultraviolet rays (principal wavelength: 254 nm); the spots other than the principal spot and the spot of the starting point from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 0.5% (1 g, 105 °C, 3 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.5 g of Naproxen, previously dried, add 100 mL of diluted methanol (4 in 5), dissolve by gentle warming, if necessary, and titrate with 0.1 mol/L sodium hydroxide VS (indicator: 3 drops of phenolphthalein TS). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS
= 23.026 mg of $C_{14}H_{14}O_3$

Packaging and storage Preserve in light-resistant, well-closed containers.

Naproxen Tablets
나프록센 정

Naproxen Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of naproxen ($C_{14}H_{14}O_3$: 230.26).

Method of preparation Prepare as directed under Tablets, with Naproxen.

Identification Perform the test as directed under the Assay with a mixture of the test solution and the standard solution (1 : 1) from the Assay; it exhibits two peaks corresponding to naproxen and the internal standard.

Dissolution Perform the test with 1 tablet of Naproxen Tablets at 50 revolutions per minute according to Method 2 under the Dissolution, using 900 mL of 0.1 mol/L phosphate buffer (pH 7.4) as the dissolution medium. Take the dissolved solution 45 minutes after starting the test, filter, dilute with the dissolution medium, if necessary, and perform the test as directed under the Ultraviolet-visible Spectroscopy, using the dissolution medium as the control. Determine the absorbance at the absorbance maximum wavelength (λmax) around 332 nm. Separately, weigh accurately an appropriate amount of naproxen RS to make the same concentration as the test solution, and determine the absorbance in the same wavelength.
The dissolution rate of Naproxen Tablets in 30 minutes should be NLT 80%.

0.1 mol/L phosphate buffer solution, pH 7.4— Weigh 2.62 g of sodium dihydrogen phosphate dihydrate and 11.50 g of potassium monohydrogen phosphate, and dissolve in water to make 1000 mL.

Uniformity of dosage units Meets the requirements.

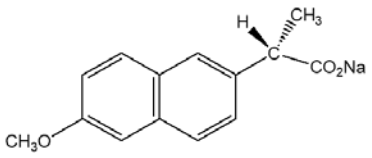
Assay Weigh accurately the mass of NLT 20 tablets of Naproxen Tablets, and powder. Weigh accurately an amount, equivalent to 0.25 g of naproxen ($C_{14}H_{14}O_3$), and perform the test as directed under the Assay of Naproxen sodium tablets. However, weigh accurately an appropriate amount of naproxen RS instead of naproxen sodium RS and add a mixture of acetonitrile and water (90 : 10) to make a solution containing 2.5 mg in 1 mL.

Amount (mg) of naproxen ($C_{14}H_{14}O_3$)
$$= 10\times C \times \frac{Q_T}{Q_S}$$

C: Concentration of the standard solution (μg/mL)

Packaging and storage Preserve in tight containers.

Naproxen Sodium
나프록센나트륨



$C_{14}H_{13}NaO_3$: 252.24
Sodium (*S*)-2-(6-methoxynaphthalen-2-yl)propanoate
[*26159-34-2*]

Naproxen Sodium, when dried, contains NLT 98.0% and NMT 102.0% of naproxen sodium ($C_{14}H_{13}NaO_3$).

Description Naproxen Sodium occurs as a white to milky white crystalline powder.
It is soluble in water or methanol, sparingly soluble in ethanol(95), very slightly soluble in acetone and practically insoluble in chloroform or toluene.

Melting point—About 255 °C (with decomposition).

Identification (1) Determine the absorption spectra of solutions Naproxen Sodium and naproxen sodium RS in methanol (1 in 40000) as directed under the Ultraviolet-visible Spectroscopy; both exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Naproxen Sodium and naproxen sodium RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Optical rotation $[\alpha]_D^{25}$: Between -15.3° and -17.0° (after drying, 0.5 g, 0.1 mol/L sodium hydroxide TS, 10 mL, 100 mm).

Purity (1) ***Heavy metals***—Weigh 1.0 g of Naproxen Sodium, dissolve in 20 mL of water, add 5 mL of 1 mol/L hydrochloric acid, and extract three times with 20 mL, 20 mL, and 10 mL of dichloromethane. Discard the dichloromethane layer, proceed with the aqueous layer as directed under Method 1, and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Related substances***—Weigh accurately about 0.1 g of Naproxen Sodium, dissolve in methanol to make 5.0 mL, and use this solution as the test solution. Separately, weigh accurately an appropriate amount of naproxen sodium RS, dissolve in methanol to make a solution containing 20 mg in 1 mL, and use this solution as the standard stock solution. Pipet 1 mL, 3 mL and 5 mL of this solution, and add methanol to make exactly 100 mL each. Pipet 1 mL each of these solutions, add methanol to make exactly 10 mL, and use these solutions as the standard solutions (1), (2) and (3). With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solutions (1), (2) and (3) on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of toluene, tetrahydrofuran, and acetic acid(100) (30 : 3 : 1) to a distance of about 15 cm, and air-dry the plate. Examine under the ultraviolet rays (principal wavelength 254 nm); the R_f value of the principal spot obtained from the test solution is equivalent to the R_f value of the spot from the standard solution, and the spots other than the principal spot from the test solution are not more intense than the spot from the standard solution (3). The spots other than the principal spot obtained from the test solution are NMT 2.0% of total spots, as compared to those obtained from the standard solutions (1), (2) and (3) (0.1%, 0.3% and 0.5%, respectively).

(3) ***Glass naproxen***—Weigh about 5.0 g of Naproxen Sodium, transfer to a separatory funnel, dissolve by adding 25 mL of water, and extract with 15 mL of chloroform each three times. Evaporate the chloroform extract on a steam bath to dryness, dissolve the residue in 10 mL of a mixture of methanol and water (3 : 1), previously neutralized with 0.1 mol/L sodium hydroxide using the phenolphthalein TS as an indicator, add phenolphthalein TS, and titrate with 0.1 mol/L sodium hydroxide VS; the consumption is NMT 2.2 mL (NMT 1.0%).

Loss on drying NMT 1.0% (1 g, in vacuum, 105 ℃, 3 hours).

Assay Weigh accurately about 0.2 g of Naproxen Sodium, add 2 drops of *p*-Naphtholbenzein TS, dissolve with 50 mL of acetic acid(100), previously neutralized with 0.1 mol/L perchloric acid, if necessary, and titrate with 0.1 mol/L perchloric acid VS.

Each mL of 0.1 mol/L perchloric acid VS
= 25.224 mg of $C_{14}H_{13}NaO_3$

Packaging and storage Preserve in tight containers.

Naproxen Sodium Tablets
나프록센나트륨 정

Naproxen Sodium Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of naproxen sodium ($C_{14}H_{13}NaO_3$: 252.25).

Method of preparation Prepare as directed under Tablets, with Naproxen Sodium.

Identification (1) Weigh a portion of powdered Naproxen Sodium Tablets, equivalent to about 0.25 g of naproxen sodium according to the labeled amount, transfer to a centrifuge tube, and add 12 mL of water and 1 mL of hydrochloric acid; a white precipitate develops. Centrifuge the mixture; the clear supernatant responds to the Qualitative Analysis for sodium salt.

(2) Prepare a mixture of the standard solution and the test solution (1 : 1) and perform the test as directed under the Assay; it exhibits two major peaks, corresponding to naproxen sodium and the internal standard.

Dissolution Perform the test with 1 tablet of Naproxen Sodium Tablets at 50 revolutions per minute according to Method 2 under the Dissolution, using 900 mL of 0.1 mol/L phosphate buffer (pH 7.4) as the dissolution medium. Take the dissolved solution 45 minutes after starting the test, filter, dilute with the dissolution medium, if necessary, and prepare a solution containing 50 μg of naproxen sodium ($C_{14}H_{13}NaO_3$) in 1 mL. Perform the test as directed under the Ultraviolet-visible Spectroscopy, use the dissolution medium as the control solution, and determine the absorbance at the absorbance maximum wavelength (λmax) around 332 nm. Separately, weigh accurately an appropriate amount of naproxen sodium RS, dissolve in the dissolution medium to prepare a solution containing 50 μg in 1 mL, and determine the absorbance in the same wavelength.

The dissolution rate of Naproxen Sodium Tablets in 45 minutes should be NLT 80%.

0.1 mol/L phosphate buffer (pH 7.4)—Weigh 2.62 g of sodium dihydrogen phosphate dihydrate and 11.50 g of potassium monohydrogen phosphate, and dissolve in water to make 1000 mL.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 tablets of Naproxen Sodium Tablets, and powder. Weigh accurately an amount, equivalent to about 0.275 g of naproxen sodium ($C_{14}H_{13}NaO_3$), transfer to a volumetric flask, add 10 mL of water, and shake until it is completely dispersed. Then add acetonitrile to fill up to the mark, and mix. Allow the precipitate to settle, pipet 1 mL of the clear supernatant, and put 2.0 mL of internal standard solution. Add the mobile phase to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately an appropriate amount of naproxen sodium RS, and add a mixture of acetonitrile and water (90 : 10) to prepare a solution containing 2.75 mg in 1 mL. Pipet 1 mL of this solution, put 2.0 mL of the internal standard solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the peak area ratios, Q_T and Q_S, of naproxen sodium to the internal standard.

$$\text{Amount (mg) of naproxen sodium } (C_{14}H_{13}NaO_3) = 10 \times C \times \frac{Q_T}{Q_S}$$

C: Concentration of the standard solution (μg/mL)

Internal standard solution—Acetonitrile solution of butyrophenone (1 in 2000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silical gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of acetonitrile, water and acetic acid(100) (50 : 49 : 1).

Flow rate: 1.2 mL/min

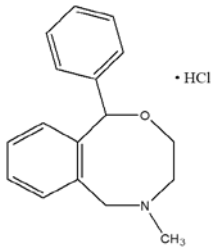
System suitability

System performance: Proceed with 20 μL of the standard solution according to the above conditions; the naproxen sodium and the internal standard are eluted in this order with the resolution being NLT 5.

System repeatability: Repeat the test 6 times with 20 μL of the standard solution according to the above conditions; the relative standard deviation of the peak area ratio is NMT 1.5%.

Packaging and storage Preserve in tight containers.

Nefopam Hydrochloride
네포팜염산염



$C_{17}H_{19}NO \cdot HCl$: 289.80

3,4,5,6-Tetrahydro-5-methyl-1-phenyl-1*H*-2,5-benzoxazocine hydrochloride (1:1), [*23327-57-3*]

Nefopam Hydrochloride, when dried, contains NLT 98.5% and NMT 101.5% of nefopam hydrochloride ($C_{17}H_{19}NO \cdot HCl$).

Description Nefopam Hydrochloride occurs as almost white crystalline powder.

It is soluble in hot water and ethanol(95) and practically insoluble in toluene, heptane and ether.

Melting point—Between 248 and 255 ℃ (with decomposition).

Identification (1) Use 1% methanol VS of Nefopam

Hydrochloride as the test solution. Use 1% methanol VS of Nefopam Hydrochloride RS as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot the test and standard solutions on a thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Develop the plate with a mixture of ethanol, ethyl acetate and ammonia water(28) (5:5:1) and air-dry it. Spray Dragendorff's TS onto the plate; the R_f value and the color of the spots obtained from the test and standard solutions are identical.

(2) Determine the absorption spectrum with 0.01 mol/L hydrochloric acid VS (1 in 10000) of Nefopam Hydrochloride as directed under the Ultraviolet-visible Spectroscopy. Then, it exhibits maximum absorption at 264-268 nm and at 272-276 nm.

(3) Determine the infrared spectra of Nefopam Hydrochloride and Nefopam Hydrochloride RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both exhibit similar intensities of absorption at the same wavenumbers.

Purity ***Heavy metals*—**Test with 1 g of Nefopam Hydrochloride according to Method 2 of the Heavy Metals. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

Loss on drying NMT 0.5% (1 g, 105 °C, constant mass).

Residue on ignition NMT 0.1% (1 g)

Assay Weigh accurately about 0.3 g of Nefopam Hydrochloride, dissolves in 50 mL acetic acid(100), add 10 mL of 6% Mercury(II) acetate TS, for non-aqueous determination, and perform potentiometric titration with 0.1 mol/L perchloric acid. Perform a blank test in the same manner and make any necessary correction.

Each mL of 1 mol/L perchloric acid
= 28.98 mg of $C_{17}H_{19}NO{\cdot}HCl$

Packaging and storage Preserve in tight containers.

Nefopam Hydrochloride Capsules
네포팜염산염 캡슐

Nefopam Hydrochloride Capsules contains NLT 95.0% and NMT 105.0% of the labeled amount of nefopam hydrochloride ($C_{17}H_{19}NO{\cdot}HCl$: 289.80).

Method of preparation Prepare as directed under Capsules, with Nefopam Hydrochloride.

Identification (1) Dissolve about 1 capsule of Nefopam Hydrochloride Capsule in 20 mL of water, filter, and add Dragendorff's TS slowly in the filtrate; a reddish brown precipitate is formed.

(2) Dissolve about 2 capsules of Nefopam Hydrochloride Capsules in 30 mL water, filter, and use the filtrate as the test solution. Weigh about 20 mg of nefopam hydrochloride RS, dissolve in 10 mL of water, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot the test solution and the standard solution on a thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of ethyl acetate, ethanol(95) and ammonia water(28) (5 : 5 : 1) as the developing solvent, and air-dry the plate. Spray evenly Dragendorff's TS on the plate; the R_f value and the color of the spots obtained from the test are identical with those from the standard solution.

Disintegration Meet requirements.

Uniformity of dosage units Meet requirements.

Assay Weigh accurately the mass of NLT 20 capsules of Nefopam Hydrochloride Capsules and powder. Weigh accurately an amount of Nefopam Hydrochloride Capsules, equivalent to about 40 mg of nefopam hydrochloride ($C_{17}H_{19}NO{\cdot}HCl$), and add water to make exactly 250 mL. Filter this solution, discard the first 20 mL of the filtrate, and use the subsequent filtrate as the test solution. Separately, weigh accurately about 40 mg of nefopam hydrochloride RS, add water to make exactly 250 mL, and use this solution as the standard solution. With the test and standard solutions, determine the absorbance, A_T and A_S at 268 nm, using water as a control solution as directed under the Ultraviolet-visible Spectroscopy.

Amount (mg) of nefopam hydrochloride ($C_{17}H_{19}NO{\cdot}HCl$)
= Amount (mg) of nefopam hydrochloride RS × (A_T/ A_S)

Packaging and storage Preserve in well-closed containers.

Nefopam Hydrochloride Injection
네포팜염산염 주사액

Nefopam Hydrochloride Injection contains NLT 95.0% and NMT 105.0% of the labeled amount of nefopam hydrochloride ($C_{17}H_{19}NO{\cdot}HCl$: 289.80).

Method of preparation Prepare as directed under Injections, with Nefopam Hydrochloride.

Identification (1) Spot 3 to 4 drops of Dragendorff's TS in 5 mL of Nefopam Hydrochloride Injection; a reddish brown precipitate is formed.

(2) Use this solution as the test solution. Separately, weigh 20 mg of nefopam hydrochloride RS and add water to make 1 mL. Use this solution as the standard solution. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chro-

matography. Next, develop the plate with a mixture of ethanol, ethyl acetate and ammonia water(28) (5 : 5 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Spray evenly Dragendorff's TS on the plate; the R_f value and the color of the spots obtained from the test are identical with those from the standard solution.

Sterility Meets requirements.

Bacterial endotoxins Less than 15 EU/mg of nefopam hydrochloride.

Particulate contamination: Visible particles Meets requirements.

Insoluble particulate matter in injections Meets requirements.

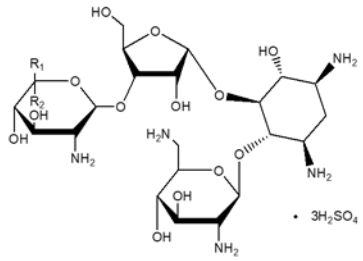
Extractable volume of injections Meets requirements.

Assay Weigh an amount of Nefopam Hydrochloride Injection, equivalent to about 40 mg of nefopam hydrochloride ($C_{17}H_{19}NO \cdot HCl$), and add water to make exactly 250 mL. Use this solution as the test solution. Separately, weigh accurately about 40 mg of nefopam hydrochloride RS, dissolve in water, and make exactly 250 mL. Use this solution as the standard solution. Determine the absorbance of the test solution and the standard solution, A_T and A_S at 268 nm using water as a control solution as directed under the Ultraviolet-visible Spectroscopy.

Amount (mg) of nefopam hydrochloride ($C_{17}H_{19}NO \cdot HCl$) = Amount (mg) of nefopam hydrochloride RS × (A_T/ A_S)

Packaging and storage Preserve in hermetic containers.

Neomycin Sulfate
네오마이신황산염



Neomycin B : R_1 = H R_2 = CH_2NH_2
Neomycin C : R_1 = CH_2NH_2 R_2 = H

Neomycin Sulfate $C_{23}H_{46}N_6O_{13} \cdot 3H_2SO_4$: 908.88
(2*R*,3*S*,4*R*,5*R*,6*R*)-5-Amino-2-(aminomethyl)-6-[(1*R*,2*R*,3*S*,4*R*,6*S*)-4,6-diamino-2-[(2*S*,3*R*,4*S*,5*R*)-4-[(2*R*,3*R*,4*R*,5*S*,6*S*)-3-amino-6-(aminomethyl)-4,5-dihydroxyoxan-2-yl]oxy-3-hydroxy-5-(hydroxymethyl)oxolan-2-yl]oxy-3-hydroxycyclohexyl]oxyoxane-3,4-diol; sulfuric acid [*1405-10-3*]

Neomycin Sulfate is a sulfate of a mixture of aminoglycoside substances having antibacterial activity produced by the growth of *Streptomyces fradiae*.
Neomycin Sulfate, when dried, contains NLT 623 μg and NMT 740 μg (potency) of neomycin ($C_{23}H_{46}N_6O_{13}$: 614.65).

Description Neomycin Sulfate occurs as a white to light yellow powder.
It is freely soluble in water and practically insoluble in ethanol(95).
It is hygroscopic.

Identification (1) Dissolve 50 mg each of Neomycin Sulfate and neomycin sulfate RS in 1 mL of water and use each solution as the test solution and the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 2 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography, develop the plate with a mixture of methanol, ammonia water(28) and dichloromethane (3 : 2 : 1) to a distance of about 10 cm, and air-dry the plate. Spray evenly the ninhydrin acetone solution (1 in 50), and heat at 110 ℃ for 15 minutes; the R_f values of principal spots obtained from the test solution and the standard solution are the same.

(2) The aqueous solution of Netilmicin Sulfate (1 in 20) responds to the Qualitative Analysis (1) for sulfate.

Optical rotation $[\alpha]_D^{20}$: Between +53.5° and 59.0° (1 g, calculated on the dried basis, water, 10 mL, 100 nm).

pH Dissolve 1.0 g of Neomycin Sulfate in 10 mL of water; the pH of this solution is between 5.0 and 7.5.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Neomycin Sulfate according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Arsenic***—Proceed with 1.0 g of Neomycin Sulfate according to Method 1 and perform the test (NMT 2 ppm).

(3) ***Related substances***—Dissolve about 0.63 g of Neomycin Sulfate in 5 mL of water and use this solution as the test solution. Pipet 1 mL of this solution, add water to make exactly 50 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 1 μL each of the test solutions and the standard solution onto the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Develop the plate with a mixture of methanol, ammonia water(28), and dichloromethane (3 : 2 : 1) to a distance of about 10 cm, and air-dry the plate. Spray evenly ninhydrin acetone solution (1 in 50), heat at 110 ℃ for 15 minutes; the spot with R_f value 0.4 obtained from the test solution is not more intense than the spot from the standard solution.

Sterility It meets the requirements when Neomycin Sulfate is used for manufacturing sterile preparations. But it is exempt from the requirements when there is a final sterilization process in the manufacturing process of sterile preparations.

Loss on drying NMT 8.0% (0.2 g, in vacuum, 60 ºC, 3 hours).

Residue on ignition NMT 0.3% (1 g).

Assay ***Cylinder plate method*** (1) Medium: (a) Agar medium for seed and base layer

Peptone	6.0 g	Sodium chloride	2.5 g
Yeast extract	3.0 g	Glucose	1.0 g
Meat extract	1.5 g	Agar	15.0 g

Weigh the above materials, add purified water to make 1000 mL, and adjust the pH after sterilization to 7.8 to 8.0 using 1 mol/L sodium hydroxide TS.

(2) Test organism and test organism suspension: Use *Staphylococcus aureus* ATCC 6538 P as the test organism. Prepare the test organism suspension so that the transmission of the suspension becomes 80% when determining the transmission using a absorption photometer at the wavelength of 650 nm.

(3) Weigh accurately about 50 mg (potency) of Neomycin Sulfate, previously dried, dissolve in 0.1 mol/L phosphate buffer solution, pH 8.0 to prepare a solution containing 1 mg (potency) per mL, and use this solution as the test stock solution. Take exactly an appropriate amount of this test stock solution, dilute with 0.1 mol/L phosphate buffer solution, pH 8.0 to make two solutions containing each 80.0 μg and 20.0 μg (potency) per mL, and use these solutions as the high concentration test solution and the low concentration test solution, respectively. Separately, take an appropriate amount of neomycin sulfate RS, weigh accurately about 50 mg (potency) after drying, and dissolve in 0.1 mol/L phosphate buffer solution, pH 8.0 to make the standard stock solution containing 1 mg (potency) per mL. Keep the standard stock solution at below 5 °C and use it within 14 days. Take exactly an appropriate amount of this standard stock solution, dilute with 0.1 mol/L phosphate buffer solution, pH 8.0 two solutions containing each 80.0 μg and 20.0 μg (potency) per mL, and use these solutions as the high concentration standard solution and the low concentration standard solution. With these solutions, perform the test as directed under the Microbial Assays for Antibiotics (A) (8).

Packaging and storage Preserve in light-resistant, tight containers.

Neomycin Sulfate Ointment
네오마이신황산염 연고

Neomycin Sulfate Ointment contains NLT 90.0% and NMT 120.0% of the labeled amount of neomycin ($C_{23}H_{46}N_6O_{13}$: 614.65).

Method of preparation Prepare as directed under Ointments, Neomycin Sulfate.

Identification Weigh an amount of Neomycin Sulfate Ointment, equivalent to about 35 mg of neomycin sulfate, according to the labeled potency, transfer it to a separatory funnel, add 50 mL of ether, and shake hard to mix. Extract with 30 mL of 0.1 mol/L phosphate buffer solution, pH 8.0, add 1 mL of ninhydrin TS and 0.5 mL of pyridine to 5 mL of the extract, and boil for 10 minutes; the resulting solution exhibits bluish purple color.

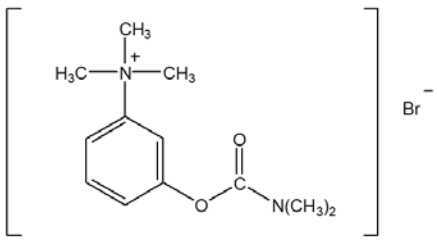
Water NMT 1.0% (1 g, volumetric titration, direct titration).

Assay Perform the test as directed under the Assay under Neomycin Sulfate. However, prepare the test solution as the following method.

Weigh accurately about 0.1 g (potency) of Neomycin Sulfate Ointment, transfer to a separatory funnel, add 50 mL of ether, and shake well to mix. Extract three times each with 25 mL of 0.1 mol/L phosphate buffer solution, pH 8.0, and add 0.1 mol/L phosphate buffer solution, pH 8.0, to the combined extract to make the solution at an appropriate concentration. Take exactly an appropriate amount of this solution, dilute with 0.1 mol/L phosphate buffer solution, pH 8.0 to make the concentration of (3), and use this solution as the test solution.

Packaging and storage Preserve in tight containers.

Neostigmine Bromide
네오스티그민브롬화물



$C_{12}H_{19}BrN_2O_2$: 303.20

3-{[(Dimethylamino)carbonyl]oxy}-*N*,*N*,*N*-trimethylbenzenaminium bromide [*114-80-7*]

Neostigmine Bromide contains NLT 98.0% and NMT 102.0% of neostigmine bromide ($C_{12}H_{19}BrN_2O_2$), calculated on the dried basis.

Description Neostigmine Bromide occurs as a white crystalline powder. It is odorless and tastes bitter.

It is very soluble in ethanol(95) and practically insoluble in ether.

An aqueous solution of Neostigmine Bromide is neutral.

Identification (1) Determine the infrared spectra of Neostigmine Bromide and neostigmine bromide RS as directed in the potassium chloride disk method under the Mid-infrared Spectroscopy; both exhibit similar intensities of absorption at the same wavenumbers.

(2) An aqueous solution of Neostigmine Bromide (1 in 50) responds to the Qualitative Analysis for bromide.

Melting point Between 171 and 176 ℃ (with decomposition).

Purity *Sulfate*—Dissolve about 0.25 g of Neostigmine Bromide in 10 mL of water, add 1 mL of 3 mol/L hydrochloric acid, and add 1 mL of barium sulfate TS; the solution is not turbid.

Loss on drying NMT 2.0% (1 g, 105 °C, 3 hours).

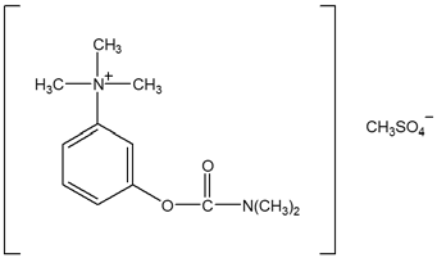
Residue on ignition NMT 0.15% (1 g).

Assay Weigh accurately about 0.225 g of Neostigmine Bromide, dissolve in 2 mL of formic acid, add 50 mL of acetic acid(100), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry).

Each mL of 0.1 mol/L perchloric acid VS
= 30.320 mg of $C_{12}H_{19}BrN_2O_2$

Packaging and storage Preserve in tight containers.

Neostigmine Methylsulfate
네오스티그민메틸황산염



$C_{13}H_{22}N_2O_6S$: 334.39

3-{[(Dimethylamino)carbonyl]oxy}-*N*,*N*,*N*-trimethylbenzenaminium; methyl sulfate [*51-60-5*]

Neostigmine Methylsulfate, when dried, contains NLT 98.0% and NMT 102.0% of neostigmine methylsulfate ($C_{13}H_{22}N_2O_6S$).

Description Neostigmine Methylsulfate occurs as a white crystalline powder.
It is very soluble in water and freely soluble in ethanol(95) and acetonitrile.

Identification (1) Determine the absorption spectra of solutions of Neostigmine Methylsulfate and neostigmine methylsulfate RS (1 in 2,000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Neostigmine Methylsulfate and neostigmine methylsulfate RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Melting point Between 145 and 149 °C.

pH Dissolve 1.0 g of Neostigmine Methylsulfate in 10 mL of newly boiled and cooled water; the pH of this solution is between 3.0 and 5.0.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Neostigmine Methylsulfate in 10 mL of water; the resulting solution is clear and colorless.

(2) ***Sulfate***—Dissolve 0.20 g of Neostigmine Methylsulfate in 10 mL of water and add 1 mL of dilute hydrochloric acid and 1 mL of barium chloride TS; no turbidity is produced immediately.

(3) ***Dymethylaminophenol***—Dissolve 0.1 g of Neostigmine Methylsulfate in 5 mL of water, add 1 mL of sodium hydroxide TS, and while cooling with ice, add 1 mL of diazobenzenesulfonic acid TS; no color develops.

Loss on drying NMT 1.0% (1 g, 105 °C, 3 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 25 mg each of Neostigmine Methylsulfate and neostigmine methylsulfate RS, previously dried, and dissolve each in the mobile phase to make exactly 50 mL, and use these solutions as the test solution and the standard solution, respectively. Take exactly 10 μL each of the test solution and the standard solution, perform the test as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas A_T and A_S of neostigmine for each solution.

Amount (mg) of neostigmine methylsulfate ($C_{13}H_{22}N_2O_6S$)
= Amount (mg) of neostigmine methylsulfate RS
× (A_T / A_S)

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 259 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: Dissolve 3.12 g of sodium dihydrogen phosphate dihydrate in 1000 mL of water and add phosphoric acid to adjust the pH to 3.0. Dissolve 0.871 g of sodium 1-pentane sulfonate in this solution. To 890 mL of this solution, add 110 mL of acetonitrile.

Flow rate: Adjust the flow rate to make the retention time of neostigmine about 9 minutes.

System suitability

System performance: Dissolve 4 mg of dimethylaminophenol and 25 mg of neostigmine methylsulfate in 50 mL of the mobile phase. Proceed with 10 μL of this solution according to the above conditions; dimethylaminophenol and neostigmine are eluted in this order with the resolution between these peaks being NLT 6.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution according to the above conditions; the relative standard deviation of neostigmine peak areas is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Neostigmine Methylsulfate Injection
네오스티그민메틸황산염 주사액

Neostigmine Methylsulfate Injection is an aqueous solution for injection. Neostigmine Methylsulfate Injection contains NLT 93.0% and NMT 107.0% of the labeled amount of neostigmine methylsulfate ($C_{13}H_{22}N_2O_6S$: 334.39).

Method of preparation Prepare as directed under Injections, with Neostigmine Methylsulfate.

Description Neostigmine Methylsulfate Injection occurs as a clear and colorless liquid.
It is gradually affected by light.

pH—Between 5.0 and 6.5.

Identification Weigh an amount of Neostigmine Methylsulfate Injection, equivalent to 0.5 mg of neostigmine methylsulfate, according to the labeled amount, and add water, if necessary, to make 10 mL. Determine the absorption spectrum of this solution as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum between 257 nm and 261 nm.

Sterility Meets the requirements.

Bacterial endotoxins Neostigmine Methylsulfate Injection is less than 5 EU per mg of neostigmine methylsulfate.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

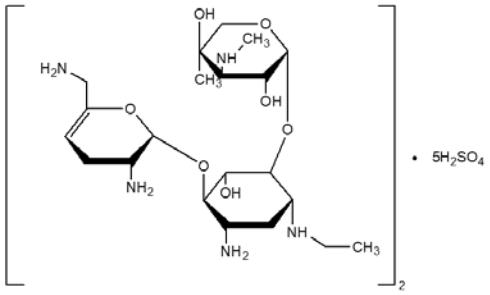
Extractable volume of injections Meets the requirements.

Assay Use Neostigmine Methylsulfate Injection as the test solution. Separately, weigh accurately about 25 mg of neostigmine methylsulfate RS, previously dried at 105 ℃ for 3 hours, and dissolve in the mobile phase to make exactly 50 mL. Use this solution as the standard solution. Perform the test as directed under the Assay of neostigmine methylsulfate.

Amount (mg) of neostigmine methylsulfate ($C_{13}H_{22}N_2O_6S$)
= Amount (mg) of neostigmine methylsulfate RS

Packaging and storage Preserve in light-resistant, hermetic containers.

Netilmicin Sulfate
네틸마이신황산염



$(C_{21}H_{41}N_5O_7)_2 \cdot 5H_2SO_4$: 1441.55

(2*R*,3*R*,4*R*,5*R*)-2-[(1*S*,2*S*,3*R*,4*S*,6*R*)-4-Amino-3-[[(2*S*,3*R*)-3-amino-6-(aminomethyl)-3,4-dihydro-2*H*-pyran-2-yl]oxy]-6-(ethylamino)-2-hydroxycyclohexyl]oxy-5-methyl-4-(methylamino)oxane-3,5-diol; sulfuric acid [*56391-57-2*]

Netilmicin Sulfate is a sulfate of sisomicin derivatives.

Netilmicin Sulfate contains NLT 595 μg and NMT 720 μg (potency) of netilmicin ($C_{21}H_{41}N_5O_7$: 475.58) per mg, calculated on the dried basis.

Description Netilmicin Sulfate occurs as a white to pale yellow powder.
It is very soluble in water and practically insoluble in ethanol(95) and ether.
It is hygroscopic.

Identification (1) Dissolve 30 mg of Netilmicin Sulfate in 3 mL of water, and add 0.2 mL of bromine TS; the color of the solution disappears immediately.

(2) Dissolve 5 mg each of Netilmicin Sulfate and netilmicin sulfate RS in 5 mL of water, respectively, and use these solutions as the test solution and the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of methanol, chloroform, ammonia water(28) and acetone (2 : 2 : 1 : 1) as the developing solvent to a distance of about 15 cm, and air-dry the plate. Spray

0.2% ninhydrin-water saturated 1-butanol TS evenly and heat at about 100 ℃ for about 5 minutes; the principal spots obtained from the test solution and the standard solution are purple to reddish brown, and the R_f values are the same.

(3) The aqueous solution of Netilmicin Sulfate (1 in 100) responds to the Qualitative Analysis (1) for sulfate.

Optical rotation $[\alpha]_D^{20}$: Between +88° and +96° (0.3 g, calculated on the dried basis, water, 10 mL, 100 mm).

pH Dissolve 0.2 g of Netilmicin Sulfate in 5 mL of water; the pH of this solution is between 3.5 and 5.5.

Purity (1) ***Clarity and color of solution***—Dissolve 0.5 g of Netilmicin Sulfate in 5 mL of water; the solution is clear and colorless to light yellow.

(2) ***Heavy metals***—Proceed with 1.0 g of Netilmicin Sulfate as directed under Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Related substances***—Weigh an amount equivalent to 50 mg of Netilmicin Sulfate, calculated on a dried basis, dissolve in 5 mL of water, and use this solution as the test solution. Pipet 0.5 mL, 1 mL, 1.5 mL, and 3 mL of the test solution, add water to make exactly 50 mL respectively, and use these solutions as the standard solution (1), (2), (3), and (4). With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solutions, the standard solution (1), the standard solution (2), the standard solution (3), and the standard solution (4) each on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of methanol, chloroform, ammonia water(28) and acetone (2 : 2 : 1 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Spray 0.2% ninhydrin-water saturated 1-butanol TS and heat at about 100 ℃ for 5 minutes; the spots other than the principal spot obtained from the test solution are not more intense than the spots obtained from the standard solution (3). The total intensity of spots other than the principal spot obtained from the test solution is not more intense than the spots from the standard solution (4) (NMT 6%).

Sterility It meets the requirements when used for the manufacturing of sterile preparations. However, it is not applied when the manufacturing process of sterile preparations has a final sterilization process.

Bacterial endotoxins It is less than 0.50 EU per mg of netilmicin (potency) when used for the manufacturing of sterile preparations.

Loss on drying NMT 15.0% (0.15 g, NMT 0.67 kPa, 110 ℃, 3 hours). Avoid hygroscopicity when taking the sample.

Residue on ignition NMT 1.0% (1 g).

Assay Weigh accurately about 50 mg (potency) of Netilmicin Sulfate and netilmicin sulfate RS, and dissolve in the mobile phase to make exactly 50 mL, respectively. Use these solutions as the test solution and the standard solution. Perform the test with 20 μL each of the test solution and the standard solution, as directed under the Liquid Chromatography according to the following conditions, and calculate the peak areas, A_T and A_S, of netilmicin from the test solution and the standard solution.

$$\text{Potency (μg) of netilmicin } (C_{16}H_{17}N_3O_5S) = \text{Potency of netilmicin sulfate RS (μg)} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 205 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of 1000 mL of a solution, made by adding diluted phosphoric acid (5 in 1000) to 20.22 g of sodium 1-heptanesulfonate, and acetonitrile (620 : 380).

Flow rate: 1 mL/min

System suitability

System performance: Weigh accurately an appropriate amount of Netilmicin Sulfate and sisomicin sulfate RS, prepare each solution containing 1 mg per mL, and use these solutions as the system suitability solution. Proceed with 20 μL of system suitability solution according to the above conditions; the resolution between sisomicin and netilmicin is NLT 1. Proceed with 20 μL of the standard solution according to the above conditions; the number of theoretical plates is NLT 3000, and the symmetry factor is NMT 2.

System repeatability: Repeat the test 5 times with 20 μL each of the standard solutions according to the above conditions; the relative standard deviation of the peak area of netilmicin is NMT 1.0%.

Packaging and storage Preserve in light-resistant, tight containers, filled with nitrogen or argon (NMT 5 ℃).

Netilmicin Sulfate Injection
네틸마이신황산염 주사액

Netilmicin Sulfate Injection contains NLT 90.0% and NMT 120.0% of labeled amount of netilmicin ($C_{21}H_{41}N_5O_7$: 475.58).

Method of preparation Prepare as directed under Injections, with Netilmicin Sulfate.

Description Netilmicin Sulfate Injection occurs as a clear, colorless to pale yellow liquid.

Identification Perform the test according to the Identification (2) of Netilmicin sulfate.

pH Between 3.5 and 6.0.

Sterility Netilmicin Sulfate Injection meets the requirements of the Sterility.

Bacterial endotoxins Less than 0.50 EU/mg per mg (potency) of netilmicin.

Particulate contamination: Visible particles in injections and ophthalmic solutions Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Extractable volume of injections Meets the requirements.

Assay Proceed as directed under the Assay under Netilmicin sulfate. However, pipet a volume of Netilmicin Sulfate Injection, equivalent to about 0.100 g (potency) according to the labeled potency, dissolve in the mobile phase to make exactly 100 mL, and use this solution as the test solution.

Each mL of potency of netilmicin ($C_{16}H_{17}N_3O_5S$) (μg)
= Potency of netilmicin sulfate RS (μg)× $\frac{A_T}{A_S}$ ×2

Packaging and storage Preserve in hermetic containers.

Newlase
뉴라제

Newlase is a powdered digestive enzyme obtained by extracting and purifying enzymes produced by culturing filamentous fungi of the genus *Rhyzopus*, which contains, when dried, NLT 50000 units and NMT 66000 units of protein digestibility (pH 3.0) and 3000 to 4000 units of fat digestibility (pH 7.0) in 1g.

Description Newlase occurs as a pale yellow powder.
It is sparingly soluble in water and insoluble in ethanol(95).

Identification Perform the test according to the Assay; Newlase shows a positive reaction.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Newlase according to Method 2 and perform the test. Prepare the control solution with 5.0 mL of lead standard solution (NMT 50 ppm).

(2) ***Arsenic***—Proceed with 1.0 g of Newlase according to Method 3 and perform the test (NMT 2 ppm).

Loss on drying NMT 1.0% (1 g, 105 °C, 4 hours).

Residue on ignition NMT 25% (1 g).

Assay (1) ***Protein digestion activity***—Weigh accurately 0.5 g of Newlase and dissolve in 0.002 mol/L hydrochloric acid to make 250 mL. Take 10.0 mL of this solution, add 0.002 mol/L hydrochloric acid to make 50 mL, and use it as the test solution. Separately, take 5.0 mL of casein solution (pH 3.0), allow to stand at 37 ± 0.5 ℃ for 10 minutes, add 1.0 mL of the test solution, and shake to mix. After allowing this solution to stand at 37 ± 0.5 ℃ for 10 minutes, add 5 mL of 7.2% trichloroacetic acid solution, shake to mix, and let it stand at 37 ± 0.5 ℃ for 30 minutes, and filter. Take 2.0 mL of the filtrate, add 5.0 mL of 0.55 mol/L sodium carbonate solution and 1 mL of dilute Folin TS (1 in 3), allow to stand at 37 ± 0.5 ℃ for 30 minutes, and measure the absorbance A_T at a wavelength of 660 nm by testing this solution as directed under the Ultraviolet-visible Spectroscopy. Separately, take 1.0 mL of the test solution, add 5 mL of 7.2% trichloroacetic acid solution, shake to mix, add 5 mL of casein solution, allow it to stand it at 37 ± 0.5 °C for 30 minutes, and proceed as above to measure the absorbance A_B as directed under the Ultraviolet-visible Spectroscopy.

Protein digestion activity (unit/g)
$$= (AT - AB) \times F \times \frac{11}{2} \times \frac{1}{10} \times 2500$$

F: Amount of tyrosine for an absorbance difference of 1.000. It is obtained from the tyrosine calibration curve.

Preparation of tyrosine calibration curve: Weigh accurately 0.5 g of tyrosine RS, previously dried at 105 °C for 3 hours, dissolve in 0.2 mol/L hydrochloric acid TS to make 500 mL. Take 1.0 mL, 2.0 mL, 3.0 mL, and 4.0 mL of this solution and add 0.2 mol/L hydrochloric acid solution to make 100 mL, respectively. Take 2.0 mL each of this solution, add 5 mL of 0.55 mol/L sodium carbonate solution and 1 mL of dilute Folin TS (1 in 3), allow to stand at 37 ± 0.5 °C for 30 minutes, and measure the absorbance A_1, A_2, A_3, and A_4 at a wavelength of 660 nm by performing the test as directed under the Ultraviolet-visible Spectroscopy. Separately, use 2 mL of 0.2 mol/L hydrochloric acid solution and measure the absorbance A_0 by performing the test as directed under the Ultraviolet-visible Spectroscopy by proceeding as above. Prepare a calibration curve with the absorbance difference on the vertical axis and the amount of tyrosine (μg) on the horizontal axis to determine the amount of tyrosine for the absorbance difference of 1.000.

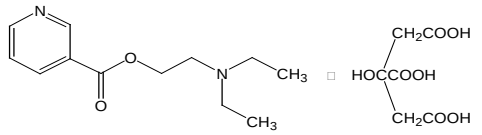
(2) ***Fat digestion activity***— (i) Test solution: Weigh accurately about 0.5 g of Newlase and dissolve in water to make 10 mL. Take exactly 5.0 mL of this solution, add water to make 10 mL, and use this solution as the test solution.

(ii) Procedure: Proceed according to the Fat digestion activity as directed under the Digestive Power. However, use olive oil as the substrate solution and 0.1 mol/L

phosphate buffer (pH 7.0) as the buffer.

Packaging and storage Preserve in tight containers.

Nicametate Citrate
니카메테이트시트르산염



$C_{12}H_{18}N_2O_2 \cdot C_6H_8O_7$: 414.14
2-Diethylaminoethyl pyridine-3-carboxylate 2-hydroxypropane-1,2,3-tricarboxylic acid, [*1641-74-3*]

Nicametate Citrate, when dried, contains NLT 97.0% and NMT 103.0% of nicametate citrate ($C_{12}H_{18}N_2O_2 \cdot C_6H_8O_7$).

Description Nicametate Citrate occurs as a white crystalline powder.
It has a unique aroma and a slightly acidic taste.
It is freely soluble in water and acetic acid(100), sparingly soluble in methanol and practically insoluble in ethanol(95), acetone or chloroform.

Identification (1) A solution of Nicametate Citrate (1 in 100) responds to the Qualitative Analysis for citrate.

(2) Add 5 drops of Reinecke salt TS to 5 mL of the aqueous solution of Nicametate Citrate (1 in 100); a pale red precipitate is produced.

(3) Mix 5 mg of Nicametate Citrate and 0.1 g of 2,4-dinitrochlorobenzene, heat gently to dissolve for 5 to 6 seconds. After cooling, add 4 mL of potassium hydroxide-ethanol TS; the resulting solution exhibits a dark red color.

(4) Dissolve 0.1 g of Nicametate Citrate in water to make 100 mL. Take 5 mL of this solution and add water to make 100 mL. Determine the absorption spectrum of this solution as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum between 262 nm and 265 nm.

Absorbance $E_{1cm}^{1\%}$ (263 nm): Between 72.4 and 77.6 (After drying, 5 mg, water, 100 mL).

pH Between 3.0 and 5.0 (2% aqueous solution).

Purity (1) ***Chloride***—Proceed with 0.5 g of Nicametate Citrate as directed under the Chloride and perform the test. Prepare the control solution with 0.40 mL of 0.01 mol/L hydrochloric acid VS (NMT 0.028%).

(2) ***Sulfate***—Proceed with 0.5 g of Nicametate Citrate and perform the test. Prepare the control solution with 1.0 mL of 0.005 mol/L sulfuric acid VS (NMT 0.096%).

(3) ***Oxalate***—Dissolve 0.5 g of Nicametate Citrate in 3 mL of water, add 4 mL of ethanol and 0.2 mL of calcium chloride TS, and allow it to stand for 1 hour; the solution is clear.

(4) ***Heavy metals***—Proceed with 1.0 g of Nicametate Citrate according to Method 2 and perform the test. Prepare the control solution with 3.0 mL of lead standard solution (NMT 30 ppm).

(5) ***Arsenic***—Proceed with 1.0 g of Nicametate Citrate according to Method 1 and perform the test (NMT 2 ppm).

Loss on drying NMT 1.0% (1 g, in vacuum, phosphorus pentoxide, 5 hours).

Residue on ignition NMT 0.20% (1 g)

Assay Weigh accurately about 0.4 g of Nicametate Citrate, previously dried, dissolve in 50 mL of acetic acid(100) for non-aqueous titration, and titrate with 0.1 mol/L perchloric acid VS (indicator: 10 drops of α-naphtholbenzein TS). The endpoint of the titration is when the yellowish brown color of this solution turns yellow to green. Perform a blank test in the same manner and make any necessary correction.

Each mL of 1 mol/L perchloric acid VS
= 20.721 mg of $C_{12}H_{18}N_2O_2 \cdot C_6H_8O_7$

Packaging and storage Preserve in tight containers.

Nicametate Citrate Tablets
니카메테이트시트르산염 정

Nicametate Citrate Tablet contains NLT 95.0% and NMT 105.0% of labeled amount of nicametate citrate ($C_{18}H_{26}N_2O_9$: 414.14)

Method of preparation Prepare as directed under Tablets, with Nicametate Citrate.

Identification Use the powdered 2 tablets of Nicametate Citrate Tablets. Extract with two 20 mL portions of mixture of methanol and water (8 : 2), and filter it. Put the filtrate into a 100-mL volumetric flask, add mixture of methanol and water (8 : 2) to make 100 mL, and use this solution as the test solution. Separately, weigh accurately about 0.1 g of nicametate citrate RS and dissolve in the mixture of methanol and water (8 : 2) to make 100 mL. Use this solution as the standard solution. Perform the test with these solutions using the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of acetone, acetic acid(100) and water (10 : 5 : 3) to a distance of about 10 cm, and air-dry the plate. Spray Dragendorff's TS evenly onto the plate; the R_f value and the color of the spots obtained from the sample and the standard solutions are the same.

Dissolution Perform the test with 1 tablet of Nicametate

Citrate Tablets at 100 revolutions per minutes according to Method 2, using 900 mL of 0.05 mol/L of sodium acetate buffer (pH 4.0) as the dissolution medium. Filter the medium 45 minutes after starting the dissolution test, and use this solution as the test solution. Separately, weigh accurately about 11 mg of nicametate citrate RS and dissolve it in 0.05 mol/L sodium acetate buffer (pH 4.0) to make exactly 100 mL. Use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography and determine, A_T and A_S, of the peak area of nicametate citrate. The dissolution rate of Nicametate Citrate Tablets in 45 minutes is NLT 80%.

Dissolution rate (%) for the labeled amount of nicametate citrate ($C_{12}H_{18}N_2O_2 \cdot C_6H_8O_7$)

$$= W_S \times \frac{A_T}{A_S} \times \frac{1}{C} \times 900$$

*W*s: Amount (mg) of nicametate citrate RS

C: Labeled amount (mg) of nicametate citrate ($C_{12}H_{18}N_2O_2 \cdot C_6H_8O_7$) in 1 tablet

Operating Conditions

Detector: An ultraviolet absorption photometer (wavelength: 263 nm).

Column: A stainless steel column 4.6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: A mixture of methanol and 0.005 mol/L sodium octanesulfonate solution (45 : 55).

Flow rate: 1.2 mL/min

System suitability

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution under the above operating conditions; the relative standard deviation of the peak areas of nicametate citrate is NMT 2.0%.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately NLT 20 tablets of Nicametate Citrate Tablets and powder. Weigh accurately an amount, equivalent to about 100 mg of nicametate citrate ($C_{12}H_{18}N_2O_2 \cdot C_6H_8O_7$), and add the mixture of acetic acid and sodium acetate buffer (pH 4.0) to make 100mL. Pipet 10 mL of this solution, add the mixture of acetic acid and sodium acetate buffer (pH 4.0) to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 100 mg of nicametate citrate RS, and add the mixture of acetic acid and sodium acetate buffer (pH 4.0) to make 100mL. Pipet 10 mL of this solution, add the mixture of acetic acid and sodium acetate buffer (pH 4.0) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography and determine, A_T and A_S, of the peak area of nicametate.

Amount (mg) of nicametate citrate ($C_{12}H_{18}N_2O_2 \cdot C_6H_8O_7$)

$$= \text{Amount (mg) of nicametate citrate RS} \times \frac{A_T}{A_S}$$

Operating Conditions

Detector: An ultraviolet absorption photometer (wavelength: 263 nm).

Column: A stainless steel column 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μ*m* in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile Phase: Dissolve 1.08 g of sodium 1-octanesulfonate in water 1000 mL. To 550 mL of this solution, add 450 mL of methanol.

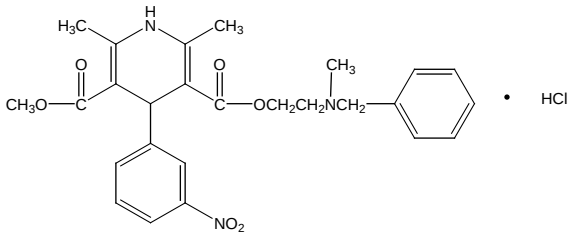
Flow rate: 1.0 mL/min

System suitability

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution under the above operating conditions; the relative standard deviation of the peak areas of nicametate is NMT 2.0%.

Packaging and storage Preserve in well-closed containers.

Nicardipine Hydrochloride
니카르디핀염산염



and enantiomer

$C_{26}H_{29}N_3O_6 \cdot HCl$: 515.99

3-(2-(Benzyl(methyl)amino)ethyl) 5-methyl 2,6-dimethyl-4-(3-nitrophenyl)-1,4-dihydropyridine-3,5-dicarboxylate hydrochloride [*54527-84-3*]

Nicardipine hydrochloride, when dried, contains NLT 98.5% and NMT 101.0% of nicardipine hydrochloride ($C_{26}H_{29}N_3O_6 \cdot HCl$).

Description Nicardipine Hydrochloride occurs as a slightly greenish yellow crystalline powder.
It is freely soluble in methanol or acetic acid(100), sparingly soluble in ethanol(95) and insoluble in water, acetonitrile or acetic anhydride.
A solution of Nicardipine Hydrochloride in methanol (1 in 20) shows no optical rotation.
It is gradually affected by light.

Identification (1) Determine the absorption spectra of Nicardipine Hydrochloride and a solution of nicardipine

hydrochloride RS in ethanol(99.5) (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Nicardipine Hydrochloride and nicardipine hydrochloride RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) Dissolve 20 mg of Nicardipine Hydrochloride in 10 mL of water and 3 mL of nitric acid; the solution responds to the Qualitative Analysis for chloride.

Melting point Between 167 and 171 °C.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Nicardipine Hydrochloride as directed under Method 4 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Related substances***—Perform the test using light-resistant container. Dissolve 0.10 g of Nicardipine Hydrochloride in 50 mL of the mobile phase and use this solution as the test solution. Pipet 1.0 mL of this solution and add the mobile phase to make exactly 50 mL. Pipet 1 mL of this solution, add the mobile phase to make exactly 10 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak area of each solution by automatic integration method; each peak area other than the peak of nicardipine is not greater than the peak area of nicardipine from the standard solution. Also, the sum of each peak area is not greater than 2 times the peak area of nicardipine from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silical gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 30 °C.

Mobile phase: A mixture of a solution of perchloric acid (43 in 50000) and acetonitrile (3 : 2).

Flow rate: Adjust the flow rate so that the retention time of nicardipine is about 6 minutes.

System suitability

Detection sensitivity: Pipet 2.0 mL of the standard solution and add the mobile phase to make exactly 20 mL. Adjust the peak area of nicardipine obtained from 20 μL of this solution to 8% to 12% of the peak area of nicardipine obtained from the standard solution.

System performance: Dissolve 2 mg each of Nicardipine Hydrochloride and nifedipine in 50 mL of the mobile phase. Proceed with 10 μL of this solution according to the above conditions; nicardipine and nifedipine are eluted in this order with the resolution being NLT 3.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area of nicardipine is NMT 3.0%.

Time span of measurement: About four times the retention time of nicardipine after the solvent peak.

Loss on drying NMT 1.0% (1 g, 105 °C, 2 hours).

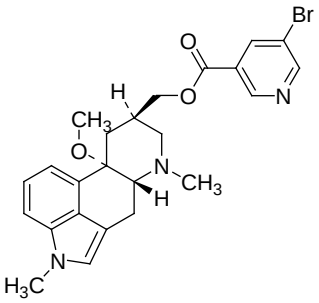
Residue on ignition NMT 0.1% (1 g).

Assay Perform the test using light-resistant containers. Weigh accurately about 0.9 g of Nicardipine Hydrochloride, previously dried, dissolve in 100 mL of a mixture of acetic anhydride and acetic acid(100) (7 : 3), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 1 mol/L perchloric acid VS
= 51.60 mg of $C_{26}H_{29}N_3O_6 \cdot HCl$

Packaging and storage Preserve in light-resistant, well-closed containers.

Nicergoline
니세르골린



$C_{24}H_{26}BrN_3O_3$: 484.39

[(6a*R*,9*R*,10a*S*)-10a-Methoxy-4,7-dimethyl-6a,8,9,10-tetrahydro-6*H*-indolo[4,3-fg]quinoline-9-yl]methyl-5-bromopyridine-3-carboxylate [*27848-84-6*]

Nicergoline, when dried, contains NLT 98.5% and NMT 101.0% of nicergoline ($C_{24}H_{26}BrN_3O_3$).

Description Nicergoline occurs as white to light yellow crystals or a crystalline powder.
It is sparingly soluble in ethanol(99.5), acetonitrile and acetic anhydride, and practically insoluble in water.
It is gradually changed to pale brown by light.

Melting point—About 136 ℃ (with decomposition).

Identification (1) Determine the absorption spectra of the solutions of Nicergoline and nicergoline RS in ethanol(99.5) (1 in 100000) as directed under the Ultraviolet-

visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infra spectra of Nicergoline and nicergoline RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Optical rotation $[\alpha]_D^{20}$: Between +5.2° and +6.2° (after drying, 0.5 g, ethanol(95), 10 mL, 100 mm).

Purity (1) ***Heavy metals*—**Weigh 2.0 g of Nicergoline and perform the test according to Method 2. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Related substances*—**Dissolve 25 mg of Nicergoline in 25 mL of acetonitrile and use it as the test solution. Pipet 1.0 mL of this solution and add acetonitrile to make exactly 100 mL. Pipet 10 mL of this solution, add acetonitrile to make exactly 50 mL, and use it as the standard solution. Take 20 μL each of the test solution and the standard solution and perform the test according to the Liquid Chromatography under the following conditions. Determine the peak area of each solution according to the automatic integration method; the peak area of a related substance with a retention time relative to nicergoline of about 0.5 is not greater than 4 times the peak area of nicergoline in the standard solution, and the peak area of other individual related substances is not greater than 2.5 times the peak area of nicergoline in the standard solution, and among the standard solutions of the peak area, there are NMT 2 peak areas greater than the peak area of nicergoline. In addition, the sum of peak areas other than nicergoline in the test solution is not greater than 7.5 times the peak area of nicergoline in the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 288 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with 5 μm octadecylsilanized silica gel for liquid chromatography.

Column temperature: A constant temperature of about 25 °C.

Mobile phase: A mixture of 0.05 mol/L potassium dihydrogen phosphate TS (pH 7.0), methanol and acetonitrile (350 : 350 : 300).

Flow rate: Adjust the flow rate so that the retention time of nicergoline is about 25 minutes.

System suitability

Test for required detectability: Add acetonitrile to 1 mL of the test solution to make exactly 50 mL, and use it as the system suitability solution. Take exactly 5 mL of this solution and add acetonitrile to make exactly 100 mL. Confirm that the peak area of nicergoline obtained from 20 μL of this solution is 3 to 7% of the peak area of nicergoline obtained from 20 μL of system suitability solution.

System performance: Proceed with 20 μL of the test solution under the above conditions; the number of theoretical plates of nicergoline is NLT 8000 and the coefficient of symmetry is NMT 2.0.

System reproducibility: Repeat the test 6 times with 20 μL each of the standard solution under the above conditions; the relative standard deviation of the peak area of nicergoline is NMT 4.0%.

Time span of measurement: About 2 times the retention time of nicergoline after the solvent peak.

Loss on drying NMT 0.5% (2 g, in vacuum, 60 ℃, 2 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.4 g of Nicergoline, after drying, add 10 mL of acetic anhydride, dissolve it by heating. After cooling, add 40 mL of nitrobenzene and titrate with 0.1 mol/L perchloric acid VS (indicator: 10 drops of neutral red TS). However, the endpoint of the titration is when the solution changes from red to bluish purple to bluish green. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 24.22 mg of $C_{24}H_{26}BrN_3O_3$

Packaging and storage Preserve in light-resistant, tight containers.

Nicergoline Tablets
니세르골린 정

Nicergoline Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of nicergoline ($C_{24}H_{26}BrN_3O_3$: 484.39).

Method of preparation Prepare as directed under Tablets, with Nicergoline.

Identification Powder Nicergoline Tablets, weigh an amount equivalent to 10 mg of nicergoline according to the labeled amount, add 20 mL of ethanol(99.5), shake strongly for 10 minutes to mix, and filter using a membrane filter with a pore size of NMT 0.45 μm. Add ethanol(99.5) to 2 mL of the filtrate to make 100 mL. Determine the absorption spectra of this solution as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum between 226 nm and 230 nm and a minimum between 286 nm and 290 nm.

Purity (1) ***Related substances***—With 20 mL of the test solution obtained from the Assay, perform the test according to the Liquid Chromatography under the following conditions. Measure each peak area of the test solution according to the automatic integration method and obtain each amount by the percentage peak area method;

the total area of the peaks other than nicergoline is NMT 2.0%.

Operating conditions

For the detector, column, column temperature, mobile phase and flow rate, comply with the operating conditions in the Assay.

System suitability

System performance: Proceed as directed under the system suitability under the Assay.

Test for required detectability: Add a mixture of acetonitrile and water (17 : 3) to 1 mL of the standard solution obtained from the Assay to make 50 mL and use it as the system suitability solution. Pipet 5 mL of this solution and add a mixture of acetonitrile and water (17 : 3) to make exactly 100 mL. Confirm that the peak area of nicergoline obtained from 20 μL of this solution is 3 to 7% of the peak area of nicergoline obtained from 20 μL of the system suitability solution.

System reproducibility: Repeat the test 6 times with each 20 μL of the system suitability solution under the above conditions; the relative standard deviation of the peak area of nicergoline is NMT 1.5%.

Time span of measurement: About 2 times the retention time of nicergoline from the solvent peak.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements when the content uniformity test is perform as follows: Add exactly 25 mL of diluted ethanol (4 in 5) to 1 Nicergoline Tablet, sonicate to disperse the particles into smaller pieces, and shake vigorously for 5 minutes to mix. Centrifuge this solution for 10 minutes, take exactly 4 mL of the clear supernatant, add diluted ethanol (4 in 5) to this solution to make exactly 25 mL, and use this solution as the test solution. Separately, dry nicergoline RS under reduced pressure at 60 °C for 2 hours, and dissolve exactly 10 mg of this drug in 25 mL of diluted ethanol (4 in 5). Pipet 4 mL of this solution, add diluted ethanol (4 in 5) to make exactly 50 mL, and use this solution as the standard solution. With the test solution and the standard solution, determine the absorbance A_{T1} and A_{S1} at 288 nm and absorbances A_{T2} and A_{S2} at 340 nm as directed under the Ultraviolet-visible Spectroscopy.

$$\text{Amount (mg) of nicergoline } (C_{24}H_{26}BrN_4O_3) = \text{Amount (mg) of nicergoline RS} \times \frac{A_{T1}-A_{T2}}{A_{S1}-A_{S2}} \times \frac{1}{2}$$

Assay Take NLT 20 tablets of Nicergoline Tablets and weigh accurately the mass, powder them. Weigh accurately an amount equivalent to about 20 mg of nicergoline ($C_{24}H_{26}BrN_3O_3$), add exactly 20 mL of a mixture of acetonitrile and water (17 : 3), shake strongly for 10 minutes, centrifuge for 10 minutes, and use the clear liquid at the top layer as the test solution. Separately, weigh accurately about 20 mg of nicergoline RS, previously dried for 2 hours under reduced pressure at 60 ℃ and dissolve exactly in 20 mL of a mixture of acetonitrile and water (17 : 3) to use as the standard solution. Take exactly 20 μL each of the test solution and standard solution and perform the test according to the Liquid Chromatography under the following conditions, and measure the A_T and A_S peak areas of nicergoline in each solution.

$$\text{Amount (mg) of nicergoline } (C_{24}H_{26}BrN_4O_3) = \text{Amount (mg) of nicergoline RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 288 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: A mixture of 0.05 mol/L potassium dihydrogen phosphate TS (pH 7.0), methanol, and acetonitrile (350 : 350 : 300).

Flow rate: Adjust the flow rate so that the retention time of nicergoline is about 25 minutes.

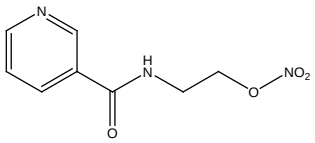
System suitability

System performance: Proceed with 20 μL of standard solution under the above conditions; the number of theoretical plates of nicergoline is NLT 8000 and the coefficient of symmetry is NMT 2.0.

System reproducibility: Repeat the test 6 times with 20 μL each of standard solution under the above conditions; the relative standard deviation of the nicergoline peak area is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Nicorandil
니코란딜



$C_8H_9N_3O_4$: 211.17

2-[(Pyridin-3-ylcarbonyl)amino]ethyl nitrate [*65141-46-0*]

Nicorandil contains NLT 98.5% and NMT 101.0% of nicorandil (C8H9N3O4), calculated on the anhydrous basis.

Description Nicorandil occurs as white crystals.
It is freely soluble in methanol, ethanol(99.5) and acetic acid(100), sparingly soluble in acetic anhydride and practically insoluble in water.

Melting point—About 92 °C (with decomposition).

Identification (1) Determine the absorption spectra of Nicorandil and nicorandil RS (1 in 50000) as directed

under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Nicorandil and nicorandil RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit the same intensities of absorption at the same wavenumbers.

Purity (1) ***Sulfate***—Dissolve 2.0 g of Nicorandil in 20 mL of dilute ethanol, add 1 mL of dilute hydrochloric acid and water to make 50 mL, and use this solution as the test solution. Prepare the control solution with 0.40 mL of 0.005 mol/L sulfuric acid VS, 20 mL of dilute ethanol, 1 mL of dilute hydrochloric acid and water to make 50 mL (NMT 0.010%).

(2) ***Heavy metals***—Proceed with 2.0 g of Nicorandil as directed under Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Related substances***—Dissolve 20 mg of Nicorandil in 10 mL of mobile phase and use this solution as the test solution. Perform the test with 10 μL of the test solution as directed under the Liquid Chromatography according to the following conditions. Determine each peak area of the test solution by the automatic integration method; the peak area of *N*-(2-hydroxyethyl)isonicotinamide nitric acid ester, which has a relative retention time of about 0.86 with respect to nicorandil, is NMT 0.5% of the peak area of nicorandil, the each area of other peaks is NMT 0.1%, and the sum area of the peaks other than nicorandil and *N*-(2-hydroxyethyl)isonicotinamide nitric acid ester is NMT 0.25% of the total peak area.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.0 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: A mixture of water, tetrahydrofuran, triethylamine and trifluoroacetic acid (982 : 10 : 5 : 3).

Flow Rate: Adjust the flow rate so that the retention time of nicorandil is about 18 minutes.

System suitability

Test for required detectability: Pipet 1 mL of the test solution, add the mobile phase to make exactly 500 mL, and use this solution as the system suitability test solution. Pipet 1 mL of the system suitability test solution and add the mobile phase to make exactly 20 mL. Confirm that the peak area obtained from 10 μL of this solution is 2% to 8% of the peak area of nicorandil in the system suitability test solution.

System performance: Dissolve 10 mg of *N*-(2-hydroxyethyl)isonicotinamide nitric acid ester in the mobile phase to make 100 mL. Proceed with the solution, prepared by adding 10 mL of the test solution to 1 mL of this solution, according to the above conditions; *N*-(2-hydroxyethyl)isonicotinamide nitric acid ester and nicorandil are eluted in this order with the resolution between these peaks being NLT 3.0.

System repeatability: Repeat the test 6 times with 10 μL each of the system suitability solution according to the above condition; the relative standard deviation of the peak area of nicorandil is NMT 1.5%.

Time span of measurement: About 3 times the retention time of nicorandil after the solvent peak.

Water NMT 0.1% (2 g, volumetric titration, direct titration).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.3 g of Nicorandil, dissolve in 30 mL of a mixture of acetic anhydride and acetic acid(100) (7 : 3), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 21.12 mg of $C_8H_9N_3O_4$

Packaging and storage Preserve in tight containers at a temperature between 2 and 8 °C.

Nicorandil Tablets
니코란딜 정

Nicorandil Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of nicorandil ($C_8H_9N_3O_4$: 211.18).

Method of preparation Prepare as directed under Tablets, with Nicorandil.

Identification (1) Weigh an amount equivalent to 20 mg of nicorandil ($C_8H_9N_3O_4$), according to the labeled amount of Nicorandil Tablets, add 50 mL of water, shake to mix for 10 minutes, and then filter. Take 5 mL of the filtrate and add water to make 100 mL. Determine the absorption spectrum of this solution as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum between 260 nm and 264 nm.

(2) Weigh an amount equivalent to 50 mg of nicorandil ($C_8H_9N_3O_4$), according to the labeled amount of Nicorandil Tablets, add 5 mL of dilute methanol (4 in 5), shake to mix for 10 minutes, and then filter. Use the filtrate as the test solution. Separately, weigh 50 mL of nicorandil RS, dissolve in 5 mL of dilute methanol (4 in 5), and use this solution as the standard solution. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography (with a fluorescence indi-

cator). Next, develop the plate with acetone as the developing solvent to a distance of about 13 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the colors and R_f values of the spots obtained from the test solution and the standard solution are the same.

Dissolution Perform the test with 1 tablet of Nicorandil Tablets at 50 revolutions per minute according to Method 2, using 500 mL of water as the dissolution medium. Take the medium 15 minutes after starting the dissolution test, and filter. Discard the initial 10 mL of the filtrate and pipet V mL of the subsequent filtrate. Add water to make exactly V' mL so that the solution contains 4 μg of nicorandil ($C_8H_9N_3O_4$) per mL according to the labeled amount. Use this solution as the test solution. Separately, weigh accurately 20 mg of nicorandil RS, and dissolve in water to make 100 mL. Pipet 2 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine, A_T and A_S, of the peak area of nicorandil. The dissolution rate of Nicorandil Tablets in 15 minutes is NLT 70%.

Dissolution rate (%) with respect to the labeled amount of *nicorandil* ($C_8H_9N_3O_4$)

$$= W_S \times \frac{V'}{V} \times \frac{A_T}{A_S} \times \frac{1}{C}$$

*W*s: Amount (mg) of nicorandil RS

C: The labeled amount (mg) of nicorandil ($C_8H_9N_3O_4$) in 1 tablet

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless-steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: A mixture of water and methanol (65 : 35).

Flow rate: 1.0 mL/min

Uniformity of dosage units Meets the requirements according to the following procedure. After adding 1 mL of water to 1 tablet of Nicorandil Tablets to disintegrate, add 15 mL of water, shake to mix for 10 minutes, and adjust the volume to V mL with water to contain about 0.1 mg of nicorandil ($C_8H_9N_3O_4$) in 1 mL. Then, filter the solution. Discard the initial 10 mL of the filtrate, take 10.0 mL of the subsequent filtrate, add water to make 50 mL, and use this solution as the test solution. Separately, weigh accurately 20 mg of nicorandil RS, and dissolve in water to make 100 mL. Take 5.0 mL of this solution, add water to make 50 mL, and use this solution as the standard solution. Determine the absorption spectra of the test solution and the standard solution, A_T and A_S, using water as the control solution, as directed under the Ultraviolet-visible Spectroscopy at a wavelength of 262 nm.

Amount (mg) of nicorandil ($C_8H_9N_3O_4$)

$$= \text{Amount (mg) of nicorandil RS} \times \frac{A_T}{A_S}$$

Assay Weigh accurately the mass of NLT 20 tablets of Nicorandil Tablets and powder. Weigh accurately an amount equivalent to about 20 mg of nicorandil ($C_8H_9N_3O_4$), and add the mobile phase to make 100 mL. After filtering this solution, take 10 mL of the filtrate, add the mobile phase to make 100 mL, and use this solution as the test solution. Separately, weigh accurately about 20 mg of nicorandil RS and dissolve in the mobile phase to make 100 mL. Take 10 mL of this solution, add the mobile phase to make 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine, A_T and A_S, of the peak area of nicorandil.

Amount (mg) of nicorandil ($C_8H_9N_3O_4$)

$$= \text{Amount (mg) of nicorandil RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: A mixture of water and methanol (65 : 35).

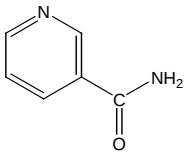
Flow rate: 1.0 mL/min

System suitability

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area of nicorandil is NMT 2.0%.

Packaging and storage Preserve in well-closed containers.

Nicotinamide
니코틴산아미드



$C_6H_6N_2O$: 122.13

Pyridine-3-carboxamide [*98-92-0*]

Nicotinamide, when dried, contains NLT 98.5% and NMT 102.0% of nicotinamide ($C_6H_6N_2O$).

Description Nicotinamide occurs as white crystals or a crystalline powder, which is odorless and has a bitter taste.
It is freely soluble in water or ethanol(95) and slightly soluble in ether.

Identification (1) Mix 5 mg of Nicotinamide with 10 mg of 1-chloro-2,4-dinitrobenzene, heat gently for 5 to 6 seconds to dissolve. After cooling, add 4 mL of potassium hydroxide-ethanol TS; the resulting solution exhibits a red color.

(2) Add 5 mL of sodium hydroxide TS to 20 mg of Nicotinamide and boil carefully; the gas produced changes the moistened red litmus paper to blue.

(3) Add water to 20 mg of Nicotinamide and nicotinamide RS to make 1000 mL, and determine the absorption spectra of these solutions as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

pH Dissolve 1.0 g of Nicotinamide in 20 mL of water; the pH of the resulting solution is between 6.0 and 7.5.

Melting point Between 128 and 131 ℃.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Nicotinamide in 20 mL of water; the resulting solution is clear and colorless.

(2) ***Chloride***—Proceed with about 0.5 g of Nicotinamide and perform the test. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid (NMT 0.021%).

(3) ***Sulfate***—Proceed with about 1.0 g of Nicotinamide and perform the test. Prepare the control solution with 0.40 mL of 0.005 mol/L sulfuric acid (NMT 0.019%).

(4) ***Heavy metals***—Proceed with 1.0 g of Nicotinamide according to Method 1 and perform the test. Prepare the control solution with 3.0 mL of lead standard solution (NMT 30 ppm).

(5) ***Readily carbonizable substances***—Proceed with 0.20 g of Nicotinamide and perform the test. The color of this solution is not more intense than that of the matching fluid A.

Loss on drying NMT 0.5% (1 g, in vacuum, silica gel, 4 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 25 mg of Nicotinamide and nicotinamide RS, previously dried, dissolve in 3 mL of water, respectively, and add the mobile phase to make exactly 100 mL. Pipet 8 mL of each of these solutions, and add the mobile phase to each solution to make exactly 50 mL. Pipet 5 mL of each of these solutions, add exactly 5 mL of internal standard solution to each solution, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the peak area ratios, Q_T and Q_S, of nicotinamide to internal standard, respectively.

$$\text{Amount (mg) of nicotinamide } (C_6H_6N_2O) = \text{Amount (mg) of nicotinamide RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of nicotinic acid (1 in 250000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: Dissolve 1.0 g of sodium 1-heptanesulfonate in water to make 1000 mL. Add 300 mL of methanol to 700 mL of this solution.

Flow Rate: Adjust the flow rate so that the retention time of nicotinamide is about 7 minutes.

System suitability

System performance: Proceed with 20 μL of the standard solution according to the above conditions; the nicotinic acid and nicotinamide are eluted in this order with the resolution being NLT 5.

System repeatability: Repeat the test 6 times with 20 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area of nicotinamide to that of the internal standard is NMT 1.0%.

Packaging and storage Preserve in tight containers.

33.3% Nicotinamide Powder
니코틴산아미드 3배산

33.3% Nicotinamide Powder contains NLT 32.6% of nicotinamide ($C_6H_6N_2O$: 122.13).

Method of preparation Prepare by finely dispersing nicotinamide in edible fatty acid. 33.3% Nicotinamide Powder can be added with nicotinamide coated with silicon dioxide. 33.3% Nicotinamide Powder is a drug substance.

Description 33.3% Nicotinamide Powder occurs as a white to pale yellow powder.

Identification (1) Mix 5 mg of 33.3% Nicotinamide Powder with 10 mg of 2,4-dinitrochlorobenzene, heat gently for 5 to 6 seconds to dissolve. After cooling, add 4 mL of potassium hydroxide-ethanol TS; the resulting solution exhibits a red color.

(2) Add 5 mL of sodium hydroxide TS to 20 mg of 33.3% Nicotinamide Powder and boil over low heat; the gas produced changes moistened red litmus paper to blue.

(3) Dissolve about 20 mg of 33.3% Nicotinamide Powder in water to make 1000 mL. Determine the absorption spectrum of this solution as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum between 261 nm and 263 nm and a minimum between 243 nm and 247 nm. When the absorbance of this solution at the absorbance maximum wavelength is represented as A_1 and the absorbance at the absorbance minimum wavelength is represented as A_2, A_2/A_1 is between 0.63 and 0.67.

Water NMT 1.0% (0.5 g, volumetric titration, direct titration).

Residue on ignition NMT 1.3% (1 g).

Assay Weigh accurately about 20 mg of 33.3% Nicotinamide Powder, previously dried, and dissolve in water to make 100 mL. Take 5.0 mL of this solution and 8.0 mL of the internal standard solution, add water to make 100.0 mL, and use this solution as the test solution. Separately, weigh accurately 20 mg of nicotinamide RS, and dissolve in water to make 100.0 mL. Take 5.0 mL of this solution and 8.0 mL of the internal standard solution, add water to make 100 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography under the following conditions, and calculate the peak area ratios, Q_T and Q_S, of nicotinamide to internal standard, respectively.

$$\text{Amount (mg) of nicotinamide } (C_6H_6N_2O) = \text{Amount (mg) of nicotinamide RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—Weigh about 50 mg of anhydrous caffeine RS and dissolve in water to make 100 mL.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 15 cm to 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm to 10 μm in particle diameter).

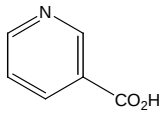
Mobile phase: Dissolve 1.0 g of sodium 1-hexanesulfonate in 750 mL of water and add 250 mL of methanol and 10 mL of acetic acid.

Flow Rate: Adjust the flow rate so that the retention time of nicotinamide is about 4 minutes.

Selection of column: Proceed with 20 μL of the standard solution under the above conditions. Use a column with the resolution of NLT 4.0 with nicotinamide and the internal standard being eluted in this order.

Packaging and storage Preserve in light-resistant, tight containers.

Nicotinic Acid
니코틴산



$C_6H_5NO_2$: 123.11

Pyridine-3-carboxylic acid [*59-67-6*]

Nicotinic Acid, when dried, contains NLT 99.5% and NMT 101.0% of nicotinic acid ($C_6H_5NO_2$).

Description Nicotinic Acid occurs as white crystals or a crystalline powder, which is odorless and has a slightly sour taste.

It is sparingly soluble in water, slightly soluble in ethanol(95) and very slightly soluble in ether.

It is soluble in sodium hydroxide TS or sodium carbonate TS.

Identification (1) Mix 5 mg of Nicotinic Acid with 10 mg of 1-chloro-2,4-dinitrobenzene and heat gently for 5 to 6 seconds to dissolve. After cooling, add 4 mL of potassium hydroxide-ethanol TS; the resulting solution exhibits a dark red color.

(2) Dissolve 20 mg of Nicotinic Acid and nicotinic acid RS in water to make 1000 mL. With these solutions, determine the absorption spectra as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

Melting point Between 234 and 238 ℃.

pH Dissolve 0.20 g of Nicotinic Acid in 20 mL of water; the pH of this solution is between 3.0 and 4.0.

Purity (1) ***Clarity and color of solution***—Dissolve 0.20 g of Nicotinic Acid in 20 mL of water; the resulting solution is clear and colorless.

(2) ***Chloride***—Proceed with 0.5 g of Nicotinic Acid and perform the test. Prepare the control solution with

0.30 mL of 0.01 mol/L hydrochloric acid (NMT 0.021%).

(3) ***Sulfate***—Dissolve 1.0 g of Nicotinic Acid in 3 mL of dilute hydrochloric acid and water to make 50 mL. Use the resulting solution as the test solution to perform the test. Prepare the control solution with 0.40 mL of 0.005 mol/L sulfuric acid and 3 mL of dilute hydrochloric acid to make 50 mL (NMT 0.019%).

(4) ***Nitro compounds***—Dissolve 8 mL of sodium hydroxide TS and water in 1.0 g of Nicotinic Acid to make 20 mL; the color of this resulting solution is not more intense than that of the matching fluid A.

(5) ***Heavy metals***—Proceed with 1.0 g of Nicotinic Acid according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

Loss on drying NMT 0.5% (1 g, 105 ℃, 1 hour).

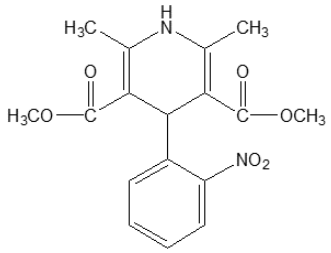
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.3 g of Nicotinic Acid, previously dried, dissolve in 50 mL of water, and titrate with 0.1 mol/L sodium hydroxide VS (indicator: 5 drops of phenolphthalein TS).

Each mL of 0.1 mol/L sodium hydroxide VS
= 12.311 mg of $C_6H_5NO_2$

Packaging and storage Preserve in well-closed containers.

Nifedipine
니페디핀



$C_{17}H_{18}N_2O_6$: 346.34

Dimethyl-2,6-dimethyl-4-(2-nitrophenyl)-1,4-dihydropyridine-3,5-dicarboxylate [*21829-25-4*]

Nifedipine contains NLT 98.0% and NMT 102.0% of nifedipine ($C_{17}H_{18}N_2O_6$), calculated on the dried basis.

Description Nifedipine occurs as a yellow crystalline powder, and odorless and tasteless.
It is freely soluble in acetone or dichloromethane, sparingly soluble in methanol, ethanol(95) or acetic acid(100), slightly soluble in ether and practically insoluble in water.
It is changed by light.

Identification (1) Dissolve 50 mg of Nifedipine in 5 mL of ethanol(95), add 5 mL of hydrochloric acid and 2 g of zinc powder, allow to stand for 5 minutes, and filter. Perform the test with the filtrate as directed under the Qualitative Analysis for aromatic primary amine; the solution exhibits a purple color.

(2) Determine the absorption spectra of the solutions of Nifedipine and nifedipine RS in methanol (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared spectra of Nifedipine and nifedipine RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Melting point Between 172 and 175 ℃.

Purity (1) ***Clarity and color of solution***—Dissolve 0.5 g of Nifedipine in 5 mL of acetone; the solution is yellow and clear.

(2) ***Chloride***—To 2.5 g of Nifedipine, add 12 mL of dilute acetic acid and 13 mL of water, and heat to boiling. Filter it after cooling, discard the first 10 mL of the filtrate, take 5 mL of the subsequent filtrate, and add 6 mL of dilute nitric acid and water to make 50 mL. Use this solution as the test solution. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid (NMT 0.021%).

(3) ***Sulfate***—Take 4 mL of the filtrate of (2) and add 1 mL of dilute hydrochloric acid and water to make 50 mL. Use this solution as the test solution. Prepare the control solution with 0.45 mL of 0.005 mol/L sulfuric acid (NMT 0.054%).

(4) ***Heavy metal***—Proceed with 2.0 g of Nifedipine as directed under Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(5) ***Arsenic***—Prepare the test solution with 1.0 g of Nifedipine according to Method 3 and perform the test it (NMT 2 ppm).

(6) ***Basic substances***—Perform the test in a light-resistant container away direct sunlight. To about 5.0 g of Nifedipine, dissolve 80 mL of a mixture of acetone and acetic acid(31) (5 : 3), and titrate with 0.02 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction. NMT 1.9 mL of 0.02 mol/L perchloric acid VS is consumed.

(7) ***Related substances***—Perform the test quickly using a light-resistant container. Weigh accurately 25 mg of Nifedipine, dissolve in 25 mL of methanol, add the mobile phase to make exactly 250 mL, and use this solution as the test solution. Separately, weigh accurately an appropriate amount of nifedipine RS, and dissolve in methanol to make a solution containing 1 mg per mL. Take accurately an appropriate amount of this solution, add the mobile phase to make a solution containing 0.3 mg per mL, and use this solution as the standard solution for nifedipine. Also, weigh accurately an appropriate

amount of nifedipine nitrophenylpyridine analog RS, and dissolve in methanol to make a solution containing 1 mg per mL. Pipet an appropriate amount of this solution, add the mobile phase to make a solution containing 0.6 mg per mL, and use this solution as the standard solution (1). Weigh accurately an appropriate amount of nifedipine nitrosophenylpyridine analog RS, and dissolve in methanol to make a solution containing 1 mg per mL. Take an accurate amount of this solution, add the mobile phase to make a solution containing 0.6 μg per mL, and use this solution as the standard solution (2). Transfer accurately 5 mL each of the standard solution (1) and the standard solution (2) into a container, add exactly 5 mL of the mobile phase to the container, and use the solution as the standard solution. Perform the test with 25 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Measure the peak areas of the nifedipine related substances, A_T and A_S in each solution to determine the amount of the nifedipine related substances. Nifedipine nitrosophenylpyridine analogues and nifedipine nitrosophenylpyridine analogues are NMT 0.2%.

Operating conditions

Detector: An ultraviolet absorbance photometer (wavelength: 265 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter). Fill the assistant column with octadecylsilanized silica gels.

Mobile phase: A mixture of water, methanol and acetonitrile (50 : 25 : 25).

Flow rate: 1 mL/min

System suitability

System performance: Proceed with 25 μL of a mixture of the standard solution for nifedipine, the standard solution (1) and the standard solution (2) under the above conditions; nitrophenylpyridine, nitrosophenylpyridine and nifedipine are eluted in this order, and the resolution of nitrophenylpyridine and nitrosophenylpyridine is NLT 1.5, and that of nitrosophenylpyridine and nifedipine is NLT 1.0.

System repeatability: Repeat the test 6 times with 25 μL each of the mixed solution according to the above conditions; the relative standard deviation of the peak area of each related substance is NMT 10%.

Loss on drying NMT 0.5% (0.5 g, 105 ℃, 2 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Perform the test in a light-resistant container away from direct sunlight. Weigh accurately about 0.12 g of Nifedipine and dissolve in methanol to make exactly 200 mL. Pipet 5 mL of this solution and add methanol to make exactly 100 mL. Perform the test with this solution as directed under the Ultraviolet-visible Spectroscopy, and determine the absorbance of this solution, *A*, at the absorbance maximum wavelength at about 350 nm.

$$\text{Amount (mg) of nifedipine } (C_{17}H_{18}N_2O_6) = \frac{A}{142.3} \times 40000$$

Packaging and storage Preserve in light-resistant, tight containers.

Nifedipine Capsules
니페디핀 캡슐

Nifedipine Capsules contain NLT 90.0% and NMT 110.0% of the labeled amount of nifedipine ($C_{17}H_{18}N_2O_6$ 346.34).

Method of preparation Prepare as directed under Capsules, with Nifedipine.

Identification (1) Take the contents of 3 capsules of Nifedipine Capsules, put into a centrifuge tube, add 20 mL of 0.1 mol/L sodium hydroxide TS, and then add 25 mL of dichloromethane. Stopper the tube, and invert it several times to carefully release the pressure in the centrifuge tube. Stopper it again, shake gently for 1 hour, centrifuge for 10 minutes at 2000 to 2500 revolutions per minute, and use the clear liquid in the lower layer as the test solution. Separately, weigh an appropriate amount of nifedipine RS, dissolve in dichloromethane to make a solution containing 1.2 mg per mL, and use this solution as the standard solution. Mix equal volumes of the test solution and the standard solution, and use this solution as the mixed solution With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 500 μL each of the test solution, the standard solution and the mixed solution on a plate (0.5 mm in thickness) made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of ethyl acetate and cyclohexane (1 : 1) as a developing solvent to a distance of about 15 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm); each solution exhibits dark blue principal spots at a R_f value of about 0.3. Also, spray the plate with the coloring agent; the spots from each solution exhibit a light orange band against a yellow background.

(2) The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

Coloring agent—Dissolve 10 mL of 3 mol/L hydrochloric acid TS in 3 g of bismuth subnitrate and 30 g of potassium iodide, and add water to make 100 mL. Before use, take exactly 10 mL of this solution, add 10 mL of 3 mol/L hydrochloric acid TS and water to make 100 mL.

Related substances Perform the test quickly in a light-resistant container away from direct sunlight. Prepare the test solution as directed under the Assay. Separately, weigh accurately an appropriate amount of nifedipine RS,

and dissolve in methanol to make a solution containing 1 mg per mL. Pipet an appropriate amount of this solution, add the mobile phase to make a solution containing 0.3 mg per mL, and use this solution as the standard solution for nifedipine. Also, weigh accurately an appropriate amount of nifedipine nitrophenylpyridine analog RS, and dissolve in methanol to make a solution containing 1 mg per mL. Take an appropriate amount of this solution, add the mobile phase to make a solution containing 6 μg per mL, and use this solution as the standard solution (1). Weigh accurately an appropriate amount of nifedipine nitrosophenylpyridine analog RS, and dissolve in methanol to make a solution containing 1 mg per mL. Take an appropriate amount of this solution, add the mobile phase to make a solution containing 1.5 μg per mL, and use this solution as the standard solution (2). Pipet 5 mL each of the standard solution (1) and the standard solution (2), and make a solution by adding accurately 5 mL of the mobile phase. Use this solution as the standard solution. Perform the test with 25 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and measure the peak areas A_T and A_S of nifedipine related substance of each solution to determine the amount of nifedipine related substance. Dimethyl 4-(2-nitrophenyl)-2,6-dimethylpyridine-3,5-dicarboxylic acid, equivalent to nifedipine nitrophenylpyridine, is NMT 2.0% and Dimethyl 4 (2-nitrosophenyl)-2,6-dimethylpyridine-3,5-dicarboxylic acid, equivalent to nifedipine nitrosophenylpyridine, is NMT 0.5%.

Operating conditions

For the detector, column, mobile phase and flow rate, comply with the operating conditions under the Assay.

System suitability

System performance: Proceed with 25 μL of the mixture of the standard solution for nifedipine, the standard solution (1), the standard solution (2) (1 : 1 : 1) under the above conditions; nitrophenylpyridine, nitrosophenylpyridine and nifedipine are eluted in this order. The resolution between the peaks of nitrophenylpyridine and nitrosophenylpyridine is NLT 1.5 and the resolution between the peaks of nitrosophenylpyridine and nifedipine is NLT 1.0.

System repeatability: Repeat the test 6 times with 25 μL each of the mixed solution under the above conditions; the relative standard deviation calculated on the peak area of each related substance is NMT 10%.

Dissolution Take 1 capsule of Nifedipine Capsules and perform the test at 50 revolutions per minute according to Method 2, using 900 mL of Solution 1 for the Disintegration as the test solution. Take the dissolved solution 20 minutes after starting the test, filter, and use the filtrate as the test solution by suitably diluting with the dissolution solution, if necessary. Separately, weigh accurately a portion of nifedipine RS, add the dissolution solution to make the same concentration with the test solution, and use this solution as the standard solution. Perform the test with the test solution and the standard solution as directed under the Ultraviolet-visible Spectroscopy, using the dissolution solution as the control solution, and determine the ultraviolet absorbance at the absorbance maximum wavelength at about 340 nm.

It meets the requirements when the dissolution rate of Nifedipine Capsules in 20 minutes is NLT 80%.

Uniformity of dosage units Meets the requirements.

Assay Perform this procedure quickly using a light-resistant container away direct sunlight. Take 5 capsules of Nifedipine Capsules, put the contents into a volumetric flask with a small amount of methanol, add the mobile phase to make a solution containing 0.1 mg of nifedipine per mL, and make the total amount *V* mL. Use this solution as the test solution. Separately, take accurately an appropriate amount of nifedipine RS, dissolve in methanol to make a solution containing 1 mg per mL. Take an appropriate amount of this solution, add the mobile phase to make a solution containing 0.1 mg per mL, and use this solution as the standard solution. Perform the test with 25 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and measure the peak areas A_T and A_S.

$$\text{Amount (mg) of nifedipine } (C_{17}H_{18}N_2O_6) \text{ in 1 capsule} = \frac{V \times C}{5} \times \frac{A_T}{A_S}$$

C: Concentration (mg/mL) of standard solution

Operating conditions

Detector: An ultraviolet absorbance photometer (wavelength: 265 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with 5 μm octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter). Fill the assistant column with octadecylsilanized silica gels.

Mobile phase: A mixture of water, methanol and acetonitrile (50 : 25 : 25).

Flow rate: 1 mL/min

System suitability

System performance: Proceed with 25 μL of the standard solution according to the above conditions; the symmetry factor is NMT 1.5.

System repeatability: Repeat the test 6 times with 25 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area for nifedipine is NMT 1.0%.

Packaging and storage Preserve in light-resistant, tight containers at between 15 and 25 °C.

Nifedipine Tablets
니페디핀 정

Nifedipine Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of nifedipine ($C_{17}H_{18}N_2O_6$: 346.33).

Method of preparation Prepare as directed under Tablets, with Nifedipine.

Identification Weigh an amount equivalent to 20 mg of nifedipine according to the labeled amount, add 5 mL of acetone, shake well to dissolve, centrifuge, and use the clear supernatant as the test solution. Separately, weigh 20 mg of nifedipine RS, dissolve in 5 mL of acetone, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on a thin-layer chromatographic plate made of silica gel for thin-layer chromatography (fluorescent indicator added). Next, develop the plate with a mixture of ethyl acetate and cyclohexane (50 : 50) as a developing solvent to a distance of about 15 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm), the colors and R_f values of the spots obtained from the test solution and the standard solution are the same.

Dissolution Perform the test quickly using a light-resistant container. Take 1 tablet of Nifedipine Tablets and perform the test at 100 revolutions per minute according to Method 2, using 900 mL of the test solution. Take the dissolved solution 60 minutes after starting the test and filter it. Discard the first 10 mL of the filtrate, pipet *V* mL of the subsequent filtrate, add the test solution to contain about 10 μg of nifedipine per mL according to the labeled amount. Make it exactly *V′* mL and use this solution as the test solution. Separately, weigh accurately about 100 mg of nifedipine RS and dissolve in methanol to make exactly 100 mL. Take exactly 1 mL of this solution, add the test solution to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 25 μL each of the test solution and the standard solution according to the Liquid Chromatography under the following conditions, and measure the peak areas A_T and A_S of nifedipine ($C_{17}H_{18}N_2O_6$) in each solution. It meets the requirements when the dissolution rate of Nifedipine Tablets in 60 minutes is NLT 50%.

Dissolution rate (%) relative to the labeled amount of nifedipine ($C_{17}H_{18}N_2O_6$)

$$= W_S \times \frac{V'}{V} \times \frac{A_T}{A_S} \times \frac{1}{C} \times 9$$

*W*s: Amount (mg) of nifedipine RS

C: Labeled amount (mg) of nifedipine ($C_{17}H_{18}N_2O_6$) in 1 tablet

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 338 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 30 °C.

Mobile phase: A mixture of acetonitrile, methanol and water (7 : 7 : 5).

Flow rate: 1 mL/min

System suitability

System repeatability: Repeat the test 6 times under the above conditions with 25 μL each of standard solution; the relative standard deviation of the peak area of nifedipine is NMT 2.0%.

Test solution—Dissolve 180 g of polysorbate 80 in Solution 2 of the Dissolution to make 6 L.

Uniformity of dosage unit Meets the requirements.

Assay Perform this procedure quickly using a light-resistant vessels. Weigh accurately the mass of NLT 20 Nifedipine Tablets, and power. Weigh accurately an amount equivalent to about 50 mg of nifedipine ($C_{17}H_{18}N_2O_6$) and dissolve in methanol to make exactly 50 mL. Filter it, discard the first 10 mL of the filtrate, take exactly 10 mL of the subsequent filtrate, add the mobile phase to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 50 mg of nifedipine RS and dissolve in methanol to make exactly 50 mL. Pipet 10 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 25 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas A_T and A_S of the test solution and the standard solution of nifedipine, respectively.

Amount (mg) of nifedipine ($C_{17}H_{18}N_2O_6$)

$$= \text{amount (mg) of nifedipine RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 265 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: A mixture of water, acetonitrile and methanol (2 : 1 : 1).

Flow rate: 1 mL/min

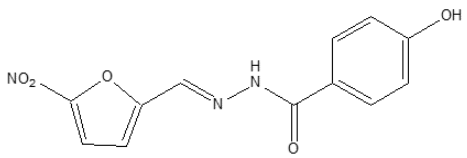
System suitability

System repeatability: Repeat the test 6 times with 25 μL each of standard solution under the above conditions; the relative standard deviation of the peak area of

nifedipine is NMT 2.0%.

Packaging and storage Preserve in light-resistant, tight containers.

Nifuroxazide
니푸록사지드



$C_{12}H_9N_3O_5$: 275.22

(*E*)-4-Hydroxy-*N'*-((5-nitrofuran-2-yl)methylene) benzohydrazide [*965-52-6*]

Nifuroxazide, when dried, contains NLT 98.5% and NMT 101.5% of nifuroxazide ($C_{12}H_9N_3O_5$).

Description Nifuroxazide is a bright yellow crystalline powder.
It is slightly soluble in ethanol(95) and dichloromethane, and practically insoluble in water.

Identification Determine the infrared spectra of Nifuroxazide and nifuroxazide RS, both previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Absorbance $E_{1cm}^{1\%}$ (367 nm): Between 940 and 1000.
Weigh accurately 10.0 mg of Nifuroxazide in the dark, dissolve in 10 mL of ethylene glycol monomethyl ether, and add methanol to make exactly 100 mL. Pipet 5.0 mL of this solution and add methanol to make 100 mL.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Nifuroxazide as directed under Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Related substances I***—Dissolve 1 g of Nifuroxazide in dimethyl sulfoxide to make 10 mL, and use this solution as the test solution (1). While stirring, add 50.0 mL of water to 5.5 mL of the test solution (1), allow to stand for 15 minutes, filter, and use this solution as test solution (2). To 0.5 mL of the test solution (1), add 5.0 mL of the solution, obtained by dissolve 50 mg of nifuroxazide related substance I (4-hydroxybenzohydroxazide) in dimethyl sulfoxide to make 1000 mL, and put 50.0 mL of water while stirring. Then, allow it to stand for 15 minutes, filter, and use this solution as the control solution. Add 0.5 mL of phosphomolybdic acid-tungstic acid TS and 10.0 mL of 2 mol/L sodium carbonate TS to 10 mL each of the test solution (2) and the control solution, and allow to stand for 1 hour. With these solutions, determine the absorption at 750 nm as directed under the Ultraviolet-visible Spectroscopy; the absorbance obtained from the test solution (2) is not greater than the absorbance from the control solution (NMT 0.05%).

(3) ***Other related substances***—Weigh accurately about 0.1 g of Nifuroxazide, dissolve in dimethyl sulfoxide, add the mobile phase to make exactly 100 mL, and use this solution as the test solution. Weigh exactly 10 mg of nifuroxazide analog II (methyl *p*-hydroxybenzoate), dissolve in 2 mL of *N*,*N*-dimethylformamide, and add the mobile phase to make 20 mL. Pipet 1 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the control solution (1). Weigh exactly 5 mg of Nifuroxazide and 10 mg of the related substance II, dissolve in 2 mL of *N*,*N*-dimethylformamide, and add the mobile phase to make 20 mL. Pipet 1 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the control solution (2). After preparing the test solution, the control solution (1) and the control solution (2), immediately protected from light, perform the test with 20 μL each of the solution as directed under the Liquid Chromatography according to the following conditions. The number of peak having NMT 0.6 times the area of the major peak obtained from the standard solution (1) is NMT 1 from the test solution (0.3%), and the peak is greater than 0.2 times (0.1%) of the major peak area obtained from the control solution (1). Also, the total area of the peaks of the related substances from the test solution is not greater than the area of the major peak from the control solution (1) (0.5%). Exclude any peak having the area NMT 0.1 times the area of the major peak obtained from the control solution (1) (0.05%).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 280 nm).

Column: A stainless steel column 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of water and acetonitrile (65 : 35).

Flow rate: 1.0 mL/min

System suitability

System performance: Proceed with 20 μL of the control solution (2) under the above conditions; the resolution between peaks of nifuroxazide and related substance II is NLT 4. With regard to about 6.5 minute of the reference retention time for nifuroxazide, the related substances I, II, III and IV are eluted at about 0.4, 1.2, 2.8 and 5.2 minutes, respectively.

Loss on drying NMT 0.5% (1 g, 105 ℃, 3 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.2 g of Nifuroxazide, previously dried, dissolve by heating, if necessary, in 30 mL of *N*,*N*-dimethylformamide, add 20 mL of water, mix, and titrate with 0.1 mol/L sodium hydroxide VS

(potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS
= 27.52 mg of $C_{12}H_9N_3O_5$

Packaging and storage Preserve in light-resistant, tight containers

Nifuroxazide Capsules
니푸록사지드 캡슐

Nifuroxazide Capsules contain NLT 95.0% and NMT 105.0% of the labeled amount of nifuroxazide ($C_{12}H_9N_3O_5$: 275.22).

Method of preparation Prepared as directed under Capsules, with Nifuroxazide.

Identification Take the contents of the capsule, weigh an amount equivalent to 50 mg of nifuroxazide, and add 1 mL of dimethylformamide to mix. Add 4 mL of acetone, shake to mix, and use the filtrate as the test solution. Separately, take 50 mg of nifuroxazide RS, dissolve in 1 mL of dimethylformamide, add 4 mL of acetone, and use this solution as the standard solution. With these solutions, spot 10 μL each of the test solution and the standard solution on a thin-layer chromatographic plate made of silica gel for thin-layer chromatography (fluorescent indicator added) as directed under the Thin Layer Chromatography. Then, develop the plate with a mixture of acetone and acetic anhydride (100 : 2) as a developing solvent to a distance of about 10 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the R_f value and color of the spots obtained from the test solution and the standard solution are the same.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of the contents of NLT 20 capsules of Nifuroxazide Capsules. Weigh accurately an amount equivalent to about 0.1 g of nifuroxazide ($C_{12}H_9N_3O_5$), and dissolve in 2-methoxyethanol to make 100 mL. After filtering, discard the first 20 mL of the filtrate, take the subsequent 10.0 mL of the filtrate, and add methanol to make 100 mL. Take 5.0 mL of this solution, add methanol to make 100 mL, and use this solution as the test solution. Separately, weigh accurately about 0.1 g of nifuroxazide RS, dilute it to the same concentration as the test solution, and use this solution as the standard solution. With the test solution and the standard solution, determine the absorbance A_T and A_S at 367 nm as directed under the Ultraviolet-visible Spectroscopy, using methanol as the control solution.

$$\text{Amount (mg) of nifuroxazide } (C_{12}H_9N_3O_5) = \text{Amount (mg) of nifuroxazide RS} \times \frac{A_T}{A_S}$$

Packaging and storage Preserve in well-closed containers.

Nifuroxazide Suspension
니푸록사지드 현탁액

Nifuroxazide Suspension contains NLT 95.0% and NMT 105.0% of the labeled amount of nifuroxazide ($C_{12}H_9N_3O_5$: 275.22).

Method of preparation Prepare as directed under Suspension, with Nifuroxazide.

Identification Shake Nifuroxazide Suspension well to mix, take an amount equivalent to 50 mg of nifuroxazide, and evaporate to dryness. Add 1 mL of dimethylformamide to the residue, mix, add 4 mL of acetone, shake to mix, centrifuge, and use the clear supernatant as the test solution. Separately, take 50 mg of nifuroxazide RS, dissolve in 1 mL of dimethylformamide, and add 4 mL of acetone, and use this solution as the standard solution. With these solutions, spot 10 μL each of the test solution and the standard solution on a thin-layer chromatographic plate (fluorescent indicator added) made of silica gel for thin-layer chromatography as directed under the Thin Layer Chromatography, develop the plate with a mixture of acetone and acetic anhydride (100 : 2) as a developing solvent to about 10 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the R_f values and colors of the spots obtained from the test and standard solutions are the same.

pH Between 4.5 and 6.5.

Assay Shake the Nifuroxazide Suspension well to mix, take exactly an amount equivalent to about 0.1 g of nifuroxazide ($C_{12}H_9N_3O_5$), dissolve in 2-methoxyethanol, and make 100.0 mL. After filtering this, discard the first 20 mL of the filtrate, take the subsequent 10.0 mL of the filtrate, add methanol to make 100.0 mL. Take 5.0 mL of this solution, add methanol to make 100.0 mL, and use this solution as the test solution. Separately, weigh accurately about 0.1 g of nifuroxazide RS, dilute it to make the same concentration as the test solution, and use this solution as the standard solution. With the test solution and standard solution, perform the test as directed under the Ultraviolet-visible Spectroscopy, using methanol as a control solution, and determine the absorbances, A_T and A_S at a wavelength of 367 nm.

$$\text{Amount (mg) of nifuroxazide } (C_{12}H_9N_3O_5) = \text{Amount (mg) of nifuroxazide RS} \times \frac{A_T}{A_S}$$

Packaging and storage Preserve in light-resistant, tight

containers.

Nimesulide Tablets
니메술리드 정

Nimesulide Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of nimesulide ($C_{13}H_{12}N_2O_5S$: 308.30).

Method of preparation Nimesulide Tablets are prepared as directed under Tablets, with Nimesulide.

Identification Weigh an amount equivalent to 0.1 g of nimesulide ($C_{13}H_{12}N_2O_5S$) according to the labeled amount of Nimesulide Tablets, add 10 mL of methanol, shake well to mix, centrifuge, and use the clear liquid at the top layer as the test solution. Weigh about 0.1 g of nimesulide RS, add 10 mL of methanol, and use it as the standard solution. Perform the test with the test solution and the standard solution as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on a thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of acetone, ethyl acetate, and 28% aqueous ammonia (90 : 90 : 3.5) as a developing solvent to about 10 cm, air-dry the plate, and expose it to ultraviolet rays (main wavelength: 254 nm). The R_f value and color of the spots obtained from the test solution and standard solution are the same.

Disintegration Meets the requirements.

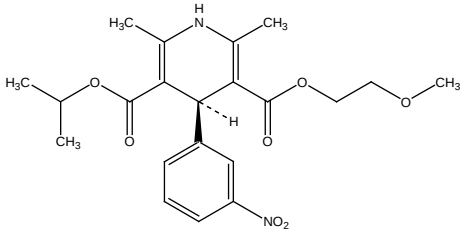
Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 tablets of Nimesulide Tablets and powder. Weigh accurately an amount equivalent to about 50 mg of nimesulide ($C_{13}H_{12}N_2O_5S$), add 70 mL of 0.1 mol/L ethanolic hydrochloric acid, dissolve by heating at 70 ℃ for 30 minutes, cool, and add 0.1 mol/L ethanolic hydrochloric acid to make 100 mL. Filter this solution, take 5.0 mL of the filtrate, add 0.1 mol/L ethanolic hydrochloric acid to make 200 mL, and use it as the test solution. Separately, weigh accurately about 50 mg of nimesulide RS and dissolve in 0.1 mol/L ethanolic hydrochloric acid to make 100 mL. Take 5.0 mL of this solution, add 0.1 mol/L ethanolic hydrochloric acid to make 200 mL, and use it as the standard solution. Determine the absorbances A_T and A_S of the test solution and the standard solution, respectively, at 297 nm as directed under the Ultraviolet-visible Spectroscopy.

$$\text{Amount (mg) of nimesulide } (C_{13}H_{12}N_2O_5S) = \text{Amount (mg) of nimesulide RS} \times \frac{A_T}{A_S}$$

Packaging and storage Preserve in well-closed containers.

Nimodipine
니모디핀



and enantiomer

$C_{21}H_{26}N_2O_7$: 418.44

(*RS*)-3-(2-Methoxyethyl) 5-propan-2-yl-2,6-dimethyl-4-(3-nitrophenyl)-1,4-dihydropyridine-3,5-dicarboxylate [*66085-59-4*]

Nimodipine contains NLT 98.5% and NMT 101.5% of nimodipine ($C_{21}H_{26}N_2O_7$), calculated on the dried basis.

Description Nimodipine occurs as a bright yellow or yellow crystalline powder.
It is freely soluble in ethyl acetate, sparingly soluble in ethanol(95) and practically insoluble in water.
It is affected by light.
It shows crystalline polymorphism.

Identification Determine the infrared spectra of Nimodipine and nimodipine RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Optical rotation $[\alpha]_D^{20}$: Between -10° and +10° (1 g, acetone, 20 mL, 100 mm).

Purity ***Related substances***—Weigh accurately about 40 mg of Nimodipine and dissolve in 2.5 mL of tetrahydrofuran, add the mobile phase to make exactly 25 mL, and use it as the test solution. Separately, weigh accurately about 40 mg of nimodipine RS, dissolve in 2.5 mL of tetrahydrofuran, add the mobile phase to make exactly 25 mL, and add the mobile phase to 1 mL of this solution to make exactly 100 mL. Use this solution as the standard stock solution (1). Weigh accurately about 20 mg of nimodipine related substance I [2-methoxyethyl-1-methylethyl-2,6-dimethyl-4-(3-nitrophenyl)pyridine-3,5-dicarboxylate] RS and dissolve it in 2.5 mL of tetrahydrofuran. Add the mobile phase to 5 mL of this solution to make exactly 100 mL, and use this solution as the standard stock solution (2). Add the mobile phase to 2 mL of standard stock solution (1) to make exactly 10 mL, and use it as the standard solution (1). Take 2.5 mL of the standard stock solution (1) and 1 mL of the standard stock solution (2), put them in a 25 mL volumetric flask, add the mobile phase to make exactly 25 mL, and use it as the standard solution (2). Perform the test with 20 μL

each of the test solution, the standard solution (1) and the standard solution (2) as directed under the Liquid Chromatography according to the following conditions, and determine the peak area of each related substance in the test solution, A_T, the peak area of the related substance I in the standard solution (2), A_{S1}, and the peak area of nimodipine in the standard solution (1), A_{S2}; related substance I is NMT 0.1%, other related substances is NMT 0.2%, and the total amount of related substances is NMT 0.5%.

$$\text{Content (\%) of related substance I} = (A_{T1} / A_{S1}) \times (C_{S1} / C_{T1}) \times 100$$

A_{T1}: Peak area of related substance I in the test solution

A_{S1}: Peak area of related substance I in the standard solution (2)

C_{S1}: Concentration of related substance I in the standard solution (2) (μg/mL)

C_{T1}: Concentration of nimodipine in the test solution (μg/mL)

$$\text{Content (\%) of other related substances} = (A_{T2} / A_{S2}) \times (C_{S2} / C_{T2}) \times 100$$

$$(AT2 / AS2) \times (CS2 / CT2) \times 100$$

A_{T2}: Peak area of related substances other than related substance I in the test solution

A_{S2}: Peak area of nimodipine in the standard solution (1)

C_{S2}: Concentration of nimodipine in the standard solution (1) (μg/mL)

C_{T2}: Concentration of nimodipine in the test solution (μg/mL)

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 235 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 12.5 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 - 10 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: A mixture of water, methanol and tetrahydrofuran (3 : 1 : 1).

Flow rate: 2 mL/min

System suitability

System performance: Proceed with 20 μL of the standard solution (4) under the above conditions; the relative retention times of the related substance I peak and the nimodipine peak are about 0.9 and 1.0, respectively, and the resolution between these two peaks are NLT 1.5.

System reproducibility: Repeat the test 5 times under the above conditions with 20 μL each of standard solution (4); the relative standard deviation of the peak area of nimodipine is NMT 2.0%.

Time span of measurement: About 4 times the retention time of nimodipine.

Loss on drying NMT 0.5% (1.0 g, 105 ℃, 4 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.180 g of Nimodipine, add it to a mixture of 25 mL of *t*-butyl alcohol and 25 mL of perchloric acid TS, and heat gently to dissolve. After cooling, add 0.l mL of ferroin TS and titrate with 0.1 mol/L cerium sulfate VS. Perform a blank test in the same manner and make any necessary correction.

$$\text{Each mL of 0.1 mol/L cerium sulfate VS} = 20.92 \text{ mg of } C_{21}H_{26}N_2O_7$$

Packaging and storage Preserve in light-resistant, tight containers at 15 to 30 ℃.

Nimodipine Injection
니모디핀 주사액

Nimodipine Injection contains NLT 90.0% and NMT 110.0% of nimodipine ($C_{21}H_{26}N_2O_7$: 418.45) of the labeled amount.

Method of preparation Prepared as directed under Injection, with Nimodipine.

Identification The retention time of the major peak obtained from the test solution and the standard solution from the Assay and the ultraviolet absorption spectrum between 200 and 400 nm are the same.

pH Between 6.0 and 8.0.

Alcohol number Alcohol number is NLT 2.3 when tested according to Method 2, Gas chromatography under the Alcohol Determination.

Purity ***Related Substance***—Use Nimodipine Injection as the test solution. If necessary, take an amount exactly equivalent to about 2 mg of nimodipine ($C_{21}H_{26}N_2O_7$) according to the labeled amount with Nimodipine Injection, add ethanol(99.5) to make exactly 10 mL, and use it as the test solution. Pipet 1 mL of the test solution, add the mobile phase to make exactly 100 mL, take exactly 2 mL again, and add the mobile phase to make exactly 10 mL. Use it as the standard solution (1). Separately, take accurately about 2 mg of nimodipine related substance[2-methoxyethyl-1-methylethyl-2,6-dimethyl-4-(3-nitrophenyl)pyridine-3,5-dicarboxylate] RS, add ethanol(99.5) to make exactly 20 mL, take exactly 1 mL again, and add ethanol(99.5) to make exactly 100 mL. Use it as the standard solution (2). With 20 μL each of the test solution, the standard solution (1) and the standard solution (2), perform the test as directed under the Liquid Chromatography under the following conditions. Calculate the peak area of nimodipine related substance I ob-

tained from the test solution, A_{T1}, and the peak area of nimodipine related substance I obtained from the standard solution (2), A_{S1}. In addition, determine the peak area of each related substance excluding nimodipine related substance I obtained from the test solution, A_{T2}, and the peak area of nimodipine from the standard solution (1), A_{S2}. The amount of nimodipine related substance I is NMT 0.5%, the amount of other related substances is NMT 0.2%, and the total amount of related substances is NMT 0.5%.

$$\text{Content (\%) of related substance I} = (A_{T1} / A_{S1}) \times (C_{S1} / C_{T1}) \times 100$$

A_{T1}: Peak area of nimodipine related substance I in the test solution

A_{S1}: Peak area of nimodipine related substance I in the standard solution (2)

C_{S1}: Concentration (μg/mL) of nimodipine related substance I in the standard solution (2)

C_{T1}: Concentration (μg/mL) of nimodipine related substance I in the test solution

$$\text{Content (\%) of other related substances} = (A_{T2} / A_{S2}) \times (C_{S2} / C_{T2}) \times 100$$

A_{T2}: Peak area of related substances other than related substance I in the test solution

A_{S2}: Peak area of nimodipine in the standard solution (1)

C_{S2}: Concentration (μg/mL) of nimodipine in the standard solution (1)

C_{T2}: Concentration (μg/mL) of nimodipine in the test solution

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 235 nm).

Column: A stainless steel column about 4.0 mm in internal diameter and about 12.5 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 30 °C.

Mobile phase: A mixture of water, tetrahydrofuran and acetonitrile (16 : 6 : 3).

Flow rate: 1.5 mL/min

System suitability

System performance: Proceed with 20 μL of the system suitability solution according to the above operating conditions, the resolution of nimodipine and nimodipine related substance I is more than 1.5, and the symmetry coefficient of the nimodipine peak is NMT 2.0.

System reproducibility: Repeat the test 6 times under the above conditions with 20 μL each of the standard solution (1), the relative standard deviation of the peak area of nimodipine is NMT 2.0%.

System suitability solution—Take exactly 2 mg each of nimodipine RS and nimodipine related substance I RS, add ethanol(99.5) to make exactly 20 mL, take exactly 1 mL again, and add ethanol(99.5) to make 100 mL. Use it as the system suitability solution.

Bacterial endotoxins Less than 5.0 EU/mL.

Sterility Meets the requirements.

Particulate contamination: Visible particles Meets the requirements.

Particulate matter for injections Meets the requirements.

Extractable volume of injections Meets the requirements.

Assay Take exactly an amount, equivalent to about 10 mg of nimodipine ($C_{21}H_{26}N_2O_7$), according to the labeled amount of Nimodipine Injection, add water to make exactly 50 mL, and use it as the test solution. Separately, weigh accurately about 10 mg of nimodipine RS, dissolve in ethanol(95), add ethanol(95) to make 50 mL, and use it as the standard solution. Perform the test as directed under the Liquid Chromatography with 10 μL each of the test and standard solutions under the following conditions, and determine, A_T and A_S, of the peak area of nimodipine.

$$\text{Amount (mg) of nimodipine } (C_{21}H_{26}N_2O_7) = \text{Amount (mg) of nimodipine RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorbance photometer (wavelength: 235 nm). However, a photo-diode array detector (200 nm to 400 nm) is used when the Identification is performed.

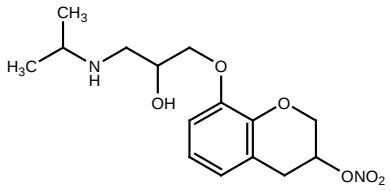
Column: A stainless steel column about 4.0 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 μm to 10 μm in particle diameter).

Mobile phase: A mixture of water, tetrahydrofuran and acetonitrile (64 : 24 : 12).

Flow rate: 1.2 mL/min

Packaging and storage Preserve in hermetic containers.

Nipradilol
니프라딜롤



and enantiomer

$C_{15}H_{22}N_2O_6$: 326.34

3,4-Dihydro-8-[2-hydroxy-3-[(1-methylethyl)amino]propoxy]-2*H*-1-benzopyran-3-ol 3-nitrate, [*81486-22-8*]

Nipradilol, when dried, contains NLT 99.0% and NMT 101.0% of nifradilol ($C_{15}H_{22}N_2O_6$).

Description Nipradilol occurs as a white to light yellowish white crystalline powder and is odorless.
It is freely soluble in acetic acid(100), soluble in chloroform, sparingly soluble in methanol or acetone, slightly soluble in anhydrous ethanol, ethyl acetate or water and practically insoluble in hexane.
It is soluble in dilute hydrochloric acid.
It is colored by light.
A solution of Nipradilol in 0.2 mol/L hydrochloric acid (1 in 20) shows no optical rotation.

Identification (1) Add a few drops of diphenylamine TS to 5 mg of Nipradilol; it turns dark brown.

(2) Dissolve 2 mL of diluted hydrochloric acid (1 in 100) in 20 mg of Nipradilol, and add 1 mL of Reinecke salt TS; a pale red precipitate is formed.

(3) Determine the absorption spectrum as directed under the Ultraviolet-visible Spectroscopy with a solution of Nipradilol in methanol (1 in 10000); it exhibits a maximum between 273 and 277 nm.

(4) Determine the infrared absorption spectrum of Nipradilol as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; it exhibits absorption at the wavenumbers of about 3277 cm^{-1}, 3117 cm^{-1}, 1620 cm^{-1}, 1587 cm^{-1}, 1382 cm^{-1}, 1367 cm^{-1}, 1280 cm^{-1} and 765 cm^{-1}.

Absorbance $E_{1cm}^{1\%}$ (275 nm): Between 59 and 60 (10 mg after drying, 100 mL of methanol).

Purity (1) ***Clarity and color of solution***—Dissolve 10 mL of 0.5 mol/L hydrochloric acid in 1.0 g of Nipradilol; the resulting solution is clear and its color is not more intense than that of the matching fluid for B.

(2) ***Heavy metals***—Proceed with 1.0 g of Nipradilol according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Arsenic***—Proceed with 1.0 g of Nipradilol according to Method 3 and perform the test (NMT 2 ppm).

(4) ***Related Substance***—Weigh accurately about 25 mg of Nipradilol, add the mobile phase, dissolve it to make exactly 20 mL, and use this solution as the test solution. Take exactly 1.0 mL of the test solution, add the mobile phase to make exactly 200 mL, and use this solution as the standard solution. With 20 μL each of the test solution and the standard solution, perform the test as directed under the Liquid Chromatography; the sum of each peak other than the major peak obtained from the test solution is NMT 3 times the area of the major peak from the standard solution.

Operating conditions

For the detector, column, column temperature, mobile phase, flow rate and selection of column, comply with the operating conditions of the Assay.

Detection sensitivity: Add 1 mL of the mobile phase to the test solution to make 50 mL. Take 20 μL of this solution and adjust the peak height of nifradilol to be 70% of the full scale.

Time span of measurement: About 5 times the retention time of nifradilol from the solvent peak.

Loss on drying NMT 0.5% (1 g, in vacuum, phosphorus pentoxide 60 ℃, 4 hours).

Residue on ignition NMT 0.1% (1 g).

Isomer ratio Dissolve 1 mL of anhydrous pyridine solution of p-nitrobenzoyl chloride (3 in 100) in 5 mg of Nipradilol, and evaporate the solvent under reduced pressure. Dissolve the residue in 5 mL of chloroform, wash twice with 5 mL of sodium bicarbonate TS, then with 5 mL of 1 mol/L hydrochloric acid and then with 5 mL of water. Add 5 mL of chloroform and 2 g of anhydrous sodium sulfate, shake to mix, centrifuge, and use the above clear supernatant as the test solution. With 2 μL of the test solution, perform the test as directed under the Liquid Chromatography according to the following conditions.
Determine the areas of two adjacent peaks, S_a and S_b, according to the automatic integration method, having retention times of about 7 minutes, where S_a is the peak area of shorter retention time (racemic A) and S_b is the peak area of longer retention time (racemic B); $S_a/(S_a+S_b) \times 100$ is between 45 and 55.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 264 nm).

Column: A stainless steel column about 4 mm and about 20 cm in length, packed with silica gel for liquid chromatography (10 μm in particle diameter).

Mobile phase: A mixture of hexane and ethyl acetate (7 : 5).

Flow rate: Adjust the flow rate so that the retention time of racemic B is about 6 minutes.

Assay Weigh accurately about 0.06 g each of Nipradilol and nipradilol RS, previously dried, and dissolve in the mobile phase respectively to make exactly 50 mL. Pipet 5 mL of this solution, add exactly 5 mL of internal standard solution to each solution, put the mobile phase to make 20 mL, and use these solutions as the test solution and the standard solution, respectively. With 10 μL each of the test solution and standard solution, perform the test as directed under the Liquid Chromatography according to the following conditions. Determine the ratios of peak areas of nifradilol, Q_T and Q_S to the peak area of the internal standard of each solution.

Amount (mg) of nifradilol ($C_{15}H_{22}N_2O_6$)

$$= \text{amount (mg) of nifradilol RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—Propranolol hydrochloride solution (1 in 2000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 274 nm).

Column: A stainless steel column about 4.0 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 30 °C.

Mobile phase: A mixture of water, acetonitrile, acetic acid(100) and Tetramethylammonium hydroxide (110 : 50 : 1 : 1)

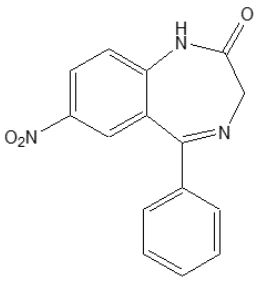
Flow rate: Adjust the flow rate so that the retention time of nifradilol is about 8 minutes.

System suitability

System performance: Proceed with 10 μL of the standard solution according to the above conditions; nifradilol and internal standard are eluted in this order with resolution between their peaks being over 2.0.

Packaging and storage Preserve in light-resistant, tight containers.

Nitrazepam
니트라제팜



$C_{15}H_{11}N_3O_3$: 281.27

7-Nitro-5-phenyl-1*H*-benzo[e][1,4]diazepin-2(3*H*)-one [*146-22-5*]

Nitrazepam, when dried, contains NLT 99.0% and NMT 101.0% of nitrazepam ($C_{15}H_{11}N_3O_3$).

Description Nitrazepam occurs as white to pale yellow crystals or a crystalline powder, which is odorless.

It is freely soluble in acetic acid(100), soluble in acetone or chloroform, slightly soluble in methanol, ethanol or anhydrous ethanol, very slightly soluble in ether and practically insoluble in water.

Melting point—About 227 °C (with decomposition).

Identification (1) Add 0.1 mL of sodium hydroxide TS to 3 mL of a solution of Nitrazepam in methanol (1 in 500); the resulting solution exhibits a yellow color.

(2) Add 15 mL of dilute hydrochloric acid to 20 mg of Nitrazepam, boil for 5 minutes, and filter after cooling. The filtrate responds to the Qualitative Analysis for primary aromatic amines.

(3) Put 0.5 mL of sodium hydroxide TS to the filtrate obtained in (2) to neutralize, add 2 mL of ninhydrin TS, and heat on a steam bath; the resulting solution exhibits a violet color.

(4) Determine the absorption spectra of solutions of Nitrazepam and nitrazepam RS in anhydrous ethanol (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

Purity (1) ***Clarity and color of solution***—Dissolve 0.10 g of Nitrazepam in 20 mL of acetone; the resulting solution is clear and pale yellow.

(2) ***Heavy metals***—Proceed with 1.0 g of Nitrazepam according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Arsenic***—Proceed with 1.0 g of Nitrazepam according to Method 3 and perform the test (NMT 2 ppm).

(4) ***Related substances***—Dissolve 0.25 g of Nitrazepam in 10 mL of a mixture of methanol and chloroform (1 : 1), and use this solution as the test solution. Pipet 1.0 mL of this solution and add a mixture of methanol and chloroform (1 : 1) to make exactly 20 mL. Pipet 2.0 mL of this solution, add a mixture of methanol and chloroform (1 : 1) to make exactly 50 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel (with a fluorescent indicator) for thin-layer chromatography. Next, develop the plate with a mixture of nitromethane and ethyl acetate (17 : 3) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 0.5% (1 g, 105 ℃, 4 hours).

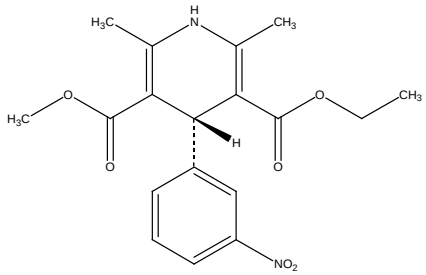
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.4 g of Nitrazepam, previously dried, dissolve in 40 mL of acetic acid(100), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 28.127mg of $C_{15}H_{11}N_3O_3$

Packaging and storage Preserve in light-resistant, tight containers.

Nitrendipine
니트렌디핀



and enantiomer

$C_{18}H_{20}N_2O_6$: 360.36

Ethyl methyl 2,6-dimethyl-4-(3-nitrophenyl)-1,4-dihydro pyridine-3,5-dicarboxylate [*39562-70-4*]

Nitrendipine, when dried, contains NLT 98.5% and NMT 101.0% of nitrendipine ($C_{18}H_{20}N_2O_6$).

Description Nitrendipine occurs as a yellow crystalline powder.
It is soluble in acetonitrile, sparingly soluble in methanol or ethanol(99.5) and practically insoluble in water.
It is gradually colored to brownish yellow by light.
A solution of Nitrendipine in acetonitrile (1 in 50) exhibits no optical rotation.

Identification (1) Determine the absorption spectra of solutions of Nitrendipine and nitrendipine RS in methanol (1 in 80,000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Nitrendipine and nitrendipine RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Melting point—Between 157 and 161 ℃.

Purity (1) ***Heavy metals***—Proceed with 2.0 g of Nitrendipine as directed under Method 4 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Related substances***—Proceed quickly using light-resistant containers. Dissolve 40.0 mg of Nitrendipine in 5 mL of acetonitrile, add the mobile phase to make exactly 25 mL, and use this solution as the test solution. Add the mobile phase to 1.0 mL of this solution to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the area of the peaks other than the major peak in the test solution, A_i, and the peak area of nitrendipine in the standard solution, A_S, by the automatic integration method; the related substances having the relative retention time with regard to nitrendipine of about 0.8 is NMT 1.0%, the related substances having the relative retention time with regard to nitrendipine of about 1.3 is NMT 0.25%, and the amount of each of the other related substances is NMT 0.2%. In addition, the total amount of related substances other than nitrendipine is NMT 2.0%.

$$\text{Content (\%) of related substances} = \frac{A_i}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: A mixture of water, tetrahydrofuran and acetonitrile (14 : 6 : 5).

Flow rate: Adjust the flow rate so that the retention time of nitrendipine is about 12 minutes.

System suitability

Test for required detectability: Pipet 2 mL of the standard solution and add the mobile phase to make exactly 10 mL. The peak area of nitrendipine from 10 μL of this solution is between 14% and 26% of that from the standard solution.

System performance: Dissolve 10 mg of Nitrendipine and 3 mg of propyl p-hydroxybenzoate in 5 mL of acetonitrile, and add the mobile phase to make 100 mL. Proceed with 5 μL of this solution according to the above conditions; propyl p-hydroxybenzoate and nitrendipine are eluted in this order with the resolution being NLT 6.

System repeatability: Repeat the test 6 times according to the above conditions with 10 μL each of the standard solution; the relative standard deviation of the peak area of nitrendipine is NMT 2.0%.

Time span of measurement: About 2.5 times the retention time of nitrendipine after the solvent peak.

Loss on drying NMT 0.5% (1 g, 105 ℃, 2 hours).

Residue on ignition 0.1% (1 g).

Assay Weigh accurately about 0.3 g of Nitrendipine, previously dried, dissolve in 60 mL of a solution of sulfuric acid in ethanol(99.5) (3 in 100), add 50 mL of water, and titrate with 0.1 mol/L ammonium ceric sulfate VS (indicator: 3 drops of 1,10-phenanthroline monohydrate TS). The endpoint of the titration is when the reddish brown color disappears. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L ammonium ceric sulfate VS
= 18.02 mg of $C_{18}H_{20}N_2O_6$

Packaging and storage Preserve in light-resistant, tight containers.

Nitroglycerin Tablets
니트로글리세린 정

Nitroglycerin Tablets contain NLT 80.0% and NMT 120.0% of the labeled amount of nitroglycerin ($C_3H_5N_3O_9$: 227.09).

Method of preparation Prepare as directed under Tablets, with Nitroglycerin.

Identification (1) Weigh an amount of Nitroglycerin Tablets, previously powdered, equivalent to 6 mg of nitroglycerin ($C_3H_5N_3O_9$) according to the labeled amount, add 12 mL of ether, shake well to mix, and filter. Use the filtrate as the test solution. Take 5 mL of the test solution, evaporate ether, dissolve the residue in 1 - 2 drops of sulfuric acid, and add 1 drop of diphenylamine TS; the resulting solution exhibits a dark blue color.

(2) Take 5 mL of the test solution obtained in (1), evaporate ether, add 5 drops of sodium hydroxide TS to the residue, and heat over a low flame to concentrate to about 0.1 mL. After cooling, put 20 mg of potassium hydrogen sulfate to the residue, and heat; the odor of acrolein is perceptible.

Purity ***Free nitrate ion***—Weigh accurately an amount of Nitroglycerin Tablets, previously powdered, equivalent to 20 mg of nitroglycerin ($C_3H_5N_3O_9$), according to the labeled amount, transfer to a separatory funnel, add 40 mL of isopropyl ether and 40 mL of water, and then shake to mix for 10 minutes to collect the aqueous layer. Add 40 mL of isopropyl ether to this solution, shake to mix for 10 minutes, then collect the aqueous layer, and filter. Use this solution as the test solution. Separately, transfer 10 mL of nitric acid standard solution into a separatory funnel, add 30 mL of water and 40 mL of the isopropyl ether layer of the first extraction used in the preparation of the test solution, and shake to mix for 10 minutes. Prepare the standard solution in the same manner as the preparation of the test solution below. Transfer 20 mL each of the test solution and the standard solution into a separate Nessler tube, add 30 mL of water and 60 mg of Griess-Romijin's nitric acid reagent, shake well to mix, and allow to stand for 30 minutes; the color of the test solution is not more intense than that of the standard solution when observed from the side of the tubes.

Disintegration Meets the requirements. However, the time of the test is limited within 2 minutes and fluted discs are not used.

Uniformity of dosage units It meets the requirements when tested according to the following procedure. Transfer 1 tablet of Nitroglycerin Tablets into a stoppered centrifuge tube, add exactly *V* mL of acetic acid(100) to make a solution containing about 30 μg of nitroglycerin ($C_3H_5N_3O_9$) per mL, and shake vigorously to mix for 1 hour. After disintegrating the tablet, centrifuge and use the clear supernatant as the test solution. When the tablet does not disintegrate during this procedure, transfer 1 tablet of Nitroglycerin Tablets into a stoppered centrifuge tube, coat the tablet with 0.05 mL of acetic acid(100), and grind with a glass rod. While washing the glass rod, add acetic acid(100) to make exactly *V* mL of a solution containing about 30 μg of nitroglycerin (C3H5N3O9) per mL. Then, shake to mix for 1 hour, centrifuge, and use the clear supernatant as the test solution. Separately, dry potassium nitrate at 105 ℃ for 4 hours, weigh accurately 90 mg of the dried potassium nitrate, dissolve in 5 mL of water, and add acetic acid(100) to make exactly 100 mL. Pipet 5.0 mL of this solution, add acetic acid(100) to make exactly 100 mL, and use this solution as the standard solution. Pipet 2 mL each of the test solution and the standard solution, add 2 mL of salicylic acid TS to each solution, shake to mix, and allow to stand for 15 minutes. While cooling with ice after adding 10 mL of water, put about 12 mL of sodium hydroxide (2 in 5) to make alkaline, and add water to make exactly 50 mL. With these solutions, perform the test as directed under the Ultraviolet-visible Spectroscopy, using a solution prepared with 2 mL of acetic acid(100) in the same manner as a control. Determine the absorbances, A_T and A_S, of each solution, obtained from the test solution and the standard solution, at 410 nm.

$$\text{Amount (mg) of nitroglycerin } (C_3H_5N_3O_9) \text{ (mg)} = \text{Amount (mg) of potassium nitrate RS} \times 0.7487 \times \frac{A_T}{A_S} \times \frac{V}{2000}$$

It meets the requirements when the acceptable deviation criterion (%) is NMT 25% between the average content of 10 tablets of Nitroglycerin Tablets and the content of each tablet. When the deviation is NLT 25% and NMT 30% only for 1 tablet, perform the test again with 20 tablets of Nitroglycerin Tablets in the same manner. It meets the requirements when the acceptable deviation criterion (%) is NLT 25% and NMT 30% for NMT 1 tablet and NMT 30% for none between the average content of 30 tablets of Nitroglycerin Tablets, tested twice, and the content of each tablet.

Assay Weigh accurately NLT 20 tables of Nitroglycerin Tablets and softly press to disintegrate. Weigh accurately an amount of Nitroglycerin Tablets, equivalent to about 3.5 mg of nitroglycerin ($C_3H_5N_3O_9$), add exactly 50 mL of acetic acid(100), shake to mix for 1 hour, filter, and use this filtrate as the test solution. Separately, dry potassium nitrate at 105 ℃ for 4 hours, weigh accurately about 90 mg of the dried potassium nitrate, dissolve in 5 mL of water, and add acetic acid(100) to make exactly 100 mL. Pipet 10 mL of this solution, add acetic acid(100) to make exactly 100 mL, and use this solution as the standard solution. Pipet 2 mL each of the test solution and the standard solution, add 2 mL of salicylic acid TS to each

solution, shake to mix, allow to stand for 15 minutes, and add 10 mL of water. While cooling with ice, add about 12 mL of sodium hydroxide (2 in 5) to make alkaline, and add water to make exactly 50 mL. With these solutions, perform the test as directed under the Ultraviolet-visible Spectroscopy, using a solution prepared with 2 mL of acetic acid(100) in the same manner as a control. Determine the absorbances, A_T and A_S, of each solution, obtained from the test solution and the standard solution, at 410 nm.

$$\text{Amount (mg) of nitroglycerin } (C_3H_5N_3O_9) = \text{Amount (mg) of potassium nitrate} \times 0.7487 \times \frac{A_T}{A_S} \times \frac{1}{20}$$

Packaging and storage Preserve in light-resistant, tight containers at below 20 ℃.

Nitrous Oxide
아산화질소

N_2O : 44.01

Nitrous oxide [*10024-97-2*]

Nitrous Oxide contains NLT 97.0 vol% and NMT 101.0 vol% of nitrous oxide (N_2O).

Description Nitrous Oxide occurs as a colorless gas at room temperature and atmospheric pressure. It is odorless.

1 mL of Nitrous Oxide is soluble in 1.5 mL of water or 0.4 mL of ethanol(95) at 20 ℃, 101.3 kPa, and soluble in ether or fatty oils.

1000 mL of Nitrous Oxide weighs approximately 1.96 g at 0 ℃, 101.3 kPa.

Identification (1) Put a glowing splinter of wood to Nitrous Oxide; it bursts into flame immediately.

(2) Take 1 mL each of Nitrous Oxide and nitrous oxide directly from pressure-resistant metal hermetic container with a pressure-reducing valve to gas measuring tubes for gas chromatography or syringes, respectively, using a polyvinyl chloride-based introduction tube. Perform the test with these gases as directed under the Gas Chromatography according to the operating conditions under the Assay; the retention time of the major peak obtained from Nitrous Oxide corresponds with that of nitrous oxide.

Purity Calculate the collected amount of Nitrous Oxide by maintaining the temperature of the container at 18 to 22 ℃ for more than 6 hours before the test, and correcting the volume at 20 ℃, 101.3 kPa.

(1) ***Acidity or alkalinity***—Add 0.3 mL of methyl red TS and 0.3 mL of bromothymol blue TS to 400 mL of freshly boiled and cooled water, and boil for 5 minutes. Transfer 50 mL of this solution to each of three Nessler tubes A, B and C. Add 0.10 mL of 0.01 mol/L hydrochloric acid to tube A and 0.20 mL of 0.01 mol/L hydrochloric acid VS to tube B, and cover each tube with a stopper to allow to cool. Next, pass 1000 mL of Nitrous Oxide through the solution in tube A for 15 minutes, while placing the end of the gas introduction tube with a diameter of approximately 1 mm at a position of 2 mm from the bottom of the Nessler tube; the color of the solution in tube A is not more intense than the reddish orange color of the solution in tube B or than the yellowish green color of the solution in tube C.

(2) ***Carbon dioxide***—Pass 1000 mL of Nitrous Oxide through 50 mL of barium hydroxide TS in a Nessler tube in the same manner as directed in (1); the resulting solution exhibits no more turbidity than the following control solution.

Control solution—Add 50 mL of barium hydroxide TS to a Nessler tube, and add 1 mL of a solution prepared by dissolving 0.1 g of sodium bicarbonate in 100 mL of freshly boiled and cooled water.

(3) ***Oxidizing substances***—Take 15 mL each of potassium iodide starch TS into each of two Nessler tubes A and B, add acetic acid(100) dropwise to each of the tubes, mix, and use these solutions as solution A and solution B, respectively. Pass 2000 mL of Nitrous Oxide through solution A for 30 minutes in the same manner as directed in (1); the color of solution A is the same as that of the stoppered, untreated solution B.

(4) ***Potassium permanganate reducing substances***—Take 50 mL of water into each of two Nessler tubes A and B, add 0.10 mL of 0.02 mol/L potassium permanganate to each of the tubes, and use these solutions as solutions A and B, respectively. Pass 1000 mL of Nitrous Oxide through solution A in the same manner as directed in (1); the color of solution A is the same as that of solution B.

(5) ***Chloride***—Take 50 mL of water into each of two Nessler tubes A and B, add 0.5 mL of silver nitrate TS to each of the tubes, and use these solutions as solutions A and B, respectively. Pass 1000 mL of Nitrous Oxide through solution A in the same manner as directed in (1); the turbidity of solution A is the same as that of solution B.

(6) ***Carbon monoxide***—Take 5.0 mL of Nitrous Oxide directly from a pressure-resistant metal hermetic container with a pressure-reducing valve to gas measuring tubes for gas chromatography or syringes, using a polyvinyl chloride-based introduction tube. Perform the test with this according to as directed under the Gas Chromatography according to the following conditions; it exhibits no peak at the elution position of carbon monoxide.

Operating conditions

Detector: A thermal conductivity detector

Column: A column about 3 mm in internal diameter and about 3 m in length, packed with 300 to 500 μm zeolite for gas chromatography (pore diameter 0.5 nm).

Column temperature: A constant temperature of

about 50 °C.

Carrier gas: Hydrogen or helium

Flow rate: Adjust the flow rate so that the retention time of carbon monoxide is about 20 minutes.

System suitability

Detection sensitivity: Adjust the sensitivity so that the peak height of carbon monoxide obtained from 5.0 mL of the mixed gas used in the system performance is about 10 cm.

System performance: Take 0.1 mL each of carbon monoxide and air into a gas mixer, add carrier gas to make 100 mL, and mix well. Proceed with 5.0 mL of this mixed gas according to the above conditions; oxygen, nitrogen, and carbon monoxide are eluted in this order with each peak completely resolved.

(7) ***Nitrogen monoxide***—Proceed in the same manner as directed in (8) Nitrogen dioxide, pass 500 ± 50 mL of Nitrous Oxide in the form of vapor through a nitric oxide-nitrogen dioxide detector tube at a constant rate, and determine the amount of nitrogen monoxide; the amount is less than 1 ppm.

(8) ***Nitrogen dioxide***—Prepare a container with a tube of sufficient length so that, when the valve of the container is opened, the content of the liquid phase is vaporized during passage and the injection port connected to the detector tube has no frost. Pass 550 ± 50 mL of Nitrous Oxide in the form of vapor through a nitric oxide-nitrogen dioxide detector tube at a constant rate via the tube (previously flush the system with Nitrous Oxide to displace air), and determine the amount of nitrogen dioxide; the amount is less than 1 ppm. However, measure the gas with a gas volume meter placing downward from the detector tube in order to prevent contamination.

Assay Take Nitrous Oxide as directed under the Purity. Take 1.0 mL of Nitrous Oxide directly from a pressure-resistant metal hermetic container with a pressure-reducing valve to gas measuring tubes for gas chromatography or syringes, respectively, using a polyvinyl chloride-based introduction tube. Perform the test with this as directed under the Gas Chromatography according to the following conditions, and calculate the peak area of air, A_T. Separately, take 3.0 mL of nitrogen into a gas mixer, add carrier gas to make the total volume exactly 100 mL, mix well, and use this gas as the standard mixed gas. Proceed with 1.0 mL of this mixed gas in the same manner as Nitrous Oxide, and calculate the peak area of nitrogen, A_S.

$$\text{Amount (vol\%) of nitrous oxide } (N_2O) = 100 - 3 \times \frac{A_T}{A_S}$$

Operating conditions

Detector: Thermal conductivity detector

Column: A column about 3 mm in internal diameter and about 3 m in length, packed with silica gel for gas chromatography (300 μm to 500 μm in particle diameter).

Column temperature: A constant temperature of about 50 °C.

Carrier gas: Hydrogen or helium

Flow rate: Adjust the flow rate so that the retention time of nitrogen is about 2 minutes.

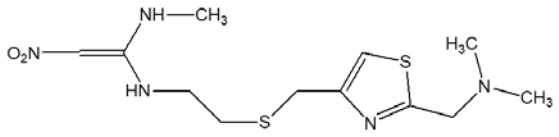
System suitability

System performance: Take 3.0 mL of nitrogen into a gas mixer, add Nitrous Oxide to make 100 mL, and mix well. Proceed with 1.0 mL of this mixed gas according to the above conditions; nitrogen and Nitrous Oxide are eluted in this order with each peak completely resolved.

System repeatability: Repeat the test 6 times with the standard mixed gas according to the above conditions; the relative standard deviation of the peak area of nitrogen is NMT 2.0%.

Packaging and storage Preserve in pressure-resistant metal hermetic containers at below 40 ℃.

Nizatidine
니자티딘



$C_{12}H_{21}N_6O_2S_2$: 331.46

(E)-1-*N'*-[2-[[2-[(Dimethylamino)methyl]-1,3-thiazol-4-yl]methylsulfanyl]ethyl]-1-*N*-methyl-2-nitroethene-1,1-diamine [*76963-41-2*]

Nizatidine contains NLT 98.0% and NMT 101.0% of nizatidine ($C_{12}H_{21}N_6O_2S_2$), calculated on the dried basis.

Description Nizatidine occurs as a white or pale brown crystalline powder.

It is freely soluble in acetic acid(100), soluble in methanol, sparingly soluble in water, slightly soluble in ethanol(99.5), 2-propanol or acetic anhydride and practically insoluble in ether.

Identification (1) Determine the infrared spectra of Nizatidine and nizatidine RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

Melting point Between 130 and 135 ℃. Perform the test with Nizatidine, previously dried.

Purity (1) ***Heavy metals***—Proceed with 0.1 g of Nizatidine as directed under Method 2 and perform the test. Prepare the control solution with 1.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Related substances***—Weigh accurately about 50 mg of Nizatidine, dissolve in a mixture of ammonium acetate buffer and methanol (76 : 24) to make exactly 10 mL, and use this solution as the test solution. Separately, weigh accurately about 50 mg of nizatidine RS and dissolve in a mixture of ammonium acetate buffer and methanol (76 : 24) to make exactly 100 mL. To 5.0 mL of this solution, add a mixture of ammonium acetate buffer and methanol (76 : 24) to make exactly 50 mL, and use this solution as the standard solution (1). Take a certain amount of the standard solution (1), dilute with a mixture of ammonium acetate buffer and methanol (76 : 24) to make 25 μg/mL and 15 μg/mL of solutions, respectively, and use these solutions as the standard solution (2) and the standard solution (3). Perform the test with 50 μL each of the test solution, the standard solutions (1), (2) and (3) by the peak percentage peak area method under the Liquid Chromatography according to the following conditions; the total area of each peak other than the major peak obtained from the test solution is NMT 3 times the area of the major peak obtained from the standard solution (2) (1.5%) and the area of each peak is NMT the area of the major peak obtained from the standard solution (3) (0.3%).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silical gel for liquid chromatography (5 μm in particle diameter).

Control the step or gradient elution by mixing the mobile phases A and B as directed under the following table.

Mobile phase A: Ammonium acetate buffer

Mobile phase B: Methanol

Adjust the composition of the mobile phase so that the retention time of nizatidine is about 12 minutes.

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 - 3	76	24
3 - 20	76 → 50	24 → 50
20 - 45	50	50
45 - 50	50 → 76	50 → 24
50 - 70	76	24

Flow rate: 1 mL/min

System suitability

System performance: Proceed with 50 μL of the standard solution (1) according to the above conditions; the symmetry factor of nizatidine peak is NMT 2.0.

Time span of measurement: About 3 times the retention time of nizatidine peak.

Ammonium acetate buffer—Weigh 5.9 g of ammonium acetate, dissolve in 760 mL of water to make 0.1 mol/L solution, add 1 mL of diethylamine, and adjust the pH to 7.5 with acetic acid.

Loss on drying NMT 1.0% (2 g, 100 °C, 1 hour).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 15 mg of Nizatidine, dissolve in mobile phase to make exactly 50 mL, and use this solution as the test solution. Separately, weigh accurately about 15 mg of nizatidine RS, dissolve in the mobile phase to make exactly 50 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions and determine the peak areas of nizatidine, A_T and A_S respectively.

$$\text{Amount (mg) of nizatidine } (C_{12}H_{21}N_6O_2S_2) = \text{Amount (mg) of nizatidine RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silical gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of ammonium acetate buffer and methanol (76 : 24).

Flow rate: 1 mL/min

System suitability

System performance: Proceed with 10 μL of the standard solution according to the above conditions; the number of theoretical plates is NLT 1,500 with the symmetry factor being NMT 2.0.

System repeatability: Repeat the test 5 times with 10 μL of the standard solution according to the above conditions; the relative standard deviation of the peak area of nizatidine is NMT 1.5%.

Packaging and storage Preserve in light-resistant, tight containers.

Nizatidine Tablets
니자티딘 정

Nizatidine contains NLT 90.0% and NMT 110.0% of the labeled amount of nizatidine ($C_{12}H_{21}N_5O_2S_2$: 331.47).

Method of preparation Prepare as directed under Tablets, with Nizatidine.

Identification (1) Weigh an amount equivalent to 0.15 g of nizatidine ($C_{12}H_{21}N_5O_2S_2$) according to the labeled amount of Nizatidine Tablets, add 20 mL of methanol, shake well to mix, and filter it. Separately, weigh 0.15 g of nizatidine RS, add 20 mL of methanol, shake well to

mix, and filter it. Determine the infrared spectra of the residues, obtained by evaporating the filtrate to dryness, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) Proceed with Nizatidine Tablets as directed under the Assay; the test solution and the standard solution exhibit peaks at the same retention time.

Dissolution Perform the test with 1 tablet of Nizatidine Tablets at 50 revolutions per minute according to Method 2 under the Dissolution, using 900 mL of water as the dissolution medium. Take 20 mL of the medium 30 minutes after starting the test and filter. Take 10.0 mL of the filtrate, add water to make 50 mL, and use this solution as the test solution. Separately, weigh accurately about 75 mg of nizatidine RS, and dissolve in water to make 100 mL. To 2.0 mL of this solution, add the dissolution medium to make 100 mL, and use this solution as the standard solution. Determine the absorbances of the test solution and the standard solution, A_T and A_S at 314 nm as directed under the Ultraviolet-visible Spectroscopy. The dissolution rate in 30 minutes of Nizatidine Tablets is NLT 75%.

Dissolution rate (%) with respect to the labeled amount of nizatidine ($C_{12}H_{21}N_5O_2S_2$)

$$= W_S \times \frac{A_T}{A_S} \times \frac{1}{C} \times 90$$

W_S: Amount (mg) of nizatidine RS

C: Labeled amount (mg) of nizatidine ($C_{12}H_{21}N_5O_2S_2$) in 1 tablet

Purity ***Related substances*—**Weigh accurately the mass of NLT 20 tablets of Nizatidine Tablets and powder. Weigh accurately about 0.2 g of nizatidine ($C_{12}H_{21}N_5O_2S_2$), add 50 mL of the mobile phase, shake to mix, and add the mobile phase to make 100 mL. Use this solution as the test solution. Separately, weigh accurately nizatidine RS, make the concentration of 40 μg per mL, and use this solution as the standard solution. Perform the test with 10 μL each of test solution and standard solution as directed under the Assay and determine the peak area of each related substance in the test solution and the peak area of nizatidine in the standard solution, A_T and A_S. Each related substance is NMT 0.5% and the total related substances are NMT 1.5%.

$$\text{Content (\%) of each related substance} = 2 \times \frac{A_T}{A_S}$$

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately NLT 20 tablets of Nizatidine Tablets and powder. Weigh accurately about 0.1 g of nizatidine ($C_{12}H_{21}N_5O_2S_2$), add 50 mL of the mobile phase, shake well to mix, and make 100 mL with the mobile phase. Filter this solution, take 5.0 mL of the filtrate, add the mobile phase to make 50.0 mL, and use this solution as the test solution. Separately, weigh accurately about 0.1 g of nizatidine RS, proceed in the same manner with the test solution, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography and determine the peak area of nizatidine, A_T and A_S.

Amount (mg) of nizatidine ($C_{12}H_{21}N_5O_2S_2$)

$$= \text{Amount (mg) of nizatidine RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 230 nm).

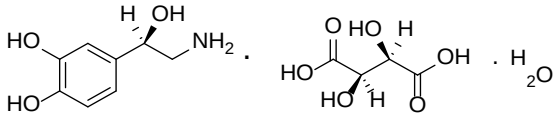
Column: A stainless steel column about 4 mm in internal diameter and about 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm to 10 μm in particle diameter).

Mobile phase: A mixture of methanol and acetate buffer solution, pH 7.5 (24 : 76).

Flow rate: 1.0 mL/min

Packaging and storage Preserve in tight containers.

Norepinephrine Tartrate Hydrate
노르에피네프린타르타르산염수화물



and enantiomer

Noradrenaline Tartrate

Norepirenamine Tartrate

$C_8H_{11}NO_3 \cdot C_4H_6O_6 \cdot H_2O$: 337.28

(*RS*)-4-(2-Amino-1-hydroxyethyl)benzene-1,2-diol; (*RR*)- & (*SS*)-2,3-dihydroxybutanedioic acid; hydrate [*69815-49-2*] [*51-40-1,* anhydride]

Norepinephrine Tartrate Hydrate contains NLT 97.0% and NMT 102.0% of *dl*-norepinephrine tartrate ($C_8H_{11}NO_3 \cdot C_4H_6O_6$), calculated on the anhydrous basis.

Description Norepinephrine Tartrate Hydrate occurs as a white to pale brown or slightly reddish brown crystalline powder.

It is freely soluble in acetic acid(100), very slightly soluble in water and practically insoluble in ethanol(95) or ether.

It dissolves in dilute hydrochloric or acetic acid.

It is gradually changed to brown by air or light.

Identification (1) Determine the infrared spectra of Norepinephrine Tartrate Hydrate and norepinephrine tartrate RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) Dissolve 50 mg of Norepinephrine Tartrate Hy-

drate in 10 mL of water and add one drop of ferric chloride TS to this solution; the resulting solution exhibits a strong green.

(3) Take 1 mL of the solution from (2), add water to make 500 mL, and take 1 mL again to make 1000 mL. To 10 mL of this solution, add 1.0 mL of 0.10 mol/L iodine solution, allow to stand for 5 minutes, and add 2.0 mL of 0.10 mol/L sodium thiosulfate solution; the resulting solution is colorless or light pink.

Optical rotation $[\alpha]_D^{20}$: Between -10° and -12° (0.50 g calculated on the anhydrous basis, 100 mL of water, 100 mm).

Purity ***Arterenone***—Dissolve 0.2 g of Norepinephrine Tartrate Hydrate in water to make exactly 100 mL. Perform the test with this solution as directed under the Ultraviolet-visible Spectroscopy; the absorbance at 310 nm is NMT 0.2.

Water Between 4.5% and 5.8% (0.5 g, volumetric titration, direct titration).

Residue on ignition NMT 0.1% (0.2 g).

Assay Weigh accurately about 0.25 g of Norepinephrine Tartrate Hydrate, previously dried, add 100 mL of acetic acid for non-aqueous titration, dissolve by warming, if necessary, and titrate with 0.1 mol/L perchloric acid VS (indicator: 2 drops of methylosaniline chloride TS). The endpoint of the titration is when the bluish purple color of this solution turns to blue and then finally to bluish green. Perform a blank test in the same manner and make any necessary correction.

Each mL of 1 mol/L perchloric acid VS
= 31.93 mg of $C_8H_{11}NO_3 \cdot C_4H_6O_6$

Packaging and storage Preserve in light-resistant, tight containers at room temperature.

Norepinephrine Tartrate Injection
노르에피네프린타르타르산염 주사액

Noradrenaline Tartrate Injection
Norepirenamine Tartrate Injection

Norepinephrine Tartrate Injection is an aqueous solution for injection, which contains NLT 90.0% and NMT 115.0% of the labeled amount of *dl*-norepinephrine ($C_8H_{11}NO_3$: 169.18).

Method of preparation Prepare as directed under Injections, with Norepinephrine Tartrate Hydrate.

Description Norepinephrine Tartrate Injection occurs as a clear and colorless liquid.

pH—Between 3.0 and 4.5.

Identification (1) Perform the test according to the Identification (2) of Norepinephrine Tartrate Hydrate.

(2) Weigh accurately the amount equivalent to 2 mg of norepinephrine according to the labeled amount of Norepinephrine Tartrate Injection, put the water to make 10 mL, add 2.0 mL of 0.10 mol/L iodine solution, and allow to stand for 5 minutes. Then, add 3.0 mL of 0.10 mol/L sodium thiosulfate solution; the resulting solution is colorless or pale pink.

Purity (1) ***Clarity and color of solution***—Pipet an appropriate amount of Norepinephrine Tartrate Injection, put into the test tube, and observe against a white background; no pink color or precipitation appears. If the yellow color appears, use this solution as the test solution. Put 2.0 mL of 0.1 mol/L iodine solution into the water to make 500 mL and use this solution as the standard solution. With the test solution and the standard solution, determine the absorbance at 460 nm as directed under the Ultraviolet-visible Spectroscopy; the absorbance of the test solution is not greater than that of the standard solution.

Sterility Meets the requirements.

Bacterial endotoxins Less than 83.4 EU per mg of norepinephrine.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Extractable volume of injections Meets the requirements.

Assay Weigh accurately an amount of Norepinephrine Tartrate Injection, equivalent to about 5 mg of *dl*-norepinephrine ($C_8H_{11}NO_3$), add dilute acetic acid (1 in 25) to make exactly 25 mL, and use this solution as the test solution. Separately, weigh accurately an appropriate amount of norepinephrine tartrate injection RS, dissolve by adding dilute acetic acid (1 in 25) to make 0.4 mg/mL concentration, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas A_T and A_S of norepinephrine, respectively.

$$\text{Amount (mg) of } dl\text{-norepinephrine } (C_8H_{11}NO_3) \text{ in 1 mL of Norepinephrine Tartrate Injection} = \frac{\text{Concentration of standard solution (mg / mL)}}{\text{Amount of Norepinephrine Tartrate Injection taken (mL)}} \times \frac{A_T}{A_S} \times 25 \times \frac{169.18}{337.28}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 280 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silical gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: Dissolve 1.1 g of sodium 1-heptanesulfonate in 800 mL of water, add 200 mL of methanol, adjust pH to 3.0 ± 0.1 with 1 mol/L phosphoric acid, and filter using a membrane filter.

Flow rate: 2.0 mL/min

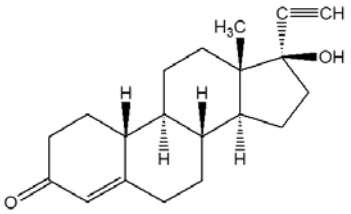
System suitability

System performance: Weigh accurately an appropriate amount each of isoproterenol and norepinephrine tartrate RS respectively, and dissolve in dilute acetic acid (1 in 25) to make 20 mL of solution at a concentration of 0.4 mg/mL. Proceed with 20 μL of the resulting solution under the above conditions; the resolution of norepinephrine and isoproterenol peaks is NLT 4.0.

System repeatability: Repeat the test 5 times with 20 μL standard solution according to the above conditions; the relative standard deviation of norepinephrine peak area is NMT 2.0%

Packaging and storage Preserve in light-resistant, hermetic containers.

Norethisterone
노르에티스테론



Norethindrone

$C_{20}H_{26}O_2$: 298.42

(8*R*,9*S*,10*R*,13*S*,14*S*,17*R*)-17-Ethynyl-17-hydroxy-13-methyl-1,2,6,7,8,9,10,11,12,14,15,16-dodecahydrocyclopenta[a]phenanthren-3-one [*68-22-4*]

Norethisterone, when dried, contains NLT 97.0% and NMT 103.0% of norethisterone ($C_{20}H_{26}O_2$).

Description Norethisterone occurs as a white to pale yellow crystalline powder. It is odorless.
It is sparingly soluble in ethanol(95), acetone or tetrahydrofuran, slightly soluble in ether and very slightly soluble in water.
It is affected by light.

Identification (1) Add 2 mL sulfuric acid to 2 mg of Norethisterone; the resulting solution exhibits a reddish brown color with a yellowish green fluorescence. Add 10 mL of water to this solution cautiously; the resulting solution exhibits a yellow color and a pale brown precipitate is produced.

(2) To 25 mg of Norethisterone, add 3.5 mL of a solution made by dissolving 50 mg of hydroxylamine hydrochloride and 50 mg of anhydrous sodium acetate in 25 mL of methanol. Heat on a steam bath for 5 hours under a reflux condenser. After cooling, take the precipitate obtained by adding 15 mL of water and filtering. Wash this precipitate with 1 - 2 mL of water, recrystallize with methanol, and dry in a desiccator (in vacuum, silica gel) for 5 hours; the crystals melt between 112 and 118 ℃.

Optical rotation $[\alpha]_D^{20}$: Between -32 and -37° (After drying, 0.25 g, acetone, 25 mL, 200 mm).

Melting point Between 203 and 209 ℃.

Purity ***Related substances***—With 0.1 g each of Norethisterone and norethisterone RS, prepare the test and standard solutions according to Purity (2), Related substances (A) of Norethisterone Acetate. With these solutions, perform the test as directed under the Thin Layer Chromatography. Next, develop the plate with a mixture of chloroform and methanol (95 : 5) as the developing solvent to a distance of 3/4 of entire length, and air-dry the plate. Spray evenly with a mixture of methanol and sulfuric acid, and heat the plate at 100 ℃ for 5 minutes; The R_f value of the principal spot from the test solution is identical with that of the standard solution (1), and the spots other than the principal spot from the test solution are not more intense (0.5%) than the spots from the standard solution. The total intensity of the spots other than the principal spot from the test solution is not more intense (1.5%) than the spots from the standard solution (1).

Loss on drying NMT 0.5% (0.5 g, in vacuum, silica gel, 4 hours).

Residue on ignition NMT 0.1% (0.5 g).

Assay Weigh accurately 0.2 g of Norethisterone, previously dried, dissolve in 40 mL of tetrahydrofuran, add 10 mL of silver nitrate solution (1 in 20), and titrate with 0.1 mol/L sodium hydroxide VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS
= 29.843 mg of $C_{20}H_{26}O_2$

Packaging and storage Preserve in light-resistant, tight containers.

Norethisterone Tablets
노르에티스테론 정

Norethindrone Tablets

Norethisterone Tablets contains NLT 90.0% and NMT 110.0% of the labeled amount of norethisterone

($C_{20}H_{26}O_2$: 298.42).

Method of preparation Prepare as directed under Tablets, with Norethisterone.

Identification Weigh an amount of Norethisterone Tablets, previously powdered, equivalent to about 50 mg of norethisterone according to the labeled amount, add 15 mL of hexane, and shake occasionally for 15 minutes. Centrifuge this mixture and discard the hexane layer. Extract the residues with each 10 mL of hexane twice, centrifuge, and discard the hexane layer. Add 25 mL of chloroform to the residue, shake for 1 - 2 minutes, and filter. Evaporate the filtrate until it is concentrated to 3 mL, add an appropriate amount of hexane to separate crystals, and evaporate to dryness. Determine the infrared spectra of this residue and norethisterone RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Dissolution Perform the test with 1 tablet of Norethisterone Tablet at 75 revolutions per minute according to Method 2 under the Dissolution, using 500 mL of 0.1 mol/L hydrochloric acid TS containing 0.09% sodium lauryl sulfate degassed with the dissolution medium. Take NLT 20 mL of the dissolved solution 30 minutes after starting the Dissolution and filter using a 0.45 μm membrane filter. Discard the first 10 mL of the filtrate and use the subsequent filtrate as the test solution. Separately, weigh accurately about 35 mg of norethisterone RS, put in a 500-mL volumetric flask, add 100 mL of methanol, and sonicate to completely dissolve. After cooling at room temperature, add methanol to make exactly 500 mL. Pipet 2.0 mL of this solution, add the test solution to make exactly 200 mL, and use this solution as the standard solution. Perform the test with 100 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of each solution. The acceptable dissolution criterion is NLT 80% (Q) of Norethisterone Tablets dissolved in 30 minutes.

Dissolution rate (%) of the labeled amount of norethisterone ($C_{20}H_{26}O_2$)
= Amount (mg) of norethisterone RS $\times \frac{A_T}{A_S} \times \frac{1}{C}$

C: Labeled amount (mg) of norethisterone ($C_{20}H_{26}O_2$) in 1 tablet

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of water and acetonitrile (3 : 2).

Flow rate: 1.5 mL/min

System suitability

System repeatability: Repeat the test 5 times with each 100 μL of the standard solution according to the above conditions; the relative standard deviation of the peak area of norethisterone is NMT 3.0%.

Uniformity of dosage units Meets the requirements.

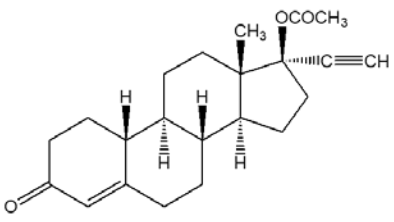
Assay Weigh accurately the mass of NLT 20 tables of Norethisterone Tablets and powder. Weigh accurately an amount of Norethisterone Tablets, equivalent to about 0.7 mg of norethisterone ($C_{20}H_{26}O_2$), put in a volumetric flask, add purified methanol to the gauge line, and shake to mix. Allow it to stand for 10 minutes with occasional shaking. Filter the mixture, transfer 10.0 mL of the filtrate to a suitable flask, add 2.0 mL of isoniazid TS, and allow it to stand for 30 minutes with the stopper closed. Use this solution as the test solution. Transfer 10.0 mL of the remaining filtrate to a suitable flask, add 2.0 mL of methanol, and use this solution as a control solution of the test solution. Take 10.0 mL of methanol to a suitable flask, add 2.0 mL of isoniazid TS, shake to mix with the stopper closed, and allow it to stand for 30 minutes. Use this solution as a control solution of the reagent solution. Separately, weigh accurately a certain amount of norethisterone RS and dissolve in methanol to make a solution containing 14 μg per mL. Pipet 10.0 mL of this solution, add 2.0 mL of isoniazid TS, and allow it to stand for 30 minutes with a stopper closed. Use this solution as the standard solution. With these solutions, determine the absorbances, A_T, A_B and A_S, of the test solution, the control solution of the test solution and the standard solution at 380 nm as directed under the Ultraviolet-visible Spectroscopy, using methanol as the control for the control solution of the test solution and using the control solution of the reagent solution as the control for the test solution and the standard solution.

Amount (mg) of norethisterone ($C_{20}H_{26}O_2$)
$= 0.05 \times C \times \frac{A_T - A_B}{A_S}$

C: Concentration of standard solution (μg/mL)

Packaging and storage Preserve in well-closed containers.

Norethisterone Acetate
노르에티스테론아세테이트



Norethindrone Acetate $C_{22}H_{28}O_3$: 340.46
[(8*R*,9*S*,10*R*,13*S*,14*S*,17*R*)-17-Ethynyl-13-methyl-3-oxo-1,2,6,7,8,9,10,11,12,14,15,16-dodecahydrocyclopenta[a]phenanthren-17-yl] acetate [*51-98-9*]

Norethisterone Acetate contains NLT 97.0% and NMT 103.0% of norethisterone acetate ($C_{22}H_{28}O_3$), calculated on the dried basis.

Description Norethisterone Acetate occurs as a white to milky white crystalline powder. It is odorless.
It is soluble in ether or ethanol(95) and practically insoluble in water.

Identification Determine the infrared spectra of Norethisterone Acetate and norethisterone acetate RS, both previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Optical rotation $[\alpha]_D^{20}$: Between -30° and -35° (0.50 g as a calculated dried basis, ethanol(95), 25 mL, 100 mm).

Purity (1) ***Clarity and color of solution***—Dissolve 0.5 g of Norethisterone Acetate in ethanol(95); the solution is clear.

(2) ***Related substances***—(i) Dissolve 0.1 g of Norethisterone Acetate in chloroform to make exactly 10 mL and use it as the test solution. Separately, dissolve 0.1 g of norethisterone acetate RS in chloroform to make exactly 10 mL and dilute this solution by adding chloroform to make the standard solutions (1), (2), (3), and (4) at concentrations of 150, 50, 30 and 10 μg/mL, respectively. With these solutions, perform the test as directed under the Thin Layer Chromatography. Next, develop the plate with a mixture of toluene and ethyl acetate (1 : 1) as the developing solvent to a distance of about 15 cm, and air-dry the plate. Spray evenly a mixture of methanol and sulfuric acid on the plate and heat the plate at 100 ℃ for 5 minutes; spots other than the principal spot from the test solution are not more intense than the spot from the standard solution (2), and the total intensity of the spots other than the principal spot from the test solution is not more intense than that from the standard solution (1).

(ii) Dissolve 62.5 mg of Norethisterone Acetate in the mobile phase to make exactly 25 mL, and use this solution as the test solution. To 1.0 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine each peak area of these solutions; each peak area other than the major peak of the test solution is not greater than 1/2 of the major peak area of the standard solution (0.5%), and the total peak area other than the major peak of the test solution is not greater than the major peak area of the standard solution (1.0%). Exclude the peak area NMT 0.025 times of the area of the major peak of the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 to 10 μm in particle diameter).

Mobile phase: A mixture of acetonitrile and water (6: 4).

Flow rate: 1.0 mL/min

System suitability

System performance: Dissolve 8 mg each of desoxycorticosterone acetate RS and norethisterone acetate RS in the mobile phase to make exactly 100 mL. Proceed with 20 μL of this solution according to the above conditions; desoxycorticosterone acetate and norethisterone acetate are eluted in this order with the resolution between these peaks being NLT 3.5.

Time span of measurement: About 2 times the retention time of norethisterone acetate.

(3) ***Ethinyl-group***—Weigh accurately about 0.2 g of Norethisterone Acetate, add 40 mL of tetrahydrofuran and 10 mL of silver nitrate solution (1 in 10), and titrate with 0.1 mol/L sodium hydroxide VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.
The content of ethinyl group is between 7.13% and 7.17%.

Each mL of 0.1 mol/L sodium hydroxide VS
= 2.503 mg of -C≡CH

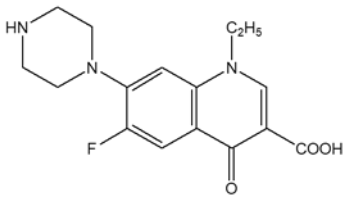
Loss on drying NMT 0.5% (1 g, 105 ℃, 3 hours).

Assay Weigh accurately about 0.1 g each of Norethisterone Acetate and norethisterone acetate RS and dissolve in ethanol(95) to make exactly 200 mL. Pipet 5.0 mL each of these solutions in ethanol(95) to make exactly 250 mL and use these solutions as the test solution and the standard solution, respectively. Measure the absorbances of the test solution (A_T) and the standard solution (A_S) at the wavelength of 240 nm as directed under the Ultraviolet-visible Spectroscopy.

Amount (mg) of norethisterone acetate ($C_{22}H_{28}O_3$)
= Amount (mg) of norethisterone acetate RS× $\frac{A_T}{A_S}$

Packaging and storage Preserve in light-resistant, well-closed containers.

Norfloxacin
노르플록사신



$C_{16}H_{18}FN_3O_3$: 319.33
Ethyl-6-fluoro-4-oxo-7-(piperazin-1-yl)-1,4-dihydroquinoline-3-carboxylic acid [*70458-96-7*]

Norfloxacin, when dried, contains NLT 99.0% and NMT 101.0% of norfloxacin ($C_{16}H_{18}FN_3O_3$).

Description Norfloxacin occurs as a white to light yellow and crystalline powder.
It is freely soluble in acetic acid(100), slightly soluble in ethanol(99.5) or acetone, very slightly soluble in methanol and practically insoluble in water.
It dissolves in dilute hydrochloric acid or sodium hydroxide TS.
It is hygroscopic.
It is gradually colored by light.

Identification (1) Dissolve 10 mg of Norfloxacin and norfloxacin RS in the sodium hydroxide solution (1 in 250) to make 10 mL, respectively. Add sodium hydroxide solution (1 in 250) to 5 mL each of these solutions to make 100 mL and determine the absorption spectra of these solutions as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Dissolve Norfloxacin and norfloxacin RS in acetone, respectively, evaporate the acetone in vacuum, and dry the residues. Determine the infrared spectra of the residues as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Purity (1) ***Sulfates***—Dissolve 1.0 g of Norfloxacin in 7 mL of 0.5 mol/L sodium hydroxide TS and 23 mL of water, add 1 drop of phenolphthalein TS, add gradually diluted hydrochloric acid (1 in 3) until the red color disappears, add 0.5 mL of dilute hydrochloric acid, and cool on ice for 30 minutes. Filter through a glass filter, wash the residues with 10 mL of water, combine the filtrate and the washings, and add 1 mL of dilute hydrochloric acid and water to make exactly 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution as follows. To 0.5 mL of 0.005 mol/L sulfuric acid, add hydrochloric acid diluted with 7 mL of 0.5 mol/L sodium hydroxide TS and 1 drop of phenolphthalein TS until the red color disappears, and then add 1.5 mL of dilute hydrochloric acid and 1 - 2 drops of bromophenol blue TS and water to make exactly 50 mL (NMT 0.024%).

(2) ***Heavy metals***—Proceed with 2.0 g of Norfloxacin according to Method 2 and perform the test. Prepare the control solution with 3.0 mL of lead standard solution (NMT 15 ppm).

(3) ***Arsenic***—Proceed with 1.0 g of Norfloxacin according to Method 3 and perform the test (NMT 2 ppm).

(4) ***Related substances***—Perform the test using light-resistant containers. Dissolve 0.10 g of Norfloxacin in 50 mL of a mixture of methanol and acetone (1 : 1) and use this solution as the test solution. Pipet 1 mL of this solution and add a mixture of methanol and acetone (1 : 1) to make exactly 100 mL. Pipet 2 mL of this solution, add a mixture of methanol and acetone (1 : 1) to make exactly 10 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 20 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography (5 μm to 7 μm in particle diameter with fluorescent indicator). Develop the plate with a mixture of chloroform, toluene, diethylamine and water (20 : 20 : 10 : 7 : 4) to a distance of about 9 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm and 366 nm); the number of spots other than the principal spot from the test solution is NMT 2 and these spots are not more intense than the spots from the standard solution.

Loss on drying NMT 1.0% (1 g, 105℃, 2 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.5 g of Norfloxacin, previously dried, dissolve in 50 mL of acetic acid(100), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 1 mol/L perchloric acid VS
= 31.933 mg of $C_{16}H_{18}FN_3O_3$

Packaging and storage Preserve in light-resistant, tight containers.

Norfloxacin Capsules
노르플록사신 캡슐

Norfloxacin Capsules contains NLT 90.0% and NMT 110.0% of the labeled amount of norfloxacin ($C_{16}H_{18}FN_3O_3$: 319.34).

Method of preparation Prepare as directed under Capsules, with Norfloxacin.

Identification Proceed as directed under the Assay described below; the test solution shows the major peak at the same retention time as the standard solution.

Dissolution Perform the test with 1 capsule of Norfloxacin Capsules at 50 revolutions per minutes according to Method 2, using 900 mL of 0.05 mol/L sodi-

um acetate buffer (pH 4.0) as the dissolution medium. Filter the medium 45 minutes from the start of the test and use this solution as the test solution. Separately, weigh accurately about 22 mg of norfloxacin RS, dissolve in 0.05 mol/L sodium acetate buffer (pH 4.0) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution according to the following conditions as directed under the Liquid Chromatography and determine the peak areas A_T and A_S of norfloxacin, respectively. The dissolution rate in 45 minutes of Norfloxacin Capsules is NLT 80%.

Dissolution rate (%) of the labeled amount of norfloxacin ($C_{16}H_{18}FN_3O_3$)

$$= W_S \times \frac{A_T}{A_S} \times \frac{1}{C} \times 900$$

*W*s: Amount (mg) of norfloxacin RS

C: Labeled amount (mg) of norfloxacin ($C_{16}H_{18}FN_3O_3$) in 1 capsule

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 278 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: A mixture of phosphoric acid (1 in 1000) and acetonitrile (850:150).

Flow rate: 2.0 mL/min

System suitability

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution under the above conditions; the relative standard deviation of norfloxacin peak areas is NMT 2.0%.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately about the mass of NLT 20 capsules of Norfloxacin Capsules equivalent to 0.1 g as norfloxacin ($C_{16}H_{18}FN_3O_3$), put it with about 80 mL of the mobile phase in a 200-mL flask, sonicate for 10 minutes, adjust the scale with phosphoric acid solution (1 in 1000), and mix it. Pipette 10.0 mL of this solution, put into a 25-mL flask, dilute with the mobile phase, filter, and use the filtrate as the test solution. Separately, weigh accurately about 0.1 g of norfloxacin RS, add the mobile phase to make exactly 500 mL, and use this solution as the standard solution. Perform the test with the test solution and the standard solution according to the following conditions as directed under the Liquid Chromatography and determine, A_T and A_S, of the peak area of norfloxacin.

Amount (mg) of norfloxacin ($C_{16}H_{18}FN_3O_3$)

$$= \text{Amount (mg) of norfloxacin RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 275 nm).

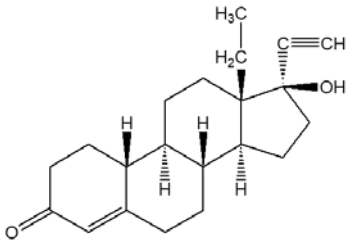
Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel.

Mobile phase: A mixture of perchloric acid solution (1 in 1000) and acetonitrile (850 : 150).

Flow rate: 2.0 mL/min

Packaging and storage Preserve in light-resistant, well-closed containers.

Norgestrel
노르게스트렐



$C_{21}H_{28}O_2$: 312.45

(8*R*,9*S*,10*R*,13*S*,14*S*,17*R*)-13-Ethyl-17-ethynyl-17-hydroxy-1,2,6,7,8,9,10,11,12,14,15,16-dodecahydrocyclopenta[a]phenanthren-3-one [*6533-00-2*]

Norgestrel, when dried, contains NLT 98.0% and NMT 101.0% of norgestrel ($C_{21}H_{28}O_2$).

Description Norgestrel occurs as white crystals or a crystalline powder.

It is soluble in chloroform or tetrahydrofuran, sparingly soluble in ethanol(95), slightly soluble in ether, and practically insoluble in water.

Identification (1) Dissolve 1 mg of Norgestrel in 2 mL of ethanol(95) and add 1 mL of sulfuric acid; the resulting solution exhibits a purple color. Examine this solution under ultraviolet light (main wavelength: 365 nm); the solution shows an orange fluorescence.

(2) Determine the infrared spectra of Norgestrel and norgestrel RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Melting point Between 206 and 212 ℃.

Purity (1) ***Heavy metals***—Weigh 1.0 g of Norgestrel, heat gently to carbonize. After cooling, add 10 mL solution of magnesium nitrate in ethanol(95) (1 in 10) and ignite in ethanol(95) to burn. After cooling, proceed with 1 mL of sulfuric acid as directed under Method 4 below and perform the test. Prepare the control solution with 2.0

mL of lead standard solution (NMT 20 ppm).

(2) ***Related substances***—Dissolve 30 mg of Norgestrel in 5 mL of chloroform and use this solution as the test solution. Pipet 1 mL of this solution, add chloroform to make exactly 100 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of dichloromethane and ethyl acetate (2 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 0.5% (1 g, 105 ℃, 3 hours).

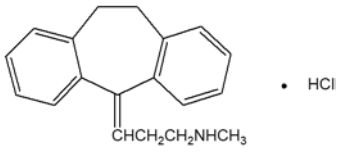
Residue on ignition NMT 0.2% (0.5 g).

Assay Weigh accurately about 0.2 g of Norgestrel, previously dried, dissolve in 40 mL of tetrahydrofuran, add 10 mL of silver nitrate solution (1 in 20), and titrate with 0.1 mol/L sodium hydroxide VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS
= 31.245 mg of $C_{21}H_{28}O_2$

Packaging and storage Preserve in well-closed containers.

Nortriptyline Hydrochloride
노르트립틸린염산염



$C_{19}H_{21}N \cdot HCl$: 299.84

3-(10,11-Dihydro-5*H*-dibenzo[a,d]cycloheptен-5-ylidene)-*N*-methylpropan-1-amine hydrochloride [*894-71-3*]

Nortriptyline Hydrochloride, when dried, contains NLT 98.5% and NMT 101.0% of nortriptyline hydrochloride ($C_{19}H_{21}N \cdot HCl$).

Description Nortriptyline Hydrochloride occurs as a white to yellow crystalline powder. It is odorless or a slight characteristic odor.

It is freely soluble in acetic acid(100) or chloroform, soluble in ethanol(95), sparingly soluble in water and practically insoluble in ether.

pH—Dissolve 1.0 g of Nortriptyline Hydrochloride in 100 mL of water; the pH of this solution is about 5.5.

Melting point—Between 215 and 220 ℃.

Identification (1) Add 1 mL of bromine TS to 5 mL of Nortriptyline Hydrochloride solution (1 in 100); the color of the test solution disappears.

(2) Add 1 - 2 drops of a solution of quinhydrone in methanol (1 in 40) to 5 mL of Nortriptyline Hydrochloride solution (1 in 100); the resulting solution gradually exhibits a red color.

(3) Determine the absorption spectra of Nortriptyline Hydrochloride and nortriptyline hydrochloride RS solution (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(4) Determine the infrared spectra of Nortriptyline Hydrochloride and nortriptyline hydrochloride RS, previously dried, as directed in the potassium chloride disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(5) A solution of Nortriptyline Hydrochloride (1 in 100) responds to the Qualitative Analysis for chloride.

Purity (1) ***Clarity and Color of Solution***—Dissolve 0.10 g of Nortriptyline Hydrochloride in 10 mL of water; the solution is colorless to light yellow and clear.

(2) ***Heavy metals***—Proceed with 1.0 g of Nortriptyline Hydrochloride according to Method 2 and perform the test. Prepare the control solution with 1.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Arsenic***—Prepare the test solution with 1.0 g of Nortriptyline Hydrochloride according to Method 3 and perform the test (NMT 2 ppm).

(4) ***Related substances***—Weigh 0.50 g of Nortriptyline Hydrochloride, dissolve in 20 mL of chloroform, and use this solution as the test solution. Pipet 2 mL of this solution and add chloroform to make exactly 100 mL. Pipet 5 mL of this solution, add chloroform to make exactly 50 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 4 μL each of the test solution and the standard solution on a plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of cyclohexane, methanol and diethylamine (8 : 1 : 1) as the developing solvent to a distance of about 15 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot obtained from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 0.5% (1 g, 105 ℃, 2 hours).

Residue on ignition NMT 0.1% (1 g).

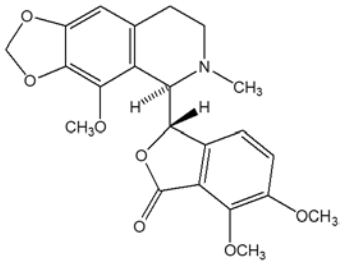
Assay Weigh accurately about 0.5 g of Nortriptyline Hydrochloride, previously dried, dissolve in 5 mL of acetic acid(100), add 50 mL acetic anhydride, and titrate

with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry) Perform a blank test in the same manner and make any necessary correction.

Each mL of 1 mol/L perchloric acid VS
= 29.984 mg of $C_{19}H_{21}N \cdot HCl$

Packaging and storage Preserve in tight-resistant, well-closed containers.

Noscapine
노스카핀



Narcotine $C_{22}H_{23}NO_7$: 413.42
(3*S*)-6,7-Dimethoxy-3-((5*R*)-4-methoxy-6-methyl-5,6,7,8-tetrahydro-[1,3]dioxolo[4,5-g]isoquinolin-5-yl)isobenzofuran-1(3*H*)-one [*128-62-1*]

Noscapine, when dried, contains NLT 98.5% and NMT 101.0% of noscapine ($C_{22}H_{23}NO_7$).

Description Noscapine occurs as white crystals or a crystalline powder. It is odorless and tasteless.
It is very soluble in acetic acid(100), slightly soluble in ethanol(95) or ether, and practically insoluble in water.

Identification (1) Determine the absorption spectra of Noscapine and noscapine RS in methanol solution (1 in 20000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Noscapine and noscapine RS, previously dried, according to the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Specific optical rotation $[\alpha]_D^{20}$: Between +42° and +48° (After drying, 0.5 g, 0.1 mol/L hydrochloric acid TS, 25 mL, 100 mm).

Melting point Between 174 and 177 ℃.

Purity (1) ***Chloride***—Dissolve 0.7 g of Noscapine in 20 mL of acetone, add 6 mL of dilute nitric acid and water to make 50 mL. Use this solution as the test solution. Add 20 mL of acetone, 6 mL of dilute nitric acid and water to 0.4 mL of 0.01 mol/L hydrochloric acid to make 50 mL (NMT 0.02%). Use this solution as the control solution.

(2) ***Heavy metals***—Weigh 2.0 g of Noscapine and perform the test according to Method 2. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Morphine***—Dissolve 10 mg of Noscapine in 1 mL of water and 5 mL of 1-nitroso-2-naphthol TS by shaking to mix, add 2 mL of potassium nitrate solution (1 in 10), and warm at 40℃ for 2 minutes. Then, add 1 mL of sodium nitrate solution (1 in 5000) and warm the mixture at 40 ℃for 5 minutes. After cooling, add 10 mL of chloroform, mix by shaking, centrifuge, and collect the aqueous layer; the color of the resulting solution is not more intense than light red.

(4) ***Related substances***—Dissolve 0.7 g of Noscapine in 50 mL of acetone and use this solution as the test solution. Pipet 5 mL of this solution and add acetone to make exactly 50 mL. Pipet 5 mL of this solution, add acetone to make exactly 100 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on a plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of acetone, toluene, ethanol(99.5) and ammonia water(28) (60 : 60 : 9 : 2) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Spray dilute bismuth subnitrate-potassium iodide TS for spray evenly onto the plate; spots other than the principal spot from the test solution are not more intense than the spot from the standard solution.

Loss on drying NMT 0.5% (2 g, 105℃, 4 hours).

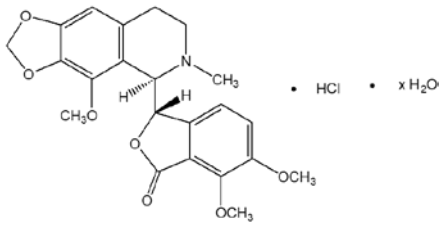
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.8 g of Noscapine, previously dried, dissolve in 30 mL of acetic acid, and titrate with 0.1 mol/L perchloric acid VS (indicator: 3 drops of methylosaniline chloride TS). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 41.34 mg of $C_{22}H_{23}NO_7$

Packaging and storage Preserve in light-resistant, well-closed container.

Noscapine Hydrochloride Hydrate
노스카핀염산염수화물



Noscapine Hydrochloride
Narcotine Hydrochloride $C_{22}H_{23}NO_7 \cdot HCl \cdot xH_2O$
(3*S*)-6,7-Dimethoxy-3-((5*R*)-4-methoxy-6-methyl-5,6,7,8-tetrahydro-[1,3]dioxolo[4,5-g]isoquinolin-5-yl)isobenzofuran-1(3*H*)-one hydrate hydrochloride [*912-60-7*]

Noscapine Hydrochloride Hydrate, when dried, contains NLT 98.0% and NMT 101.0% of noscapine hydrochloride ($C_{22}H_{23}NO_7 \cdot HCl$: 449.88).

Description Noscapine Hydrochloride Hydrate occurs as colorless or white crystals or a crystalline powder. It is odorless and has a bitter taste.
It is freely soluble in water, acetic acid(100) or acetic anhydride, soluble in ethanol(95) and practically insoluble in ether.

Identification (1) To 1 mg of Noscapine Hydrochloride Hydrate, add 1 drop of formaldehyde-sulfuric acid TS; the resulting solution exhibits a purple color, and then changes to yellowish brown.

(2) To 1 mg of Noscapine Hydrochloride Hydrate, add 1 drop of ammonium vanadate in sulfuric acid (1 in 200); the resulting solution exhibits an orange color.

(3) Dissolve 20 mg of Noscapine Hydrochloride Hydrate in 1 mL of water and add 3 drops of sodium acetate TS; the resulting solution exhibits a white, flocculent precipitate.

(4) Dissolve 1 mg of Noscapine Hydrochloride Hydrate in 1 mL of diluted sulfuric acid (1 in 35), mix with 5 drops of chromotropic acid (1 in 50), and add 2 mL of sulfuric acid by drop; the resulting solution exhibits a purple color.

(5) Dissolve 0.1 g of Noscapine Hydrochloride Hydrate in 10 mL of water, make the solution alkaline with ammonia TS, and shake to mix with 10 mL of chloroform. Separate the chloroform layer, wash with 5 mL water, and filter. Evaporate most of the filtrate on a steam bath, add 1 mL purified methanol, and evaporate to dryness. Dry the residues at 105 ℃ for 4 hours; the residue melts between 174 and 177 ℃.

(6) Make a solution of Noscapine Hydrochloride Hydrate (1 in 50) alkaline with ammonia TS and filter the precipitate. Acidify the filtrate with dilute nitric acid; the solution responds to the Qualitative Analysis (2) for chloride.

Purity ***Morphine***—Dissolve 10 mg of Noscapine Hydrochloride Hydrate in 1 mL of water, add 5 mL of 1-nitroso-2-naphthol TS and 2 mL of potassium nitrate (1 in 10), and warm at 40 ℃ for 2 minutes. Then add 1 mL of sodium nitrate solution (1 in 5000) and warm at 40 ℃for 5 minutes. After cooling, add 10 mL of chloroform, shake to mix, centrifuge, and collect the aqueous layer; the color of resulting solution is not more intense than light red.

Loss on drying NMT 9.0% (0.5 g, 120 ℃, 4 hours).

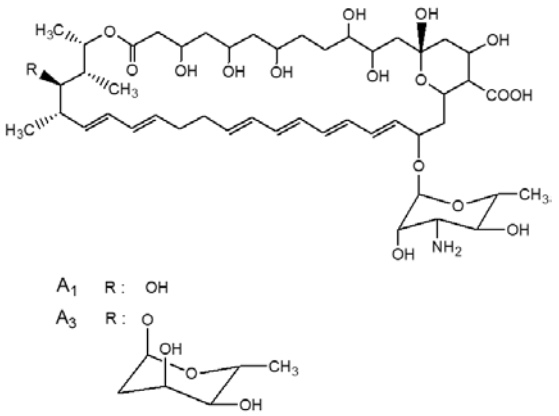
Residue on ignition NMT 0.5% (1 g).

Assay Weigh accurately about 0.5 g of Noscapine Hydrochloride Hydrate, previously dried, dissolve in 50 mL of a mixture of acetic acid(100) and acetic anhydride (7 : 3), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 44.99 mg of $C_{22}H_{23}NO_7 \cdot HCl$

Packaging and storage Preserve in light-resistant, well-closed containers.

Nystatin
니스타틴



Nystatin A_1 $C_{47}H_{75}NO_{17}$: 926.10
(4*E*,6*E*,8*E*,10*E*,14*E*,16*E*,18*S*,19*R*,20*R*,21*S*,35*S*)-3-[(2*S*,3*S*,4*S*,5*S*,6*R*)-4-Amino-3,5-dihydroxy-6-methyloxan-2-yl]oxy-19,25,27,29,32,33,35,37-octahydroxy-18,20,21-trimethyl-23-oxo-22,39-dioxabicyclo[33.3.1]nonatriaconta-4,6,8,10,14,16-hexaene-38-carboxylic acid [*1400-61-9*]

Nystatin is a mixture of polyene macrolide compounds with antifungal activity obtained by culturing *Streptomyces noursei*.

Nystatin contains more than 4600 units (potency) of nystatin A1 ($C_{47}H_{75}NO_{17}$) per mg, calculated on the dried basis. 1 unit corresponds to 0.27 μg of nystatin.

Description Nystatin occurs as a white to light brown powder.
It is soluble in formamide, sparingly soluble in methanol, slightly soluble in ethanol(95) and very slightly soluble in water.
It is soluble in sodium hydroxide TS.

Identification (1) Weigh 1 mg of Nystatin, dissolve in 5 mL of water and 1 mL of sodium hydroxide TS, heat for 2 minutes, and cool. Add 3 mL of a methanol solution of 4-aminoacetophenone (1 in 200) and 1 mL of hydrochloric acid to this solution; the solution exhibits a purple color.

(2) Weigh 10 mg each of Nystatin and nystatin RS, add a mixture of 0.25 mL of sodium hydroxide TS and 50 mL of diluted methanol (4 in 5), melt it by heating at below 50 °C, and add diluted methanol (4 in 5) to make 500 mL. Determine the absorption spectra of these solutions as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

pH The pH of a solution obtained by suspending 0.3 g of Nystatin in 10 mL of water is between 6.5 and 8.0.

Purity ***Heavy metals***—Weigh about 1.0 g of Nystatin and perform the test according to Method 4. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

Abnormal toxicity It meets the requirements when used in the manufacturing of preparations other than those applied to the skin. Suspend an amount equivalent to 600 IU of Nystatin in 5% arabic gum solution, dissolve, and inject intraperitoneally into 5 healthy mice weighing 17 to 24 g. For animals, ones that showed no abnormality for at least 5 days before the test are used for testing. No animals die when observed for 24 hours after administration. If 1 animal dies, repeat the test with 5 animals, and make sure that no animal dies when observed for 24 hours.

Loss on drying NMT 5.0% (0.3 g, in vacuum, 60 °C, 3 hours).

Content ratio of Nystatin Weigh accurately about 20 mg each of Nystatin and the nystatin RS, dissolve in dimethyl sulfoxide to make exactly 50 mL, and use them as the test solution and the standard solution, respectively. Store the test solution and the standard solution in a refrigerator, protected from light and use within 24 hours. Perform a test with 20 μL each of the test solution and the standard solution according to the Liquid Chromatography under the following conditions to obtain individual peak areas. Calculate their amounts according to the percentage peak area method; the content of nystatin A_1 is NLT 85.0% and that of other components is NMT 4.0%. However, peaks with a holding time of less than 2 minutes are excluded.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 304 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 150 mm in length, packed with octadecyl silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 30 °C.

Mobile phase: Control the mixing ratio of mobile phase A and mobile phase B in stages or gradient elution as follows.

Mobile phase A: A mixture of 0.05 mol/L ammonium acetate solution and acetonitrile (71 : 29).

Mobile phase B: A mixture of acetonitrile and 0.05 mol/L ammonium acetate solution (60 : 40).

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 - 25	100	0
25 - 35	100 → 0	0 → 100
35 - 40	0	100
40 - 45	0 → 100	100 → 0
45 - 50	100	0

Flow rate: 1 mL/min

System suitability

System performance: Weigh accurately about 20 mg of nystatin RS, dissolve in 25 mL of methanol, and add water to make 50 mL. Add 2 mL of dilute hydrochloric acid to 10 mL of this solution, and allow it to stand at room temperature for 1 hour. Proceed with 20 μL of this solution under the above conditions; the resolution between the two major peaks is NLT 3.5, and the retention time of nystatin A_1 is about 14 minutes.

Assay ***Cylinder plate method*** (1) Medium: Agar medium for gradation and base layer Use the medium of the Microbial Assays for Antibiotics A) (2) (A) ④ (a).

(2) Test organism: Use *Saccharomyces cerevisiae* ATCC 9763 as the test organism.

(3) Weigh accurately an amount equivalent to about 60,000 units of Nystatin, dissolve in *N*,*N*-dimethylformamide to make a solution containing 3,000 units per mL, and use the solution as the test stock solution. Take accurately an appropriate amount of this solution, dilute with 1% phosphate buffer (pH 6.0) to contain 300 and 150 units per mL, and use these solutions as a high-concentration test solution and a low-concentration test solution, respectively. Use light-resistant containers. Separately, weigh accurately an amount equivalent to about 60,000 units of nystatin RS (previously dried under reduced pressure at NMT 0.67 kPa at 40 °C for 2 hours) and dissolve in *N*,*N*-dimethylformamide to prepare a standard stock solution containing 3,000 units per mL. Store this standard solution below 5 °C and use it within 3 days. Take exactly an appropriate amount of this standard stock solution and dilute with 1% phosphate buffer

(pH 6.0) to contain 300 and 150 units per mL, and use them as high-concentration standard solutions and low-concentration standard solutions, respectively. Use light-resistant containers. Perform the test with these solutions according to the Microbial Assays for Antibiotics A) (8).

Packaging and storage Preserve in light-resistant, tight containers (in a cold place).

Nystatin Tablets
니스타틴 정

Nystatin Tablets contain NLT 90.0% and NMT 120.0% of the labeled amount of nystatin ($C_{47}H_{75}NO_{17}$: 926.10).

Method of preparation Prepare as directed under Tablets, with Nystatin.

Identification Powder Nystatin Tablets, weigh an amount equivalent to 10 mg of nystatin, add 5 mL of water, and shake to mix. Add 2 drops of phosphomolybdic acid-tungstic acid TS and allow to stand for 1 hour; the resulting solution exhibits a green color.

Loss on drying NMT 5.0% (0.1 g, 0.7 kPa, 60 ℃, 3 hours).

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Perform the test according to the Assay under Nystatin. However, weigh accurately NLT 20 tablets of Nystatin Tablets and powder them. Weigh accurately an amount equivalent to about 600,000 units (potency) according to the labeled potency of Nystatin Tablets, put in a blender, add 150 mL of *N,N*-dimethylformamide, and mix for 2 minutes. Then, add *N,N*-dimethylformamide to make exactly 200 mL, and filter or centrifuge, if necessary. Take exactly an appropriate amount of this solution, dilute it with 1% phosphate buffer (pH 6.0) to make it the same concentration as in (3), and use this solution as the test solution.

Packaging and storage Preserve in light-resistant, tight containers.

Nystatin, Neomycin Sulfate and Polymyxin B Sulfate Suppositories
니스타틴·네오마이신황산염·폴리믹신B황산염 좌제

Nystatin, Neomycin Sulfate and Polymyxin B Sulfate Suppositories contain NLT 90.0% and NMT 120.0% of the labeled amount of nystatin ($C_{47}H_{75}NO_{17}$: 926.10), neomycin ($C_{23}H_{46}N_6O_{13}$: 614.65) and polymyxin B.

Method of preparation Prepare as directed under Suppositories, with Nystatin, Neomycin Sulfate and Polymyxin B Sulfate.

Identification Weigh 5 g of Nystatin, Neomycin Sulfate and Ploymyxin B Sulfate Suppositories, put it into a centrifuge tube, add 20 mL of chloroform, shake vigorously to mix, and centrifuge. Discard the clear liquid at the top layer, add 20 mL of chloroform again, and perform the same procedure. Dissolve the remaining precipitate in 10 mL of a mixture of dimethylformamide and 1 mol/L hydrochloric acid TS (1 : 1), and use this solution as the test solution. Separately, weigh about 200,000 units (potency) of nystatin RS, dissolve in 10 mL of a mixture of dimethylformamide and 1 mol/L hydrochloric acid TS (1 : 1), and use this solution as the standard solution (i). Separately, weigh about 70 mg (potency) of neomycin sulfate RS, dissolve in 10 mL of water, and use this solution as the standard solution (ii). Separately, weigh about 70,000 units (potency) of polymyxin B sulfate RS, dissolve in 10 mL of water, and use this solution as the standard solution (3). With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot the test and standard solutions (i), (ii) and (iii) on the thin-layer chromatographic plate made using silica gel for thin-layer chromatography, and develop with a mixture of n-butanol, acetic acid(100), water and pyridine (40 : 17 : 16 : 8) as a developing solvent. Then, air-dry the plate and evenly spray with 0.5% ninhydrin in ethanol(95); the R_f values of the spots obtained from the test and standard solutions are the same.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Take NLT 20 suppositories of Nystatin, Neomycin Sulfate and Polymyxin B Sulfate Suppositories, weigh accurately the mass, cut into small pieces, if necessary, and mix evenly to use samples of (1), (2) and (3).

(1) ***Nystatin Standard curve method***—(i) Medium: Agar medium for seed and base layer Use the medium of the Potency assay a)(ii)(a)④ⓐ.

(ii) Test organism: Use *Saccharomyces cerevisiae* ATCC 9763 as the test organism.

(iii) Weigh accurately about 100,000 units (potency) according to the indicated potency of nystatin of Nystatin, Neomycin Sulfate and Polymyxin B Sulfate Suppositories, add dimethylformamide to make 100 mL. Pipet an appropriate amount of this solution, dilute with 1% phosphate buffer (pH 6.0) to contain 200 units (potency) per mL, and use it as the test solution. Separately, weigh accurately about 10 mg of the nystatin RS and dissolve in dimethylformamide to prepare the standard stock solution containing 3000 units (potency) per mL. Store this standard stock solution at below 5 ℃ and use within 3 days. Pipet an appropriate amount of the standard stock solu-

tion, dilute with 1% phosphate buffer (pH 6.0) to contain 120, 160, 200, 240 and 280 units (potency) per mL, and use them as the standard solutions. Use the solution containing 200 units (potency) per mL as the standard intermediate diluent. Perform the test as directed under the Microbial Assays for Antibiotics b) (iv) with the test solution, the standard solution and the standard intermediate diluent.

(2) ***Neomycin sulfate***—*Cylinder plate method* (i) Medium: (a) Agar medium for seed layer and base layer

Peptone	6.0 g
Sodium chloride	2.5 g
Yeast extract	3.0 g
Glucose	1.0 g
Meat extract	1.5 g
Agar	15.0 - 20.0 g

Weigh the above, add purified water to make 1000 mL, and adjust the pH to 7.8 - 8.0 after sterilizing with 1 mol/L sodium hydroxide TS.

(ii) Test organism and test suspension: Use *Staphylococcus aureus* ATCC 6538 P as the test organism. However, make a test suspension so that the transmittance of the test suspension is 80% when measured using an absorbance photometer at a wavelength of 650 nm.

(iii) Weigh accurately about 0.1 g (potency) according to the labeled potency of neomycin of Nystatin, Neomycin Sulfate and Polymyxin B Sulfate Suppositories, add 0.1 mol/L phosphate buffer (pH 8.0), shake vigorously to mix, and filter or centrifuge to make a solution containing 1 mg (potency) in 1 mL. Then, take exactly an appropriate amount of this solution, dilute with 0.1 mol/L phosphate buffer (pH 8.0) to contain 80.0 and 20.0 μg (potency) in 1 mL, and use these solutions as the high concentration test solution and the low concentration test solution, respectively. Separately, take an appropriate amount of neomycin sulfate RS, dry it, weigh accurately about 20 mg (potency), and dissolve in 0.1 mol/L phosphate buffer (pH 8.0) to prepare a standard stock solution containing 1 mg (potency) in 1 mL. Store the standard stock solution at below 5 ℃ and use it within 30 days. Pipet an appropriate amount of this standard stock solution and dilute with 0.1 mol/L phosphate buffer (pH 8.0) to contain 80.0 μg and 20.0 μg (potency) in 1 mL, and use them as the high concentration standard solution and the low concentration standard solution, respectively. With these solutions, perform the test according to a)(8) under the Microbial Assays for Antibiotics.

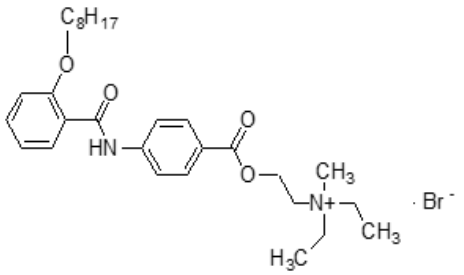
(3) ***Polymyxin B sulfate***—*Cylinder plate method* (i) Medium: Agar medium for seed and base layer Use the medium of the Microbial Assays for Antibiotics a) (ii) (a)⑤ⓐ.

(ii) Test organism: Use *Escherichia coli* NIHJ or NCCP 14134 as the test organism.

(iii) Weigh accurately about 200,000 units (potency) according to the labeled potency of Polymyxin B of Nystatin, Neomycin Sulfate and Polymyxin B Sulfate Suppositories, add 20 mL of 1% phosphate buffer (pH 6.0), shake vigorously to mix, and filter or centrifuge. Pipet an appropriate amount of this solution, dilute with 1% phosphate buffer (pH 6.0), dilute it to contain 4,000 and 1000 units (potency) in 1 mL, and use them as the high concentration test solution and the low concentration test solution. Separately, weigh accurately about 200,000 units (potency) of polymyxin B sulfate RS and dissolve in 1% phosphate buffer (pH 6.0) to prepare a standard stock solution containing 10,000 units (potency) per mL. Store the standard stock solution at below 5 ℃ and use it within 14 days. Pipet an appropriate amount of this standard stock solution, dilute with 1% phosphate buffer (pH 6.0) to make solutions containing 4,000 units and 1000 units per mL, and use these solutions as the high concentration standard solution and the low concentration standard solution, respectively. With these solutions, perform the test according to a)(8) under the Microbial Assays for Antibiotics.

Packaging and storage Preserve in tight containers.

Octylonium Bromide
옥틸로늄브롬화물



$C_{29}H_{43}O_4N_2Br$: 563.57

N,*N*-Diethyl-*N*-methyl-2-[[4-[[2-(octyloxy)benzoyl]amino]benzoyl]oxy]-ethanaminium bromide, [*26095-59-0*]

Octylonium Bromide, when dried, contains NLT 97.0% and NMT 101.0% of octylonium bromide ($C_{29}H_{43}N_4O_2$).

Description Octylonium Bromide occurs as white acicular crystals.
It is odorless and extremely bitter.
It is freely soluble in water, ethanol(95), chloroform or acetic acid(31) and practically insoluble in ether.

Identification (1) An aqueous solution of Octylonium Bromide responds to the Qualitative Analysis for bromide.

(2) Determine the absorption spectrum of a solution of Octylonium Bromide in ethanol(95) (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum near 292 nm.

(3) Determine the infrared spectra of Octylonium Bormide and octylonium bromide RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wave numbers.

(4) To 3 mL of an aqueous solution of Octylonium

Bromide, add potassium ferrocyanide TS; a pale yellow precipitate develops.

Melting point Between 167 and 169 ℃.

Absorbance ratio The absorbance ratio for a 0.001% solution of Octylonium Bromide in ethanol(95) at the absorbance maximum wavelength near 292 nm and the absorbance minimum wavelength near 247 nm is between 4.7 and 5.2.

Purity (1) ***Clarity and color of solution***—A 5% aqueous solution of Octylonium Bromide is clear and colorless.

(2) ***Heavy metals***—Weigh 1.0g of Octylonium Bromide according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Sulfate***—Weigh 0.5 g of Octylonium Bromide and perform the test. Prepare the control solution with 1 mL of 0.005 mol/L sulfuric acid (NMT 0.1%).

Loss on drying NMT 0.1% (1 g, 105 ℃, 4 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.45 g of Octylonium Bromide, previously dried, transfer to a beaker, add 2 mL of anhydrous formic acid, dissolve in 50 mL of acetic anhydride, and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 56.36 mg of $C_{29}H_{43}O_4N_2Br$

Packaging and storage Preserve in well-closed containers.

Octylonium Bromide Tablets
옥틸로늄브롬화물 정

Octylonium Bromide Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of octylonium bromide ($C_{29}H_{43}O_4N_2Br$: 563.57).

Method of preparation Prepare as directed under Tablets, with Octylonium Bromide.

Identification Weigh an amount of Octylonium Bromide Tablets, equivalent to about 20 mg of octylonium bromide according to the labeled amount, dissolve in 5 mL of water, then centrifuge, and use the clear supernatant as the test solution. Dissolve about 20 mg of octylonium bromide RS in water to make 5 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Develop the plate with a mixture of methanol, acetone and acetic acid(100) (45 : 5 : 2) as the developing solvent, and air-dry the plate. Spray evenly Dragendorff's TS on the plate; the R_f values and the colors of the spots obtained from the test and the standard solutions are the same.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 tablets of Octylonium Bromide Tablets, and powder. Weigh accurately an amount of this powder, equivalent to about 20 mg of octylonium bromide ($C_{29}H_{43}O_4N_2Br$), and add the mobile phase to make exactly 100 mL. After filtering this solution, pipet 10 mL of the filtrate, add the mobile phase to make exactly 50 mL, and use this solution as the test solution. Separately, weigh accurately about 20 mg of octylonium bromide RS, and add the mobile phase to make exactly 100 mL. Pipet 10 mL of this solution, add the mobile phase to it make exactly 50 mL, and use this solution as the standard solution. Pipet 20 μL each of the test solution and the standard solution, perform the test as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of octylonium in each solution.

Amount (mg) of octylonium bromide ($C_{29}H_{43}O_4N_2Br$)
= Amount (mg) of octylonium bromide RS × (A_T / A_S)

Operating conditions

Detector: An ultraviolet absorption spectrophotometer (wavelength: 292 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: A mixture of acetonitrile and 0.01 mol/L potassium dihydrogen phosphate TS (3 : 1).

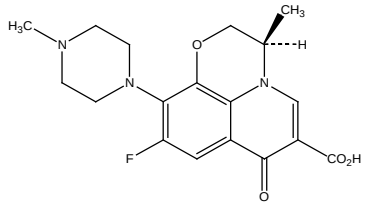
Flow rate: 0.8 mL/min

System suitability

System repeatability: Repeat the test 6 times with 20 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak areas of octylonium is NMT 2.0%.

Packaging and storage Preserve in well-closed containers.

Ofloxacin
오플록사신



and enantiomer

$C_{18}H_{20}FN_3O$: 361.37

7-Fluoro-2-methyl-6-(4-methylpiperazin-1-yl)-10-oxo-4-oxa-1-azatricyclo[7.3.1.0^{5,13}]trideca-5(13),6,8,11-tetraene-11-carboxylic acid [*82419-36-1*]

Ofloxacin, when dried, contains NLT 99.0% and NMT 101.0% of ofloxacin ($C_{18}H_{20}FN_3O$).

Description Ofloxacin occurs as white to pale yellowish white crystals or a crystalline powder.
It is freely soluble in acetic acid(100), slightly soluble in water, and very slightly soluble in acetonitrile or ethanol(99.5).
A solution of Ofloxacin in sodium hydroxide TS (1 in 20) shows no optical rotation.
It is changed in color by light.

Melting point—About 265 °C (with decomposition).

Identification (1) Determine the absorption spectra of the solutions of Ofloxacin and ofloxacin RS in 0.1 mol/L hydrochloric acid TS (1 in 150000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Ofloxacin and ofloxacin RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Optical rotation $[\alpha]_D^{20}$: Between +74.5° and +78.0° (1 g, Water, 100 mL, 100 mm).

Purity (1) ***Heavy metals***—Proceed with 2.0 g of Ofloxacin according to Method 4 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Arsenic***—Proceed with 2.0 g of Ofloxacin according to Method 2 and perform the test (NMT 1 ppm).

(3) ***Related substances***—Proceed the test keeping, protected from light. Dissolve 10 mg of Ofloxacin in 50 mL of a mixture of water and acetonitrile (6 : 1) and use this solution as the test solution. Pipet 1 mL of this solution and add a mixture of water and acetonitrile (6 : 1) to make exactly 20 mL. Pipet 1 mL of this solution and add a mixture of acetonitrile and water (6 : 1) to make 10 mL, and use this solution as the standard solution. Take exactly each 10 μL of the test solution and the standard solution and perform the test as directed under the Liquid Chromatography according to the following conditions. Determine the peak area of each solution by the automatic integration method; each peak area other than the major peak from the test solution is not greater than 0.4 times the peak area of ofloxacin from the standard solution. The total area of the peaks is not greater than the peak area from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 294 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silical gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 45 °C.

Mobile phase: Dissolve 4.0 g of sodium perchlorate and 4.0 g of ammonium acetate in 1300 mL of water, adjust the pH to 2.2 with phosphoric acid, and add 240 mL of acetonitrile.

Flow rate: Adjust the flow rate so that the retention time of ofloxacin is about 20 minutes.

System suitability

Test for required detectability: Pipet 1 mL of the standard solution and add a mixture of water and acetonitrile (6 : 1) to make exactly 20 mL. Proceed with 10 μL of this solution according to the above conditions, and confirm that the peak area of ofloxacin is equivalent to 4% - 6% of the peak area of ofloxacin from the standard solution.

System performance: Pipet 0.5 mL of the test solution, add 1 mL of a solution of ofloxacin demethylation in a mixture of water and acetonitrile (6 : 1) (1 in 20000), and add 100 mL of a mixture of water and acetonitrile (6 : 1) to make 100 mL. Proceed with 10 μL of the resulting solution according to the above operating conditions; ofloxacin demethylation and ofloxacin are eluted in this order with the resolution being NLT 2.5.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak areas of ofloxacin is NMT 2.0%.

Time span of measurement: About 1.8 times the retention time of ofloxacin after the solvent peak.

Loss on drying NMT 0.2% (1 g, 105℃, 4 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.3 g of Ofloxacin, previously dried, dissolve in 100 mL of acetic acid(100), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Separately, perform a blank test and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 36.14 mg of $C_{18}H_{20}FN_3O$

Packaging and storage Preserve in light-resistant, tight containers.

Ofloxacin Ophthalmic Ointment
오플록사신 안연고

Ofloxacin Ophthalmic Ointment contains NLT 90.0% and NMT 110.0% of the labeled amount of ofloxacin ($C_{18}H_{20}FN_3O_4$: 361.37).

Method of preparation Prepare as directed under Ophthalmic Ointments, with Ofloxacin.

Identification The retention time of the major peak obtained from the test solution and the standard solution from the Assay and the ultraviolet absorption spectrum between 200 and 400 nm are the same.

Foreign metallic matter Meets the requirements.

Sterility Meets the requirements.

Assay Weigh accurately an amount of Ofloxacin Ophthalmic Ointment equivalent to about 7.5 mg of ofloxacin ($C_{18}H_{20}FN_3O_4$) according to the labeled amount, add 15 mL of chloroform, and dissolve by warming on a steam bath at 60 °C. After cooling, add 0.1 mol/L hydrochloric acid TS to make exactly 50 mL, and stir for 30 minutes to centrifuge. Pipet 5 mL of the supernatant, place it in a 50-mL volumetric flask, add water to make exactly 50 mL, and use this solution as the test solution. Separately, weigh accurately about 15 mg of ofloxacin RS, dissolve in 0.1 mol/L hydrochloric acid TS to make 50 mL, pipet 5 mL of this solution, place it in a 100-mL volumetric flask, and add water to make exactly 100 mL. Use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak area of ofloxacin, A_T and A_S, in each solution.

Amount (mg) of ofloxacin ($C_{18}H_{20}FN_3O_4$)
= Amount (mg) of ofloxacin RS ($C_{18}H_{20}FN_3O_4$)
× A_T / A_S × 1 / 2

Operating conditions

Detector: An ultraviolet absorption spectrophotometer (wavelength: 294 nm). However, proceed with a photo-diode array detector (200 to 400 nm) for the Identification.

Column: A stainless-steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: A mixture of 0.1 mol/L citric acid-sodium hydroxide buffer solution (pH 5.0) and methanol (5 : 2).

Flow rate: 1.2 mL/min

System suitability

System repeatability: Repeat the test 6 times with 10 μL of the standard solution according to the above conditions; the relative standard deviation of the peak area of ofloxacin is NMT 2.0%.

Packaging and storage Preserve in tight containers.

Ofloxacin Optic Solution
오플록사신 점이액

Ofloxacin Optic Solution contains NLT 90.0% and NMT 110.0% of the labeled amount of ofloxacin ($C_{18}H_{20}FN_3O_4$: 361.37).

Method of preparation Prepare as directed under Optic solution, with Ofloxacin.

Identification The retention time and the UV spectrum between 200 nm and 400 nm of the major peak of the Sample solution correspond to those of the Standard solution, as obtained in the Assay.

pH Between 5.5 and 7.5.

Sterility Meets the requirements.

Assay Take exactly an amount of Ofloxacin Optic Solution, equivalent to 3 mg of ofloxacin ($C_{21}H_{20}N_3O_4$), according to the labeled amount, add water to make exactly 20 mL, and use this solution as the test solution. Separately, weigh accurately about 0.15 g of ofloxacin RS, dissolve in 0.1 mol/L hydrochloric acid to make 100 mL. Pipet 10 mL of the resulting solution, and add water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of ofloxacin from each solution.

Amount (mg) of ofloxacin ($C_{18}H_{20}FN_3O_4$)
= Amount (mg) of ofloxacin RS × (A_T/ A_S) × 0.02

Operating conditions

Detector: An ultraviolet absorbance spectrophotometer (wavelength: 294 nm). However, a photo-diode array detector (200 nm - 400 nm) is used when the Identification is performed.

Column: A stainless steel column 4.6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: A mixture of 0.1 mol/L citric acid-sodium hydroxide buffer solution (pH 5.0) and methanol (5 : 2).

Flow rate: Adjust the flow rate so that the retention

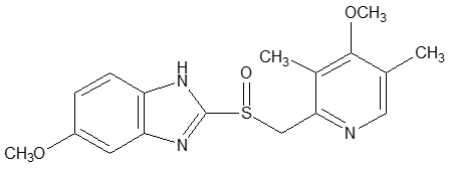
time of ofloxacin is about 5 minutes.

System suitability

System repeatability: Repeat the test 6 times with 10 μL of the standard solution according to the above conditions; the relative standard deviation of the peak areas of ofloxacin is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Omeprazole
오메프라졸



$C_{17}H_{19}N_3O_3S$: 345.42

5-Methoxy-2-((4-methoxy-3,5-dimethylpyridin-2-yl) methylsulfinyl)-1*H*-benzo[d]imidazole [*73590-58-6*]

Omeprazole contains NLT 98.0% and NMT 102.0% of omeprazole ($C_{17}H_{19}N_3O_3S$) calculated on the dried basis.

Description Omeprazole occurs as a white to pale purple powder.

It is soluble in dichloromethane, methanol or ethanol(95), and very slightly soluble in water.

Melting point—About 150 °C (with decomposition).

Identification Determine the infrared spectra of Omeprazole and omeprazolen RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers. If any difference appears between the spectra, dissolve Omeprazole and omeprazolen RS in methanol, evaporate to dryness, and perform the test with the residue in the same manner.

Purity (1) ***Clarity and color of solution***—Dissolve 0.2 g of Omeprazole in 10 mL of dichloromethane; the resulting solution is clear. Perform the test with the resulting solution as directed under Ultraviolet-visible Spectrophotometry using dichloromethane as the control solution; the absorbance at the wavelength of 440 nm is NMT 0.10.

(2) ***Heavy metals***—Proceed with 2.0 g of Omeprazole according to Method 2 under the Heavy Metals and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Related substances***—(i) Weigh 1.0 g of Omeprazole, dissolve in a mixture of dichloromethane and methanol (1 : 1) to make 20 mL, and use this solution as the test solution. Pipet 1 mL of this solution, add a mixture of dichloromethane and methanol (1 : 1) to make exactly 200 mL, and use this solution as the test solution for identification. Separately, weigh accurately about 15 mg of omeprazole RS, add a mixture of dichloromethane and methanol (1 : 1) to make 100 mL, and use this solution as standard solution (1). Pipet 10 mL of this solution, add a mixture of dichloromethane and methanol (1 : 1) to make 30 mL, and use this solution as the standard solution (2). With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution, the standard solution (1) and (2) on a plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of dichloromethane saturated with ammonia water, dichloromethane and 2-propanol (2 : 2 : 1) as the developing solvent to a distance of about 15 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); any spot other than the principal spot obtained from the test solution is not more intense than the spots from the standard solution 1 (NMT 0.3%) and the total amount of all spots other than the principal spot from the test solution is NMT 1.0% compared to the principal spots from the standard solution (1) and the standard solution (2).

(ii) Weigh accurately about 16 mg of Omeprazole, dissolve in the mobile phase to make 100 mL, and use this solution as the test solution (prepare this test solution before use). Perform the test with 40 μL each of the test solution and the mobile phase as directed under the Liquid Chromatography according to the following operating conditions; the each peak area other than the major peak for the total peak areas obtained from the test solution, as the peak which does not appear in the mobile phase, is NMT 0.3% and the sum of each peak area is NMT 1.0%.

Operating conditions

For the detector, column, mobile phase and flow rate, comply with the operating conditions under the Assay.

Time span of measurement: NLT twice of the retention time of omeprazole

Loss on drying NMT 0.2% (1.0 g, in vacuum, phosphorus pentoxide, 50 ℃, 2 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.1 g each of Omeprazole and omeprazole RS and dissolve in a mixture of sodium borate and acetonitrile (3 : 1) to make exactly 50 mL. Pipet 5 mL each of these solutions, add a mixture of 0.01 mol/L sodium borate and acetonitrile (3 : 1) to make exactly 50 mL, and use the resulting solutions as the test solution and the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of omeprazole in each solution.

$$\text{Amount (mg) of omeprazole } (C_{17}H_{19}N_3O_3S) = \text{Amount (mg) of omeprazole RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 280 nm).

Column: A stainless steel column 4.6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of phosphate buffer solution and acetonitrile (3 : 1).

Flow rate: 0.8 mL/min

System suitability

System repeatability: Repeat the test 6 times with a solution prepared by dissolving 10 mL of the standard solution in 0.01 mol/L sodium borate and acetonitrile (3 : 1) to make 20 mL; the relative standard deviation of the peak area of omeprazole is NMT 1.0%.

Phosphate buffer solution—Dissolve 0.725 g of sodium dihydrogen phosphate dihydrate and 4.472 g of anhydrous sodium dihydrogen phosphate in 300 mL of water to make 1000 mL. Take 250 mL of this solution and add water to make 1000 mL.

Packaging and storage Preserve in light-resistant, tight containers in a cold place.

Omeprazole Tablets
오메프라졸 정

Omeprazole Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of omeprazole ($C_{17}H_{19}N_3O_3S$: 345.42).

Method of preparation Prepare as directed under Tablets, with Omeprazole.

Identification The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

Dissolution Take 1 tablet of Omeprazole Tablets and perform the test at 100 revolutions per minute according to Method 2 under the Dissolution, using 500 mL of solution 1 from the Disintegration as the dissolution medium. After 2 hours, filter solution 1 from the Disintegration through a filter paper, discard the filtrate, and wash the residue on the filtrate paper with water. Dissolve this residue in 60 mL of 0.01 mol/L sodium borate solution using ultrasonic extraction for 5 minutes, add 20 mL of ethanol and 0.01 mol/L sodium borate solution to make 100 mL, and filter. Take 5.0 mL of the filtrate, add 20 mL of ethanol and 0.01 mol/L sodium borate solution to make 50 mL, and use this solution as the test solution. Separately, weigh accurately about 20 mg of omeprazole RS, dissolve in 10 mL of ethanol, and add 0.01 mol/L sodium borate solution to make 100 mL. Take 5.0 mL of this solution, add 10 mL of ethanol and 0.01 mol/L sodium borate solution to make 50 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Assay. After 2 hours, the remaining amount of omeprazole in solution 1 from the Disintegration is NLT 85% of the labeled amount.

Dissolution Take 1 tablet of Omeprazole Tablets and perform the test at 100 revolutions per minute according to Method 2, using 500 mL of solution 1 from the Disintegration as the dissolution medium. 2 hours after starting the dissolution test, add 400 mL of 0.235 mol/L dibasic sodium phosphate, perform the dissolution test for 30 minutes, take 20 mL of the dissolved solution, and filter. Take 5.0 of the filtrate, add 1.0 mL of 0.25 mol/L sodium hydroxide solution, and use this solution as the test solution. Separately, weigh accurately about 20 mg of omeprazole RS, dissolve in 10 mL of ethanol, and add buffer solution, pH 6.8, to make 100 mL. Take 5.0 mL of this solution, and add buffer solution, pH 6.8, to make 50 mL. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the conditions of the Assay, and determine the peak areas, A_T and A_S, of omeprazole in each solution. The acceptable dissolution criterion is NLT 80% of Omeprazole Tablets dissolved in 30 minutes.

Dissolution rate (%) of the labeled amount of omeprazole ($C_{17}H_{19}N_3O_3S$)

$$= \text{Amount (mg) of omeprazole RS} \times \frac{A_T}{A_S} \times \frac{900}{5} \times \frac{1}{C} \times 100$$

C: Labeled amount (mg) of omeprazole ($C_{17}H_{19}N_3O_3S$) in 1 tablet

pH 6.8 buffer solution—Mix with 100 mL of solution 1 from the Disintegration and 80 mL of 0.235 mol/L dibasic sodium phosphate.

Related substances Weigh accurately the mass of NLT 20 tablets of Omeprazole Tablets, and powder. Weigh accurately an amount of this powder, equivalent to about 20 mg of omeprazole ($C_{17}H_{19}N_3O_3S$), add 60 mL of the mobile phase, shake to mix while protected from light, and add the mobile phase to make 100 mL. Filter this solution, and use the filtrate as the test solution. Take 1.0 mL of the test solution, add the mobile phase to make 200 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak areas of each solution by the automatic integration method, and calculate the amount of related substances; all peaks other than the major peak from the test solution are not greater than the peak area of the major peak from the standard solution (NMT 0.5%), and the total area of peaks other than the major peak from the test solution is not greater than 4 times the peak area of the major peak from the standard solution (NMT 2%).

Operating conditions

Detector: An ultraviolet absorption spectrophotometer (wavelength: 280 nm).

Column: A stainless steel column about 4.0 mm in internal diameter and about 30 cm in length, packed with porous silica gel for liquid chromatography (5 μm to 10 μm in particle diameter).

Mobile phase: A mixture of dichloromethane and ammonia methanol solution (975 : 25).

Flow rate: 1.0 mL/min

Time span of measurement: About 2 times the retention time of omeprazole after the solvent peak.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 tablets of Omeprazole Tablets, and powder. Weigh accurately an amount of this powder, equivalent to about 20 mg of omeprazole ($C_{17}H_{19}N_3O_3S$), dissolve in 60 mL of 0.01 mol/L sodium borate solution using ultrasonic extraction for 5 minutes, add 20 mL of ethanol and 0.01 mol/L sodium borate solution to make 100 mL, mix, and filter. Take 5.0 mL of the filtrate, add 10 mL of ethanol and 0.01 mol/L sodium borate solution to make 50 mL, and use this solution as the test solution. Separately, weigh accurately about 20 mg of omeprazole RS, add 20 mL of ethanol and 0.01 mol/L sodium borate solution to make 100 mL, take 5.0 mL of this solution, add 10 mL of ethanol and 0.01 mol/L sodium borate solution to make 50 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of omeprazole in each solution.

$$\text{Amount (mg) of omeprazole } (C_{17}H_{19}N_3O_3S) = \text{Amount (mg) of omeprazole RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption spectrophotometer (wavelength: 280 nm).

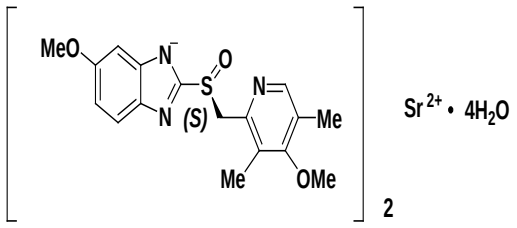
Column: A stainless steel column about 4.0 mm in internal diameter and about 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm to 20 μm in particle diameter).

Mobile phase: A mixture of pH 7.6 phosphate buffer solution and acetonitrile (66 : 34).

Flow rate: 1.0 mL/min

Packaging and storage Preserve in tight containers.

Esomeprazole Strontium Tetrahydrate
에스오메프라졸스트론튬수화물



$(C_{34}H_{36}N_6O_6S)2Sr{\cdot}4H_2O$: 848.50

Bis(5-Methoxy-2-[(*S*)-[(4-methoxy-3,5-dimethylpyridine-2-yl)methyl]sulfinyl]-1*H*-benzimidazol-1-yl) strontium salt tetrahydrate [*934714-36-0*]

Esomeprazole Strontium Tetrahydrate contains NLT 98.0% and NMT 102.0% of esomeprazole strontium [$(C_{17}H_{18}N_3O_3S)2{\cdot}Sr$: 776.44] calculated on the dries basis.

Description Esomeprazole Strontium Tetrahydrate occurs as a white to almost white crystalline powder.
It is soluble in water.

Identification (1) Determine the infrared spectra of Esomeprazole Strontium Tetrahydrate and esomeprazole strontium tetrahydrate RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) The major peaks of the test solution and standard solution obtained under the Assay are the same in the retention time.

(3) Dissolve about 50 mg of 20% acetonitrile solution in Esomeprazole Strontium Tetrahydrate, and perform the test according to the Flame Coloration (1); it exhibits a red color (strontium).

Purity (1) ***Clarity and color of solution***—Dissolve 0.2 g of Esomeprazole Strontium Tetrahydrate in acetone to make 10 mL. Determine the absorbance of this solution at 440 nm and 650 nm as directed under the Ultraviolet-visible Spectroscopy; it is NMT 0.2.

(2) ***Isomer***—Weigh 50 mg of Esomeprazole Strontium Tetrahydrate, dissolve it in diluent to make 100 mL, and use this solution as the test solution. Perform the test with 5 μL of the test solution according to the following condition as directed under the percentage peak area method under the Liquid Chromatography; the amount of *R*-isomer is NMT 0.1%.

$$\text{Content (\%) of } R\text{-isomer} = A_i / A_S \times 100$$

A_i: Peak area of *R*-isomer in the test solution

A_S: Total areas of esomeprazole and *R*-isomer in the test solution

Diluent—A mixture of phosphate buffer solution (pH 7.6) and acetonitrile (3 : 1).

Phosphate buffer solution, pH 7.6—Dissolve 1.12 g of anhydrous sodium hydrogen phosphate and 0.18 g of anhydrous sodium dihydrogen phosphate in 1000 mL of water. Adjust the pH to 7.6 with phosphoric acid.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 280 nm).

Column: A stainless steel column about 4.0 mm in internal diameter and about 15 cm in length, packed with α1-acid glycoprotein-coated silica gel for liquid chromatography of 5 μm.

Column temperature: A constant temperature of about 30 °C.

Mobile phase: Control the mixing ratio of mobile phase A and mobile phase B in stages or gradient elution as follows.

Mobile phase A: Weigh 1.42 g of dibasic sodium phosphate, dissolve in 900 mL of water, adjust the pH to 6.5 with 85% phosphoric acid, and add water to make 1000 mL.

Mobile phase B: Acetonitrile

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 - 20	90	10
20 - 25	90 → 70	10 → 30
25 - 30	70	30
30 - 35	70 → 90	30 → 10
35 - 40	90	10

Flow rate: 0.8 mL/min

Time span of measurement: About 4 times the retention time of esomeprazole.

System suitability

System performance: Weigh accurately about 5 mg of omeprazole RS, dissolve in 25 mL of diluent and add diluent to make 50 mL. Pipet 5 mL of this solution and add diluent to make 100 mL as the system suitability solution. Proceed with 5 μL of the system suitability solution under the above operating conditions; *R*-isomer and esomeprazole are eluted in this order with the resolution being NLT 5.

System repeatability: Repeat the test 6 times with 5 μL of the system suitability solution under the above conditions; the relative standard deviation of the peak area of *R*-isomer and esomeprazole is NMT 10.0%, respectively.

(3) ***Related substances***—Weigh accurately 50 mg of Esomeprazole Strontium Tetrahydrate, dissolve in the mobile phase A to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 10 mg of omeprazole, about 10 mg of related substance A RS, and about 5 mg of related substance B RS, and add the mobile phase A to make exactly 200 mL. Pipet 1 mL of this solution, add the mobile phase A to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 5 μL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions. Determine each peak area of both solutions by the automatic integration method; the amount of related substance A with the relative retention time about 0.7 is NMT 0.1%, the amount of related substance B with the relative retention time about 3.9 is NMT 0.05%, and the amount of other individual related substances is NMT 0.10%, and the total amount of related substances is NMT 0.3%.

$$\text{Content (\%) of each related substance} = C_S / C_T \times A_i / A_S \times 100$$

C_S: Concentration (mg/mL) of each related substance in the standard solution

C_T: Concentration (mg/mL) of each related substance in the test solution

A_i: Peak area of each related substance obtained from the test solution

A_S: Peak area of each related substance obtained from the standard solution

Operating conditions

For the detector, column, column temperature, mobile phase and flow rate, proceed as directed in the operating conditions under the Assay.

System suitability

System performance: Dissolve 10 mg of related substance A RS in the mobile phase A to make 200 mL. Use this solution as the related substances A standard stock solution. Separately, add 1 mL of related substance A standard stock solution to 50 mg of omeprazole RS and dissolve it in the mobile phase A to make 100 mL. Use this solution as the system suitability solution. Proceed with 5 μL of the system suitability solution according to the above conditions; the resolution between omeprazole and related substance A is NLT 2.0.

System repeatability: Repeat the test 6 times with 5 μL of the system suitability solution under the above operating conditions; the relative standard deviation of the peak area of omeprazole and related substance A is NMT 10.0%, respectively.

Loss on drying Between 7.5% and 9.5% (1.0 g, 125 °C, constant mass).

Strontium Weigh accurately about 400 mg of Esomeprazole Strontium Tetrahydrate, dissolve in 30 mL of methanol, and add 40 mL of ammonia-ammonium chloride buffer solution. To this solution, add 0.5 mL of phosphate buffer solution (pH 7.0) and 1 mL of diluent, and titrate with 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction (10.8 to 11.8% calculated on the dried basis).

Each mL of 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS = 4.381mg of Sr

Ammonia-ammonium chloride buffer solution—Dissolve 54 g of ammonium chloride with water, add 350 mL of ammonia water(28), and dilute with water to make 1000 mL.

Diluent—Mix the same amount of ethylenediaminetetraacetic acid disodium salt solution (37.2 mg/mL) and copper sulfate solution (24.9 mg/mL).

Assay Weigh accurately about 50 mg of Esomeprazole Strontium Tetrahydrate, add the mobile phase A to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 50 mg of omeprazole RS, dissolve in the mobile phase A, and make exactly 100 mL. Use this solution as the standard solution. Perform the test with 5 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas of esomeprazole from each solution, AT and AS, respectively.

$$\text{Content (\%) of esomeprazole strontium } [(C_{17}H_{18}N_3O_3S)_2 \cdot Sr] = A_T / A_S \times 776.44 / (345.42 \times 2) \times 100$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 280 nm).

Column: Stainless steel column about 4.6 mm in internal diameter and 15 cm in length, packed with octylsilanized porous silica gel for liquid chromatography of 5 μm.

Column temperature: A constant temperature of about 30 °C.

Mobile phase: Control the mixing ratio of mobile phase A and mobile phase B in stages or gradient elution as follows:

Mobile phase A: A mixture of phosphate buffer solution (pH 7.6) and acetonitrile (3 : 1).

Mobile phase B: A mixture of phosphate buffer solution (pH 7.6) and acetonitrile (3 : 2).

For dispensing of phosphate buffer solution, pH 7.6, follow Purity (2).

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 - 15	100	0
15 - 25	100 → 0	0 → 100
25 - 50	0	100
50 - 60	0 → 100	100 → 0
60 - 65	100	0

Flow rate: 1.0 mL/min

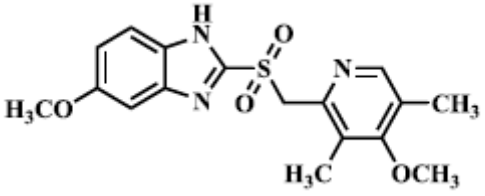
System suitability

System performance: Weigh accurately about 10 mg of related substance A RS and add the mobile phase A to make exactly 200 mL. Use this solution as the related substance A standard stock solution. Separately, weigh accurately about 50 mg of omeprazole RS, take exactly 1 mL of related substance A standard stock solution, and add the mobile phase A to make 100 mL. Use this solution as the system suitability solution. Proceed with 5 μL of the system suitability solution according to the above operating conditions; the resolution of esomeprazole and related substance A is NLT 2.0, respectively, and the symmetry coefficient of the esomeprazole peak is NMT 1.5.

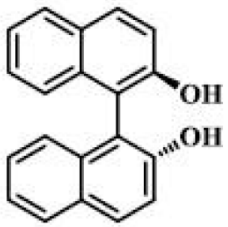
System repeatability: Repeat the test 5 times with each 5 μL of the system suitability solution; the relative standard deviation of the peak area of esomeprazole is NMT 0.73%.

Packaging and storage Preserve in light-resistant, tight containers.

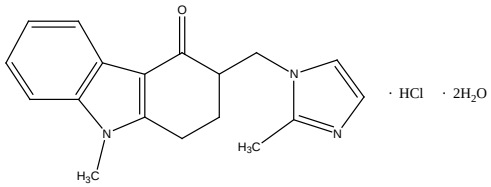
Note ***Related substance A***—Omeprazole sulfone., 5-Methoxy-2-[[(4-methoxy-3.5-dimethylpyridine-2-yl)methyl]sulfonyl]-1*H*-benzimidazole



Related substance B— (*S*)-Binol., (*S*)-(-) 1,1'-Bi(2-naphthol)



Ondansetron Hydrochloride Hydrate
온단세트론염산염수화물



Ondansetron Hydrochloride

$C_{18}H_{19}N_3O \cdot HCl \cdot 2H_2O$: 365.85

9-Methyl-3-[(2-methyl-1*H*-imidazol-1-yl)methyl]-2,3,4,9-tetrahydro-1*H*-carbazol-4-one dihydrate hydrochloride

Ondansetron Hydrochloride Hydrate contains NLT 98.0% and NMT 102.0% of ondansetron hydrochloride ($C_{18}H_{19}N_3O \cdot HCl$: 329.824), calculated on the anhydrous basis.

Description Ondansetron Hydrochloride Hydrate occurs as a white powder.
It is soluble in methanol, sparingly soluble in ethanol(95), slightly soluble in 2-propanone or dichloromethane, and very slightly soluble in acetone, chloroform or ethyl acetate.

Identification (1) Determine the infrared spectra of Ondansetron Hydrochloride Hydrate and ondansetron hydrochloride hydrate RS as directed in the paste method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wave numbers.

(2) Dissolve 20 mg of Ondansetron Hydrochloride Hydrate in 2 mL of water, add 2 mol/L nitric acid and filter; the filtrate responds to the Qualitative Analysis (2) for chloride.

Purity (1) ***Related substance I***—Weigh accurately about 50 mg of Ondansetron Hydrochloride Hydrate, dissolve in the mobile phase to make exactly 100 mL, and use this solution as the test solution. Separately weigh exactly 4.0 mg of ondansetron related substance I (1,2,3,9-tetrahydro-9-methyl-3-methylene-4*H*-carbazol-4-on) RS and dissolve in the mobile phase to make 100 mL. To 1.0 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak area, A_T and A_S, of related substance I from each solution.

$$\text{Content (\%) of related substance I} = 10 \times \frac{C}{W} \times \frac{A_T}{A_S}$$

C: Concentration (μg/mL) of related substance I in the standard solution

W: Weight (mg) of sample taken

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 328 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 20 cm in length, packed with nitrilated silica gel for liquid chromatography (3 μm to 10 μm in particle diameter).

Mobile phase: A mixture of phosphate buffer solution and acetonitrile (80 : 20).

Flow rate: 1.5 mL/min

System suitability

System performance: Dissolve 6 mg of ondansetron related substance I RS and 10 mg of ondansetron related substance II (1,2,3,9-tetrahydro-9-methyl-4*H*-carbazol-4-on) RS in the mobile phase to make 100 mL. Pipet 1.0 mL of this solution and add the mobile phase to make 100 mL. Proceed with 20 μL of this solution according to the above conditions; the relative retention times of the related substance I peak and the related substance II peak are about 1 and 0.8, respectively, and the resolution between these two peaks is NLT 1.5. Proceed with 20 μL of the standard solution according to the above operating conditions; the number of theoretical plates is NLT 400.

System repeatability: Repeat the test 5 times with 20 μL of the standard solution according to the above conditions; the relative standard deviation of the peak areas of ondansetron is NMT 2.0%.

Phosphate buffer solution—Add 1 mol/L sodium hydroxide TS to 0.02 mol/L potassium dihydrogen phosphate buffer solution to adjust pH to 5.4.

(2) ***Other related substances***—(i) Weigh accurately 125 mg of Ondansetron Hydrochloride Hydrate, dissolve in methanol to make exactly 10 mL, and use this solution as the test solution. Separately, weigh accurately 25 mg of ondansetron hydrochloride hydrate RS and dissolve in methanol to make exactly 100 mL. Dilute this solution quantitatively with methanol to prepare the solutions according to the following table, and use these solutions as the standard solutions.

Standard solution	Dilution factor	Concentration (μg/mL)	Percent (%) compared to sample
1	1 in 5	50	0.4
2	1 in 10	25	0.2
3	1 in 20	12.5	0.1

Separately, dissolve 1.0 mg of ondansetron related substance III {3[(dimethylamino)methyl]-1,2,3,9-tetrahydro-9-methyl-4*H*-carbazole-4-on} RS in methanol to make exactly 10 mL, and use this solution as the resolution test solution. Further, dissolve 1.0 mg of ondansetron related substance IV {6,6'-methylene bis[(1,2,3,9-tetrahydro-9-methyl-3-[(2-methyl-1*H*-

imidazole-1-yl)-methyl]-4*H*-carbazole-4-on} RS in methanol to make exactly 10 mL, and use this solution as the identification solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 20 μL each of the test solution and the standard solutions and 10 μL of the identification solution onto the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Further, to test system suitability, spot 20 μL of the test solution on the same plate, then drop 10 μL of each of the resolution test solution and identification solution, overlapping the droplets. Develop the plate with a mixture of chloroform, ethyl acetate, methanol and ammonia water(28) (90 : 50 : 40 : 1) as the developing solvent to a distance of about 15 cm, and air-dry the plate. Examine under ultraviolet rays (principal wavelength 254 nm) and compare the spots other than the principal spot from the test solution to the principal spot from the standard solution; the three sports for the system suitability test are completely separated, the spots other than the principal spot from the test solution having the same R_f value as the principal spot from the identification solution are not larger or more intense than the principal spot from standard solution 1 (0.4%), the spots other than the principal spot from the test solution are not larger or more intense than the principal spot from standard solution 2 (0.2%), and the total intensity of the spots other than the principal spot from the test solution is NMT 1.0%.

(ii) The test solution, the standard solution, the mobile phase and operating conditions: proceed as directed under the Assay. Perform the test with 10 μL of the test solution according to the percentage peak area method under the Liquid Chromatography according to the following conditions, and measure the peak areas of the related substances; the amount of each related substance is NMT 0.2% and the amount of total related substances is NMT 0.5%.

$$\text{Content (\%) of each related substance} = 100 \times \frac{A_i}{A_S}$$

A_i: Peak area of each related substance
A_S: Total area of related substance peaks

Water Between 9.0 and 10.5% (0.5 g, volumetric titration, direct titration).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 45 mg of Ondansetron Hydrochloride Hydrate, dissolve in the mobile phase to make exactly 50 mL. To 5.0 mL of this solution, add the mobile phase to make exactly 50 mL and use this solution as the test solution. Separately weigh accurately about 9.0 mg of ondansetron hydrochloride hydrate RS (measure water content previously), dissolve in the mobile phase to make exactly 100 mL, use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of ondansetrone from each solution.

$$\text{Amount (mg) of ondansetron hydrochloride} = 500 \times C \times \frac{A_T}{A_S}$$

C: Concentration (mg/mL) of ondansetron hydrochloride in the standard solution

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 216 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 20 cm in length, packed with nitrilated silica gel for liquid chromatography (3 μm to 10 μm in particle diameter).

Mobile phase: A mixture of phosphate buffer solution and acetonitrile (50 : 50).

Flow rate: 1.5 mL/min

System suitability

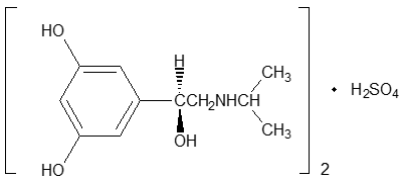
System performance: Dissolve 9 mg of ondansetron hydrochloride RS and 5 mg of ondansetron related substance III RS in the mobile phase to make exactly 100 mL. Proceed with 10 μL of this solution according to the above conditions; the relative retention times of the ondansetron peak and related substances III peak are 1.0 and 1.1, respectively, and the resolution between the two peaks is NLT 1.5. Proceed with 10 μL of the standard solution according to the above operating conditions; the symmetry factor for the ondansetron peak is NMT 2.0.

System repeatability: Repeat the test 5 times with 10 μL of the standard solution according to the above conditions; the relative standard deviation of the peak areas of ondansetron is NMT 1.5%.

Phosphate buffer solution—Add 1 mol/L sodium hydroxide TS to 0.02 mol/L potassium dihydrogen phosphate buffer solution to adjust pH to 5.4.

Packaging and storage Preserve in light-resistant, tight containers.

Orciprenaline Sulfate
오르시프레날린황산염



and enantiomer

$(C_{11}H_{17}NO_3)_2 \cdot H_2SO_4$: 520.59

bis{5-[1-Hydroxy-2-(propan-2-ylamino)ethyl] benzene-1,3-diol} sulfate [*5874-97-5*]

Orciprenaline Sulfate contains NLT 98.5% and NMT 101.0% of orciprenaline sulfate $[(C_{11}H_{17}NO_3)_2 \cdot H_2SO_4]$, calculated on the dried basis.

Description Orciprenaline Sulfate occurs as white crystals or a crystalline powder.
It is freely soluble in water, slightly soluble in acetic acid(100), and practically insoluble in ether.
An aqueous solution of Orciprenaline Sulfate (1 in 20) shows no optical rotation.

Melting point—About 220 °C (with decomposition).

Identification (1) Determine the absorption spectra of the solutions of Orciprenaline Sulfate and orciprenaline sulfate RS in 0.01 mol/L hydrochloric acid TS (1 in 10000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Orciprenaline Sulfate and orciprenaline sulfate RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) An aqueous solution of Orciprenaline Sulfate (1 in 100) responds to the Qualitative Analysis for sulfate.

pH Dissolve 1.0 g of Orciprenaline Sulfate in 10 mL of water; the pH of this solution is between 4.0 and 5.5.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Orciprenaline Sulfate in 10 mL of water; the solution is clear and its color is not more intense than that of the following control solution.

Control solution—To 3 mL of matching fluids T for color, add 1 mL of diluted hydrochloric acid (1 in 40).

(2) ***Orciprenaline sulfate***—Weigh 0.200 g of Orciprenaline Sulfate, dissolve in 0.01 mol/L hydrochloric acid TS to make exactly 20 mL. Perform the test with this solution as directed under the Ultraviolet-visible Spectroscopy; the absorbance at a wavelength of 328 nm is NMT 0.075.

(3) ***Heavy metals***—Proceed with 2.0 g of Orciprenaline Sulfate according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(4) ***Iron***—Dissolve 2.0 g of Orciprenaline Sulfate in 45 mL of water, add 2 mL of hydrochloric acid, and use this solution as the test solution. Add water to 1.0 mL of iron standard solution to make 45 mL, add 2 mL of hydrochloric acid, and use this solution as the standard solution. Add 50 mg of ammonium peroxydisulfate and 3 mL of 30% ammonium thiocyanate to the test solution and the standard solution, and mix; the color of the test solution is not more intense than that of the standard solution. (NMT 5 ppm).

(5) ***Related substances***—Dissolve 0.2 g of Orciprenaline Sulfate in a mixture of water and methanol (1 : 5) to make 10 mL, and use this solution as the test solution. Pipet 1 mL of the test solution, add a mixture of water and methanol (1 : 5) to make 100 mL, and use this solution as the standard solution (1). Pipet 5 mL of the standard solution (1), add a mixture of water and methanol (1 : 5) to make 10 mL, and use this solution as the standard solution (2). Pipet 5 mL of the standard solution (1), add a mixture of water and methanol (1 : 5) to make 20 mL, and use this solution as the standard solution (3). With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution, the standard solution (1), the standard solution (2) and the standard solution (3) on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, 2-propanol, water and ammonia water(28) (50 : 30 : 16 : 4) as the developing solvent to a distance of about 15 cm, and air-dry the plate. Expose the plate to iodine vapor; the spots other than the principal spot obtained from the test solution are not more intense than the spots from the standard solution (1) (NMT 1.0%) and the number of the spots more intense than the spots from the standard solution (2) is NMT 1 (NMT 0.5%). However, if the spots obtained from the standard solution (3) is not clearly visible, the test is not valid.

Loss on drying NMT 1.5% (1 g, in vacuum, 105 °C, 4 hours).

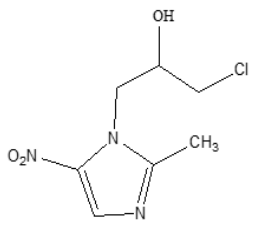
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.7 g of Orciprenaline Sulfate, add 100 mL of acetic acid(100), warm on a steam bath, and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 52.06 mg of $(C_{11}H_{17}NO_3)_2 \cdot H_2SO_4$

Packaging and storage Preserve in light-resistant, tight containers.

Ornidazole
오르니다졸



$C_7H_{10}ClN_3O_3$: 219.63
α-(Chloromethyl)-2-methyl-5-nitro-1*H*-imidazole-1-ethanol, [*16773-42-5*]

Ornidazole, when dried, contains NLT 98.5% and

NMT 101.0% of ornidazole ($C_7H_{10}ClN_3O_3$).

Description Ornidazole occurs as a white to pale yellow crystalline powder.

Identification (1) Weigh about 20 mg of Ornidazole and ornidazole RS, dissolve them in 10 mL of methanol, and use these solutions as the test solution and the standard solution, respectively. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography (with a fluorescent indicator). Next, develop the plate with a mixture of ethyl acetate and methanol (9 : 1), and air-dry the plate. Expose the plate to ultraviolet irradiation or chlorine vapor, spray o-Tolidine TS evenly on the plate; the R_f value and color (yellow spots with blue band) of spots obtained from the test solution and the standard solution are the same.

Chlorine vapor—Prepare with 2% potassium permanganate and hydrochloric acid.

(2) Weigh accurately about 0.18 g of Ornidazole and add ethanol(95) to make 200 mL. Take 10 mL of this solution, add ethanol(95) to make 100 mL, and take again 10 mL of this solution, add ethanol(95) to make 100 mL. Determine the absorption spectrum of this solution as directed under the Ultraviolet-visible Spectroscopy, using ethanol(95) as the control solution; it exhibits a maximum between 308 nm and 312 nm.

(3) Determine the infrared spectra of Ornidazole and ornidazole RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both exhibit similar intensities of absorption at the same wavenumbers.

pH Between 4.5 and 7.5 (1% aqueous solution).

Purity (1) ***Clarity and color of solution***—Dissolve 0.1 g of Ornidazole in 10 mL of water; the solution is clear and colorless.

(2) ***Heavy metals***—Proceed with 1.0 g of Ornidazole according to Method 2 under the Heavy Metals, and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

Loss on drying NMT 0.5% (1 g, in vacuum, 60 ℃, 4 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.2 g of Ornidazole, previously dried, dissolve in 50 mL of acetic acid(100) for non-aqueous titration, and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS

= 21.96 mg of $C_7H_{10}ClN_3O_3$

Packaging and storage Preserve in well-closed containers.

Ornidazole Injection
오르니다졸 주사액

Ornidazole Injection is an oily injection and contains NLT 95.0% and NMT 105.0% of the labeled amount of ornidazole ($C_7H_{10}ClN_3O_3$: 219.63).

Method of preparation Prepare as directed under Injections, with Ornidazole.

Description Ornidazole Injection occurs as a clear, greenish pale yellow liquid.

Identification Weigh an amount of Ornidazole Injection equivalent to 0.1 g of ornidazole according to the labeled amount, add 50 mL of methanol, shake to mix, centrifuge, and use the clear supernatant as the test solution. Separately, dissolve 20 mg of ornidazole RS in 10 mL of methanol and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 20 μL each of the test solution and the standard solution on a thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of ethyl acetate and methanol (9 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots from the test solution and the standard solution are the same in R_f value.

pH The pH of an aqueous solution of Ornidazole Injection (1 in 2) is between 4.3 and 6.3.

Sterility Meets the requirements.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets requirements.

Extractable volume of injections Meets the requirements.

Pyrogen It meets the requirements when tested by injecting 0.5 mL per kg body weight of a rabbit.

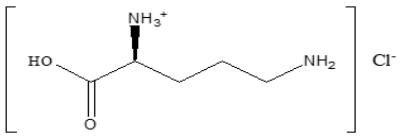
Assay Pipet an amount of Ornidazole Injection equivalent to 50 mg of ornidazole ($C_7H_{10}ClN_3O_3$), and add ethanol(95) to make exactly 100 mL. Pipet 2 mL of this solution and add ethanol(95) to make exactly 100 mL. Pipet 5 mL of this resulting solution, add ethanol(95) to make

exactly 100 mL, and use this solution as the standard solution. Separately, weigh accurately about 50 mg of ornidazole RS, proceed in the same manner as the test solution, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at the wavelength of 312 nm as directed under the Ultraviolet-visible Spectroscopy.

Amount (mg) of ornidazole ($C_7H_{10}ClN_3O_3$)
= Amount (mg) of ornidazole RS × (A_T / A_S)

Packaging and storage Preserve in hermetic containers.

L-Ornithine Hydrochloride
L-오르니틴염산염



$C_5H_{12}N_2O_2 \cdot HCl$: 168.62
L-Ornithine hydrochloride, [*3184-13-2*]

L-Ornithine Hydrochloride, when dried, contains NLT 98.5% and NMT 101.0% of L-ornithine hydrochloride ($C_5H_{12}N_2O_2 \cdot HCl$).

Description L-Ornithine Hydrochloride occurs as white crystals or a crystalline powder, and is odorless.

Identification (1) Dissolve 10 mg of L-Ornithine Hydrochloride in 100 mL of water. To 1 mL of this solution, add 1 mL of acetic acid(31) and 1 mL of ninhydrin TS, heat on a steam bath for 30 minutes; the resulting solution exhibits a bluish purple color.

(2) Dissolve 20 mg of L-Ornithine Hydrochloride in 10 mL of water. To 1 mL of this solution, add 1 mL of 1% sodium pentacyanonitrosylferrate(III) TS and 10% acetaldehyde solution; the resulting solution does not exhibit a blue color.

(3) Coat a small amount of L-Ornithine Hydrochloride on a copper net, and ignite in a colorless flame; it exhibits a green color.

Optical rotation $[\alpha]_D^{20}$: Between + 23.0° and + 25.0° (after drying, 4 g, 6 mol/L hydrochloric acid TS, 100 mL, 100 mm).

Purity (1) ***Clarity and color of solution***—Weight 0.5 g of L-Ornithine Hydrochloride, dissolve in 10 mL of water. Perform the test with this solution as directed under the Ultraviolet-visible Spectroscopy using water as the control solution, and determine the transmission rate at a wavelength of 430 nm; the transmission rate NLT 98.0%.

(2) ***Sulfate***—Proceed with 1.0 g of L-Ornithine Hydrochloride according to the Sulfate and perform the test. Prepare the control solution with 0.4 mL of 0.005 mol/L sulfuric acid (NMT 0.019%).

(3) ***Ammonium***—Proceed with 1.0 g of L-Ornithine Hydrochloride according to the Ammonium and perform the test. Prepare the control solution with 2.0 mL of ammonium standard solution (NMT 0.002%).

(4) ***Heavy metals***—Proceed with 1.0 g of L-Ornithine Hydrochloride according to Method 3 and perform the test. Prepare the control solution with 1.0 mL of lead standard solution (NMT 10 ppm).

(5) ***Iron***—Put 1.50 g of L-Ornithine Hydrochloride into a 100-mL Nessler tube, add 10 mL of dilute hydrochloric acid (1 in 5), and use this solution as the test solution. Pipet 1.5 mL of iron standard solution, transfer into a 100-mL Nessler tube, add 10 mL of dilute hydrochloric acid (1 in 5), and use this solution as the standard solution. Add 3 mL of 20% hydroxylamine hydrochloride solution to the test solution and the standard solution, warm on a steam bath for 10 minutes, cool, add 5 mL of 0.3% *o*-phenanthroline TS, shake to mix, and add water to make about 70 mL. Add 20 mL of 20% sodium acetate solution and water to make 100 mL, shake to mix, and observe from above or side of the Nessler tube against a white background. The color of the test solution is not more intense than that of the condition solution (NMT 10 ppm).

(6) ***Arsenic***—Proceed with 1.0 g of L-Ornithine Hydrochloride according to Method 3 and perform the test. Prepare the control solution with 1.0 mL of arsenic standard solution (NMT 1 ppm).

(7) ***Other amino acids***—Dissolve 0.2 g of L-Ornithine Hydrochloride in a small amount of ammonia TS (1 in 2), add water to make 100 mL, and use this solution as the test solution. Perform the test with 5 µL of the test solution as directed under the Thin Layer Chromatography. Spot each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of 1-propanol and ammonia water (2 : 1) to a distance of about 10 cm, and air-dry the plate. Spray ninhydrin TS evenly on the plate, air-dry, heat at 80 ℃ for 10 minutes; any spot other than the principal spot does not appear.

Loss on drying NMT 0.2% (2 g, 105 ℃, 3 hours).

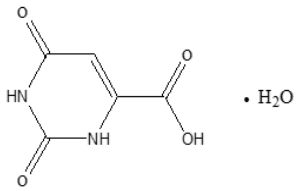
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 90 mg of L-Ornithine Hydrochloride, previously dried, dissolve in 3 mL of formic acid and 50 mL of acetic acid(100) for non-aqueous titration, add 3 mL of mercury(II) acetate TS for non-aqueous titration, and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 8.431 mg of $C_5H_{12}N_2O_2 \cdot HCl$

Packaging and storage Preserve in tight containers.

Orotic Acid Hydrate
오로트산수화물



$C_5H_4N_2O_4 \cdot H_2O$: 174.11

1,2,3,6-Tetrahydro-2,6-dioxo-4-pyrimidinecarboxylic acid hydrate, [*65-86-1*, anhydrous]

Orotic Acid Hydrate contains NLT 98.0% and NMT 101.0% of orotic acid ($C_5H_4N_2O_4$: 156.10), calculated on the anhydrous basis.

Description Orotic Acid Hydrate occurs as a colorless or white crystal, or a crystalline powder, which is odorless. It is sparingly soluble in dimethylformamide, very slightly soluble in water, and practically insoluble in ethanol(95), ether and chloroform.
It dissolves in sodium hydroxide TS. The pH of a saturated solution of Orotic Acid Hydrate is between 2.0 and 3.0.

Identification (1) Add 1 drop of iron(III) chloride TS to 5 mL of a saturated solution of Orotic Acid Hydrate; the solution exhibits a deep red color.

(2) To 0.1 g of Orotic Acid Hydrate, add 20 mL of 0.01 mol/L hydrochloric acid TS, shake vigorously to mix, and filter it. To 10 mL of the filtrate, add 5 drops of bromine TS, shake to mix for 10 seconds, and add a very small amount of sodium thiosulfate to decolorize. Warm at 56 ℃ on a steam bath for 3 minutes; the solution exhibits an orange color.

(3) Determine the absorption spectrum as directed under the Ultraviolet-visible Spectroscopy with a solution of Orotic Acid Hydrate in 0.01 mol/L sodium hydroxide (1 in 100000); it exhibits a maximum between 283 and 287 nm.

Purity (1) ***Clarity and color of solution***—Dissolve 0.5 g of Orotic Acid Hydrate in 5 mL of water and 10 mL of sodium hydroxide TS; the resulting solution is clear and colorless.

(2) ***Heavy metals***—Proceed with 1.0 g of Orotic Acid Hydrate according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Arsenic***—Weigh 1.0 g of Orotic Acid Hydrate and perform the test according to Method 3 under the Arsenic (NMT 2 ppm).

Water Between 4.3% and 11.5% (0.2 g, volumetric titration, direct titration).

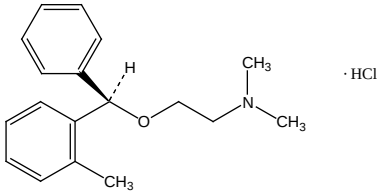
Residue on ignition NMT 0.10% (1 g).

Assay Weigh accurately about 0.35 g of Orotic Acid Hydrate, and dissolve in 8 mL of 0.5 mol/L sodium hydroxide. To this solution, add 30 mL of water, and titrate the excess sodium hydroxide with 0.1 mol/L hydrochloric acid VS (indicator: 3 drops of phenolphthalein TS). Perform a blank test in the same manner.

Each mL of 0.5 mol/L sodium hydroxide VS
= 78.05 mg of C5H4N2O4

Packaging and storage Preserve in tight containers.

Orphenadrine Hydrochloride
오르페나드린염산염



and enantiomer

$C_{18}H_{23}NO \cdot HCl$: 305.84

N,*N*-Dimethyl-2-[(2-methylphenyl)(phenyl) methoxy]ethanamine hydrochloride [*341-69-5*]
Orphenadrine Hydrochloride, when dried, contains NLT 98.5% and NMT 101.0% of orphenadrine hydrochloride ($C_{18}H_{23}NO \cdot HCl$).

Description Orphenadrine Hydrochloride occurs as a white crystalline powder.
It is freely soluble in water or ethanol(95).

Identification (1) Determine the infrared spectra of Orphenadrine Hydrochloride and orphenadrine hydrochloride RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) An aqueous solution of Orphenadrine Hydrochloride (1 in 50) responds to the Qualitative Analysis (2) for chloride.

Melting point About 160 °C.

Purity (1) ***Clarity and color of solution***—Weight 0.7 g of Orphenadrine Hydrochloride, dissolve in ethanol(95) to make exactly 10 mL; the solution is clear and the absorbance measured at the wavelength of 436 nm as directed under the Ultraviolet-visible Spectroscopy is NMT 0.050.

(2) ***Heavy metals***—Proceed with 2.0 g of Orphenadrine Hydrochloride according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead

standard solution (NMT 10 ppm).

(3) ***Related substances***—Dissolve 0.300 g of Orphenadrine Hydrochloride in water to make 50 mL, add 2 mL of ammonia water(28) to this solution, and extract 3 times with each of 10 mL of toluene. Combine the extracts, add anhydrous sodium sulfate, shake, filter, and concentrate the filtrate under reduced pressure at a temperature NMT 50 °C. Dissolve the residue in toluene to make exactly 20 mL, and use the resulting solution as the test solution. Dissolve 20 mg of orphenadrine hydrochloride RS and 20 mg of orphenadrine related substance I {(*RS*)-*N*,*N*-dimethyl-2-[(3-methylphenyl)phenylmethoxy]ethanamine} RS in 20 mL of water, add 1 mL of ammonia water(28), and extract 3 times with each of 5 mL of toluene. Combine the extracts, add anhydrous sodium sulfate, shake, filter, and concentrate the filtrate under reduced pressure at a temperature NMT 50 °C. Dissolve the residue in toluene to make exactly 20 mL, and use the resulting solution as the standard solution. Perform the test with 2 μL of the test solution as directed under the Gas Chromatography according to the following conditions, and measure each peak area; the amount of each related substance other than the major peak is NMT 0.3% and the total amount of related substances is NMT 1.0%. However, exclude any related substances whose amount is NMT 0.02%.

$$\text{Content (\%) of related substances} = 100 \times \frac{A_i}{A_S}$$

A_i: Peak area of each related substance

A_S: Sum of each peak area obtained from the test solution

Operating conditions

Detector: A hydrogen flame ionization detector

Column: A glass column about 0.32 mm in internal diameter and 60 m in length, coated the inside with poly(dimethyl)(diphenyl)siloxane in a thickness of 1 μm.

Split ratio: About 1 : 25.

Column temperature: 240 °C

Sample injection port temperature: 290 °C

Detector temperature: 290 °C

Carrier gas: Helium

Flow rate: 1 mL/min

System suitability

System performance: Proceed with 2 μL of the standard solution according to the above conditions; the resolution between the peaks of the related substance I and orphenadrine is NLT 1.5.

Time span of measurement: About 1.3 times the retention time of orphenadrine.

Loss on drying NMT 0.5% (1 g, 105 °C, 3 hours).

Residue on ignition NMT 0.1% (1 g).

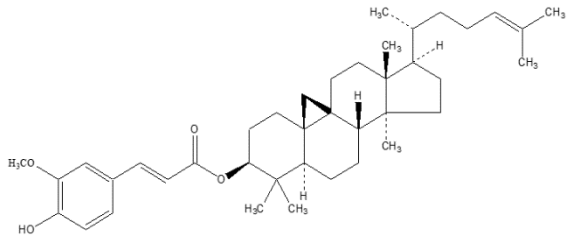
Sterility Meets the requirements. However, this test is applied when Orphenadrine Hydrochloride is used in the manufacture of sterile preparations without undergoing a sterilization process.

Assay Weigh accurately about 0.25 g of Orphenadrine Hydrochloride, previously dried, dissolve in 50 mL of acetic anhydride, and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 30.59 mg of $C_{18}H_{23}NO \cdot HCl$

Packaging and storage Preserve in light-resistant, well-closed containers or light-resistant, hermetic containers.

γ-Oryzanol
γ-오리자놀



$C_{40}H_{58}O_4$: 602.89

(3β)-9,19-Cyclolanost-24-en-3-ol 3-(4-hydroxy-3-methoxyphenyl)-2-propenoate, [*11042-64-1*]

γ-Oryzanol, when dried, contains NLT 98.0% and NMT 101.0% of γ-oryzano ($C_{40}H_{58}O_4$).

Description γ-Oryzanol occurs as white to pale yellow crystals or a crystalline powder and is odorless.
It is freely soluble in acetone, chloroform or propylene glycol, sparingly soluble in ether or petroleum ether, slightly soluble in methanol and very slightly soluble in water. It is freely soluble in potassium hydroxide-ethanol TS.

Melting point—About 165 °C.

Identification (1) Dissolve 10 mg of γ-Oryzanol in 10 mL of potassium hydroxide-ethanol TS; the resulting solution exhibits a yellow color.

(2) Dissolve 0.1 g of γ-Oryzanol in 20 mL of acetone, add 30 mL of a solution of iron(III) chloride in ethanol (1 in 50); the color of the solution turns green.

(3) Weigh 0.1 g of γ-Oryzanol, dissolve in 10 mL of hexane, and use this solution as the test solution. Weigh 0.1 g of γ-oryzanol RS, dissolve in 10 mL of hexane, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a

mixture of hexane and ethyl acetate (5 : 1) and air-dry the plate. Examine the plate under ultraviolet light; the R_f values of the spots obtained from the test and solution and the standard solution are same.

(4) Determine the absorption spectra of the test solution obtained in the Assay as directed under the Ultraviolet-visible Spectroscopy; it exhibits maxima at around the wavelengths of 231 nm, 291 nm and 315 nm.

Purity (1) ***Clarity and color of solution***—Add 5 mL of freshly boiled ad cooled water to 0.5 g of γ-Oryzanol, heat in a water while shaking occasionally; the resulting solution does not exhibit a yellow color.

(2) ***Heavy metals***—Proceed with 1.0 g of γ-Oryzanol according to Method 2 and perform the test. Prepare the control solution with 3.0 mL of lead standard solution (NMT 30 ppm).

(3) ***Arsenic***—Proceed with 1.0 g of γ-Oryzanol according to Method 3 and perform the test (NMT 2 ppm).

(4) ***Free ferulic acid***—Dissolve 0.1 g of γ-Oryzanol in 10 mL of Hexane, and perform the test with this solution as the test solution under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Then, develop the plate with a mixture of ethyl acetate and hexane (1 : 1) to a distance of about 10 cm, and air-dry the plate. Examine the plate under ultraviolet light; any spot other than the principal spots obtained from the test solution does not appear.

Loss on drying NMT 3.0% (0.5 g, in vacuum, phosphorus pentoxide, 80 ℃, 3 hours).

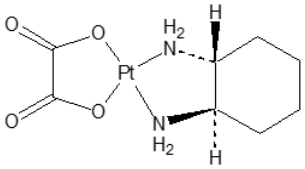
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 10 mg of γ-Oryzanol, dissolve in 60 mL of n-heptane, add n-heptane additionally to make 100 mL, pipet 10.0 mL of the resulting solution, and add n-heptane to make 100 mL. Perform the test with this solution as directed under the Ultraviolet-visible Spectroscopy, and determine the absorbance of this solution, *A*, at the wavelength of 315 nm.

$$\text{Amount (mg) of γ-oryzanol } (C_{40}H_{58}O_4) = A / 359 \times 10{,}000$$

Packaging and storage Preserve in tight containers.

Oxaliplatin
옥살리플라틴



$C_8H_{14}N_2O_4Pt$: 397.29

[(1*R*,2*R*)-Cyclohexane-1,2-diamine](ethanedioato-*O*,*O'*)platinum(II) [*61825-94-3*]

Oxaliplatin contains NLT 98.0% and NMT 102.0% of oxaliplatin ($C_8H_{14}N_2O_4$), calculated on the dried basis.

Description Oxaliplatin occurs as a white crystalline powder.
It is slightly soluble in water, very slightly soluble in methanol and practically insoluble in ethanol(95).

Identification Determine the infrared spectra of Oxaliplatin and oxaliplatin RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Optical rotation $[\alpha]_D^{20}$: Between +74.5° and +74.8° (after drying, 0.250 g, water, 50 mL, 100 mm).

Purity (1) ***Clarity and color of solution***—Dissolve 0.1 g of Oxaliplatin in water to make 50 mL; the resulting solution is clear and colorless.

(2) ***Acidity or alkalinity***—Dissolve 0.10 g of Oxaliplatin in water to make 50 mL; when adding 0.5 mL phenolphthalein TS, the resulting solution is colorless; when adding 0.01 mol/L sodium hydroxide TS, the resulting solution exhibits pink and the amount used is NMT 0.6 mL.

(3) ***Related substances***—(i) Related substance I: Weigh accurately 0.10 g of Oxaliplatin, add water, shake vigorously to mix, sonicate for a very short time, and add water to make 50 mL. Use this solution as the test solution. Separately, weigh accurately 14.0 mg of Oxaliplatin related substance I {Oxalic acid}, dissolve in water to make exactly 250 mL, and use this solution as the standard stock solution. Add water to 5.0 mL of the standard stock solution to make exactly 200 mL; use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions; the peak area of related substance I from the test solution is not greater than 3 times the major peak area of the standard solution (0.15%). Inject the test solution within 20 minutes after preparing the test solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 205 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with base-deactivated octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: A mixture of pH 6.0 phosphate buffer solution and acetonitrile (8 : 2).

Flow rate: 2 mL/min

System suitability

System performance: Dissolve 12.5 mg of sodium nitrate in water to make 250 mL; to 2.0 mL of this solution, add 25.0 mL of standard stock solution and add water to make 100 mL. Proceed with 20 μL of this solution according to the above conditions; the resolution between the peaks of nitrate and related substance I is NLT 9. Proceed with 20 μL of the standard solution according to the above conditions; the signal-to-noise ratio of the peak of related substance I is NLT 10.

Time span of measurement: About 2 times the retention time of related substance I.

pH 6.0 phosphate buffer solution—Dissolve 1.36 g of potassium dihydrogen phosphate in 10 mL of 32% tetrabutylammonium hydroxide solution, add water to make 1000 mL, and adjust pH to 6.0 with phosphoric acid.

(ii) Related substance II: Weigh accurately 0.10 g of Oxaliplatin, add water, shake well, sonicate for a very short time, and add water to make exactly 50 mL. Use this solution as the test solution. Separately, weigh accurately 5 mg of oxaliplatin related substance II {(*SP*-4-2)-diaqua[(1*R*,2*R*)-cyclohexane-1,2-diamine-κ*N*,κ*N'*]platinum (diaquaaminocyclohexane platinum)} RS, dissolve in 25 mL of methanol, add water to make exactly 100.0 mL, and sonicate for about 1 hour and 30 minutes until dissolved. Use this solution as the standard stock solution. Add water to 3.0 mL of this solution to make exactly 200 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions; the peak area of oxliplatin related substance II from the test solution is not greater than 4 times the major peak area from the standard solution (NMT 0.15%). Inject the test solution within 20 minutes after preparing the test solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 215 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with base-deactivated octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: A mixture of pH 3.0 phosphate buffer solution and acetonitrile (8 : 2).

Flow rate: 2 mL/min

System suitability

System performance: Add 0.02% sodium hydroxide solution to 50.0 mL of the standard solution to adjust pH to 6.0. Heat the solution for 4 hours at 70 °C, then cool (Related substance V is created). Proceed with 20 μL of this solution according to the above conditions; the resolution between the peaks of related substances II and V is NLT 7. Proceed with 20 μL of the standard solution according to the above conditions; signal-to-noise ratio of related substance II is NLT 10.

Relative retention time: The relative retention times of related substance II and related substance V are about 4.3 and 6.4, respectively.

Time span of measurement: About 2.5 times the retention time of related substance II.

pH 3.0 phosphate buffer solution—Dissolve 1.36 g of potassium dihydrogen phosphate and 1 g of sodium 1-heptanesulfonate in 1000 mL of water and adjust pH to 3.0 ± 0.05 with phosphoric acid.

(iii) Related substance III and other related substances: Weigh accurately 0.10 g of Oxaliplatin, add water, shake well, sonicate for a very short time to dissolve, and then add water to make 50 mL. Use this solution as the test solution. Separately dissolve 5.0 mg of oxaliplatin related substance III {(*OC*-6-33)-[(1*R*,2*R*)-cyclohexane-1,2-diamine-κ*N*,κ*N'*][ethanedioato(2-)-κ*O*,κO^2]dihydroxyplatinum} RS and 5.0 mg of oxaliplatin RS in water to make exactly 100 mL, and use this solution as the standard solution (i). To 1.0 mL of the standard solution (i), add water to make exactly 100 mL, and use this solution as the standard solution (ii). Dissolve 50.0 mg of oxaliplatin RS in water to make exactly 50 mL and use this solution as the standard solution (iii). Dissolve 5 mg of dichlorodiaminocyclohexane platinum RS in the standard solution (iii) to make exactly 50 mL; use this solution as the standard solution (iv). Add water to 5 mL of the standard solution (iv) to make exactly 50 mL, and use this solution as the standard solution (v). Add 1 mL of the standard solution (i) to 0.10 g of Oxaliplatin and dissolve in water to make exactly 50 mL, and use this solution as the standard solution (vi). Perform the test with 10 μL each of the test solution, the standard solution (ii), the standard solution (v), and the standard solution (vi) as directed under the Liquid Chromatography according to the following conditions; the peak area of related substance III from the test solution is not greater than 3/4 times the peak area of related substance III from the standard solution (vi) (0.15%); the peak areas of the other individual related substances are not greater than 2 times the peak area of oxaliplatin from the standard solution (ii) (0.1%); and the total area of the individual peaks is not greater than 3 times the peak area of oxaliplatin from the standard solution (ii) (0.15%). Disregard the peak area of oxaliplatin from the standard solution (ii) and peaks with a retention time NMT 2 minutes. Introduce the test solution within 20 minutes after preparing the test solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 210 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 ℃.

Mobile phase: A mixture of a solution prepared by adding 0.6 mL of dilute phosphoric acid to 1000 mL of water, shaking to mix, and adjusting to pH 3.0 with sodium hydroxide TS or phosphoric acid and acetonitrile (99 : 1).

Flow rate: 1.2 mL/min

System suitability

System performance: Proceed with 10 μL of the standard solution (5) according to the above conditions; the resolution between the dichlorodiaminocyclohexane platinum peak and oxaliplatin peak is NLT 2. Proceed with 10 μL of the standard solution (2) according to the above conditions; the signal-to-noise ratio of the peak for related substance III is NLT 50, and the signal-to-noise ratio of the peak for oxaliplatin is NLT 10.

Time span of measurement: About 3 times the retention time of oxaliplatin.

(iv) Total related substances: The total amount of related substances I, II and III and other related substances is NMT 0.30%.

(4) ***Related substance IV***—Weigh accurately 30 mg of oxaliplatin and dissolve in methanol to make exactly 50 mL; use this solution as the test solution. Weigh exactly 5.0 mg of oxaliplatin related substance IV {(*SP*-4-2)-[(1*S*,2*S*)-cyclohexane-1,2-diamine-κ*N*,κ*N*′][ethanediato(2-)-κO^1,κO^2]platinum} RS and dissolve in methanol to make exactly 100 mL; use this solution as the standard solution (i). To 15.0 mL of the standard solution (i), add methanol to make exactly 50 mL, and use this solution as the standard solution (ii). Dissolve 75 mg of oxaliplatin RS in methanol to make exactly 100 mL, and use this solution as the standard solution (iii). To 5.0 mL of the standard solution (iii), add methanol to make exactly 100 mL, and use this solution as the standard solution (iv). To 40 mL of the standard solution (iii), add 1.0 mL of the standard solution (ii) and add methanol to make exactly 50 mL, and use this solution as the standard solution (v). Add 5.0 mL of the standard solution (iv) to 4.0 mL of the standard solution (i) and add methanol to make exactly 50 mL, and use this solution as the standard solution (vi). Proceed with 20 μL each of the test solution, the standard solution (v) and the standard solution (vi) as directed under the Liquid Chromatography according to the following conditions; the peak height of related substance IV from the test solution is not greater than 3 times the peak height of related substance IV from the standard solution (v) (0.15%).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with silica gel OC for chiral separations for liquid chromatography.

Column temperature: A constant temperature of about 40 ℃.

Mobile phase: A mixture of methanol and ethanol(99.5) (7 : 3).

Flow rate: 0.3 mL/min

System suitability

System performance: Proceed with 20 μL of the standard solution (vi) according to the above conditions; the resolution between peaks of oxaliplatin and related substance IV is NLT 1.5. Proceed with 20 μL of the standard solution (i) according to the above conditions; the signal-to-noise ratio of the peaks of related substance IV is NLT 10.

Time span of measurement: About 2 times the retention time of oxaliplatin.

(5) ***Silver***—Weigh accurately 0.1000 g of oxaliplatin and dissolve in water to make exactly 50 mL. Pipet 20 μL of this solution, add 0.5 mol/L nitric acid TS to make exactly 40 μL, and use this solution as the test solution. Weigh accurately 1.575 g of nitric acid, dissolve in 0.5 mol/L nitric acid TS to make exactly 1000 mL, take a suitable amount of this solution, and dilute with 0.5 mol/L nitric acid TS to obtain a solution contining 10 ppb of silver per mL. Use this solution as the standard solution (i). To 20 μL of the test solution, add 8 μL of the standard solution (i) and add 0.5 mol/L nitric acid TS to make 40 mL, and use this solution as the standard solution (ii). To 20 μL of the test solution, add 16 μL of the standard solution (i) and add 0.5 mol/L nitric acid TS to make 40 μL, and use this solution as the standard solution (iii). Perform the test with the test solution and the standard solutions according to the standard addition method under the Atomic Absorption Spectroscopy, and determine the concentration of silver in the test solution and quantify (NMT 5 ppm).

Gas: Air–acetylene or hydrogen

Lamp: Silver hollow-cathode lamp

Wavelength: 328.1 nm

Loss on drying NMT 0.5% (1.0 g, 105 ℃, 2 hours).

Bacterial endotoxins Less than 1.0 EU per mg of Oxaliplatin (when used for preparation of sterile preparations without additional processes to remove endotoxin).

Assay Weigh accurately about 50 mg each of Oxaliplatin and oxaliplatin RS, dissolve in water to make exactly 500 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 20 μL each of the test solution and the standard solution according to the operating conditions for testing Related

substance III and other related substances, and determine the peak areas A_T and A_S of oxaliplatin.

$$\text{Amount (mg) of oxaliplatin } (C_8H_{14}N_2O_4Pt) = 500 \times C \times \frac{A_T}{A_S}$$

C: Concentration of oxaliplatin in the standard solution (mg/mL)

Operating conditions

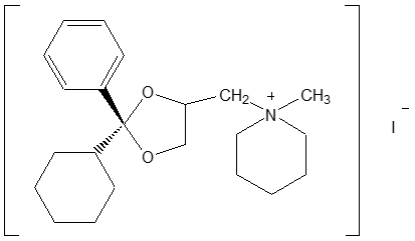
System suitability

System performance: Weigh 5 mg of dichlorodiaminocyclohexane platinum RS and dissolve to make 50 mL in a solution of 50 mg of oxaliplatin RS dissolved in water to make 500 mL. Proceed with 20 μL of this solution according to the above conditions; the resolution between the peaks of dichlorodiaminocyclohexane platinum and oxaliplatin is NLT 2.0.

System repeatability: Repeat the test 5 times with 20 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area of oxaliplatin is NMT 2.0%.

Packaging and storage Preserve in hermetic containers (when the label states that it does not contain bacterial endotoxins).

Oxapium Iodide
옥사피움요오드화물



and enantiomer

$C_{22}H_{34}INO_2$: 471.42

1-[(2-Cyclohexyl-2-phenyl-1,3-dioxolan-4-yl)methyl]-1-methylpiperidin-1-ium iodide [*6577-41-9*]

Oxapium Iodide, when dried, contains NLT 98.5% and NMT 101.0% of oxapium iodide ($C_{22}H_{34}INO_2$).

Description Oxapium Iodide occurs as a white crystalline powder.

It is soluble in methanol, ethanol(95) or acetonitrile, slightly soluble in acetic anhydride or acetic acid(100), and practically insoluble in ether.

A solution of Oxapium Iodide in methanol (1 in 100) shows no optical rotation.

Identification (1) Dissolve 0.1 g of Oxapium Iodide in 10 mL of methanol and add 2 mL of dilute nitric acid and silver nitrate TS; greenish yellow precipitates are produced.

(2) Determine the infrared spectra of Oxapium Iodide and oxapium iodide RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Melting point Between 198 and 203 ºC.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Oxapium Iodide according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Related substances***—Dissolve 50 mg of Oxapium Iodide in 100 mL of a mixture of water and acetonitrile (1 : 1), and use this solution as the test solution. Pipet 1 mL of the test solution, add a mixture of water and acetonitrile (1 : 1) to make exactly 50 mL, and use this solution as the standard solution. Perform the test with 50 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine each peak area of the solutions by the automatic integration method; the sum of the peak areas other than the major peak obtained from the test solution is not greater than the area of the major peak from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature between 20 and 30 ℃.

Mobile phase: Add 57 mL of acetic acid(100) and 139 mL of triethylamine to water to make 1000 mL. To 50 mL of this solution, add 500 mL of acetonitrile, 10 mL of dilute acetic acid and 440 mL of water.

Flow rate: Adjust the flow rate so that the retention time of oxapium is about 4 minutes.

System suitability

Detection sensitivity: Adjust the sensitivity so that the peak height of oxapium obtained from 50 μL of the standard solution is between 5% and 15% of the full scale.

System performance: Dissolve 50 mg of Oxapium Iodide and 3 mg of benzophenone in 100 mL of the mobile phase. Proceed with 20 μL of this solution according to the above operating conditions; oxapium and benzophenone are eluted in this order with the resolution being NLT 5.

Time span of measurement: Approximately 6 times the retention time of oxapium after the peak of Iodide ion.

Loss on drying NMT 0.5% (1 g, 105 ℃, 4 hours).

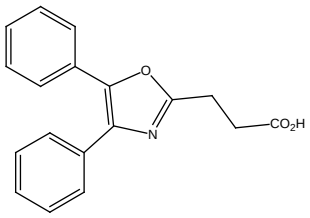
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.7 g of Oxapium Iodide, previously dried, dissolve in 50 mL of a mixture of acetic anhydride and acetic acid(100) (9 : 1), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry, platinum electrode). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 47.14 mg of $C_{22}H_{34}INO_2$

Packaging and storage Preserve in light-resistant, tight containers.

Oxaprozin
옥사프로진



$C_{18}H_{15}NO_3$: 292.32
3-(4,5-Diphenyl-1,3-oxazol-2-yl)propanoic acid [*82419-36-1*]

Oxaprozin, when dried, contains NLT 98.5% and NMT 101.0% of oxaprozin ($C_{18}H_{15}NO_3$).

Description Oxaprozin occurs as a white to yellowish white crystalline powder.
It is sparingly soluble in methanol or ethanol(95), slightly soluble in ether, and practically insoluble in water.
It is gradually affected by light.

Melting point—About 265 °C (with decomposition).

Identification Determine the infrared spectra of Oxazolam and oxazolam RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Melting point Between 161 and 165 ºC.

Absorbance $E_{1cm}^{1\%}$ (285 nm): Between 455 and 495 (10 mg after drying, methanol, 1000 mL).

Purity (1) ***Heavy metals***—Proceed with 2.0 g of Oxaprozin according to Method 4 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Arsenic***—Proceed with 2.0 g of Oxaprozin according to Method 3 and perform the test (NMT 1 ppm).

(3) ***Related substances***—Dissolve 0.1 g of Oxazolam in 10 mL of methanol and use this solution as the test solution. Pipet 1 mL of this solution, add methanol to make exactly 100 mL, and use this solution as the standard solution (1). Pipet 5 mL, 3 mL and 1 mL each of the test solution, add methanol to make 10 mL, and use these solutions as the standard solutions (2), (3) and (4), respectively. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution, the standard solutions (1), (2), (3) and (4), on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate and acetic acid(100) (99 : 1) to a distance of about 15 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the total intensity of the spots other than the principal spot obtained from the test solution is NMT 1.0% compared to the spots from the standard solutions (1), (2), (3) and (4).

Loss on drying NMT 0.3% (1 g, 105 ℃, 2 hours).

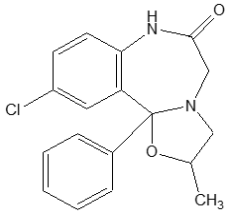
Residue on ignition NMT 0.3% (1 g).

Assay Weigh accurately about 0.5 g of Oxazolam, previously dried, dissolve in 50 mL of ethanol(95), and titrate with 0.1 mol/L sodium hydroxide VS (potentiometric titration under the Titrimetry). Separately, perform a blank test and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS
= 29.33 mg of $C_{18}H_{15}NO_3$

Packaging and storage Preserve in light-resistant, tight containers.

Oxazolam
옥사졸람



$C_{18}H_{17}ClN_2O_2$: 328.79
10-Chloro-2-methyl-11b-phenyl-2,3,7,11b-tetrahydrobenzo[f]oxazolo[3,2-d][1,4]diazepin-6(5H)-one [*24143-17-7*]

Oxazolam, when dried, contains NLT 99.0% and NMT 101.0% of oxazolam ($C_{18}H_{17}ClN_2O_2$).

Description Oxazolam occurs as white crystals or a crystalline powder and is odorless and tasteless.
It is very soluble in acetic acid(100), soluble in 1,4-dioxane or dichloromethane, slightly soluble in ethanol(95) or ether, and practically insoluble in water.
It dissolves in dilute hydrochloric acid.
It is gradually colored by light.

Melting point—About 187 °C (with decomposition).

Identification (1) To 10 mg of Oxazolam, add 10 mL of ethanol(95), heat to dissolve, add 1 drop of hydrochloric acid; the resulting solution exhibits a yellow color. Expose to ultraviolet light (main wavelength: 365 nm); the solution exhibits a yellowish green fluorescence. Add 1 mL of sodium hydroxide TS to the solution; the color and fluorescence of the solution disappear immediately.

(2) To 10 mL of Oxazolam, add 5 mL of dilute hydrochloric acid, dissolve by heating on a steam bath for 10 minutes, and cool. 1 ml of the resulting solution responds to the Qualitative Analysis for primary aromatic amines.

(3) Transfer 2 g of Oxazolam to a 200-mL flask, add 50 mL of ethanol(95) and 25 mL of 6 mol/L hydrochloric acid TS, connect the flask to a reflux condenser, and heat the resulting solution under a reflux condenser for 5 hours After cooling, neutralize the solution with sodium hydroxide solution (1 in 4), and extract with 30 mL of dichloromethane. Dehydrate the extract with 3 g of anhydrous sodium sulfate, filter, and evaporate the dichloromethane of the filtrate. Dissolve the residue in 20 mL of methanol by heating on a steam bath, and cool in iced water rapidly. Collect the crystals, dry in vacuum at 60 ℃ for 1 hour, and determine its melting point; the melting point is 96 to 100 ℃.

(4) Determine the absorption spectra of the solutions of Oxazolam and oxazolam RS in ethanol(95) (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(5) Perform the test with Oxazolam as directed under the Flame Coloration (2); it exhibits a green color.

Absorbance $E_{1cm}^{1\%}$ (246 nm): Between 410 and 430 (1 mg after drying, ethanol(95), 100 mL).

Purity (1) ***Chloride***—To 1.0 g of Oxazolam, add 50 mL of water, allow to stand for 1 hour with occasional shaking, and filter. Pipet 25 mL of the filtrate, add 6 mL of dilute nitric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 0.20 mL of 0.01 mol/L hydrochloric acid (NMT 0.014%).

(2) ***Heavy metals***—Proceed with 1.0 g of Oxazolam according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Arsenic***—Weigh 1.0 g of Oxazolam, place into a Kjeldahl flask, add 5 mL of sulfuric acid and 5 mL of nitric acid, and then heat gently. Continue heating until the solution becomes colorless to light yellow, adding 2 mL - 3 mL of nitric acid occasionally. After cooling, add 15 mL of saturated ammonium oxalate, and heat until dense white smokes are produced to concentrate to the volume of 2 mL to 3 mL. After cooling, add water to make 10 mL, and perform the test with this solution as the test solution (NMT 2 ppm).

(4) ***Related substances***—Dissolve 50 mg of Oxazolam in 10 mL of dichloromethane and use this solution as the test solution. Pipet 1 mL of this solution, add dichloromethane to make exactly 200 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of toluene and acetone (8 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Observe the plate under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot obtained from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 0.5% (1 g, 105 ℃, 3 hours).

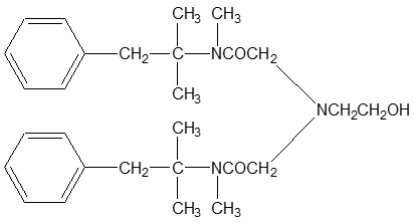
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.65 g of Oxazolam, previously dried, dissolve in 100 mL of a mixture of acetic acid(100) and 1.4-dioxane (1 : 1), and titrate with 0.1 mol/L perchloric acid VS (indicator: 2 drops of methylosaniline chloride TS). The endpoint of the titration is when the color the solution changes from violet through blue to bluish green. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 32.879 mg of $C_{18}H_{17}ClN_2O_2$

Packaging and storage Preserve in light-resistant, tight containers.

Oxethazaine
옥세타자인



$C_{28}H_{41}N_3O_3$: 467.64

2,2'-[(2-Hydroxyethyl)imino]*bis*[*N*-methyl-*N*-(2-methyl-1-phenyl-2-propanyl)acetamide] [*126-27-2*]

Oxethazaine, when dried, contains NLT 98.5% and NMT 101.0% of oxethazaine ($C_{28}H_{41}N_3O_3$).

Description Oxethazaine occurs as a white to pale yellowish white crystalline powder.
It is very soluble in acetic acid(100), freely soluble in methanol or ethanol(95), sparingly soluble in ether, and practically insoluble in water.

Identification (1) Determine the absorption spectra of

solutions of Oxethazaine and oxethazaine RS in ethanol(95) (1 in 2500) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Oxethazaine and oxethazaine RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Melting point Between 101 and 104 ℃.

Purity (1) ***Chloride***—Dissolve 1.0 g of Oxethazaine in 20 mL of ethanol(95), add 6 mL of dilute nitric acid and add water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid, 20 mL of ethanol(95), 6 mL of dilute nitric acid and water to make 50 mL (NMT 0.011%).

(2) ***Heavy metals***—Proceed with 2.0 g of Oxethazaine according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Related substances***—Dissolve 0.40 g of Oxethazaine in 10 mL of ethanol(95) and use this solution as the test solution. Pipet 1 mL of this solution, add ethanol(95) to make exactly 100 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of isopropyl ether, tetrahydrofuran, methanol and ammonia water(28) (24 : 10 : 5 :1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot from the test solution are not more intense than the spots from the standard solution.

(4) ***2-aminoethanol***—Dissolve 1.0 g of Oxethazaine in methanol to make exactly 10 mL. To this solution, add 0.1 mL of a solution of 1-fluoro-2,4-dinitrobenzene in methanol (1 in 26) and shake to mix, then warm for 20 minutes at 60 ℃; the color of the solution is not more intense than that of the following control solution.

Control solution—Dissolve 0.10 g of 2-aminoethanol in methanol to make exactly 200 mL, pipet 1 mL of this solution and add methanol to make exactly 10 mL. Proceed in the same manner as directed above.

Loss on drying NMT 0.5% (1 g, in vacuum, 60 ℃, 3 hours).

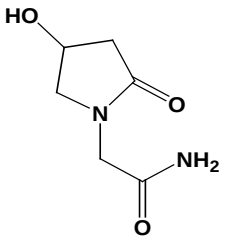
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.9 g of Oxethazaine, previously dried, dissolve in 50 mL of acetic acid(100), and titrate with 0.1 mol/L perchloric acid VS (indicator: 2 drops of methylosaniline chloride TS). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 46.76 mg of $C_{28}H_{41}N_3O_3$

Packaging and storage Preserve in tight containers.

Oxiracetam
옥시라세탐



$C_6H_{10}N_2O_3$: 158.16
4-Hydroxy-2-oxo-1-pyrrolidineacetamide, [*62613-82-5*]

Oxiracetam contains NLT 98.0% and NMT 102.0% of oxiracetam ($C_6H_{10}N_2O_3$), calculated on the anhydrous basis.

Description Oxiracetam occurs as a white crystalline powder and is odorless.
It is soluble in water and practically insoluble in acetone or ether.

Melting point—Between 167 and 170 ℃.

Identification (1) Determine the infrared spectra of Oxiracetam and oxiracetam RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) Dissolve 0.5 g each of Oxiracetam and oxiracetam RS in 5 mL of water, respectively, and use these solutions as the test solution and the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate using a mixture of ethyl acetate, ethanol and acetic acid (10 : 9 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Place the plate in a suitable container containing between 2 g and 4 g of iodine crystal, cover with a lid and allow to stand for 3 to 5 minutes; the test solution and the standard solution show the same color spots at the same R_f value.

Purity (1) ***Chloride***—Perform the test with 2.0 g of Oxiracetam. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid (NMT 0.005%).

(2) ***Ammonium***—Weigh accurately about 1 g of Oxiracetam, place in a test tube, and dissolve in 14 mL of water. If necessary, alkalize the test solution by adding 2

mol/L sodium hydroxide TS. Add water to make 15 mL and add 0.3 mL of Nessler's TS. Separately pipet 10 mL of ammonium standard solution, place in a test tube, and add 5 mL of water and 0.3 mL of Nessler's TS. Close the test tube and allow to stand for 5 minutes; the yellow color observed in the test solution is not more intense than the color of the control solution (NMT 0.001%).

Ammonium standard solution—Weigh accurately about 0.741 g of ammonium chloride and dissolve in water to make exactly 1000 mL. Pipet 1 mL of this solution and add water to make exactly 100 mL. Pipet 1 mL of this solution, add water to make exactly 25 mL, and use this solution as the ammonium standard solution (1 ppm NH_4).

Nessler's TS—Dissolve 11 g of potassium iodide and 15 g of mercury(II) iodide in water to make 100 mL. Separately dissolve 25 g of sodium hydroxide in water to make 100 mL. Prepare by mixing the two solutions at a ratio of 1 : 1; prepare before use.

(3) ***Heavy metals***—Weigh 1.0 g of Oxiracetam according to Method 2 as directed under the Heavy Metals and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

Water NMT 1.0% (2 g, volumetric titration, direct titration)

Assay Weigh accurately about 50 mg of Oxiracetam and oxiracetam RS, dissolve in 5 mL of water, add 40 mL of acetonitrile and 1.0 mL of the internal standard solution, and then add the mobile phase to make 50 mL. Use these solutions as the test solution and the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the peak area ratios, Q_T and Q_S, of oxiracetam to the peak area of the internal standard.

Amount (mg) of oxiracetam ($C_6H_{10}N_2O_3$)
= Amount (mg) of oxiracetam RS × Q_T / Q_S

Internal standard solution—A solution of caffeine anhydrous in the mobile phase (1 in 1000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

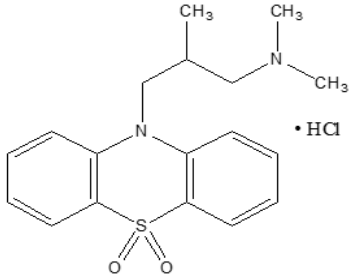
Column: A stainless steel column about 4.0 mm in internal diameter and 30 cm in length, packed with aminopropylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of acetonitrile and water (97 : 3).

Flow rate: 1.2 mL/min

Packaging and storage Preserve in well-closed containers.

Oxomemazine Hydrochloride
옥소메마진염산염



$C_{18}H_{22}N_2O_2S·HCl$: 366.91

N,*N*,β-Trimethyl-10*H*-phenothiazine-10-propylamine 5,5-dioxide monohydrochloride, [*4784-40-1*]

Oxomemazine Hydrochloride, when dried, contains NLT 98.0% and NMT 101.0% of oxomemazine hydrochloride ($C_{18}H_{22}N_2O_2S·HCl$).

Description Oxomemazine Hydrochloride occurs as a fine white powder and is odorless.
It is freely soluble in water or methanol, practically insoluble in ether or ethyl acetate, and sparingly soluble in ethanol, acetone or chloroform.

Identification (1) Weigh 0.5 g of Oxomemazine Hydrochloride, place in a separatory funnel, and dissolve in 10 mL of water. Add 1 mL of 40% sodium hydroxide solution, then extract 2 times with 10 mL of chloroform each time. Collect the chloroform layer in another separatory funnel, wash 2 times with 5 mL of water each time, then combine the chloroform. Add 0.5 g of anhydrous potassium carbonate, shake to mix, then filter. Evaporate the filtrate to dryness on a steam bath, then dry the residue in vacuum to a constant mass. Remove from the desiccator and crystallize using an agitator, then measure as directed under the Melting Point; the melting point is between 113 and 118 ℃.

(2) Add 1 mL of sulfuric acid to 50 mg of Oxomemazine Hydrochloride; the solution exhibits a light pink color. Add 2 mL of water and 0.5 mL of nitric acid to 50 mg of Oxomemazine Hydrochloride; the solution exhibits a light yellow color.

(3) Weigh an appropriate amount of Oxomemazine Hydrochloride and dissolve in 0.1 mol/L hydrochloric acid TS to prepare a 20 mg/L solution. Determine the absorption spectra of this solution as directed under the Ultraviolet-visible Spectroscopy; it exhibits maxima at around 268 nm, 296 nm and 330 nm.

pH Between 4.0 and 6.0 (3% aqueous solution).

Purity (1) ***Clarity and color of solution***—Dissolve 1 g of Oxomemazine Hydrochloride in 10 mL of water; the solution is clear or slightly turbid, and is not more intense than 0.0001 mol/L iodine TS.

(2) ***Heavy metals***—Proceed with 1.0 g of Oxomemazine Hydrochloride as directed under Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

Loss on drying NMT 0.5% (2 g, between 100 and 105 ℃, constant mass).

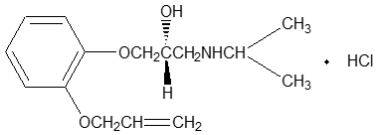
Residue on ignition NMT 0.1% (2 g).

Assay Weigh accurately 0.7 g of Oxomemazine Hydrochloride, previously dried, dissolve in 100 mL of water, and titrate with 0.1 mol/L silver nitrate VS (potentiometric titration under the Titrimetry) (electrode: silver electrode). Perform a blank test and make any necessary correction.

Each mL of 0.1 mol/L silver nitrate VS
= 36.691 mg of $C_{18}H_{22}N_2O_2S \cdot HCl$

Packaging and storage Preserve in tight containers.

Oxprenolol Hydrochloride
옥스프레놀롤염산염



and enantiomer

$C_{15}H_{23}NO_3 \cdot HCl$: 301.81
1-(Propan-2-ylamino)-3-(2-prop-2-enoxyphenoxy)propan-2-ol hydrochloride [*6452-73-9*]

Oxprenolol Hydrochloride, when dried, contains NLT 98.5% and NMT 101.0% of oxprenolol hydrochloride ($C_{15}H_{23}NO_3 \cdot HCl$).

Description Oxprenolol Hydrochloride occurs as a white crystalline powder.
It is very soluble in water, freely soluble in ethanol(95) or acetic acid(100), slightly soluble in acetic anhydride, and practically insoluble in ether.

Identification (1) To 2 mL of an aqueous solution of Oxprenolol Hydrochloride (1 in 100), add 1 drop of copper(II) sulfate TS and 2 mL of sodium hydroxide TS; the solution exhibits a bluish purple color. Add 1 mL of ether to this solution, shake well to mix and allow to stand; the ether layer exhibits a purple color, and the water layer exhibits a bluish purple color.

(2) Add 3 drops of Reinecke salt TS to 3 mL of an aqueous solution of Oxprenolol Hydrochloride (1 in 150); a pale red precipitate is formed.

(3) Determine the infrared spectra of Oxprenolol Hydrochloride and oxprenolol hydrochloride RS, previously dried, as directed in the potassium chloride disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(4) An aqueous solution of Oxprenolol Hydrochloride (1 in 50) responds to the Qualitative Analysis for chloride.

Melting point Between 107 and 110 ℃.

pH Dissolve 1.0 g of Oxprenolol Hydrochloride in 10 mL of water. The pH of this solution is between 4.5 and 6.0.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Oxprenolol Hydrochloride in 10 mL of water; the solution is clear and colorless.

(2) ***Heavy metals***—Proceed with 2.0 g of Oxprenolol Hydrochloride as directed under Method 4 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Arsenic***—Proceed with 1.0 g of Oxprenolol Hydrochloride as directed under Method 3 and perform the test (NMT 2 ppm).

(4) ***Related substances***—Dissolve 0.25 g of Oxprenolol Hydrochloride in 10 mL of water, and use this solution as the test solution. Pipet 4 mL of this solution and add water to make exactly 100 mL. Pipet 5 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, in a developing chamber saturated with ammonia vapor, develop the plate with a mixture of chloroform and methanol (9 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 0.5% (1 g, 80 ℃, 3 hours).

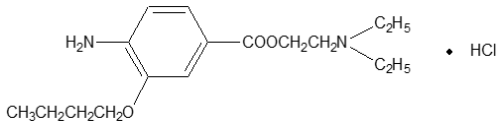
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.6 g of Oxprenolol Hydrochloride, previously dried, dissolve in 50 mL of a mixture of acetic anhydride and acetic acid(100) (7 : 3), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 30.181 mg of $C_{15}H_{23}NO_3 \cdot HCl$

Packaging and storage Preserve in tight containers.

Oxybuprocaine Hydrochloride
옥시부프로카인염산염



Benoxinate Hydrochloride

$C_{17}H_{28}N_2O_3 \cdot HCl$: 344.88

2-(Diethylamino)ethyl 4-amino-3-butoxybenzoate hydrochloride [*5987-82-6*]

Oxybuprocaine Hydrochloride, when dried, contains NLT 98.5% and NMT 101.0% of oxybuprocaine hydrochloride ($C_{17}H_{28}N_2O_3 \cdot HCl$).

Description Oxybuprocaine Hydrochloride occurs as white crystals or a crystalline powder.
It is odorless, has a salty taste, and paralyzes the tongue.
It is very soluble in water, freely soluble in ethanol(95) and chloroform, and practically insoluble in ether.
It is gradually colored by light.
Dissolve 1.0 g of Oxybuprocaine Hydrochloride in 10 mL of water; the pH of this solution is between 5.0 and 6.0.

Identification (1) Dissolve 10 mg of Oxybuprocaine Hydrochloride in 1 mL of dilute hydrochloric acid and 4 mL of water; the solution responds to the Qualitative Analysis for primary aromatic amines.

(2) Dissolve 0.1 g of Oxybuprocaine Hydrochloride in 8 mL of water and add 3 mL of ammonium thiocyanate TS; an oil-like substance forms, and a white crystal is precipitated when the wall of the vessel is scratched with a glass rod. Separately take this crystal, recrystallize with water, and dry for 5 hours in a desiccator (vacuum, phosphorus pentoxide); the melting point is between 103 and 106 ℃.

(3) Determine the absorption spectra of aqueous solution of Oxybuprocaine Hydrochloride and oxybuprocaine hydrochloride RS (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(4) An aqueous solution of Oxybuprocaine Hydrochloride (1 in 10) responds to the Qualitative Analysis for chloride.

Melting point Between 158 and 162 ºC.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of oxybuprocaine hydrochloride in 10 mL of water; the solution is clear and colorless.

(2) ***Heavy metals***—Proceed with 1.0 g of oxybuprocaine hydrochloride according to Method 1.and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Related substances***—Dissolve 0.25 g of Oxybuprocaine Hydrochloride in 10 mL of chloroform and use this solution as the test solution. Pipet 1.0 mL of the test solution and add chloroform to make exactly 20 mL. Pipet 1 mL of this solution, add chloroform to make exactly 50 mL and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on a plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of chloroform, ethanol(95) and formic acid (7 : 2 : 1) to about 10 cm, and air-dry the plate. Spray evenly *p*-dimethylaminobenzaldehyde TS for spray on the plate; the spots other than the principal spot from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 0.5% (1 g, 105 ℃, 2 hours).

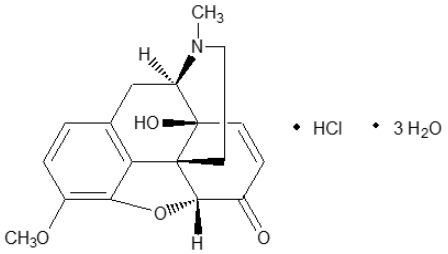
Residue on ignition NMT 0.1% (1 g).

Assay Weigh exactly about 0.6 g of Oxubyprocaine Hydrochloride, previously dried, dissolve in 50 mL of a mixture of acetic anhydride and acetic acid(100) (7 : 3), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 34.488 mg of $C_{17}H_{28}N_2O_3 \cdot HCl$

Packaging and storage Preserve in light-resistant, well-closed containers.

Oxycodone Hydrochloride Hydrate
옥시코돈염산염수화물



Oxycodone Hydrochloride

$C_{18}H_{21}NO_4 \cdot HCl \cdot 3H_2O$: 405.87

(1*S*,5*R*,13*R*,17*S*)-17-Hydroxy-10-methoxy-4-methyl-12-oxa-4-azapentacyclo[9.6.1.0^{1,13}.0^{5,17}.0^{7,18}] octadeca-7(18),8,10-trien-14-one trihydrate hydrochloride [*591229-40-2*]

Oxycodone Hydrochloride Hydrate contains NLT 98.0% and NMT 101.0% of oxycodone hydrochloride ($C_{18}H_{21}NO_4 \cdot HCl$: 351.83), calculated on the anhydrous basis.

Description Oxycodone Hydrochloride Hydrate occurs as a white crystalline powder.
It is freely soluble in water, methanol or acetic acid(100), sparingly soluble in ethanol(95), slightly soluble in acetic

anhydride and practically insoluble in ether.
Dissolve 1.0 g of Oxycodone Hydrochloride Hydrate in 10 mL of water; the pH of this solution is 3.8 to 5.8.
It is affected by light.

Identification (1) Determine the absorption spectra of aqueous solutions of Oxycodone Hydrochloride Hydrate and oxycodone hydrochloride hydrate RS (1 in 10000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelength.

(2) Determine the infrared spectra of Oxycodone Hydrochloride Hydrate and oxycodone hydrochloride hydrate RS according to the potassium bromide disk method as directed under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) An aqueous solution of Oxycodone Hydrochloride Hydrate (1 in 50) responds to the Qualitative Analysis (2) for chloride.

Optical rotation $[\alpha]_D^{20}$: Between -140° and -149° (0.5 g calculated on the anhydrous basis, water, 25 mL, 100 mm).

Purity (1) ***Clarity and color of solution***—Dissolve 0.5 g of Oxycodone Hydrochloride Hydrate in 10 mL of water; the solution is clear and colorless.

(2) ***Morphine***—Dissolve 10 mg of Oxycodone Hydrochloride Hydrate in 1 mL of water, add 5 mL of 1-nitroso-2-naphthol TS and 2 mL of potassium nitrate (1 in 10), and warm at 40 ℃ for 2 minutes. Then, add 1 mL of sodium nitrate solution (1 in 5000), and warm at 40 ℃ for 5 minutes. After cooling, add 10 mL of chloroform, shake to mix, centrifuge, and collect the aqueous layer; the color of the resulting solution is not more intense than pale bright red.

(3) ***Codeine***—Dissolve 10 mg of Oxycodone Hydrochloride Hydrate in 5 mL of sulfuric acid, add 1 drop of iron(III) chloride TS, and warm; the solution does not exhibit a blue color. Add 1 more drop of nitric acid; the solution does not exhibit a red color.

(4) ***Thebaine***—Dissolve 0.1 g of Oxycodone Hydrochloride Hydrate in 2 mL of diluted hydrochloric acid (1 in 10), heat the solution on a steam bath for 25 minutes, cool, add 0.5 mL of hydrochloric acid-4-aminoantipyrine TS and 0.5 mL of potassium hexacyanoferrate(III) TS, shake to mix, add 2 mL of ammonia TS and 3 mL of chloroform, and shake to mix; the chloroform layer does not exhibit a red color.

Water Between 12% and 15% (0.2 g, volumetric titration, direct titration).

Residue on ignition NMT 0.1% (0.5 g).

Assay Weigh accurately about 0.5 g of Oxycodone Hydrochloride Hydrate, calculated on the anhydrous basis, dissolve in 50 mL of a mixture of acetic anhydride and acetic acid(100) (7 : 3), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 35.182 mg of $C_{18}H_{21}NO_4 \cdot HCl$

Packaging and storage Preserve in light-resistant, tight containers.

Oxygen
산소

O_2 : 32.00

[*7782-44-7*]

Prepare Oxygen with air through the air-liquifaction process.

Oxygen contains NLT 99.5 vol% and NMT 101.0 vol% of oxygen (O_2).

Description Oxygen occurs as a colorless gas and is odorless.
1 mL of Oxygen dissolves in about 32 mL of water or about 7 mL of ethanol(95) at 20 ℃ and 101.3 kPa.
1000 mL of Oxygen is about 1.429 g at 0 ℃ and 101.3 kPa.

Identification Perform the test with Oxygen as directed under the Assay; it shows a paramagnetic signal equal to the standard oxygen gas.

Purity The amount of Oxygen is collected after maintaining the container at between18 and 22 ℃ for NLT 6 hours before performing the test, and converted to the volume at the pressure of 101.3 kPa at 20 ℃.

(1) ***Carbon dioxide***—Transfer 50 mL of barium hydroxide TS to a Nessler tube. Place the end of the gas injection tube (about 1 mm in internal diameter) 2mm away from the floor and pass 1000 mL of Oxygen through the Nessler tube; the turbidity of the solution is not more intense than the following control solution.

Control solution—Transfer 50 mL of barium hydroxide TS to a Nessler tube and add 1 mL of a solution dissolved 0.1 g of sodium bicarbonate in 100 mL of newly boiled and cooled water.

(2) ***Nitrogen***—Take 1.0 mL of Oxygen into a gas flowmeter for gas chromatography or a syringe through a PVC injection tube directly from a pressure-resistant metal hermetic container with a pressure-reducing valve. Perform the test with this as directed under the Gas Chromatography according to the following conditions and calculate the peak area, AT, of nitrogen. Separately, take 0.50 mL of nitrogen in a gas mixture dispenser, add the carrier gas to make the total volume to exactly 100 mL, and mix well. Take 1.0 mL of this mixture, proceed in the same manner as in the preparation of Oxygen, and

calculate the peak area, AS of nitrogen; AT is not greater than AS.

Operating conditions

Detector: A thermal conductivity detector

Column: A column about 3 mm in internal diameter and about 3 m in length, packed with zeolite for gas chromatography (250 μm to 355 μm in particle diameter, 0.5 nm in pore diameter).

Column temperature: A constant temperature of about 50 °C.

Carrier gas: Hydrogen or helium

Flow rate: Adjust the flow rate so that the retention time of nitrogen is about 5 minutes.

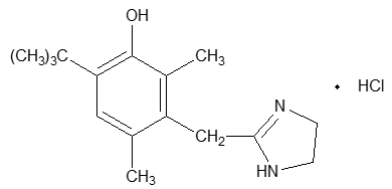
Selection of column: Take 0.5 mL of nitrogen in a gas mixture dispenser, add Oxygen to make 100 mL, and mix well. Proceed with 1.0 mL of this mixture according to the above conditions; oxygen and nitrogen are eluted in this order and each peak is completely separated.

(3) ***Carbon monoxide***—Connect a tube with a sufficient length to a carbon monoxide container so that all liquid contents are vaporized passing through the tube when opening the valve of the container, and prevent the inlet tube connected to the detector tube from frosting. Through the tube (previously replace the air in the apparatus with Oxygen), pass 1000 ± 50 mL of Oxygen in the form of vapor through the carbon monoxide detector tube at an appropriate flow rate, and determine carbon monoxide concentration; NMT 0.001%. But, to prevent contamination, connect the gas volumetric apparatus to the bottom of the detector tube during measurement.

Assay Use Oxygen as the sample gas. Separately, quantify standard nitrogen gas and standard oxygen gas with a magnetic analyzer as directed under the Oxygen assay.

Packaging and storage Preserve in pressure-resistant metal hermetic containers at NMT 40 ℃.

Oxymetazoline Hydrochloride
옥시메타졸린염산염



$C_{16}H_{24}N_2O \cdot HCl$: 296.84

6-*tert*-Butyl-3-(4,5-dihydro-1*H*-imidazol-2-ylmethyl)-2,4-dimethylphenol hydrochloride [*2315-02-8*]

Oxymetazoline hydrochloride contains NLT 98.5 and NMT 101.5% of oxymetazoline hydrochloride ($C_{16}H_{24}ClN_2O \cdot HCl$), calculated on the dried basis.

Description Oxymetazoline hydrochloride occurs as a white, fine crystalline powder.

It is soluble in water or ethanol(95), and practically insoluble in benzene, chloroform or ether.

It is hygroscopic.

Melting point—About 300 °C (with decomposition).

Identification (1) Determine the absorption spectra of aqueous solutions of Oxymetazoline Hydrochloride and oxymetazoline hydrochloride RS (1 in 10000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths, and the difference of each absorbance of Oxymetazoline Hydrochloride and Oxymetazoline Hydrochloride RS at the absorbance maximum wavelength at about 279 nm is NMT 3.0%.calculated on the dried basis.

(2) Determine the infrared spectra of Oxymetazoline Hydrochloride and oxymetazoline hydrochloride RS, previously dried, as directed in the paste method under the Mid-infrared Spectroscopy; both spectra exhibit maximum of absorption at the same wave numbers.

(3) To a solution of 50 mg of Oxymetazoline Hydrochloride dissolved in 3 mL of water, add 1 mL of ammonia TS and filter. Acidify the filtrate with nitric acid; the filtrate responds to the Qualitative Analysis for chloride.

pH Dissolve 1.0 g of Oxymetazoline Hydrochloride in 20 mL of water; the pH of this solution is between 4.0 and 6.5.

Purity ***Heavy metals*—**Proceed with 1.0 g of Oxymetazoline Hydrochloride according to Method 2 and perform the test. Prepare the control solution with 1.0 mL of lead standard solution (NMT 10 ppm).

Loss on drying NMT 1.0% (1 g, 105 ℃, 3 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 25 mg of Oxymetazoline Hydrochloride, and dissolve in the mobile phase to make exactly 50 mL. Separately, weigh an appropriate amount of oxymetazoline hydrochloride RS, previously dried at 105 ℃ for 3 hours, dissolve in the mobile phase to prepare a solution containing 0.5 mg per mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak area of oxymetazoline hydrochloride, A_T and A_S, in each solution.

$$\text{Amount (mg) of oxymetazoline hydrochloride } (C_{16}H_{24}N_2O \cdot HCl) = 50 \times C \times \frac{A_T}{A_S}$$

C: Concentration (mg/mL) of the standard solution

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 280 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with porous silica gel coated with strongly acidic cation exchange resin for liquid chromatography (10 μm in particle diameter).

Mobile phase: A mixture of water, methanol, 1 mol/L sodium acetate TS and acetic acid(100) (46 : 40 : 10 : 4).

Flow rate: 1 mL/min

System suitability

System performance: Proceed with 20 μL of the standard solution under the above operating conditions; the symmetry factor is NMT 2.0.

System repeatability: Repeat the test 6 times according to the above conditions with 20 μL of the standard solution; the relative standard deviation of the peak area is NMT 2.0%

Packaging and storage Preserve in tight containers.

Oxymetazoline Hydrochloride Nasal Solution
옥시메타졸린염산염 점비액

Oxymetazoline Hydrochloride Nasal Solution contains NLT 90.0% and NMT 110.0% of the labeled amount of oxymetazoline hydrochloride ($C_{16}H_{24}O_2$: 296.84).

Method of preparation Prepare as directed under Nasal Solutions, with Oxymetazoline Hydrochloride.

Description Oxymetazoline Hydrochloride Nasal Solution occurs as a clear, colorless liquid.

Identification Weigh accurately the amount equivalent to 2.5 mg of oxymetazoline hydrochloride according to the labeled amount of Oxymetazoline Hydrochloride Nasal Solution, add water 10 to make 10 mL, then add 2 mL of sodium carbonate solution (1 in 10), and extract with 10 mL of chloroform. Take the chloroform layer and extract with 10 mL of 0.1 mol/L hydrochloric acid. Take 8 mL of the hydrochloric acid layer and place in a test tube, neutralize with a small amount of 1 mol/L sodium hydroxide solution, add 1 more drop of 1 mol/L sodium hydroxide solution and mix, then add a few drops of sodium pentacyanonitrosylferrate(III) TS and 2 drops of sodium hydroxide solution (15 in 100), and allow to stand for 10 minutes. To this solution, add 0.1 mol/L hydrochloric acid to adjust pH to between 8 and 9, then allow to stand for 10 minutes; the solution exhibits a purple color.

pH Between 4.0 and 6.5.

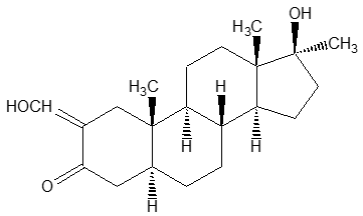
Assay Use Oxymetazoline Hydrochloride Nasal Solution as the test solution. Separately, weigh oxymetazoline hydrochloride RS, previously dried at 105 ℃ for 3 hours, and dissolve in the mobile phase to make the same concentration as the test solution. Use this solution as the standard solution. Perform the test solution with the test solution and the standard solution as directed under the Assay under Oxymetazoline Hydrochloride.

$$\text{Amount (mg) of oxymetazoline hydrochloride } (C_{16}H_{24}N_2O\cdot HCl) = C \times \frac{A_T}{A_S}$$

C: Concentration (mg/mL) of the standard solution

Packaging and storage Preserve in tight containers.

Oxymetholone
옥시메톨론



$C_{21}H_{32}O_3$: 332.48

17β-Hydroxy-2-hydroxymethylidene-17α-methyl-3-androstanone [*434-07-1*]

Oxymetholone, when dried, contains NLT 97.0% and NMT 103.0% of oxymetholone ($C_{21}H_{32}O_3$).

Description Oxymetholone occurs as a white to pale yellowish crystalline powder and is odorless.

It is freely soluble in chloroform, soluble in 1,4-dioxane, sparingly soluble in methanol, ethanol(95) or acetone, slightly soluble in ether, and practically insoluble in water.

It is gradually colored and decomposed by light.

Identification (1) Dissolve 2 mg of Oxymetholone in 1 mL of ethanol(95) and add 1 drop of iron(III) chloride TS; the resulting solution exhibits a violet color.

(2) Dissolve 0.01 g of Oxymetholone and oxymetholone RS in methanol to make 50 mL. Take 5 mL of these solutions, and add 5 mL of sodium hydroxide-methanol TS and add methanol to make 50 mL. Determine the absorption spectra of both solutions as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared spectra of Oxymetholone and oxymetholone RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both exhibit similar intensities of absorption at the same wave numbers.

Optical rotation $[\alpha]_D^{20}$: Between +29° and +33° (0.1 g after drying, acetone, 10 mL, 100 mm).

Melting point Between 175 and 182 ºC.

Purity (1) ***Clarity and color of solution***—Dissolve 0.5 g of Oxymetholone in 25 mL of ethanol(99.5); the solution is clear and colorless to pale yellow.

(2) ***Related substances***—Dissolve 50 mg of Oxymetholone in 5 mL of chloroform and use this solution as the test solution. Pipet 1 mL of the test solution, add chloroform to make exactly 200 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on a plate made of silica gel for thin-layer chromatography. Air-dry the plate, and immediately develop the plate with a mixture of toluene and ethanol(99.5) (49 : 1) as the developing solvent to a distance of about 12 cm, and air-dry the plate. Spray vanillin-sulfuric acid TS evenly on the plate, then heat for 3 to 5 minutes at 100 ℃; spots other than the principal spot and the spot from the starting point from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 1.0% (0.5 g, in vacuum, phosphorus pentoxide, 4 hours).

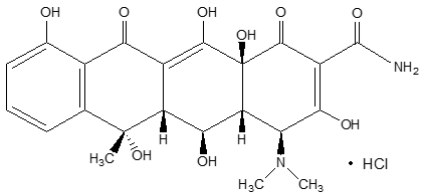
Residue on ignition NMT 0.15% (0.5 g).

Assay Weigh accurately about 40 mg of Oxymetholone, previously dried, and dissolve in methanol to make exactly 50 mL. Pipet 5 mL of this solution and add methanol to make exactly 50 mL. Pipet 5 mL of this solution, and add 5 mL of sodium hydroxide-methanol TS and methanol to make exactly 50 mL. Perform the test with this solution as directed under the Ultraviolet-visible Spectroscopy using a solution prepared by adding methanol to 5 mL of sodium hydroxide-methanol TS to make 50 mL as the control solution, and measure the absorbance, *A*, at the absorbance maximum wavelength of about 315 nm.

$$\text{Amount (mg) of oxymetholone } (C_{21}H_{32}O_3) = \frac{A}{541} \times 50000$$

Packaging and storage Preserve in light-resistant, tight containers.

Oxytetracycline Hydrochloride
옥시테트라사이클린염산염



$C_{22}H_{24}N_2O_9 \cdot HCl$: 496.89

(4*S*,4a*R*,5*S*,5a*R*,6*S*,12a*S*)-4-(dimethylamino)-3,5,6,10,11,12a-hexahydroxy-6-methyl-1,12-dioxo-1,4,4a,5,5a,6,12,12a-octahydrotetracene-2-carboxamide hydrochloride [*2058-46-0*]

Oxytetracycline Hydrochloride is the hydrochloride of a tetracycline compound having antibacterial activity produced by the growth of *Streptomyces rimosus*.

Oxytetracycline Hydrochloride contains NLT 880 μg and NLT 945 μg (potency) of oxytetracycline ($C_{22}H_{24}N_2O_9$: 460.43) per mg, calculated on the dried basis.

Description Oxytetracycline Hydrochloride occurs as yellow crystals or a crystalline powder.
It is freely soluble in water and slightly soluble in ethanol(99.5).

Identification (1) Determine the absorption spectra of solutions of Oxytetracycline Hydrochloride and oxytetracycline hydrochloride RS in 0.1 mol/L hydrochloric acid TS (1 in 50000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Weigh 20 mg of Oxytetracycline Hydrochloride, dissolve in 3 mL water, and add 1 drop of silver nitrate TS; the resulting solution is turbid.

Optical rotation $[\alpha]_D^{20}$: Between -188° and -200° (0.25 g calculated on the dried basis, 0.1 mol/L hydrochloric acid, 25 mL, 100 mm).

pH Dissolve 0.1 g of Oxytetracycline Hydrochloride in 10 mL of water; the pH of this solution is between 2.0 and 3.0.

Absorbance Weigh accurately about 50 mg each of Oxytetracycline Hydrochloride and oxytetracycline hydrochloride RS and dissolve each in 0.1 mol/L hydrochloric acid TS to make exactly 250 mL. Pipet 10 mL each of these solutions, add 0.1 mol/L hydrochloric acid TS to make exactly 100 mL, and use these solutions as the test and standard solutions. With the test and standard solutions, measure the absorbance A_T and A_S at 353 nm as directed under the Ultraviolet-visible Spectroscopy, using 0.1 mol/L hydrochloric acid TS as the control solution (92.5 ± 4.3%).

$$\text{Absorbance ratio (\%)} = \frac{A_T}{A_S} \times \frac{Potency\ (\mu g)\ in\ amount\ of\ Oxytetracycline\ Hydrochloride\ RS\ taken}{Amount\ (mg)\ of\ Oxytetracycline\ Hydrochloride\ taken}$$

$$\times \frac{100}{(100-m)}$$

m: Water (%) of sample

Purity (1) ***Heavy metals***—Proceed with 0.5 g of Oxytetracycline Hydrochloride according to Method 2 and perform the test. Prepare the control solution with 2.5 mL of lead standard solution (NMT 50 ppm).

(2) ***Related substances***—Weigh accurately about 20 mg of Oxytetracycline Hydrochloride, dissolve in 0.01 mol/L hydrochloric acid TS to make exactly 25 mL, and use this solution as the test solution. Separately, weigh accurately about 20 mg of 4-epioxytetracycline, dissolve in 0.01 mol/L hydrochloric acid TS to make exactly 25 mL, and use the resulting solution as the 4-epioxytetracycline stock solution. Further, dissolve about 20 mg of tetracycline hydrochloride in 0.01 mol/L hydrochloric acid TS to make exactly 25 mL, and use the resulting solution as the tetracycline hydrochloride stock solution. Weigh accurately about 8 mg of β-apoxytetracycline, dissolve in 5 mL of 0.01 mol/L sodium hydroxide TS, add 0.01 mol/L hydrochloric acid TS to make exactly 100 mL, and use the resulting solution as the β-apoxytetracycline stock solution. Pipet 1 mL of 4-epioxytetracycline stock solution, 4 mL of tetracycline hydrochloride stock solution and 40 mL of β-apoxytetracycline stock solution, add 0.01 mol/L hydrochloric acid TS to make exactly 200 mL, and use the resulting solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and measure the peak areas of each solution using the automatic integration method; the peak areas of 4-epioxytetracycline and tetracycline from the test solution are not larger than the respective peak areas from the standard solution, and the total area for the peak of α-apoxytetracycline, the peak of β-apoxytetracycline and the peaks between these two is not greater than the peak area of β-apoxytetracycline from the standard solution. Further, the peak area of 2-acetyl-2-decarboxamide oxytetracycline eluted after the major peak of the test solution is not greater than 4 times the peak area of 4-epioxytetracycline from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with styrene-divinylbenzene copolymer for liquid chromatography (8 μm in particle diameter).

Column temperature: A constant temperature of about 60 °C.

Mobile phase: Control the mixing ratio of mobile phase A and mobile phase B in stages or gradient elution as follows.

Mobile phase A: Mix 60 mL of 0.33 mol/L potassium dihydrogen phosphate TS, 100 mL of tetrabutylammonium hydrogen sulfate (1 in 100), 10 mL of ethylenediamine tetraacetic acid disodium salt dihydrate solution (1 in 2500) and 200 mL of water, and adjust pH to 7.5 with 2 mol/L sodium hydroxide TS. Add 30 g of *t*-butyl alcohol and add water to make 1000 mL.

Mobile phase B: Mix 60 mL of 0.33 mol/L potassium dihydrogen phosphate TS, 50 mL of tetrabutylammonium hydrogen sulfate (1 in 100), 10 mL of ethylenediamine tetraacetic acid disodium salt dihydrate solution (1 in 2500) and 200 mL of water, and adjust pH to 7.5 with 2 mol/L sodium hydroxide TS. Add 100 g of *t*-butyl alcohol and add water to make 1000 mL.

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 - 20	70 → 10	30 → 90
20 - 35	10 → 20	90 → 80

Flow rate: 1.0 mL/min

System suitability

Test for required detectability: To exactly 1 mL of 4-epioxytetracycline stock solution, add 0.01 mol/L hydrochloric acid TS to make exactly 200 mL. Pipet 4 mL of this solution and add 0.01 mol/L hydrochloric acid TS to make exactly 20 mL. Confirm the peak area of 4-epioxytetracycline obtained from 20 μL of this solution is between 14% and 26% of the peak area of 4-epioxytetracycline from the standard solution.

System performance: Weigh accurately about 8 mg of α-apoxytetracycline and dissolve in 5 mL of 0.01 mol/L sodium hydroxide TS, add 0.01 mol/L hydrochloric acid TS to make exactly 100 mL, and use the resulting solution as the α-apoxytetracycline stock solution. Pipet 3 mL of the test solution, 2 mL of the 4-epioxytetracycline stock solution, 6 mL of the tetracycline hydrochloride stock solution, 6 mL of the β-apoxytetracycline stock solution and 6 mL of the α-apoxytetracycline stock solution, and add 0.01 mol/L hydrochloric acid TS to make exactly 50 mL. Proceed with 20 μL of this solution according to the above conditions; 4-epioxytetracycline, oxytetracycline, tetracycline, α-apoxytetracycline and β-apoxytetracycline are eluted in this order, with the resolutions between 4-epioxytetracycline and oxytetracycline, between oxytetracycline and tetracycline and between α-apoxytetracycline and β-apoxytetracycline being NLT 4, NLT 5 and NLT 4, respectively, and the symmetry factor of oxytetracycline being NMT 1.3.

System repeatability: Pipet 1 mL of 4-epioxytetracycline stock solution and add 0.01 mol/L hydrochloric acid TS to make exactly 200 mL. Repeat the test 6 times with 20 μL each of these solutions according to the above operating conditions; the relative standard deviation of the peak areas of 4-epioxytetracycline is NMT 2.0%.

Relative retention time: The relative retention time of α-apoxytetracycline with respect to oxytetracycline is about 2.1.

Time span of measurement: About 3.5 times the retention time of oxytetracycline after the solvent peak.

0.33 mol/L potassium dihydrogen phosphate—TS Dissolve 4.491 g of potassium dihydrogen phosphate in water to make 100 mL.

Loss on drying NMT 2.0% (1 g, in vacuum, 60 ℃, 3 hours).

Residue on ignition NMT 0.5% (1 g).

Sterility It meets the requirements when used in sterile preparations. However, it is excluded in cases where there is a final sterilization process in the manufacturing of a sterile preparation.

Bacterial endotoxins It is less than 0.4 EU per mg (potency) of oxytetracycline when used for the manufacturing of sterile preparations.

Histamine It meets the requirements when used in sterile preparations. Proceed with an appropriate amount of Oxytetracycline Hydrochloride to prepare a solution containing 5.0 mg (potency) per mL, and use the solution as the test solution. Use 0.6 mL of the test solution for the test.

Assay Weigh accurately about 50 mg (potency) of Oxytetracycline Hydrochloride and dissolve in 25 mL of 0.1 mol/L hydrochloric acid TS, add water to make exactly 250 mL, and use this solution as the test solution. Separately, weigh accurately about 50 mg (potency) of oxytetracycline RS, dissolve in 25 mL of 0.1 mol/L hydrochloric acid TS, add water to make exactly 250 mL, and use this solution as the standard solution. Store the standard solution at below 5℃ and use it within 7 days. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of oxytetracycline from each solution.

$$\text{Potency (μg) of oxytetracycline } (C_{22}H_{24}N_2O_9) = \text{Potency (μg) of oxytetracycline RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: Dissolve 50 g of *t*-butyl alcohol in water to make 200 mL, add 60 mL of phosphate buffer solution, pH 7.5, 50 mL of *t*-butylammoniumhydrogensulfate and 10 mL of edetate TS, and add water to make 1000 mL.

Flow rate: 1.4 mL/min

System suitability

System repeatability: Repeat the test 6 times with 20 μL of the standard solution according to the above operating conditions; the relative standard deviation of the peak areas of erythromycin is NMT 2.0%.

Packaging and storage Preserve in light-resistant, tight containers.

Oxytetracycline Hydrochloride Capsules
옥시테트라사이클린염산염 캡슐

Oxytetracycline Hydrochloride Capsules contain NLT 90.0% and NMT 120.0% of the labeled amount of oxytetracycline ($C_{22}H_{24}N_2O_9$: 460.44).

Method of preparation Prepare as directed under Capsules, with Oxytetracycline Hydrochloride.

Identification Weigh an amount of the content of Oxytetracycline Hydrochloride Capsules, previously powdered, equivalent to about 10 mg of oxytetracycline hydrochloride, dissolve in 20 mL of water, add 1 mL of sodium carbonate solution (1 in 100) to 1 mL of this solution, and then add 1 mL of diazobenzenesulfonic acid TS; the resulting solution exhibits an orangey red color.

Loss on drying NMT 5.0% (0.1 g, 0.7 kPa, 60 ℃, 3 hours).

Dissolution Perform the test with 1 capsule of Cefalexin Capsule at 75 revolutions per minute according to Method 2 under the Dissolution, using 900 mL of water as the dissolution medium. Take the dissolved solution 60 minutes after starting the dissolution test, filter, and discard the first 10 mL of the filtrate. Pipet *V* mL of the subsequent filtrate, add water to make exactly *V*□ mL, and use this solution as the test solution. Separately, weigh accurately an appropriate amount of oxytetracycline RS, dissolve in 5 mL of 0.1 mol/L hydrochloric acid, then add the dissolution medium to make it the same concentration as the test solution, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at the absorbance maximum wavelength of around 273 nm, as directed under the Ultraviolet-visible Spectroscopy, using the dissolution medium as a control solution. It meets the requirements when the dissolution rate of Oxytetracycline Hydrochloride Capsules in 60 minutes is NLT 80% (Q).

$$\text{Dissolution rate (\%) of the labeled amount of oxytetracycline } (C_{22}H_{24}N_2O_9) = Cs \times \frac{A_T}{A_S} \times \frac{V'}{V} \times \frac{1}{C} \times 90000$$

Cs: Concentration [mg (potency)/mL] of the standard solution

C: Labeled amount [mg (potency)] of oxytetracycline ($C_{22}H_{24}N_2O_9$) per capsule

Uniformity of dosage units Meets the requirements.

Assay Take NLT 20 capsules of Oxytetracycline Hydrochloride Capsules, weigh accurately the mass of the content equivalent to about 50 mg (potency) according to the labeled potency, dissolve in 25 mL of 0.1 mol/L hydrochloric acid TS, add water to make exactly 250 mg, and use this solution as the test solution. Separately, weigh accurately about 50 mg (potency) of oxytetracycline RS, dissolve in 25 mL of 0.1 mol/L hydrochloric acid TS, add water to make exactly 250 mL, and use this solution as the standard solution. Store the standard solution at below 5 °C and use it within 7 days. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of oxytetracycline hydrochloride in the test solution and the standard solution.

$$\text{Potency (μg) of oxytetracycline } (C_{22}H_{24}N_2O_9) = \text{Potency (μg) of oxytetracycline RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: Dissolve 50 g of *t*-butyl alcohol in water to make 200 mL, then add 60 mL of phosphate buffer solution, pH 7.5, 50 mL of *t*-butylammonium hydrogen sulfate and 10 mL of edetate TS, and add water to make 1000 mL.

Flow rate: 1.4 mL/min

Packaging and storage Preserve in tight containers.

Oxytocin
옥시토신

$C_{43}H_{66}N_{12}O_{12}S_2$: 1007.19

1-({(4*R*,7*S*,10*S*,13*S*,16*S*,19*R*)-19-amino-7-(2-amino-2-oxoethyl)-10-(3-amino-3-oxopropyl)-16-(4-hydroxybenzoyl)-13-[(1S)-1-methylpropyl]-6,9,12,15,18-pentaoxo-1,2-dithia-5,8,11,14,17-pentaaza-cycloicosan-4-yl}carbonyl)-L-prolyl-L-leucyl-glycinamide [*50-56-6*]

Oxytocin is a synthetic peptide having the property of causing the contraction of uterin.

Oxytocin contains NLT 540 and NMT 600 oxytocin units per mg of peptide, calculated on the anhydrous and acetic acid-free basis.

Description Oxytocin occurs as a white powder.
It is very soluble in water and freely soluble in ethanol(99.5).
It is soluble in hydrochloric acid TS.
The pH of a solution prepared by dissolving 0.10 g of oxytocin in 10 ml of freshly boiled and cooled water is between 4.0 and 6.0.
It is hygroscopic.

Identification Determine the absorption spectra of solutions of Oxytocin and oxytocin RS (1 in 2000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

Constituent amino acids Weigh accurately about 1 mg of Oxytocin, transfer to a test tube for hydrolysis, dissolve in 6 mol/L hydrochloric acid TS for nitrogen substitution, then seal in vacuum, and heat at 110 ℃ - 115 ℃ for 16 hours. Cool, remove the stopper, evaporate the hydrolysate to dryness in vacuum, dissolve the residue in 2 mL of 0.02 mol/L hydrochloric acid TS, and use this solution as the test solution. Separately weigh accurately about 24 mg of L-asparaginate, about 24 mg of L-threonine, about 21 mg of L-serine, about 29 mg of L-glutamic acid, about 23 mg of L-proline, about 15 mg of glycine, about 18 mg of L-alanine, about 23 mg of L-valine, about 48 mg of L-cystine, about 30 mg of methionine, about 26 mg of L-isoleucine, about 26 mg of L-leucine, about 36 mg of L-tyrosine, about 33 mg of phenylalanine, about 36 mg of L-lysine hydrochloride, about 42 mg of L-histidine hydrochloride hydrate and about 42 mg of L-arginine hydrochloride, dissolve in 10 mL of 1 mol/L hydrochloric acid TS, and add water to make exactly 100 mL. Pipet 5 mL of this solution, add water to make exactly 20 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the respective molar ratios with respect to leucine; between 0.95 and 1.05 for asparaginic acid, between 0.95 and 1.05 for glutamic acid, between 0.95 and 1.05 for proline, between 0.95 and 1.05 for glycine, between 0.80 and 1.10 for isoleucine, between 0.80 and 1.05 for tyrosine, between 0.80 and 1.05 for cystine, and NMT 0.01 for each of the other amino acids.

Operating conditions

Detector: A visible absorption photometer (wavelengths: 440 nm and 570 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 8 cm in length, packed with strongly acidic ion exchange resin for liquid chromatography (sodium type) where polystyrene (3 μm in particle diameter) is bonded to a sulfonic acid group.

Column temperature: A constant temperature of about 57 °C.

Chemical reactor: A constant temperature of about 130 ℃.

Color development time: About 1 minute.

Mobile phase: Control the mixing ratio of mobile phase A, mobile phase B and mobile phase C stepwise or via the gradient elution as follows.

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)	Mobile phase C (vol%)
0 - 9	100	0	0
9 - 25	0	100	0
25 - 61	0	100 →0	0 →100
61 - 80	0	0	100

Prepare mobile phase A, mobile phase B and mobile phase C according to the following table.

	Mobile phase A	Mobile phase B	Mobile phase C
Citric acid	19.80	22.00	6.10
Monohydrate Sodium citrate	6.19	7.74	26.67
Dihydrate Sodium chloride	5.66	7.07	54.35
Ethanol (99.5)	260.0 mL	20.0 mL	-
Benzyl alcohol	-	-	5.0 mL
Thiodiglycol	5.0 mL	5.0 mL	
Lauromacrogol Solution (1 in 4)	4.0 mL	4.0 mL	4.0 mL
Caprylic acid	0.1 mL	0.1 mL	0.1 mL
Water	A sufficient quantity	A sufficient quantity	A sufficient quantity
Total volume	2000 mL	1000 mL	1000 mL
pH	3.3	3.2	4.9

Mobile phase flow rate: About 0.26 mL/min.
Reaction TS flow rate: About 0.3 mL/min.
System suitability

System performance: Proceed with 20 μL of the standard solution according to the above conditions; asparaginic acid, threonine, serine, glutamic acid, proline, glycine, alanine, valine, cystine, methionine, isoleucine, leucine, tyrosine, phenylalanine, lysine, hystidine and arginine are eluted in this order, and the resolutions between threonine and serine, between glycine and alanine, and between isoleucine and leucine are NLT 1.5, 1.4 and 1.2, respectively.

System repeatability: Repeat the test 3 times with 20 μL of the standard solution according to the above operating conditions; the relative standard deviation of the peak areas of asparaginic acid, proline, valine and arginine are NMT 2.0%, respectively.

Reaction TS—Mix 407 g of lithium acetate dihydrate, 245 mL of acetic acid(100) and 801 mL of 1-methoxy-2-propanol, add water to make 2000 mL, then stir to mix while passing nitrogen for at least 10 minutes, use the resulting solution as solution A. Separately add 77 g of ninhydrin and 0.134 g of sodium borohydride in 1957 mL of 1-methoxy-2-propanol and stir to mix while passing nitrogen for about 30 minutes, and use the resulting solution as solution B. Mix solution A and solution B when using.

Purity (1) ***Acetic acid***—Weigh accurately about 15 mg of Oxytocin, dissolve in internal standard solution to make exactly 10 mL, and use this solution as the test solution. Separately, weigh accurately about 1 g of acetic acid(100), dissolve in internal standard solution to make exactly 100 mL. Pipet 2 mL of the resulting solution, add the internal standard solution to make exactly 200 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the ratios, Q_T and Q_S of the peak area of oxytocin to that of the internal standard; the amount of acetic acid is between 6.0% and 10.0%.

$$\text{Content (\%) of acetic acid } (CH_3COOH)\ (\%) = \frac{Q_T}{Q_S} \times \frac{W_S}{W_T} \times \frac{1}{10}$$

W_S: Amount (mg) of acetic acid(100) taken
W_T: Amount (mg) of Oxytocin taken

Internal standard solution—A solution of propionic acid in the mobile phase (1 in 10000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 210 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: Add 900 mL of water to 0.7 mL of phosphoric acid, adjust the pH to 3.0 with 8 mol/L sodium hydroxide TS, then add water to make 1000 mL. Add 50 mL of methanol to 950 mL of this solution.

Flow rate: Adjust the flow rate so that the retention time of acetic acid is about 3 minutes.

System suitability

System performance: Proceed with 10 μL of the standard solution according to the above conditions; acetic acid and propionic acid are eluted in this order with the resolution being NLT 14.

System repeatability: Repeat the test 6 times with 10 μL of the standard solution according to the above operating conditions; the relative standard deviation of the peak areas of acetic acid to those the internal standard is NMT 2.0%.

(2) ***Related substances***—Dissolve 25 mg of Oxytocin in 100 mL of mobile phase A and use this solution as the test solution. Perform the test with 50 μL of the test solution as directed under the Liquid Chromatography according to the following conditions, measure the individual peak areas according to the automatic integration

method, and find the individual peak areas according to the percentage peak area method; the amount of the each peak other than oxytocin is NMT 1.5%. The sum of the peaks other than oxytocin is NMT 5.0%.

Operating conditions

For the detector, column, column temperature, mobile phase and flow rate, proceed as directed under the Operating conditions under the Assay.

System suitability

Test for required detectability: Pipet 1 mL of the test solution, add the mobile phase to make exactly 100 mL, and use this solution as the system suitability solution. Pipet 1.0 mL of this solution and add the mobile phase A to make exactly 10 mL. Confirm the peak area of oxytocin obtained from 50 mL of this solution is between 5% and 15% of the peak area of oxytocin obtained from the system suitability solution.

System performance: Take a sufficient amount of Oxytocin and vasopressin and dissolve in mobile phase A to prepare solutions containing 0.1 mg per mL each. Proceed with 50 μL of these solutions according to the above operating conditions; vasopressin and oxytocin are eluted in this order with the resolution being NLT 14 and the symmetry factor of the oxytocin peaks is NMT 1.5.

System repeatability: Repeat the test 6 times with 50 μL of the system suitability solution according to the above conditions; the relative standard deviation of the ratios of the peak area of oxytocin is NMT 2.0%.

Time span of measurement: About 2.5 times the retention time of oxytocin.

Water NMT 5.0% (50 mg, coulometric titration).

Assay Weigh accurately an amount of Oxytocin, equivalent to about 13000 units, add the mobile phase A to make exactly 100 mL, and use this solution as the test solution. Separately, dissolve 1 vial of oxytocin RS in the mobile phase A to make a clear solution containing about 130 units per mL, and use this solution as the standard solution. Perform the test with 25 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of oxytocin from each solution.

$$\text{Number of units in 1 mg of Oxytocin, calculated on the anhydrous and acetic acid-free basis} = \frac{A_T}{A_S} \times \frac{W_S}{W_T} \times 100$$

W_S: Number of units in 1 mL of the standard solution

W_T: Amount (mg) of Oxytocin taken, calculated on the anhydrous and acetic acid-free basis

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: Control the mixing ratio of mobile phase A and mobile phase B in stages or gradient elution as follows.

Mobile phase A: Dissolve 15.6 g of Sodium phosphate dibasic, dihydrate in 1000 mL of water.

Mobile phase B: A mixture of water and acetonitrile (1 : 1).

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 - 30	70 →40	30 →60
30 - 30.1	40→70	60 →30
30.1 - 45	70	30

Flow rate: 1.0 mL/min

System suitability

System performance: Take a sufficient amount of Oxytocin and vasopressin and dissolve in mobile phase A to prepare solutions containing 0.1 g per mL each. Proceed with 25 μL of these solutions according to the above operating conditions; vasopressin and oxytocin are eluted in this order with the resolution being NLT 14 and the symmetry factor of the oxytocin peaks is NMT 1.5.

System repeatability: Repeat the test 6 times with 25 μL of the standard solution according to the above conditions; the relative standard deviation of the peak areas of oxytocin is NMT 1.0%.

Packaging and storage Preserve in tight containers at a temperature at 2 to 8 °C.

Oxytocin Injection
옥시토신 주사액

Oxytocin Injection is an aqueous injection and contains NLT 90.0% and NMT 110.0% of the oxytocin units as labeled.

Method of preparation Prepare as directed under injections, with synthesized Oxytocin.

Description Oxytocin Injection occurs as a clear, colorless liquid.

pH Between 2.5 and 4.5.

Sterility It meets the requirements when tested according to the membrane filtration method.

Bacterial endotoxins Less than 10 EU per 1 unit of oxytocin.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Extractable volume of injections Meets the requirements.

Assay Take an appropriate amount of Oxytocin Injection according to the labeling unit, and add the diluent to prepare a solution containing about 1 unit per mL. Use this solution as the test solution. Separately, dissolve 1 vial of oxytocin RS in mobile phase A to make exactly 20 mL. Take an appropriate amount of this solution, and add the diluent to prepare a solution containing about 1 unit per mL. Use this solution as the standard solution. Perform the test with 100 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak area, A_T and A_S of oxytocin from each of the solutions.

$$\text{Number of units per mL of Oxytocin Injection} = W_S \times \frac{A_T}{A_S} \times \frac{b}{a}$$

W_S: Number of units per mL of the standard solution

a: Amount (mL) of Oxytocin Injection taken

b: Total volume (mL) after adding diluent to prepare the test solution

Diluent—Dissolve 5 g of chlorobutanol, 1.1 g of sodium acetate trihydrate, 5 g of acetic acid(100) and 6 mL of ethanol(95) in water to make 1000 mL.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: Control the mixing ratio of mobile phase A and mobile phase B stepwise or via the gradient elution as follows.

Mobile phase A: Dissolve 15.6 g of sodium dihydrogen phosphate dihydrate in 1000 mL of water.

Mobile phase B: A mixture of water and acetonitrile (1 : 1).

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 - 30	70 → 40	30 → 60
30 - 30.1	40 → 70	60 → 30
30.1 - 45	70	30

Flow rate: 1.0 mL/min

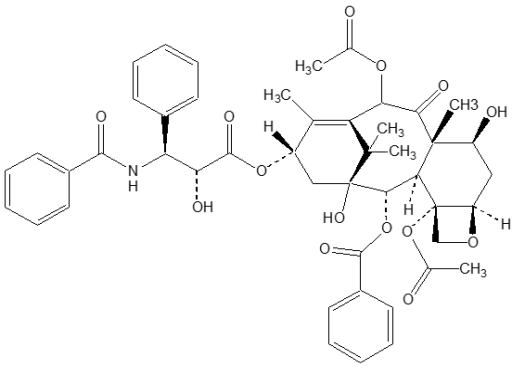
System suitability

System performance: Weigh an appropriate amount of oxytocin and vasopressin and dissolve in mobile phase A to prepare a solution containing 20 μg per mL, respectively. Proceed with 100 μL of this solution under the above operating conditions; vasopressin and oxytocin are eluted in this order with the resolution being NLT 14, and the symmetry factor of oxytocin is NMT 1.5.

System repeatability: Repeat the test 6 times with 100 μL each of the standard solution according to the above operating conditions; the relative standard deviation of the peak area of oxytocin is NMT 2.0%.

Packaging and storage Preserve in hermetic containers in a cold place, avoiding freezing.

Paclitaxel
파클리탁셀



$C_{47}H_{51}NO_{14}$: 853.91

(1*S*,2*S*,3*R*,4*S*,7*R*,9*S*,10*S*,12*R*,15*S*)-4,12-*bis*(acetyloxy)-1,9-dihydroxy-15-{[(2*R*,3*S*)-2-hydroxy-3-phenyl-3-(phenylformamido)propanoyl]oxy}-10,14,17,17-tetramethyl-11-oxo-6-oxatetracyclo[11.3.1.0^{3,10}.0^{4,7}]heptadec-13-en-2-yl benzoate [*33069-62-4*]

Paclitaxel contains NLT 97.0% and not more 102.0% of paclitaxel ($C_{47}H_{51}NO_{14}$), calculated on the anhydrous basis and solvent-free basis.

Description Paclitaxel occurs as a white powder.
It is soluble in ethanol(95) and practically insoluble in water.

Identification (1) Determine the infrared spectra of Paclitaxel and paclitaxel RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

Optical rotation $[\alpha]_D^{20}$: Between -49.0° and -55.0° (0.2

g calculated on the anhydrous basis, methanol, 20 mL, 100 mm).

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Paclitaxel according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Related substances***—(i) If it is indicated as being dissociated from a natural product, weigh accurately about 10 mg of Paclitaxel, add a mixture of methanol and acetic acid(100) (200:1). And if necessary, sonicate to dissolve, make exactly 10 mL, and use this solution as the test solution. Perform the test with 15 μL of the test solution as directed under the Liquid Chromatography according to the following conditions, and determine the content (%) of each related substance; the amounts (%) of related substances in Table 1 are not greater than the amounts in Table 1, the amount of each related substance is NMT 0.1%, and the amount of total related substances is NMT 2.0%.

$$\text{Content (\%) of each related substance} = 100 \times \frac{FA_{\text{i}}}{A_U}$$

F: Relative correction factor for the peak of each related substance

(See Table 1)

A_{i}: Peak area of each related substance

A_{u}: Peak area of paclitaxel

Table 1

Relative retention Time	Relative correction factor(F)	Name	Limit (%)
0.24	1.29	Baccatine III	0.2
0.53	1.00	10-deacetylpaclitaxel	0.5
0.57	1.00	7-xylosil paclitaxel	0.2
0.78	1.26	Cephalomannine (Paclitaxel related substance I)	a_1[1]
0.78	1.26	2",3"-dehydrocephalomannin	a_2[1]
0.86	1.00	10-deacetyl-7-epipaclitaxel (paclitaxel related substance II)	0.5
1.10	1.00	Benzyl analogue[3]	b_1[2]
1.10	1.00	3",4"-dehydropaclitaxel C	b_2[2]
1.40	1.00	7-epicephalomannine	0.3
1.85	1.00	7-epipaclitaxel	0.5

[1] Depending on the relative amounts present, separation of these peaks may be incomplete. The sum of a_1 and a_2 is NMT 0.5%.

[2] Depending on the relative amounts present, separation of these peaks may be incomplete. The sum of b_1 and b_2 is NMT 0.5%.

[3] This related substance is identified as (2*R*,3*S*)-2-hydroxy-3-phenyl-3-(2-phenylacetylamino) propanoic acid ester at position 13 of baccatin III.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 227 nm).

Column: A stainless-steel column with about 4.6 mm in internal diameter and 25 cm in length, packed with pentafluorophenyl propyl silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 30 °C.

Mobile phase: Control the mixing ratio of mobile phase A and mobile phase B in stages or gradient elution as follows.

Mobile phase A: Acetonitrile

Mobile phase B: Water

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 - 35	35	65
35 - 60	35 → 80	65 → 20
60 - 70	80 → 35	20 → 65
70 - 80	35	65

Flow rate: 2.6 mL/min

System suitability

System performance: Weigh 10 mg each of paclitaxel related substances I (cephalomannine) RS and paclitaxel related substance II (10-deacetyl-7-epipaclitaxel) RS, and dissolve in methanol to make 100 mL. Take 5 mL of this solution and add methanol to make 50 mL. Then, to 5.0 mL of this solution, add a mixture of methanol and acetic acid(100) (200:1) to make 50 mL. Proceed with 15 μL of this solution according to the above operating conditions; the relative retention time for the peaks of paclitaxel related substance I and paclitaxel related substance II are about 0.78 and 0.86, respectively with the resolution between these peaks being NLT 1.0.

System repeatability: Weigh about 10 mg of paclitaxel RS, add a mixture of methanol and acetic acid(100) (200:1), if necessary, sonicate to dissolve, and make 100 mL. Pipet 5 mL of this solution, add a mixture of methanol and acetic acid(100) (200 : 1) to make 100 mL. Repeat the test 5 times with 15 μL each of this solution; the relative standard deviation of the peak areas of the paclitaxel is NMT 2.0%.

(ii) If it is indicated as being manufactured through a semi-synthetic process, weigh about 10 mg of Paclitaxel, add a mixture of methanol and acetic acid(100) (200:1), if necessary, sonicate to dissolve, make exactly 10 mL, and use this solution as the test solution. Take 15 μL each of the mixture of methanol and acetic acid(100) (200:1) and the test solution, and perform the test as directed under the Liquid Chromatography, determine the content (%) of each related substance excluding all peaks obtained from the mixture of methanol and acetic acid(100) (200:1); the amounts (%) of related sub-

stances in Table 2 are not greater than the amounts in Table 2, the amount of each related substance is NMT 0.1%, and the amount of total related substances is NMT 2.0%.

$$\text{Content (\%) of each related substance} = 100 \times \frac{FA_i}{A_S}$$

F: Relative correction factor for the peak of each related substance

(See Table 2)

A_i: Peak area of each related substance

A_S: Total area of all peaks obtained from the test solution

Table 2

Relative retention time	Relative correction factor (F)	Name	Limit (%)
0.11	1.24	10-deacetylbaccatine III	0.1
0.20	1.29	Baccatine III	0.2
0.42	1.39	Photodegradation product[2]	0.1
0.47	1.00	10-deacetylpaclitaxel	0.5
0.80	1.00	2-devenzoyl paclitaxel-2-pentenoate	0.7
0.92[1]	1.00	Oxetane ring, acetyl and benzoyl[2]	x_1
0.92[1]	1.00	10-acetoacetylpaclitaxel	x_2
0.94[1]	1.00	10-deacetyl-7-epipaclitaxel (paclitaxel related substances II)	x_3
1.37	1.00	7-epipaclitaxel	0.4
1.45	1.00	10,13-bis side chain paclitaxel[2]	0.5
1.54	1.00	7-acetylpaclitaxel	0.6
1.80	1.75	13-tes-baccatine III	0.1
2.14	1.00	7-tes-paclitaxel	0.3

[1] Depending on the relative amounts present, separation of these peaks may be incomplete. The sum of x_1, x_2 and x_3 is NMT 0.4%.

[2] The chemical names of these related substances are as follows:

Photodegradation product: (1*R*,2*R*,4*S*,5*S*,7*R*,10*S*,11*R*,12*S*,13*S*,15*S*,16*S*)-2-10-diacetyloxy-5,13-hydroxy-4,16,17,17-tetramethyl-8-oxa-3-oxo-12-phenylcarbonyloxypentacyclo [11.3.1.0.^{1,11}.O^{4,11}.O^{7,10}] heptadec-15-yl (2*R*,3*S*)-2-hydroxy-3-phenyl-3-(phenylcarbonylamino) propanoate

Oxetane ring, acetyl and benzoyl group transfer: (1*S*,2*S*,3*R*,4*S*,5*S*,7*R*,8*S*,10*R*,13*S*)-5-10-diacetyloxy-1,2,4,7-tetrahydroxy-8,12,15,15-tetramethyl-9-oxo-4-(phenylcarbonyloxymethyl) tricyclo [9.3.1.0.^{3,8}] pentadec-11-en-13-yl (2*R*,3*S*)-2-hydroxy-3-phenyl-3-(phenylcarbonylamino) propanoate

10,13-bis side chain paclitaxel: (2*R*,3*S*)-2-hydroxy-3-phenyl-3-(phenylcarbonylamino) propanoic acid esters at position 13 of baccatin III and (2*R*,3*S*)-2-hydroxy-3-phenyl-3-(phenylcarbonylamino) propanoic acid esters at position 10 of baccatin III

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 227 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 μm in particle diameter).

Column temperature: A constant temperature of about 35 °C.

Mobile phase: Control the mixing ratio of mobile phase A and mobile phase B in stages or gradient elution as follows.

Mobile phase A: A mixture of water and acetonitrile (3 : 2).

Mobile phase B: Acetonitrile

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 - 20	100	0
20 - 60	100 → 10	0 → 90
60 - 62	10 → 100	90 → 0
72 - 70	100	0

Flow rate: About 1.2 mL/min

System suitability

System performance: Weigh 96 mg of paclitaxel RS, add a mixture of methanol and acetic acid(100) (200 : 1), shake to dissolve, make exactly 10 mL, and use this solution as the standard solution (1). Weigh 8 mg of paclitaxel related substances II RS, add a mixture of methanol and acetic acid(100) (200 : 1), shake to dissolve, make exactly 100 mL, and use this solution as the standard solution (2). Take 5.0 mL each of standard solution (1) and standard solution (2), add a mixture of methanol and acetic acid(100) (200:1) to make exactly 50 mL, and use this solution as the system suitability solution. Proceed with 15 μL of this solution according to the above operating conditions; the relative retention time of the peaks of paclitaxel related substance II and paclitaxel are about 0.94 and 1.0, respectively, with the resolution between these peaks being NLT 1.2.

System repeatability: Repeat the test 5 times with 15 μL each of the system suitability solution according to the above conditions; the relative standard deviation of the peak areas of paclitaxel is NMT 2.0%.

Water NMT 4.0% (0.1 g, coulometric titration).

Residue on ignition NMT 0.2% (1 g).

Microbiological examination of non-sterile products The total aerobic microbial count is NMT 100 CFU and the total combined yeasts/molds count is NMT 100 CFU per g of Paclitaxel. Also, *Escherichia coli*, *Salmonella*, *Pseudomonas aeruginosa* and *Staphylococcus* aureus are

not detected.

Bacterial endotoxins Paclitaxel contains less than 0.4 EU/mg of bacterial endotoxins.

Assay Weigh accurately about 10 mg each of Paclitaxel and paclitaxel RS, add a mixture of methanol and acetic acid(100) (200 : 1) each, if necessary, sonicate to dissolve, make exactly 10 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with exactly 10 μL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of paclitaxel from each solution.

$$\text{Amount (mg) of paclitaxel } (C_{47}H_{51}NO_{14}) = \text{Amount (mg) of paclitaxel RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 227 nm).

Column: A stainless steel column 4.6 mm in internal diameter and 25 cm in length, packed with pentafluorophenyl propyl silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of water and acetonitrile (11 : 9).

Flow rate: 1.5 mL/min

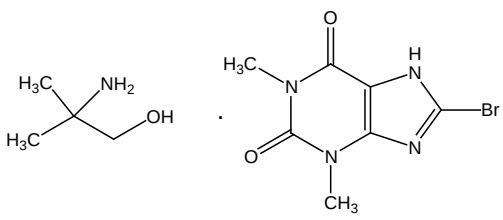
System suitability

System performance: Proceed with 10 μL of the standard solution according to the above conditions; the symmetry factor for paclitaxel peak is NLT 0.7 and NMT 1.3.

System repeatability: Repeat the test 5 times with 10 μL each of the standard solution according to the above operating conditions; the relative standard deviation of the peak areas of paclitaxel is NMT 1.5%.

Packaging and storage Preserve in light-resistant, tight containers at 20 to 25 ℃.

Pamabrom
파마브롬



$C_{11}H_{18}BrN_5O_3$: 348.20

2-Amino-2-methylpropan-1-ol ; 8-bromo-1,3-dimethyl-7*H*-purine-2,6-dione [*606-04-2*]

Pamabrom contains NLT 72.2% and NMT 76.6% of 8-bromotheophylline ($C_7H_7BrN_4O_2$) and NLT 24.6% and NMT 26.6% of 2-amino-2-methyl-1-propanol ($C_4H_{11}NO$), calculated on the anhydrous basis.

Description Pamabrom occurs as a white powder.
It is sparingly soluble in water.

Identification Weigh 25 mg of Pamabrom, dissolve in 25 mL of water while shaking, add methanol while mixing to make exactly 100 mL; and use this solution as the test solution. Separately, weigh 20 mg of 8-bromotheophylline RS, add 25 mL of water, 50 mL of methanol and a small amount of dilute ammonia TS, shake gently to dissolve, add methanol to make 100 mL; and use this solution as the standard solution. Spot 10 μL each of the test solution and the standard solution onto a plate made of silica gel with fluorescent indicator for thin-layer chromatography, develop the plate with a mixture of xylene, methanol and acetic acid(100) (11 : 2 : 1) as the developing solvent to a distance of about 15 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm); the R_f values of the principal spots obtained from the test solution and the standard solution are the same.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Pamabrom according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Theophylline***—Weigh accurately about 0.2 g of Pamabrom, add 50 mL of a mixture of water and methanol (70 : 30), sonicate for 5 minutes to dissolve. After cooling, add a mixture of water and methanol (70 : 30) to make exactly 200 mL, and use this solution as the test solution. Weigh accurately about 0.1 g of theophylline RS, add a mixture of water and methanol (70 : 30), shake to dissolve, add 3 drops of ammonia water(28), and add a mixture of water and methanol (70 : 30) to make exactly 100 mL. Pipet 1.0 mL of this solution, add a mixture of water and methanol (70 : 30) to make exactly 200 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the conditions under the Assay, and determine the peak areas, A_T and A_S, of theophylline from each solution, respectively (NMT 0.5%).

$$\text{Content (\%) of theophylline} = 20 \times \frac{C}{W} \times \frac{A_T}{A_S}$$

C: Concentration (μg/mL) of theophylline RS in the standard solution

W: Amount (mg) of sample taken

Water NMT 3.0% (1.0 g, volumetric titration, direct titration).

Assay (1) ***8-vromotheophylline***—Weigh accurately about 0.2 g of Pamabrom, add 50 mL of a mixture of water and methanol (70 : 30) and 2 drops of ammonia

water(28), sonicate for 5 minutes to dissolve. After cooling, add a mixture of water and methanol (70 : 30) to make exactly 200 mL. To 5.0 mL of this solution, add 10.0 mL of the internal standard solution and the mobile phase to make exactly 100 mL, filter, and use this filtrate as the test solution. Weigh accurately about 75 mg of 8-bromotheophylline RS, add a mixture of water and methanol (70 : 30), shake to dissolve, add 2 drops of ammonia water(28), and add a mixture of water and methanol (70 : 30) to make exactly 100 mL. To 5.0 mL of this solution, add 10.0 mL of the internal standard solution and the mobile phase to make exactly 100 mL, filter and use this filtrate as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the ratios, Q_T and Q_S, of peak area of 8-bromotheophylline to that of the internal standard from each solution.

$$\text{Amount of 8-bromotheophylline } (C_7H_7BrN_4O_2) \text{ (mg)} = 4000 \times C \times \frac{Q_T}{Q_S}$$

C: Concentration of 8-bromotheophylline RS in the standard solution (mg/mL)

Internal standard solution—Weigh about 12.5 mg of caffeine, add a mixture of water and methanol (70 : 30) to make exactly 100 mL.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 280 nm).

Column: A stainless steel column, about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 μm - 10 μm in particle diameter).

Mobile phase: A mixture of water, methanol and acetic acid(100) (69 : 30 : 1).

System suitability

System performance: Proceed with 20 μL of the standard solution under the above operating conditions; the relative retention times of caffeine and 8-bromotheophylline are about 0.6 and 1.0, and the resolution is NLT 2.0.

System repeatability: Repeat the test 5 times with 20 μL each of the standard solution according to the above operating conditions; the relative standard deviation of the peak area of 8-bromotheophylline is NMT 2.0%.

(2) ***2-amino-2-methyl-1-propanol***—Weigh accurately about 1 g of Pamabrom, add 10 mL of water, and gently heat on a steam bath until completely dissolved. Cool it down and titrate with 0.5 mol/L hydrochloric acid VS (indicator: methyl orange TS) Separately, perform a blank test and make any necessary correction.

Each mL of 0.5 mol/L hydrochloric acid VS
= 44.57 mg of $C_4H_{11}NO$

Packaging and storage Preserve in well-closed containers.

Pancreas
판크레아스

Pancreas is prepared from pancreas of *Sus scrofa* Linné *var. domesticus* Gray (*Suidae*), and contains NLT 1.55 FIP units/mg of protein digestion activity, NLT 18.62 FIP units/mg of starch digestive activity and NLT 38 FIP units/mg of fat digestion activity.

Description Pancreas occurs as a milky white amorphous powder and has a slight characteristic odor.

Identification Perform the test as direct under the Assay; the result is positive.

Loss on drying NMT 2.0% (1 g, phosphorus pentoxide, 80°C, 4 hours).

Assay (1) ***Fat digestion activity***—Weigh accurately an amount of Pancreas, equivalent to about 500 FIP, put it in a mortar, add 1 mL of cold buffer solution for lipase suspension, and grind well to mix. Then quantitatively put it in a 200-mL volumetric flask, wash the mortar using cold buffer solution for lipase suspension, and combine the washings to the solution in the flask. Make a very fine suspension, fill it up to the gauge line with cold buffer solution for lipase suspension, mix well to dilute. After about 10 minutes, place the flask in iced water and use it for the quantitative test. Separately, weigh accurately an amount of lipase RS, equivalent to about 500.0 FIP, (for reference standards stored in the refrigerator, first allow them to reach room temperature, and then open the package), put them in a mortar, proceed them in the same manner as the test solution, and use this solution as the standard solution. Put 29.5 mL of the substrate solution in a 100-mL beaker, warm to 37 ℃ in a thermostat at 37 ± 0.1°C. Set up a beaker with a pH meter whose pH has been previously adjusted with a standard buffer solution, a stirrer, and a micro buret containing 0.1 mol/L sodium hydroxide. While stirring with a stirrer, adjust pH to 9.0 with 0.1 mol/L sodium hydroxide, then add 0.5 mL of standard lipase solution, previously mixed well. After exactly 1 minute with a stopwatch, determine the volume (mL) of 0.1 mol/L sodium hydroxide consumed. Test multiple times to obtain an average volume(mL) consumed (S). The average volume(mL) consumed is about 0.12 mL. Proceed with the potency of the lipase in the test solution in the same way as the standard lipase solution. In the case of potency, if the volume(mL) of 0.1 mol/L sodium hydroxide consumed from the test solution is not the same as that of the standard lipase solution, dilute the test solution or make the test solution again to make it the same, and determine the volume(mL) of 0.1 mol/L sodium hydroxide consumed (M).

Fat digestion activity (FIP unit/mg)
= Potency of the lipase RS (FIP unit/mg)
$$\times \frac{M}{S} \times \frac{G_s}{G_m}$$

G_s: Amount (mg) of lipase RS
G_m: Amount (mg) of the sample

Definition of FIP units—Under the conditions described in the above procedure, one unit is the amount of enzymes that releases 1 μmole of fatty acid per minute at 37°C and pH 9.0.

(2) ***Starch digestive activity***—Weigh accurately about 0.5 g of Pancreas, put it in a mortar, wash the container well with 0.2 mol/L phosphate buffer (pH 6.8, 0 5 °C), and put the washings into a volumetric flask. Place the volumetric flask in an ice water bath, fill up to the gauge line and mix. Dilute this solution again with cooled 0.2 mol/L phosphate buffer solution to make about 10 FIP units/mL. Perform a potency test after about 10 minutes using this solution as the test solution. Put 25.0 mL of substrate solution in a test tube (22 mm × 200 mm), add 10 mL of 0.2 mol/L phosphate buffer solution and 1 mL of 0.2 mol/L sodium chloride solution, and allow it to stand in a thermostat at 25 °C. When the substrate solution reaches 25 °C, add 1.0 mL of the test solution and mix. After exactly 10 minutes (use a stopwatch), wash the test tube with 2 mL of 1 mol/L hydrochloric acid, combine the washings with the solution, and add 10 mL of 0.05 mol/L iodine and 45 mL of 0.1 mol/L sodium hydroxide while stirring. Allow to stand in a dark place for 15 minutes, then add 4 mL of 20% sulfuric acid, and titrate with 0.1 mol/L sodium thiosulfate VS. Perform a blank test in the same manner and make any necessary correction.

Starch digestive activity (FIP unit/mg)
$$= \frac{5(V_b - B_m)}{[1 - 0.03(V_b - B_m)] \times G_m}$$

V_m: volume(mL) of 0.1 mol/L sodium thiosulfate solution consumed in the test solution.
V_b: volume(mL) of 0.1 mol/L sodium thiosulfate solution consumed in the control solution.
G_m: Amount of the sample (mg)

Definition of FIP unit—Under the conditions described in the above procedure, one unit is the amount of enzymes that is required to hydrolyze 1 μmol of glycosidic bond per minute.

(3) ***Protein digestion activity***—Weigh accurately about 0.1 g of Pancreas, grind it with the cooled calcium chloride solution in a mortar, and add it quantitatively to a 100-mL volumetric flask. Wash the mortar with the calcium chloride solution, combine the washings to make 100 mL, use the solution as the test solution, and mark it as P. Separately, weigh accurately about 0.1 g of protease RS and proceed in the same manner as in the preparation of the test solution, and use this solution as the standard solution.

(i) Free protease: Dilute the test solution (P) with buffer solution to a potency equivalent to the standard solution and mark it as P_1.

(ii) Total protease: Take 10.0 mL of the test solution, add 10 mL of enterokinase solution, activate at 35 °C for 90 minutes, dilute to a potency equivalent to the standard solution, and mark it as P_2. Label two test tubes for the standard solution as S_1, S_2, and S_3, and label two test tubes for the control solution as S_1B, S_2B, and S_3B. Also, label two test tubes with the test solution as P and two test tubes with a control solution as PB.
Add 2.0 mL of the buffer solution into the test tube S_1 and 1.0 mL of the buffer solution into the test tubes S_2 and P, respectively.
Put 1.0 mL of the standard solution into the test tube S_1, 2.0 mL into the test tube S_2, and 3.0 mL into the test tube S_3, and put 2.0 mL of the test solution into the test tube P, respectively. In the same way, fill the control test tubes S_1B, S_2B, S_3B and PB, respectively. Then add 5.0 mL of trichloroacetic acid solution into the control test tubes, and shake to mix. Place all test tubes on a steam bath at 35 °C, add 2 mL of substrate solution to the control test tube, and mix. Stop the reaction by adding 2 mL of the substrate solution, previously warmed on a steam bath, to test tubes S_1, S_2, S_3, and P, respectively, at precise time intervals and mixing. Take each test tube out of the water bath, allow them to stand at room temperature for 20 minutes, and filter the content of two test tubes each using the same type of filter paper. Make sure the filtrate is free from bubbles and test it as directed under the Ultraviolet-visible Spectroscopy using test tube B as the control tube, and determine the absorbance at a layer length of 10 mm and a wavelength of 275 nm. For test tube B, add 5.0 mL of trichloroacetic acid to 3 mL of buffer solution, and proceed in the same manner.
Create a calibration curve from the absorbance for the concentration of each standard solution. At this time, the absorbance should be between 0.150 and 0.600. Obtain the concentration of the test solution from the plotted calibration curve.

Protein digestion activity (FIP unit/mg)
= Potency of the protease RS (FIP unit/mg)
$$\times \frac{V_m \times a}{G_m}$$

V_m: Dilution factor of the sample
a: Amount of sample obtained from the calibration curve (mg)
G_m: Amount of the sample (mg)

Definition of potency—Under the above test conditions, one unit is the amount of enzymes that releases the peptide from casein to produce an absorbance equivalent to 1 μmol of tyrosine at 275 nm per minute.

Adjustment of filter paper (for the Assay for protein

digestion activity)—Filter 5 mL of trichloroacetic acid through filter paper, and using the filtrate as the test solution and the unfiltered trichloroacetic acid as the control solution, determine the absorbance at a wavelength of 280 nm as directed under the Ultraviolet-visible Spectroscopy; it can be used if the absorbance is less than 0.04.

Packaging and storage Preserve in well-closed containers.

Pancreatin
판크레아틴

Pancreatin is an enzyme mainly prepared from pancreas of *Sus scrofa* Linné *var. domesticus* Gray (*Suidae*), and has starch digestive activity, protein digestive activity and fat digestion activity. Pancreatin contains NLT 90.0% of digestive activity units of the labeled amount. It is typically diluted with suitable diluents.

Description Pancreatin occurs as a white to pale yellow or pale yellowish brown powder and has a characteristic odor.

Identification Perform the test according to the Assay; Pancreatin shows a positive reaction.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Pancreatin according to Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Arsenic***—Proceed with 2.0 g of Pancreatin according to Method 2 and perform the test (NMT 1 ppm).

(3) ***Fats***—To 1.0 g of Pancreatin, add 20 mL of ether, shake occasionally to mix, extract for 30 minutes, and filter. Wash the residue with 10 mL of ether, combine the filtrate and the washings, evaporate ether, and dry the residue at 105℃ for 2 hours; the amount of the residue is NMT 20 mg.

Loss on drying NMT 4.0% (1 g, in vacuum, phosphorus pentoxide, 24 hours).

Residue on ignition NMT 5.0% (1 g).

Assay (1) ***Assay for amylase activity***—(i) Test solution: Dissolve Pancreatin in water cooled with ice, adjust to contain 0.4 units/mL to 0.8 units/mL of starch saccharifying activity, and use this solution as the test solution.

(ii) Substrate solution: Use potato starch solution TS for starch digestibility test. Add 10 mL of the phosphate buffer solution for pancreatin instead of 10 mL of 1 mol/L acetic acid-sodium acetate buffer solution, pH 5.0.

(iii) Procedure: Proceed as directed in (1) starch saccharifying activity test of the Starch digestibility test under the Digestive Power

(2) ***Assay for protein digestive activity***—(i) Test solution: Dissolve Pancreatin in an appropriate amount of water cooled with ice, adjust to contain 15 units/mL to 25 units/mL of protein digestive activity, and use this solution as the test solution.

(ii) Substrate solution: Use the substrate solution 2 in the Assay for the Protein digestive activity under the Digestion test. However, adjust the pH of solution to 8.5.

(iii) Procedure: Proceed as directed under the Assay for the Protein digestive activity under the Digestion test. However, use trichloroacetic acid B as the precipitation TS.

(3) ***Assay for fat digestive activity***—(i) Test solution: Dissolve Pancreatin in an appropriate amount of water cooled with ice, adjust to contain 1 unit/mL to 5 units/mL of fat digestive activity, and use this solution as the test solution.

(ii) Emulsifier: Prepare with 18 g of polyvinyl alcohol I and 2 g of polyvinyl alcohol II according to the Fat digestive activity under the Digestion test.

(iii) Substrate solution: Prepare the substrate solution according to the Fat digestive activity under the Digestion test.

(iv) Procedure: Proceed according to the Fat digestive activity as directed under the Digestion test. Prepare the buffer solution with phosphate buffer solution of pH 8.0.

Packaging and storage Preserve in tight containers and store at below 30℃.

Pancreatin II
판크레아틴II

Pancreatin II is obtained from the pancreas of pigs (*Sus scrofa* Linné *var. domesticus* Gray, in the *Suidae* family) or cattle (*Bos taurus* Linné, in the *Bovidae* family), and contains NLT 20,000 FIP units of starch digestibility, 35,000 FIP units of fat digestion activity, and 2,000 FIP units of protein digestion activity per g.

Description Pancreatin II occurs as a white to pale yellow powder. It has a characteristic odor.

Identification Perform the test with Pancreatin II as directed in the potency test; the result is positive.

Loss on drying NMT 5%.

Fat To 1 g of Pancreatin II, add 20 mL of ether, and mix occasionally. After extracting for about 30 minutes, filter. Wash with 10 mL of ether, combine filtrate and washings, evaporate ether to dryness, and dry the residue at 105 ℃ for 2 hours; the amount is NMT 30 mg (NMT 3%).

Microbiological examination of non-sterile products When tested with 10 g of Pancreatin II as directed under

the Microbiological Examination of Non-sterile Products, *Salmonella* bacteria is not detected.

Potency test (1) ***Starch digestibility test***—Weigh accurately 300 mg of Pancreatin II, transfer to a 500-mL volumetric flask, and shake to mix well. Add 0.2 mol/L phosphate buffer solution to the gauge line, mix at room temperature with a magnetic stirrer for 20 minutes, and filter. Use the filtrate as the test solution. Immediately, proceed to the next procedure. To each of 4 Erlenmeyer flasks, add 25 mL of 1% soluble starch solution, 10 mL of 0.2 mol/L phosphate buffer solution (pH 6.8), and 1 mL of 0.2 mol/L sodium chloride solution, mix, and allow to stand on a steam bath at 25 ± 0.1 ℃ for 10 minutes. To each of 2 Erlenmeyer flasks, add 1.0 mL each of the test solution at 1 minute interval, and exactly after 10 minutes, add 2 mL of hydrochloric acid to stop the reaction. Add 10 mL of 0.05 mol/L iodine, immediately add 45 mL of 0.1 mol/L sodium hydroxide, close the stopper, and allow to stand in the dark for 15 minutes. Add 4 mL of 20% sulfuric acid, and titrate 0.1 mol/L sodium thiosulfate VS. To the remaining 2 Erlenmeyer flasks, previously add 2 mL of 1 mol/L hydrochloric acid solution, add 1.0 mL each of the test solution at 1 minute interval, and proceed as described above.

$$\text{Starch digestibility of 1 g of Pancreatin II (FIP unit)} = 500 \times [5(V_B - V_L) - 0.006] \times \frac{1}{\text{amount (g) of sample taken}}$$

V_L: Average volume (mL) of 0.1 mol/L sodium thiosulfate consumed in the test solution

V_B: Average volume (mL) of 0.1 mol/L sodium thiosulfate consumed to the blank test

500: Dilution factor of the test solution

5: 50/10 (50: μmol of glucoside binding corresponding to 1 mL of 0.05 mol/L I_2 solution, 10: elapsed time (minutes))

(2) ***Fat digestion activity***—Weigh accurately about 25 mg of lipase RS for pancreatin assay (corresponding to about 1000 FIP units of fat digestion activity), grind with a small amount of water using a cold mortar to make a powder, and add water to the gauge line (preserve at 0 ℃). Weigh accurately about 25 mg of Pancreatin II, proceed in the same manner as the standard solution below, and use this solution as the test solution (preserve at 0 ℃). Immediately, proceed to the next procedure. To 250-mL beaker, add 25 mL of olive oil emulsion, 20 mL of tris buffer solution, 5 mL of 8% sodium taurocholate solution, and 22.5 mL of water in this order, mix with stirrer on a steam bath at 37 ± 0.1 ℃, and allow to stand for isothermal solution. Add 0.1 mol/L sodium hydroxide to adjust the pH to exactly 9.0, add 5.0 mL of the test solution or the standard solution, and titrate with 0.1 mol/L sodium hydroxide VS exactly for 5 minutes until the pH of the solution becomes 9.0.

$$\text{Fat digestion activity of 1 g of Pancreatin II (FIP unit)} = \text{Potency (FIP unit/g) of lipase RS} \times \frac{V_T}{T_S} \times \frac{Amount\ (mg)\ of\ RS}{Amount\ (mg)\ of\ sample}$$

V_T: Volume (mL) of 0.1 mol/L sodium thiosulfate consumed in the test solution

V_S: Volume (mL) of 0.1 mol/L sodium thiosulfate consumed to the standard solution

(3) ***Protein digestion activity***—Weigh accurately about 25 mg of protease RS for pancreatin assay (corresponding to about 75 FIP units of protein digestion activity), add cold 0.02 mol/L calcium chloride solution to make 25 mL, take 4.0 mL of this solution, and add pH 7.5 borate buffer solution to make 100 mL. Use this solution as the standard solution [0.040 mg (0.0660 FIP units) /mL] (storage: prepare at 0 ℃ in an ice bath and use within 1 hour). Weigh accurately 100 mg of Pancreatin II, and add 0.02 mol/L calcium chloride solution to make 100 mL. Add 10.0 mL of the above solution to the 50-mL Erlenmeyer flask, add 10 mL of enterokinase solution, close the stopper, and activate for 15 minutes by shaking to mix with a magnetic stirrer on a steam bath at 35 ± 0.1 ℃. After activating, cool the solution at about 0 ℃ in ice, take 6.0 mL of this solution, and add pH 7.5 borate buffer solution to make 100 mL (0.03 mg/mL) (storage: prepare at 0 ℃ in ice and use within 1 hour).
With 17 test tubes, label 2 each as S_1, S_2, S_3, S_{1B}, S_{2B}, S_{3B}, U, and U_B, and for the remaining 1, label it as R_L. According to the table below, sequentially add the labeled amounts of test solution (mL) into the designated test tubes.

	S_1	S_2	S_3	U	S_{1B}	S_{2B}	S_{3B}	U_B	R_L
pH 7.5 borate Buffer solution	2	1	-	1	2	1	-	1	3
Standard solution	1	2	3	-	1	2	3	-	-
Test solution	-	-	-	2	-	-	-	2	-
5% trichloroacetic acid solution	-	-	-	-	5	5	5	5	5

After completing the procedure, mix, take 2.0 mL of casein solution, previously maintained at 35 ± 0.1 ℃, and add at regular intervals. After exactly 30 minutes, take 5 mL of 5% trichloroacetic acid solution, and add to S_1, S_2, S_3, and U to stop the reaction. After removing from the water bath, allow to stand at room temperature for 20 minutes, filter by stacking two suitable filter papers, and determine the absorbance at the wavelength of 275 nm using R_L as the control solution. Calculate the average absorbance for each pair, S_1-S_{1B}, S_2-S_{2B}, and S_3-S_{3B}, and plot these absorbance values on the x-axis and the volume of the standard solution used in mL on the y-axis to prepare a calibration curve.

Protein digestion activity per g of Pancreatin II (FIP unit/g)

$$= \frac{V_R \times C_R \times 1000 \times 40}{P_P}$$

V_R: Volume(mL) corresponding to the standard solution of the test solution obtained from the calibration curve

C_R: The protease FIP units per mg of reference standards

P_P: μg of the sample in 10 mL of the final test solution

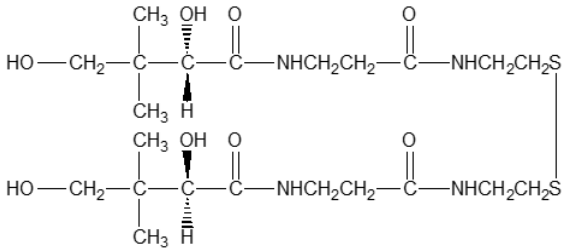
40: μg of reference standards in 1 mL of the standard solution

Filter paper—Determine the absorbance of the filtrate obtained by filtering a 5% trichloroacetic acid solution through a filter paper at the wavelength of 275 nm, using the unfiltered 5% trichloroacetic acid solution as the control solution, as directed under the Ultraviolet-visible Spectroscopy; it can be used when the absorbance is NMT 0.02.

Packaging and storage Preserve in tight containers.

Pantethine

판테틴



$C_{22}H_{42}N_4O_8S_2$: 554.72

N-[3-[2-[2-[3-[(2,4-Dihydroxy-3,3-dimethylbutanoyl)amino]propanoylamino]ethyldisulfanyl]ethylamino]-3-oxopropyl]-2,4-dihydroxy-3,3-dimethylbutanamide [*16816-67-4*]

Pantethine is an aqueous solution containing 80.0% of pantethine.

It contains NLT 98.0% and NMT 101.0% of pantethine ($C_{22}H_{42}N_4O_8S_2$), calculated on the anhydrous basis.

Description Pantethine occurs as a colorless to pale yellow, clear, and viscous liquid.
It is miscible with water, methanol, or ethanol(95).
It is decomposed by light.

Identification (1) To 0.7 g of Pantethine, add 5 mL of sodium hydroxide TS, shake to mix, and add 1 to 2 drops of copper(II) sulfate TS; the resulting solution exhibits a bluish purple color.

(2) To 0.7 g of Pantethine, add 3 mL of water, shake to mix, add 0.1 g of zinc powder and 2 mL of acetic acid(100), and boil for 2 to 3 minutes. After cooling, add 1 to 2 drops of sodium nitroprusside TS; the resulting solution exhibits a purple color.

(3) To 1.0 g of Pantethine, add 500 mL of water, and shake to mix. To 5 mL of this solution, add 3 mL of 1 mol/L hydrochloric acid TS, and heat on a steam bath for 30 minutes. After cooling, add 7 mL of a solution of hydroxylamine hydrochloride in sodium hydroxide TS (3 in 140), and allow to stand for 5 minutes. Add 3 drops of 2,4-dinitrophenol TS, add dropwise 1 mol/L hydrochloric acid TS until the color of the solution becomes colorless, and add 1 mL of iron(III) chloride TS; the resulting solution exhibits a purple color.

Optical rotation $[a]_D^{20}$: Between +15.0° and +18.0° (1 g, calculated on the anhydrous basis, water, 25 mL, 100 mm).

Purity (1) ***Heavy metals***—Proceed with 2.0 g of Pantethine according to Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Arsenic***—Proceed with 2.0 g of Pantethine according to Method 3 and perform the test (NMT 1 ppm).

(3) ***Related substances***—Dissolve 0.6 g of Pantethine in 10 mL of water, and use this solution as the test solution. Pipet 2 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 2 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with water-saturated methyl ethyl ketone as the developing solvent to a distance of about 10 cm, and air-dry the plate. Allow the plate to stand for 10 minutes in iodine vapor; the spots other than the principal spot obtained from the test solution are not more intense than the spots from the standard solution.

(4) ***Mercapto compounds***—Add 20 mL of water to 1.5 g of Pantethine, shake to mix, and add 1 drop of ammonia TS and 1 to 2 drops of sodium nitroprusside TS; the resulting solution does not exhibit a red color.

Water Between 18% and 22% (0.2 g, volumetric titration, direct titration).

Residue on ignition NMT 0.1% (2 g).

Assay Weigh accurately about 0.3 g of Pantethine, and add water to make exactly 20 mL. Pipet 5 mL of this solution, transfer to an iodine bottle, add exactly 25 mL of 0.05 mol/L bromine, and put 100 mL of water again. Rapidly add 5 mL of diluted sulfuric acid (1 in 5), immediately close the stopper, and heat at 40 ℃ - 50 ℃ for 15 minutes while occasionally stirring to mix. After cooling, carefully add 5 mL of potassium iodide solution (2 in 5), immediately close the stopper, shake to mix, and add 100 mL of water. Titrate free iodine with 0.1 mol/L sodium thiosulfate VS (indicator: 2 mL of starch TS). Per-

form a blank test in the same manner.

Each mL of 0.05 mol/L bromine VS
= 5.547 mg of $C_{22}H_{42}N_4O_8S_2$

Packaging and storage Preserve in light-resistant, tight containers at NMT 10 ℃.

D-Panthenol Injection
D-판테놀 주사액

D-Panthenol Injection contains NLT 90.0% and NMT 130.0% of the labeled amount of D-panthenol ($C_9H_{19}NO_4$: 205.25).

Method of preparation Prepare as directed under Injections, with D-Panthenol.

Identification Perform the test with D-Panthenol Injection as directed under the Analysis for Vitamins.

Sterility Meets the requirements.

Bacterial endotoxins Less than 0.6 EU per mg of D-Panthenol.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Extractable volume of injections Meets the requirements.

Assay Perform the test with D-Panthenol Injection as directed under the Analysis for Vitamins.

Packaging and storage Preserve in hermetic containers.

D-Panthenol Ointment
D-판테놀 연고

D-Panthenol Ointment contains NLT 90.0% and NMT 150.0% of the labeled amount of D-panthenol ($C_9H_{19}NO_4$: 205.25).

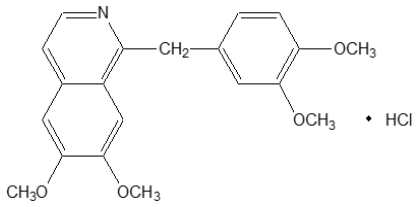
Method of preparation Prepare as directed under Ointments, with D-Panthenol.

Identification Perform the test with D-Panthenol Ointment as directed under the Analysis for Vitamins.

Assay Perform the test with D-Panthenol Ointment as directed under the Analysis for Vitamins.

Packaging and storage Preserve in tight containers.

Papaverine Hydrochloride
파파베린염산염



$C_{20}H_{21}NO_4 \cdot HCl$: 375.85
1-[(3,4-Dimethoxyphenyl)methyl]-6,7-dimethoxyisoquinoline hydrochloride [*61-25-6*]

Papaverine Hydrochloride, when dried, contains NLT 98.5% and NMT 101.0% of papaverine hydrochloride ($C_{20}H_{21}NO_4 \cdot HCl$).

Description Papaverine Hydrochloride occurs as white crystals or a crystalline powder.
It is sparingly soluble in water or acetic acid(100), slightly soluble in ethanol(95), and practically insoluble in acetic anhydride or ether.
Dissolve 1.0 g of Papaverine Hydrochloride in 50 mL of water; the pH of the solution is between 3.0 and 4.0.

Identification (1) To 1 mg of Papaverine Hydrochloride, add 1 drop of formaldehyde solution-sulfuric acid TS; the resulting solution is colorless to pale yellowish green, and then gradually turns dark red to brown.

(2) Dissolve 20 mg of Papaverine Hydrochloride in 1 mL of water and add 3 drops of sodium acetate TS; a white precipitate is formed.

(3) Dissolve 1 mg of Papaverine Hydrochloride with 3 mL of acetic anhydride and 5 drops of sulfuric acid, heat on a steam bath for 1 minute, and examine the solution under ultraviolet light (main wavelength: 365 nm); the solution exhibits a yellowish green fluorescence.

(4) Dissolve 0.1 g of Papaverine Hydrochloride in 10 mL of water, make the solution alkaline with ammonia TS, and shake to mix with 10 mL of ether. Separate the ether layer, wash with 5 mL of water, and filter. Evaporate the filtrate on a steam bath, dry the residue at 105℃ for 3 hours; the residue melts between 145 and 148 ℃.

(5) Make an aqueous solution of Papaverine Hydrochloride (1 in 50) alkaline with ammonia TS, discard the produced precipitate by filtering, and acidify the filtrate with dilute nitric acid; the resulting solution responds to the Qualitative Analysis (2) for chloride.

Purity (1) ***Clarity and color of solution***—Dissolve 0.10 g of Papaverine Hydrochloride in 10 mL of water; the resulting solution is clear and colorless.

(2) ***Related substances***—Dissolve about 20 mg of Papaverine Hydrochloride, weighed accurately, in diluent to make exactly 10 mL, and use this solution as the test solution. Pipet 1.0 mL of the test solution, add the diluent

to make exactly 100 mL. Pipet 1.0 mL of this solution, add the diluent to make exactly 10 mL, and use this solution as the standard solution (1). Separately, weigh accurately 12 mg of noscapine RS, dissolve in 1.0 mL of the test solution, add diluent to make 100 mL, and use this solution as the standard solution (2). Perform the test with 10 μL each of the test solution and the standard solutions (1), (2) as directed under the Liquid Chromatography according to the following conditions. Determine each peak area from each solution by the automatic integration method, and measure the amount of each related substance; the amounts of papaverine related substances I {tetrahydropapaverine}, papaverine related substances II {dihydropapaverine}, papaverine related substances III {papaverinol}, noscapine, papaverine related substance IV {2-(3,4-dimethoxyphenyl)-*N*-[2-(3,4-dimethoxyphenyl)-ethyl] acetamide}, papaverine related substance V {papaveraldine } are NMT 0.1%, respectively. In addition, the peak areas ofindividual related substances other than the above related substances are not larger than the major peak area obtained from standard solution (1) (NMT 0.1%), and the peak area of total related substances is not larger than 5 times the major peak area of standard solution (1) (NMT 0.5%). Exclude any peaks smaller than 0.5 times the major peak area obtained from standard solution (1) (NMT 0.05%). However, determine the peak areas of papaverine related substances II, noscapine and papaverine related substances V by multiplying the peak areas obtained by the automatic integration method by the correction factors 2.7, 6.2 and 0.5, respectively.

Diluent—A mixture of mobile phase A and acetonitrile (80 : 20).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 238 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 25 cm in length, packed with octylsilane silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: Control the mixing ratio of mobile phase A, mobile phase B and mobile phase C stepwise or via the gradient elution as follows.

Mobile phase A: Dissolve 3.4 g of potassium dihydrogen phosphate in 1000 mL of water, adjust the pH to 3.0 with dilute phosphoric acid.

Mobile phase B: Acetonitrile

Mobile phase C: Methanol

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)	Mobile phase C (vol%)
0 - 5	85	5	10
5 - 12	85 → 60	5	10 → 35
12 - 20	60	5	35
20 - 24	60 → 40	5 in 20	35 → 40
24 - 27	40	20	40
27 - 32	40 → 85	20 in 5	40 → 10
32 - 40	85	5	10

Flow rate: 1 mL/min

System suitability

System performance: Proceed with 10 μL of the standard solution (2) under the above operating conditions; the resolution of noscapine and papaverine are NLT 1.5. The relative retention times of papaverine related substances I, II and III, noscapine, papaverine related substances IV and V to that of papaverine (approximate retention time of 23.4 minutes) are 0.7, 0.75, 0.8, 0.9, 1.1 and 1.2, respectively.

(3) ***Morphine***—Dissolve 10 mg of Papaverine Hydrochloride in 1 mL of water, add 5 mL of 1-nitroso-2-naphthol TS and 2 mL of potassium nitrate (1 in 10), and warm at 40 ℃ for 2 minutes. Then, add 1 mL of sodium nitrate (1 in 5000) and warm at 40 ℃ for 5 minutes. After cooling, add 10 mL of chloroform, shake to mix, centrifuge, and collect the aqueous layer; the color of the resulting solution is not more intense than light red.

(4) ***Readily carbonizable substances***—Perform the test with 0.12 g of Papaverine Hydrochloride. The color of the solution is not more intense than that of the matching fluid for color S or P.

Loss on drying NMT 1.0% (1 g, 105 ℃, 4 hours).

Residue on ignition NMT 0.2% (1 g).

Assay Weigh accurately about 0.5 g of Papaverine Hydrochloride, previously dried, add 100 mL of a mixture of acetic anhydride and acetic acid(100) (7 : 3), and warm to dissolve. After cooling, titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 37.585 mg of $C_{20}H_{21}NO_4 \cdot HCl$

Packaging and storage Preserve in light-resistant, tight containers.

Papaverine Hydrochloride Injection
파파베린염산염 주사액

Papaverine Hydrochloride Injection is an aqueous solution for injection. It contains NLT 95.0% and NMT 105.0% of the labeled amount of papaverine hydrochloride ($C_{20}H_{21}NO_4 \cdot HCl$: 375.85).

Method of preparation Prepare as directed under Injections, with Papaverine Hydrochloride.

Description Papaverine hydrochloride injection occurs as a clear, colorless liquid.

pH—Between 3.0 and 5.0.

Identification (1) Add 3 drops of sodium acetate TS to 1 mL of papaverine hydrochloride injection; a white precipitate is formed.

(2) Dilute a volume of Papaverine Hydrochloride Injection, equivalent to 0.1 g of Papaverine Hydrochloride according to the labeled amount, with water to make 10 mL, render the solution alkaline with ammonia TS and shake with 10 mL of ether. Separate the ether layer, wash with 5 mL of water, then filter. Evaporate the filtrate on a steam bath to dryness and dry the residue at 105 ℃ for 3 hours: the residue so obtained melts between 145 and 148 ℃.

(3) Weight 1 mg of the residue from (2) and perform the test as directed under Identification (1) and (3) for Papaverine hydrochloride.

(4) Alkalify 2 mL of Papaverine Hydrochloride Injection with ammonia TS, filter the precipitate off and acidify the filtrate with dilute nitric acid: the solution responds to the Qualitative Tests (2) for chloride.

Sterility Meets the requirements.

Bacterial endotoxins Less than 6.0 EU per mg of papaverine hydrochloride.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

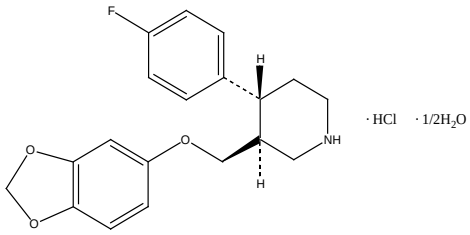
Extractable volume of injections Meets the requirements.

Assay Pipet an amount of papaverine hydrochloride injection equivalent to about 0.2 g of papaverine hydrochloride ($C_{20}H_{21}NO_4 \cdot HCl$), add water to make 10 mL, alkalize by adding ammonia TS, and extract with 20 mL, 15 mL, 10 mL and 10 mL of chloroform. Combine the chloroform extracts, wash with 10 mL of water, and extract the washings twice with 5 mL of chloroform, respectively. Combine all of the chloroform extracts, evaporate the chloroform on a steam bath, dissolve the residue in 30 mL of acetic acid(100), and titrate with 0.05 mol/L perchloric acid (indicator: 2 drops of methylrosaniline chloride TS). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.05 mol/L perchloric acid VS
= 18.793 mg of $C_{20}H_{21}NO_4 \cdot HCl$

Packaging and storage Preserve in light-resistant, hermetic containers.

Paroxetine Hydrochloride Hydrate
파록세틴염산염수화물



Paroxetine Hydrochloride

$C_{19}H_{21}ClFNO_3 \cdot ½H_2O$: 374.84

(3*S*,4*R*)-3-[(2*H*-1,3-benzodioxol-5-yloxy)methyl]-4-(4-fluorophenyl)piperidine [*110429-35-1*]

Paroxetine Hydrochloride Hydrate contains NLT 97.5% and NMT 102.0% of paroxetine hydrochloride ($C_{19}H_{21}ClFNO_3$: 365.84), calculated on the anhydrous basis.

Method of preparation If there is any possibility of 4-(4-fluorophenyl)-1-methyl-1,2,3,6-tetrahydropyridine [4-(4-fluorophenyl)-1-methyl-1,2,3,6-tetrahydropyridine] to be inserted as the potential impurities according to the manufacturing process of Paroxetine Hydrochloride Hydrate, take caution with starting material, manufacturing process, and intermediate material control to minimize the residue of impurities in consideration of risk assessment results. If needed, the manufacturing process can be justified by the test data proving that there is no quality risk in final drug substances.

Description Paroxetine Hydrochloride Hydrate occurs as a white crystalline powder.
It is freely soluble in methanol, sparingly soluble in ethanol(95) and dichloromethane, and slightly soluble in water.

Identification (1) Put about 0.16 g of Paroxetine Hydrochloride Hydrate in a test tube, add 0.2 g of potassium dichromate and 1 mL of sulfuric acid, and place a filter paper soaked in 1,5-diphenylcarbonohydrazide TS at the mouth of the test tube; the filter paper turns purple.

(2) Determine the infrared spectra of Paroxetine Hydrochloride Hydrate and paroxetine hydrochloride hydrate RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers. If the absorption spectra are different, dissolve Paroxetine Hydrochloride Hydrate and paroxetine hydrochloride hydrate RS in a mixture of 2-propanol and water (9 : 1) to make a 10% solution, recrystallize. Then determine the spectra again using the residue obtained.

(3) Perform the test with the test solution and the standard solution (3) obtained in the related substance I, as directed under the Liquid Chromatography according to the test conditions in the related substance I; the reten-

tion times of the major peaks obtained are the same.

Purity (1) ***Heavy metals***—Weigh 1.0 g of Paroxetine Hydrochloride Hydrate, put it in a platinum crucible, and perform the test according to Method 2. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Related substances I***—Weigh accurately about 0.1 g of Paroxetine Hydrochloride Hydrate, dissolve in 20 mL of methanol, add the mobile phase to make exactly 100 mL, and use this solution as the test solution. Add the mobile phase to 1.0 mL of the test solution to make exactly 100 mL. To 1.0 mL of this solution add the mobile phase to make exactly 10 mL, and use this solution as the standard solution (1). Separately, dissolve 5 mg of paroxetine related substances I {(3*S*,4*R*)-3-[(1,3-benzodioxol-5-yloxy)methyl]-4-(4-fluorophenyl)piperidin((+)-trans-paroxetine)} RS and 5 mg of paroxetine hydrochloride hydrate RS in 2 mL of methanol, add the mobile phase to make exactly 100 mL; and use this solution as the standard solution (2). Dissolve 10 mg of paroxetine hydrochloride hydrate RS in 2 mL of methanol, add the mobile phase to make exactly 10 mL; and use this solution as standard solution (3). Perform the test with 10 μL each of the test solution, the standard solution (1) and the standard solution (2) according to the following conditions as directed under the Liquid Chromatography; the peak area equivalent to related substance I obtained from the test solution is not more than twice the major peak area obtained from the standard solution (1) (NMT 0.2%).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 295 nm).

Column: A stainless steel column about 4.0 mm in internal diameter and about 10 cm in length, packed with silica gel AGP for liquid chromatography (5 μ*m* in particle diameter).

Mobile phase: A mixture of 0.58% sodium chloride solution and methanol (8 : 2).

Flow rate: About 0.5 mL/min

System suitability

System performance: Proceed with 10 μL of the standard solution (2) according to the above conditions; the resolution between the peaks of related substance I and of paroxetine are NLT 2.2.

Time span of measurement: About 2.5 times the retention time of paroxetine.

(3) ***Related substances II***—Dissolve 50.0 mg of Paroxetine Hydrochloride Hydrate in a mixture of water and tetrahydrofuran (9 : 1) to make exactly 50 mL, and use this solution as the test solution. To 5.0 mL of the test solution, add a mixture of water and tetrahydrofuran (9 : 1) to make exactly 50 mL, and use this solution as the standard solution (1). Separately, dissolve 2 mg of paroxetine related substance II {(3*S*,4*R*)-3-[(1,3-benzodioxol-5-yloxy)methyl]-4-(4-ethoxyphenyl)piperidine} RS in a mixture of water and tetrahydrofuran (9 : 1) to make exactly 20 mL, and use this solution as the standard solution (2). To 2.0 mL of the standard solution (1), add 2.0 mL of the standard solution (2) and a mixture of water and tetrahydrofuran (9 : 1) to make exactly 20 mL, and use this solution as the standard solution (3). To 2.0 mL of the standard solution, add a mixture of water and tetrahydrofuran (9 : 1) to make exactly 200 mL, and use this solution as the standard solution (4). Dissolve 2 mg of paroxetine related substance III {(3*S*,4*R*)-3-[(1,3-benzodioxol-5-yloxy)methyl]-4-phenylpiperidine (desfluoroparoxetine)} RS in a mixture of water and tetrahydrofuran (9 : 1) to make exactly 20 mL, and use this solution as the standard solution (5). Take 20 μL each of the test solution, the standard solutions (3), (4) and (5), and perform a test under the Liquid Chromatography according to the following conditions; the peak area equivalent to related substance III obtained from the test solution is not larger than 3 times the major peak area obtained from the standard solution (4) (0.3%), the individual peak area of each related substance other than the related substance III is not larger than the major peak area obtained from the standard solution (4) (0.1%), and the total area ofthese peaks is not larger than 5 times the major peak area obtained from the standard solution (4) (0.5%). However, exclude any peak having an area smaller than half the area of the major peak from the standard solution (4).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 295 nm).

Column: A stainless steel column 4.6 mm in internal diameter and 25 cm in length, packed with octylsilane silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: Control the mixing ratio of mobile phase A and mobile phase B in stages or gradient elution as follows.

Mobile phase A: A mixture of water, tetrahydrofuran and trifluoroacetic acid (900 : 100 : 5).

Mobile phase B: A mixture of acetonitrile, tetrahydrofuran and trifluoroacetic acid (900 : 100 : 5).

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 - 30	80	20
30 - 50	80 → 20	20 → 80
50 - 60	20	80
60 - 65	20 → 80	80 → 20
65 - 70	80	20

Flow rate: 1.0 mL/min

System suitability

System performance: Take 2.0 mL of the standard solution (1) and 1.0 mL of the standard solution (5), mix, and add a mixture of water and tetrahydrofuran (9 : 1) to make 20 mL. Proceed with 20 μL of this resulting solution according to the above conditions; the relative retention time of related substances III with respect to the re-

tention time of paroxetine peak is about 0.8. Proceed with 20 μL of the standard solution (3) according to the above conditions; the resolutions between the peak of related substance II and the peak of paroxetine are NLT 3.5.

Time span of measurement: About 2.5 times the retention time of paroxetine.

Water Between 2.2% and 2.7% (0.3 g, volumetric titration, direct titration).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 50 mg each of Paroxetine Hydrochloride Hydrate and paroxetine hydrochloride hydrate RS, dissolve in water to make exactly 100 mL, and use these solutions as the test solution and the standard solution. Perform the test with exactly 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of paroxetine from each solution.

Amount (mg) of paroxetine hydrochloride ($C_{19}H_{21}ClFNO_3$)
= Amount (mg) of paroxetine hydrochloride, calculated on the anhydrous basis, in paroxetine hydrochloride hydrate RS $\times \frac{A_T}{A_S}$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 295 nm).

Column: A stainless steel column, about 4.6 mm in internal diameter and about 25 cm in length, packed with trimethylsilyl silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: Dissolve 3.85 g of ammonium acetate in 500 mL of water, adjust the pH to 5.5 with acetic acid(100), then add water to make 600 mL. Next, gently add acetonitrile, mix, add 10 mL of triethylamine, and then adjust the pH to 5.5 by adding acetic acid(100) again.

Flow rate: 1 mL/min

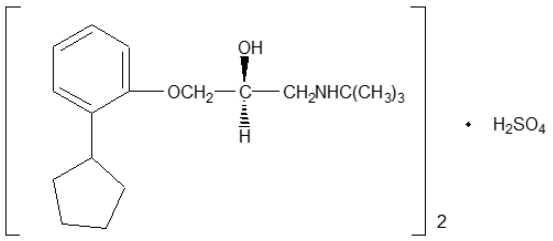
System suitability

System performance: Weigh accurately 5.0 mg each of Paroxetine Hydrochloride Hydrate and paroxetine related substance III RS, dissolve in water to make exactly 10 mL. Proceed with 10 μL of this solution according to the above conditions; the resolution between the peaks of paroxetine related substance III and of paroxetine is NLT 2.0.

Time span of measurement: About 2 times the retention time of paroxetine.

Packaging and storage Preserve in light-resistant, well-closed containers.

Penbutolol Sulfate
펜부톨롤황산염



$(C_{18}H_{29}NO_2)_2 \cdot H_2SO_4$: 680.94

(2*S*)-1-(*tert*-Butylamino)-3-(2-cyclopentylphenoxy)propan-2-ol;sulfuric acid [*38363-32-5*]

Penbutolol Sulfate, when dried, contains NLT 98.5% and NMT 101.0% of penbutolol sulfate [$(C_{18}H_{29}NO_2)_2 \cdot H_2SO_4$].

Description Penbutolol Sulfate occurs as a white crystalline powder.
It is very soluble in acetic acid(100), freely soluble in methanol, sparingly soluble in ethanol(95), slightly soluble in water, and practically insoluble in acetic anhydride or ether.

Identification (1) Determine the absorption spectra of solutions of Penbutolol Sulfate and penbutolol sulfate RS in methanol (1 in 10000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Penbutolol Sulfate and penbutolol sulfate RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) To 0.1 g of Penbutolol Sulfate, add 25 mL of water, warm to dissolve, and cool; the resulting solution responds to the Qualitative Analysis for sulfate.

Optical rotation $[\alpha]_D^{20}$: Between -23° and -25° (0.2 g after drying, methanol, 20 mL, 100 mm).

Melting point Between 213 and 217 ℃.

Purity (1) ***Heavy metals***—Proceed with 2.0 g of Penbutolol Sulfate according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Arsenic***—P Proceed with 1.0 g of Penbutolol Sulfate according to Method 4 and perform the test (NMT 2 ppm).

(3) ***Related substances***—Dissolve 0.8 g of Penbutolol Sulfate in 10 mL of methanol, and use this solution as the test solution. Pipet 1 mL of this solution, add methanol to make exactly 200 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot

10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of 2-propanol, ethanol(95) and ammonia water(28) (85 : 12 : 3) to a distance of about 10 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot obtained from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 0.5% (0.5 g, 105 ℃, 3 hours).

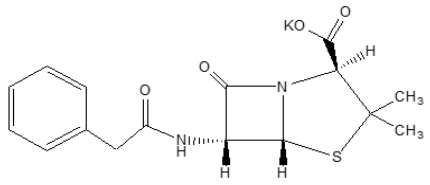
Residue on ignition NMT 0.2% (1 g).

Assay Weigh accurately about 0.8 g of Penbutolol Sulfate, previously dried, dissolve in 50 mL of a mixture of acetic anhydride and acetic acid(100) (7 : 3), and titrate with 1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 68.09 mg of $(C_{18}H_{29}NO_2)_2 \cdot H_2SO_4$

Packaging and storage Preserve in well-closed containers.

Penicillin G Potassium
페니실린G칼륨



Benzylpenicillin Potassium $C_{16}H_{17}N_2KO_4S$: 372.48
Potassium(2*S*,5*R*,6*R*)-3,3-dimethyl-7-oxo-6-[(2-phenylacetyl)amino]-4-thia-1-azabicyclo[3.2.0] heptane-2-carboxylate [*113-98-4*]

Penicillin G Potassium is the potassium salt of a penicillin compound with antibacterial activity produced by the growth of the *Penicillium* genus.
Penicillin G Potassium contains NLT 1430 units (potency) and NMT 1630 units (potency) of penicillin G ($C_{16}H_{18}N_2O_4S$: 334.39) per mg (potency), calculated on the dried basis. 1 unit is equivalent to 0.57 μg of penicillin G potassium.

Description Penicillin G Potassium occurs as white crystals or a crystalline powder. It is very soluble in water and slightly soluble in ethanol(99.5).

Identification (1) Determine the absorption spectra of solutions of Penicillin G Potassium and penicillin G potassium RS (1 in 1000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelength.

(2) Determine the infrared spectra of Penicillin G Potassium and penicillin G potassium RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both exhibit similar intensities of absorption at the same wavenumbers.

(3) Penicillin G Potassium responds to the Qualitative Analysis (1) for potassium salt.

Crystalline Meets the requirements.

Optical rotation $[\alpha]_D^{20}$: Between +270° and +300° (1 g calculated on the dried basis, water, 50 mL, 100 mm).

pH Dissolve 1.0 g of Penicillin G Potassium in 100 mL of water; the pH of this solution is between 5.0 and 7.5.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Penicillin G Potassium in 10 mL of water; the solution is clear and colorless to bright yellow.

(2) ***Heavy metals***—Proceed with 2.0 g of Penicillin G Potassium according to Method 4 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Arsenic***—Proceed with 1.0 g of Penicillin G Potassium according to Method 4 and perform the test. However, transfer 10 mL of a solution of magnesium nitrate hexahydrate-ethanol (95) (1 in 10) into the porcelain crucible, add 1 mL of hydrogen peroxide(30), and ignite the ethanol to burn (NMT 2 ppm).

(4) ***Related substances***—Weigh accurately 40 mg of Penicillin G Potassium, add water to make exactly 20 mL, and use this solution as the test solution. Pipet 1 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions and determine the peak areas from the respective solutions according to the automatic integration method; each peak area other than penicillin G from the test solution is not greater than the peak area of penicillin G from the standard solution. Also, the sum of peak areas other than penicillin G from the test solution is not greater than 3 times the peak area of penicillin G from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (7 μm in particle diameter).

Column temperature: A constant temperature of about 25 ℃.

Mobile phase: To a mixture of dibasic ammonium phosphate (33 in 5000) and acetonitrile (19 : 6), add phosphoric acid to adjust the pH to 8.0.

Flow rate: Adjust the flow rate so that the retention

time of penicillin G is about 7.5 minutes.

Time span of measurement: About 5 times the retention time of penicillin G.

System suitability

Test for required detectability: Pipet 10 mL of the standard solution and add water to make exactly 100 mL. Confirm that the peak area of penicillin obtained from 20 μL of this solution is equivalent to 7% to 13% of that of penicillin from the standard solution.

System performance: Dissolve 40 mg of Penicillin G Potassium in 20 mL of water. Separately, dissolve 10 mg of methyl *p*-hydroxybenzoate in 20 mL of acetonitrile. To 1 mL of this solution, add water to make 20 mL. Take 1 mL each of these solutions, and add water to make 100 mL. Proceed with 20 μL of this solution according to the above conditions; penicillin G and methyl *p*-hydroxybenzoate are eluted in this order with the resolution between these peaks being NLT 8.

System repeatability: Repeat the test 5 times with 20 μL each of the standard solutions according to the above conditions; the relative standard deviation of the peak area of penicillin G is NMT 2.0%.

Loss on drying NMT 1.0% (3 g, NMT 0.67 kPa, 60 ℃, 3 hours).

Sterility It meets the requirements when used in the manufacturing of sterile preparations. However, it is excluded in cases where there is a final sterilization process in the manufacturing of sterile preparations.

Bacterial endotoxins Less than 0.01 EU per 100 units (potency) of penicillin G when used in the manufacturing of sterile preparations.

Thermal stability Based on the assay results, weigh accurately about 50000 units (potency) of Penicillin G Potassium (A units), store at 100 ± 1 ℃ for 96 hours (4 days), and determine the potency (B units) by conducting assay (loss of potency is NMT 10%).

$$\text{Loss of potency ratio} = \frac{A\ unit - B\ unit}{A\ unit} \times 100$$

Penicillin G potassium content (by weight ratio) Weigh accurately 60 mg to 70 mg of Penicillin G Potassium, transfer into a stoppered centrifuge tube, dissolve in 2.0 mL of water, and cool at 0 to 5 ℃. Add 2.0 mL of amyl acetate TS for penicillin cooled to 0 to 8 ℃ and 0.5 mL of diluted phosphoric acid (1 in 5), close the stopper tightly, vigorously shake for about 15 seconds to mix, and centrifuge for about 20 seconds to separate the two liquid layers. Extract as much of the amyl acetate layer as possible (about 1.7 mL to 1.8 mL) using a 2.0 mL syringe with an appropriate injection needle, transfer into a glass filter (about 10 mm in diameter) containing 0.1 g of anhydrous sodium sulfate, and filter with suction into a small test tube, cooled with ice around its perimeter. Pipet 1.0 mL of this solution, and transfer separately into the previously weighed test tubes with dimensions of about 15 × 15 mm and a flat bottom with 0.5 mL of *N*-ethylpiperidine TS for penicillin and 1.0 mL of acetone TS for penicillin, respectively. At this point, complete the procedure of acidifying the test solution and adding the following filtrate within 3 minutes. Place the test tubes described above in a stoppered weighing bottle, close the stopper, and allow to stand at 0 to 8 ℃ for NLT 2 hours. Carefully filter the precipitate with suction with the previously weighed glass filter (G4, about 10 mm in diameter), and wash the top with 1 mL of acetone TS for penicillin at 0 to 8 ℃ using a syringe. To the test tube described above, place a glass filter, dry at room temperature in vacuum for 1 hour, and weigh. (NLT 85.0%).

$$\text{Penicillin G potassium content (\%)} = \frac{Mass\ (mg)\ of\ N\text{-}ethylpiperidine\ penicillin\ precipitate \times 166.5}{Amount\ (mg)\ of\ \text{Penicillin G Potassium}\ taken}$$

Assay Weigh accurately about 60 mg of Penicillin G Potassium, dissolve in 1% phosphate buffer solution (pH 6.0), dilute with 1% phosphate buffer solution (pH 6.0) to make the solution containing 2000 units (potency) per mL, and use this solution as the test solution. Separately, weigh accurately about 40 mg of penicillin G potassium RS, dissolve in 1% phosphate buffer solution (pH 6.0), dilute with 1% phosphate buffer solution (pH 6.0) to make the solution containing 2000 units (potency) per mL, and use this solution as the standard solution. Pipet 2 mL each of the test solution and the standard solution, transfer into the 100-mL flask for iodine titration, add 2.0 mL of 1 mol/L sodium hydroxide TS, and allow to stand for 15 minutes. Add 2.0 mL of diluted hydrochloric acid (1 in 10) and 10.0 mL of 0.01 mol/L iodine VS, allow to stand for 15 minutes, add 5 mL of carbon tetrachloride if necessary, and shake to mix. Titrate with 0.01 mol/L sodium thiosulfate VS using a microburette (indicator: starch TS). Separately, pipet 2 mL each of the test solution and the standard solution, add 10.0 mL of 0.01 mol/L iodine VS, and perform a blank test in the same manner (however, do not allow it to stand for 15 minutes) as above and make any necessary correction. The amount (mL) of 0.01 mol/L iodine VS consumed in the test solution and the standard solution is denoted as V_T and V_S, respectively.

$$\text{Potency of penicillin G potassium in the test solution} = \text{Potency of penicillin G potassium RS} \times \frac{V_T}{V_S}$$

Packaging and storage Preserve in tight containers.

Penicillin G Potassium for Injection
주사용 페니실린G칼륨

Penicillin G Potassium for Injection is an injection dissolved before use. Penicillin G Potassium for Injection contains NLT 93.0% and NMT 107.0% of the labeled amount of penicillin G potassium ($C_{16}H_{17}KN_2O_4S$:

372.48).

Method of preparation Prepare as directed under Injections, with Penicillin G Potassium.

Description Penicillin G Potassium for Injection occurs as white crystals or a crystalline powder.

Identification Perform the test directed under the Identification (2) of Penicillin G potassium.

Crystallinity Meets the requirements.

pH Weigh an amount of Penicillin G Potassium for Injection, equivalent to 100000 units of penicillin G potassium, and dissolve in 10 mL of water; the pH of this solution is between 5.0 and 7.5.

Purity ***Clarity and color of solution***—Dissolve an amount of Penicillin G Potassium for Injection equivalent to 1.0×10^6 units of penicillin G potassium according to the labeled amount in water; the solution is clear. Determine the absorbance of this solution as directed under the Ultraviolet-visible Spectroscopy; the absorbance at a wavelength of 400 nm is NMT 0.10.

Loss on drying NMT 1.2% (3 g, in vacuum at the pressure not exceeding·0.67 kPa, 60 °C, 3 hours).

Sterility Meets the requirements.

Bacterial endotoxin Less than 1.25×10^{-4} EU per unit penicillin G.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of the contents of NLT 10 units of Penicillin G Potassium for Injection. Weigh accurately an amount equivalent to about 6 × 104 units of penicillin G potassium, dissolve in water to make exactly 20 mL, and use this solution as the test solution. Separately, weigh accurately about 6 x 104 units of penicillin G potassium RS, dissolve in water to make exactly 20 mL, and use this solution as the standard solution. Perform the test with 5 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak area, A_T and A_S of penicillin G from each of the solutions.

Amount (unit) of penicillin G potassium ($C_{16}H_{17}KN_2O_4S$)
= Potency (μg) of penicillin G potassium RS$\times \frac{A_T}{A_S}$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (7 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: Add phosphoric acid to a mixture of diammonium hydrogen phosphate solution (33 in 5000) and acetonitrile (19 : 6) to adjust the pH to 8.0.

Flow rate: Adjust the flow rate so that the retention time of penicillin G is about 7.5 minutes.

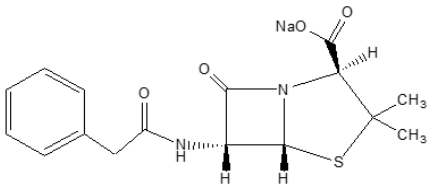
System suitability

System performance: Proceed with 5 μL of the standard solution according to the above conditions; the number of theoretical plates and the symmetry factor of the peak of benzylpenicillin are NLT 6000 and NMT 2.0, respectively.

System repeatability: Repeat the test 6 times with 5 μL each of the standard solutions according to the above conditions; the relative standard deviation of the peak area of penicillin G potassium is NMT 1.0%.

Packaging and storage Preserve in hermetic containers.

Penicillin G Sodium
페니실린G나트륨



Benzylpenicillin Sodium $C_{16}H_{17}N_2NaO_4S$: 356.37
Sodium(2*S*,5*R*,6*R*)-3,3-dimethyl-7-oxo-6-[(2-phenylacetyl)amino]-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylate [*69-57-8*]

Penicillin G Sodium is the sodium salt of a penicillin compound with antibacterial activity produced by the growth of the *Penicillium* genus. Penicillin G Sodium contains NLT 1500 units (potency) and NMT 1750 units (potency) of penicillin G sodium ($C_{16}H_{18}N_2O_4S$: 334.39) per mg, calculated on a dried basis.

Description Penicillin G Sodium occurs as white crystals or a crystalline powder. It is odorless or has a slightly characteristic odor.
It is very soluble in water and slightly soluble in acetone.
It is very soluble in Isotonic Sodium Chloride Injection and Glucose Injection.

Identification (1) Determine the infrared spectra of Penicillin G Sodium and penicillin G sodium RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar inten-

sities of absorption at the same wavenumbers.

(2) Penicillin G Sodium responds to the Qualitative Analysis (1) for sodium salt.

Crystallinity Meets the requirements.

pH Dissolve 0.6 g of Penicillin G Sodium in 10 mL of water; the pH of this solution is between 5.0 and 7.5.

Loss on drying NMT 1.5% (0.1 g, in vacuum, 60 ℃, 3 hours).

Sterility It meets the requirements when used in the manufacturing of a sterile preparation. However, it is excluded in cases where there is a final sterilization process in the manufacturing of sterile preparations.

Bacterial endotoxins NMT 0.01 EU per 100 units (potency) of penicillin G when used in the manufacturing of sterile preparations.

Thermo stability Perform the test as directed under the Thermostability in Penicillin G Potassium (Loss potency NMT 10%).

Content of penicillin G sodium (by weight ratio) Perform the test as directed under the Content of penicillin G potassium in Penicillin G Potassium (NLT 85.0%). However, calculate as the following method.

$$\text{The content (\%) of penicillin G sodium} = \frac{Mass\ (mg)\ of\ N\text{-}ethylpiperidine\ penicillin\ precipitate \times 159.3}{Amount\ (mg)\ of\ Penicillin\ G\ Sodium\ taken}$$

Assay Weigh accurately about 10 mg (potency) of Penicillin G Sodium according to the labeled potency, dissolve in the mobile phase to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 10 mg of penicillin G sodium RS, dissolve in the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Proceed with 10 μL each of the test solution and the standard solution, perform the test as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of penicillin G sodium in the test solution and the standard solution.

$$\text{Amount (unit) of penicillin G sodium } (C_{16}H_{17}N_2NaO_4S) = \text{Potency (unit) of penicillin G sodium RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

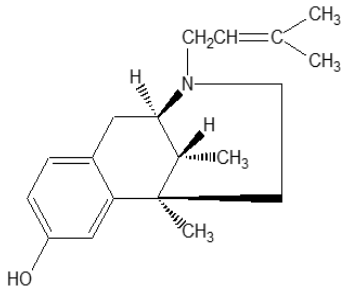
Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of 0.01 mol/L potassium dihydrogen phosphate solution and methanol (3 : 2).

Flow rate: 1.0 mL/min

Packaging and storage Preserve in tight containers.

Pentazocine
펜타조신



and enantiomer

$C_{19}H_{27}NO$: 285.42

(2*RS*,6*RS*,11*RS*)-6,11-Dimethyl-3-(3-methyl but-2-en-1-yl)-1,2,3,4,5,6-hexahydro-2,6-methanobenzo[d]azocin-8-ol [*359-83-1*]

Pentazocine, when dried, contains NLT 99.0% and NMT 101.0% of pentazocine ($C_{19}H_{27}NO$).

Description Pentazocine occurs as a white to pale yellowish white crystalline powder and is odorless.
It is freely soluble in acetic acid(100) or chloroform, soluble in ethanol(95), sparingly soluble in ether, and practically insoluble in water.

Identification (1) To 1 mg of Pentazocine, add 0.5 mL of formaldehyde-sulfuric acid TS; the resulting solution exhibits a deep red color and immediately changes to a grayish brown color.

(2) Dissolve 5 mg of Pentazocine in 5 mL of sulfuric acid, add 1 drop of iron(III) chloride TS, and heat on a steam bath for 2 minutes; the color of the solution changes from pale yellow to deep yellow. Add 1 drop of nitric acid, and shake to mix; the resulting solution maintains a yellow color.

(3) Determine the absorption spectra of solutions of Pentazocine and pentazocine RS in 0.01 mol/L hydrochloric acid TS (1 in 10000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

Melting point Between 150 and 158 ℃.

Absorbance $E_{1cm}^{1\%}$ (278 nm): Between 67.5 and 71.5 (0.1 g after drying, 0.01 mol/L hydrochloric acid TS, 1000 mL).

Purity (1) ***Clarity and color of solution***—Dissolve 0.1 g of Pentazocine in 20 mL of 0.1 mol/L hydrochloric acid TS; the resulting solution is colorless and clear.

(2) ***Heavy metals***—Proceed with 1.0 g of Pentazocine according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution

(NMT 20 ppm).

(3) ***Arsenic***—Proceed with 1.0 g of Pentazocine according to Method 3 and perform the test. However, use a solution of magnesium nitrate in ethanol(95) (1 in 10) (NMT 2 ppm).

(4) ***Related substances***—Dissolve 0.20 g of Pentazocine in 10 mL of chloroform, and use this solution as the test solution. Pipet 1 mL of this solution, add chloroform to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of chloroform, methanol and isopropylamine (94 : 3 : 3) as the developing solvent to a distance of about 13 cm, and air-dry the plate. Allow the plate to stand for 5 minutes in iodine vapor; the spots other than the principal spot from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 0.5% (1 g, in vacuum, phosphorus pentoxide, 60 ℃, 5 hours).

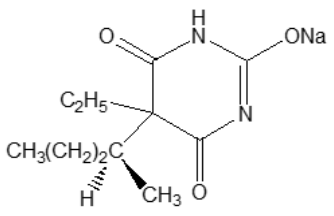
Residue on ignition NMT 0.2% (1 g).

Assay Weigh accurately about 0.5 g of Pentazocine, previously dried, dissolve in 50 mL of acetic acid(100), and titrate with 0.1 mol/L perchloric acid VS (indicator: 2 drops of methylrosaniline chloride TS). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 28.542 mg of $C_{19}H_{27}NO$

Packaging and storage Preserve in well-closed containers.

Pentobarbital Sodium
펜토바르비탈나트륨



$C_{11}H_{17}N_2NaO_3$: 248.25

Sodium 5-ethyl-4,6-dioxo-5-(pentan-2-yl)-1,4,5,6-tetrahydropyrimidin-2-olate [*57-33-0*]

Pentobarbital Sodium contains NLT 98.5% and NMT 101.0% of pentobarbital sodium ($C_{11}H_{17}N_2NaO_3$), calculated on the dried basis.

Description Pentobarbital Sodium occurs as a white crystalline grain or a powder. It is odorless or has a slightly characteristic odor and a slightly bitter taste.
It is very soluble in water, freely soluble in ethanol(95), and practically insoluble in ether.
An aqueous solution of Pentobarbital Sodium is decomposed when allowed to stand, and the decomposition is accelerated when heated.

Identification (1) Determine the absorption spectra of the test solution and the standard solution obtained from the Assay as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Ignite about 0.2 g of Pentobarbital Sodium, and dissolve the residue in acid; the solution responds to the Qualitative Analysis for sodium salt.

pH Dissolve 1.0 g of Pentobarbital Sodium in 100 mL of water; the pH of this solution is between 9.8 and 11.0.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Pentobarbital Sodium in 10 mL of freshly boiled and cooled water, and examine the solution after allowing to stand for 1 minute; the resulting solution is clear with no insoluble substances.

(2) ***Isomer***—Dissolve 300 ± 5 mg of Pentobarbital Sodium in 5 mL of water, add a solution prepared by dissolving 300 ± 5 mg of 4-nitrobromobenzyl in 10.0 mL of ethanol(95), shake to mix, and reflux for 30 minutes. After cooling to 25 ℃, filter in vacuum, wash the residue 4 times each with 5 mL of water, transfer the entire precipitate into the small flask, and reflux with 25 mL of ethanol(95) for 10 minutes; there are no insoluble substances. Cool this solution to 25 ℃, filter in vacuum, and dry the residue at 105 ℃ for 30 minutes; the melting point is between 136 and 146 ℃.

(3) ***Heavy metals***—Dissolve 2.0 g of Pentobarbital Sodium in 50 mL of water, add 5 mL of dilute hydrochloric acid, shake vigorously to mix, and warm on a steam bath for 2 minutes while occasionally shaking to mix. After cooling, add 25 mL of water, shake to mix, and filter. Discard the first 10 mL of the filtrate, take the subsequent 40 mL of the filtrate, add 1 drop of phenolphthalein TS, and add dropwise ammonia TS until the solution becomes pale red. Add 2 mL of dilute acetic acid and water to make 50 mL and use this solution as the test solution. Prepare the control solution by adding 2.5 mL of dilute hydrochloric acid, 1 drop of phenolphthalein TS, and dropwise ammonia TS until the solution becomes pale red, and adding 2 mL of dilute hydrochloric acid, 3.0 mL of lead standard solution, and water to make 50 mL (NMT 30 ppm).

(4) ***Related substances***—Weigh accurately about 0.11 g of Pentobarbital Sodium, add 80 mL of mobile phase, dissolve by sonicating, and add the mobile phase to make exactly 100 mL., Use this solution as the test solution. Separately weigh exactly about 0.1 mg of pentobarbital RS, dissolve in the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid

Chromatography according to the following conditions. Determine the peak area of each solution by the automatic integration method and calculate the amount of each related substance in the test solution according to the following formula; pentobarbital related substance I {6-imino-5-ethyl-5-(1-methylbutyl)barbituric acid} is NMT 0.2%, pentobarbital related substance II {5-ethyl-5-(1-ethylpropyl)barbituric acid} is NMT 0.1%, and pentobarbital related substance III {5-ethyl-5-(1,3-dimethylbutyl)barbituric acid} is NMT 0.3%. Each amount of other related substances is NMT 0.1%, and the total amount of related substances is NMT 0.5%. However, determine the peak areas of related substance I and related substance III by dividing the peak areas obtained according to the automatic integration method by correction factors of 1.5 and 0.9, respectively.

$$\text{Content (\%) of related substances} = \frac{248.25}{226.27} \times 10000 \times \frac{C}{W} \times \frac{A_i}{A_S}$$

248.25: Molecular weight of pentobarbital sodium

226.27: Molecular weight of pentobarbital

C: Concentration (mg/mL) of pentobarbital in the standard solution

W: Amount (mg) of sample calculated on the anhydrous basis

A_i: Peak area of each related substance obtained from the test solution

A_S: Peak area of pentobarbital obtained from the standard solution

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 214 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Flow rate: About 1.0 mL/min

System suitability

System performance: Proceed with 10 μL of the standard solution according to the above conditions; the relative retention times for pentobarbital related substances I, II, and III to pentobarbital are about 0.39, about 0.93, and about 1.5, respectively. Also, the mass distribution ratio (k') is NLT 2.5, and the number of theoretical plates and the symmetry factor of the pentobarbital peak are NLT 15000 and NMT 1.5, respectively.

System repeatability: Repeat the test 6 times with 10 μL of the standard solution according to the above conditions; the relative standard deviation of the peak area of pentobarbital is NMT 15.0%.

Loss on drying NMT 3.5% (1 g, 105 ℃, 6 hours).

Assay Weigh accurately 25 mg of Pentobarbital Sodium, previously dried, dissolve in diluted ammonia water(28) (1 in 200) to make exactly 50 mL. Pipet 2 mL of this solution, add diluted ammonia water(28) (1 in 200) to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 0.1 g of pentobarbital RS, and dissolve in diluted ammonia water(28) (1 in 200) to make exactly 100 mL. Pipet 1 mL of this solution, add diluted ammonia water(28) (1 in 200) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with the test solution and the standard solution as directed under the Ultraviolet-visible Spectroscopy using the diluted ammonia water(28) (1 in 200) as the blank test solution, and determine the absorbances, A_T and A_S, at the wavelength of 240 nm.

$$\text{Amount (mg) of pentobarbital sodium } (C_{11}H_{17}N_2NaO_3) = \text{Amount (mg) of pentobarbital RS} \times \frac{A_T}{A_S} \times 1.097 \times \frac{1}{4}$$

Packaging and storage Preserve in tight containers.

Pentobarbital Sodium Capsules
펜토바르비탈나트륨 캡슐

Pentobarbital Sodium Capsules contain NLT 92.5% and NMT 107.5% of the labeled amount of pentobarbital sodium ($C_{11}H_{17}N_2NaO_3$: 248.25).

Method of preparation Prepare as directed under Capsules, with Pentobarbital Sodium.

Identification Weigh an amount of Pentobarbital Sodium Capsules, equivalent to about 0.1 g of pentobarbital sodium according to the labeled amount, transfer to a separatory funnel with 15 mL of water, add 2 mL of hydrochloric acid, shake well to mix and extract 5 times with 25 mL each of chloroform. Filter each extract through a suitable filter. Evaporate the filtrate to dryness on a steam bath with the aid of a current of air, add 10 mL of ether to the residue and evaporate to dryness again. Dry the residue recrystallized with heated ethanol at 105 ºC for 30 minutes. With the residue so obtained, proceed as directed under the Identification under Pentobarbital Sodium.

Dissolution Perform the test with 1 capsule of Pentobarbital Sodium Capsules at 100 revolutions per minute according to Method 1, using 900 mL of water as the dissolution medium. Take the dissolved solution after 45 minutes from starting the test and filter. Add freshly prepared diluted strong ammonia water (1 in 20) to obtain a solution having known concentration of about 10 μg of pentobarbital per mL and use this solution as the test solution. Separately, weigh accurately a suitable amount of pentobarbital RS, dissolve in freshly prepared diluted strong ammonia water (1 in 20) to obtain a solution having known concentration of about 10 μg of pentobarbital per mL and use this solution as the standard solution. Perform the test with the test solution and the standard solution as directed under the Ultraviolet-visible Spectroscopy, using the diluted strong ammonia water (1 in 20) as a control solution, and determine the absorbance at

the absorbance maximum wavelength at around 240 nm. Multiply the amount of pentobarbital by 1.097 to obtain the amount of pentobarbital sodium.

It meets the requirements when the dissolution rate of Pentobarbital Sodium Capsules in 45 minutes is NLT 75%.

Uniformity of dosage units It meets the requirements when the Content uniformity test is performed according to the following procedure.

Transfer the contents of 1 capsule of Pentobarbital Sodium Capsules with 5 mL of ethanol to a 250-mL volumetric flask, add 10 mL of freshly prepared diluted strong ammonia water (1 in 200) and dilute immediately with the same solution to make 250 mL. Shake to mix and filter if necessary. Discard the first 20 mL of the filtrate and dilute the subsequent filtrate with diluted strong ammonia water (1 in 200) to obtain a solution having known concentration of about 10 μg of pentobarbital sodium per mL and use this solution as the test solution. Separately, weigh accurately a suitable amount of pentobarbital RS, dissolve in the diluted strong ammonia water (1 in 20) to obtain a solution having known concentration of 10 μg of pentobarbital per mL, and use this solution as the standard solution. Perform the test with the test solution and the standard solution as directed under the Ultraviolet-visible Spectroscopy, using the diluted ammonia water(28) (1 in 20) as a control solution, and determine the absorbances at the absorbance maximum wavelength at around 240 nm.

$$\text{Amount (mg) of pentobarbital sodium in 1 capsule} = \text{Labeled amount (mg) of pentobarbital sodium in 1 capsule} \times \frac{Concentration\left(\frac{\mu g}{mL}\right)of\ \text{pentobarbital of standard solution}}{Concentration\left(\frac{\mu g}{mL}\right)of\ \text{pentobarbital, calculated on the labled amount of test solution}} \times \frac{A_T}{A_S} \times 1.097$$

Assay Weigh accurately the mass of the contents of NLT 20 capsules of Pentobarbital Sodium Capsules and mix uniformly. Weigh accurately an amount of the contents, equivalent to about 50 mg of pentobarbital sodium ($C_{11}H_{17}N_2NaO_3$) and transfer to a separatory funnel. Add 15 mL of water and 1 mL of hydrochloric acid, shake to mix and extract five times with 25 mL each of chloroform. Filter the extract through about 15 g of anhydrous sodium sulfate placed on a funnel with glass wool. Wash anhydrous sodium sulfate with 15 mL of chloroform, combine the washings with the filtrate, add chloroform to make exactly 100 mL. To 2.0 mL of this solution, add 1.0 mL of internal standard solution and use this solution as the test solution. Separately, weigh accurately about 45 mg of pentobarbital RS, previously dried at 105 ℃ gel for 2 hours, dissolve in chloroform to make exactly 100 mL. To 2.0 mL of this solution, add 1.0 mL of internal standard solution and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Gas Chromatography and determine the peak area ratios, Q_T and Q_S of pentobarbital to the peak area of the internal standard.

$$\text{Amount (mg) of pentobarbital sodium } (C_{11}H_{17}N_2NaO_3) = \text{Amount (mg) of pentobarbital sodium RS} \times \frac{Q_T}{Q_S} \times 1.097$$

Internal standard solution—A solution of n-tricosane in chloroform (4 in 10000).

Operating conditions

Detector: A hydrogen flame ionization detector

Column: A column about 4 mm in internal diameter and about 0.9 m in length, packed with diatomaceous earth for gas chromatography (149 μm to 177 μm in particle diameter), coated with polyamide at the ratio of 3%.

Column temperature: 200 ± 10 ℃

Sample injection port and detector temperature: About 225 ℃

Carrier gas: Nitrogen

Flow rate: Between 60 and 80 mL/min.

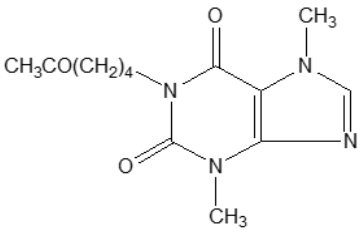
System suitability

System performance: Proceed with 5 μL of the standard solution according to the above conditions; n-tricosane and pentobarbital are eluted in this order with the resolution being NLT 2.3 and the symmetry factor being NMT 2.0.

System repeatability: Repeat the test 6 times with 5 μL of the standard solution according to the above conditions; the relative standard deviation of the peak area ratio is NMT 1.5%.

Packaging and storage Preserve in tight containers.

Pentoxifylline
펜톡시필린



$C_{13}H_{18}N_4O_3$: 278.31

3,7-Dimethyl-1-(5-oxohexyl)-1*H*-purine-2,6 (3*H*,7*H*)-dione [*6493-05-6*]

Pentoxifylline, when dried, contains NLT 98.0% and NMT 102.0% of pentoxifylline ($C_{13}H_{18}N_4O_3$).

Description Pentoxifylline occurs as a white crystalline powder. It has a characteristic odor and a bitter taste.

It is freely soluble in acetic acid(100), soluble in water, methanol, ethanol, or acetic anhydride, and slightly soluble in ether.

Identification (1) Determine the infrared spectra of Pentoxifylline and pentoxifylline RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) The retention times of the major peaks obtained from the test solution and the standard solution in the Assay are the same.

Melting point Between 104 and 106 ℃.

pH The pH of an aqueous solution of Pentoxifylline (1 in 100) is between 5.0 and 7.5.

Absorption $E_{1cm}^{1\%}$ (274 nm): Between 360 and 376 (10 mg, water, 1000 mL).

Purity (1) ***Acid***—Dissolve 1 g of Pentoxifylline in 50 mL of freshly boiled and cooled water, and add 1 drop of bromothymol blue TS. The volume of 0.01 mol/L sodium hydroxide TS consumed until the color of this solution changes is NMT 0.2 mL.

(2) ***Chloride***—Dissolve 2.0 g of Pentoxifylline in 80 mL of hot water, cool rapidly to 20 ℃, and add water to make 100 mL. To 40 mL of this solution, add 6 mL of dilute nitric acid and water to make 50 mL, and use this solution as the test solution. Prepare the control solution by adding 6 mL of dilute nitric acid and water to 0.25 mL of 0.01 mol/L hydrochloric acid solution to make 50 mL (NMT 0.011%).

(3) ***Sulfate***—To 40 mL of the 100 mL solution from (2), add 1 mL of dilute hydrochloric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution by adding 1 mL of dilute hydrochloric acid and water to 0.40 mL of 0.005 mol/L sulfuric acid to make 50 mL (NMT 0.024%).

(4) ***Heavy metals***—Proceed with 2.0 g of Pentoxifylline according to Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(5) ***Arsenic***—Proceed with 2.0 g of Pentoxifylline according to Method 3 and perform the test (NMT 1 ppm).

(6) ***Related substances***—Weigh accurately about 35 mg of Pentoxifylline, dissolve in the mobile phase to make exactly 100 mL, and use this solution as the test solution. Weigh accurately about 7 mg of pentoxifylline RS and dissolve in the mobile phase to make exactly 100 mL. Pipet 1 mL of this solution, add the mobile phase to make exactly 100, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions and determine the area of the peak of each related substance obtained from the test solution, A_T, and the area of the pentoxifylline, A_S; the amount of each related substance from the test solution is NMT 0.2%, and the amount of total related substances is NMT 0.5%.

$$\text{Content (\%) of related substance} = (A_T / A_S) \times (C_S / C_T) \times 100$$

C_S: Concentration (mg/mL) of pentoxifylline in the standard solution

C_T: Concentration (mg/mL) of pentoxifylline in the test solution

Operating conditions

Proceed as directed under the operating conditions under the Assay.

Time span of measurement: NLT 5 times the retention time of pentoxifylline.

System suitability

System performance: Proceed with 20 μL of the system suitability solution according to the above conditions; the resolution between the caffeine peak and the pentoxifylline peak is NLT 10.0.

System repeatability: Repeat the test 6 times with 20 μL each of the standard solution under the above operating conditions; the relative standard deviation of the peak areas of pentoxifylline is NMT 5.0%.

System suitability solution—Weigh about 7 mg of caffeine, and dissolve in the mobile phase to make exactly 100 mL. Weigh accurately 1 mL of this solution and about 35 mg of pentoxifylline RS, transfer into a 100-mL volumetric flask, add the mobile phase to make 100 mL, and use this solution as the system suitability solution.

Loss on drying NMT 0.5% (1 g, in vacuum, phosphorus pentoxide, 60 ℃, 3 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 50 mg of Pentoxifylline, and dissolve in the mobile phase to make 100 mL. Pipet 10 mL of this solution, and add the mobile phase to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 5 mg of pentoxifylline RS, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions and determine the peak areas, A_T and A_S, of pentoxifylline from each solution.

$$\text{Amount (mg) of pentoxifylline} = \text{Amount (mg) of pentoxifylline RS} \times (A_T / A_S) \times 10$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 273 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of perchloric acid solution (1 in 1000), acetonitrile, tetrahydrofuran and methanol

(80 : 15 : 2.5 : 2).

Flow rate: 0.7 mL/min

System suitability

System performance: Proceed with 10 μL of the system suitability solution according to the above conditions; the resolution between the caffeine peak and the pentoxifylline peak is NLT 10.0.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solutions under the above operating conditions; the relative standard deviation of the peak areas of pentoxifylline is NMT 2.0%.

System suitability solution—Weigh accurately about 6 mg of caffeine and 12 mg of pentoxifylline RS, and dissolve in the mobile phase to make exactly 50 mL. Pipet 10 mL of this solution, add the mobile phase to make exactly 50 mL, and use this solution as the system suitability solution.

Each mL of 0.1 mol/L perchloric acid VS
= 27.831 mg of $C_{13}H_{18}N_4O_3$

Packaging and storage Preserve in tight containers.

Pentoxifylline Injection
펜톡시필린 주사액

Pentoxifylline Injection contains NLT 95.0% and NMT 105.0% of the labeled amount of pentoxifylline ($C_{13}H_{18}N_4O_3$: 278.31).

Method of preparation Prepare as directed under Injections, with Pentoxifylline.

Identification Perform the test as directed under the Thin Layer Chromatography with the test solution and the standard solution from the Assay. Spot 2 μL each of the test solution and the standard solution on a thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of chloroform and ethanol(95) (8 : 2) as the developing solvent to a distance of about 15 cm, and air-dry the plate. Examine the plate under ultraviolet light (principal wavelength: 254 nm); the R_f values of the spots from the test solution and the standard solution are the same.

pH Between 5.0 and 8.5.

Sterility Meets the requirements.

Bacterial endotoxins Less than 3 EU per mg of pentoxifylline

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Extractable volume of injections Meets the requirements.

Assay Pipet an amount of Pentoxifylline Injection equivalent to 20 mg of pentoxifylline ($C_{13}H_{18}N_4O_3$), put in a separatory funnel, extract 3 times by shaking vigorously with about 10 mL of chloroform each, combine the extracts, and evaporate to dryness on a steam bath. Dissolve the residue in a small amount of methanol, transfer to a 100-mL volumetric flask, wash the container with methanol, and combine washings in the volumetric flask. Add methanol to make 100 mL. Pipet 10.0 mL of this solution, add methanol to make 200 mL, and use this solution as the test solution. Separately, weigh accurately about 20 mg of pentoxifylline RS and dissolve in methanol to make 100 mL. Pipet 10.0 mL of this solution, add methanol to make 200 mL, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at 274 nm as directed under the Ultraviolet-visible Spectroscopy, using methanol as the control solution.

$$\text{Amount (mg) of pentoxifylline } (C_{13}H_{18}N_4O_3) = Amount\ (mg)\ of \text{ pentoxifylline RS} \times \frac{A_T}{A_S}$$

Packaging and storage Preserve in light-resistant, hermetic containers.

Pentoxifylline Extended-Release Tablets
펜톡시필린 서방정

Pentoxifylline Extended-Release Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of pentoxifylline ($C_{13}H_{18}N_4O_3$: 278.31).

Method of preparation Prepare as directed under Tablets, with Pentoxifylline.

Identification The retention time of major peak and the ultraviolet absorption spectrum between 200 nm and 400 nm of the test solution and the standard solution for Assay are the same.

Purity ***Related substances***—Pipet 10 mL of the test stock solution from the Assay, add diluent to make exactly 25 mL, and use this solution as the test solution. Separately, weigh accurately about 9.6 mg of pentoxifylline RS, add 0.8 mL of methanol, mix for 1 minute, and add diluent to make exactly 100 mL. Pipet 10 mL of this solution, add diluent to make exactly 50 mL, then pipet 5 mL of this solution, and add diluent to make exactly 100 mL. Use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions and determine the peak area, A_T, of the peak of each related substance ob-

tained from the test solution, and the peak area, A_S, of the pentoxifylline obtained from the standard solution; the amount of each related substance in the test solution is NMT 0.3%, and the total amount of related substances is NMT 1.0%.

$$\text{Content (\%) of related substance} = (A_T / A_S) \times (C_S / C_T) \times 100$$

C_S: Concentration (mg/mL) of pentoxifylline in the standard solution

C_T: Concentration (mg/mL) of pentoxifylline in the test solution

Operating conditions

Proceed as directed under the operating conditions under the Assay.

Time span of measurement: NLT 5 times the retention time of pentoxifylline

System suitability

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution under the above conditions; the relative standard deviation of the peak areas of pentoxifylline is NMT 5.0%.

Uniformity of dosage units Meets the requirements.

Dissolution Perform the test with 1 tablet of Pentoxifylline Extended-Release Tablets at 100 revolutions per minute according to Method 2, using 1000 mL of water as the dissolution medium. Take the medium 1 hour, 3 hours, and 6 hours after starting the test, add water of the same amount taken, then filter the medium, and use the filtrate as the test solution. Separately, weigh accurately about 20 mg of pentoxifylline RS, and dissolve in water to make 100 mL. Take 5.0 mL of this solution, add water to make 50 mL, and use this solution as the standard solution. The dissolution rates in 1 hour, 3 hours, and 6 hours are NMT 30%, 25% to 50%, and 50% to 75% respectively.

Assay Weigh accurately the mass of NLT 20 Pentoxifylline Extended-Release Tablets, and powder. Weigh accurately an amount equivalent to about 40 mg of pentoxifylline ($C_{13}H_{18}N_4O_3$), add 0.4 mL of methanol, mix for about 1 minute, and add 30 mL of diluent. Dissolve by sonicating for 60 minutes. To this solution, add 15 mL of diluent, cool, then add diluent to make exactly 50 mL, and use this solution as the test stock solution. Centrifuge this solution, pipet 3 mL of the clear supernatant, add diluent to make exactly 50 mL, and use this solution as the test solution. Separately, weigh accurately about 40 mg of pentoxifylline RS, proceed in the same manner as the test solution, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions and determine the peak areas, A_T and A_S, of pentoxifylline in each solution.

$$\text{Amount (mg) of pentoxifylline} = \text{Amount (mg) of pentoxifylline RS} \times (A_T / A_S)$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 273 nm). However, a photo-diode array detector (200 nm to 400 nm) is used when Identification is performed.

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of perchloric acid solution (1 in 1000), acetonitrile, tetrahydrofuran and methanol (80 : 15 : 2.5 : 2).

Flow rate: 0.7 mL/min

System suitability

System performance: Proceed with 10 μL of the system suitability solution according to the above conditions; the resolution between the caffeine peak and the pentoxifylline peak is NLT 10.0.

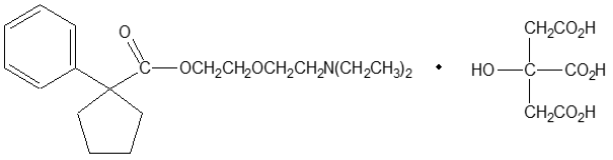
System repeatability: Repeat the test 6 times with 10 μL each of the standard solution under the above conditions; the relative standard deviation of the peak areas of pentoxifylline is NMT 2.0%.

System suitability solution—Weigh accurately about 10 mg of caffeine and 20 mg of pentoxifylline RS, dissolve in the 0.2 mL of methanol, and add diluent to make exactly 25 mL. Pipet 3 mL of this solution, add diluent to make exactly 50 mL, and use this solution as the system suitability solution.

Diluent—A mixture of water and ethanol(95) (7 : 3).

Packaging and storage Preserve in tight containers.

Pentoxyverine Citrate
펜톡시베린시트르산염



$C_{20}H_{31}NO_3 \cdot C_6H_8O_7$: 525.59

2-[2-(Diethylamino)ethoxy]ethyl1-phenyl cyclopentane-1-carboxylate 2-hydroxypropane -1,2,3-tricarboxylate [*23142-01-0*]

Pentoxyverine Citrate, when dried, contains NLT 98.5% and NMT 101.0% of pentoxyverine citrate ($C_{20}H_{31}NO_3 \cdot C_6H_8O_7$).

Description Pentoxyverine Citrate occurs as a white crystalline powder.

It is very soluble in acetic acid(100), freely soluble in

water or ethanol(95), and practically insoluble in ether.

Identification (1) Dissolve 0.1 g of Pentoxyverine Citrate in 10 mL of water, and add 10 mL of Reinecke salt TS; a pale red precipitate is formed.

(2) Determine the infrared spectra of Pentoxyverine Citrate and pentoxyverine citrate RS, previously dried, as directed in the paste method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) An aqueous solution of Pentoxyverine Citrate (1 in 10) responds to the Qualitative Analysis (1) and (2) for citrate.

Melting point Between 92 and 95 ℃.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Pentoxyverine Citrate in 10 mL of water; the resulting solution is clear and colorless.

(2) ***Heavy metals***—Proceed with 2.0 g of Pentoxyverine Citrate according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Arsenic***—Proceed with 1.0 g of Pentoxyverine Citrate according to Method 3 and perform the test (NMT 2 ppm).

(4) ***Related substances***—Dissolve 0.20 g of Pentoxyverine Citrate in 10 mL of ethanol(95), and use this solution as the test solution. Pipet 1 mL of this solution, add ethanol(95) to make exactly 200 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 15 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. After air-drying the plate, develop immediately the plate with a mixture of chloroform, methanol, ethyl acetate and ammonia water(28) (25 : 10 : 10 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Allow the plate to stand in iodine vapor for 10 minutes; the spots other than the principal spot obtained from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 0.5% (1 g, in vacuum, phosphorus pentoxide, 60 ℃, 4 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately 0.5 g of Pentoxyverine Citrate, previously dried, dissolve in 30 mL of acetic acid(100), add 30 mL of acetic anhydride, and titrate with 0.1 mol/L perchloric acid VS (indicator: 3 drops of methylrosaniline chloride TS) However, the endpoint of the titration is when the violet color of the solution changes from bluish green to green. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 52.56 of $C_{20}H_{31}NO_3 \cdot C_6H_8O_7$

Packaging and storage Preserve in well-closed containers.

Saccharated Pepsin
함당펩신

Saccharated Pepsin is an enzyme preparation with proteolytic activities containing Lactose Hydrate mixed with pepsin obtained from the gastric mucous membrane of pigs or cattle and contains NLT 3800 units and NMT 6000 units per gram.

Description Saccharated Pepsin occurs as a white powder. It has a characteristic odor and has a slight sweet taste.
Saccharated Pepsin is slightly turbidly soluble in water and insoluble in ethanol(95) or ether.
It is sparingly hygroscopic.

Purity (1) ***Rancidity***—Saccharated Pepsin has no unpleasant or rancid odor.

(2) ***Acid***—Dissolve 0.5 g of Saccharated Pepsin in 50 mL of water, and add 0.50 mL of 0.1 mol/L sodium hydroxide TS and 2 drops of phenolphthalein TS; the resulting solution exhibits a red color.

Loss on drying NMT 1.0% (1 g, 80 ℃, 4 hours).

Residue on ignition NMT 0.5% (1 g).

Assay (1) ***Test solution***—Weigh accurately an amount equivalent to about 1250 units of Saccharated Pepsin, and dissolve in 0.01 mol/L hydrochloric acid TS, previously cooled with ice, to make exactly 50 mL.

(2) ***Standard solution***—Weigh accurately an appropriate amount of saccharated pepsin RS, and dissolve in 0.01 mol/L hydrochloric acid TS, previously cooled with ice, to make a solution containing about 25 units per mL.

(3) ***Substrate solution***—Use substrate solution 1 as directed under Protein digestive activity of Protein Digestion Test (2). However, adjust the pH to 2.0.

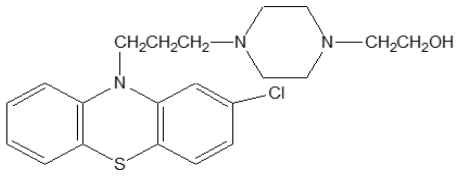
(4) ***Procedure***—Proceed as directed under Protein digestive activity of Protein Digestion Test (2), and determine A_T and A_{TB}. However, use trichloroacetic acid TS A as the precipitation TS. Separately, proceed with the standard solution in the same manner as the test solution, and determine A_S and A_{SB}. Unit per g of Saccharated Pepsin is calculated according to the following equation:

$$\text{Unit per g of Saccharated Pepsin} = U_S \times \frac{A_T - A_{TB}}{A_S - A_{SB}} \times \frac{1}{W}$$

U_S: Number of units per mL of the standard solution
W: Amount (g) of the sample per mL of the test solution

Packaging and storage Preserve in tight containers and store at below 30 ℃.

Perphenazine
페르페나진



$C_{21}H_{26}ClN_3OS$: 403.97

2-{4-[3-(2-Chloro-10*H*-phenothiazin-10-yl) propyl]piperazin-1-yl}ethan-1-ol [*58-39-9*]

Perphenazine, when dried, contains NLT 98.5% and NMT 101.0% of perphenazine ($C_{21}H_{26}ClN_3OS$).

Description Perphenazine occurs as white to pale yellow crystals or a crystalline powder. It is odorless and has a bitter taste.
It is freely soluble in methanol or ethanol(95), soluble in anhydrous ether, sparingly soluble in ether, and practically insoluble in water.
It dissolves in dilute hydrochloric acid.
It is gradually colored by light.

Identification Determine the infrared spectra of Perphenazine and perphenazine RS, previously dried, as directed in the paste method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Melting point Between 95 and 100 ℃.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Perphenazine according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Related substances***—Perform the test using a light-resistant container in a stream of nitrogen gas. Dissolve 0.10 g of Perphenazine in 10 mL of ethanol(95), and use this solution as the test solution. Pipet 1 mL of this solution and add ethanol(95) to make exactly 10 mL. Pipet 1 mL of this solution, add ethanol(95) to make exactly 20 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of 1-butanone and 1 mol/L ammonia TS (5 : 1) as the developing solvent to a distance of about 12 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot obtained from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 0.5% (1 g, in vacuum, phosphorus pentoxide, 65 ℃, 4 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.4 g of Perphenazine, previously dried, dissolve in 50 mL of acetic acid(100), and titrate with 0.1 mol/L perchloric acid VS (indicator: 3 drops of methylrosaniline chloride TS). The endpoint of the titration is when the violet color of this solution changes from bluish purple to bluish green. Perform a blank test in the same manner.

Each mL of 0.1 mol/L perchloric acid VS
= 20.198 mg of $C_{21}H_{26}ClN_3OS$

Packaging and storage Preserve in light-resistant, tight containers.

Perphenazine Tablets
페르페나진 정

Perphenazine Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of perphenazine ($C_{21}H_{26}ClN_3OS$: 403.98).

Method of preparation Prepare as directed under Tablets, with Perphenazine.

Identification The ultraviolet-visible absorption spectrum at 200 to 400 nm and the retention time of the major peak obtained from the test solution and the standard solution under the Assay are the same.

Dissolution Perform the test with 1 tablet of Perphenazine Tablets at 100 revolutions per minute according to Method 2, using 900 mL of diluted pH 6.8 phosphate buffer solution (1 in 2) as the dissolution medium. Take NLT 30 mL of the dissolved solution 90 minutes after starting the test, and filter through a membrane filter with a pore size of NMT 0.8 μm. Discard the first 10 mL of the filtrate, and use the subsequent filtrate as the test solution. Separately, weigh accurately about 10 mg perphenazine RS, previously dried in vacuum in a phosphorus pentoxide desiccator at 65 ℃ for 4 hours, dissolve in 5 mL of 0.1 mol/L hydrochloric acid TS, and add diluted pH 6.8 phosphate buffer solution (1 in 2) to make exactly 250 mL. Pipet 5 mL of this solution, add diluted pH 6.8 phosphate buffer solution (1 in 2) to make exactly 50 mL, and use this solution as the standard solution. Perform the test with the test solution and the standard solution as directed under the Ultraviolet-visible Spectroscopy and determine the absorbances, A_T and A_S, at the wavelength of 255 nm.
It meets the requirements if the dissolution rate of Perphenazine Tablets in 90 minutes is NLT 70%.

Dissolution rate (%) of the labeled amount of perphenazine ($C_{21}H_{26}ClN_3OS$)

$$= W_S \times \frac{A_T}{A_S} \times \frac{1}{C} \times 36$$

W_S: Amount (mg) of the reference standard

C: Labeled amount (mg) of perphenazine ($C_{21}H_{26}ClN_3OS$) in 1 tablet

Uniformity of dosage units It meets the requirements when the procedure for content uniformity is performed according to the following procedure.

Disintegrate 1 Tablet of Perphenazine Tablets by shaking with 5 mL of water, shake well with 70 mL of methanol and add methanol to make exactly 100 mL. Centrifuge this solution, pipet χ mL of the clear supernatant, add methanol buffer solution to make V mL of a solution containing about 4 μg of perphenazine ($C_{21}H_{26}ClN_3OS$) per mL, and use this solution as the test solution. Separately, weigh accurately about 10 mg of perphenazine RS, previously dried in vacuum in a phosphorus pentoxide desiccator at 65 ℃ for 4 hours, and dissolve in methanol to make exactly 250 mL. Pipet 5 mL of this solution, add methanol to make exactly 50 mL, and use this solution as the standard solution. Perform the test with the test solution and the standard solution as directed under the Ultraviolet-visible Spectroscopy and determine the absorbances, A_T and A_S, at the wavelength of 258 nm.

Amount (mg) perphenazine ($C_{21}H_{26}ClN_3OS$)

$$= \text{Amount (mg) of perphenazine RS} \times \frac{A_T}{A_S} \times \frac{V}{25} \times \frac{1}{x}$$

Assay Weigh accurately the mass of NLT 20 Perphenazine Tablets, and finely powder. Weigh accurately a portion of the powder, equivalent to about 5 mg of perphenazine ($C_{21}H_{26}ClN_3OS$) dissolve in methanol to make exactly 100 mL and filter. Discard the first 10 mL of the filtrate, pipet 10 mL of the subsequent filtrate and 5 mL of the internal standard solution, add methanol to make exactly 100 mL and use this solution as the test solution. Separately, weigh accurately about 25 mg of perphenazine RS, previously dried in vacuum in a phosphorus pentoxide desiccator at 65 ℃ for 4 hours, and dissolve in methanol to make exactly 100 mL. Pipet 2 mL of this solution and 5 mL of the internal standard solution, add methanol to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the peak area ratios, Q_T and Q_S, of perphenazine to the peak area of the internal standard, respectively.

Amount (mg) perphenazine ($C_{21}H_{26}ClN_3OS$)

$$= \text{Amount (mg) of perphenazine RS} \times \frac{Q_T}{Q_S} \times \frac{1}{5}$$

Internal standard solution—Weigh 50 mg of anhydrous caffeine RS and dissolve in methanol to make 100 mL.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm). However, a photo-diode array detector (200 nm to 400 nm) is used when the Identification is performed.

Column: A stainless steel column, about 4 mm in internal diameter and 15 cm to 30 cm in length, packed with nitrilized silica gel for liquid chromatography (5 μm to 10 μm in particle diameter).

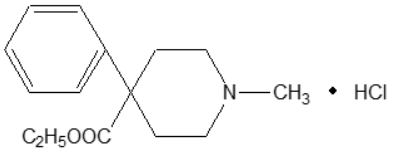
Mobile phase: Dissolve 0.65 g of ammonium acetate in 84 mL of water, and add 916 mL of methanol.

Flow rate: Adjust the flow rate so that the retention time of perphenazine is about 5.5 minutes.

Selection of column: Proceed with 20 μL of the standard solution according to the above conditions; the internal standard and perphenazine are eluted in this order with the resolution being NLT 3.0.

Packaging and storage Preserve in light-resistant, tight containers.

Pethidine Hydrochloride
페티딘염산염



Operidine $C_{15}H_{21}NO_2 \cdot HCl$: 283.79

Ethyl 1-methyl-4-phenylpiperidine-4-carboxylate hydrochloride [*50-13-5*]

Pethidine Hydrochloride, when dried, contains NLT 98.0% and NMT 101.0% of pethidine hydrochloride ($C_{15}H_{21}NO_2 \cdot HCl$).

Method of preparation If there is any possibility of 1-methyl-4-phenyl-1,2,3,6-tetrahydropyridine to be inserted as the potential impurities according to the manufacturing process of Pethidine Hydrochloride, take caution with starting material, manufacturing process, and intermediate material to minimize the residue of impurities in consideration of risk assessment results. If necessary, the manufacturing process may be verified by the test data proving that no quality risk exists in final drug substances.

Description Pethidine Hydrochloride occurs as a white crystalline powder.

It is freely soluble in water, acetic acid(100), or ethanol(95), sparingly soluble in acetic anhydride, and practically insoluble in ether.

Dissolve 1.0 g of Pethidine Hydrochloride in 20 mL of water; the pH of the solution is between 3.8 and 5.8.

Identification (1) Determine the absorption spectra of aqueous solutions of Pethidine Hydrochloride and pethidine hydrochloride RS (1 in 2000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Pethidine Hydrochloride, previously dried, and pethidine hydrochloride RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) An aqueous solution of Pethidine Hydrochloride (1 in 50) responds to the Qualitative Analysis (2) for chloride.

Melting point Between 187 and 189 ℃.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Pethidine Hydrochloride in 10 mL of water; the resulting solution is clear and colorless.

(2) ***Sulfate***—Perform the test with 0.20 g of Pethidine Hydrochloride. Prepare the control solution with 1.0 mL of 0.005 mol/L sulfuric acid (NMT 0.240%).

(3) ***Related substances***—Dissolve 50 mg of Pethidine Hydrochloride in 20 mL of the mobile phase, and use this solution as the test solution. Pipet 1 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak area of each solution by the automatic integration method; the sum of peak areas other than the major peak from the test solution is not greater than the major peak area from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 257 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (about 5 μm in particle diameter).

Column temperature: A constant temperature of about 40 ℃.

Mobile phase: Dissolve 2.0 g of sodium lauryl sulfate in 1000 mL of diluted phosphoric acid (1 in 1000), and add sodium hydroxide TS to adjust the pH to 3.0. To 550 mL of this solution, add 450 mL of acetonitrile.

Flow rate: Adjust the flow rate so that the retention time of pethidine is about 7 minutes.

System suitability

Test for required detectability: Take exactly 2 mL of the standard solution, and add the mobile phase to make exactly 20 mL. Confirm that the peak area of pethidine obtained from 20 μL of this solution is equivalent to 5% to 15% of the peak area of pethidine obtained from the standard solution.

System performance: To 2 mL of the test solution and 2 mL of a solution of isoamyl p-hydroxybenzoate in the mobile phase (1 in 50000), add the mobile phase to make 10 mL. Proceed with 20 μL of this solution according to the above conditions; pethidine and isoamyl p-hydroxybenzoate are eluted in this order with the resolution between their peaks being NLT 2.

System repeatability: Repeat the test 6 times with 20 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area of pethidine is NMT 2.0%.

Time span of measurement: About 2 times the retention time of pethidine after the solvent peak.

Loss on drying NMT 0.5% (1 g, 105 ℃, 3 hours).

Residue on ignition NMT 0.1% (0.5 g).

Assay Weigh accurately 0.5 g of Pethidine Hydrochloride, previously dried, dissolve in 50 mL of a mixture of acetic anhydride and acetic acid(100) (7 : 3), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 28.379 mg of $C_{15}H_{21}NO_2 \cdot HCl$

Packaging and storage Preserve in light-resistant, tight containers.

Pethidine Hydrochloride Injection
페티딘염산염 주사액

Operidine Injection

Pethidine Hydrochloride Injection is an aqueous injection and contains NLT 95.0% and NMT 105.0% of the labeled amount of pethidine hydrochloride ($C_{15}H_{21}NO_2 \cdot HCl$: 283.79).

Method of preparation Prepare as directed under Injections, with Pethidine Hydrochloride.

Description Pethidine Hydrochloride Injection occurs as a clear, colorless liquid.
It is affected by light.

pH Between 4.0 and 6.0.

Identification Take an amount of Pethidine Hydrochloride Injection, equivalent to 0.1 g of Pethidine Hydrochloride according to the labeled amount, add water to make 200 mL, and determine the absorption spectra as directed under Ultraviolet-visible Spectroscopy; it exhibits maxima between 250 nm and 254 nm, between 599 nm and 259 nm, and between 261 nm and 265 nm.

Sterility Meets the requirements.

Bacterial endotoxins Less than 6.0 EU per mg of pethi-

dine hydrochloride.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Extractable volume of injections Meets the requirements.

Assay Pipet an amount of Pethidine Hydrochloride Injection equivalent to about 0.1 g of pethidine hydrochloride ($C_{15}H_{21}NO_2$·HCl), add exactly 10 mL of the internal standard solution, and add the mobile phase to make 50 mL. Take 5 mL of this solution, add the mobile phase to make 20 mL, and use this solution as the test solution. Separately, weigh accurately about 0.1 g of Pethidine Hydrochloride RS, previously dried at 105 ℃ for 3 hours, add exactly 10 mL of the internal standard solution and add the mobile phase to make exactly 50 mL. Take 5 mL of this solution, add the mobile phase to make 20 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Calculate the ratios, QT and QS, of the peak area of pethidine to that of the internal standard for the test solution and the standard solution, respectively.

$$\text{Amount (mg) of pethidine hydrochloride } (C_{15}H_{21}NO_2\cdot HCl) = \text{Amount (mg) of pethidine hydrochloride RS (mg)} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of isoamyl parahydroxybenzoate in the mobile phase (1 in 12500).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 257 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (about 5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: Dissolve 2.0 g of sodium lauryl sulfate in 1000 mL of diluted phosphoric acid (1 in 1000), adjust the pH to 3.0 with sodium hydroxide TS and to 550 mL of this solution, add 450 mL of acetonitrile.

Flow rate: Adjust the flow rate so that the retention time of pethidine is about 7 minutes.

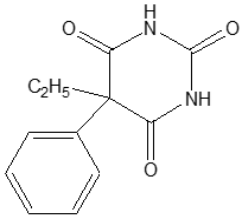
System suitability

System performance: Proceed with 20 μL of the standard solution according to the above operating conditions; pethidine and the internal standard are eluted in this order with the resolution between their peaks being NLT 2.0.

System repeatability: Repeat the test 6 times with 20 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area ratio of pethidine to the internal standard is NMT 1%.

Packaging and storage Preserve in light-resistant, hermetic containers. Colored containers may be used for Pethidine Hydrochloride Injection.

Phenobarbital
페노바르비탈



$C_{12}H_{12}N_2O_3$: 232.24

5-Ethyl-5-phenyl-1,3-diazinane-2,4,6-trione [*50-06-6*]

Phenobarbital, when dried, contains NLT 99.0% and NMT 101.0% of phenobarbital ($C_{12}H_{12}N_2O_3$).

Description Phenobarbital occurs as white crystals or a crystalline powder. It is odorless and has a bitter taste.
It is very soluble in *N*,*N*-dimethylformamide, freely soluble in ethanol(95), acetone, or pyridine, soluble in ether, and very slightly soluble in water.
It is soluble in sodium hydroxide TS or ammonia TS.
The pH of the saturated solution of Phenobarbital is between 5.0 and 6.0.

Identification (1) Determine the absorption spectra of solutions of Phenobarbital and phenobarbital RS in boric acid-potassium chloride-sodium hydroxide buffer solution, pH 9.6 (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Phenobarbital and phenobarbital RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both exhibit similar intensities of absorption at the same wavenumbers.

Melting point Between 175 and 179 ℃.

Purity (1) ***Clarity and color of solution***—Dissolve 0.5 g of Phenobarbital in 5 mL of sodium hydroxide TS; the resulting solution is colorless and clear.

(2) ***Chloride***—Dissolve 0.30 g of Phenobarbital in 20 mL of acetone, add 6 mL of dilute nitric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution by adding 20 mL of acetone, 6 mL of dilute nitric acid and water to 0.30 mL of 0.01 mol/L hydrochloric acid TS to make 50 mL (NMT 0.035%).

(3) ***Heavy metals***—Proceed with 1.0 g of Phenobar-

bital according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(4) ***Phenylbarbituric acid***—Dissolve 1.0 g of Phenobarbital in 5 mL of ethanol(95) by boiling for 3 minutes; the resulting solution is clear.

(5) ***Related substances***—Dissolve about 0.10 g of Phenobarbital in 100 mL of acetonitrile, and use this solution as the test solution. Pipet 2 mL of the test solution, and add acetonitrile to make exactly 100 mL. Pipet 5 mL of this solution, add acetonitrile to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak area of each solution by the automatic integration method; each peak area of related substances other than the phenobarbital peak obtained from the test solution is not greater than the peak area of phenobarbital from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 210 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 150 mm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 45 ℃.

Mobile phase: A mixture of water and acetonitrile (11 : 9).

Flow rate: Adjust the flow rate so that the retention time of phenobarbital is about 5 minutes.

Time span of measurement: About 12 times the retention time of phenobarbital after the solvent peak.

System suitability

Test for required detectability: Weigh exactly 5 mL of the standard solution and add the acetonitrile to make exactly 20 mL. The peak area of phenobarbital obtained from 10 μL of this solution is equivalent to 20% to 30% of the peak area of phenobarbital from the standard solution.

System performance: Proceed with 10 μL of the standard solution according to the above conditions; the number of theoretical plates is NLT 3000 with the symmetry factor being NMT 2.0.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solutions according to the above conditions; the relative standard deviation of the peak area of phenobarbital is NMT 3.0%.

Loss on drying NMT 1.0% (1 g, 105 ℃, 2 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.5 g of Phenobarbital, previously dried, dissolve in 50 mL of *N*,*N*-dimethylformamide, and titrate the solution with 0.1 mol/L potassium hydroxide-ethanol (Indicator: 1 mL of alizarin yellow GG-thymolphthalein TS). However, the endpoint of the titration is when the color of the solution changes from yellow to yellowish green. Separately, perform a blank test with a solution prepared by adding 22 mL of ethanol(95) to 50 mL of *N*,*N*-Dimethylformamide in the same manner and make any necessary correction.

Each mL of 0.1 mol/L potassium hydroxide-ethanol VS
= 23.224 mg of $C_{12}H_{12}N_2O_3$

Packaging and storage Preserve in well-closed containers.

10% Phenobarbital Powder
페노바르비탈 10배산

10% Phenobarbital Powder contains NLT 9.3% and NMT 10.7% of phenobarbital ($C_{12}H_{12}N_2O_3$: 232.24).

Method of preparation

Phenobarbital	100 g
Starch, lactose hydrate or a mixture of these ingredients	A sufficient amount
Total amount	1000 g

Prepare as directed under Powders with the above.

Identification (1) Determine the absorption spectrum of the test solution obtained in the Assay as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum between 238 nm and 242 nm.

(2) Weigh 6 g of 10% Phenobarbital Powder, add 150 mL of ethanol, shake well to mix, then filter. Evaporate the filtrate on a steam bath until about 5 mL remains, add 50 mL of water to precipitate, then filter, and collect the crystals. Dry the crystals for 2 hours at 105 ℃ and measure as directed in the potassium bromide disk method under Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Dissolution Perform the test with about 0.3 g of 10% Phenobarbital Powder at 50 revolutions per minute according to Method 2 under the Dissolution, using 900 mL of water as the dissolution medium. Take the dissolved solution 30 minutes after starting the test, filter, then take NLT 20 mL of the filtrate, and filter using a membrane filter with a pore size of NMT 0.45 μm. Discard the first 10 mL of the filtrate, pipet 5 mL of the subsequent filtrate, add pH 9.6 boric acid-potassium chloride-sodium hydroxide buffer solution to make exactly 10 mL, and use this solution as the test solution. Separately weigh about 17 mg of phenobarbital RS, previously dried at 105℃ for 2 hours, and dissolve in water to make 100 mL. Pipet 5 mL of this solution and add water to make exactly 25 mL. Again, pipet 5 mL of this solution, add pH 9.6 boric acid-potassium chloride-sodium hydroxide

buffer solution to make exactly 10 mL, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at 240 nm as directed under the Ultraviolet-visible Spectroscopy, using a mixture of pH 9.6 boric acid, potassium chloride, sodium hydroxide buffer solution and water (2 : 1) as the control solution. Meets the requirements if the dissolution rate of 10% Phenobarbital Powder in 30 minutes is NLT 80%.

Dissolution rate (%) with respect to the labeled amount of phenobarbital ($C_{12}H_{12}N_2O_3$)

$$= \frac{W_S}{W_T} \times \frac{A_T}{A_S} \times \frac{1}{C} \times 180$$

W_S: Amount (mg) of phenobarbital RS

W_T: Amount (g) of 10% Phenobarbital Powder taken.

C: Labeled amount (mg) of phenobarbital ($C_{12}H_{12}N_2O_3$) per g

Particle size distribution estimation by analytical sieving Meets the requirements.

Uniformity of dosage units (distribution) Meets the requirements.

Assay Weigh accurately about 0.2 g of 10% Phenobarbital Powder and dissolve in pH 9.6 boric acid-potassium chloride-sodium hydroxide buffer solution to make exactly 100 mL. Pipet 5.0 mL of this solution, add exactly 100 mL of pH 9.6 boric acid-potassium chloride-sodium hydroxide buffer solution, and use this solution as the test solution. Separately, weigh accurately about 20 mg of phenobarbital RS, previously dried for 2 hours at 105 ℃, and dissolve in pH 9.6 boric acid-potassium chloride-sodium hydroxide buffer solution to make exactly 100 mL. Pipet 5 mL of this solution, add pH 9.6 boric acid-potassium chloride-sodium hydroxide buffer solution to make 100 mL, and use this solution as the standard solution. Determine the absorbances, A_T and A_S of the test solution and the standard solution, respectively, at 240 nm as directed under Ultraviolet-visible Spectroscopy, using pH 9.6 boric acid-potassium chloride-sodium hydroxide buffer solution as the control solution.

Amount (mg) of phenobarbital ($C_{12}H_{12}N_2O_3$)

$$= \text{Amount (mg) of phenobarbital RS} \times \frac{A_T}{A_S}$$

Packaging and storage Preserve in well-closed containers.

Phenobarbital Tablets
페노바르비탈 정

Phenobarbital Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of phenobarbital ($C_{12}H_{12}N_2O_3$: 232.24).

Method of preparation Prepare as directed under Tablets, with Phenobarbital.

Identification (1) Weigh an amount of Phenobarbital Tablets, previously powdered, equivalent to 60 mg of phenobarbital according to the labeled amount, add 50 mL of chloroform, shake well to mix, and then filter. Evaporate the filtrate to dryness, and dry at 105 ℃ for 2 hours. With this residue and phenobarbital RS, determine the infrared spectra as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both exhibit similar intensities of absorption at the same wavenumbers. If any difference appears in the absorption spectra, dissolve the residue and phenobarbital RS in chloroform, respectively, evaporate the solvent and repeat the test on the residues.

(2) The retention times of the major peaks obtained from the test solution and the standard solution in the Assay are the same.

Dissolution Perform the test with 1 tablet of Theophylline Tablets at 50 revolutions per minute according to Method 2 under the Dissolution, using 900 mL of water as the dissolution medium. Take the dissolved solution 45 minutes after starting the test, filter, dilute with pH 9.6 alkaline borate buffer solution to an appropriate concentration, and use this solution as the test solution. Separately, weigh accurately an appropriate amount of phenobarbital RS, previously dried at 105 ℃ for 2 hours, dissolve in pH 9.6 alkaline borate buffer solution to make a solution having a certain concentration, and use this solution as the standard solution. Perform the test with the test solution and the standard solution as directed under the Ultraviolet-visible Spectroscopy, and determine the absorbance at the absorbance maximum wavelength of about 240 nm.

It meets the requirements if the dissolution rate of Phenobarbital Tablets in 45 minutes is NLT 75%.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 Phenobarbital Tablets, and powdered. Weigh accurately an amount equivalent to about 20 mg of phenobarbital ($C_{12}H_{12}N_2O_3$), add 15.0 mL of the internal standard solution, sonicate, and shake to mix for 15 minutes. Filter, and use the filtrate as the test solution. Separately, weigh accurately about 20 mg of phenobarbital RS (previously dried at 105 ℃ for 2 hours), add 15.0 mL of the internal standard solution, and use this solution as the standard solution. If necessary, sonicate and shake to mix to dissolve. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the ratios, Q_T and Q_S, of peak area of phenobarbital to the peak area of the internal standard, respectively.

Amount (mg) phenobarbital ($C_{12}H_{12}N_2O_3$)

= Amount (mg) of phenobarbital RS× $\frac{Q_T}{Q_S}$

Internal standard solution—Dissolve 12.5 mg of caffeine in 100 mL of a mixture of methanol and pH 4.5 buffer solution (1 : 1).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm to 10 μm in particle diameter).

Mobile phase: A mixture of pH 4.5 buffer solution and methanol (3 : 2).

Flow rate: 2.0 mL/min

System suitability

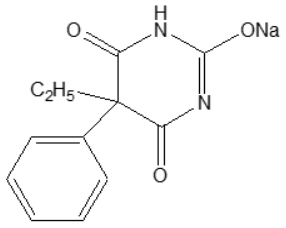
System performance: Proceed with 10 μL of the standard solution under the above conditions; the resolution between caffeine and phenobarbital is NLT 1.2, and the symmetry factor is NMT 2.0.

System repeatability: Repeat the test 6 times with 10 μL of the standard solution according to the above conditions; the relative standard deviation of the peak area ratio is NMT 2.0%.

pH 4.5 buffer solution—Dissolve 6.6 g of sodium acetate trihydrate and 3.0 mL of acetic acid(100) in water to make 1000 mL. If necessary, add acetic acid(100) to adjust the pH to 4.5 ± 0.1.

Packaging and storage Preserve in well-closed containers.

Phenobarbital Sodium
페노바르비탈나트륨



$C_{12}H_{11}N_2NaO_3$: 254.22

Sodium 5-ethyl-4,6-dioxo-5-phenyl-1*H*-pyrimidin-2-olate [*57-30-7*]

Phenobarbital Sodium contains NLT 98.5% and NMT 101.0% of phenobarbital sodium ($C_{12}H_{11}N_2NaO_3$), calculated on the dried basis.

Description Phenobarbital Sodium occurs as white crystals or a crystalline powder. It is odorless and has a bitter taste.

It is very soluble in water, soluble in ethanol(95), and practically insoluble in ether or chloroform. It is hygroscopic and gradually decomposes if left in humid air.

Identification (1) Take 50 mg of Phenobarbital Sodium into a separatory funnel, dissolve in 15 mL of water, shake to mix by adding 2 mL of hydrochloric acid, and extract 4 times each with 25 mL of chloroform. Filter all chloroform extract solutions, take 50 mL of the filtrate, and evaporate on a steam bath in a stream of air. Add 10 mL of ether, evaporate again, and dry at 105 °C for 2 hours. With this residue and phenobarbital RS, determine the infrared spectra as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit maxima at the same wavenumbers.

(2) Ignite 0.2 g of Phenobarbital Sodium, and dissolve by adding 10 mL of water to the residue; the resulting solution turns red litmus paper into blue. Also, this solution responds to the Qualitative Analysis for sodium salt.

(3) The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

pH Dissolve 1.0 g of Phenobarbital Sodium in 10 mL of freshly boiled and cooled water; the pH of this solution is between 9.2 and 10.2.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Phenobarbital Sodium in 10 mL of freshly boiled and cooled water; the resulting solution is clear and colorless after 1 minute.

(2) ***Heavy metals***—Dissolve 2.0 g of Phenobarbital Sodium in 52 mL of water, add 8 mL of 1 mol/L hydrochloric acid, shake vigorously to mix, and filter. Discard the first 5 mL of the filtrate, take 20 mL of the subsequent filtrate, and add water to make 25 mL. Use this solution as the test solution, proceed with the solution according to Method 1, and perform the test. Prepare the control solution with 1.5 mL of lead standard solution (NMT 30 ppm).

Loss on drying NMT 7.0% (1 g, 150 ℃, 4 hours).

Assay Weigh accurately about 22 mg of Phenobarbital Sodium, add 15.0 mL of internal standard solution, sonicate, and shake for 15 minutes to mix. Filter through a membrane filter with a pore size of NMT 0.5 μm, and use the filtrate as the test solution. Separately, weigh accurately about 20 mg of phenobarbital RS (previously dried at 105 ℃ for 2 hours), add 15.0 mL of internal standard solution, and use this solution as the standard solution. If necessary, dissolve it by sonication and shaking to mix. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the ratios of the peak area, Q_T and Q_S, of phenobarbital to that of the internal standard.

Amount (mg) of phenobarbital sodium ($C_{12}H_{11}N_2NaO_3$)
= Amount (mg) of phenobarbital RS× $\frac{Q_T}{Q_S}$ ×1.095

Internal standard solution—Dissolve 12.5 mg of caffeine in 100 mL of a mixture of methanol and pH 4.5 buffer solution (1 : 1).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm to 10 μm in particle diameter).

Mobile phase: A mixture of pH 4.5 buffer solution and methanol (3 : 2).

Flow rate: 2 mL/min

System suitability

System performance: Proceed with 10 μL of the standard solution according to the above conditions; the resolution between caffeine and phenobarbital is NLT 1.2, and the symmetry factor is NMT 2.0.

System repeatability: Repeat the test 6 times with 10 μL of the standard solution according to the above conditions; the relative standard deviation of the peak area ratio is NMT 2.0%.

pH 4.5 buffer solution—Dissolve 6.6 g of sodium acetate trihydrate and 3.0 mL of acetic acid(100) in water to make 1000 mL. If necessary, add acetic acid(100) to adjust the pH to 4.5 ± 0.1.

Packaging and storage Preserve in tight containers.

Phenobarbital Sodium Tablets
페노바르비탈나트륨 정

Phenobarbital Sodium Tablets contain NLT 92.5% and NMT 107.5% of the labeled amount of phenobarbital sodium ($C_{12}H_{11}N_2NaO_3$: 254.22).

Method of preparation Prepare as directed under Tablets, with Phenobarbital Sodium.

Identification (1) To 0.2 g of the residue obtained from the Assay, add 15 mL of diluted ethanol (1 in 4), dissolve on a steam bath, and filter through a glass filter when hot. Then, cool. Wash with a small amount of diluted ethanol (1 in 4), evaporate the filtrate from the stoppered test tube, and then dry at 105 ℃ for 1 hour. With this residue and phenobarbital RS, determine the infrared spectra as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both exhibit similar intensities of absorption at the same wavenumbers.

(2) The powdered Phenobarbital Sodium Tablets responds to the Qualitative Analysis for sodium salt.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

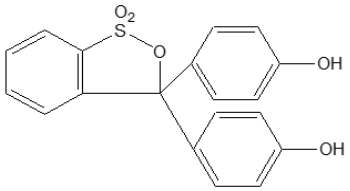
Assay Weigh accurately the mass of NLT 20 Phenobarbital Sodium Tablets, and powdered. Weigh accurately a portion of the powder, equivalent to 22 mg of phenobarbital sodium ($C_{12}H_{11}N_2NaO_3$), dissolve in 15 mL of internal standard solution, mix, and sonicate for 15 minutes. Filter, and use the filtrate as the test solution. Separately, weigh accurately about 20 mg of Phenobarbital RS (previously dried at 105 ºC for 2 hours), dissolve in 15 mL of internal standard solution, and use this solution as the standard solution. Perform the test as directed under the Assay of Phenobarbital Sodium.

$$\text{Amount (mg) of phenobarbital sodium } (C_{12}H_{11}N_2NaO_3) = \text{Amount (mg) of phenobarbital RS} \times \frac{Q_T}{Q_S} \times 1.095$$

Internal standard solution—Dissolve 12.5 mg of caffeine in 100 mL of a mixture of methanol and pH 4.5 buffer solution (1 : 1).

Packaging and storage Preserve in tight containers.

Phenolsulfonphthalein
페놀설폰프탈레인



$C_{19}H_{14}O_5S$: 354.38

4-[3-(4-Hydroxyphenyl)-1,1-dioxo-2,1λ6-benzoxathiol-3-yl]phenol [*143-74-8*]

Phenolsulfonphthalein, when dried, contains NLT 98.0% and NMT 101.0% of phenolsulfonphthalein ($C_{19}H_{14}O_5S$).

Description Phenolsulfonphthalein is a vivid red to dark red crystalline powder.
It is very slightly soluble in water or ethanol(95).
It is soluble in sodium hydroxide TS.

Identification (1) Dissolve 5 mg of Phenolsulfonphthalein in 2 to 3 drops of sodium hydroxide TS, add 2 mL of 0.05 mol/L bromine solution and 1 mL of dilute sulfuric acid, shake well to mix, and allow to stand for 5 minutes. Add sodium hydroxide TS to make the solution alkaline; the resulting solution exhibits a bluish purple color.

(2) Dissolve 10 mg of Phenolsulfonphthalein and phenolsulfonphthalein RS in diluted sodium carbonate TS (1 in 10) to make 200 mL. Take 5 mL of this solution, and add diluted sodium carbonate TS (1 in 10) to make 100 mL. Determine the absorption spectra of this solution as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the

same wavelengths.

Purity (1) ***Insoluble substances***—Weigh accurately about 1 g of Phenolsulfonphthalein, add 20 mL of sodium bicarbonate solution (1 in 40), shake to mix, and allow to stand for 1 hour. Add water to make 100 mL, and allow to stand for 24 hours. Filter and collect the insoluble substances using the previously weighed glass filter, wash 1 time with 25 mL of sodium bicarbonate solution (1 in 100) and 5 times with 5 mL each of water, and dry at 105 ℃ for 1 hour; the residue is NMT 0.2%.

(2) ***Related substances***—Dissolve 0.10 g of Phenolsulfonphthalein in 5 mL of dilute sodium hydroxide TS, and use this solution as the test solution. Pipet 0.5 mL of this solution, add dilute sodium hydroxide TS to make exactly 100 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of *t*-amyl alcohol, acetic acid(100), and water (4 : 1 : 1) as the developing solvent to a distance of about 15 cm, and air-dry the plate. After allowing the plate to stand in ammonia vapor, examine under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot obtained from the test solution are not more intense than the spot from the standard solution.

Loss on drying NMT 1.0% (1 g, silica gel, 4 hours).

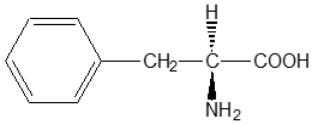
Residue on ignition NMT 0.2% (1 g).

Assay Weigh accurately 0.15 g of Phenolsulfonphthalein, previously dried, transfer to an iodine bottle, dissolve in 30 mL of sodium hydroxide solution (1 in 250), and add water to make 200 mL. Add exactly 50 mL of 0.05 mol/L bromine solution, rapidly add 10 mL of hydrochloric acid again, immediately close the stopper, and allow to stand for 5 minutes while occasionally shaking to mix. Add 7 mL of potassium iodide TS, immediately close the stopper again, shake gently for 1 minute to mix, and titrate free iodine with 0.1 mol/L sodium thiosulfate VS (indicator: 1 mL of starch TS). Perform a blank test in the same manner.

Each mL of 0.05 mol/L bromine VS
= 4.430 mg of $C_{19}H_{14}O_5S$

Packaging and storage Preserve in well-closed containers.

L-Phenylalanine
L-페닐알라닌



$C_9H_{11}NO_2$: 165.19
(2*S*)-2-Amino-3-phenylpropanoic acid [*63-91-2*]

L-Phenylalanine, when dried, contains NLT 98.5% and NMT 101.0% of L-phenylalanine ($C_9H_{11}NO_2$).

Description L-Phenylalanine occurs as white crystals or a crystalline powder. It is odorless or has a slight, characteristic odor and a slightly bitter taste.
It is freely soluble in formic acid, sparingly soluble in water, and practically insoluble in ethanol(95) or ether.
It dissolves in dilute hydrochloric acid.

Identification Determine the infrared spectra of L-Phenylalanine and L-phenylalanine RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Optical rotation $[\alpha]_D^{20}$: Between -33.0° and -35.5° (0.5 g after drying, water, 25 mL, 100 mm).

pH Dissolve 0.20 g of L-Phenylalanine in 20 mL of water by warming, and cool; the pH of the solution is between 5.3 and 6.3.

Purity (1) ***Clarity and color of solution***—Dissolve 0.5 g of L-Phenylalanine in 10 mL of 1 mol/L hydrochloric acid TS; the resulting solution is clear and colorless.

(2) ***Chloride***—Perform the test with 0.5 g of L-Phenylalanine. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid (NMT 0.021%).

(3) ***Sulfate***—Perform the test with 0.6 g of L-Phenylalanine. Prepare the control solution with 0.35 mL of 0.005 mol/L sulfuric acid (NMT 0.028%).

(4) ***Ammonium***—Perform the test with 0.25 g of L-Phenylalanine. Prepare the control solution with 5.0 mL of ammonium standard solution (NMT 0.02%).

(5) ***Heavy metals***—Add 40 mL of water and 2 mL of dilute acetic acid to 1.0 g of L-Phenylalanine, and dissolve by warming. After cooling, add water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution by adding 2 mL of dilute acetic acid and water to 2.0 mL of lead standard solution to make 50 mL (NMT 20 ppm).

(6) ***Iron***—Weigh accurately 0.333 g of L-Phenylalanine, dissolve in water to make 45 mL, add 2 mL of hydrochloric acid, and use this solution as the test solution. Add water to 1.0 mL of iron standard solution to make 45 mL, add 2 mL of hydrochloric acid, and use this solution as the standard solution. To the test solution and the standard solution, add 50 mg of ammonium peroxydisulfate and 3 mL of 30% ammonium thiocyanate solution, and mix; the color obtained from the test solution is not more intense than that from the standard solution (NMT 30 ppm).

(7) ***Arsenic***—Dissolve 1.0 g of L-Phenylalanine in 3 mL of 1 mol/L hydrochloric acid TS and 2 mL of water by warming and perform the test using this solution as the test solution (NMT 2 ppm).

(8) ***Related substances***—Dissolve 0.10 g of L-Phenylalanine in 25 mL of water, and use this solution as the test solution. Pipet 1 mL of this solution and add water to make exactly 50 mL. Pipet 5 mL of this solution, add water to make exactly 20 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of 1-butanol, water and acetic acid(100) (3 : 1 : 1) as the developing solvent to a distance of about 10 cm, and dry the plate at 80 ℃ for 30 minutes. Spray evenly a solution of ninhydrin in acetone (1 in 50) on the plate, and heat at 80 ℃ for 5 minutes; the spots other than the principal spot from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 0.3% (1 g, 105 ℃, 3 hours).

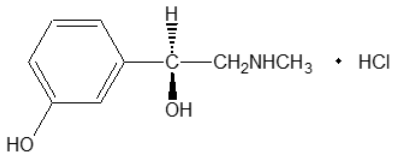
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.17 g of L-Phenylalanine, previously dried, dissolve in 3 mL of formic acid, add 50 mL of acetic acid(100), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 16.519 mg of $C_9H_{11}NO_2$

Packaging and storage Preserve in tight containers.

Phenylephrine Hydrochloride
페닐레프린염산염



$C_9H_{13}NO_2 \cdot HCl$: 203.67
3-[(1*R*)-1-Hydroxy-2-(methylamino)ethyl]phenol hydrochloride [*61-76-7*]

Phenylephrine Hydrochloride, when dried, contains NLT 98.0% and NMT 102.0% of phenylephrine hydrochloride ($C_9H_{13}NO_2 \cdot HCl$).

Description Phenylephrine Hydrochloride occurs as white crystals or a crystalline powder, and is odorless and has a bitter taste.
It is very soluble in water, freely soluble in ethanol(95), and practically insoluble in ether.
Dissolve 1.0 g of Phenylephrine Hydrochloride in 100 mL of water; the pH of the solution is between 4.5 and 5.5.

Identification (1) To 1 mL of an aqueous solution of Phenylephrine Hydrochloride (1 in 100), add 1 drop of copper(II) sulfate TS, and add 1 mL of sodium hydroxide solution (1 in 5); the resulting solution exhibits a blue color. Add 1 mL of ether, and shake to mix; the ether layer does not exhibit a blue color.

(2) To 1 mL of an aqueous solution of Phenylephrine Hydrochloride (1 in 100), add 1 drop of iron(III) chloride TS; the resulting solution exhibits a violet color which persists.

(3) Dissolve 0.3 g of Phenylephrine Hydrochloride in 3 mL of water, add 1 mL of ammonia TS, and rub the inner wall of the test tube with a glass rod; a precipitate is formed. Filter and collect the precipitate, wash with a few drops of water cooled with ice, and dry at 105 ℃ for 2 hours; the melting point is between 170 and 177 ℃.

(4) An aqueous solution of Phenylephrine Hydrochloride (1 in 100) responds to the Qualitative Analysis (2) for chloride.

Optical rotation $[\alpha]_D^{20}$: Between -42.0° and -47.5° (0.5 g after drying, water, 10 mL, 100 mm).

Melting point Between 140 and 145 ℃.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Phenylephrine Hydrochloride in 10 mL of water; the resulting solution is colorless and clear.

(2) ***Sulfate***—Perform the test with 0.5 g of Phenylephrine Hydrochloride. Prepare the control solution with 0.50 mL of 0.005 mol/L sulfuric acid (NMT 0.048%).

(3) ***Ketone***—Dissolve 0.20 g of Phenylephrine Hydrochloride in 1 mL of water, add 2 drops of sodium nitroprusside TS and 1 mL of sodium hydroxide TS, and add 0.6 mL of acetic acid(100); the color of the resulting solution is not more intense than the following control solution.

Control solution—Without using Phenylephrine Hydrochloride, proceed in the same manner as above.

(4) ***Related substances***—Weigh accurately 500 mg of Phenylephrine Hydrochloride, dissolve in methanol to make exactly 10 mL, and use this solution as the test solution. Separately, weigh accurately about 20 mg of phenylephrine hydrochloride RS, dissolve in methanol to make exactly 20 mL, and use this solution as the standard solution (1). Pipet 5 mL of the standard solution (1), add methanol to make exactly 10 mL, and use this solution as the standard solution (2). Pipet 1 mL of the standard solution (1), add methanol to make exactly 4 mL, and use this solution as the standard solution (3). Pipet 1 mL of the standard solution (1), add methanol to make exactly 10 mL, and use this solution as the standard solution (4).

Pipet 1 mL of the standard solution (1), add methanol to make exactly 20 mL, and use this solution as the standard solution (5). With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution, the standard solution (2), the standard solution (3), the standard solution (4), and the standard solution (5) on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography, develop the plate with a mixture of 1-butanol, water and formic acid (7 : 2 : 1) as the developing solvent to a distance of about 15 cm, and air-dry the plate with warm air. Spray anhydrous sodium carbonate solution (1 in 10), and spray saturated p-nitrobenzene diazonium fluoroborate solution. After drying the plate, examine the plate under ultraviolet light (main wavelength: 254 nm). The sum of spots other than the principal spot obtained from the test solution is not more intense than that of the standard solution (2) (NMT 1.0%), and individual related substances are not more intense than those in the standard solution (3) (NMT 0.5%).

Loss on drying NMT 0.5% (1 g, 105 ℃, 2 hours).

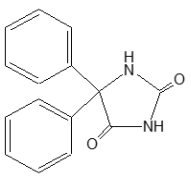
Residue on ignition NMT 0.2% (1 g).

Assay Weigh accurately about 0.1 g of Phenylephrine Hydrochloride, previously dried, transfer into the iodine bottle, dissolve in 40 mL of water, and add exactly 50 mL of 0.05 mol/L bromine VS. To this solution, add 5 mL of hydrochloric acid, immediately close the stopper, shake to mix, and allow to stand for 15 minutes. Carefully add 10 mL of potassium iodide TS, immediately close the stopper, shake well to mix, and allow to stand for 5 minutes. Titrate free iodine with 0.1 mol/L sodium thiosulfate VS (indicator: 1 mL of starch TS). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.05 mol/L bromine VS
= 3.3945 mg of $C_9H_{13}NO_2 \cdot HCl$

Packaging and storage Preserve in light-resistant, tight containers.

Phenytoin
페니토인



Diphenylhydantoin $C_{15}H_{12}N_2O_2$: 252.27
5,5-Diphenylimidazolidine-2,4-dione [*57-41-0*]

Phenytoin, when dried, contains NLT 99.0% and NMT 101.0% of phenytoin ($C_{15}H_{12}N_2O_2$).

Description Phenytoin occurs as a white crystalline powder or grain, and is odorless and tasteless. It is sparingly soluble in ethanol(95) or acetone, slightly soluble in ether, and practically insoluble in water.
It dissolves in sodium hydroxide TS.

Melting point—About 296 ℃ (with decomposition).

Identification (1) Dissolve 20 mg of Phenytoin in 2 mL of ammonia TS, and add 5 mL of silver nitrate TS; a white precipitate is formed.

(2) To 10 mg of Phenytoin, add 1 mL of ammonia TS and 1 mL of water, boil, and add dropwise 2 mL of a solution prepared by adding 10 mL of ammonia TS to 50 mL of copper sulfate solution (1 in 20); a red crystalline precipitate is formed.

(3) Mix 0.1 g of Phenytoin and 0.2 g of sodium hydroxide, and fuse by heating; the produced gas turns the moistened red litmus paper blue.

(4) To 0.1 g of Phenytoin, add 3 mL of chlorinated lime TS, shake for 5 minutes to mix, and dissolve the oily sediment in 15 mL of hot water. After cooling, add 1 mL of dilute hydrochloric acid, add 4 mL of water, filter the produced white precipitate, and take the precipitate. Wash with water, remove the moisture attached to the precipitate by pressing with a filter paper, dissolve the precipitate in 1 mL of chloroform, and add 5 mL of diluted ethanol (9 in 10). Scrape the inner wall of the test tube with a glass rod to form a white crystalline precipitate. Wash this precipitate with ethanol(95), and dry; the melting point is between 165 and 169 ℃.

Purity (1) ***Clarity and color of solution***—Dissolve 0.20 g of Phenytoin in 10 mL of 0.2 mol/L sodium hydroxide TS; the resulting solution is colorless and clear. Also, heat the solution; it does not become turbid. After cooling, mix with 5 mL of acetone; the resulting solution is colorless and clear.

(2) ***Acidity or alkalinity***—To 2.0 g of Phenytoin, add 40 mL of water, shake for 1 minute to mix, filter, and perform the test using the filtrate as the test solution.

(i) To 10 mL of the test solution, add 2 drops of phenolphthalein TS; the resulting solution is colorless. Also, add 0.15 mL of 0.01 mol/L sodium hydroxide TS; the resulting solution exhibits a red color.

(ii) To 10 mL of the test solution, add 0.30 mL of 0.01 mol/L hydrochloric acid and 5 drops of methyl red TS; the resulting solution exhibits a red to orange color.

(3) ***Chloride***—Dissolve 0.30 g of Phenytoin in 30 mL of acetone, and add 6 mL of dilute nitric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution by adding 30 mL of acetone, 6 mL of dilute nitric acid, and water into 0.60 mL of 0.01 mol/L hydrochloric acid to make 50 mL (NMT 0.071%).

(4) ***Heavy metals***—Proceed with 1.0 g of Phenytoin according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(5) ***Related substances***—Weigh accurately about

0.1 g of Phenytoin, dissolve in methanol to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 0.1 mg of phenytoin RS, dissolve in methanol to make exactly 10 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak area by the automatic integration method, and calculate the amount of related substances according to the following equation; the total amount of related substances other than benzophenone is NMT 0.9%.

$$\text{Content (\%) of related substances} = 100 \times \frac{C_S}{C_T} \times \frac{A_i}{A_S}$$

C_S: Concentration (μg/mL) of phenytoin in the standard solution

C_{T1}: Concentration (μg/mL) of phenytoin in the test solution

A_i: Peak area of each related substance in the test solution

A_S: Peak area of phenytoin in the standard solution

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of methanol and water (55:45).

Flow rate: About 1.5 mL/min.

System suitability

System performance: Weigh accurately 1 mg of benzoin, dissolve in 100 mL of methanol, take 10 mL of this solution, and dissolve 10 mg of phenytoin in the solution. Use this solution as the system suitability solution. Proceed with the system suitability solution according to the above conditions; the relative retention times of phenytoin and benzoin are 0.75 and 1.0, respectively, and the resolution is NLT 1.5.

(6) ***Benzophenone***—Weigh accurately about 0.1 g of Phenytoin, dissolve in methanol to make exactly 100 mL, and use this solution as the test solution. Separately, weigh 0.1 mg of benzophenone, add methanol to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the peak areas, A_T and A_S, of benzophenone from the test solution and the standard solution, respectively. Calculate the amount of benzophenone according to the following equation; it is NMT 0.1%.

$$\text{Content (\%) of benzophenone} = 100 \times \frac{C_S}{C_T} \times \frac{A_T}{A_S}$$

C_S: Concentration (μg/mL) of benzophenone in the standard solution

C_T: Concentration (μg/mL) of phenytoin in the test solution

A_T: Peak area of benzophenone in the test solution

A_S: Peak area of benzophenone in the standard solution

Operating conditions

Perform the test according to the operating conditions under the Purity (5) Related substances.

System suitability

System repeatability: Repeat the test 6 times with 20 μL each of the standard solutions according to the above operating conditions; the relative standard deviation of the peak area of benzophenone is NMT 5.0%.

Loss on drying NMT 0.5% (2 g, 105 ℃, 2 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.5 g of Phenytoin, previously dried, dissolve in 40 mL of ethanol(95) by warming, immediately add 0.5 mL of thymolphthalein TS, and titrate with 0.1 mol/L sodium hydroxide VS until the solution exhibits a pale blue color. Add 1 mL of pyridine, 5 drops of phenolphthalein TS, and 25 mL of silver nitrate TS, and titrate with 0.1 mol/L sodium hydroxide VS until the solution exhibits a 1 minute-persisting pale red color.

Each mL of 0.1 mol/L sodium hydroxide VS
= 25.227 mg of $C_{15}H_{12}N_2O_2$

Packaging and storage Preserve in well-closed containers.

Phenytoin Capsules
페니토인 캡슐

Phenytoin Capsules contain NLT 95.0% and NMT 105.0% of the labeled amount of phenytoin ($C_{15}H_{12}N_2O_2$: 252.27).

Method of preparation Prepare as directed under Capsules, with Phenytoin.

Identification The retention times of major peaks obtained from the test solution and standard solution under the Assay are the same.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Take NLT 20 capsules of Phenytoin Capsules,

weigh accurately the mass of the contents and powder. Weigh accurately an amount equivalent to about 0.1 g of phenytoin ($C_{15}H_{12}N_2O_2$), dissolve in acetonitrile to make 100.0 mL, filter, and use the filtrate as the test solution. Separately, proceed in the same manner as in the preparation of the test solution with about 0.1 g of phenytoin RS, and use this solution as the standard solution. Perform the test with the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions and determine the peak areas, A_T and A_S, of the test solution and the standard solution, respectively.

$$\text{Amount (mg) of phenytoin } (C_{15}H_{12}N_2O_2) = \text{Amount (mg) of phenytoin RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 μm in particle diameter).

Mobile phase: A mixture of acetonitrile and water (50 : 50).

Flow rate: 1.0 mL/min

Packaging and storage Preserve in tight containers.

Phenytoin Tablets
페니토인 정

Diphenylhydantoin Tablets

Phenytoin Tablets contain NMT 95.0% and NLT 105.0% of the labeled amount of phenytoin ($C_{15}H_{12}N_2O_2$: 252.27).

Method of preparation Prepare as directed under Tablets, with Phenytoin.

Identification Weigh an amount of Phenytoin Tablets, previously powdered, equivalent to 0.3 g of phenytoin according to the labeled amount, transfer into a separatory funnel, and add 1 mL of dilute hydrochloric acid and 10 mL of water. Extract 1 time with 100 mL of ether and 4 times each with 25 mL of ether while shaking well, combine the extracts, and filter. Evaporate the filtrate to dryness on a steam bath, and perform the test with the residue as directed under the Identification of Phenytoin.

Dissolution Perform the test with 1 tablet of Phenytoin Tablets at 100 revolutions per minute according to Method 2, using 900 mL of 0.05 mol/L tris buffer solution as the dissolution medium. Take the dissolved solution 120 minutes after starting the test, and filter. Discard the first 3 mL of the filtrate, pipet 10.0 mL of the subsequent filtrate, add the mobile phase to make exactly 50 mL, and use this solution as the test solution. Separately, weigh accurately an appropriate amount of phenytoin RS, dissolve in methanol to make a solution containing about 3.0 mg per mL, and then add the dissolution medium to make a solution containing about 0.06 mg per mL. Pipet an appropriate amount of this solution, add the mobile phase to make a solution containing the same concentration as the test solution, and use this solution as the standard solution. Perform the test with 25 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak area of phenytoin in each solution. Meets the requirements if the dissolution rate of Phenytoin Tablets in 120 minutes is NLT 70% (Q).

$$\text{Dissolution rate (\%) of the labeled amount of phenytoin } (C_{15}H_{12}N_2O_2) = C_S \times \frac{A_T}{A_S} \times \frac{1}{C} \times 450000$$

A_T: Peak area of phenytoin in the test solution

A_S: Peak area of phenytoin in the standard solution

C_S: Concentration of the standard solution (mg/mL)

C: Labeled amount (mg) of phenytoin ($C_{15}H_{12}N_2O_2$) in 1 tablet

0.05 mol/L tris buffer solution—Dissolve 60.5 g of 2-amino-2-hydroxymethyl-1,3-propanediol in 6 L of water, add another water to make 10 L, and adjust the pH to 9.0 ± 0.05 with phosphoric acid. Take 6 L of this solution, dissolve 100 g of sodium lauryl sulfate, combine with the remaining solution, and mix well.

Triethylamine solution—To 1 mL of triethylamine, add water to make 100 mL.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column, about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (1.5 to 10 μm in particle diameter).

Mobile phase: A mixture of water, methanol, acetonitrile, triethylamine solution and acetic acid(31) (500 : 270 : 230 : 5 : 1).

Flow rate: 1.5 mL/min

System suitability

System performance: Proceed with 25 μL of the standard solution according to the above conditions; the number of theoretical plates and the symmetry factor of the peak of phenytoin are NLT 6500 and NMT 1.5, respectively.

System repeatability: Repeat the test 5 times with 25 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area of phenytoin is NMT 2.0%.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 Phenytoin Tablets, and powder. Weigh accurately an amount equivalent to about 25 mg of phenytoin ($C_{15}H_{12}N_2O_2$), add the mobile phase, shake for about 10 minutes to mix, and add the mobile phase again to make exactly 25 mL. Then filter. Discard the first 10 mL of the filtrate, take exactly 5 mL of the subsequent filtrate, add 10.0 mL of the internal standard solution, add the mobile phase to make exactly 50 mL and use this solution as the test solution. Separately, weigh accurately about 25 mg of Phenytoin RS (previously dry at 105 ºC for 2 hours and measure the loss on drying), dissolve in the internal standard solution to make exactly 25 mL. Pipet 5 mL of this solution, add 10.0 mL of the internal standard solution, add the mobile phase to make exactly 50 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the ratios of the peak area, Q_T and Q_S, of phenytoin to the peak area of the internal standard, respectively.

$$\text{Amount (mg) phenytoin } (C_{15}H_{12}N_2O_2) = \text{Amount (mg) of phenytoin RS, calculated on the dried basis} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of butyl p-hydroxybenzoate in methanol (1 in 10000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 15 cm to 30 cm in length, packed with octadecylsilanized silica gel (5 μm to 10 μm in particle diameter).

Column temperature: Ordinary temperature

Mobile phase: A mixture of 5 mol/L ammonium monohydrogen phosphate solution and methanol (50 : 50)

Flow rate: Adjust the flow rate so that the retention time of phenytoin is about 5 minutes.

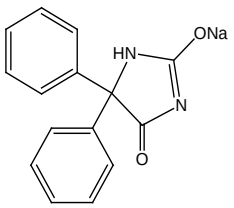
System suitability

System performance: Proceed with 10 μL of the standard solution according to the above conditions; phenytoin and the internal standard are eluted in this order with the resolution being NLT 2.0.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution according to the above conditions; the relative standard deviation of the ratios of phenytoin peak area is NMT 2.0%.

Packaging and storage Preserve in well-closed containers.

Phenytoin Sodium
페니토인나트륨



$C_{15}H_{11}N_2NaO_2$: 274.25

Sodium 5,5-diphenylimidazolidin-3-ide-2,4-dione [*630-93-3*]

Phenytoin Sodium contains NLT 98.0% and NMT 102.0% of phenytoin sodium ($C_{15}H_{11}N_2NaO_2$), calculated on the dried basis.

Description Phenytoin Sodium occurs as white crystals or a crystalline powder and is odorless.

It is soluble in water or ethanol(95) and practically insoluble in ether or chloroform.

Dissolve 1.0 g of Phenytoin Sodium in 20 mL of water; the pH of this solution is about 12.

It is hygroscopic.

Allow to stand an aqueous solution of Phenytoin Sodium; the solution slowly absorbs carbon dioxide and precipitates crystals of phenytoin.

Identification (1) Transfer 0.3 g of Phenytoin Sodium into the separatory funnel, dissolve in 50 mL of water, add 10 mL of dilute hydrochloric acid, and extract with 100 mL of ether. Next, extract 4 times each with 25 mL of ether, combine the extracts, and filter. Evaporate the filtrate to dryness on a steam bath, and perform the test with the residue as directed under the Identification of Phenytoin.

(2) Ignite 0.5 g of Phenytoin Sodium. After cooling, dissolve the residue in 10 mL of water; the resulting solution turns red litmus paper blue. Phenytoin Sodium responds to the Qualitative Analysis (1) for sodium salt.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Phenytoin Sodium in 20 mL of freshly boiled and cooled water; the resulting solution is colorless and clear. Also, even if it is slightly turbid, add 4.0 mL of 0.1 mol/L sodium hydroxide TS; the resulting solution is colorless and clear.

(2) ***Heavy metals***—Proceed with 1.0 g of Phenytoin Sodium according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Related substances***—Weigh accurately about 0.1 g of Phenytoin Sodium, dissolve in the mobile phase to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 50 μg of benzophenone, about 0.1 mg of phenytoin RS, about 0.9 mg of phenytoin related substance I {diphenylglycine} RS, and about 0.9 mg of phenytoin related substance II {diphenylhydantoin} RS, dissolve in the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following con-

ditions. Determine the peak area of each solution by the automatic integration method, and calculate the amount of related substances according to the following equation; the amount of phenytoin related substance I and phenytoin related substance II are NMT 0.9%, respectively, and the amount of benzophenone is NMT 0.1%.

$$\text{Content (\%) of related substances} = 100 \times \frac{C_S}{C_T} \times \frac{A_T}{A_S}$$

C_S: Concentration (μg/mL) of each related substance in the standard solution

C_T: Concentration (μg/mL) of Phenytoin Sodium in the test solution

A_S: Peak area of each related substance obtained from the standard solution

A_T: Peak area of each related substance obtained from the test solution

Also, calculate the amount of other individual related substances according to the following equation; the total amount of related substances other than benzophenone is NMT 0.9%.

$$\text{Content (\%) of individual related substances} = 100 \times \frac{274.25}{252.27} \times \frac{C}{D} \times \frac{A_i}{A_S}$$

274.25: Molecular weight of phenytoin sodium

252.27: Molecular weight of phenytoin

C: Concentration (μg/mL) of phenytoin in the standard solution

D: Concentration (μg/mL) of phenytoin sodium in the test solution

A_i: Peak area of related substances obtained from the test solution

A_S: Peak area of phenytoin obtained from the standard solution

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: Ordinary temperature

Mobile phase: A mixture of 0.05 mol/L ammonium dihydrogen phosphate buffer solution, acetonitrile and methanol (45 : 35 : 20) with a pH level adjusted to 2.5 with phosphoric acid.

Flow rate: About 1.5 mL/min.

System suitability

System performance: Dissolve about 75 mg of benzoin in 10 mL of methanol, add a mixture of 0.05 mol/L ammonium dihydrogen phosphate buffer solution and acetonitrile (45 : 35) with a pH level adjusted to 2.5 with phosphoric acid to make 50 mL. Pipet 1.0 mL of this solution, transfer into a 10-mL volumetric flask, add a solution containing 10.0 mg of phenytoin RS dissolved in 100 mL of the mobile phase to make 10 mL, and use this solution as the system suitability solution. Proceed with the system suitability solution according to the above conditions; the relative retention time for phenytoin and benzoin are 1.0 and 1.3, respectively, with the resolution being NLT 1.5. The number of theoretical plates and symmetry factor of the phenytoin peak are NLT 9400 and NMT 1.5, respectively.

System repeatability: Repeat the test 6 times with 20 μL each of the standard solutions according to the above conditions; the relative standard deviation is NMT 5.0%.

Assay Weigh accurately about 25 mg of Phenytoin Sodium, and dissolve in mobile phase to make exactly 25 mL. Pipet 5 mL of this solution, add 10.0 mL of the internal standard solution, add the mobile phase to make exactly 50 mL, and use this solution as the test solution. Separately, weigh accurately about 25 mg of phenytoin RS, and dissolve in mobile phase to make exactly 25 mL. Pipet 5 mL of this solution, add 10.0 mL of the internal standard solution, add the mobile phase to make exactly 50 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the ratios of the peak area, Q_T and Q_S, of phenytoin to that of the internal standard.

$$\text{Amount (mg) of phenytoin sodium } (C_{15}H_{11}N_2NaO_2) = \text{Amount (mg) of phenytoin RS, calculated on the dried basis} \times \frac{Q_T}{Q_S} \times 1.087$$

Internal standard solution—A solution of butyl p-hydroxybenzoate in methanol (1 in 10000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and 15 cm to 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm to 10 μm in particle diameter).

Mobile phase: A mixture of 0.005 mol/L ammonium monohydrogen phosphate VS and methanol (50 : 50).

Flow rate: Adjust the flow rate so that the retention time of phenytoin is about 5 minutes.

System suitability

System performance: Proceed with 10 μL of the standard solution according to the above conditions; phenytoin and internal standard are eluted in this order with the resolution being NLT 2.0.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solutions according to the above conditions; the relative standard deviation of the ratios of the peak area of phenytoin to that of the internal standard is NMT 2.0%.

Packaging and storage Preserve in tight containers.

Phenytoin Sodium for Injection
주사용 페니토인나트륨

Diphenylhydantoin Sodium for Injection
$C_{15}H_{11}N_2NaO_2$: 274.25

Phenytoin Sodium for Injection, when dried, contains NLT 98.5% and NMT 101.0% of phenytoin sodium ($C_{15}H_{11}N_2NaO_2$) and contains NLT 92.5% and NMT 107.5% of the labeled amount of phenytoin sodium ($C_{15}H_{11}N_2NaO_2$).

Method of preparation Prepare as directed under Injections.

Description Phenytoin Sodium for Injection occurs as white crystals or a crystalline powder and is odorless.
It is soluble in water or ethanol(95) and practically insoluble in ether or chloroform.
Dissolve 1.0 g of Phenytoin Sodium in 20 mL of water; the pH of this solution is about 12.
It is hygroscopic.
When allowed to stand, an aqueous solution of Phenytoin Sodium for Injection slowly absorbs carbon dioxide and precipitates phenytoin crystals.

Identification (1) Transfer 0.3 g of Phenytoin Sodium into the separatory funnel, dissolve in 50 mL of water, add 10 mL of dilute hydrochloric acid, and extract with 100 mL of ether. Next, extract 4 times each with 25 mL of ether, combine the extracts, and filter. Evaporate the filtrate to dryness on a steam bath, and perform the test with the residue as directed under the Identification of Phenytoin.

(2) Ignite 0.5 g of Phenytoin Sodium. After cooling, dissolve the residue in 10 mL of water; the resulting solution turns red litmus paper blue. Phenytoin Sodium responds to the Qualitative Analysis (1) for sodium salt.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Phenytoin Sodium in 20 mL of freshly boiled and cooled water; the resulting solution is colorless and clear. Also, even if it is slightly turbid, add 4.0 mL of 0.1 mol/L sodium hydroxide TS; the resulting solution is colorless and clear.

(2) ***Heavy metals***—Proceed with 1.0 g of Phenytoin Sodium according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

Loss on drying NMT 2.5% (1 g, 105 ℃, 4 hours).

Sterility Meets the requirements.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Measure accurately the mass of the contents of about 10 units of phenytoin sodium for injection. Weigh accurately about 25 mg of Phenytoin Sodium for Injection and dissolve in the mobile phase to make exactly 25 mL. Pipet 5 mL of this solution, add 10.0 mL of the internal standard solution, then add the mobile phase to make exactly 50 mL, and use this solution as the test solution. Separately, weigh accurately about 25 mg of phenytoin RS, and dissolve in mobile phase to make exactly 25 mL. Pipet 5 mL of this solution, add 10.0 mL of the internal standard solution, add the mobile phase to make exactly 50 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the ratios the peak area, Q_T and Q_S of phenytoin to that of the internal standard.

Amount (mg) of phenytoin sodium ($C_{15}H_{11}N_2NaO_2$)
= Amount (mg) of phenytoin RS, calculated on the dried basis$\times \frac{Q_T}{Q_S} \times 1.087$

Internal standard solution—A solution of butyl p-hydroxybenzoate in methanol (1 in 10000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and 15 cm to 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm to 10 μm in particle diameter).

Column temperature: Room temperature

Mobile phase: A mixture of 0.005 mol/L ammonium phosphate dibasic solution and methanol (50 : 50).

Flow rate: Adjust the flow rate so that the retention time of phenytoin is about 5 minutes.

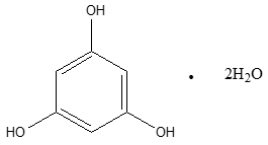
System suitability

System performance: Proceed with 10 μL of the standard solution according to the above conditions; phenytoin and the internal standard are eluted in this order with resolution being NLT 2.0.

System repeatability: Repeat the test 6 times with 10 μL of the standard solution according to the above conditions; the relative standard deviation of the peak area ratio is NMT 2.0%.

Packaging and storage Preserve in hermetic containers.

Phloroglucinol Dihydrate
플로로글루시놀수화물



$C_6H_6O_3 \cdot 2H_2O$: 162.1

Benzene-1,3,5-triol dihydrate [*6099-90-7*]

Phloroglucinol Dihydrate, when dried, contains NLT 99.0% and NMT 101.0% of phloroglucinol dihydrate ($C_6H_6O_3$: 126.1).

Description Phloroglucinol Dihydrate occurs as a white powder.
It is freely soluble in ethanol(99.5) or ethanol(95), sparingly solution in water, and practically insoluble in dichloromethane.

Identification (1) Determine the infrared spectra of Phloroglucinol Dihydrate and phloroglucinol dihydrate RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) Weigh accurately about 200 mg of Phloroglucinol Dihydrate, dissolve in methanol to make exactly 10 mL, and use this solution as the test solution. Separately, weigh accurately 200 mg of phloroglucinol dihydrate RS, dissolve in methanol to make exactly 10 mL, and use this solution as the standard solution. Spot each 10 μL of the test solution and the standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, hexane and anhydrous formic acid (125 : 75 : 4) to a distance of NLT 2/3 of the length of the plate and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the R_f value, position and size of the principal spot obtained from the test solution corresponds to those of the principal spot from the standard solution.

pH Dissolve 2.5 g of Phloroglucinol Dihydrate in ethanol(95) to make 25 mL. To 10 mL of this solution, add carbon dioxide-free water to make 100 mL; the pH of the solution is between 4.0 and 6.0.

Purity (1) ***Clarity and color of solution*—**Dissolve about 2.5 g of Phloroglucinol Dihydrate in ethanol(95) to make 25 mL; the solution is clear and not more intense than the control solution.

Control solution—To a mixture of 1.0 mL of cobalt(II) chloride hexahydrate colorimetric stock solution, 2.4 mL of iron(III) chloride hexahydrate colorimetric stock solution and 0.4 mL of copper(II) sulfate pentahydrate colorimetric stock solution, add 10 g/L hydrochloric acid to make 10 mL. To 12.5 mL of this solution, add 10 g/L hydrochloric acid to make 100 mL.

(2) ***Chloride*—**Perform the test with 0.5 g of Phloroglucinol Dihydrate. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid (NMT 0.02%).

(3) ***Sulfate***—Perform the test with 0.5 g of Phloroglucinol Dihydrate. Prepare the control solution with 0.50 mL of 0.005 mol/L sulfuric acid (NMT 0.05%).

(4) ***Heavy metals*—**Proceed with 1.0g of Phloroglucinol Dihydrate according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(5) ***Related substances*—**Weigh accurately about 50 mg of Phloroglucinol Dihydrate, add the diluent to make exactly 10 mL, and use this solution as the test solution. Pipet 1 mL of the test solution and add the diluent to make exactly 100 mL. Pipet 1 mL of this solution, add the diluent to make exactly 10 mL, and use this solution as the standard solution. Perform the test with each 20 μL of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine all peak areas of each solution by the automatic integration method and calculate the amount of related substances in the test solution; phloroglucinol related substance I {pyrogallol}, phloroglucinol related substance II {phloroglucide}, benzene-1,2,4-triol, 2,6-dichlorophenol, phloroglucinol related substance III {4-chlororesorcinol} and 3,5-dichloroaniline are eluded at the relative retention time of about 0.9, about 1.3, about 0.7, about 1.8, about 1.5 and about 2.0 to phloroglucinol, respectively, and each peak area of those peaks are NMT 0.15%; any other individual related substance is NMT 0.1%, and the total amount of related substances is NMT 0.3%. Exclude any related substance the percent peak area of which is NMT 0.05%. Determine the peak areas of phloroglucinol related substance I, phloroglucinol related substance II, benzene-1,2,4-triol, 2,6-dichlorophenol, phloroglucinol related substance III and 3,5-dichloroaniline by multiplying the peak areas determined by the automatic integration method by their response factors, 0.6, 0.2, 0.7, 0.6, 0.6 and 0.4, respectively. Protect the test solution and standard solution from light after preparation and use immediately.

Diluent—A mixture of mobile phase A and mobile phase B (1 : 9).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 265 nm).

Column: A stainless steel column, about 4.0 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: Adjust the mobile phase using a stepwise change or gradient elution by mixing mobile phase A and mobile phase B as directed under the following table.

Mobile phase A: Dissolve 1.36 g of potassium dihydrogen phosphate in 900 mL of water, adjust pH to 3.0 with phosphoric acid, and add water to make 1000 mL.

Mobile phase B: Acetonitrile

Time (minute)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 - 9	100	0
9 - 15	100 → 50	0 → 50
15 - 25	50 → 20	50 → 80
25 - 30	20	80

Flow rate: 1.0 mL/min (the retention time of phloroglucinol is about 12 minutes).

System suitability

System performance: Dissolve each 6 mg of phloroglucinol related substance I RS, resorcinol and phloroglucinol related substance II RS in the diluent to make 10 mL. To this solution, add 2 mL of the test solution and add the diluent to make 20 mL. Pipet 1 mL of this solution, add the diluent to make 50 mL, and use this solution as the system suitability solution. Proceed with 10 μL of the system suitability solution according to the above operating conditions; the resolution of the peaks of phloroglucinol related substance I and phloroglucinol related substance II is NLT 2.5, and the resolution of the peaks of phloroglucinol related substance II and resorcinol is NLT 4.0.

Loss on ignition Between 20.0% and 23.0%(1 g, 105 ℃).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.6 g of Phloroglucinol Dihydrate and dissolve in 50 mL of water. Titrate this solution with 1 mol/L sodium hydroxide VS (potentiometric titration under the Titrimetry).

Each mL of 1 mol/L sodium hydroxide VS
= 63.05 mg of $C_6H_6O_3$

Packaging and storage Preserve in light-resistant, tight containers.

Phloroglucinol Tablets
플로로글루시놀 정

Phloroglucinol Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of phloroglucinol hydrate ($C_6H_6O_3 \cdot 2H_2O$: 162.14).

Method of preparation Prepare as directed under Tablets, with Phloroglucinol Hydrate.

Identification (1) Weigh the amount of Phloroglucinol Tablets, equivalent to 80 mg of phloroglucinol hydrate according to the labeled amount, dissolve in 8 mL of methanol, and use this solution as the test solution. Separately, dissolve about 80 mg of phloroglucinol RS in methanol to make 8 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on a thin-layer chromatographic plate made of silica gel for thin-layer chromatography (with a fluorescent indicator). Next, develop the plate with a mixture of toluene, ethyl acetate and acetic acid(100) (5 : 4 : 1) (as the developing solvent) to a distance of about 15 cm and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots from the test solution exhibits an R_f value corresponding to that of the standard solution.

(2) The absorbance maximum wavelength of the absorption spectra obtained from the test solution correspond to those of the standard solution, as obtained in the Assay.

Disintegration Perform the test with Phloroglucinol Tablets as directed under the Disintegration. (However, in the case of sublingual tablets, perform the test as directed under Disintegration in the section on soluble tablets of the British Pharmacopoeia.)

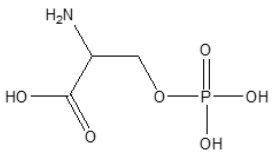
Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 tablets of Phloroglucinol Tablets, and powder. Weigh accurately an amount of the powder equivalent to about 20 mg of phloroglucinol hydrate ($C_6H_6O_3 \cdot 2H_2O$), add methanol to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 20 mg of phloroglucinol RS, previously dried at 105 ℃ for 2 hours, proceed in the same manner as in the test solution, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at the wavelength of 267 nm as directed under the Ultraviolet-visible Spectroscopy, using methanol as a control solution.

Amount (mg) phloroglucinol hydrate ($C_6H_6O_3 \cdot 2H_2O$)
= Amount (mg) phloroglucinol RS × A_T / A_S × 162.14/126.11

Packaging and storage Preserve in light-resistant, tight containers.

DL-Phosphoserine
DL-포스포세린



$C_3H_8NO_6P$: 185.07

2-Aino-3-phosphonooxypropanoicacid, [*17885-08-4*]

DL-Phosphoserine, when dried, contains NLT 97.0% and NMT 101.0% of DL-phosphoserine

($C_3H_8NO_6P$).

Description DL-Phosphoserine occurs as a white crystalline powder.
It is very soluble in water.

Identification (1) To 5 mL of an aqueous solution of DL-Phosphoserine (1 in 1000), add 1 mL of ninhydrin TS; the solution exhibits a bluish purple to violet color.

(2) An aqueous solution of DL-Phosphoserine responds to the Qualitative Analysis for phosphate.

Melting point—Between 166 and 167 ℃.

Purity ***Heavy metals***—Proceed with 1.0 g of DL-Phosphoserine according to Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

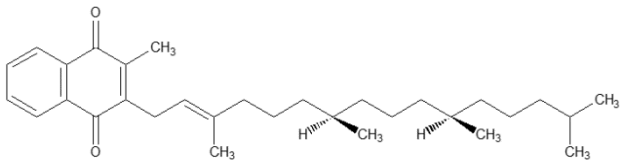
Residue on ignition NMT 0.1% (1 g)

Assay Weigh accurately an amount equivalent to 30 mg of DL-Phosphoserine, previously dried, transfer into a 100-mL Kjeldahl flask, add 8 mL of perchloric acid, and mix. Add 2 to 3 glass beads, and heat slowly on a hot plate until the white smoke disappears completely. After the complete decomposition, cool the decomposed solution, transfer into a 100-mL volumetric flask using a small amount of water, and wash the Kjeldahl flask with a small amount of water. Combine the washings with the content of the volumetric flask. Fill up to the gauge line with water, and mix evenly. Transfer 1.0 mL of this solution into a volumetric flask, add 2 drops of 0.1% alcoholic phenolphthalein TS, and slowly add 1 to 2 drops of 40% sodium hydroxide TS until the solution becomes red. Add 5 mL of a mixture of 5% ammonium molybdate solution and 10 mol/L sulfuric acid (1 : 1) TS and 0.5 mL of a solution prepared by dissolving 0.25 g of 1-amino-2-naphthol-4-sulfonic acid in a mixture of 97.5 mL of 18% potassium metabisulfite solution and 2.5 mL of 18.27% sodium metabisulfite, and add water to make 25.0 mL. Maintain the solution on a steam bath at 37 to 40 ℃ for 7 minutes, take it out, and use this solution as the test solution. Separately, weigh accurately about 30 mg of DL-phosphoserine RS, proceed in the same manner as the test solution, and use this solution as the standard solution. Perform the test with the test solution and the standard solution as directed under the Ultraviolet-visible Spectroscopy using the blank test solution as the control solution, and determine the absorbances, A_T and A_S, at 750 nm.

Amount (mg) of DL-phosphoserine ($C_3H_8NO_6P$)
= Amount (mg) of DL-phosphoserine RS$\times \frac{A_T}{A_S}$

Packaging and storage Preserve in tight containers.

Phytonadione
피토나디온



Vitamin K1
Phytomenadione $C_{31}H_{46}O_2$: 450.70
2-Methyl-3-((7*R*,11*R*,*E*)-3,7,11,15-tetramethylhexadec-2-en-1-yl)naphthalene-1,4-dione [*84-80-0*]

Phytonadione contains NLT 97.0% and NMT 102.0% of lactulose ($C_{31}H_{46}O_2$).

Description Phytonadione occurs as a pale yellow to orange clear viscous solution.
It is miscible with chloroform.
It is soluble in ethanol(99.5) and practically insoluble in water.
It is gradually decomposed, and exhibits to reddish brown by light.

Specific gravity—d_{20}^{20}: About 0.967.

Identification (1) Determine the absorption spectra of solutions of Phytonadione and phytonadione RS in isooctane (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.
Determine the ultraviolet-visible absorption spectrum of solutions of Phytonadione and phytonadione RS in isooctane (1 in 10000); both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) Determine the infrared absorption spectrum of Phytonadione and phytonadione RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Refractive index n_D^{20}: Between 1.525 and 1.529.

Purity (1) ***the ratio of absorbance***—Perform the test with the solution of Phytonadione in isooctane (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy, and determine the absorbances A_1, A_2 and A_3 at the wavelengths of 248.5 nm, 253.5 nm and 269.5 nm; A_2/A_1 is between 0.69 and 0.73, and $A_2/A3$ is between 0.74 and 0.78. Determine the absorbances A_4 and A_5 at the wavelengths of 284.5 nm and 326 nm with the solution of Phytonadione in isooctane (1 in 100000); A_4/A_5 is between 0.28 and 0.34.

(*2*) ***Heavy metals***—Carbonize 1.0 g of Phytonadione by gentle ignition. After cooling, add 10 mL solution of magnesium nitrate in ethanol(95) (1 in 10) and ignite in ethanol to burn. After cooling, add 1 mL of sulfuric acid, proceed according to Method 4 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Menadione***—Dissolve 20 mg of Phytonadione in 0.5 mL of a mixture of ethanol(95) and water (1 : 1), add 1 drop of the solution of 3-methyl-phenyl-5-pyrazolone in ethanol(95) (1 in 20) and 1 drop of ammonia water(28), and allow to stand for 2 hours; the resulting solution does not exhibit a green to bluish purple color.

Isomer ratio Perform the test quickly away from sunlight. Dissolve 30 mg of Phytonadione in 50 mL of the mobile phase. To 4 mL of this solution, add the mobile phase to make 25 mL. Add the mobile phase to 10 mL of this solution to make 25 mL, and use this solution as the test solution. With 50 μL of the test solution, perform the test as directed under the Liquid Chromatography according to the following conditions, and determine the peak area of the Z-form A_{TZ} and E-form A_{TE}; $A_{TZ}/(A_{TZ} + A_{TE})$ is between 0.28 and 0.34.

Operating conditions

Proceed as directed under the operating conditions under the Assay.

System suitability

System performance: Proceed with 50 μL of the standard solution according to the above conditions; Z-form and E-form are eluted in this order with the resolution being NLT 1.5.

System repeatability: Repeat the test 6 times with 50 μL each of the standard solution according to the above conditions; the relative standard deviation of the sum of the peaks of Z-form and E-form is NMT 2.0%.

Assay Perform the test quickly away from sunlight. Weigh accurately about 30 mg each of Phytonadione and phytonadione RS, previously dried, and dissolve each in the mobile phase to make exactly 50 mL. Pipet 4 mL of each of these solutions, and add the mobile phase to each solution to make exactly 25 mL. Pipet10 mL of this solution, add 7 mL each of the internal standard solution, add the mobile phase to make exactly 25 mL, and use this solution as the test solution and the standard solution. Perform the test with 50 μL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the ratio of the peak areas of E-form and Z-form, Q_T and Q_S, to that of the internal standard in each solution.

$$\text{Amount (mg) of phytonadione } (C_{31}H_{46}O_2) = \text{Amount (mg) of phytonadione RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of cholesterol benzoate in the mobile phase (1 in 400).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 30 °C.

Mobile phase: A mixture of hexane and n-amyl alcohol (4000 : 3).

Flow rate: Adjust the flow rate so that the retention time of the lately eluted peak of the 2 peaks of phytonadione is about 25 minutes.

System suitability

System performance: Proceed with 50 μL of the standard solution according to the above conditions; Z-form and E-form are eluted in this order with the resolution being NLT 1.5.

System repeatability: Repeat the test 6 times with 50 μL each of the standard solution according to the above conditions; the relative standard deviation of the sum of the ratio of the peak areas of Z-form and E-form to that of the internal standard is NMT 1.0%.

Packaging and storage Preserve in light-resistant, tight containers in a cold place.

Phytonadione Injection
피토나디온 주사액

Vitamin K1 Injection

Phytonadione Injection is an aqueous solution for injection. Phytonadione Injection contains NLT 90.0% and NMT 110.0% of the labeled amount of phytonadione (C31H46O2: 450.70).

Method of preparation Prepare as directed under Injections, with Phytonadione. A suitable solubilizing agent or suspending agent may be added to Phytonadione Injection.

Identification The retention times of the major peaks from the test solution and the standard solution obtained in the Assay are the same.

pH Between 3.5 and 7.0.

Sterility Meets the requirements.

Bacterial endotoxins Less than 14.0 EU/mg of phytonadione.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Extractable volume of injections Meets the requirements.

Assay Pipet Phytonadione Injection in the amount equivalent to about 10 mg of phytonadione ($C_{31}H_{46}O_2$)

according to the labeled amount, add the mobile phase to make exactly 10 mL, and mix. Pipet 1 mL of this solution, add the mobile phase to make exactly 10 mL, and use this solution as the test solution. And in case of Phytonadione Injection containing less than 10 mg of Phytonadione per mL, pipet a volume of Phytonadione Injection, equivalent to 1 mg of phytonadione ($C_{31}H_{46}O_2$), add the mobile phase to make exactly 10 mL. Separately, weigh accurately about 10 mg of phytonadione RS, and add the mobile phase to make exactly 10 mL. Take 1.0 mL of this solution, add the mobile phase to make exactly 10 mL, and use the resulting solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the peak areas, A_T and A_S, of phytonadione in the solutions, respectively.

$$\text{Amount (mg) of phytonadione } (C_{31}H_{46}O_2) = D \times \frac{C}{V} \times \frac{A_T}{A_S}$$

D: 100 (in case of Phytonadione Injection containing 10 mg or more of phytonadione per mL)

10 (for injection containing less than 10 mg of phytonadione per mL)

C: Concentration (mg/mL) of the standard solution.

V: Amount (mL) of sample

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 μm to 10 μm in particle diameter).

Mobile phase: A mixture of ethanol(99.5) and water (95 : 5).

Flow rate: 0.7 mL/min

System suitability

System repeatability: Repeat the test 6 times according to the above conditions with 10 μL each of the standard solution; the relative standard deviation of the peak area is NMT 1.5%.

Packaging and storage Preserve in light-resistant, hermetic containers.

Phytonadione Tablets
피토나디온 정

Vitamin K1 Tablets

Phytonadione Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of phytonadione ($C_{31}H_{46}O_2$: 450.70).

Method of preparation Prepare as directed under Tablets, with Phytonadione.

Identification (1) Reduce Phytonadione Tablets to powder, weigh an amount of the powder equivalent to about 10 mg of phytonadione according to the labeled amount, and dissolve in 750 mL of ethanol(99.5) with shaking. Add ethanol(99.5) to make 1000 mL, filter the resulting solution, and use the filtrate as the test solution. Separately, proceed with the phytonadione RS in the same manner as the test solution, and use this solution as the standard solution. Determine the absorption spectra of the test solution and the standard solution as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

Disintegration Meets the requirements (disintegration time: 30 minutes).

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 tablets of Pyrazinamide Tablets, and reduce to powder. Weigh accurately the amount of the powder equivalent to about 5 mg of phytonadione ($C_{31}H_{46}O_2$), add 20 mL of ethanol(99.5), shake vigorously to mix for 15 minutes to dissolve, and add ethanol(99.5) to make exactly 50 mL. Filter and use the filtrate as the test solution. Separately, weigh accurately 5 mg of phytonadione RS, dissolve in ethanol(99.5) to make exactly 50 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak area of phytonadione, A_T and A_S, in each solution.

$$\text{Amount (mg) of phytonadione } (C_{31}H_{46}O_2) = \text{Amount (mg) of phytonadione RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 μm to 10 μm in particle diameter).

Mobile phase: A mixture of ethanol (99.5)·and water (95 : 5).

Flow rate: 1.5 mL/min

System suitability

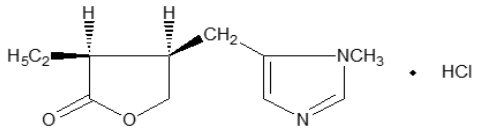
System performance: Proceed with 10 μL of the standard solution under the above operating conditions; the symmetry factor is NMT 2.0.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak areas is NMT 2.0%

Packaging and storage Preserve in light-resistant, tight

containers.

Pilocarpine Hydrochloride
필로카르핀염산염



$C_{11}H_{16}N_2O_2 \cdot HCl$: 244.72

(3*S*,4*R*)-3-Ethyl-4-[(1-methyl-1*H*-imidazol-5-yl)methyl]dihydrofuran-2(3*H*)-one [*54-71-7*]

Pilocarpine Hydrochloride, when dried, contains NLT 99.0% and NMT 101.0% of pilocarpine hydrochloride ($C_{11}H_{16}N_2O_2 \cdot HCl$).

Description Pilocarpine Hydrochloride occurs as colorless crystals or a white powder. It is odorless and has a slightly bitter taste.
It is very soluble in acetic acid(100), freely soluble in water, methanol or ethanol(95), soluble in acetic anhydride, and practically insoluble in ether.
Dissolve 1.0 g of Pilocarpine Hydrochloride in 10 mL of water; the pH of the solution is between 3.5 and 4.5.
It is hygroscopic.
It is affected by light.

Identification (1) Dissolve 0.1 g of Pilocarpine Hydrochloride in 5 mL of water, add 1 drop of dilute nitric acid, 1 mL of hydrogen peroxide TS, 1 mL of chloroform, and 1 drop of potassium dichromate (1 in 300), and shake vigorously to mix; the chloroform layer exhibits a violet color, and the water layer becomes colorless to pale yellow.

(2) ***Chloride***—To 1 mL of an aqueous solution of Pilocarpine Hydrochloride (1 in 20), add 1 mL of dilute nitric acid and 2 to 3 drops of silver nitrate TS; a white precipitate or turbidity is formed.

Melting point Between 200 and 203 ℃.

Purity (1) ***Sulfate***—Dissolve 0.5 g of Pilocarpine Hydrochloride in 20 mL of water, and use this solution as the test solution. To 5.0 mL of the test solution, add 1 mL of dilute hydrochloric acid and 0.5 mL of barium chloride TS; the resulting solution is not turbid.

(2) ***Nitrate***—To 2.0 mL of the test solution from (1), add 2 mL of iron(II) sulfate TS, and superimpose on the 4 mL of sulfuric acid; the interface does not exhibit a dark brown color.

(3) ***Related substances***—Dissolve 0.3 g of Pilocarpine Hydrochloride in 10 mL of methanol, and use this solution as the test solution. Pipet 1 mL of this solution, add methanol to make exactly 100 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of chloroform, methanol and ammonia water (85 : 14 : 2) to a distance of about 13 cm, and dry the plate at 105 ℃ for 10 minutes. After cooling, spray evenly bismuth potassium iodide TS; the spots other than the principal spot obtained from the test solution are not more intense than the spots from the standard solution.

(4) ***Readily carbonizable substances***—Proceed with 0.25 g of Pilocarpine Hydrochloride and perform the test. The color of the solution is not more intense than that of the matching fluid for color B.

Loss on drying NMT 3.0% (1 g, 105 ℃, 2 hours).

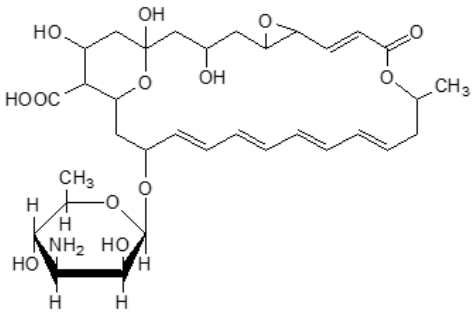
Residue on ignition NMT 0.5% (0.1 g).

Assay Take accurately 0.5 g of Pilocarpine Hydrochloride, previously dried, dissolve in 50 mL of a mixture of acetic anhydride and acetic acid(100) (7 : 3), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 24.472 mg of $C_{11}H_{16}N_2O_2 \cdot HCl$

Packaging and storage Preserve in light-resistant, tight containers.

Pimaricin
피마리신



$C_{33}H_{47}NO_{13}$: 665.73

(1*R*,3*S*,5*R*,7*R*,8*E*,12*R*,14*E*,16*E*,18*E*,20*E*,22*R*,24*S*,25*R*,26*S*)-22-[(3-Amino-3,6-dideoxy-β-D-mannopyranosyl)oxy]-1,3,26-trihydroxy-12-methyl-10-oxo--6,11,28-Trioxatricyclo[22.3.1.$0^{5,7}$]octacosa-8,14,16,18,20-pentaene-25-carboxylic acid [*7681-93-8*]

Pimaricin is a polyene marcrolide compound with antitumor activity obtained from the incubation of *Streptomyces parvulus*. Pimaricin contains NLT 900 μg (potency) and NMT 1020 μg (potency) of pimaricin ($C_{33}H_{47}NO_{13}$: 665.73) per mg, calculated on the anhydrous basis.

Description Pimaricin occurs as a white to yellowish white crystalline powder. It is slightly soluble in methanol or acetic acid(100) and practically insoluble in water or ethanol(99.5).

Identification (1) To 3 mg of Pimaricin, add 1 mL of hydrochloric acid and shake to mix; it exhibits a bluish purple color.

(2) Weigh 5 mg each of Pimaricin and pimaricin RS, and dissolve each in a solution of acetic acid(100) in methanol (1 in 100) to make 1000 mL. Determine the absorption spectra of these solutions as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

Optical rotation $[\alpha]_D^{20}$: Between +243° and +259° (0.1 g, acetic acid(100), 25 mL, 100 mm).

pH Suspend 0.1 g (potency) of Pimaricin in 10 mL of water; the pH of the solution is between 4.0 and 7.0.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Pimaricin according to Method 4 and perform the test. Prepare the control solution with 3.0 mL of lead standard solution (NMT 30 ppm).

(2) ***Related substances***—Weigh 20 mg of Pimaricin, dissolve in methanol to make exactly 100 mL, and use this solution as the test solution. Proceed with 10 μL of the test solution as directed under the Liquid Chromatography according to the following conditions, and determine each peak area according to the automatic integration method. Determine the amount of substances other than pimaricin according to the percentage peak area method; the sum of the amounts is NMT 4.0%.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 303 nm).

Column: A stainless steel column about 3.9 mm in internal diameter and 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: Dissolve 1.0 g of ammonium acetate in 1000 mL of a mixture of water, methanol and tetrahydrofuran (47 : 44 : 2).

Flow rate: Adjust the flow rate so that the retention time of pimaricin is about 10 minutes.

System suitability

Test for required detectability: Pipet 1 mL of the test solution, add methanol to make exactly 100 mL, and use this solution as the system suitability solution. Pipet 1 mL of the system suitability test solution and add mobile to make exactly 10 mL. The peak area of pimaricin obtained from 10 μL of this solution is between 7% to 13% of that obtained from the system suitability solution.

System performance: Proceed with 10 μL of the system suitability solution according to the above conditions; the number of theoretical plates and the symmetry factor of the peak of pimaricin are NLT 1500 plates and NMT 2.0, respectively.

System repeatability: Repeat the test 6 times with 10 μL of the system suitability solution under the above operating conditions; the relative standard deviation of the peak area of pimaricin is NMT 2.0%.

Time span of measurement: About 3 times the retention time of pimaricin

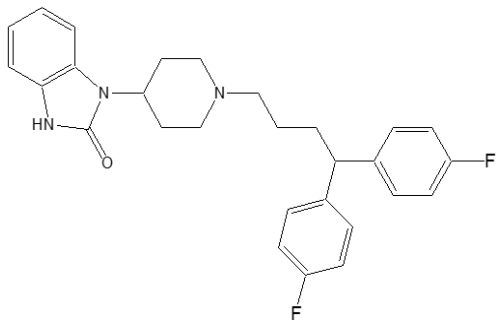
Water Between 6.0% and 9.0% (0.2 g, volumetric titration, direct titration).

Assay Weigh accurately about 25 mg (potency) each of Pimaricin and pimaricin RS, and dissolve each in methanol to make exactly 100 mL. Pipet 2 mL each of the dissolved solutions, add a solution of acetic acid(100) in methanol (1 in 100) to make exactly 100 mL, and use the resulting solutions as the test solution and the standard solution. With the test solution and the standard solution, determine the absorbances, A_{T1}, A_{S1}, A_{T2}, A_{S2}, A_{T3} and A_{S3}, at the wavelengths of 295.5 nm, 303 nm and 311 nm as directed under the Ultraviolet-visible Spectroscopy.

$$\text{Potency (μg) of pimaricin } (C_{33}H_{47}NO_{13}) = \text{Potency (μg) of pimaricin RS} \times \frac{A_{T2} - \frac{A_{T1} + A_{T3}}{2}}{A_{S2} - \frac{A_{S1} + A_{S3}}{2}}$$

Packaging and storage Preserve in light-resistant, tight containers.

Pimozide
피모지드



$C_{28}H_{29}F_2N_3O$: 461.55

1-{1-[4,4-Bis(4-fluorophenyl)butyl]piperidin-4-yl}-1*H*-benzo[d]imidazol-2(3*H*)-one [*2062-78-4*]

Pimozide contains NLT 98.0% and NMT 101.0% of pimozide ($C_{28}H_{29}F_2N_3O$), calculated on the dried basis.

Description Pimozide occurs as a white crystalline powder.

It is freely soluble in acetic acid(100), slightly soluble in methanol or ethanol(99.5), and practically insoluble in water.

Identification (1) Dissolve 35 mg each of Pimozide and pimozide RS in a solution of 0.1 mol/L hydrochloric acid in methanol (1 in 10) to make 100 mL. To 5.0 mL of this solution, add the solution of 0.1 mol/L hydrochloric acid in methanol (1 in 10) to make 50 mL, and determine the absorption spectra of the resulting solutions as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Proceed with Pimozide and pimozide RS according as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Melting point Between 216 and 220 ℃.

Purity (1) ***Heavy metals***—Proceed with 2.0 g of Pimozide according to Method 2 under the Heavy Metals and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Arsenic***—Proceed with 1.0 g of Pimozide according to Method 3 and perform the test (NMT 2 ppm).

(3) ***Related substances***—Weigh accurately about 0.10 g of Pimozide, dissolve exactly in 10 mL of methanol, and use this solution as the test solution. Pipet 1 mL of this solution, add methanol to make exactly 200 mL, and use it as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak areas of each solution according to the automatic integration method; the peak areas other than pimozide from the test solution are not larger than that of pimozide from the standard solution. The total area of the peaks other than pimozide from the test solution is not greater than 1.5 times the peak area of pimozide from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 280 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 10 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: Control the mixing ratio of mobile phase A and mobile phase B in stages or gradient elution as follows.

Mobile phase A: Dissolve 2.5 g of ammonium acetate and 8.5 g of tetrabutylammonium hydrogen sulfate in water to make 1000 mL.

Mobile phase B: Acetonitrile

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 - 10	80 → 70	20 → 30
10 - 15	70	30

Flow rate: 2.0 mL/min

System suitability

Test for required detectability: Pipet 1 mL of the standard solution, and add methanol to make exactly 10 mL. Confirm that the peak area of pimozide obtained from 10 μL of this solution is equivalent to 8% - 12% of the peak area of pimozide obtained from the standard solution.

System performance: Dissolve 5 mg of Pimozide and 2 mg of mebendazole in methanol to make 100 mL. Proceed with 10 μL of this solution under the above operating conditions; mebendazole and pimozide are eluted in this order with the resolution between these peaks being NLT 5.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area of pimozide is NMT 2.0%.

Time span of measurement: About 1.5 times the retention time of pimozide.

Loss on drying NMT 0.5% (1 g, in vacuum, 80 ℃, 4 hours).

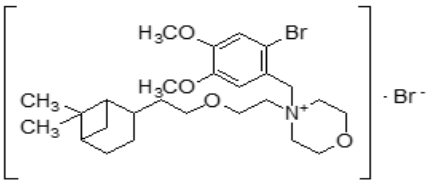
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.5 g of Pimozide, dissolve in 40 mL of acetic acid(100), and titrate with 1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 46.155 mg of $C_{28}H_{29}F_2N_3O$

Packaging and storage Preserve in light-resistant, tight containers.

Pinaverium Bromide
피나베륨브롬화물



$C_{26}H_{41}Br_2NO_4$: 591.42

4-[(2-Bromo-4,5-dimethoxyphenyl) methyl]-4-[2-[2-(6,6-dimethylbicyclo [3.1.1]hept-2-yl)ethoxy]ethyl]morpholinium bromide, [*53251-94-8*]

Pinaverium Bromide, when dried, contains NLT 99.0% and NMT 101.0% of pinaverium bromide ($C_{26}H_{41}Br_2NO_4$).

Description Pinaverium Bromide is a fine crystalline powder, and has a bitter taste.
It is slightly soluble in water, freely soluble in ethanol(95), and practically insoluble in ether.

Melting point—Between 159 and 164 °C.

Identification (1) Dissolve 0.2 g of Pinaverium Bromide in 10 mL of chloroform and use this solution as the test solution. Weigh 0.2 g of pinaverium bromide RS, dissolve in 10 mL of chloroform, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 mL each of the test solution and the standard solution on the thin plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of methanol, acetone and hydrochloric acid (45: 5 : 2), and air-dry the plate. Spray evenly Dragendorff's TS on the plate; the R_f value and the color of the spots obtained from the test solution are same as those from the standard solution.

(2) Dissolve 10 mg of Pinaverium Bromide in 100 mL of water. With this solution, determine the absorption spectrum as directed under the Ultraviolet-visible Spectroscopy; it exhibits maxima around 286 nm, 243 nm, and between 212 and 217 nm.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Pinaverium Bromide according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Related substances***—Dissolve 0.2 g of Pinaverium Bromide in 5 mL of ethanol(95) and use this solution as the test solution. With this solution, perform the test as directed under the Thin Layer Chromatography. Spot the test solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate using a mixture of ethanol(95) and ammonia water (99 : 1), dry the plate at 40 ℃. Expose the plate to ultraviolet light (main wavelength: 254 nm); a black spot (bromomethyl-1-bromo-2-demethoxy-3,4-benzene) does not appear at R_f value of 0.67. Spray evenly Dragendorff's TS; a yellow spot (dimethyl-6,6-norpyranyl ethoxyl-ethylmorpholine) does not appear at R_f value of 0.65.

Loss on drying NMT 1.0% (1 g, in vacuum, phosphorus pentoxide, 60 ℃, constant mass).

Residue on ignition NMT 1.0% (1.0 g).

Assay Weigh accurately 0.45 g of Pinaverium Bromide, previously dried, transfer to a beaker, add 2 mL of anhydrous formic acid, dissolve in 50 mL of acetic anhydride, and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 59.14 mg of $C_{26}H_{41}Br_2NO_4$

Packaging and storage Preserve in tight containers.

Pinaverium Bromide Tablets
피나베륨브롬화물 정

Pinaverium Bromide Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of pinaverium bromide ($C_{26}H_{41}Br_2NO_4$: 591.42).

Method of preparation Prepare as directed under Tablets, with Pinaverium Bromide.

Identification (1) Take 2 tablets of Pinaverium Bromide Tablets, add 10 mL of chloroform, filter, and use the filtrate as the test solution. Weigh 0.1 g of pinaverium bromide RS, add 10 mL of chloroform, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of methanol, acetone and hydrochloric acid (45 : 5 : 2) as the developing solvent, and air-dry the plate. Spray evenly Dragendorff's TS on the plate; the colors and R_f values of the spots obtained from the test solution and the standard solution are the same.

(2) Take 1 tablet of Pinaverium Bromide Tablets, add 100 mL of water, and dissolve by warming on a steam bath. After cooling, filter and take 10 mL of the filtrate. Then add water to make 100 mL, and determine the absorption spectrum as directed under the Ultraviolet-visible Spectroscopy; it exhibits maxima at around the wavelengths of 286 nm, 243 nm and 212 nm to 217 nm.

Dissolution Perform the test with 1 tablet of Pinaverium Bromide Tablets at 50 revolutions per minute according to Method 2, using 900 mL of 0.05 mol/L acetic acid-sodium acetate buffer solution, pH 4.0, as the dissolution medium. Filter the dissolved solution 15 minutes after starting the dissolution test, and use this filtrate as the test solution. Separately, weigh accurately about 10 mg of pinaverium bromide RS, and add the dissolution medium to make exactly 100 mL. Take exactly 50 mL of this solution, add the dissolution medium to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas of pinaverium bromide, A_T and A_S, in each solution. Meets the requirements if the dissolution rate of Pinaverium Bromide Tablets in 15 minutes is NLT 80%.

Dissolution rate (%) of the labeled amount of pinaverium bromide ($C_{26}H_{41}Br_2NO_4$)
$= W_S \times (A_T / A_S) \times (1 / C) \times 450$

Ws: Amount (mg) of pinaverium bromide RS

C: Labeled amount (mg) of pinaverium bromide ($C_{26}H_{41}Br_2NO_4$) per tablet

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 243 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: A mixture of acetonitrile and 0.01 mol/L potassium dihydrogen phosphate (3 : 1).

Flow rate: 0.8 mL/min

System suitability

System repeatability: Repeat the test 6 times with 20 μL of the standard solution under the above operating conditions; the relative standard deviation of the peak areas of pinaverium bromide is NMT 2.0%.

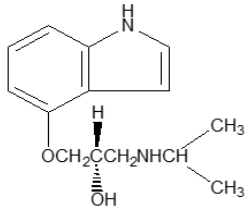
Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 tablets of Pinaverium Bromide Tablets, and powder them. Weigh accurately an amount of the powder, equivalent to about 50 mg of pinaverium bromide ($C_{26}H_{41}Br_2NO_4$), add 150 mL of water, dissolve on a steam bath by shaking occasionally to mix, add water to make exactly 200 mL, and filter. Discard the first 20 mL of the filtrate, pipet 5 mL of the subsequent filtrate, add water to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 50 mg of pinaverium bromide RS, and add water to make exactly 200 mL. Pipet 5 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at the wavelength of 243 nm as directed under the Ultraviolet-visible Spectroscopy.

Amount (mg) of pinaverium bromide ($C_{26}H_{41}Br_2NO_4$)
= Amount (mg) of pinaverium bromide RS × (A_T / A_S)

Packaging and storage Preserve in tight containers.

Pindolol
핀돌롤



and enantiomer

$C_{14}H_{20}N_2O_2$: 248.32

1-[(1*H*-indol-4-yl)oxy]-3-(isopropylamino)propan-2-ol [*13523-86-9*]

Pindolol, when dried, contains NLT 98.5% and NMT 101.0% of pindolol ($C_{14}H_{20}N_2O_2$).

Description Pindolol occurs as a white crystalline powder and has a slightly characteristic odor.
It is sparingly soluble in methanol, slightly soluble in ethanol(95), and practically insoluble in water or ether.
It dissolves in dilute sulfuric acid or acetic acid(100).

Identification (1) To 1 mL of a solution of Pindolol in methanol (1 in 10000), add 1 mL of a solution of hydrochloric acid in 1-(4-pyridyl)pyridinium chloride hydrochloride (1 in 1000) and 1 mL of sodium hydroxide TS, and add 1 mL of hydrochloric acid; the resulting solution exhibits a blue to bluish purple color and the color soon changes to purple.

(2) Dissolve 50 mg of Pindolol in 1 mL of dilute sulfuric acid, and add 1 mL of Reinecke salt TS; a pale red precipitate is formed.

(3) Determine the absorption spectra of solutions of Pindolol and pindolol RS in methanol (1 in 50000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(4) Determine the infrared spectra of Pindolol and pindolol RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Melting point Between 169 and 173 ℃.

Absorbance $E_{1cm}^{1\%}$ (264 nm): Between 333 and 350 (10 mg, methanol, 500 mL).

Purity (1) ***Clarity and color of solution***—Dissolve 0.5 g of Pindolol in 10 mL of acetic acid(100), and examine immediately; the resulting solution is clear, and the color is not more intense than the following control solution.

Control solution—Pipet 4 mL of the matching fluid for color A, add exactly 6 mL of water, and mix.

(2) ***Heavy metals*—**Proceed with 1.0 g of Pindolol

according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Arsenic***—Proceed with 1.0 g of Pindolol according to Method 3, and perform the test (NMT 2 ppm).

(4) ***Related substances***—Dissolve 0.10 g of Pindolol in 10 mL of methanol, and use this solution as the test solution. Pipet 2 mL of this solution and add methanol to make exactly 100 mL. Pipet 5 mL of this solution, add methanol to make exactly 20 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of chloroform, acetone and isopropylamine (5 : 4 : 1) as the developing solvent to a distance of about 12 cm, and air-dry the plate. Spray evenly a sulfuric acid solution (3 in 5) and a sodium nitrite solution (1 in 50) on the plate; the spots other than the principal spot from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 0.5% (1 g, 105 ℃, 4 hours).

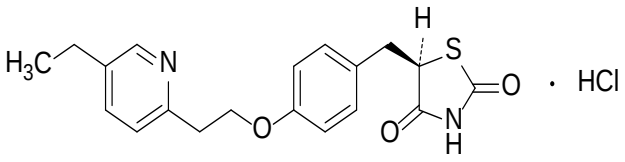
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.5 g of Pindolol, previously dried, dissolve in 80 mL of methanol, and titrate with 0.1 mol/L hydrochloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L hydrochloric acid VS
= 24.832 mg of $C_{14}H_{20}N_2O_2$

Packaging and storage Preserve in light-resistant, tight containers.

Pioglitazone Hydrochloride
피오글리타존염산염



and enantiomer

$C_{19}H_{20}N_2O_3S \cdot HCl$: 392.90

(5*RS*)-5-{4-[2-(5-Ethylpyridin-2-yl)ethoxy]benzyl}thiazolidine-2,4-dione monohydrochloride [*112529-15-4*]

Pioglitazone Hydrochloride contain NLT 99.0% and NMT 101.0% of the labeled amount of Pioglitazone Hydrochloride ($C_{19}H_{20}N_2O_3S \cdot HCl$: 392.90), calculated on the anhydrous basis.

Description Pioglitazone Hydrochloride occurs as a white crystalline powder.

It is soluble in dimethylformamide and methanol, slightly soluble in ethanol(99.5) and practically insoluble in water.

It dissolves in 0.1 mol/L hydrochloric acid TS.

A solution of Pioglitazone Hydrochloride in *N*,*N*-dimethylformamide (1 in 20) shows no optical rotation.

Identification (1) Determine the absorption spectra of solutions of Pioglitazone Hydrochloride and pioglitazone hydrochloride RS in 0.1 mol/L hydrochloric acid TS (1 in 50000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Pioglitazone Hydrochloride and pioglitazone hydrochloride RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both exhibit similar intensities of absorption at the same wavenumbers.

(3) Dissolve 50 mg of Pioglitazone Hydrochloride in 1 mL of nitric acid, and add 4 ml of dilute nitric acid; the resulting solution responds to the Chemical identification reaction (2) for chloride.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Pioglitazone Hydrochloride according to Method 4 and perform the test. After incinerating, use 3 mL of hydrobromic acid instead of 3 mL of hydrochloric acid. However, prepare the control solution with 1.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Related substances***—Weigh 20 mg of Pioglitazone Hydrochloride, dissolve in 20 mL of methanol, add the mobile phase to make 100 mL, and use this solution as the test solution. Pipet 1 mL of this solution, add the mobile phase to it make exactly 200 mL, and use this solution as the standard solution. Perform the test with 40 μL each of the test solution and standard solution as directed under the Liquid Chromatography under the following conditions. Determine the peak area of each solution by the automatic integration method; the peak area with a relative retention time to pioglitazone of about 0.7, 1.4 and 3.0 from the test solution is not greater than 3/10 of the peak area of pioglitazone from the standard solution (NMT 0.15%); the peak area of pioglitazone and the above peak from the test solution is not greater than 1/5 of the peak area of pioglitazone from the standard solution (NMT 0.10%). The sum of peak areas other than pioglitazone from the test solution is not greater than that of pioglitazone from the standard solution (NMT 0.5%).

Operating conditions

For the detector, column, column temperature, mobile phase and flow rate, proceed as directed in the operating conditions under the Assay.

Time span of measurement: About 4 times the retention time of pioglitazone after the solvent peak.

System suitability

Test for required detectability: Take exactly 1 mL of the standard solution, and add the mobile phase to

make exactly 10 mL. Confirm that the peak area of pioglitazone obtained from 40 μL of this solution is equivalent to 7 to 13% of the peak area of pioglitazone obtained from the standard solution.

System performance: Dissolve 50 mg of Pioglitazone Hydrochloride in a solution of benzophenone in methanol (1 in 750), and add methanol to make 100 mL. Pipet 1 mL of this solution, and add the mobile phase to make 20 mL. Proceed with 40 μL of this solution under the above operating conditions; pioglitazone and benzophenone are eluted in this order with the resolution being NLT 10.

System repeatability: Repeat the test 6 times with 40 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area of pioglitazone is NMT 2.0%.

Water NMT 0.2% (0.5 g, coulometric titration). However, use anolyte for water determination A for anolyte for water determination.

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 50 mg of Pioglitazone Hydrochloride and pioglitazone hydrochloride RS (previously determine the content of water), add exactly 10 mL each of the internal standard solution, and add methanol to make 100 mL. Pipet 2 mL each of this solution, add the mobile phase to make exactly 20 mL, and use these solutions as the test solution and the standard solution, respectively. Take 20 μL each of the test solution and the standard solution, perform the test according to the Liquid Chromatography under the following conditions, and calculate the peak area ratios Q_T and Q_S of pioglitazone to that of the internal standard, respectively.

$$\text{Amount (mg) of pioglitazone hydrochloride } (C_{19}H_{20}N_2O_3S\cdot HCl) = W_S \times Q_T / Q_S$$

W_{Sb}: Amount (mg) of pioglitazone hydrochloride RS, calculated on the anhydrous basis

Internal standard solution—A solution of benzophenone in methanol (1 in 750).

Operating conditions

Detector: An ultraviolet absorption spectrophotometer (wavelength: 269 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 ℃.

Mobile phase: A mixture of ammonium acetate solution (77 in 10000), acetonitrile and acetic acid(100) (25 : 25 : 1).

Flow rate: Adjust the flow rate so that the retention time of pioglitazone is about 7 minutes.

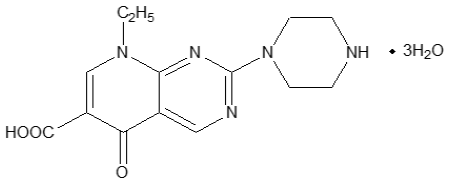
System suitability

System performance: Proceed with 20 μL of the standard solution according to the above operating conditions; pioglitazone and the internal standard are eluted in this order with the resolution being NLT 10.

System repeatability: Repeat the test 6 times with 20 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area ratio of pioglitazone to the peak area of the internal standard is NMT 1.0%.

Packaging and storage Preserve in well-closed containers.

Pipemidic Acid Hydrate
피페미드산수화물



Pipemidic Acid

Pipemidic Acid Trihydrate $C_{14}H_{17}N_5O_3\cdot 3H_2O$: 357.36

8-Ethyl-5-oxo-2-(piperazin-1-yl)-5,8-dihydropyrido[2,3-d]pyrimidine-6-carboxylic acid [*72571-82-5*]

Pipemidic Acid Hydrate contains NLT 98.5% and NMT 101.0% of pipemidic acid ($C_{14}H_{17}N_5O_3$: 303.32), calculated on the anhydrous basis.

Description Pipemidic Acid Hydrate occurs as a pale yellow crystalline powder.

It is freely soluble in acetic acid(100), soluble, very slightly soluble in water or ethanol(99.5), and practically insoluble in methanol.

It dissolves in sodium hydroxide TS.

It is gradually colored by light.

Melting point—About 250 ℃ (with decomposition).

Identification (1) Dissolve 0.1 g of Pipemidic Acid Hydrate in 20 mL of sodium hydroxide TS, heat on a steam bath for 1 hour under the reflux condenser, and cool. Take 2 mL of this solution, add 1 drop of phenolphthalein TS, add dilute acetic acid to neutralize, and add another 1 mL of dilute acetic acid. Add 4 mL of a solution of *p*-benzoquinone in methanol (1 in 1000) and boil with mild heat; the resulting solution exhibits an orange color.

(2) Dissolve 0.1 g each of Pipemidic Acid Hydrate and pipemidic acid hydrate RS in 20 mL of sodium hydroxide TS, and add water to make 200 mL. Take 1 mL each of these solutions, and add water to make 100 mL. Determine the absorption spectra of these solutions as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared spectra of Pipemidic Ac-

id Hydrate and pipemidic acid hydrate RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Purity (1) ***Chloride*—**Dissolve 1.0 g of Pipemidic Acid Hydrate in 35 mL of water and 10 mL of sodium hydroxide TS, add 15 mL of dilute nitric acid, shake well to mix, and filter with the glass filter. Pipet 30 mL of the filtrate and add 6 mL of dilute nitric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution by adding 5 mL of sodium hydroxide TS, 13.5 mL of dilute nitric acid, and water to 0.30 mL of 0.01 mol/L hydrochloric acid to make 50 mL (NMT 0.021%).

(2) ***Sulfate*—**Dissolve 1.0 g of Pipemidic Acid Hydrate in 35 mL of water and 10 mL of sodium hydroxide TS, add 15 mL of dilute hydrochloric acid, shake well to mix, and filter with the glass filter. Take 30 mL of the filtrate and add water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution by adding 5 mL of sodium hydroxide TS, 7.5 mL of dilute hydrochloric acid, and water to 0.50 mL of 0.005 mol/L sulfuric acid to make 50 mL (NMT 0.048%).

(3) ***Heavy metals*—**Proceed with 2.0 g of Pipemidic Acid Hydrate according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(4) ***Arsenic*—**Proceed with 1.0 g of Pipemidic Acid Hydrate according to Method 3 and perform the test (NMT 2 ppm).

(5) ***Related substances*—**Dissolve 0.10 g of Pipemidic Acid Hydrate in 10 mL of diluted acetic acid(100) (1 in 20), and use this solution as the test solution. Pipet 1 mL of this solution, add diluted acetic acid(100) (1 in 20) to make exactly 200 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of chloroform, methanol, formic acid, and triethylamine (25 : 15 : 5 :1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot from the test solution are not more intense than the spots from the standard solution.

Water Between 14.5% and 16.0% (20 mg, volumetric titration).

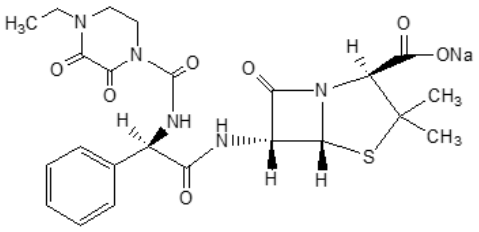
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.35 g of Pipemidic Acid Hydrate, dissolve in 40 mL of acetic acid(100), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 30.33 mg of $C_{14}H_{17}N_5O_3$

Packaging and storage Preserve in light-resistant, well-closed containers.

Piperacillin Sodium
피페라실린나트륨



$C_{23}H_{26}N_5NaO_7S$: 539.54

Sodium (2*S*,5*R*,6*R*)-6-{[(2*R*)-2-[(4-ethyl-2,3-dioxopiperazine-1-carbonyl)amino]-2-phenyl-acetyl]amino}-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylate [*59703-84-3*]

Piperacillin Sodium contains NLT 863 μg (potency) of piperacillin ($C25H_{23}N9O_{27}S$: 517.55) per mg, calculated on the anhydrous basis.

Description Piperacillin Sodium occurs as a white powder or a mass.
It is very soluble in water, freely soluble in methanol or ethanol(95) and practically insoluble in acetonitrile.

Identification (1) Determine the infrared spectra of Piperacillin Sodium and piperacillin sodium RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) Piperacillin Sodium responds to the Qualitative Analysis (1) for sodium salt.

Optical rotation $[\alpha]_D^{20}$: Between +175° and +190° (0.8 g, calculated on the anhydrous basis, water, 20 mL, 100 mm).

pH Dissolve 1.0 g of Piperacillin Sodium in 4 mL of water; the pH is between 5.0 and 7.0.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Piperacillin Sodium in 10 mL of water; the solution is clear and colorless.

(2) ***Heavy metals***—Proceed with 2.0 g of Piperacillin Sodium according to Method 4 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Arsenic***—Proceed with 2.0 g of Piperacillin Sodium according to the Method 4, and perform the test (NMT 1 ppm).

(4) ***Related substances***—Weigh accurately about

0.1 g of Piperacillin Sodium, dissolve in the mobile phase A to make exactly 50 mL, and use this solution as the test solution. Pipet 1 mL of this solution, add the mobile phase A to make exactly 100 mL, and use this solution as the standard solution. Pipet 20 μL each of the test solution and the standard solution, perform the test with these solutions as directed under the Liquid Chromatography according to the following operating conditions, and determine the peak areas from each solution by calculating each peak area from each solution with the automatic integration method; the peak area with the retention time of about 7 minutes from the test solution is not greater than 1/2 of the peak area of piperacillin from the standard solution; the sum of the peak areas of the related substances I with the retention time of about 17 minutes and 21 minutes is not more than twice the peak area of piperacillin from the standard solution; the peak area of the related substances II with the retention time of about 56 minutes is not greater than the peak area of piperacillin from the standard solution. In addition, the sum of peak areas other than piperacillin in the test solution is not greater than 5 times the peak area of piperacillin from the standard solution. However, the peak areas of ampicillin, related substances I and related substances II are determined by multiplying the measured areas by their respective correction factors of 1.39, 1.32 and 1.11.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: Control the mixing ratio of mobile phase A and mobile phase B in stages or gradient elution as follows.

Mobile phase A: A mixture of water, acetonitrile and 0.2 mol/L potassium dihydrogen phosphate TS (45 : 4 : 1).

Mobile phase B: A mixture of acetonitrile and 0.2 mol/L potassium dihydrogen phosphate TS (25 : 24 : 1).

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 - 7	100	0
7 - 13	100 → 83	0 → 17
13 - 41	83	17
14 - 56	83 → 20	17 → 80
56 - 60	20	80

Flow rate: 1.0 mL/minute. Under this condition, the retention time of piperacillin is about 33 minutes.

Time span of measurement: About 1.8 times the retention time of piperacillin after the solvent peak

System suitability

System performance: Proceed with 20 μL of the standard solution according to the above conditions; the number of theoretical plates and the symmetry factor of the peak of piperacillin are NLT 15000 and NMT 1.5, respectively.

System repeatability: Repeat the test 3 times with 20 μL each of the standard solutions according to the above operating conditions; the relative standard deviation of the peak area of piperacillin is NMT 2.0%.

(5) ***Dimethylaniline***—Weigh accurately about 1.0 g of Piperacillin Sodium, add 5 mL of 1 mol/L sodium hydroxide TS and 1 mL of the internal standard solution, centrifuge, if necessary, and use the supernatant as the test solution. Separately, weigh accurately about 50 mg of dimethylaniline, add 2.0 mL of hydrochloric acid, and add water to make 50 mL. Pipet 5.0 mL of this solution, and add water to make exactly 250 mL. Pipet 1.0 mL of this solution, add 5.0 mL of 1 mol/L sodium hydroxide TS, add 1.0 mL of the internal standard solution, centrifuge, if necessary, and use the supernatant as the standard solution. Perform the test with 1 μL each of the test solution and the standard solution as directed under the Gas Chromatography according to the following conditions, and calculate the peak area ratio, Q_T and Q_S, of dimethylaniline to that of the internal standard, respectively (NMT 20 ppm).

$$\text{Content (ppm) of dimethylaniline} = \text{Amount (mg) of dimethylaniline taken} \times \frac{Q_T}{Q_S} \times \frac{Purity\ (\%)\ of\ dimethylaniline}{Amount\ (mg)\ of\ Piperacillin\ Sodium\ taken} \times 4$$

Internal standard solution—Dissolve 50.0 mg of naphthalene in cyclohexane to make 50 mL. Take 5.0 mL of this solution, add cyclohexane to make 100 mL, and use this solution as the internal standard solution.

Operating conditions

Detector: A flame ionization detector

Column: A column about 2 mm in internal diameter and about 2 m in length, packed with diatomaceous earth for gas chromatography coated with 50% phenyl-50% methyl polysiloxane for gas chromatography equivalent to 3% of the mass.

Column temperature: 120 °C

Temperatures of the sample injection port and the detector: 150 °C

Carrier gas: Nitrogen

Flow rate: 30 mL/min

Water NMT 1.0% (3 g, volumetric titration, direct titration).

Sterility It meets the requirements when used in the manufacturing of sterile preparations. However, the manufacturing process of sterile preparations which include the terminal sterile process is exceptional.

Bacterial endotoxins Less than 0.07 EU per mg (potency) of piperacillin when used in the manufacturing of sterile preparations.

Assay Weigh accurately about 0.1 g (potency) of Piperacillin Sodium, and dissolve in water to make exactly 100 mL. Pipet 5.0 mL of this solution, add exactly 5 mL of the internal standard solution, and use this solution as the test solution. Separately, weigh accurately an amount equivalent to about 0.1 mg (potency) of piperacillin RS, and dissolve in the mobile phase to make exactly 100 mL. Pipet 5 mL of this solution, add exactly 5 mL of the internal standard solution, and use this solution as the standard solution. Perform the test with 5 μL each of the test solution and the standard solution as directed under Liquid Chromatography according to the following conditions and calculate the ratios of the peak height, Q_T and Q_S, of piperacillin to that of the internal standard for the test solution and the standard solution, respectively.

$$\text{Potency (μg) of piperacillin } (C_{23}H_{26}N_5O_7S) = \text{Potency (μg) of piperacillin RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of acetanilide in the mobile phase (1 in 5000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 150 mm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: Weigh 60.1 g of acetic acid(100), 101.0 g of triethylamine and water to make exactly 1000 mL. To 25 mL of this solution, add 25 mL of dilute acetic acid, 210 mL of acetonitrile and water to make exactly 1000 mL.

Flow rate: Adjust the flow rate so that the retention time of piperacillin is about 5 minutes.

System suitability

System performance: Proceed with 5 μL of the standard solution according to the above conditions; the internal standard and piperacillin are eluted in this order with the resolution being NLT 3.

System repeatability: Repeat the test 6 times with 5 μL each of the standard solutions under the above operating conditions; the relative standard deviation of the peak height ratio of piperacillin to that of the internal standard is NMT 1.0%.

Packaging and storage Preserve in hermetic containers.

Piperacillin Sodium for Injection
주사용 피페라실린나트륨

Piperacillin Sodium for Injection is a preparation for injection which is dissolved before use, and contains NLT 93.0% and NMT 107.0% of the labeled amount of piperacillin ($C_{23}H_{27}N_5O_7S$: 517.55).

Method of preparation Prepare as directed under Injections, with Piperacillin Sodium.

Description Piperacillin Sodium occurs as a white powder or a mass.

Identification Perform the test as directed under the Identification (1) and (2) under Piperacillin Sodium.

pH Take Piperacillin Sodium for Injection in the amount equivalent to 1.0 g (potency) as piperacillin sodium according to the labeled amount and dissolve it in 4 mL of water; the pH of the solution is 5.0 to 7.0.

Purity (1) ***Clarity and color of solution***—Take Piperacillin Sodium for Injection in the amount equivalent to 4.0 g (potency) as piperacillin sodium according to the labeled amount, and dissolve in 17 mL of water; the solution is colorless and clear.

(2) ***Related substances***—Proceed as directed under the Purity (4) under Piperacillin Sodium.

Water NMT 1.0% (3 g, volumetric titration, direct titration).

Sterility Meets the requirements.

Bacterial endotoxins Less than 0.04 EU per mg (potency) of piperacillin.

Uniformity of dosage units Meets the requirements of the mass variation test.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Assay Take NLT 10 containers of Piperacillin Sodium Injection, weigh accurately the amount equivalent to about 20 mg (potency) as piperacillin sodium according to the labeled amount, and dissolve in water to make exactly 20 mL. Pipet 5 mL of this solution, add exactly 5 mL of the internal standard solution, and use the resulting solution as the test solution. Separately, weigh accurately about 20 mg (potency) of piperacillin RS, and dissolve in the mobile phase to make exactly 20 mL. Pipet 5 mL of this solution, add exactly 5 mL of the internal standard solution, and use the resulting solution as the standard solution. Perform the test as directed under the Operating conditions of the Assay under Piperacillin Sodium.

$$\text{Potency (μg) of piperacillin } (C_{23}H_{26}N_5O_7S) = \text{Potency (μg) of piperacillin RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of acetanilide in the mobile phase (1 in 5000).

Packaging and storage Preserve in hermetic containers. Plastic containers for aqueous injections may be used.

Piperacillin Sodium·Tazobactam Sodium
피페라실린나트륨·타조박탐나트륨

Piperacillin Sodium·Tazobactam Sodium contains NLT 837 μg (potency) and NMT 980 μg (potency) of piperacillin ($C_{23}H_{27}N_5O_7S$: 517.56) per mg and NLT 103 μg and NMT 120 μg of tazobactam ($C_{10}H_{12}N_4O_5S$: 300.29) per mg.

Description Piperacillin Sodium·Tazobactam Sodium occurs as a white or milky white powder consisting of freeze-dried mixture of piperacillin sodium and tazobactam sodium, or piperacillin, tazobactam, and sodium bicarbonate dissolved in water for injection.
It is freely soluble in water or methanol, sparingly soluble in ethanol, and practically insoluble in acetone, chloroform, or ethyl acetate.

Identification (1) The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

(2) Dissolve 0.5 g of Piperacillin Sodium·Tazobactam Sodium in a mixture of acetone and water (1 : 1) to make 25 mL. Separately, weigh about 0.4 g (potency) of piperacillin RS and about 50 mg of tazobactam RS, dissolve each in 2 mL of 1 mol/L sodium bicarbonate VS, and add a mixture of acetone and water (1 : 1) to make 25 mL. Use these solutions as the piperacillin standard solution and the tazobactam standard solution, respectively. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography, develop the plate using a mixture of toluene, acetone, and acetic acid(100) (5 : 2 : 2) as the developing solvent, air-dry the plate, and examine the plate under ultraviolet light (main wavelength: 254 nm); the R_f values and colors of the spots obtained from the test solution and piperacillin standard solution are the same. Again, spray evenly 4-dimethylaminobenzaldehyde-methanol TS on the plate, and dry; the R_f values of the red spots obtained from the test solution and tazobactam standard solution are the same.

pH Dissolve Piperacillin Sodium·Tazobactam Sodium in water to make 0.2g (potency)/mL solution; the pH of the solution is between 4.5 and 6.8.

Purity ***Related substances***—Perform the test as directed under the Assay and determine the ratio of the peak area of each related substance to the total peak area of peaks other than the solvent peak in the test solution. However, weigh accurately 20 mg of related substance I RS [(2R,4S)-2-{(1R)-Carboxy[2-(4-ethyl-2,3-dioxopiperazine-1-carboxamido)-2-phenylacetamido]methyl}-5,5-dimethylthiazolidine-4-carboxylic acid], dissolve in the mobile phase to make exactly 250 mL. Pipet 2 mL of this solution, add the mobile phase to make exactly 25 mL, and use this solution as the related substance I standard solution (this solution is stable for about 1 hour at room temperature). The amount of related substance I is NMT 5.0%, and the total amount of related substances other than related substance I is NMT 5.0%.

Sterility It meets the requirements when used in the manufacturing of sterile preparations. However, it is excluded in cases where there is a terminal sterilization process in the manufacturing of sterile preparations.

Bacterial endotoxins Meet the requirement when Piperacillin Sodium·Tazobactam Sodium is used in sterile preparations. However, Piperacillin Sodium·Tazobactam Sodium is NMT 0.07 EU per mg (potency) as piperacillin.

Water NMT 2.0% (0.5 g, volumetric titration, direct titration)

Assay Weigh accurately about 0.5 g of Piperacillin Sodium·Tazobactam Sodium, and dissolve in the mobile phase to make exactly 50 mL. Pipet 1 mL of this solution, add the mobile phase to make exactly 50 mL, and use this solution as the test solution. Separately, weigh accurately about 25 mg (potency) of piperacillin RS and about 15 mg of tazobactam RS, dissolve each in the mobile phase to make exactly 25 mL, and use these solutions as the piperacillin standard stock solution and tazobactam standard stock solution. Mix 5.0 mL of piperacillin standard stock solution and 1.0 mL of tazobactam standard stock solution, add the mobile phase to make exactly 25 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas of piperacillin and tazobactam, A_{T1}, A_{T2}, A_{S1}, and A_{S2}, for each solution.

$$\text{Potency (μg) piperacillin } (C_{23}H_{27}N_5O_7S) = Potency\ (\mu g)\ of\ piperacillin\ RS \times \frac{A_{T1}}{A_{S1}} \times 20$$

A_{T1}: Peak area of piperacillin in the test solution
A_{S1}: Peak area of piperacillin in the standard solution

$$\text{Content (μg) tazobactam } (C_{10}H_{12}N_4O_5S) = Content\ (\mu g)\ of\ tazobactam\ RS \times \frac{A_{T2}}{A_{S2}} \times 4$$

A_{T2}: Peak area of tazobactam in the test solution
A_{S1}: Peak area of tazobactam in the standard solution

Operating conditions

Detector: An ultraviolet absorption spectrophotometer (wavelength: 210 nm).

Column: A stainless steel column between 3.9 mm and 4.5 mm in internal diameter and about 15 cm in length, packed with methylphenylpropylsilanized silica gel for liquid chromatography (4 μm to 5 μm in particle diameter).

Mobile phase: Mix 775 mL of 0.005 mol/L tetrabutylammonium hydroxide TS and 225 mL of acetonitrile, and adjust the pH to between 3.5 and 3.7 with 20% phosphoric acid solution.

Flow rate: 1.0 mL/min

Packaging and storage Preserve in tight containers.

Piperacillin Sodium·Tazobactam Sodium for Injection
주사용 피페라실린나트륨·타조박탐나트륨

Piperacillin Sodium·Tazobactam Sodium for Injection is an injection which is dissolved before use and contains NLT 90.0% and NMT 120.0% of the labeled amount of piperacillin ($C_{23}H_{27}N_5O_7S$: 517.56) and tazobactam ($C_{10}H_{12}N_4O_5S$: 300.29).

Description Piperacillin Sodium·Tazobactam Sodium for Injection occurs as a white to milky white powder or a mass.

Method of preparation Prepare as directed under Injections, with Piperacillin Sodium·Tazobactam Sodium.

Identification Perform the test as directed under the Identification (1) and (2) under Piperacillin Sodium·Tazobactam Sodium.

pH Dissolve Piperacillin Sodium·Tazobactam Sodium for Injection in water to make 0.2 g (potency)/mL of piperacillin; the pH of the solution is 4.5 to 6.8.

Sterility Meets the requirements.

Bacterial endotoxins Less than 0.07 EU per mg (potency) of piperacillin.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

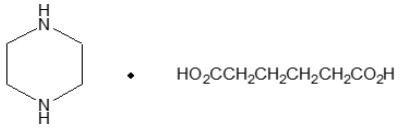
Uniformity of dosage units Meets the requirements.

Water NMT 2.0% (0.5 g, volumetric titration, direct titration)

Assay Perform the test as directed under the Assay under Piperacillin Sodium·Tazobactam Sodium. Prepare the test solution by weighing accurately Piperacillin Sodium·Tazobactam Sodium for Injection in the amount equivalent to about 2 g (potency) as piperacillin according to the labeled potency and adding the mobile phase to make a solution having a concentration of 0.2 mg (potency) as piperacillin per mL.

Packaging and storage Preserve in hermetic containers.

Piperazine Adipate
피페라진아디프산염



$C_4H_{10}N_2 \cdot C_6H_{10}O_4$: 232.28

Piperazine hexanedioate [*142-88-1*]

Piperazine Adipate, when dried, contains NLT 98.5% and NMT 101.0% of piperazine adipate ($C_4H_{10}N_2 \cdot C_6H_{10}O_4$).

Description Piperazine Adipate occurs as a white crystalline powder. It is odorless and has a slightly sour taste. It is soluble in water or acetic acid(100) and practically insoluble in ethanol(95), acetone or ether.

Melting point—About 250 ℃ (with decomposition).

Identification (1) Dissolve 0.5 g of Piperazine Adipate in 10 mL of water, add 1 mL of hydrochloric acid, and extract 2 times each with 20 mL of ether. Combine the ether extracts, evaporate the residue to dryness on a steam bath, and dry the residue at 105 ℃ for 1 hour; the melting point is between 152 and 155 ℃.

(2) To 3 mL of an aqueous solution (1 in 100) of Piperazine Adipate, add 3 drops of Reinecke salt TS; a pale red precipitate is formed.

(3) Determine the infrared spectra of Piperazine Adipate and piperazine adipate RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

pH Dissolve 1 g of Piperazine Adipate in 20 mL of water; the pH of this solution is between 5.0 and 6.0.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Piperazine Adipate in 30 mL of water; the resulting solution is clear and colorless.

(2) ***Heavy metals*—**Proceed with 2.0 g of Piperazine Adipate according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Related substances***—Weigh accurately 1 g of Piperazine Adipate, dissolve in the diluent to make exact-

ly 10 mL, and use this solution as the test solution (1). Pipet 1.0 mL of the test solution (1), dissolve in the diluent to make exactly 10 mL, and use this solution as the test solution (2). Separately, weigh accurately 0.1 g of piperazine adipate RS, dissolve in the diluent to make exactly 10 mL, and use this solution as the standard solution (1). Weigh accurately 25 mg of ethylenediamine, dissolve in the diluent to make exactly 100 mL, and use this solution as the standard solution (2). Weigh accurately 25 mg of triethylenediamine, dissolve in the diluent to make exactly 100 mL, and use this solution as the standard solution (3). Weigh accurately 25 mg of triethylenediamine and 1 g of piperazine adipate RS, dissolve in the diluent to make exactly 100 mL, and use this solution as the standard solution (4). With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solutions (1) and (2) and the standard solutions (1), (2), (3), and (4) on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Develop the plate with a mixture of acetone and 13.5 mol/L ammonia water (80 : 20) as the developing solvent to a distance of about 15 cm, and dry the plate at 105 ℃. Spray a solution of 0.3% ninhydrin in a mixture of 1-butanol and acetic acid(100) (100 : 3) on the plate, spray a 0.15% ninhydrin-anhydrous alcohol solution additionally, dry the plate at 105 ℃ for 10 minutes, and examine the plate; the spots other than the principal spot obtained from the test solution (1) are not more intense than the principal spot from the standard solution (2) (NMT 0.25%). Spray iodine TS on the plate, allow to stand for 10 minutes, and examine the plate. The spot corresponding to triethylenediamine obtained from the test solution (1) is not more intense than the principal spot from the standard solution (3) (NMT 0.25%). This test is valid when the principal spot obtained from the standard solution (4) and the spot corresponding to triethylenediamine are clearly separated.

Diluent—A mixture of 13.5 mol/L ammonia water and anhydrous alcohol (3 : 2).

Loss on drying NMT 0.5% (1 g, 105 ℃, 4 hours).

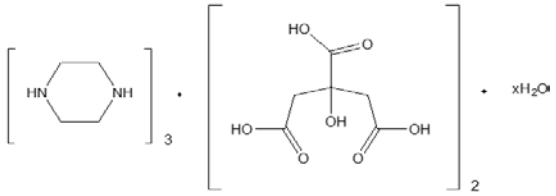
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.2 g of Piperazine Adipate, previously dried, dissolve in 20 mL of acetic acid(100) and 40 mL of acetone for non-aqueous titration, and titrate with 0.1 mol/L perchloric acid VS (indicator: 6 drops of bromocresol green-methylrosaniline chloride TS). However, the endpoint of the titration is when the color of the solution changes from purple to bluish purple. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 11.614 mg of $C_4H_{10}N_2 \cdot C_6H_{10}O_4$

Packaging and storage Preserve in well-closed containers.

Piperazine Citrate Hydrate
피페라진시트르산염수화물



Piperazine Citrate $(C_4H_{10}N_2)_3 \cdot 2C_6H_8O_7 \cdot xH_2O$
Piperazine 2-2-hydroxypropane-1,2,3-tricarboxylate hexahydrate [*41372-10-5*]

Piperazine Citrate Hydrate contains NLT 98.0% and NMT 100.5% of piperazine citrate [$(C_4H_{10}N_2)_3 \cdot 2C_6H_8O_7$: 642.65], calculated on the anhydrous basis.

Description Piperazine Citrate Hydrate occurs as a white crystalline powder and has a slight odor.
It is soluble in water and practically insoluble in ethanol(95) or ether.
The pH of an aqueous solution of Piperazine Citrate Hydrate (1 in 10) is about 5.

Identification (1) Dissolve 0.2 g of Piperazine Citrate Hydrate in 5 mL of 3 mol/L hydrochloric acid, add 1 mL of sodium nitrite solution (1 in 2) while shaking to mix. Next, immerse in ice for 15 minutes, shake to mix if necessary, precipitate the crystals, and filter the precipitate using a glass filter. Wash with 10 mL of cold water, and dry at 105 ℃. The melting point of the obtained *N*,*N'*-dinitrosopiperazine is between 156 and 160 ℃.

(2) Piperazine Citrate Hydrate responds to the Qualitative Analysis for citrate.

Purity (1) ***Primary amine and ammonia***—Dissolve 0.5 g of Piperazine Citrate Hydrate in 10 mL of water, add 1 mL of 2.5 mol/L sodium hydroxide, 1 mL of acetone and 1 mL of sodium nitroprusside TS, shake to mix, and allow to stand for 10 minutes. Determine the absorbance A_1 and A_2 at wavelengths of 520 nm and 600 nm; the ratio A_2/A_1 is NMT 0.5. Prepare the blank test solution by using the same amount of the same test solution, and using water instead of sodium hydroxide solution (NMT 0.7% of primary amine and ammonia).

(2) ***Heavy metals***—Dissolve 1.25 g of Piperazine Citrate Hydrate in water to make 25 mL. Use this solution as the test solution and perform the test. Separately, to 3 mL of lead standard solution, add water to make 30 mL. To 10 mL of this solution, add 2 mL of the test solution, and use this solution as the control solution. Also, to 10 mL of water, add 2 mL of the test solution, and use this solution as the blank test solution. To 12 mL each of the test solution, the control solution, and the blank test solution, add 2 mL of pH 3.5 acetate buffer solution, mix, add 1.2 mL of thioacetamide TS, and mix immediately. Allow them to stand for 2 minutes; the color of the test

solution is not more intense than that of the control solution (NMT 20 ppm).

System suitability—The control solution exhibits a faint brown color compared to the blank test solution.

(3) ***Related substances***—Weigh accurately 1 g of Piperazine Citrate Hydrate, dissolve in the diluent to make exactly 10 mL, and use this solution as the test solution (1). Pipet 1.0 mL of the test solution (1), add diluent to make exactly 10 mL, and use this solution as the test solution (2). Separately, weigh accurately 0.1 g of piperazine citrate RS, dissolve in the diluent to make exactly 10 mL, and use this solution as the standard solution (1). Weigh accurately 25 mg of ethylenediamine, dissolve in diluent to make exactly 100 mL, and use this solution as the standard solution (2). Weigh accurately 25 mg of triethylenediamine, dissolve in diluent to make exactly 100 mL, and use this solution as the standard solution (3). Weigh accurately 25 mg of triethylenediamine and 1.0 g of piperazine citrate RS, dissolve in diluent to make exactly 100 mL, and use this solution as the standard solution (4). With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solutions (1) and (2) and the standard solutions (1), (2), (3), and (4) on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Develop the plate with a mixture of acetone and 13.5 mol/L ammonia water (80 : 20) as the developing solvent to a distance of about 15 cm, and dry the plate at 105 ℃. Spray evenly a solution of 0.3% ninhydrin in a mixture of 1-butanol and acetic acid(100) (100 : 3) on the plate, spray a 0.15% ninhydrin-anhydrous alcohol solution additionally, dry the plate at 105 ℃ for 10 minutes, and examine the plate. The spots other than the principal spot obtained from the test solution (1) are not more intense than the principal spot from the standard solution (2) (NMT 0.25%). Spray iodine TS on the plate, allow to stand for 10 minutes, and examine the plate; the spot corresponding to triethylenediamine obtained from the test solution (1) is not more intense than the spot obtained from the standard solution (3) (NMT 0.25%). This test is valid when the principal spot obtained from the standard solution (4) and the spot corresponding to triethylenediamine are clearly separated.

Diluent—A mixture of 13.5 mol/L ammonia water and anhydrous alcohol (3 : 2).

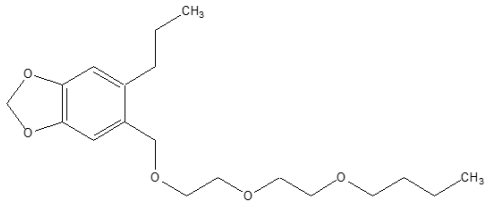
Water NMT 12.0% (0.3 g, direct titration).

Assay Weigh accurately about 0.2 g of Piperazine Citrate Hydrate, and dissolve in 100 mL of acetic acid(100). Dissolve by heating if necessary, and titrate with 0.1 mol/L perchloric acid VS (indicator: 3 drops of methylrosaniline chloride TS). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 10.711 mg $(C_4H_{10}N_2)_3 \cdot 2C_6H_8O_7$

Packaging and storage Preserve in well-closed containers.

Piperonyl Butoxide
피페로닐부톡시드



$C_{19}H_{30}O_5$: 338.43
5-[[2-(2-Butoxyethoxy)ethoxy]methyl]-6-propyl-1,3-benzodioxole, [*51-03-6*]

Piperonyl Butoxide contains NLT 80.0% of piperonyl butoxide ($C_{19}H_{30}O_5$).

Description Piperonyl Butoxide occurs as a pale yellow to pale brown transparent oily liquid that is odorless or has a slight odor.
It is miscible with methanol, acetone, or hexane.
It is practically insoluble in water.
Refractive index n_D^{20}: Between 1.497 and 1.512.

Identification (1) To 0.5 mL of a solution of Piperonyl Butoxide in methanol (1 in 1000), add 20 mL of tannic acid-acetic acid TS and heat while occasionally shaking to mix; the resulting solution exhibits a blue color.

(2) Determine the absorption spectrum of a solution of Piperonyl Butoxide in diluted methanol (9 in 10) (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; it exhibits maxima at a wavelength of between 236 nm and 240 nm and between 288 nm and 292 nm, and when the absorbance values obtained at each maximum wavelength are A_1 and A_2, A_1/A_2 is between 1.13 and 1.33.

Specific gravity d_{20}^{20}: Between 1.050 and 1.070.

Purity (1) ***Color***—The color of Piperonyl Butoxide is not more intense than the color of a mixture of 1.4 mL of cobalt chloride colorimetric stock solution, 0.3 mL of copper sulfate colorimetric stock solution, and 4.3 mL of ferric chloride colorimetric stock solution.

(2) ***Heavy metals***—Proceed with 1.0 g of Piperonyl Butoxide according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Arsenic***—Proceed with 1.0 g of Piperonyl Butoxide according to Method 3 and perform the test (NMT 2 ppm).

(4) ***Related substances***—Take each 0.1 μL to 0.2 μL of Piperonyl Butoxide, perform the test as directed under the Gas Chromatography according to the following conditions, and determine A_1, the sum of the peak

areas of peaks other than the major peak which appears in the ratio of retention time to the major peak ranging from 0.02 to 2.0, and A_2, the total peak area including all peaks; A_1/A_2 is NMT 0.12.

Operating conditions

Detector: A flame ionization detector

Column: A glass column, about 2 mm to 3 mm in internal diameter and 1 m to 2 m in length, packed with diatomaceous earth for gas chromatography coated with phenylmethylsilicone polymer of 177 μm and 250 μm at a rate of 10%.

Column temperature: A constant temperature of about 250 ℃.

Carrier gas: Nitrogen

Flow rate: Adjust the flow rate so that the major peak shows after 15 to 20 minutes.

Assay Weigh accurately an amount of Piperonyl Butoxide equivalent to 20 mg of piperonyl butoxide ($C_{19}H_{30}O_5$), transfer into a 100-mL volumetric flask, add a mixture of methanol and water (80 : 20), and shake to mix and dissolve. Add a mixture of methanol and water (80 : 20) to make 100 mL, and use this solution as the test solution. Separately, weigh accurately 20 mg of piperonyl butoxide RS, transfer into a 100-mL volumetric flask, dissolve in a mixture of methanol and water (80 : 20), and add another mixture of methanol and water (80 : 20) to make 100 mL. Use this solution as the standard solution. Perform the test with the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions and determine the peak areas of piperonyl butoxide, A_T and A_S, of each solution.

Amount (mg) of piperonyl butoxide ($C_{19}H_{30}O_5$)
= Amount (mg) of piperonyl butoxide RS× $\frac{A_T}{A_S}$

Operating conditions

Detector: An ultraviolet absorption spectrophotometer (wavelength: 254 nm).

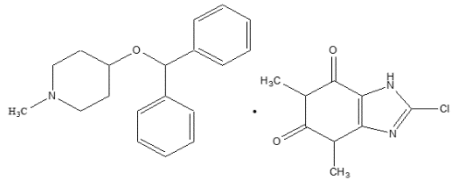
Column: A stainless steel column about 4 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: Mixture of methanol and water (80 : 20).

Flow rate: 1 mL/min

Packaging and storage Preserve in tight containers.

Piprinhydrinate
피프린히드리네이트



$C_{26}H_{30}ClN_5O_3$: 496.00

4-(Diphenylmethoxy)-1-methylpiperidine 8-chloro theophyllinate, [*606-90-6*]

Piprinhydrinate, when dried, contains NLT 98.0% and NMT 101.0% of piprinhydrinate ($C_{26}H_{30}ClN_5O_3$).

Description Piprinhydrinate occurs as a white crystalline powder. It is odorless and has a bitter taste.
It causes localized anesthesia on the tongue when tasted with the tongue.
It is freely soluble in ethanol and sparingly soluble in water.

Identification Add 10 mg of Piprinhydrinate to 2 mL of sulfuric acid and the solution exhibits an orange red. Add water to this solution and the solution changes to white.

Melting point Between 170 and 175 ℃.

Purity (1) ***Heavy metals***—Proceed with 1 g of Piprinhydrinate according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Arsenic***—Mix 0.2 g of Piprinhydrinate with 0.3 g of potassium nitrate and 0.5 g of anhydrous sodium carbonate, transfer into a platinum crucible, and heat until the ignition is complete. Next, cool this crucible, boil the residue with 10 mL of dilute sulfuric acid for 5 minutes, filter, and wash the undissolved residue with 10 mL of water. Combine the washings and the filtrate, and evaporate until the white smoke forms. Dissolve this residue in 5 mL of water and perform the test (NMT 10 ppm).

Loss on drying NMT 1.0% (1.0 g, 105 ℃, 2 hours).

Residue on ignition NMT 0.15% (1.0 g)

Assay Weigh accurately about 0.5 g of Piprinhydrinate, previously dried, dissolve in 60 mL of acetic acid(100) for non-aqueous titration, and titrate with 0.05 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.05 mol/L perchloric acid VS
= 24.800 mg of $C_{26}H_{30}ClN_5O_3$

Packaging and storage Preserve in tight containers.

Piprinhydrinate Injection
피프린히드리네이트 주사액

Piprinhydrinate Injection contains NLT 95.0% and NMT 105.0% of the labeled amount of piprinhydrinate (C26H30ClN5O3 : 496.00).

Method of preparation Prepare as directed under Injections, with Piprinhydrinate.

Identification (1) Take Piprinhydrinate Injection in the amount equivalent to 10 mg of piprinhydrinate according to the labeled amount, evaporate to dryness on a steam bath, and add sulfuric acid to the residue; it exhibits a yellowish red color. Add water to it; it turns to a white color.

(2) Take Piprinhydrinate Injection in a suitable quantity according to the labeled amount, and add water to make a solution having a concentration of 15 μg to 20 μg per mL. Determine the absorption spectrum of this solution as directed under the Ultraviolet-visible Spectroscopy, using water as a control solution; it exhibits a maximum at about 280 nm.

pH Between 6.0 and 8.0.

Sterility Meets the requirements.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

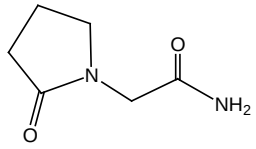
Extractable volume of injections Meets the requirements.

Assay Pipet Piprinhydrinate Injection in the amount equivalent to about 1.5 mg of piprinhydrinate (C26H30ClN5O3), add water to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 15 mg of piprinhydrinate RS, and dissolve in water to make exactly 100 mL. Pipet 10 mL of this solution, add water to make exactly 100 mL, and use the resulting solution as the standard solution. Determine the absorbances, AT and AS, of the test solution and the standard solution, respectively, using water as a control solution, at the wavelength of 278 nm as directed under the Ultraviolet-visible Spectroscopy.

Amount (mg) of piprinhydrinate ($C_{26}H_{30}ClN_5O_3$)
= Amount (mg) of piprinhydrinate RS × (A_T / A_S) × 0.1

Packaging and storage Preserve in hermetic containers.

Piracetam
피라세탐



$C_6H_{10}N_2O_2$: 142.16
2-(2-Oxopyrrolidin-1-yl)acetamide [*72496-41-4*]

Piracetam contains NLT 98.0% and NMT 102.0% of piracetam ($C_6H_{10}N_2O_2$), calculated on the dried basis.

Description Piracetam occurs as a white powder.
It is freely soluble in water and soluble in ethanol(95).
It shows polymorphism.

Identification Determine the infrared spectra of Piracetam and piracetam RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers. If any difference appears between the spectra, dissolve Piracetam and piracetam RS in ethanol(95), respectively, evaporate to dryness in water baths, and perform the test again with the residues.

Purity (1) ***Clarity and color of solution***—Dissolve 2.0 g of Piracetam in water to make 10 mL; the resulting solution is clear and colorless.

(2) ***Heavy metals***—Proceed with 2.0 g of Piracetam according to Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Related substances***—Dissolve 50.0 mg of Piracetam in a mixture of acetonitrile and water (10 : 90) to make exactly 100 mL, and use this solution as the test solution. Separately, dissolve 5 mg of Piracetam and 10 mg of piracetam related substance I (2-pyrrolidone) in a mixture of water and acetonitrile (90 : 10) to make exactly 100 mL, and use this solution as the standard solution (1). To 1.0 mL of the test solution, add a mixture of water and acetonitrile (90 : 10) to make exactly 100 mL. To 5.0 ml of this solution, add a mixture of water and acetonitrile (90 : 10) to make exactly 50 mL, and use this solution as the standard solution (2). Perform the test with 20 μL each of the test solution and the standard solution (2) as directed under the Liquid Chromatography according to the following conditions. The peak areas other than the major peak obtained from the test solution are not larger than the major peak obtained from the standard solution (2), and the sum of the peak areas other than the major peak obtained from the test solution is not larger than 3 times the area of the major peak obtained from the standard solution (2). However, exclude any peak having an area smaller than 0.5 times the area of the major peak from the standard solution (2).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 205 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of phosphate buffer solution and acetonitrile (90 : 10).

Flow rate: 1.0 mL/min

System suitability

Proceed with the standard solution (1) under the above conditions; the resolution between piracetam and piracetam related substance I is NLT 3.0, and the symmetry factor of piracetam peak is NMT 2.0.

Time span of measurement: About 8 times the retention time of piracetam.

Phosphate buffer solution (pH 6.0)—Dissolve 1.0 g of potassium dihydrogen phosphate in water to make 1000 mL and adjust its pH to 6.0 with phosphoric acid.

Loss on drying NMT 1.0% (1.0 g, 105 ℃, constant mass).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.75 g of Piracetam, dissolve it in 50 mL of water, add 20.0 mL of 1 mol/L sodium hydroxide, and heat to boiling for 15 minutes. After cooling, put 25.0 mL of 1 mol/L hydrochloric acid, and heat to boiling for 2 hours. After cool, titrate with 1 mol/L sodium hydroxide VS (indicator: 2 drops of phenolphthalein TS). Perform a blank test in the same manner and make any necessary correction.

Each mL of 1 mL of 1 mol/L sodium hydroxide VS
= 142.15 mg of $C_6H_{10}N_2O_2$

Packaging and storage Preserve in light-resistant, well-closed containers.

Piracetam Capsules
피라세탐 캡슐

Piracetam Capsules contain NMT 95.0% and NLT 105.0% of the labeled amount of piracetam ($C_6H_{10}N_2O_2$: 142.16).

Method of preparation Prepare as directed under Capsules, with Piracetam.

Identification (1) Weigh 0.5 g of the content of Piracetam Capsules, dissolve in 15 mL of water, add 3 mL of 50% sodium hydroxide solution and heat the solution; the gas evolved (ammonia gas) turns a red litmus paper to blue.

(2) The retention times of the major peaks of the test solution and the standard solution obtained under the Assay are the same.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of the contents of NLT 20 capsules of Piracetam Capsules. Weigh accurately an amount equivalent to about 50 mg of piracetam ($C_6H_{10}N_2O_2$), dissolve in water to make exactly 50 mL, and filter. Take 2.0 mL of the filtrate, add water to make exactly 50 mL, and use this solution as the test solution. Separately, proceed in the same manner as in the preparation of the test solution with about 50 mg of piracetam RS, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of piracetam in each solution.

Amount (mg) of piracetam ($C_6H_{10}N_2O_2$)
$= \text{Amount (mg) of piracetam RS} \times \frac{A_T}{A_S}$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 214 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm to 10 μm in particle diameter).

Mobile phase: A solution obtained by adjusting the pH of 10% methanol to 6.5 with 0.001 mol/L ammonium monohydrogen phosphate solution.

Flow rate: 1.0 mL/min

Packaging and storage Preserve in tight containers.

Piracetam Injection
피라세탐 주사액

Piracetam Injection contains NLT 95.0% and NMT 105.0% of the labeled amount of piracetam ($C_6H_{10}N_2O_2$: 142.16).

Method of preparation Prepare as directed under Injections, with Piracetam.

Identification (1) Weigh an amount of Piracetam Injection equivalent to 0.5 g of piracetam according to the labeled amount, dissolve in 15 mL of water, add 3 mL of 50% sodium hydroxide and heat; the gas produced (ammonia gas) turns red litmus paper to blue.

(2) The retention times of the major peaks from the test solution and the standard solution obtained under the Assay are the same.

pH Between 5.0 and 7.0.

Sterility Meets the requirements.

Bacterial endotoxins Less than 0.3 EU per mg of piracetam.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Extractable volume of injections Meets the requirements.

Assay Pipet an amount of Piracetam Injection equivalent to 50 mg of piracetam ($C_6H_{10}N_2O_2$) according to the labeled amount, add water to make 50 mL, and filter. Take 2.0 mL of the filtrate, add water to make 50 mL, and use this solution as the test solution. Separately, weigh accurately about 50 mg of piracetam RS, and proceed in the same manner as for the test solution, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of piracetam in each solution.

$$\text{Amount (mg) of piracetam } (C_6H_{10}N_2O_2) = \text{Amount (mg) of piracetam RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 214 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 to 10 μm in particle diameter).

Mobile phase: A solution of 10% methanol, adjusted the pH to 6.5 with 0.001 mol/L ammonium monohydrogen phosphate.

Flow rate: 1.0 mL/min

Packaging and storage Preserve in light-resistant, hermetic containers.

Piracetam Tablets
피라세탐 정

Piracetam Tablets contain NMT 95.0% and NLT 105.0% of the labeled amount of piracetam ($C_6H_{10}N_2O_2$: 142.16).

Method of preparation Prepare as directed under Tablets, with Piracetam.

Identification (1) Weigh accurately the amount of Piracetam Tablets, equivalent to about 0.5 g of piracetam according to the labeled amount, dissolve in 15 mL of water, add 3 mL of 50% sodium hydroxide, and heat; the generated gas (ammonia gas) changes the red litmus paper to blue.

(2) The major peaks of the test solution and the standard solution obtained under the Assay are the same in the retention time.

Dissolution Take 1 tablet of Piracetam Tablets, and perform the test according to Method 2 under the Dissolution at 50 revolutions per minute, using 900 mL of water as the dissolution medium. Take the dissolved solution after 30 minutes from the start of the test and filter. Discard the first 10 mL of the filtrate, pipet *V* mL of the subsequent filtrate, add water to make exactly *V'* mL of a solution containing about 50 μg of piracetam per mL according to the labeled amount. Separately, weigh accurately about 20 mg of piracetam RS, and dissolve in water to make 100 mL. Pipet 25 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and measure the peak areas, A_T and A_S, of piracetam ($C_6H_{10}N_2O_2$) in each solution. Meets the requirements if the dissolution rate of Piracetam Tablets in 30 minutes is NLT 80%.

$$\text{The dissolution rate (\%) of the labeled amount of piracetam } (C_6H_{10}N_2O_2) = W_S \times \frac{A_T}{A_S} \times \frac{V'}{V} \times \frac{1}{C} \times 225$$

W_S: Amount of piracetam RS (mg)

C: Labeled amount (mg) of piracetam ($C_6H_{10}N_2O_2$) in 1 tablet

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 214 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: A solution of 10% methanol, adjusted the pH to 6.5 with 0.001 mol/L ammonium monohydrogen phosphate.

Flow rate: 0.8 mL/min

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 tables of Piracetam Tablets, and powder them. Weigh accurately the amount of the powder, equivalent to about 50 mg of piracetam ($C_6H_{10}N_2O_2$), dissolve in water to make exactly 50 mL, and filter. Take 2.0 mL of the filtrate, add water to make exactly 50 mL, and use this solution as the test solution. Separately, weigh accurately about 50 mg of

piracetam RS, proceed in the same manner as in the preparation of the test solution, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of piracetam in each solution.

$$\text{Amount (mg) of piracetam } (C_6H_{10}N_2O_2) = Amount\ (mg)\ of\ piracetam\ RS \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 214 nm).

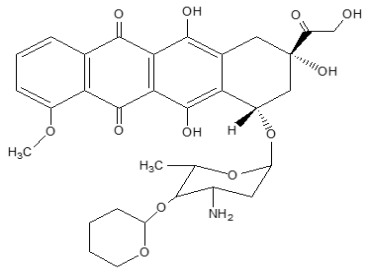
Column: A stainless steel column about 4 mm in internal diameter and about 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm to 10 μm in particle diameter).

Mobile phase: A solution of 10% methanol, adjusted the pH to 6.5 with 0.001 mol/L ammonium monohydrogen phosphate.

Flow rate: 1.0 mL/min

Packaging and storage Preserve in light-resistant, tight containers.

Pirarubicin
피라루비신



$C_{32}H_{37}NO_{12}$: 627.64

(8*S*,10*S*)-10-{[(2*R*,4*S*,5*S*,6*S*)-4-Amino-6-methyl-5-{[(*S*)-tetrahydro-2*H*-pyran-2-yl]oxy}tetrahydro-2*H*-pyran-2-yl]oxy}-6,8,11-trihydroxy-8-(2-hydroxy-acetyl)-1-methoxy-7,8,9,10-tetrahydrotetracene-5,12-dione [*72496-41-4*]

Pirarubicin is a derivative of daunorubicin. Pirarubicin contains NLT 950 μg (potency) of pirarubicin ($C_{32}H_{37}NO_{12}$) per mg, calculated on the anhydrous basis.

Description Pirarubicin is a reddish brown crystalline powder. It is soluble in chloroform, very slightly soluble in acetonitrile, methanol or ethanol(99.5), and practically insoluble in water.

Identification (1) Dissolve 10 mg of Pirarubicin in 80 mL of methanol and 6 mL of diluted hydrochloric acid (1 in 5000), and add water to make exactly 100 mL. Pipet 10 mL of the resulting solution, add diluted methanol (4 in 5) to make 100 mL, and determine the absorption spectra of this solution and pirarubicin RS as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Dissolve 5 mg each of Pirarubicin and pirarubicin RS in 5 mL of chloroform and use these solutions as the test solution and the standard solution, respectively. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on a plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of chloroform and methanol (5 : 1) as the developing solution to a distance of 10 cm, and air-dry the plate; the principal spot obtained from the test solution and the spot obtained from the standard solution are reddish brown and their R_f values are the same.

Optical rotation $[\alpha]_D^{20}$: Between +195° and +215° (10 mg, chloroform, 10 mL, 100 mm).

Absorbance $E_{1cm}^{1\%}$ (495 nm): Between 195 and 220. Weigh accurately about 10 mg (potency) of Pirarubicin, dissolve in 80 mL of methanol and 6 mL of diluted hydrochloric acid (1 in 5000), and add water to make exactly 100 mL. Pipet 10 mL of this solution, add an aqueous solution of methanol (4 in 5) to make exactly 50 mL, and determine the absorbance as directed under the Ultraviolet-visible Spectroscopy at 495 nm.

Purity (1) ***Clarity and color of solution***—Dissolve 10 mg of Pirarubicin in 10 mL of 0.01 mol/L hydrochloric acid TS; the resulting solution is clear and red.

(2) ***Heavy metals***—Proceed with 1.0 g of Pirarubicin according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Related substances***—Dissolve 10 mg of Pirarubicin in 20 mL of the mobile phase, and use this solution as the test solution. Pipet 1 mL of this solution, add the mobile phase to make exactly 200 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions and determine each peak area of the solutions by the automatic integration method; the areas of the doxorubicin peak with the relative retention times of about 0.45 and the peak with the relative retention time of about 1.2, compared to the peak of pirarubicin, are not larger than the peak area of pirarubicin from the standard solution and the sum of peak areas with the relative retention times of about 0.1.9 and about 2.0, respectively, compared to the peak area of pirarubicin is not larger than 5 times the peak area of pirarubicin from the standard solution. However, determine the peak area of doxorubicin by multiplying the correction factor of 0.94, and the peak areas with the relative retention time of about 1.9 and about 2.0 by multiplying the correction factor of 1.09.

Operating conditions

For the detector, column, column temperature, mobile phase and flow rate, proceed the test according to the operating conditions under the Assay.

System suitability

System performance and system repeatability: Proceed the test as directed under the system suitability under the Assay.

Test for required detectability: Pipet 2 mL of the standard solution and add the mobile phase to make exactly 10 mL. Confirm that the peak area of pirarubicin obtained from 20 μL of the resulting solution is equivalent to 14% to 26% of the peak area of pirarubicin from the standard solution.

Time span of measurement: About 4 times the retention time of pirarubicin.

Water NMT 2.0% (0.1 g, volumetric titration, direct titration).

Sterility It meets the requirements when used in the manufacturing of a sterile preparation.

Bacterial endotoxins It is less than 2.50 EU per mg (potency) of pirarubicin when used in the manufacturing of sterile preparations.

Histamine It meets the requirements when used in a sterile preparation. Weigh an appreciated amount of Pirarubicin, and dissolve it in diluted hydrochloric acid (1 in 3800) to make a solution containing 2.0 mg (potency) per mL. Pipet an appreciated amount of the resulting solution, and dilute it 100 times with water, and use the solution as the test solution. Use 0.5 mL of the solution for the test.

Assay Weigh accurately about 10 mg (potency) each of Pirarubicin and pirarubicin RS and dissolve each in the mobile phase to make exactly 10 mL, respectively. Pipet 5.0 mL each of these solutions, add exactly 5 mL each of the internal standard solutions and use these solutions as the test solution and the standard solution, respectively. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the ratios, Q_T and Q_S, of the peak area of pirarubicin to that of the internal standard solution from each solution.

$$\text{Potency (μg) of pirarubicin } (C_{32}H_{37}NO_{12}) = \text{Potency (μg) of pirarubicin RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of 2-naphthol in acetone (1 in 1000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: A mixture of 0.05 mol/L ammonium formate buffer solution (pH 4.0) and acetonitrile (3: 2).

Flow rate: Adjust the flow rate so that the retention time of pirarubicin is about 7 minutes.

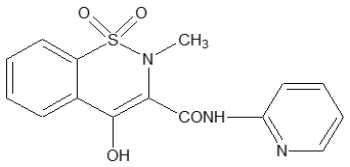
System suitability

System performance: Proceed with 20 μL of the standard solution under the above conditions; pirarubicin and the internal standard are eluted in this order with the resolution between these peaks being NLT 9.

System repeatability: Repeat the test 6 times with 20 μL each of the standard solutions according to the above conditions; the relative standard deviation of the peak area of pirarubicin to that of the internal standard is NMT 1.0%.

Packaging and storage Preserve in hermetic containers.

Piroxicam
피록시캄



$C_{15}H_{13}N_3O_4S$: 331.35

(3*E*)-3[Hydroxy-(pyridin-2-ylamino)methylidene]-2-methyl-1,1-dioxo-3,4-dihydro-1*H*-[1,2]benzo-thiazin-4-one [*36322-90-4*]

Piroxicam contains NLT 97.0% and NMT 103.0% of piroxicam ($C_{15}H_{13}N_3O_4S$), calculated on the anhydrous basis.

Description Piroxicam is a grayish white to pale brown or pale yellow powder and it is odorless.
It is sparingly soluble in acetic anhydride, slightly soluble in acetonitrile, methanol or ethanol(99.5), very slightly soluble in acetic acid(100), and practically insoluble in water.

Identification Determine the infrared spectra of Piroxicam and piroxicam RS as directed in the paste method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers. When the any difference appears between two spectra, dissolve each with methylene chloride, evaporate to dryness, and perform the test with the residue in the same manner.

Purity ***Heavy metals***—Weigh 1.0 g of Piroxicam according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

Water NMT 0.5% (1 g, volumetric titration, direct titration).

Residue on ignition NMT 0.3% (1 g).

Assay Weigh accurately about 50 mg of Piroxicam, dissolve with 0.01 mol/L methanolic hydrochloric acid TS to make exactly 100 mL. Place 10.0 mL of this solution in a 100-mL volumetric flask, add 50 mL of 0.01 mol/L methanolic hydrochloric acid TS and 20.0 mL of water, fill 0.01 mol/L methanolic hydrochloric acid TS to the gauge line line, mix, and use this solution as the test solution. Separately, weigh accurately about 50 mg of piroxicam RS, and dissolve with 0.01 mol/L methanolic hydrochloric TS to make exactly100 mL. Place 10.0 mL of this solution in a 100-mL volumetric flask, add 50 mL of 0.01 mol/L methanolic hydrochloric acid TS and 20.0 mL of water, fill 0.01 mol/L methanolic hydrochloric acid TS to the gauge line, mix, and use this solution as the standard solution. Perform the test with 25 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas of piroxicam, A_T and A_S, from each solution.

$$\text{Amount (mg) of piroxicam } (C_{15}H_{13}N_3O_4S) = \text{Amount (mg) of piroxicam RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column, about 3.9 mm in internal diameter and about 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 μm - 10 μm in particle diameter).

Mobile phase: A mixture of buffer solution and methanol (55 : 45).

System suitability

System performance: Proceed with 25 μL of the standard solution according to the above conditions; the symmetry factor is NMT 1.5.

System repeatability: Repeat the test 6 times with 25 μL of the standard solution according to the above conditions; the relative standard deviation of the peak is NMT 2.0%.

Buffer solution—Dissolve 7.72 g of anhydrous citric acid in 400 mL of water and separately dissolve 5.35 g of sodium monohydrogen phosphate in 100 mL of water. Combine the phosphate solution and the citric acid solution, and add water to make 1000 mL.

Packaging and storage Preserve in light-resistant, tight containers.

Piroxicam Capsules
피록시캄 캡슐

Piroxicam Capsules contain NLT 92.5% and NMT 107.5% of the labeled amount of piroxicam ($C_{15}H_{13}N_3O_4S$: 331.35).

Method of preparation Prepare as directed under Capsules, with Piroxicam.

Identification The retention time of the major peaks obtained from the test solution and the standard solution from the Assay and the ultraviolet absorption spectra between 200 and 400 nm are the same.

Water NMT 8.0%. (0.3 g. volumetric titration, direct titration).

Dissolution Perform the test with 1 capsule of Piroxicam Capsules at 50 revolutions per minute according to Method 1, using 900 mL of the 1st fluid for the Disintegration as the dissolution medium. Take the dissolved solution 45 minutes after starting the test, filter, and if necessary, dilute suitably with the dissolution medium, and use this solution as the test solution. Separately, weigh accurately a suitable amount of piroxicam RS, dissolve in methanol to obtain a solution having known concentration of about 0.5 mg of piroxicam per mL, and use this solution as the standard stock solution. Take a suitable amount of the standard stock solution, dilute exactly with the dissolution medium to obtain a solution of a certain concentration, and use this solution as the standard solution. Determine the absorbances of the test solution and the standard solution at the absorbance maximum wavelength around 333 nm.

It meets the requirements if the dissolution rate of Piroxicam Capsules in 45 minutes is NLT 75%.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of the contents of NLT 20 capsules of Piroxicam Capsules, completely transfer to a suitable container where possible, and determine the average weight of 1 capsule. Mix the contents well, weigh accurately the amount equivalent to about 50 mg of piroxicam ($C_{15}H_{13}N_3O_4S$) according to the labeled amount, and place into a 100-mL volumetric flask. Add 70 mL of 0.01 mol/L methanolic hydrochloric acid TS and shake to mix for 30 minutes using a mechanical shaker. Add 0.01 mol/L methanolic hydrochloric acid TS to dilute to 100 mL and mix the solution. Centrifuge this solution to obtain the clear supernatant. Transfer 10.0 mL of this solution to 100-mL volumetric flask, add about 50 mL of 0.01 mol/L methanolic hydrochloric acid and 20.0 mL of water, fill the flask up to the gauge line with 0.01 mol/L methanolic hydrochloric acid, and mix. Use this solution as the test solution. Perform the test as directed under the Assay of Piroxicam. However, use the following detector among the operating conditions.

Detector—An ultraviolet absorption photometer (wavelength: 254 nm) with a photo-diode array detector (200 nm to 400 nm).

$$\text{Amount (mg) of piroxicam } (C_{15}H_{13}N_3O_4S) = \text{Amount (mg) of piroxicam RS} \times \frac{A_T}{A_S}$$

Packaging and storage Preserve in light-resistant, tight containers.

Piroxicam Injection
피록시캄 주사액

Piroxicam Injection contains NLT 90.0% and NMT 110.0% of the labeled amount of piroxicam ($C_{15}H_{13}N_3O_4S$: 331.35).

Method of preparation Prepare as directed under Injections, with Piroxicam.

Identification The retention times of the major peaks from the test solution and standard solution obtained under the Assay are the same.

pH Between 7.7 and 8.3.

Sterility Meets the requirements.

Bacterial endotoxins Less than 15 EU per mg of piroxicam.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Extractable volume of injections Meets the requirements.

Assay Pipet an amount of Piroxicam Injection equivalent to 40 mg of piroxicam ($C_{15}H_{13}N_3O_4S$) according to the labeled amount, and add 0.01 mol/L methanolic hydrochloric acid TS to make exactly 50 mL. Take 5 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 40 mg of piroxicam RS, add 0.01 mol/L methanolic hydrochloric acid TS to make exactly 50 mL, then proceed in the same manner as for the test solution, and use this solution as the standard solution. Pipet 20 μL each of the test solution and the standard solution, and perform the test as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S of piroxicam of each solution.

$$\text{Amount (mg) of piroxicam } (C_{15}H_{13}N_3O_4S) = \text{Amount (mg) of piroxicam RS} \times (A_T / A_S)$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 to 10 μm in particle diameter).

Mobile phase: A mixture of buffer solution, methanol and acetonitrile (41 : 41 : 18).

Flow rate: 1.0 mL/min

System suitability

System repeatability: Repeat the test 6 times with 20 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area for piroxicam is NMT 2.0%.

Buffer solution—Dissolve 7.72 g of anhydrous citric acid in 400 mL of water, and separately dissolve 5.36 g of dibasic sodium phosphate dihydrate in 100 mL of water. Combine the dibasic sodium phosphate dihydrate solution and citric acid solution, add water to make 1000 mL and mix.

Packaging and storage Preserve in light-resistant, hermetic containers.

Piroxicam Tablets
피록시캄 정

Piroxicam Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of piroxicam ($C_{15}H_{13}N_3O_4S$: 331.35).

Method of preparation Prepare as directed under Tablets, with Piroxicam.

Identification The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

Water NMT 6.0% (0.2 g, volumetric titration, direct titration)

Dissolution Perform the test with 1 tablet of Piroxicam Tablets at 90 revolutions per minute according to Method 2 under the Dissolution, using 900 mL of the Solution 1 for dissolution test as the dissolution medium. Take the medium 15 minutes after starting the test, filter the solution, dilute with fresh medium, if necessary, and use the filtrate as the test solution. Separately, weigh accurately an appropriate amount of piroxicam RS, dissolve in methanol to make a solution containing 0.5 mg per mL, and use this solution as the standard stock solution. Dilute this standard stock solution with the dissolution medium to obtain the same concentration as the test solution, and use as the standard solution. Determine the absorbances

of the test solution and the standard solution at the wavelength of 333 nm as directed under the Ultraviolet-visible Spectroscopy, using the dissolution medium as a control solution. Meets the requirements if the dissolution rate of Piroxicam Tablets in 15 minutes is NLT 70%.

Uniformity of dosage units It meets the requirements when the procedure for content uniformity is performed according to the following procedure.
Perform the test with 1 tablet of Piroxicam Tablets as directed under the Assay.

Assay Weigh accurately the mass of NLT 20 tables of Piroxicam Tablets, and powder them. Weigh accurately the amount of the powder, equivalent to about 50 mg of piroxicam ($C_{15}H_{13}N_4O_4S$), add 70 mL of 0.01 mol/L methanolic hydrochloride TS, shake and mix with a mechanical shaker for 30 minutes, and add 0.01 mol/L methanolic hydrochloride TS to make 100 mL. Centrifuge the resulting solution, pipet 10.0 mL, add about 50 mL of 0.01 mol/L methanolic hydrochloride TS and 20 mL of water, add again 0.01 mol/L methanolic hydrochloride TS to make 100 mL, and use this solution as the test solution. Separately, proceed with about 50 mg of piroxicam RS in the same manner as in the preparation of the test solution, and use this solution as the standard solution. Perform the test with 25 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas of piroxicam, A_T and A_S, in each solution.

$$\text{Amount (mg) of piroxicam } (C_{15}H_{13}N_3O_4S) = \textit{Amount (mg) of piroxicam RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 3.9 mm in internal diameter and about 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 μm to 10 μm in particle diameter).

Mobile phase: A mixture of buffer solution and methanol (55 : 45).

System suitability

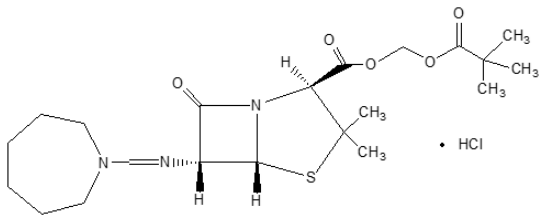
System performance: Proceed with 25 μL of the standard solution under the above operating conditions; the symmetry factor is NMT 1.5.

System repeatability: Repeat the test 6 times with 25 μL each of the standard solution under the above operating conditions; the relative standard deviation of the peaks is NMT 2.0%.

Buffer solution—Dissolve 7.72 g of citric acid in 400 mL of water, and dissolve, separately, 5.35 g of sodium monohydrogen phosphate in 100 mL of water. Combine the phosphate solution and the citric acid solution, and add water to make 1000 mL.

Packaging and storage Preserve in light-resistant, tight containers.

Pivmecillinam Hydrochloride
피브메실리남염산염



$C_{21}H_{33}N_3O_5S \cdot HCl$: 476.03

2,2-Dimethylpropanoyloxymethyl (2*S*,5*R*,6*R*)-6[(azepan-1-ylmethylidene)amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylate hydrochloride [*32887-03-9*]

Pivmecillinam Hydrochloride contains NLT 630 μg and NMT 710 μg (potency) of mecillinam ($C_{15}H_{23}N_3O_3S$: 325.43) per mg, calculated on the anhydrous basis.

Description Pivmecillinam Hydrochloride occurs as a white to yellowish white crystalline powder.
It is very soluble in methanol or acetic acid(100), freely soluble in water or ethanol(99.5) and soluble in acetonitrile.

Identification (1) Determine the infrared spectra of Pivmecillinam Hydrochloride and pivmecillinam hydrochloride RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) Dissolve 0.5 g of Pivmecillinam Hydrochloride in 10 mL of water, and add 1 mL of dilute nitric acid and 1 drop of silver nitrate TS; a white precipitate forms.

Optical rotation $[\alpha]_D^{20}$: Between +200° and +220° (1 g, calculated on the anhydrous basis, water, 100 mL, 100 mm).

pH Dissolve 0.5 g of Pivmecillinam Hydrochloride in 10 mL of water; the pH of this solution is between 3.0 and 4.5.

Purity (1) ***Heavy metals***—Weigh 1.0 g of Pivmecillinam Hydrochloride, add 10 mL of a solution of magnesium nitrate hexahydrate and ethanol(95) (1 in 10), ignite the ethanol to burn, and carbonize by gradual heating. If a carbonized substance remains, moisten it with a small amount of nitric acid, and incinerate by ignition. After cooling, add 3 mL of hydrochloric acid to the residue, warm on a steam bath to dissolve, and then heat to evaporate to dryness. Add 10 mL of water to the residue, warm on a steam bath to dissolve, cool, and adjust the pH to 3

to 4 with ammonia TS added dropwise. Then add 2 mL of dilute acetic acid, filtrate, if necessary, wash with 10 mL of water, transfer the filtrate and the solution used for washing into a colorimetric tube, and add water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 2.0 mL of lead standard solution in the same manner as in the preparation of the test solution (NMT 20 ppm).

(2) ***Arsenic***—Proceed with 1.0 g of Pivmecillinam Hydrochloride according to Method 4, and perform the test (NMT 2 ppm).

(3) ***Related substances***—Weigh accurately 50 mg of Pivmecillinam Hydrochloride, dissolve in 4.0 mL of a mixture of acetonitrile and acetic acid(100) (97 : 3), and use this solution as the test solution. Separately, weigh accurately 2.0 mg of pivmecillinam hydrochloride RS, dissolve in 4.0 mL of water, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 2 μL each of the standard solutions on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography, allow to stand for 30 minutes, spot 2 μL of the test solution, and develop the plate with a mixture of acetone, water and acetic acid(100) (10 : 1 : 1) as the developing solvent to a distance of about 12 cm. After air-drying the plate, allow it to stand for 10 minutes in iodine steam; the spots obtained from the test solution are not larger or not more intense than the spots from the standard solution. No spots other than the location of the spot from the standard solution are observed in the test solution.

(4) ***Dimethylaniline***—Weigh accurately about 1.0 g of Pivmecillinam Hydrochloride, add 5 mL of 1 mol/L sodium hydroxide TS and 1 mL of the internal standard solution, centrifuge, if necessary, and use the clear supernatant as the test solution. Separately, weigh accurately about 50 mg of dimethylaniline, add 2.0 mL of hydrochloric acid, and add water to make 50 mL. Pipet 5.0 mL of this solution, and add water to make exactly 250 mL. Pipet 1.0 mL of this solution, add 5.0 mL of 1 mol/L sodium hydroxide TS and 1.0 mL of the internal standard solution, centrifuge, if necessary, and use the clear supernatant as the standard solution. Perform the test with 1 μL each of the test solution and the standard solution as directed under the Gas Chromatography according to the following conditions, and calculate the peak area ratio, Q_T and Q_S, of dimethylaniline to the internal standard from the test solution and the standard solution, respectively (NMT 20 ppm).

$$\text{Content (ppm) of dimethylaniline} = \text{Amount (mg) of dimethylaniline taken} \times \frac{Q_T}{Q_S} \times \frac{Purity\ (\%)\ of\ dimethylaniline}{Amount\ (mg)\ of\ \text{Pivmecillinam Hydrochloride taken}} \times 4$$

Internal standard solution—Dissolve 50.0 mg of naphthalene in cyclohexane to make 50 mL. Take 5.0 mL of this solution, add cyclohexane to make 100 mL, and use this solution as the internal standard solution.

Operating conditions

Detector: A flame ionization detector

Column: A column about 2 mm in internal diameter and about 2 m in length, packed with diatomaceous earth for gas chromatography coated with 50% phenyl-50% methyl polysiloxane for gas chromatography equivalent to 3% of the mass.

Column temperature: 120 °C

Temperatures of the sample injection port and the detector: 150 °C

Carrier gas: Nitrogen

Flow rate: 30 mL/min

Water NMT 1.0% (0.25 g, coulometric titration).

Assay Weigh accurately an amount equivalent to about 20 mg (potency) of Pivmecillinam Hydrochloride and pivmecillinam hydrochloride RS, dissolve in an appropriate amount of the mobile phase, add exactly 10 mL of the internal standard solution to make exactly 100 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 10 μL of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the peak area ratios, Q_T and Q_S, of pivmecillinam to that of internal standard from each solution.

$$\text{Potency (μg) of mecillinam } (C_{15}H_{23}N_3O_3S) = \text{Potency (μg) of pivmecillinam hydrochloride RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of diphenyl in the mobile phase (1 in 12500).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: Dissolve 0.771 g of ammonium acetate in about 900 mL of water, add acetic acid(100) to adjust the pH to 3.5, and again add water to make 1000 mL. To 400 mL of this solution, add 600 mL of acetonitrile.

Flow rate: Adjust the flow rate so that the retention time of pivmecillinam is about 6.5 minutes.

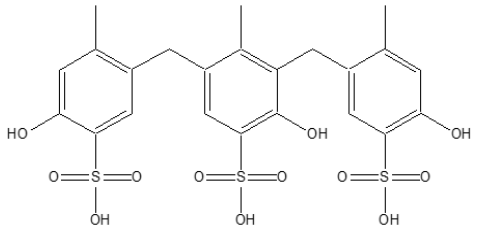
System suitability

System performance: Proceed with 10 μL of the standard solution under the above conditions; pivmecillinam and the internal standard are eluted in this order with the resolution being NLT 4.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution under the above operating conditions; the relative standard deviation of the peak area ratios of pivmecillinam to the peak area of the internal standard is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Policresulen
폴리크레줄렌



$C_{23}H_{24}O_{12}S_3$: 588.61

2-Hydroxy-3,5-bis[(4-hydroxy-2-methyl-5-sulfophenyl)methyl]-4-methylbenzenesulfonic acid, [*101418-00-2*]

Policresulen contains NLT 90.0% and NMT 110.0% of the labeled amount of the condensation product of metacresolsulfonic acid and formaldehyde.

Description Policresulen occurs as a clear reddish-brown solution and has almost no odor.
It is miscible with water, ethanol(95) and acetone.
The color of Policresulen becomes brighter with the addition of alkali hydroxide.

Identification (1) Add 1 drop of Policresulen to 10 mL of water, shake and add a drop of 2.5% iron(III) chloride TS; the resulting solution exhibits a violet color.

(2) Add 10 mL of 10% acetic acid and 1 mL of 10% barium chloride to 1 mL of Policresulen; a white precipitate is formed.

(3) Dissolve 1 mL of Policresulen in 10 mL of water, 1 g of gelatin, and 1 g of sodium chloride, add water to make 100 mL, and add a few drops of 1% aqueous gelatin solution adjusted to pH 4.7; solidified precipitates of gelatin are formed.

(4) To 1 mL of Policresulen, add 5 mL of water and an appropriate amount of *N*-dimethyl-*p*-phenylenediamine hydrochloride and mix, add sodium hydroxide TS until it becomes alkaline, and then add 1 to 2 drops of 5% potassium ferricyanide TS; the solution immediately exhibits a blue color.

(5) Take about 0.4 mL of Policresulen, and add water to make 1000 mL. Take 10 mL of this solution and add water to make 100 mL. Use this solution as the test solution. Determine the absorbance as directed under the Ultraviolet-visible Spectroscopy using water as the control; it exhibits the maximum absorption at about 283 nm.

Specific gravity d_{20}^{20}: Between 1.206 and 1.226.

Purity (1) Add 10 mL of 20% hydrochloric acid and 10% barium chloride solution to 1.0 mL of Policresulen; no turbidity is produced within 5 minutes.

(2) Add 20 mL of 10% hydrochloric acid and 1 mL of 10% sulfuric acid to 1.0 mL of Policresulen; no turbidity is produced within 5 minutes.

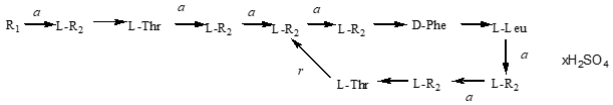
(3) Weigh accurately about 0.4 g of Policresulen and add water to make exactly 100 mL. Again, pipet 10 mL of this solution, and add water to make 100 mL. Perform the test with this solution as directed under the Ultraviolet-visible Spectroscopy using water as the control; it exhibits the maximum absorption at a wavelength of about 281 nm, and the specific absorbance is between 70.0 and 82.0.

Assay Pipet about 1 mL of Policresulen, add water to make 50 mL, and titrate with 0.1 mol/L sodium hydroxide VS (indicator: methyl orange TS). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS
= 20.0 mg of condensation product of metacresolsulfonic acid and formaldehyde

Packaging and storage Preserve in tight containers.

Polymyxin B Sulfate
폴리믹신B황산염



Polymyxin B_1 R_1 = 6-methyloctanoic acid
R_2 = L-α-γ-diaminobutyric acid
Polymyxin B_2 R_1 = 6-methylheptanoic acid
R_2 = L-α-γ-diaminobutyric acid

Thr: Threonine Phe: Phenylalanine
Leu: Leucine

Polymyxin B Sulfate
N-{(2*S*)-4-Amino-1-{{(2*S*,3*R*)-1-{{(2*S*)-4-amino-1-oxo-1-{{(3*S*,6*S*,9*S*,12*S*,15*R*,18*R*,21*S*)-6,9,18-*tris*(2-aminoethyl)-15-benzyl-3-[(1*R*)-1-hydroxyethyl]-12-(2-methylpropyl)-2,5,8,11,14,17,20-heptaoxo-1,4,7,10,13,16,19-heptazacyclotricos-21-yl}amino}butan-2-yl}amino}-3-hydroxy-1-oxobutan-2-yl}amino}-1-oxobutan-2-yl}-6-methyloctanamide sulfate [*1405-20-5*]

Polymyxin B Sulfate is the sulfate of a mixture of peptide-based compounds having antibacterial activity and obtained from *Bacillus polymyxa* culture.

Polymyxin B Sulfate contains NLT 6500 units (potency) of polymyxin B ($C_{55\sim56}H_{96\sim98}N_{16}O_{13}$) per mg, calculated on the dried basis. 1 unit corresponds to 0.129 μg of polymyxin B sulfate ($C_{55\sim56}H_{96\sim98}N_{16}O_{13}\cdot1\sim2H_2SO_4$).

Description Polymyxin B Sulfate occurs as a white to yellowish brown powder.

It is freely soluble in water and practically insoluble in ethanol(99.5).

Identification (1) To 5 mL of an aqueous solution of Polymyxin B Sulfate (1 in 10), add 5 mL of sodium hydroxide solution (1 in 10), and add 5 drops of copper(II) sulfate pentahydrate (1 in 100) while shaking to mix; the resulting solution exhibits a violet color.

(2) Transfer 5 mg each of Polymyxin B Sulfate and polymyxin B sulfate RS to stoppered test tubes, dissolve each in 1 mL of diluted hydrochloric acid (1 in 2), close the stoppers, and heat in 135 ℃ for 5 hours. Evaporate on a steam bath to dryness, and heat continuously until there is no hydrochloric acid odor. Dissolve the residues in 0.5 mL of water, and use these solutions as the test solution and the standard solution (1). Separately, dissolve 20 mg each of L-leucine, L-threonine, phenylalanine and L-serine in 10 mL of water, and use these solutions as the standard solution (2), the standard solution (3), the standard solution (4) and the standard solution (5). Perform the test with these solutions as directed under the Thin Layer Chromatography. Spot 3 μL each of the test solution and the standard solutions (1), (2), (3), (4) and (5) on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. After passing the vapor of the saturated developing solvent through the plate for 15 hours, develop the plate with a mixture of phenol and water (3 : 1) as the developing solvent while protected from light to a distance of about 13 cm. Dry the plate at 110 ℃ for 5 minutes, spray evenly ninhydrin-acetic acid TS on the plate, and heat at 110 ℃ for 5 minutes; the R_f values of each spot obtained from the test solution are the same as the R_f values of each spot from the standard solution (1). Also, the spots obtained from the test solution are visible at positions corresponding to the spots obtained from the standard solutions (2), (3) and (4), and not visible at the position corresponding to the spot obtained from the standard solution (5).

(3) An aqueous solution of Polymyxin B Sulfate (1 in 20) responds to the Qualitative Analysis for sulfate.

Optical rotation $[\alpha]_D^{20}$: Between -78° and -90° (0.5 g calculated on the dried basis, water, 25 mL, 100 mm).

pH Dissolve 1.0 g of Polymyxin B Sulfate in 50 mL of water; the pH of this solution is between 5.0 and 7.0.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Polymyxin B Sulfate according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Phenylalanine***—Weigh accurately 0.375 g of Polymyxin B Sulfate, and dissolve in 0.1 mol/L hydrochloric acid TS to make exactly 100 mL. Perform the test with this solution as directed under the Ultraviolet-visible Spectroscopy, and determine the absorbances, A_1, A_2, A_3, A_4, and A_5, at wavelengths of 252 nm, 258 nm, 264 nm, 280 nm and 300 nm. Calculate the amount of phenylalanine according to the following equation; it is between 9.0% and 12.0%.

$$\text{Content (\%) of phenylalanine} = \frac{A_2 - 0.5A_1 + 0.5A_3 - 1.8A_4\_0.8A_5}{W_T} \times 9.4787$$

W_T: Amount (g) of Polymyxin B Sulfate taken, calculated on the dried basis

Loss on drying NMT 6.0% (1 g, in vacuum, 60 ℃, 3 hours).

Residue on ignition NMT 0.75% (1 g).

Sterility It meets the requirements when used in the manufacturing of a sterile preparation. However, it is excluded in cases where there is a final sterilization process in the manufacturing of a sterile preparation.

Pyrogen It meets the requirements when used in the manufacturing of a sterile preparation. However, weigh an appropriate amount of Polymyxin B Sulfate, dissolve in isotonic sodium chloride injection to make a solution containing 20000 units (potency) per mL, and use this solution as the test solution. However, inject the test solution into a rabbit by 1.0 mL per kg of the rabbit weight.

Assay ***Cylinder plate method***—(1) Medium Agar medium for seed and base layer

Peptone	10.0 g
Meat extract	3.0 g
Sodium chloride	30.0 g
Agar	20.0 g

Dissolve in 1000 mL of water, and sterile. However, the pH after the sterilization is between 6.5 and 6.6.

(2) Test organism Use *Escherichia coli* NIHJ or NCCP 14134 as the test organism.

(3) Weigh accurately an amount of Polymyxin B Sulfate, equivalent to about 200000 units (potency), and dissolve in phosphate buffer solution, pH 6.0, to make exactly 20 mL. Take exactly an appropriate amount of this solution, dilute with phosphate buffer solution, pH 6.0, to make solutions containing 4000 units (potency) and 1000 units (potency) per mL, and use these solutions as the high-concentration test solution and low-concentration test solution, respectively. Separately, weigh accurately 200000 units (potency) of polymyxin B sulfate RS, dissolve in phosphate buffer solution, pH 6.0, to make exactly 20 mL, and use this solution as the standard stock solution. Store the standard stock solution at NMT 5 °C and use it within 14 days. Pipet an appropriate amount of the standard stock solution, dilute with phosphate buffer solution, pH 6.0, to make solutions containing 4000 units (potency) and 1000 units (potency) per mL, and use these solutions as the high-concentration standard solution and the low-concentration standard solution, respectively. Perform the test with these solutions as directed under the Microbial Assays for Antibiotics (A) (8).

Packaging and storage Preserve in light-resistant, tight

containers.

Polypase 1000
폴리파제1000

Polypase 1000 contains NLT 187 FIP lipase units per gram when tested as directed under the Digestive Power.

Description Polypase 1000 occurs as a grayish brown powder.

Identification Polypase 1000 shows positive when tested as directed under the Lipase potency test.

pH Between 5.0 and 7.0 (5% aqueous solution).

Loss on drying NMT 8.0% (2 g, 105 ℃, 1 hours).

Residue on ignition NMT 20% (1.0 g)

Particle size distribution estimation by analytical sieving Weigh 20 g of Polypase 1000 and pass it through a No. 4.7 sieve; no particles remain on the sieve.

Digestive power Weigh accurately about 70 to 90 mg of Polypase 1000, put it in a mortar, add 8 to 10 mL of water at 5℃, and grind well for 10 minutes. Then, put it in a 200-mL volumetric flask, and add cold water to make 200 mL. Each mL of this solution contains about 12 FIP fat digestion activity units. Mix well for several minutes and store at 4°C. Make this test solution before use in each test. When used in the test, the test solution is at 20 ℃. Put 10 mL of olive oil emulsion in a glass container of about 50 mL, buffer it with 8 mL of tris buffer solution and 2 mL of 8 w/v% sodium taurocholate solution, and then dilute with water to make the total amount (30 - X) mL. Allow the temperature to reach 37 ± 0.1 ℃. Adjust the pH to 9.05 using 0.05 to 0.1 mol/L sodium hydroxide solution: manually adjust using a micro buret to pH 9.0, and then automatically adjust it to pH 9.05. To the solution with the accurately adjusted pH of 9.05, add exactly X mL of test solution (containing 8 to 16 FIP lipase units), and titrate with 0.1 mol/L sodium hydroxide, maintaining the pH at 9.0 using an automatic micro buret. Measure the number of mL of 0.1 mol/L sodium hydroxide consumed per minute. Titrate, while stirring with a stirrer at a constant speed, under the nitrogen gas flow or in a well-closed container. Titrate 4 to 5 times, discard the first result, and use the average value of the remaining ones. After completing the preliminary test, adjust the amount of test solution so that the consumption of 0.1 mol/L sodium hydroxide per minute reaches 0.08 mL to 0.16 mL. Then, proceed again as above.

$$\text{Lipase potency per gram of Polypase 1000 (FIP unit)} = \frac{b \times 100000}{a} \times \frac{200}{X} \times F \times 100$$

a: Amount (mg) of sample taken
b: Number of mL of 0.1 mol/L sodium hydroxide consumed per minute
X: Number of mL of test solution taken
F: $\frac{\text{theoretical potency of standard}}{\text{test value potency of standard}}$
100000: 0.1 × 1000 × 1000
200: Dilution factor

Definition of potency—The amount of enzyme that releases 1 μmol of fatty acid per minute under the conditions of 37 ℃ and pH 9.0 is defined as 1 FIP unit of fat digestion activity.

Packaging and storage Preserve in tight containers.

Polysaccharide Iron Complex
폴리사카리드철착염

Polysaccharide Iron Complex is produced through a complex salt reaction between ferric hydroxide and a low-molecular-polysaccharide obtained by partial hydrolysis of starch. Polysaccharide Iron Complex, when dried, contains NLT 44.5% and NMT 47.5% of iron (Fe: 55.85).

Description Polysaccharide Iron Complex is a black-brown crystalline granule or brown powder. It has no odor or a slight caramel odor.
It is slowly soluble in water, and insoluble in ethanol, acetone, ether, and chloroform.

Identification (1) Dissolve 1 g of Polysaccharide Iron Complex in 25 mL of water, and add a small amount of dilute hydrochloric acid; a brown precipitate is formed. To this precipitate, add dilute sodium hydroxide TS; it dissolves again. When an excessive amount of dilute sodium hydroxide TS is added, no precipitate is formed.

(2) Put a small amount of Polysaccharide Iron Complex in a ceramic crucible and ignite it. Add hydrochloric acid to the residue, and dissolve it by heating until it turns into a yellow solution. This solution responds to the Qualitative Analysis for ferric salt.

(3) Determine the infrared spectra of Polysaccharide Iron Complex and polysaccharide iron complex RS, previously powdered, as directed under the ART method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Purity (1) ***Acidity or alkalinity***—Dissolve 1.125 g of Polysaccharide Iron Complex in 25 mL of water; the pH of this solution is between 9.0 and 11.0.

(2) ***Free alkali***—Weigh accurately 0.2 g of Polysaccharide Iron Complex, add 20 mL of water, shake well to dissolve, and then add 2 mL of 0.05 mol/L sulfuric acid; the pH of the mixture is NMT 7.5.

(3) ***Sodium chloride***—Weigh accurately 5.0 g of Polysaccharide Iron Complex, put it in a 150 mL stoppered Erlenmeyer flask, add 100 mL of water, and shake well for 1 hour to dissolve. Filter this solution with filter paper, discard the first 20 mL of the filtrate, take 60.0 mL of the next filtrate, and add it to a 400-mL beaker. Add 200 mL of nitric acid, and dissolve it completely by heating on a steam bath. After cooling, add water to make 325 mL. Add 20.0 mL of 0.1 mol/L silver nitrate TS, add 20 mL of ammonium iron(III) sulfate TS, and titrate with 0.1 mol/L potassium thiocyanate VS. Perform a blank test in the same manner and make any necessary correction (NMT 3.5%).

Each mL of 0.1 mol/L silver nitrate VS
= 5.844 mg of NaCl

(4) ***Free iron ions (Fe^{3+})***—Weigh accurately 1.0 g of Polysaccharide Iron Complex, dissolve in 50 mL of water, add 10 mL of 1 mol/L sodium hydroxide solution, and shake well to mix. Filter the precipitate by suction through a quantitative filter paper, and wash the filter paper and funnel well with water. Dissolve the residue on the filter paper by adding 4.2 mL of hydrochloric acid, wash the filter paper with water, and combine the washings with the filtrate. Then, transfer the filtrate to the flask with a volume of 50 mL, add water to make 50 mL, and use this solution as the test solution (20 mg/mL). Separately, weigh accurately 0.074 g of iron(III) nitrate nonahydrate ($Fe(NO_3)_3 \cdot 9H_2O$), dissolve in 1 mol/L hydrochloric acid to make 100 mL, and use this solution as the standard solution (Fe 0.1 mg/mL). Take 5 mL each of the test solution and the standard solution in a test tube, add 0.02 mL of newly prepared potassium ferrocyanide TS to each test tube, and observe immediately; the color of the test solution is not more intense than that of the standard solution (NMT 0.5%).

Assay Weigh accurately about 0.23 g of Polysaccharide Iron Complex, put it in a glass-stoppered flask, add 30 mL of water, and shake well to dissolve. Add 10 mL of hydrochloric acid to this solution and heat on a steam bath, shaking occasionally, until completely dissolved. After cooling, add 3 g of potassium iodide, stopper, shake well until dissolved, allow to stand for 15 minutes, and titrate with 0.1 mol/L sodium thiosulfate VS using starch TS as an indicator. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L sodium thiosulfate VS
= 5.585 mg of Fe

Packaging and storage Preserve in well-closed containers.

Polysaccharide Iron Complex Capsules
폴리사카리드철착염 캡슐

Polysaccharide Iron Complex Capsules contain NLT 95.0% and NMT 105.0% of the labeled amount of polysaccharide iron complex (Fe : 55.85).

Method of preparation Prepare as directed under Capsules, with Polysaccharide Iron Complex.

Identification (1) Weigh an amount of Polysaccharide Iron Complex Capsules equivalent to 0.2 g as polysaccharide iron complex, add 2 mL of dilute nitric acid and 10 mL of water, shake to mix, and filter to extract. The filtrate responds to the Qualitative Analysis for ferric salt.

(2) Weigh an amount of Polysaccharide Iron Complex Capsules equivalent to 0.2 g as polysaccharide iron complex, add 20 mL of water, and filter to extract by warming. Evaporate the filtrate to concentrate to about 10 mL, transfer to a test tube, and add 2 to 3 drops of 5% α-Naphthol-methanol solution. Slowly add 1 mL of sulfuric acid through the wall of the test tube; the solution exhibits a violet color on the interface after 2 to 3 minutes.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of the contents of NLT 20 capsules of Polysaccharide Iron Complex Capsules. Then, weigh accurately an amount equivalent to about 0.1 g as iron (Fe), add 50 mL of water, shake to mix, extract and filter. Transfer the filtrate and the washings to an iodine flask, add 10 mL of hydrochloric acid, and heat on a steam bath with occasional shaking. After cooling this solution, add 3 g of potassium iodide, place a stopper and shake well to mix. Allow to stand for 15 minutes in the dark and titrate with 0.1 mol/L sodium thiosulfate VS. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L sodium thiosulfate VS
= 5.585 mg of Fe

Packaging and storage Preserve in tight containers.

Polysaccharide Iron Complex Tablets
폴리사카리드철착염 정

Polysaccharide Iron Complex Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of iron (Fe: 55.85).

Method of preparation Prepare as directed under Tablets, with Polysaccharide Iron Complex.

Identification (1) Weigh accurately an amount of Polysaccharide Iron Complex Tablets, equivalent to 0.2 g of polysaccharide iron complex, add 2 mL of dilute nitric acid and 10 mL of water, shake to mix, extract, and filter. The filtrate responds to the Qualitative Analy-

sis for ferric salt.

(2) Weigh an amount of Polysaccharide Iron Complex Tablets, equivalent to about 0.2 g of polysaccharide iron complex, add 20 mL of water, extract by warming, and filter. Evaporate the filtrate to concentrate to make about 10 mL, transfer to a test tube, add 2 to 3 drops of 5% α-Naphthol-methanol solution, and slowly add 1 mL of sulfuric acid through the test tube wall; the interface exhibits a purple color after 2 to 3 minutes.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 Polysaccharide Iron Complex Tablets. Then weigh accurately an amount, equivalent to about 0.1 g of iron (Fe), add 50 mL of water, and shake to mix, extract, and filter. Transfer the filtrate and the washings to an iodine flask, add 10 mL of hydrochloric acid, and warm on a steam bath with occasional shaking. After cooling this solution, add 3 g of potassium iodide, seal tightly, shake well to mix, and allow to stand in the dark for 15 minutes. Then, titrate with 0.1 mol/L sodium thiosulfate VS using starch TS as an indicator. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L sodium thiosulfate VS
= 5.585 mg of Fe

Packaging and storage Preserve in tight containers.

Potassium Bromide
브롬화칼륨

KBr : 119.00

Potassium bromide [*7758-02-3*]

Potassium Bromide, when dried, contains NLT 99.0% and not more 101.0% of potassium bromide (KBr).

Description Potassium Bromide occurs as a colorless or white crystal, grain or crystalline powder. It is odorless.
It is freely soluble in water or glycerin, soluble in hot ethanol, and slightly soluble in ethanol(95).

Identification An aqueous solution of Potassium Bromide (1 in 10) responds to the Qualitative Analysis for potassium salt and bromide.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Potassium Bromide in 3 mL of water; the resulting solution is clear and colorless.

(2) ***Alkalinity***—Dissolve 1.0 g of Potassium Bromide in 10 mL of water, add 0.10 mL of 0.05 mol/L sulfuric acid and 1 drop of phenolphthalein TS, heat to boiling, and cool it down; the resulting solution is colorless.

(3) ***Chloride***—Perform the test as directed under the Assay; the amount of 0.1 mol/L silver nitrate solution equivalent to 1 g of Potassium Bromide is NMT 84.5 mL.

(4) ***Sulfate***—Perform the test with 2.0 g of Potassium Bromide. Prepare the control solution with 1.0 mL of 0.005 mol/L sulfuric acid (NMT 0.024%).

(5) ***Iodide***—Dissolve 0.5 g of Potassium Bromide in 10 mL of water, add between 2 and 3 drops of iron(III) chloride TS and 1 mL of chloroform, and shake well to mix; the chloroform layer does not exhibit a purple to violet color.

(6) ***Bromate***—Dissolve 1.0 g of Potassium Bromide in 10 mL of newly boiled and cooled water, add 0.1 mL of potassium iodide TS, 1 mL of starch TS and 3 drops of dilute sulfuric acid, shake gently to mix, and allow to stand for 5 minutes; the resulting solution does not exhibit a blue color.

(7) ***Heavy metals***—Proceed with 2.0 g of Potassium Bromide according to Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(8) ***Magnesium and alkaline earth metals***—To 200 mL of water, add 0.1 g of hydroxylamine hydrochloride, 10 mL of ammonium chloride buffer solution, pH 10, 1 mL of 0.1 mol/L zinc sulfate solution and 0.2 g of eryochrome black T-sodium chloride indicator, and warm at 40°C. To this solution, drop 0.01 mol/L ethylenediaminetetraacetic acid disodium salt until the purple color of the solution changes to bluish purple. To this solution, add a solution of 10.0 g of Potassium Bromide dissolved in 100 mL of water. If the color of the solution changes to purple, titrate with 0.01 mol/L ethylenediaminetetraacetic acid disodium salt until the color of the solution exhibits a bluish purple color; the color; the consumed volume is NMT 5.0 mL (NMT 0.02%, calculated as calcium).

(9) ***Barium***—Dissolve 0.5 g of Potassium Bromide in 10 mL of water, add 0.5 mL of dilute hydrochloric acid and 1 mL of potassium sulfate TS, and allow to stand for 10 minutes; the resulting solution is not turbid.

(10) ***Iron***—Dissolve 0.5 g of Potassium Bromide in water to make 10 mL and use this solution as the test solution. To 1 mL of the iron standard solution, add water to make 10 mL, and use this solution as the standard solution. To the test solution and the standard solution, add 2.0 mL of citric acid (1 in 5) and 0.1 mL of thioglycolic acid, add ammonia water(28) until this solution makes the litmus paper alkaline, and add water to make 20 mL. The color obtained from the test solution after 5 minutes is not more intense than the color from the standard solution (NMT 20 ppm).

(11) ***Arsenic***—Proceed with 1.0 g of Potassium Bromide according to Method 1 and perform the test (NMT 2 ppm).

Loss on drying NMT 1.0% (1 g, 110 °C, 4 hours).

Assay Weigh accurately about 0.4 g of Potassium Bromide, previously dried, dissolve in 50 mL of water, add 10 mL of dilute nitric acid, add exactly 50 mL of 0.1 mol/L silver nitrate solution, and titrate the excess silver nitrate with 0.1 mol/L ammonium thiocyanate VS (indi-

cator: 2 mL of ammonium iron(III) sulfate TS). Perform a blank test in the same manner.

Each mL of 0.1 mol/L silver nitrate VS
= 11.900 mg of KBr

Packaging and storage Preserve in tight containers.

Potassium Chloride
염화칼륨

KCl : 74.55

Potassium Chloride [*7447-40-7*]

Potassium Chloride, when dried, contains NLT 99.0% and NMT 101.0% of potassium chloride (KCl).

Description Potassium Chloride occurs as colorless or white crystals or a crystalline powder, which is odorless and has a salty taste.
It is freely soluble in water and practically insoluble in ethanol(95) or ether.
An aqueous solution of Potassium Chloride (1 in 10) is neutral.

Identification An aqueous solution of Potassium Chloride (1 in 50) responds to the Qualitative Analysis for potassium salt and chloride.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Potassium Chloride in 5 mL of water; the solution is clear and colorless.

(2) ***Acid or alkalinity***—Dissolve exactly 50 mL of freshly boiled and cooled water in 5.0 g of Potassium Chloride, and add 3 drops of phenolphthalein TS; the solution does not exhibit a red color. Add 0.50 mL of 0.01 mol/L sodium hydroxide to this solution; the solution exhibits a red color.

(3) ***Bromide***—Dissolve 1.0 g of Potassium Chloride in water to make 100 mL. To 5 mL of this solution, add 3 drops of dilute hydrochloric acid and 1 mL of chloroform, and add 3 drops of chloramine TS dropwise while shaking to mix; the chloroform layer does not exhibit a yellow to yellowish red color.

(4) ***Iodide***—Dissolve 0.5 g of Potassium Chloride in 10 mL of water, add 3 drops of iron(III) chloride TS and 1 mL of chloroform, shake to mix, and allow to stand for 30 minutes. When shaking again to mix, the chloroform layer does not exhibit a purple to violet color.

(5) ***Heavy metals***—Proceed with 4.0 g of Potassium Chloride according to Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 5 ppm).

(6) ***Sodium***—Dissolve 1.0 g of Potassium Chloride in 20 mL of water, and perform the Flame Coloration (1); the solution does not exhibit a persistent yellow color.

(7) ***Aluminum***—Perform the test when used in the manufacturing of hemodialysis preparations. Weigh accurately 2.0 g of Potassium Chloride, add 50 mL of water, and sonicate for 30 minutes. To this solution, add 4 mL of nitric acid and then water to make 100 mL, and use this solution as the test solution. To an appropriate amount of aluminum, add 6 mol/L hydrochloric acid, and heat at 80 ℃ for several minutes. Weigh accurately 100 mg of this aluminum, dissolve it in a mixture of 10 mL of hydrochloric acid and 2 mL of nitric acid, and heat at 80 ℃ for 30 minutes. Continue heating until the volume of the solution is reduced to about 4 mL, and cool it to room temperature. To this solution, add 4 mL of water, heat again until the volume of the solution is reduced to 2 mL. After cooling, add water to make 100 mL. Pipet 10.0 mL of this solution and add water to make 100 mL. Take exactly 1.0 mL of the solution, add water again to make 100 mL to make a concentration of 1.0 μg/mL, and use this solution as the standard solution. Perform the test with the test solution and the standard solutions as directed under the Atomic Absorption Spectroscopy according to the following conditions, and obtain the content of aluminum in the test solution using the calibration curve derived from the absorbance of the standard solution; the result is NMT 1 ppm.

Lamp: Aluminum hollow cathode lamp
Wavelength: 309.3 nm
Blank test solution: Dilute 40 mL of nitric acid with water to make 1000 mL of fluid.

(8) ***Calcium and magnesium***—Dissolve 0.20 g of Potassium Chloride in 20 mL of water, add 2 mL of ammonia TS, 2 mL of ammonium oxalate TS and 2 mL of sodium monohydrogen phosphate TS, and allow to stand for 5 minutes; the solution does not become turbid.

(9) ***Arsenic***—Proceed with 1.0 g of Potassium Chloride according to Method 1 and perform the test (NMT 2 ppm).

Loss on drying NMT 0.5% (1 g, 130 ℃, 2 hours).

Assay Weigh accurately about 0.2 g of Potassium Chloride, previously dried, dissolve in 50 mL of water, shake vigorously to mix, and titrate with 0.1 mol/L silver nitrate VS (indicator: 3 drops of fluorescein sodium TS).

Each mL of 0.1 mol/L silver nitrate VS
= 7.455 mg of KCl

Packaging and storage Preserve in tight containers.

Potassium Chloride Injection
염화칼륨 주사액

Potassium Chloride Injection is an aqueous injection and contains NLT 95.0% and NMT 105.0% of the labeled amount of potassium chloride (KCl : 74.55).

Method of preparation Prepare as directed under Injections, with Potassium Chloride.

Description Potassium Chloride Injection occurs as a clear, colorless liquid.

Identification Potassium Chloride Injection responds to the Qualitative Analysis for potassium salt and chloride.

pH Between 4.0 and 8.0.

Sterility Meets the requirements.

Bacterial endotoxins Less than 0.16 EU per mg of potassium chloride.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Extractable volume of injections Meets the requirements.

Assay Pipet an amount of Potassium Chloride Injection equivalent to about 0.6 g of potassium chloride (KCl) and add water to make 500 mL. Take 5.0 mL of this solution and add water to make 100 mL. Take 5.0 mL of the resulting solution, add 2.0 mL of sodium chloride solution (1 in 5) and 1.0 mL of hydrochloric acid, then add water to make 100 mL and use this solution as the test solution. Separately, weigh accurately about 190.7 mg of potassium chloride, dried previously at 105 ℃ for 2 hours, add water to make 1000 mL, take 100.0 mL of this solution, and add water to make 1000 mL. Pipet 10.0 mL, 15.0 mL and 20.0 mL of the resulting solution, add 2.0 mL of sodium chloride solution (1 in 5) and 1.0 mL of hydrochloric acid, and then add water to make 100 mL. Use these solutions as the standard solutions. Perform the test with the test solution and the standard solutions as directed under the Atomic Absorption Spectroscopy, using water as a control solution.

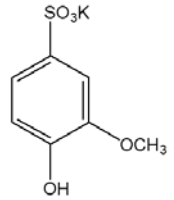
$$\text{Amount (mg) of potassium chloride (KCl)} = 200 \times C \times 1.907$$

C: Concentration (μg/mL) of potassium in the test solution from the calibration curve

Gas: Air–acetylen
Lamp: Potassium hollow cathode lamp
Wavelength: 766.5 nm

Packaging and storage Preserve in hermetic containers.

Potassium Guaiacolsulfonate
구아야콜설폰산칼륨



Sulfogaiacol $C_7H_7KO_5S$: 242.29
Potassium 4-hydroxy-3-methoxybenzenesulfonate [*1321-14-8*]

Potassium Guaiacolsulfonate contains NLT 98.5% and NMT 101.0% of potassium guaiacolsulfonate ($C_7H_7KO_5S$), calculated on the anhydrous basis.

Description Potassium Guaiacolsulfonate occurs as crystals or a crystalline powder. It is odorless or has a slight, characteristic odor and a slightly bitter taste.
It is freely soluble in water or formic acid, sparingly soluble in methanol and practically insoluble in ethanol(95), acetic anhydride, or ether.

Identification (1) Take 10 mL of potassium guaiacolsulfonate VS (1 in 100), and add 2 drops of iron(III) chloride TS; a bluish purple color develops.

(2) Dissolve Potassium Guaiacolsulfonate and 0.25 g of potassium guaiacolsulfonate RS in water to make 500 mL. Take 10 mL of these solutions respectively, and add phosphate buffer solution, pH 7.0 to make 100 mL each. Determine the absorption spectra of this solution as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) An aqueous solution of Potassium Guaiacolsulfonate (1 in 10) responds to the Qualitative Analysis for potassium salt.

pH Dissolve 1.0 g of Potassium Guaiacolsulfonate in 20 mL water. The pH of the solution is between 4.0 and 5.5.

Purity (1) ***Solubilized state***—Dissolve 1.0 g of Potassium Guaiacolsulfonate in 20 mL of water; the solution is clear and colorless.

(2) ***Sulfate***—Proceed with 0.8 g of Potassium Guaiacolsulfonate and perform the test. Prepare the control solution with 0.50 mL of 0.005 mol/L sulfuric acid (NMT 0.030%).

(3) ***Heavy metals***—Proceed with 1.0 g of Potassium Guaiacolsulfonate according to Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(4) ***Arsenic***—Proceed with 1.0 g of Potassium Guaiacolsulfonate according to Method 1 and perform the test (NMT 2 ppm).

(5) ***Selenium***—Weigh about 0.2 g of Potassium Guaiacolsulfonate and combust as directed under the Oxygen Flask Combustion with 25 mL of diluted nitric acid

(1 in 30) as an absorbent. Use a combustion flask with a volume of 1000 mL, combust, wash the stopper and the inner wall of the flask with 10 mL of water, and use 20 mL of water to move the solution in the combustion flask into a 150-mL beaker. Heat lightly until it boils, boil for 10 minutes, allow it to cool down at room temperature, and use this solution as the test solution. Separately, pipet 6 mL of standard selenium stock solution, add 25 mL of diluted nitric acid (1 in 30) and 25 mL of water, and use this solution as the standard solution. Add diluted ammonia (28) VS (1 in 2) to each of the test and standard solutions, adjust the pH to 2.0 ± 0.2, add water to dilute exactly to 60 mL, and add 10 mL of water to move to a separatory funnel. Then, wash the separatory funnel with 10 mL of water. Add 0.2 g of hydroxylamine, dissolve by mixing, add 5 mL of 2,3-diaminonaphthalene TS, and put stopper. Mix by stirring and allow to stand at room temperature for 100 minutes. Add 5.0 mL of cyclohexane, shake well, and allow to stand. If the layer is separated, remove the water layer, centrifuge cyclohexane extract, remove water, and take the cyclohexane layer. With these solutions and a control solution prepared with water added to 25 mL of diluted nitric acid (1 in 30) in the same way, perform the test as directed under the Ultraviolet-visible Spectroscopy. Determine the absorption at absorption maximum wavelength around 380 nm; the absorption of the solution from the test solution is not larger than the absorption from the standard solution (NMT 30 ppm).

(6) ***Related Substances***—Dissolve 0.20 g of Potassium Guaiacolsulfonate in 200 mL of mobile phase and use this solution as the test solution. Pipet 1.0 mL of the test solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 5 μL each of the test and standard solutions as directed under the Liquid Chromatography according to the following conditions. Determine each peak area obtained from the test solution and the standard solution by the automatic integration method; the total area of peaks other than the peak of Potassium Guaiacolsulfonate from the test solution is not larger than that of Potassium Guaiacolsulfonate from the standard solution.

Operating Conditions

Detector: An ultraviolet absorption photometer (wavelength: 279 nm).

Column: A stainless steel column, about 4 mm in internal diameter and 20 cm to 25 cm in length, with dimethylaminopropylsilanized silica gel for liquid chromatography (5 μm to 10 μm in particle diameter).

Column temperature: A constant temperature of about 30 °C.

Mobile phase: A mixture of 0.05 mol/L potassium dihydrogen phosphate VS and methanol (20 : 1).

Flow rate: Adjust the flow rate so that the retention time of Potassium Guaiacolsulfonate is about 10 minutes.

System suitability

Detection sensitivity: Adjust the sensitivity so that the peak height of Potassium Guaiacolsulfonate from 5 μL of the standard solution is NLT 10 mm.

System performance: Weigh 50 mg each of Potassium Guaiacolsulfonate and guaiacol and dissolve in 50 mL of the mobile phase. Perform the test with 5 μL of this solution under the above operating conditions; guaiacol and Potassium Guaiacolsulfonate are eluted in this order with the resolution of their peaks being NLT 4.0.

Time span of measurement: About twice the retention time of Potassium Guaiacolsulfonate.

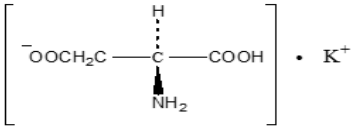
Water Between 3.0% and 4.5% (0.3 g, direct titration).

Assay Weigh accurately about 0.3 g of Potassium Guaiacolsulfonate, dissolve in 2.0 mL of formic acid, add 50 mL of acetic anhydride, and titrate with 0.1 mol/L perchloric acid (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid
= 24.229 mg of $C_7H_7KO_5S$

Packaging and storage Preserve in light-resistant, well-closed containers.

Potassium L-Aspartate
L-아스파르트산칼륨



$C_4H_6NO_4K$: 171.19
L-Aspartate potassium salt (1:1), [*14007-45-5*]

Potassium L-Aspartate contains NLT 74.6% and NMT 80.0% of L-aspartate ($C_4H_7NO_4$: 133.10) and NLT 21.9% and NMT 23.7% of potassium (K: 39.10), calculated on the anhydrous basis.

Description Potassium L-Aspartate occurs as a white powder. It is odorless and has a slightly characteristic taste.

Identification (1) A neutral solution (1 in 20) of Potassium L-Aspartate responds to the Qualitative Analysis (2) for potassium salt.

(2) To 5 mL of an aqueous solution (1 in 100) of Potassium L-Aspartate, add 1 mL of 2% ninhydrin solution, and heat for 3 minutes; the color of the resulting solution turns to a reddish purple color.

Optical rotation $[a]_D^{20}$: Between +19.0° and +22.6° (4.0 g, calculated on the anhydrous basis, 50 mL of 6 mol/L hydrochloric acid, 100 mm).

pH Dissolve 1.0 g of Potassium L-Aspartate in 10 mL of freshly boiled and cooled water. The pH of this solution

is between 6.0 and 7.5.

Purity (1) ***Clarity and color of solution*—**Perform the test with an aqueous solution (1 in 10) of Potassium L-Aspartate as directed under the Ultraviolet-visible Spectroscopy, and determine the absorbance at the wavelength 430 nm; the transmission rate is NLT 98.0%.

(2) ***Chloride*—**Perform the test with 0.5 g of Potassium L-Aspartate as directed under the Chloride. Prepare the control solution with 0.3 mL of 0.01 mol/L hydrochloric acid (NMT 0.021%).

(3) ***Sulfate*—**Perform the test with 0.6 g of Potassium L-Aspartate as directed under the Sulfate. Prepare the control solution with 0.35 mL of 0.05 mol/L sulfuric acid (NMT 0.028%).

(4) ***Iron*—**Prepare the test solution with 1.0 g of Potassium L-Aspartate according to Method 3 under the Iron and perform the test according to Method A. Prepare the control solution with 2.0 mL of iron standard solution (NMT 0.028%).

(5) ***Heavy metals*—**Proceed with 2.0 g of Potassium L-Aspartate as directed under Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(6) ***Arsenic*—**Prepare the test solution with 2.0 g of Potassium L-Aspartate according to Method 1 under the Arsenic and perform the test. Prepare the control solution with 2.0 mL of arsenic standard solution (NMT 1 ppm).

Water NMT 8.0% (0.2 g, volumetric titration, direct titration).

Other amino acids Weigh accurately 10.0 mg of Potassium L-Aspartate, dissolve in 200 mL of water, and use this solution as the test solution. To 1.0 mL of this solution, add water to make 100 mL, and use this solution as the control solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of 1-butanol, water and acetic acid(100) (2 : 1 : 1) as the developing solvent, and air-dry the plate. Spray 2% ninhydrin-1-butanol solution on the plate, and heat the plate for 3 minutes. The principal spots obtained from the test solution are not greater or not more intense than the principal spot from the control solution (NMT 1%).

Assay (1) ***L-aspartate*—**Weigh accurately about 1.6 g of Potassium L-Aspartate, and add water to make 50 mL. Place 10.0 mL of this solution in a weakly acidic ion exchange resin column, and pass it at the efflux rate of 2 mL/min. Pass 90 mL of water through the column at the efflux rate of 2 mL/min to wash the column, and combine it with the effluent. Titrate this solution with 0.1 mol/L sodium hydroxide VS. Use 5 to 6 drops of bromothymol blue TS as the indicator. The endpoint is when the yellow color turns to a green color. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS
= 13.310 mg of $C_4H_7NO_4$

Weakly acidic ion exchange resin column—Place about 50 g of weakly acidic ion exchange resin (H+ type, 30 μm to 1180 μm in particle diameter) in 300 mL of water for 24 hours, and pass it with water through a glass column for chromatography (about 25 mm in internal diameter and 30 cm in length). Pass 350 mL of 1 mol/L hydrochloric acid at the efflux rate of 2 mL/min, and pass water at the efflux rate of 2 mL/min. Add bromocresol green TS to the washings to wash the column until the green color turns to a blue color.

(2) ***Potassium*—**Weigh accurately about 0.1 g of Potassium L-Aspartate, dissolve in 25 mL of water, slowly add 25 mL of sodium tetraphenylborate solution (1 in 50) to mix, and allow to stand for 10 minutes. Filter the formed precipitate with a glass filter (G_4), and wash the precipitate 3 times with 5 mL of sodium tetraphenylborate solution (1 in 500) each time. Dry the residue at 105 ℃ for 1 hour, and weigh accurately the mass.

Amount (mg) of potassium (K)
= Amount (A mg) of potassium tetraphenylborate ($C_{24}H_{20}BK$) × 0.1091

Packaging and storage Preserve in tight containers.

Potassium Iodide
요오드화칼륨

KI: 166.00

Potassium Iodide [*7681-11-0*]

Potassium Iodide, when dried, contains NLT 99.0% and NMT 101.0% of potassium iodide (KI).

Description Potassium Iodide occurs as colorless or white crystals or a crystalline powder.
It is very soluble in water, soluble in ethanol(95), and practically insoluble in ether.
It is slightly deliquescent in humid air.

Identification A solution of Potassium Iodide (1 in 20) responds to the Qualitative Analysis for potassium salt and iodide.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Potassium Iodide in 2 mL of water; the solution is clear and colorless.

(2) ***Alkalinity***—Dissolve 1.0 g of Potassium Iodide in 10 mL of freshly boiled and cooled water, and add 0.50 mL of 0.005 mol/L sulfuric acid and 1 drop of phenolphthalein TS; the solution is colorless.

(3) ***Chloride, bromide and thiosulfate***—Dissolve 0.20 g of Potassium Iodide in 5 mL of ammonia TS, add 15.0 mL of 0.1 mol/L silver nitrate solution, shake to mix for 2 to 3 minutes, and filter. To 10 mL of the filtrate, add

15 mL of dilute nitric acid; the solution does not turn brown. Also, the turbidity of the solution is not more intense than that of the following control solution.

Control solution—To 0.30 mL of 0.01 mol/L hydrochloric acid, add 2.5 mL of ammonia TS, 7.5 mL of 0.1 mol/L silver nitrate VS, and 15 mL of dilute nitric acid.

(4) ***Nitrate, nitrite or ammonium***—Take 1.0 g of Potassium Iodide in a 40 mL test tube, add 5 mL of water, 5 mL of sodium hydroxide TS and 0.2 g of aluminum, and cover with absorbent cotton and carefully heat for 15 minutes on a steam bath; the gas produced does not change a moistened red litmus paper to blue.

(5) ***Cyanide***—Dissolve 0.5 of Potassium Iodide in 10 mL of water, add 1 drop of iron(II) sulfate TS and 2 mL of sodium hydroxide TS to 5 mL of this solution and warm, and add 4 mL of hydrochloric acid; the solution does not turn green.

(6) ***Iodate***—Dissolve 0.5 g of Potassium Iodide in 10 mL of freshly boiled and cooled water and add 2 drops of dilute sulfuric acid and 1 drop of starch TS; the solution does not turn blue immediately.

(7) ***Heavy metals***—Proceed with 2.0 g of Potassium Iodide as directed under Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(8) ***Sodium***—Dissolve 1.0 g of Potassium Iodide in 10 mL of water and perform the Flame Coloration (1); the solution does not exhibit a persistent yellow color.

(9) ***Barium***—Dissolve 0.5 g of Potassium Iodide in 10 mL of water, add 1 mL of dilute sulfuric acid and allow to stand for 5 minutes; no turbidity is produced.

(10) ***Arsenic***—Proceed with 0.40 g of Potassium Iodide as directed under Method 1 and perform the test (NMT 5 ppm).

Loss on drying NMT 1.0% (2 g, 105 ℃, 4 hours).

Assay Weigh accurately about 0.5 g of Potassium Iodide, previously dried, place in an iodine bottle, and dissolve in 10 mL of water. Add 35 mL of hydrochloric acid and 5 mL of chloroform and shake vigorously to mix; titrate with 0.05 mol/L potassium iodate VS until the purple color of the chloroform layer disappears. The endpoint is when the purple color of the chloroform layer does not reappear within 5 minutes after it is decolorized.

Each mL of 0.05 mol/L potassium iodate VS
= 16.600 mg of KI

Packaging and storage Preserve in light-resistant, tight containers.

Potassium Permanganate
과망간산칼륨

$KMnO_4$: 158.03

Potassium permanganate [*7722-64-7*]

Potassium Permanganate, when dried, contains NLT 99.0% and NMT 101.0% of potassium permanganate ($KMnO_4$).

Description Potassium Permanganate occurs as deep purple crystals and has a metallic luster.
It is soluble in water.
A solution of Potassium Permanganate (1 in 1000) is an astringent with a slightly sweet taste.

Identification A solution of Potassium Permanganate (1 in 100) responds to the Qualitative Analysis for permanganate.

Purity (1) ***Water insoluble matter***—Weigh 2.0 g of Potassium Permanganate, previously powdered, and dissolve in 200mL of water, filter it through a tared glass filter, wash with water until the last washings show no color, and dry at 105 ℃ for 2 hours; the mass of the residue is NMT 4 mg.

(2) ***Arsenic***—Weigh about 0.4 g of Potassium Permanganate and dissolve in 10mL of water, add 1 mL of sulfuric acid, put hydrogen peroxide(30) to completely decolorize, evaporate in a sand bath nearly to dryness, and dissolve the residue in 5 mL of water. Use this solution as the test solution and perform the test; it is not more intense than the following standard color (NMT 5 ppm).

Standard color—Pipet 10 mL of standard color water, add 1 mL of sulfuric acid and the same amount of hydrogen peroxide(30) as the preparation of the test solution, evaporate in a bath nearly to dryness, and add 2.0 mL of arsenic standard solution and water to make 5 mL, and use this solution as the test solution and perform the test.

Loss on drying NMT 0.5% (1 g, silica gel, 18 hours).

Assay Weigh accurately about 0.6 g of Potassium Permanganate, previously dried, and dissolve it in water to make exactly 200 mL. Use this solution as the test solution. Pipet 25 mL of 0.05 mol/L oxalic acid solution, put it into a 500-mL Erlenmeyer flask, add 200 mL of diluted sulfuric acid (1 in 20), and set the solution temperature to 30 to 35 ℃. Transfer the test solution in a burette, shake gently, add 23 mL quickly, and allow the flask to stand until the red color disappears. Then, warm it to 55 to 60 ℃ and titrate slowly until a red color persists for 30 seconds.

Each mL of 0.05 mol/L oxalic acid VS
= 3.1607 mg of $KMnO_4$

Packaging and storage Preserve in tight containers.

Povidone Ophthalmic Solution
포비돈 점안액

Povidone Ophthalmic Solution contains NLT 90.0% and NMT 110.0% of the labeled amount of povidone $(C_6H_9NO)_n$.

Method of preparation Prepare as directed under Ophthalmic Solutions, with Povidone.

Identification (1) Add 10 mL of water, 5 mL of dilute hydrochloric acid and 2 mL of 10% potassium dichromate solution to 2 mL of Povidone Ophthalmic Solution; a bright yellow precipitate is formed.

(2) Add 0.2 mL of 4-dimethylaminobenzaldehyde TS and 0.1 mL of sulfuric acid to 5 mL of Povidone Ophthalmic Solution; the resulting solution exhibits a pale orange color.

(3) Add 5 mL of water and 0.2 mL of 0.05 mol/L iodine solution to 5 mL of Povidone Ophthalmic Solution; the resulting solution exhibits a reddish brown color.

pH Between 6.0 and 8.0.

Sterility Meets the requirements.

Particulate contamination: Visible particles Meets the requirements.

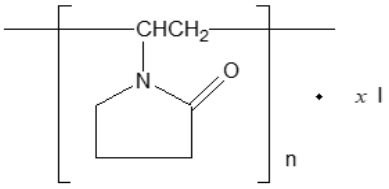
Insoluble particulate matter in ophthalmic solutions Meets the requirements.

Assay Pipet an amount of Povidone Ophthalmic Solution, equivalent to about 20 mg of povidone $(C_6H_9NO)_n$, and add water to make 100 mL. Pipet 10.0 mL of this solution, add water to make 100 mL, and use this solution as the test solution. Separately, weigh accurately about 20 mg of povidone RS, dissolve in water to make 100 mL. Pipet 10.0 mL of this solution, add water to make 100 mL, and use this solution as the standard solution. Take 10.0 mL each of the test solution and the standard solution, put in a light-resistant container, add 5 mL of 0.2 mol/L citric acid TS and 2 mL of 0.003 mol/L iodine TS, shake to mix, and allow to stand for exactly 10 minutes. Perform the test with these solutions using the solution prepared in the same manner with 10 mL of water as the control solution as directed under the Ultraviolet-visible Spectroscopy, and determine the absorbances, A_T and A_S, at the wavelength of 450 nm.

$$\text{Amount (mg) of povidone } (C_6H_9NO)_n = Amount\ (mg)\ of\ povidone\ RS \times \frac{A_T}{A_S}$$

Packaging and storage Preserve in tight containers.

Povidone Iodine
포비돈요오드



$(C_6H_9NO)_n \cdot xI$

Poly(1-ethenylpyrrolidin-2-one)-iodine [*25655-41-8*]

Povidone Iodine is a complex of 1-vinyl-2-pyrrolidone polymer and iodine.

Povidone Iodine contains NLT 9.0% and NMT 12.0% of active iodine (I: 126.90) and NLT 9.0% and NMT 1 1.5% of nitrogen (N: 14.01), calculated on the dried basis.

Description Povidone Iodine occurs as a dark reddish brown powder and has a characteristic odor.
It is freely soluble in water or ethanol(99.5).
Dissolve 1.0 g of Povidone Iodine in 100 mL of water; the pH of the solution is between 1.5 and 3.5.

Identification (1) Add 1 drop of an aqueous solution of Povidone Iodine (1 in 10) to 10 mL of diluted starch TS (1 in 10); the resulting solution exhibits an dark blue color.

(2) To 1 mL of an aqueous solution of Povidone Iodine (1 in 100), add 1 mL of sodium thiosulfate TS, and add 1 mL of ammonium thiocyanate-cobalt nitrate TS and 2 drops of 1 mol/L hydrochloric acid TS; the resulting solution exhibits a blue color, and a blue precipitate gradually forms.

Purity (1) ***Clarity and color of solution***—Dissolve 0.30 g of Povidone Iodine in 100 mL of water; the resulting solution is brown and clear.

(2) ***Heavy metals***—Proceed with 1.0 g of Povidone Iodine according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Arsenic***—Proceed with 1.0 g of Povidone Iodine according to Method 4 and perform the test (NMT 2 ppm).

(4) ***Iodine ion***—Dissolve 0.5 g of Povidone Iodine in 100 mL of water, and add sodium bisulfite TS until the color of iodine disappears completely. Next, add exactly 25 mL of 0.1 mol/L silver nitrate, add 10 mL of nitric acid, shake well to mix, and titrate excess silver nitrate with 0.1 mol/L ammonium thiocyanate VS to determine the total amount of iodine (indicator: 1 mL of ammonium iron(III) sulfate TS). However, the endpoint of the titration is when the solution exhibits a reddish brown color. Perform a blank test in the same manner.

Each mL of 0.1 mol/L ammonium thiocyanate VS
= 12.690 mg of I

Determine the amount of iodide ion by subtracting the content (%) of active iodine from the total content (%) of iodine, calculated on the dried basis. The amount is NMT 6.6%.

Loss on drying NMT 8.0% (1 g, 100 ℃, 3 hours).

Residue on ignition NMT 0.05% (5 g).

Assay (1) ***Active iodine***—Weigh accurately about 0.5 g of Povidone Iodine, dissolve in 30 mL of water, and titrate with 0.02 mol/L sodium thiosulfate VS (indicator: 2 mL of starch TS).

Each mL of 0.02 mol/L sodium thiosulfate VS
= 2.5381 mg of I

(2) ***Nitrogen***—Weigh accurately about 1 g of Povidone Iodine, dissolve in water to make exactly 50 mL, and use this solution as the test solution. Pipet 1.0 mL of this solution, and perform the test as directed under the Nitrogen Determination.

Each mL of 0.005 mol/L sulfuric acid VS
= 0.14007 mg of N

Packaging and storage Preserve in tight containers.

Povidone Iodine Topical Solution
포비돈요오드 액

Povidone Iodine Topical Solution is a liquid of povidone iodine used in an external application. Povidone Iodine Topical Solution contains NLT 85.0% and NMT 120.0% of the labeled amount of iodine (I: 126.90). Povidone Iodine Topical Solution can contain a small amount of ethanol.

Method of preparation Prepare as directed under Liquids, with Povidone Iodine.

Identification (1) Take an amount of Povidone Iodine Topical Solution, equivalent to 50 mg of iodine according to the labeled amount, and add water to make 100 mL. To 1 mL of this solution, add 1 mL of starch TS and 9 mL of water; the resulting solution exhibits an dark blue color.

(2) Transfer 10 mL of Povidone Iodine Topical Solution into an Erlenmeyer flask without touching the inlet, cover the inlet with the filter paper, and moisten the filter paper with 1 drop of starch TS; it does not exhibit a blue color within 60 seconds.

Alcohol content If Povidone Iodine Topical Solution contains ethanol, perform the test according to Method 2 under the Alcohol Determination; Povidone Iodine Topical Solution contains NLT 90.0% and NMT 110.0% of the labeled amount of alcohol.

pH Between 1.5 and 6.5.

Assay Take exactly an amount of Povidone Iodine Topical Solution, equivalent to about 50 mg of iodine (I), transfer into a stoppered Erlenmeyer flask, add water to make NLT 30 mL in total, and titrate with 0.02 mol/L sodium thiosulfate VS (indicator: 3 mL of starch TS). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.02 mol/L sodium thiosulfate VS
= 2.5380 mg of I

Packaging and storage Preserve in tight containers.

Povidone-Iodine Vaginal Suppositories
포비돈요오드 질좌제

Povidone-Iodine Vaginal Suppositories contain NLT 85.0% and NMT 125.0% of the labeled amount of iodine (I : 126.90).

Method of preparation Prepare as directed under Suppositories, with Povidone-Iodine.

Identification (1) Dissolve Povidone-Iodine Vaginal Suppositories in alcohol to make an alcohol dilution containing 0.05% iodine. Add 1 mL of starch TS and 9 mL of water to 1 mL of this solution; the resulting solution exhibits a deep blue color.

(2) Weigh 10 g of Povidone-Iodine Vaginal Suppositories, put in a 50-mL beaker, while being careful not to get it on the beaker's wall. Cover the mouth of the beaker with a filter paper, and moisten the filter paper with 1 drop of starch TS; the resulting solution does not exhibit a blue color within 60 seconds.

Disintegration Meets the requirements.

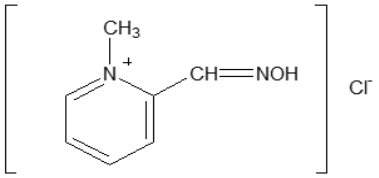
Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 Povidone-Iodine Vaginal Suppositories, break carefully into small pieces, and mix evenly. Weigh accurately about 40 mg of iodine to put in a 100-mL beaker, add water to make the total volume of NLT 30 mL, and shake to mix until the ointment dissolves. Titrate this solution with 0.02 mol/L sodium thiosulfate VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.02 mol/L sodium thiosulfate VS
= 2.5380 mg of I

Packaging and storage Preserve in tight containers.

Pralidoxime Chloride
프랄리독심염화물



$C_7H_9ClN_2O$: 172.61

[(*E*)-(1-Methylpyridin-2-ylidene)methyl]-oxoazanium chloride [*51-15-0*]

Pralidoxime Chloride contains NLT 97.0% and NMT 102.0% of pralidoxime chloride ($C_7H_9ClN_2$ O), calculated on the dried basis.

Description Pralidoxime Chloride occurs as a white to pale yellow crystalline powder, and is odorless.
It is freely soluble in water.
It is stable in air.

Identification (1) The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

(2) Determine the infrared spectra of Pralidoxime Chloride and pralidoxime chloride RS, previously dried, as directed in the paste method under the Mid-infrared Spectroscopy; both spectra exhibit maxima at the same wavenumbers.

(3) An aqueous solution of Pralidoxime Chloride (1 in 10) responds to the Qualitative Analysis for chloride.

Melting point Between 215 and 225 ℃ (with decomposition).

Purity ***Heavy metals*—**Proceed with 1.0 g of Pralidoxime Chloride according to Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

Loss on drying NMT 2.0% (1 g, 105 ℃, 3 hours).

Residue on ignition NMT 0.5% (1 g).

Assay Weigh accurately about 62.5 mg of Pralidoxime Chloride and dissolve in water to make exactly 50 mL. Pipet 2 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the test solution. Separately, weigh an appropriate amount of pralidoxime chloride RS and dissolve in water to make a solution containing 1.25 mg per mL. Pipet 2 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 15 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak areas, A_T and A_S, of pralidoxime chloride for the test solution and the standard solution, respectively.

Amount (mg) of pralidoxime chloride ($C_7H_9ClN_2O$)
$$= C \times \frac{A_T}{A_S} \times 50$$

C: Concentration (mg/mL) of the standard solution

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 270 nm).

Column: A stainless steel column 3 mm to 5 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of acetonitrile and tetraethyl ammonium chloride solution (52 : 48).

Flow rate: 1.2 mL/min

System suitability

System performance: Dissolve pyridine-2-aldoxime in water to prepare a solution containing 0.65 mg per mL. To 2 mL of this solution, add 2 mL of a solution of pralidoxime chloride RS containing 1.25 mg per mL and the mobile phase to make 100 mL. Proceed with 15 μL of this solution according to the above conditions; pyridine-2-aldoxime and pralidoxime chloride are eluted in this order with the resolution between their peaks being NLT 4.0, and the number of theoretical plates and symmetry factor are NLT 4000 and NMT 2.5, respectively.

System repeatability: Repeat the test 6 times with 15 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area of pralidoxime chloride is NMT 2.0%.

Tetraethylammonium chloride solution—Dissolve 0.17 g of tetraethylammonium chloride in 3.4 mL of diluted phosphoric acid (10 in 100), and add water to make 1000 mL.

Packaging and storage Preserve in well-closed containers.

Pralidoxime Chloride Tablets
프랄리독심염화물 정

Pralidoxime Chloride Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of pralidoxime chloride ($C_7H_9ClN_2O$: 172.61).

Method of preparation Prepare as directed under Tablets, with Pralidoxime Chloride.

Identification The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

Dissolution Perform the test with 1 tablet of Pralidoxime Chloride Tablets at 100 revolutions per minute according to Method 1, using 900 mL of water as the dissolution

medium. Take the dissolved solution after 60 minutes from start of the test, filter, dilute with the water, if necessary and use the solution as the test solution. Separately, weigh accurately an appropriate amount of pralidoxime chloride RS, dissolve in the dissolution medium to make a solution having the same concentration as the test solution, and use this solution as the standard solution. Perform the test with the test solution and the standard solution as directed under the Ultraviolet-visible Spectroscopy, using the dissolution medium as a control solution, and determine the absorbances at the absorbance maximum wavelength of about 293 nm.
The acceptable dissolution criterion is NLT 55% of Pralidoxime Chloride Tablets dissolved in 60 minutes.

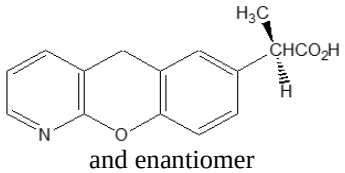
Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 tablets of Hydrocortisone Tablets, and reduce to powder. Take an accurately weighed portion of the powder, equivalent to about 0.25 g of pralidoxime chloride, add 150 mL of water and mechanically swirl for 30 minutes. Add water to make exactly 200 mL, centrifuge this solution, pipet 2 mL of the clear supernatant, add the mobile phase to make exactly 100 mL, and use it as the test solution. Separately, weigh accurately about 50 mg of pralidoxime chloride RS, and add water to make exactly 100 mL. Pipet 5 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with the test solution and the standard solution as directed under the Assay of Pralidoxime Chloride.

Amount (mg) of pralidoxime chloride ($C_7H_9ClN_2O$)
= Amount (mg) of pralidoxime chloride RS$\times \frac{A_T}{A_S} \times 5$

Packaging and storage Preserve in well-closed containers.

Pranoprofen
프라노프로펜



and enantiomer

$C_{15}H_{13}NO_3$: 255.27
2-(5*H*-Chromeno[2,3-b]pyridin-7-yl)propanoic acid [*52549-17-4*]

Pranoprofen, when dried, contains NLT 98.5% and NMT 101.0% of pranoprofen ($C_{15}H_{13}NO_3$).

Description Pranoprofen occurs as a white to pale yellowish white crystalline powder.
It is freely soluble in *N*,*N*-dimethylformamide, soluble in acetic acid(100), sparingly soluble in methanol, slightly soluble in acetonitrile, ethanol(95) or acetic anhydride, very slightly soluble in ether, and practically insoluble in water.
A solution of Pranoprofen in *N*,*N*-dimethylformamide (1 in 30) shows no optical rotation.

Identification (1) Dissolve 20 mg each of Pranoprofen and pranoprofen RS in 1 mol/L hydrochloric acid TS to make 100 mL each. To 10 mL each of the these solutions, add water to make 100 mL. Determine the absorption spectra of these solutions as directed under the Ultraviolet-visible Spectroscopy, using 0.1 mol/L hydrochloric acid TS as the blank; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Pranoprofen and pranoprofen RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Melting point Between 186 and 190 ℃.

Purity (1) ***Chloride***—Dissolve 0.5 g of Pranoprofen in 40 mL of methanol, dissolve in 6 mL of dilute nitric acid and water to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution by adding 40 mL of methanol, 6 mL of dilute nitric acid and water to 0.30 mL of 0.01 mol/L hydrochloric acid to make 50 mL (NMT 0.021%).

(2) ***Heavy metals***—Proceed with 2.0 g of Pranoprofen according to Method 4 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Related substances***—Dissolve 50 mg of Pranoprofen in 50 mL of the mobile phase, and use this solution as the test solution. Pipet 1 mL of this solution, add the mobile phase to make exactly 200 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak area from each solution according to the automatic integration method; the peak area other than the major peak from the test solution is not greater than the peak area of the major peak of each standard solution, and the sum of all peaks is not more than twice the area of major peak from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 275 nm).

Column: A stainless steel column about 6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 ℃

Mobile phase: Dissolve 7.02 g of sodium perchlorate in 1000 mL of water and adjust the pH to 2.5 with perchloric acid. To 2 volumes of this solution,

add 1 volume of acetonitrile.
