Assay (1) ***Clebopride malate***—Weigh accurately the contents of NLT 20 capsules of Clebopride Malate and Simethicone Capsules. Weigh accurately an amount equivalent to about 1 mg of clebopride malate ($C_{20}H_{24}ClN_3O_2 \cdot C_4H_6O_5$), add methanol to make 50 mL, separate the resulting solution by using a centrifuge, and use the clear supernatant as the test solution. Separately, weigh accurately about 50 mg of Clebopride malate RS and dissolve in the methanol to make 100 mL. Pipet 2.0 mL of this solution, add methanol to make 50 mL, and use it as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at the wavelength of 310 nm as directed under the Ultraviolet-visible Spectroscopy.

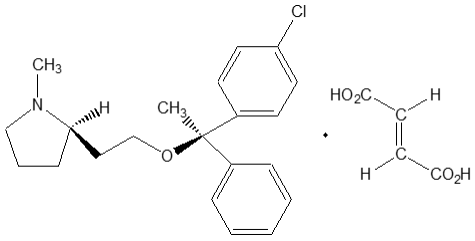
Amount (mg) of clebopride malate ($C_{20}H_{24}ClN_3O_2 \cdot C_4H_6O_5$)
= Amount (mg) of clebopride malate RS $\times \frac{A_T}{A_S} \times \frac{1}{50}$

(2) ***Simethicone***—Weigh accurately an amount of NLT 20 Clebopride Malate and Simethicone Capsules equivalent to about 50 mg of simethicone, put in a 120-mL flask, add 25 mL of toluene, and shake and disperse the resulting solution. Next, add 50 mL of diluted hydrochloric acid (2 in 5), close the flask by using a stopper with an inert surface, and use a vertical shaker to mix by shaking for exactly 5 minutes at an amplitude of 38 2 mm and about 200 reciprocations per minute. Transfer this mixture to a 125-mL separating funnel, put about 5 mL of the toluene layer in a 15-mL stoppered test tube containing 0.5 g of anhydrous sodium sulfate, close the test tube with the stopper with inert surface, and shake the tube vigorously. Centrifuge the solution, and use the clear supernatant as the test solution. Separately, proceed with about 50 mg of polydimethylsiloxane RS in the same manner as in the preparation of the test solution, and use this solution as the standard solution. Perform the test with the test solution and the standard solution as directed under the Ultraviolet-visible Spectroscopy, using the solution prepared in the same manner as the test solution with 25.0 mL of toluene as a control solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution by using a cell with 0.5 mm in thickness at the absorbance maximum wavelength (λ_{max}) around 1265 cm^{-1} as directed under the Ultraviolet-visible Spectroscopy.

Amount (mg) of simethicone ([-$(CH_3)_2$SiO-]n)
= Amount (mg) of polydimethylsiloxane RS $\times \frac{A_T}{A_S}$

Packaging and storage Preserve in tight containers.

Clemastine Fumarate
클레마스틴푸마르산염



$C_{21}H_{26}ClNO \cdot C_4H_4O_4$: 459.96
(*E*)-but-2-Enedioic acid;(2*R*)-2-[2-[(1*R*)-1-(4-chlorophenyl)-1-phenylethoxy]ethyl]-1-methylpyrrolidine [*14976-57-9*]

Clemastine Fumarate, when dried, contains NLT 98.5% and NMT 101.0% of clemastine fumarate ($C_{21}H_{26}ClNO \cdot C_4H_4O_4$).

Description Clemastine Fumarate occurs as a white, crystalline, odorless powder.
It is sparingly soluble in methanol or acetic acid(100), slightly soluble in ethanol(95), very slightly soluble in ether, and practically insoluble in water.

Identification Determine the absorption spectra of Clemastine Fumarate and clemastine fumarate RS as directed

in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit the same intensities of absorption at the same wavenumbers.

Optical rotation $[\alpha]_D^{20}$: Between +16° and +18° (0.1 g after drying, methanol, 10 mL, 100 mm).

Melting point Between 176 and 180 ℃ (with decomposition).

Purity (1) ***Clarity and color of solution*—**Dissolve 0.5 g of Clemastine Fumarate in 10 mL of methanol; the solution is clear and colorless.

(2) ***Heavy metals*—**Proceed with 1.0 g of Clemastine Fumarate as directed under Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Arsenic*—**Proceed with 1.0 g of Clemastine Fumarate as directed under Method 3 and perform the test (NMT 2 ppm).

(4) ***Related substances*—**Dissolve 0.10 g of Clemastine Fumarate in 5 mL of methanol and use this solution as the test solution. Pipet 1 mL of this solution, add methanol to make exactly 250 mL, and use this solution as the standard solution (1). Pipet 5 mL of this solution, add methanol to make exactly 10 mL and use this solution as the standard solution (2). With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution, the standard solution (1), and the standard solution (2) on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of chloroform, methanol and ammonia water(28) (90 : 10 : 1) to a distance of about 15 cm, and air-dry the plate. Spray evenly Dragendorff TS for spraying and immediately spray evenly with hydrogen peroxide TS; the spots other than the principal spot from the test solution are not more intense than the spots from the standard solution (1) and the number of spots more intense than the spots from the standard solution (2) is NMT 2.

Loss on drying NMT 0.5% (1 g, 105 ℃, 4 hours).

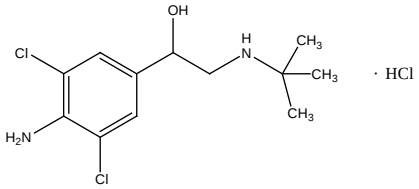
Residue on ignition NMT 0.2% (1 g).

Assay Weigh accurately about 0.4 g of Clemastine Fumarate, previously dried, dissolve in 50 mL of acetic acid(100), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 46.00 mg of $C_{21}H_{26}ClNO \cdot C_4H_4O_4$

Packaging and storage Preserve in tight containers.

Clenbuterol Hydrochloride
클렌부테롤염산염



$C_{12}H_{18}Cl_2N_2O \cdot HCl$: 313.65
1-(4-Amino-3,5-dichlorophenyl)-2-(*tert*-butyl-
Glutamic acid hydrochloride, [*21898-19-1*]

Clenbuterol Hydrochloride contains NLT 99.0% and NMT 101.0% of clenbuterol hydrochloride ($C_{12}H_{18}Cl_2N_2O \cdot HCl$), calculated on the anhydrous basis.

Description Clenbuterol Hydrochloride occurs as a white crystalline powder.
It is soluble in water or ethanol(95) and slightly soluble in acetone.

Melting point—About 173 ℃ (with decomposition).

Identification (1) Determine the infrared spectra of Clenbuterol Hydrochloride and clenbuterol hydrochloride RS as directed in the potassium bromide disk method under the Mid-infrared spectrophotometry; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) Dissolve 10 mg of Clenbuterol Hydrochloride in 10 mL of methanol, and use this solution as the test solution. Separately, dissolve 10 mg of clenbuterol hydrochloride RS in 10 mL of methanol and use this solution as the standard solution. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of toluene, ethanol(95) and ammonia water(28) (15 : 10 : 0.15) as the developing solvent to a distance of about 10 cm and air-dry the plate. Spray evenly 1 mol/L hydrochloric acid solution of 1% sodium nitrite, and after 10 minutes, immerse in a methanol solution of 0.4% naphthylethylene diamine hydrochloride, take the plate out and air-dry. The spots from the test solution and the standard solution have the same color and R_f value.

(3) An aqueous solution of Clenbuterol Hydrochloride (1 in 100) responds to the Qualitative Analysis (2) for chloride.

Optical rotation $[\alpha]_D^{20}$: Between -0.10° and +0.10° (0.30 g, water, 10 mL, 100 mm).

pH Dissolve 0.5 g of Clenbuterol Hydrochloride in 10 mL of water; the pH of this solution is between 5.0 and 7.0.

Purity (1) ***Clarity and color of solution*—**Dissolve 0.5 g of Clenbuterol Hydrochloride in 10 mL of water. The

resulting solution is not more intense than the following control suspension.

Control suspension—Dissolve 1.0 g of hydrazinium sulfate in water to make exactly 100 mL, and allow to stand for 4 to 6 hours. Add 25.0 mL of this solution to a solution of 2.5 g of hexamethylenetetramine dissolved in 25.0 mL of water, mix well, and allow to stand for 24 hours. Store in a glass container and use within 2 months. Before use, add water to 15.0 mL of the suspension to make 1000 mL, then mix 10.0 mL of this suspension with 90.0 mL of water, and shake well to mix. Use this solution as the control suspension.

(2) ***Heavy metals***—Proceed with 1.0 g of Clenbuterol Hydrochloride as directed under Method 2 and perform the test. Prepare the control solution with 1.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Related substances***—Weigh 0.100 g of Clenbuterol Hydrochloride, dissolve in the mobile phase to make exactly 50 mL and use this solution as the test solution. Take 0.1 mL of the test solution, add water to make 100 mL, and use this solution as the standard solution. Perform the test with 5 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak area of each solution according to the automatic integration method. The peak areas other than the major peak from the test solution are not greater than the major peak area from the standard solution (0.1%), and the total area of peaks other than the major peak is not greater than 2 times the peak area from the standard solution. Exclude peaks smaller than 0.1 times the major peak area from the standard solution.

Operating conditions

Detector: An ultraviolet spectrophotometry (wavelength: 215 nm).

Column: A stainless steel column about 4 mm in internal diameter and 12.5 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 ℃.

Mobile phase: A mixture of phosphate buffer solution, methanol and acetonitrile (60 : 20 : 20).

Flow rate: 0.5 mL/min

System suitability

System performance: Dissolve 10 mg of clenbuterol related substance I RS {1-(4-amino-3,5-dichlorophenyl)-2-[(1,1-dimethylethyl)amino]ethanone(clenbuterol-ketone)} in 20 mL of the mobile phase, add 5 mL of the test solution, then add the mobile phase to make 50 mL. Proceed with 5 μL of this solution according to the above conditions; the resolution between the peaks of related substance I and clenbuterol is NLT 2.5.

Phosphate buffer solution—Dissolve 3.0 g of sodium decanesulfonate and 5.0 g of potassium dihydrogen phosphate in 900 mL of water, adjust pH to 3.0 with phosphoric acid, then add water to make 1000 mL.

Water NMT 1.0% (1 g, volumetric titration, direct titration).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.25 g of Clenbuterol Hydrochloride, dissolve in 50 mL of ethanol(95), add 5.0 mL of 0.01 mol/L hydrochloric acid, and titrate with 0.1 mol/L sodium hydroxide VS (potentiometric titration under the Titrimetry). Read the amount consumed between equivalence point 1 and equivalence point 2.

Each mL of 0.1 mol/L sodium hydroxide VS
= 31.365 mg of $C_{12}H_{18}Cl_2N_2 \cdot HCl$

Packaging and storage Preserve in well-closed containers.

Clenbuterol Hydrochloride Syrup
클렌부테롤염산염 시럽

Clenbuterol Hydrochloride Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of clenbuterol hydrochloride ($C_{12}H_{18}Cl_2N_2O \cdot HCl$: 313.65).

Method of preparation Prepare as directed under Syrups, with Clenbuterol Hydrochloride.

Identification Take an amount of Clenbuterol Hydrochloride Syrup equivalent to about 0.1 mg of clenbuterol hydrochloride according to the labeled amount, transfer to a separatory funnel containing 50 mL of water, add 5 mL of 2 mol/L sodium hydroxide TS, then extract 3 times with 50 mL of ether each. Combine the ether extracts, wash with 50 mL of water, filter with a filter paper with anhydrous sodium sulfate, then evaporate the filtrate to dryness on a steam bath. Dissolve the residue in 0.1 mL of methanol and use this solution as the test solution. Separately, dissolve clenbuterol hydrochloride RS in methanol to obtain a solution containing 1.0 mg per mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of toluene, isopropanol, and ammonia (80 : 20 : 1) and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the colors and R_f values of the spots obtained from the test solution and the standard solution are the same.

pH Between 3.0 and 4.0.

Uniformity of dosage units (distribution) Meets the requirements.

Assay Pipet an amount of Clenbuterol Hydrochloride Syrup equivalent to 0.1 mg of clenbuterol hydrochloride ($C_{12}H_{18}Cl_2N_2O \cdot HCl$) according to the labeled amount. Alkalify by adding 50 mL of water and 5 mL of 2 mol/L sodium hydroxide TS, extract 4 times by shaking with 40 mL of ether each, wash the extract with 30 mL of water, then extract the ether layer 2 times using 10 mL each of 1 mol/L hydrochloric acid TS. Transfer the water layer to a 25-mL volumetric flask, add 2.0 mL of the internal standard solution and add 1 mol/L hydrochloric acid TS to the gauge line. Use this solution as the test solution. Separately, weigh accurately about 25 mg of clenbuterol hydrochloride RS and add 1 mol/L hydrochloric acid TS to make 250 mL. Pipet 1.0 mL of this solution, add 2.0 mL of the internal standard solution and 1 mol/L hydrochloric acid TS to make 25 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak area ratios for clenbuterol hydrochloride, Q_T and Q_S, to the internal standard for each solution.

$$\text{Amount (mg) of clenbuterol hydrochloride } (C_{12}H_{18}Cl_2N_2O \cdot HCl) = \text{Amount (mg) of clenbuterol hydrochloride RS} \times \frac{Q_T}{Q_S} \times \frac{1}{250}$$

Internal standard solution—Weigh accurately about 50 mg of caffeine RS, and add water to make 100 mL. Pipet 10.0 mL of this solution, add water to make 100 mL, and use this solution as the internal standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 30 cm in length, packed with cyanosilyl silica gel for liquid chromatography (5 μm to 10 μm in particle diameter).

Mobile phase: Adjust the pH of a mixture of water, ethanol, isopropanol and 0.15% sodium 1-heptanesulfonate solution (80 : 18 : 2 : 0.15) with acetic acid(100) for non-aqueous titration to 3.0.

Flow rate: 1.5 mL/min

Packaging and storage Preserve in light-resistant, tight containers.

Clenbuterol Hydrochloride Tablets
클렌부테롤염산염 정

Clenbuterol Hydrochloride Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of clenbuterol hydrochloride ($C_{12}H_{18}Cl_2N_2O \cdot HCl$: 313.65).

Method of preparation Prepare as directed under Tablets, with Clenbuterol Hydrochloride.

Identification Weigh the amount equivalent to 0.1 mg of clenbuterol hydrochloride according to the labeled amount of Clenbuterol Hydrochloride Tablets. Add 50 mL of water to make alkaline with dilute sodium hydroxide TS, and extract three times with 30 mL each of ether. Combine the ether extracts, wash with water, dehydrate with anhydrous sodium sulfate, and evaporate to dryness. Dissolve the residue in 0.1 mL of ethanol(95) and use this solution as the test solution. Separately, dissolve clenbuterol hydrochloride RS in ethanol(95) to contain 1.0 mg per mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of toluene, isopropanol, and ammonia (80 : 20 : 1) and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the colors and R_f values of the spots obtained from the test solution and the standard solution are the same.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 Clenbuterol Hydrochloride Tablets, and powder. Weigh accurately an amount equivalent to about 0.1 mg of clenbuterol hydrochloride ($C_{12}H_{18}Cl_2N_2O \cdot HCl$), and mix with 50 mL of water. Add 5 mL of 2 mol/L sodium hydroxide TS to make alkaline, extract by shaking 40 mL of ether 4 times, wash the extract with 30 mL of water, and extract the ether layer twice with 10 mL of 1 mol/L hydrochloric acid TS. Add exactly 2 mL of the standard solution and 1 mol/L hydrochloric acid TS to make exactly 25 mL, and use this solution as the test solution. Separately, weigh accurately about 25 mg of clenbuterol hydrochloride RS, and add 1 mol/L hydrochloric acid TS to make 250 mL. Pipet 1.0 mL of this solution, and add 2 mL of internal standard solution and 1 mol/L hydrochloric acid TS to make exactly 250 mL. Pipet 1 mL of this solution, add exactly 2 mL of the internal standard solution and 1 mol/L hydrochloric acid TS to make exactly 25 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution according to the following conditions as directed under the Liquid Chromatography, and determine the

ratio of peak areas, Q_T and Q_S, for clenbuterol hydrochloride to the peak area of the internal reference for each solution.

$$\text{Amount (mg) of clenbuterol hydrochloride } (C_{12}H_{18}Cl_2N_2O\cdot HCl) = \text{Amount (mg) of clenbuterol hydrochloride RS} \times (Q_T / Q_S) \times 0.004$$

Internal standard solution—Weigh accurately about 50 mg of caffeine RS, and add water to make 100 mL. Take exactly 10.0 mL of this solution, add water to make 100 mL, and use this solution as the test solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 30 cm in length, packed with cyanosilyl silica gel for liquid chromatography (5 μm to 10 μm in particle diameter).

Mobile phase: Adjust the pH of a mixture of water, methanol, isopropanol and 0.15% sodium 1-heptanesulfonate solution (80 : 18 : 2 : 0.15) to 3.0 with acetic acid(100) for non-aqueous titration.

Flow rate: 1.5 mL/min

Packaging and storage Preserve in light-resistant, tight containers.

Clidinium Bromide and Chlordiazepoxide Tablets
클리디늄브롬화물·클로르디아제폭시드 정

Clidinium Bromide and Chlordiazepoxide Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of clidinium bromide ($C_{22}H_{26}BrNO_3$: 432.35) and chlordiazepoxide ($C_{16}H_{14}ClN_3O$: 299.76).

Method of preparation Prepare as directed under Tablets, with Clidinium Bromide and Chlordiazepoxide.

Identification (1) Weigh an amount of Clidinium Bromide and Chlordiazepoxide Tablets, equivalent to 5 mg of clidinium bromide, according to the labeled amount. Add 1 mL of water and 9 mL of methanol, shake for 10 minutes to mix, centrifuge, and use the clear supernatant as the test solution. Separately, add 10 mg of clidinium bromide RS and 20 mg of chlordiazepoxide RS to 10 mL of a mixture of methanol and water (45 : 5), and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of chloroform, isopropanol and formic acid (45 : 40 : 15) as a developing solvent to a distance of about 15 cm, and air-dry the plate. Examine the plate under ultraviolet rays (major wavelength: 254 nm) or spray Dragendorff's TS evenly onto the plate; the color and R_f values of the spots obtained from the test solution and the standard solution are the same.

(2) The retention times of the major peaks obtained from the test solution and the standard solution under the Assay are the same.

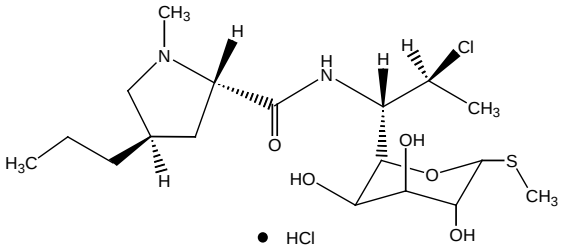
Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay (1) ***Clidinium bromide and chlordiazepoxide***—Weigh accurately the mass of NLT 20 Clidinium Bromide and Chlordiazepoxide Tablets, and powder. Weigh accurately an amount, equivalent to about 5 mg of chlordiazepoxide ($C_{16}H_{14}ClN_3O$) [about 2.5 mg of clidinium bromide ($C_{22}H_{26}BrNO_3$)], and perform the test as directed under the Assay of Clidinium Bromide and Chlordiazepoxide Tablets and Clidinium Bromide Capsules below in United States Pharmacopeia (USP). However, use clidinium bromide and chlordiazepoxide for the reference standard.

Packaging and storage Preserve in tight containers.

Clindamycin Hydrochloride
클린다마이신염산염



$C_{18}H_{33}ClN_2O_5S.HCl$: 461.44

(2*S*,4*R*)-N-{2-Chloro-1-[(2*R*,3*R*,4*S*,5*R*,6*R*)-3,4,5-trihydroxy-6-(methylsulfanyl)oxan-2-yl]propyl}-1-methyl-4-propylpyrrolidine-2-carboxamide hydrochloride [*21462-39-5*]

Clindamycin Hydrochloride is the hydrochloride of a derivative of lincomycin. Clindamycin Hydrochloride contains NLT 838 μg and NMT 940 μg (potency) of clindamycin ($C_{18}H_{33}ClN_2O_5S$: 424.98) per mg, calculated on the anhydrous basis.

Description Clindamycin Hydrochloride occurs as white to grayish white crystals or a crystalline powder.
It is freely soluble in water or methanol, and slightly soluble in ethanol(95).

Identification (1) Determine the infrared spectra of

Clindamycin Hydrochloride and clindamycin hydrochloride RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) An aqueous solution of Clindamycin Hydrochloride (1 in 100) responds to the Qualitative Analysis (2) for chloride.

Crystallinity Meets the requirements.

Optical rotation $[\alpha]_D^{25}$: Between +135° and +150° (0.5 g calculated on the anhydrous basis, water, 25 mL, 100 mm).

pH Dissolve 1 g of Clindamycin Hydrochloride in 10 mL of water; the pH of this solution is between 3.0 and 5.5.

Purity (1) ***Heavy metals***—Proceed with 2.0 g of Clindamycin Hydrochloride according to Method 4 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Related substances***—Weigh accurately 0.125 g of Clindamycin Hydrochloride, add the mobile phase to make 25 mL, and use this solution as the test solution. Weigh accurately 50 mg each of lincomycin hydrochloride RS and clindamycin hydrochloride RS, and dissolve in the mobile phase to make 100 mL. Pipet 10 mL of the resulting solution, add the mobile phase to make 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography, determine peak areas from each solution by the automatic integration method, and calculate the amount of the lincomycin according to the equation (1). Determine the amounts of 7-epi clindamycin, clindamycin B and other related substances according to the equation (2); the amounts of 7-epi clindamycin, clindamycin B and other related substances are NMT 4.0%, NMT 2.0 and NMT 1.0%, respectively, and the amount of total related substances containing lincomycin is NMT 6.0%.

$$\text{Content (\%) of lincomycin } (C_{18}H_{34}N_2O_6S) = 2.5 \times \frac{C_L \times P_L}{W} \times \frac{A_T}{A_S} (1)$$

C_L: Concentration (mg/mL) of lincomycin hydrochloride in the standard solution

P_L: Potency (μg/mg) of lincomycin ($C_{18}H_{34}N_2O_6S$) in lincomycin hydrochloride RS

W: Weight (mg) of sample taken

A_T: Peak area of lincomycin obtained from the test solution

A_S: Peak area of lincomycin obtained from the standard solution

$$\text{Content (\%) of related substances} = 2.5 \times \frac{C \times P}{W} \times \frac{A_i}{A_c} (2)$$

C: Concentration (mg/mL) of clindamycin B in the standard solution

P: Potency (μg/mg) of clindamycin ($C_{18}H_{33}ClN_2O_5S$) in clindamycin hydrochloride RS

W: Weight (mg) of sample taken

A_i: Peak area of each related substance obtained from the test solution

A_C: Peak area of clindamycin obtained from the standard solution

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 210 nm).

Column: A stainless steel column about 5 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of acetonitrile and a solution prepared by dissolving 6.8 g of potassium dihydrogen phosphate in 1000 mL of water and adjusting the pH to 7.5 with 8 mol/L potassium hydroxide solution (450 : 550).

Flow rate: 1.0 mL/min

System suitability

System performance: The relative retention times of lincomycin, clindamycin B and 7-epi clindamycin are 0.4, 0.65 and 0.9, respectively.

Time span of measurement: About 6 times the retention time of clindamycin.

Water NMT 6.0% (0.3 g, volumetric titration, direct titration).

Sterility It meets the requirements when used in the manufacturing of a sterile preparation. However, it is excluded in cases where there is a terminal sterilization process in the manufacturing of sterile preparations.

Pyrogen It meets the requirements when used in a sterile preparation. However, weigh an appropriate amount of Clindamycin Hydrochloride, dissolve in 75 mL of Isotonic Sodium Chloride Injection to make a solution containing 5.0 mg per mL, and use this solution as the test solution. However, the test injection amount shall be 1.0 mL of the test solution per kg of the weight of a rabbit.

Assay Weigh accurately about 20 mg (potency) each of Clindamycin Hydrochloride and clindamycin hydrochloride RS, dissolve in the mobile phase to make exactly 20 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas of clindamycin in each solution, A_T and A_S, respectively.

Potency (μg) of clindamycin ($C_{18}H_{33}ClN_2O_5S$)
= Potency (μg) of clindamycin hydrochloride RS × $\frac{A_T}{A_S}$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 210 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: A mixture of the solution of 0.05 mol/L potassium dihydrogen phosphate and acetonitrile whose pH is adjusted to 7.5 with 8 mol/L potassium hydroxide solution (550: 450).

Flow rate: Adjust the flow rate so that the retention time of clindamycin is about 10 minutes.

System suitability

System performance: Proceed with 20 μL of the standard solution under the above operating conditions; the number of theoretical plates and the symmetry factor of the peak of clindamycin are NLT 6000 plates and NMT 1.5, respectively.

System repeatability: Repeat the test 6 times with 20 μL each of the standard solutions; the relative standard deviation of the peak area of clindamycin is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Clindamycin Hydrochloride Capsules
클린다마이신염산염 캡슐

Clindamycin Hydrochloride Capsules contain NLT 93.0% and NMT 107.0% of the labeled amount of clindamycin hydrochloride ($C_{18}H_{33}ClN_2O_5S$: 424.98).

Method of preparation Prepare as directed under Capsules, with Clindamycin Hydrochloride.

Identification Weigh an amount equivalent to 10 mg (potency) of clindamycin hydrochloride according to the labeled amount of Clindamycin Hydrochloride Capsules, dissolve in 2 mL of methanol, shake well to mix, and separate with a centrifuge. Use the clear supernatant as the test solution. Separately, dissolve 10 mg of clindamycin hydrochloride RS in 2 mL of methanol, and use this solution as the standard solution. Perform the test with these solutions as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Develop the plate with a mixture of methanol, toluene, and ammonia water(28) (140 : 60 : 3) to a distance of about 12 cm, and air-dry the plate. Spray a solution prepared by adding 50 mL of bismuth subnitrate TS to 500 mL of L-tartaric acid (1 in 5); the R_f value of the principal spot obtained from the test solution is the same as that of the spot obtained from the standard solution.

Water NMT 7.0% (0.2 g, volumetric titration, direct titration).

Dissolution Take 1 Clindamycin Hydrochloride Capsule, proceed with 900 mL of water as the dissolution medium at 50 revolutions per minute according to Method 2, and perform the test. Take NLT 20 mL of the dissolved solution 30 minutes after starting the test and filter using a membrane filter with 0.45 μm in nominal pore size. Discard the first 10 mL of the filtrate, take exactly *V* mL of the subsequent filtrate, add water to make exactly *V'* mL so that each mL contains about 83 μg (potency) of clindamycin hydrochloride ($C_{18}H_{33}ClN_2O_5S$) according to the labeled amount, and then use this solution as the test solution. Separately, weigh accurately about 17 mg (potency) of clindamycin hydrochloride RS, dissolve in water make exactly 200 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas of clindamycin, A_T and A_S, in each solution. It meets the requirements when the dissolution rate of Clindamycin Hydrochloride Capsules in 30 minutes is NLT 80%.

Dissolution rate (%) with respect to the labeled amount of clindamycin hydrochloride ($C_{18}H_{33}ClN_2O_5S$)
= Potency (μg) of clindamycin hydrochloride RS
$$\times \frac{A_T}{A_S} \times \frac{V'}{V} \times \frac{1}{C} \times 450$$

C: Labeled amount [mg (potency)] of clindamycin hydrochloride ($C_{18}H_{33}ClN_2O_5S$) per capsule

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 210 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: A mixture of acetonitrile and a solution prepared by adjusting 0.05 mol/L potassium dihydrogen phosphate TS to pH 7.5 with 8 mol/L potassium hydroxide TS (550 : 450).

Flow rate: Adjust the flow rate so that the retention time of clindamycin is about 7 minutes.

System suitability

System performance: Proceed with 20 μL of the standard solution under the above operating conditions; the number of theoretical plates and the symmetry factor of the peak of clindamycin are NLT 3000 plates and NMT 2.0, respectively.

System performance: Repeat the test six times with 20 μL each of the standard solutions under the above operating conditions; the relative standard deviation of the peak area of clindamycin hydrochloride is NMT 2.0%.

Uniformity of dosage units It meets the requirements when the procedure for content uniformity is performed according to the following method. Take 1 Clindamycin Hydrochloride Capsule, add the mobile phase, shake to mix for 30 minutes, and then add the mobile phase to make exactly V mL so that the solution contains 0.75 mg (potency) of clindamycin. Separate this solution by using a centrifuge, and use the clear supernatant as the test solution. Separately, weigh accurately about 75 mg (potency) of clindamycin hydrochloride RS, add the mobile solution to make exactly 100 mL, and use this solution as the standard solution. Perform the test as directed under the Assay below.

Potency (μg) of clindamycin ($C_{18}H_{33}ClN_2O_5S$)
= Potency (μg) of clindamycin hydrochloride RS
$$\times \frac{A_T}{A_S} \times \frac{V}{100}$$

Assay Weigh accurately the mass of the contents of NLT 20 Clindamycin Hydrochloride Capsules. Weigh accurately an amount, equivalent to 75 mg (potency) of clindamycin, according to the labeled potency, add the mobile phase, shake to mix for 30 minutes to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 75 mg (potency) of clindamycin hydrochloride RS, add the mobile solution to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas of clindamycin, A_T and A_S, in each solution.

Potency (μg) of clindamycin ($C_{18}H_{33}ClN_2O_5S$)
= Potency (μg) of clindamycin hydrochloride RS$\times \frac{A_T}{A_S}$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 210 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 150 mm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: A mixture of 0.05 mol/L potassium dihydrogen phosphate adjusted the pH to 7.5 with 8 mol/L potassium hydroxide solution (550: 450) and acetonitrile.

Flow rate: Adjust the flow rate so that the retention time of clindamycin is about 7 minutes.

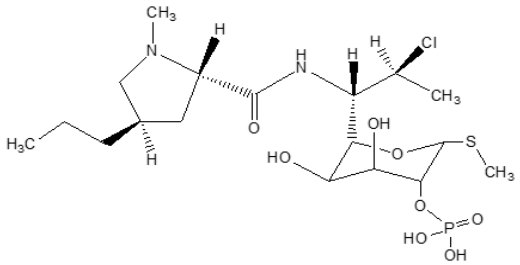
System suitability

System performance: Proceed with 20 μL of the standard solution under the above operating conditions; the number of theoretical plates and the symmetry factor of the peak of clindamycin are NLT 3000 plates and NMT 2.0, respectively.

System repeatability: Repeat the test six times with 20 μL each of the standard solutions under the above operating conditions; the relative standard deviation of the peak area of clindamycin is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Clindamycin Phosphate
클린다마이신포스페이트



$C_{18}H_{34}ClN_2O_8PS$: 504.97

Methyl 5-{2-chloro-1-[(1-methyl-4-propylprolyl)amino]propyl}-2-O-phosphono-1-thiopentopyranoside [*24729-96-2*]

Clindamycin Phosphate is the sulfate of a derivative of clindamycin.

Clindamycin Phosphate contains NLT 800 μg and NMT 846 μg (potency) of clindamycin ($C_{18}H_{33}ClN_2O_5S$: 424.98) per mg, calculated on the anhydrous basis.

Description Clindamycin Phosphate occurs as a white to pale yellowish white crystalline powder.
It is freely soluble in water, sparingly soluble in methanol, and practically insoluble in ethanol(95).

Identification Determine the infrared spectra of Clindamycin Phosphate and clindamycin phosphate RS as directed in the paste method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Crystalline Meets the requirements.

Optical rotation $[\alpha]_D^{20}$: Between° +115 and +130° (0.25 g calculated on the anhydrous basis, water, 25 mL, 100 mm).

pH Dissolve 0.10 g of Clindamycin Phosphate in 10 mL of water;, the pH of the solution is between 3.5 and 4.5.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g

of Clindamycin Phosphate in 10 mL of freshly boiled and cooled water; the resulting solution is clear and colorless.

(2) ***Heavy metals***—Proceed with 2.0 g of Clindamycin Phosphate according to Method 4 and perform the test. Prepare the control solution with 1.0 mL of lead standard solution (NMT 5 ppm).

(3) ***Arsenic***—Proceed with 1.0 g of Clindamycin Phosphate according to the Method 4 and perform the test (NMT 2 ppm).

(4) ***Related substances***—Weigh accurately 0.1 g of Clindamycin Phosphate, dissolve in 100 mL of the mobile phase, and use this solution as the test solution. Pipet 1 mL of this solution, add the mobile phase to it make exactly 100 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions and determine each peak area of each solution by the automatic integration method; the peak area of clindamycin, which has a relative retention time of about 1.8 to that of clindamycin phosphate from the test solution, is not larger than 1/2 times that of clindamycin phosphate from the standard solution. In addition, the sum of peak areas other than clindamycin phosphate from the test solution is not greater than 4 times that of clindamycin phosphate from the standard solution.

Internal standard solution—A solution of methyl *p*-hydroxybenzoate in the mobile phase (3 in 50000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 210 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: Dissolve 10.54 g of potassium dihydrogen phosphate in 775 mL of water, adjust the pH to 2.5 with phosphoric acid, and add 225 mL of acetonitrile to make exactly 1000 mL.

Flow rate: Adjust the flow rate so that the retention time of clindamycin phosphate is about 8 minutes.

System suitability

Test for required detectability: Pipet 1.0 mL of the standard solution, and add the mobile phase to make exactly 10 mL. Confirm that the peak area of clindamycin phosphate obtained from 20 μL of this solution is within the range between 7% and 13% of that of clindamycin phosphate from the standard solution.

System performance: Weigh accurately the amount equivalent to 20 mg (potency) of clindamycin phosphate, dissolve in 25 mL of the internal standard solution, add the mobile phase to make 100 mL, and use this solution as the system suitability solution. Proceed with 20 μL of this solution under the above operating conditions; clindamycin phosphate and the internal standard solution are eluted in this order with the resolution being NLT 4.

System repeatability: Repeat the test 6 times with 20 μL each of the system suitability solutions according to the above conditions; the relative standard deviation of the peak area of clindamycin phosphate to that of the internal standard is NMT 2.5%.

Time span of measurement: About 2 times the retention time of clindamycin phosphate after the solvent peak.

Water NMT 6.0% (0.5 g, volumetric titration, direct titration).

Sterility It meets the requirements when used in the manufacturing of a sterile preparation. However, it is excluded in cases where there is a terminal sterilization process in the manufacturing of sterile preparations.

Bacterial endotoxins It is less than 0.58 EU (potency) per mg of clindamycin phosphate when used in the manufacturing of sterile preparations.

Histamine It meets the requirements when used in the manufacturing of sterile preparations. Weigh an appropriate amount of Clindamycin Phosphate, dissolve in Isotonic Sodium Chloride Injection to prepare a solution containing 5 mg (potency) per mL, and use this solution as the test solution.

Assay Weigh accurately an amount of Clindamycin Phosphate and clindamycin phosphate RS, equivalent to about 20 mg (potency), dissolve each in exactly 25 mL of internal standard solution, add the mobile phase to make exactly 100 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the ratios, Q_T and Q_S, of peak area of clindamycin phosphate to those of the internal standards from each solution.

$$\text{Potency (μg) of clindamycin } (C_{18}H_{33}ClN_2O_5S) = \text{Potency (μg) of clindamycin hydrochloride RS} \times \frac{Q_T}{Q_S}$$

Internal Standard solution—A solution of p-hydroxybenzoate in the mobile phase (3 in 50000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 210 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 25 cm in length, packed with octylsilane silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: Dissolve 10.54 g of potassi-

um dihydrogen phosphate in 775 mL of water, and adjust pH to 2.5 with phosphoric acid. To this solution, add 225 mL of acetonitrile.

Flow rate: Adjust the flow rate so that the retention time of clindamycin phosphate is about 8 minutes.

System suitability

System performance: Proceed with 20 μL of the standard solution under the above conditions; clindamycin phosphate and the internal standard are eluted in this order with the resolution between these peaks being NLT 4.

System repeatability: Repeat the test 6 times with 20 μL each of the standard solutions according to the above conditions; the relative standard deviation of the peak area of clindamycin phosphate to that of the internal standard is NMT 2.5%.

Packaging and storage Preserve in tight containers.

Clindamycin Phosphate Vaginal Cream
클린다마이신포스페이트 질크림

Clindamycin Phosphate Gel contains NLT 90.0% and NMT 120.0% of the labeled amount of clindamycin phosphate ($C_{18}H_{33}ClN_2O_5S$: 424.99).

Method of preparation Prepare as directed under Creams, with Clindamycin Phosphate.

Identification The retention times of the major peaks obtained from the test solution and the standard solution in the Assay are the same.

pH Between 3.0 and 6.0.

Assay Weigh accurately an amount of Clindamycin Phosphate Gel equivalent to about 20 mg (potency), add exactly 20.0 mL of the internal standard solution, and completely dissolve it. Add the mobile phase to make exactly 100 mL to filter, and use this solution as the test solution. Separately, weigh accurately about 20 mg (potency) of clindamycin phosphate RS, add exactly 20.0 mL of the internal standard solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the ratios, Q_T and Q_S, of the peak area of clindamycin phosphate to that of the internal standard.

$$\text{Potency (μg) of clindamycin } (C_{18}H_{33}ClN_2O_5S) = \text{Potency (μg) of clindamycin phosphate RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—Weigh about 60 mg of methyl *p*-hydroxybenzoate and dissolve in the mobile phase to make exactly 1 L.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 210 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 250 mm in length, packed with octylsilane silica gel for liquid chromatography (5 μm to 10 μm in particle diameter).

Mobile phase: Dissolve 10.54 g of potassium dihydrogen phosphate in 775 mL of water, adjust pH to 2.5 with phosphoric acid, and add 225 mL of acetonitrile.

Flow rate: About 1.0 mL/min.

System suitability

System repeatability: Repeat the test 6 times with 10 μL each of the standard solutions according to the above conditions; the relative standard deviation of the peak area of clindamycin is NMT 2.5%.

Packaging and storage Preserve in tight containers.

Clindamycin Phosphate Gel
클린다마이신포스페이트 겔

Clindamycin Phosphate Gel contains NLT 90.0% and NMT 120.0% of the labeled amount of clindamycin phosphate ($C_{18}H_{33}ClN_2O_5S$: 424.99).

Method of preparation Prepare as directed under Gels, with Clindamycin Phosphate.

Identification The retention times of the major peak obtained from the test solution in the Assay are the same.

pH Between 5.5 and 7.5.

Assay Weigh accurately an amount of Clindamycin Phosphate Gel equivalent to about 20 mg (potency), add exactly 20.0 mL of the internal standard solution, and completely dissolve it. Add the mobile phase to make exactly 100 mL to filter, and use this solution as the test solution. Separately, weigh accurately about 20 mg (potency) of clindamycin phosphate RS, add exactly 20.0 mL of the internal standard solution and then the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the ratios, Q_T and Q_S, of the peak area of clindamycin phosphate to that of each solution internal standard.

$$\text{Potency (μg) of clindamycin } (C_{18}H_{33}ClN_2O_5S) = \text{Potency (μg) of clindamycin phosphate RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—Weigh about 60 mg of methyl *p*-hydroxybenzoate and dissolve in the mobile phase to make exactly 1000 mL.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 210 nm).

Column: A stainless steel column, about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm to 10 μm in particle diameter).

Mobile phase: Weigh 10.54 g of potassium dihydrogen phosphate, dissolve in 775 mL of water, adjust the pH to 2.5 with phosphoric acid, and add 225 mL of acetonitrile.

Flow rate: About 1.0 mL/min.

System suitability

System repeatability: Repeat the test 6 times with 10 μL each of the standard solutions under the above operating conditions; the relative standard deviation of the peak area of clindamycin is NMT 2.5%.

Packaging and storage Preserve in tight containers.

Clindamycin Phosphate Injection
클린다마이신포스페이트 주사액

Clindamycin Phosphate Injection is an aqueous solution for injection and contains NLT 90.0% and NMT 110.0% of the labeled amount of clindamycin phosphate ($C_{18}H_{34}ClN_2O_8PS$: 504.96).

Method of preparation Prepare as directed under Injections, with Clindamycin Phosphate.

Description Clindamycin phosphate Injection occurs as a clear, colorless to pale yellow liquid.

Identification Weigh a volume of Clindamycin Phosphate Injection, equivalent to 0.15 g (potency) of clindamycin phosphate according to the labeled amount, add 4 mL of water, 2 mL of 8 mol/L sodium hydroxide TS and 0.1 mL of sodium pentacyanonitrosylferrate(III) TS, shake to mix, heat on a steam bath for 10 minutes, and add 2 mL of hydrochloric acid; the solution exhibits a bluish green color.

pH Between 6.0 and 7.0.

Sterility Meets the requirements.

Bacterial endotoxins Less than 0.1 EU per mg (potency) of clindamycin phosphate.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Extractable volume of injections Meets the requirements.

Assay Perform the test as directed under the Assay under Clindamycin Phosphate. However, weigh accurately a volume of Clindamycin Phosphate Injection, equivalent to about 0.3 g (potency) according to the labeled potency, and add the mobile phase to make exactly 100 mL. Pipet 7 mL of this solution, add exactly 25 mL of the internal standard solution, add the mobile phase to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately 20 mg (potency) of clindamycin phosphate RS, dissolve in 25 mL of the internal standard solution, add the mobile phase to make 100 mL, and use this solution as the standard solution.

$$\text{Potency (μg) of clindamycin phosphate } (C_{18}H_{34}ClN_2O_8PS) = \text{Potency (μg) of clindamycin phosphate RS} \times \frac{Q_T}{Q_S} \times \frac{100}{7}$$

Internal standard solution—A solution of methyl *p*-hydroxybenzoate in the mobile phase (3 in 50000).

Packaging and storage Preserve in hermetic containers.

Clindamycin Phosphate Topical Solution
클린다마이신포스페이트 외용액

Clindamycin Phosphate Solution

Clindamycin Phosphate Topical Solution contains NLT 90.0% and NMT 120.0% of the labeled amount of clindamycin ($C_{18}H_{33}ClN_2O_5S$: 424.99), when quantified as a topical solution.

Method of preparation Prepare as directed under the Liquids, with Clindamycin Phosphate.

Identification The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

pH Between 4.0 and 7.0.

Assay Weigh accurately an amount of Clindamycin Phosphate Topical Solution equivalent to 20 mg (potency), according to the labeled potency, add exactly 25.0 mL of the internal standard solution, add the mobile phase to make 100 mL, and use this solution as the test solution. Separately, weigh accurately about 20 mg (potency) of clindamycin phosphate RS, dissolve in 25.0 mL of the internal standard solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test

solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the ratios, Q_T and Q_S, of the peak area of clindamycin phosphate to that of the internal standard, for the test solution and the standard solution, respectively.

$$\text{Potency (μg) of clindamycin } (C_{18}H_{33}ClN_2O_5S) = \text{Potency (μg) of clindamycin phosphate RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—Weigh about 40 mg of 4-hydroxyacetophenone, and add 10 mL of acetonitrile and the mobile phase, to make a concentration of 0.04 mg per mL.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 214 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm to 10 μm in particle diameter).

Mobile phase: Dissolve 10.54 g of potassium dihydrogen phosphate in 775 mL of water, adjust the pH to 2.5 with phosphoric acid, and add 225 mL of acetonitrile.

Flow rate: About 1.0 mL/min.

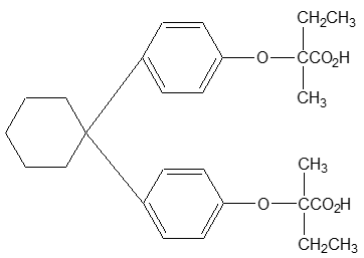
System suitability

System performance: Proceed with 20 μL of the standard solution according to the above conditions; the resolution between the two peaks of clindamycin and 4-hydroxyacetophenone is NLT 2.0.

System repeatability: Repeat the test 6 times with 20 μL each of the standard solutions according to the above conditions; the relative standard deviation of the ratio of the peak area of clindamycin to that of the internal standard is NMT 2.5%.

Packaging and storage Preserve in tight containers.

Clinofibrate
클리노피브레이트



$C_{28}H_{36}O_6$: 468.58

2-[4-[1-[4-(2-Carboxybutan-2-yloxy)phenyl]cyclohexyl]phenoxy]-2-methylbutanoic acid [*30299-08-2*]

Clinofibrate, when dried, contains NLT 98.5% and NMT 101.0% of clinofibrate ($C_{28}H_{36}O_6$).

Description Clinofibrate occurs as white to yellowish white crystals or a crystalline powder, and is odorless and tasteless.

It is freely soluble in methanol, ethanol(99.5), acetone or ether, and practically insoluble in water.

A solution of Clinofibrate in methanol (1 in 20) shows no optical rotation.

Melting point—About 146 °C (with decomposition).

Identification (1) Determine the absorption spectra of the solutions of Clinofibrate and clinofibrate RS in ethanol(99.5) (1 in 50000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Clinofibrate and clinofibrate RS as directed in the potassium bromide disk method under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Clinofibrate according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Arsenic***—Prepare the test solution with 1.0 g of Clinofibrate according to Method 3 and perform the test (NMT 2 ppm).

(3) ***Related substances***—Dissolve about 0.10 g of Clinofibrate in 10 mL of acetone and use this solution as the test solution. Pipet 1 mL of this solution, and add acetone to make exactly 50 mL. Pipet 5 mL of this solution, add acetone to make exactly 20 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 50 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of chloroform, cyclohexane and acetic acid(100) (12 : 5 : 3) to a distance of about 12 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot obtained from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 1.0% (1 g, in vacuum, 60 ℃, 3 hours).

Residue on ignition NMT 0.2% (1 g).

Isomer rate To 50 mg of Clinofibrate, add 0.4 mL of thionyl chloride, close the stopper, warm on a steam bath at 60 ℃ for 5 minutes while shaking occasionally, and evaporate the excess thionyl chloride in vacuum at below 60 ℃. Dissolve the residue in 2 mL of toluene, dried with synthetic zeolite for drying, add 2 mL of a solution of

0.15 g of D-(+)-α-methylbenzylamine dissolved in 5 mL of toluene, dried with synthetic zeolite for drying, shake gently to mix, allow to stand for 10 minutes, and evaporate the toluene in vacuum at below 60 ℃. Dissolve the residue in 5 mL of chloroform and use this solution as the test solution. With 5 μL of the test solution, perform the test as directed under the Liquid Chromatography according to the following conditions. Determine the areas, A_a, A_b and Ac, according to the order of elution, of three adjacent peaks eluted at the retention times of about 7 minutes; $A_b/(A_a+A_b+A_c) \times 100$ is between 40 and 70.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column : A stainless steel column about 4 mm in internal diameter and about 30 cm in length, packed with silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 20 °C.

Mobile phase: A mixture of hexane and 2-propanol (500 : 3).

Flow rate: Adjust the flow rate so that the retention time of the first eluted peak among three peaks of clinofibrate is about 35 minutes.

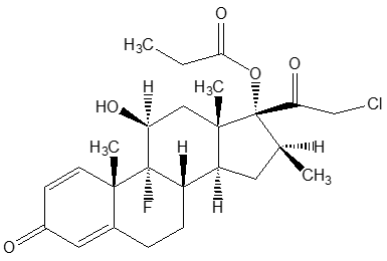
Selection of column: Proceed with 5 μL of the test solution under the above conditions; use the column where the three peaks are completely separated from each other.

Assay Weigh accurately 0.45 g of Clinofibrate, previously dried, dissolve in 40 mL of ethanol(99.5), add 30 mL of water, and titrate with 0.1 mol/L sodium hydroxide VS (indicator: 3 drops of phenol phthalein TS). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS
= 23.43 mg of $C_{28}H_{36}O_6$

Packaging and storage Preserve in tight containers.

Clobetasol Propionate
클로베타솔프로피오네이트



$C_{25}H_{32}ClFO_5$: 466.97

[(8*S*,9*R*,10*S*,11*S*,13*S*,14*S*,16*S*,17*R*)-17-(2-Chloro-acetyl)-9-fluoro-11-hydroxy-10,13,16-trimethyl-3-oxo-6,7,8,11,12,14,15,16-octahydrocyclopenta[*a*]phenanthren-17-yl]propanoate [*25122-46-7*]

Clobetasol Propionate, when dried, contains NLT 97.0% and NMT 102.0% of clobetasol propionate ($C_{25}H_{32}$ CIFO $_5$).

Description Clobetasol Propionate occurs as a white to pale yellow crystalline powder.
It is soluble in methanol or ethanol(95), and practically insoluble in water.
It is gradually colored to yellow by light.

Melting point—About 196 ℃ (with decomposition).

Identification (1) Determine the infrared spectra of Clobetasol Propionate and clobetasol propionate RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

Optical rotation $[\alpha]_D^{20}$: Between +112 ° and + 118° (0.5 g after drying, acetone, 50 mL, 100 mm).

Purity (**1)** ***Heavy metals***—Proceed with 1.0 g of Clobetasol Propionate according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) **Related substances—**Weigh accurately about 10 mg of Clobetasol Propionate, dissolve in the mobile phase to make exactly 100 mL, and use this solution as the test solution (1). Take 1 mL of this solution, add the mobile phase to make exactly 50 mL, and use this solution as the test solution (2). Weigh accurately about 10 mg of clobetasol propionate RS and 5mg of 9α-fluoro-11β-hydroxy-16β-methyl-3-oxo-androsta-1,4-diene-17(*R*)-spiro-2'-[4'-chloro-5'-ethylfuran-3-(2'*H*)-one] RS, dissolve in the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution (1), the test solution (2) and the standard solution as directed under the Liquid Chromatography according to the following conditions; the each peak area other than the major peak from the test solution (1) is NMT 0.5 times the major peak area from the test solution (2) (1.0%), and the total area of these peaks is NMT 1.25 times the major peak area from test solution (2) (2.5%). However, among the peaks from the test solution (2), disregard any peak whose area is NMT 0.025 times the major peak area (0.05%).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 240 nm).

Column: A stainless steel column about 4.6 mm in

internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of acetonitrile, 0.05 mol/L sodium dihydrogen phosphate (adjust the pH to 2.5 with phosphoric acid) and methanol (475 : 425 : 100).

Flow rate: 1 mL/min

System suitability

Selection of column: Proceed with 10 μL of the standard solution according to the above conditions; use a column with the resolution between clobetasol propionate and 9α-fluoro-11β-hydroxy-16β-methyl-3-oxo-androsta-1,4-diene-17(*R*)-spiro-2'-[4'-chloro-5'-ethylfuran-3-(2'*H*)-one] RS being NLT 3.

Loss on drying NMT 0.5% (1 g, 105 ℃, 3 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 10 mg each of Clobetasol Propionate and cobetasol propionate RS, previously dried, dissolve each in the mobile phase to make exactly 50 mL, add exactly 100 mL of the internal standard solution, add the mobile phase to make 250 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the conditions of the related substances, and determine the ratios, Q_T and Q_S, of the peak area of clobetasol propionate to that of the internal standard.

Amount (mg) of clobetasol propionate ($C_{25}H_{32}ClFO_5$)
= Amount (mg) of clobetasol propionate RS× $\frac{Q_T}{Q_S}$

Internal standard solution—A solution of beclomethasone dipropionate in the mobile phase (1 in 5000).

Packaging and storage Preserve in light-resistant, well-closed containers.

Clobetasol Propionate Cream
클로베타솔프로피오네이트 크림

Clobetasol Propionate Cream contains NLT 90.0% and NMT 115.0% of the labeled amount of clobetasol propionate ($C_{25}H_{32}ClFO_5$: 466.97).

Method of preparation Prepare as directed under Creams, with Clobetasol Propionate.

Identification (1) Weigh an amount of Clobetasol Propionate Cream equivalent to about 0.75 mg of clobetasol propionate ($C_{25}H_{32}ClFO_5$) according to the labeled amount, place in a 25-mL centrifuge tube, add 10 mL of methanol, and cover the tube with a stopper. Warm for 4 minutes on a steam bath at 60 ℃, remove from the bath, shake vigorously and extract. Repeat this procedure multiple times, cool to room temperature, add 3.5 mL of water, then centrifuge for about 10 minutes. Take 10 mL of the clear supernatant, place in a 100-mL separatory funnel, add 1 g of sodium chloride and 10 mL of water, and mix thoroughly. To this solution, add 5 mL of dichloromethane, extract after sonication for 1 minute, take the dichloromethane layer, evaporate to dryness under the current of nitrogen, dissolve the residue in 0.5 mL of dichloromethane and use this solution as the test solution. Perform the test as directed in Identification (1) under Clobetasol Propionate Ointment.

(2) The retention times of the major peaks obtained from the test solution and the standard solution in the Assay are the same.

Assay Weigh accurately an amount of Clobetasol Propionate Cream equivalent to about 1.0 mg of clobetasol propionate ($C_{25}H_{32}ClFO_5$) according to the labeled amount, add 10 mL of ethanol(99.5), warm on a steam bath while shaking occasionally until completely suspended, then cool for 30 minutes in iced water. Centrifuge, pipet 5 mL of the clear supernatant, add 5.0 mL of the internal standard solution and mix well. Use this solution as the test solution. With this test solution, perform the test as directed under the Assay under Clobetasol Propionate Ointment.

Amount (mg) of clobetasol propionate ($C_{25}H_{32}ClFO_5$)
= Amount (mg) of clobetasol propionate RS× $\frac{Q_T}{Q_S} \times \frac{1}{10}$

Internal standard solution—A solution of Beclometasone Dipropionate in 50% ethanol (1 in 5000).

Packaging and storage Preserve in tight containers and store NMT 30 ℃.

Clobetasol Propionate Ointment
클로베타솔프로피오네이트 연고

Clobetasol Propionate Ointment contains NLT 90.0% and NMT 115.0% of the labeled amount of clobetasol propionate ($C_{25}H_{32}ClFO_5$: 466.97).

Method of preparation Prepare as directed under Ointments, with Clobetasol Propionate.

Identification (1) Weigh accurately an amount of Clobetasol Propionate Ointment equivalent to about 0.5 mg of clobetasol propionate ($C_{25}H_{32}ClFO_5$) according to the labeled amount, place in a 25-mL centrifuge tube, add 10 mL of methanol, and stopper the tube. Warm on a 70 ℃ water bath for 4 minutes, take out, and shake vigorously to extract. Repeat this procedure several times, cool in iced water for 5 minutes, and centrifuge for about

10 minutes. Take 5 mL of the clear supernatant, evaporate to dryness in the nitrogen atmosphere, dissolve the residue in 0.5 mL of dichloromethane, and use this solution as the test solution. Separately, weigh accurately about 10 mg of clobetasol propionate RS, dissolve in dichloromethane to make 20 mL, and use this solution as the standard solution. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of dichloromethane, acetone and ethanol(99.5) (100 : 10 : 5) as the developing solvent to a distance of about 15 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 245 nm); the R_f values and colors of the principal spots obtained from the test solution and the standard solution are the same.

(2) The retention times of the major peaks from the test solution and the standard solution obtained in the Assay are the same.

Assay Weigh accurately an amount of Clobetasol Propionate Ointment equivalent to about 1.0 mg of clobetasol propionate ($C_{25}H_{32}ClFO_5$) according to the labeled amount, add 10 mL of ethanol(99.5), warm on a steam bath with occasional shaking to completely disperse, and cool in iced water for 30 minutes. Centrifuge, pipet 5 mL of the clear supernatant, add 5.0 mL of the internal standard solution, and shake well to mix. Use this solution as the test solution. Separately, weigh accurately about 10 mg of clobetasol propionate RS and dissolve in diluted ethanol (1 in 2) to make 100 mL. Pipet 5 mL of this solution, add 5.0 mL of the internal standard solution, mix well, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the peak area ratios, Q_T and Q_S, of clobetasol propionate to that of the internal standard in each solution.

Amount (mg) of clobetasol propionate ($C_{25}H_{32}ClFO_5$)
= Amount (mg) of clobetasol propionate RS$\times \frac{Q_T}{Q_S} \times \frac{1}{10}$

Internal standard solution—A solution of beclomethasone dipropionate in diluted ethanol (1 in 2) (1 in 5000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 240 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 10 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

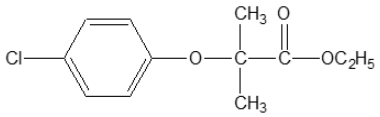
Mobile phase: A mixture of water and ethanol(99.5) (55 : 45).

Column temperature: 60 ℃

Flow rate: 2 mL/min

Packaging and storage Preserve in tight containers and store at below 30 ℃.

Clofibrate
클로피브레이트



$C_{12}H_{15}ClO_3$: 242.70

Ethyl 2-(4-chlorophenoxy)-2-methylpropanoate [*637-07-0*]

Clofibrate contains NLT 98.0% and NMT 101.0% of clofibrate ($C_{12}H_{15}ClO_3$) calculated on the anhydrous basis.

Description Clofibrate occurs as colorless or pale yellow, clear, oily liquid. It has a characteristic odor, and has a bitter taste at first followed by a sweet taste.
It is miscible with methanol, ethanol(95), ether or hexane, and practically insoluble in water.
It is gradually decomposed by light.

Identification (1) Determine the absorption spectra of the solutions of Clofibrate and clofibrate RS in ethanol(99.5) (1 in 10000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths. Determine the absorption spectra of solutions of Clofibrate and clofibrate RS in ethanol(99.5) (1 in 100000); both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Clofibrate and clofibrate RS as directed under the liquid film method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Refractive index n_D^{20}: Between 1.500 and 1.505.

Specific gravity d_{20}^{20}: Between 1.137 and 1.144.

Purity (1) ***Acid***—Dissolve 2.0 g of Clofibrate in 100 mL of neutralized ethanol, and add 1 drop of phenolphthalein TS and 0.20 mL of 0.1 mol/L sodium hydroxide TS; the resulting solution exhibits a red color.

(2) ***Heavy metals***—Weigh and proceed with 2.0 g of Clofibrate according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Arsenic***—To 5.0 g of Clofibrate, add 20 mL of nitric acid and 5 mL of sulfuric acid and heat until white fumes are evolved. After cooling, if necessary, add fur-

ther 5 mL of nitric acid, heat until white fumes are evolved, and repeat this procedure until the solution becomes colorless to pale yellow. After cooling, add 15 mL of saturated ammonium oxalate solution, and heat again until white fumes are evolved. Cool and add water to make 25 mL. Use 5 mL of this solution as the test solution and perform the test.

Standard color—Prepare a solution by proceeding in the same manner without using Clofibrate. Put 5 mL of the solution into a generator bottle, add 2.0 mL of arsenic standard solution, and then proceed as directed under the test solution (NMT 2 ppm).

(4) ***4-chlorophenol and other related substances***—Pipet 10.0 mL of Clofibrate, add 5.0 μL of tributyrin, and use this solution as the test solution. Separately, weigh accurately 50 mg of clofibrate RS and 15 mg of 4-chlorophenol, dissolve in chloroform to make 50 mL, pipet 1 mL of this solution, then add chloroform to make 10 mL as a solution containing 0.1 mg of clofibrate and 0.03 mg of 4-chlorophenol per mL. Pipet 10.0 mL of this solution, add 5.0 μL of tributyrin, and use this solution as the standard solution. Perform the test with 1 μL each of the test solution and the standard solution as directed under the Gas Chromatography according to the following conditions, and determine the ratio, Q_i, of the peak area of each related substance other than 4-chlorophenol to that of tributyrin obtained from the test solution, and the ratio, Q_S, of the peak area of clofibrate to that of tributyrin obtained from the standard solution, by Equation (1); the amount of each related substance other than 4-chlorophenol is NMT 0.01%, and the amount of total related substances is NMT 0.12%. Furthermore, determine the ratio, Q_{Tc}, of the peak area of 4-chlorophenol to that of tributyrin obtained from the test solution, and ratio, Q_{Sc}, of the peak area of 4-chlorophenol to that of tributyrin obtained from the standard solution, by Equation (2); the amount of 4-chlorophenol is NMT 0.003%.

$$\text{Content (\%) of related substances} = 0.1\times C \times \frac{Q_i}{Q_S} \quad (1)$$

C: Concentration (mg/mL) of clofibrate in the standard solution

$$\text{Content (\%) of } p\text{-chlorophenol } (ClC_6H_4OH) = 0.1 \times C \times \frac{Q_{Tc}}{Q_{Sc}} \quad (2)$$

C: Concentration (mg/mL) of 4-chlorophenol in the standard solution

Operating conditions

Detector: A flame ionization detector

Column: A column about 0.53 mm in internal diameter and about 15 m in length, internally coated with dimethylpolysiloxane oil at 1.5 μm thick.

Column temperature: Maintain at 120 °C for the first minute, then increase up to 180 °C at a rate of 5 °C per minute for 12 minutes, and then keep this temperature for 9 minutes.

Carrier gas: Helium

Flow rate: 2 mL/min

Sample injection port temperature: 210 °C

Detector temperature: 220 °C

Split ratio: About 1 : 20.

System suitability

System performance: Proceed with 1 μL of the standard solution according to the above conditions, the relative retention times of 4-chlorophenol and clofibrate to tributyrin are about 0.2 and about 0.55, respectively.

Water NMT 0.2% (5 g, volumetric titration, direct titration).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.5 g of Clofibrate, add exactly 50 mL of 0.1 mol/L potassium hydroxide-ethanol solution, and heat on a steam bath under a reflux condenser with a carbon dioxide absorbing tube (soda-lime) for 2 hours with frequent shaking. Cool, and titrate immediately the excess potassium hydroxide with 0.1 mol/L hydrochloric acid VS (indicator: 3 drops of phenolphthalein TS). Perform a blank test in the same manner.

Each mL of 0.1 mol/L potassium hydroxide VS
= 24.270 mg of $C_{12}H_{15}ClO_3$

Packaging and storage Preserve in light-resistant, tight containers.

Clofibrate Capsules
클로피브레이트 캡슐

Clofibrate Capsules contain NLT 93.0% and NMT 107.0% of the labeled amount of clofibrate ($C_{12}H_{15}ClO_3$: 242.70).

Method of preparation Prepare as directed under Capsules, with Clofibrate.

Identification Open a capsule, take out the content and use it as a sample. Determine the absorption spectrum of a solution of the sample in ethanol(99.5) (1 in 10000) as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum between 278 nm and 282 nm. Determine the absorption spectrum of a solution of the sample in ethanol(99.5) (1 in 10000) as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum between 224 nm and 228 nm.

Purity ***4-chlorophenol***—Proceed with NLT 20 capsules of Clofibrate Capsules, open the capsules, take out and mix the contents, weigh 1.0 g of the mixed contents, and

perform the test as directed under the Purity (4) of Clofibrate.

Dissolution Perform the test with 1 capsule of Clofibrate Capsule at 100 revolutions per minute according to Method 2, using 1000 mL of sodium lauryl sulfate (5 in 100) as a control solution. After 45 minutes from the start the test, pipet 5.0 mL of the dissolved solution, add methanol to make 25.0 mL, and allow to stand for 5 minutes. Filter the resulting solution, and use the test solution. Separately, weigh accurately about 20 mg of clofibrate RS, dissolve mix in 20 mL of methanol, and add water to make exactly 50 mL. Take an appropriate amount of this solution, add methanol to obtain a solution having known concentration of about 80 μg per mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas of clofibrate, A_T and A_S, in each solution. It meets the requirements when the dissolution rate for 180 minutes is NLT 80% (Q).

Dissolution rate (%) of the labeled amount of clofibrate ($C_{12}H_{15}ClO_3$)

$$= C_S \times \frac{A_T}{A_S} \times \frac{1}{C} \times 500000$$

C_S: Concentration (mg/mL) of the standard solution

C: Labeled amount (mg) of clofibrate ($C_{12}H_{15}ClO_3$) in 1 capsule

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 226 nm).

Column: A stainless steel column with about 4 mm in internal diameter and about 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (1.5 to 10 μm in particle diameter).

Mobile phase: A mixture of methanol and water (80 : 20).

Flow rate: 1 mL/min

System suitability

System performance: Proceed with 20 μL of the standard solution under the above operating conditions; the symmetry factor for clofibrate peak is NMT 1.5.

System repeatability: Repeat the test 5 times with 20 μL each of the standard solution according to the above operating conditions; the relative standard deviation of the peak area for clofibrate is NMT 2.0%.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the contents of 20 capsules of Clofibrate Capsules equivalent to 0.1 g of clofibrate ($C_{12}H_{15}ClO_3$), dissolve in acetonitrile to make exactly 100 mL. Pipet 5.0 mL of this solution, add exactly 5 mL of the internal standard solution, and use this solution as the test solution. Separately, weigh accurately about 0.1 g of clofibrate RS (previously determined the water), proceed in the same manner as the test solution, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the ratios, Q_T and Q_S, of the clofibrate to that of the internal standard, respectively.

Amount (mg) of clofibrate ($C_{12}H_{15}ClO_3$)

= Amount (mg) of clofibrate RS, calculated on the anhydrous basis $\times \frac{Q_T}{Q_S}$

Internal standard solution—A solution of ibuprofen in the mobile phase (1 in 100).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 275 nm).

Column: A stainless steel column with about 4 mm in internal diameter and 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 to 10 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

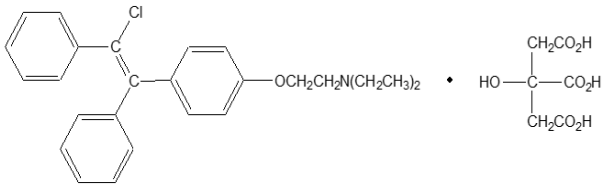
Mobile phase: A mixture of acetonitrile and diluted phosphoric acid (1 in 1000) (3: 2).

Flow rate: Adjust the flow rate so that the retention time of clofibrate is about 10 minutes.

Selection of column: Dissolve 50 mg of clofibrate and 0.3 g of Ibuprofen in 50 mL of acetonitrile. Proceed with 10 μL of this solution according to the above conditions; ibuprofen and clofibrate are eluted in this order with the resolution being NLT 6.

Packaging and storage Preserve in light-resistant, well-closed containers.

Clomifene Citrate
클로미펜시트르산염



$C_{26}H_{28}ClNO \cdot C_6H_8O_7$: 598.08

2-[4-[(*Z*)-2-Chloro-1,2-diphenylethenyl]phenoxy]-*N*,*N*-diethylethanamine;2-hydroxypropane-1,2,3-tricarboxylic acid [*50-41-9*]

Clomifene Citrate, when dried, contains NLT 98.0% and NMT 101.0% of clomifene citrate ($C_{26}H_{28}ClNO \cdot C_6H_8O_7$).

Description Clomifene Citrate occurs as a white to pale yellowish white powder and is odorless.
It is freely soluble in methanol or acetic acid(100), sparingly soluble in ethanol(95), slightly soluble in water, and practically insoluble in ether.
It is gradually colored by light.

Melting point—About 115 °C.

Identification (1) To 2 mL of a solution of Clomifene Citrate in methanol (1 in 200), add 2 mL of reinecke salt TS; a pale red precipitate is produced.

(2) Determine the absorption spectra of solutions of Clomifene Citrate and clomifene citrate RS in 0.1 mol/L hydrochloric acid TS (1 in 50000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) A solution of Clomifene Citrate in methanol (1 in 200) responds to the Qualitative Analysis (1) and (2) for citrate.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Clomifene Citrate in 30 mL of methanol; the solution is clear and colorless.

(2) ***Heavy metals***—Proceed with 2.0 g of Clomifene Citrate according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Related substances***—Weigh accurately 50 mg of Clomifene Citrate, add the mobile phase to make 100 mL. Pipet 10 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately 50 mg of clomifene citrate RS, and dissolve in the mobile phase to make 100 mL. Pipet 1 mL of this solution, add the mobile phase to make 50 mL, then pipet 1 mL of this solution, add the mobile phase to make a 10 mL solution containing about 1.0 μ*g* per mL, and use this solution as the standard solution. Perform the test with 50 μL of the test solution by the percentage peak area method under the Liquid Chromatography according to the following conditions; the amount of clomiphene related substance I {(*E*,*Z*)-2-[4-(1,2-diphenylethenyl)phenoxy]-*N*,*N*-diethyl ethanamine hydrochloride} obtained from the test solution is NMT 2.0%, the amount of individual related substances is NMT 0.5%, and the total amount of related substances is NMT 2.0%.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 290 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with butylsilyl silica gel for liquid chromatography (3 μm -10 μm in particle diameter).

Mobile phase: A mixture of methanol, water and triethylamine (55 : 45 : 0.3) adjusted the pH to 2.5 with phosphoric acid.

Flow rate: 1 mL/min

System suitability

System performance: Weigh accurately an appropriate amount of chromiphene related substance I RS and chromiphene citrate RS, prepare a solution containing 0.002 mg of chromiphene related substance I per mL, and 0.05 mg of clomifene citrate per mL, and use this solution as the system suitability solution. Proceed with 50 μL of this solution according to the above conditions; the relative retention times of clomiphene related substances I, (*Z*)-isomer and (*E*)-isomer are about 0.9, 1.0 and 1.2, respectively, the resolution between clomiphene related substances I and (*Z*)-isomer is NLT 1.0, and the resolution between the (*Z*)-isomer and the (*E*)-isomer is NLT 1.5. Proceed with 50 μL of the standard solution according to the above conditions; the number of theoretical plates and the symmetry factor for (*E*)-isomers are NLT 2000 and NMT 3.0, respectively.

System repeatability: Repeat the test 5 times with 50 μL each of the standard solution according to the above conditions; the relative standard deviations of the peak areas of (*E*)-isomer and (*Z*)-isomer are NMT 2.0%.

Loss on drying NMT 1.0% (1 g, in vacuum, phosphorus penoxide, 3 hours).

Residue on ignition NMT 0.1% (1 g).

Isomer ratio To 0.10 g of Clomifene Citrate, add 10 mL of water and 1 mL of sodium hydroxide TS, and extract 3 times with 15 mL each of ether. Combine all the ether layers and wash with 20 mL of water. To the ether layer, add 10 g of anhydrous sodium sulfate, shake to mix for 1 minute, filter, and evaporate the ether. Dissolve the residue in 10 mL of chloroform, and use this solution as the test solution. With 2 μL of the test solution, perform the test as directed under the Gas Chromatography according to the following conditions. Of the two peaks that appear at the retention time of about 20 minutes, measure the peak area, A_a, with the smaller retention time and the peak area, A_b, with the larger retention time; $A_b/(A_a+A_b)$ is between 0.3 and 0.5.

Operating conditions

Detector: A flame ionization detector

Column: A column about 3 mm in internal diameter and about 1 m in length, packed with diatomaceous earth for gas chromatography (125 μm to 150 μm in particle diameter) coated with 1% ratio of methyl silicone polymer for gas chromatography.

Column temperature: A constant temperature of about 195 °C.

Carrier gas: Nitrogen

Flow rate: Adjust the flow rate so that the retention time of the peak eluted first among the two peaks of clomifene citrate is about 20 minutes.

System suitability

Selection of column: Proceed with 2 μL of the test solution according to the above conditions; among the two peaks of clomiphene citrate, use the one with a resolution NLT 1.3.

Assay Weigh accurately about 1 g of Clomifene Citrate, previously dried, dissolve in 50 mL of acetic acid(100), and titrate with 0.1 mol/L perchloric acid VS (indicator: 2 drops of methylrosanilinium chloride TS). Perform a blank test in the same manner and make any necessary correction.

Each mL of 1 mol/L perchloric acid VS
= 59.81 mg of $C_{26}H_{28}ClNO \cdot C_6H_8O_7$

Packaging and storage Preserve in light-resistant, tight containers.

Clomifene Citrate Tablets
클로미펜시트르산염 정

Clomifene Citrate Tablets contain NLT 93.0% and NMT 107.0% of the labeled amount of clomifene citrate ($C_{26}H_{28}ClNO \cdot C_6H_8O_7$: 598.08).

Method of preparation Prepare as directed under Tablets, with Clomifene Citrate.

Identification (1) Weigh an amount, equivalent to 10 mg of clomifene citrate according to the labeled amount of Clomifene Citrate Tablets, previously powdered, add 100 mL of chloroform to shake vigorously, and filter. Concentrate the filtrate on a steam bath, allow to stand at room temperature, filter the educed crystals, and wash with a small amount of chloroform. With this crystal, and perform the test as directed under the Identification (1) and (3) under Clomifene Citrate.

(2) Determine the absorption spectrum of the crystals obtained in (1) as directed under the Ultraviolet-visible Spectroscopy with a solution of 0.1 mol/L hydrochloric acid TS (1 in 50000); it exhibits a maximum between 233 nm and 237 nm.

Dissolution Perform the test with 1 tablet of Clomifene Citrate Tablets at 100 revolutions per minute according to Method 1 under the Dissolution, using 900 mL of water as the dissolution medium. Take the dissolved solution after 30 minutes from starting the test, and filter. Discard the first 10 mL of the filtrate, pipet *V* mL of the subsequent filtrate, add 0.1 mol/L hydrochloric acid TS to make exactly *V'* mL, and use this solution as the test solution. Separately, weigh accurately an appropriate amount of clomifene citrate RS, dissolve in water to make it the same concentration as the test solution, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at the absorbance maximum wavelength of about 232 nm as directed under the Ultraviolet-visible Spectroscopy, using the dissolution medium as the control solution. It meets the requirements when the dissolution rate in 30 minutes is NLT 75% (Q).

Dissolution rate (%) with respect to the labeled amount of clomifene citrate ($C_{26}H_{28}ClNO \cdot C_6H_8O_7$)

$$= C_S \times \frac{A_T}{A_S} \times \frac{V'}{V} \times \frac{1}{C} \times 90000$$

C_S: Concentration (mg/mL) of the standard solution
C: Labeled amount (mg) of clomifene citrate ($C_{26}H_{28}ClNO \cdot C_6H_8O_7$) in 1 tablet

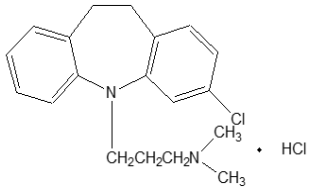
Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 Clomifene Citrate Tablets, and powder. Weigh accurately an amount, equivalent to 50 mg of clomifene citrate ($C_{26}H_{28}ClNO \cdot C_6H_8O_7$), add 50 mL of methanol, shake to mix for 10 minutes, and add methanol to make exactly 100 mL. Take a portion of this solution to centrifuge, pipet 4 mL of the clear supernatant, and add methanol to make exactly 100 mL. Separately, dry the clomifene citrate RS in a desiccator (in vacuum, phosphorus pentoxide) for 3 hours, weigh accurately about 50 mg of the dried matter, and dissolve in methanol to make exactly 100 mL. Pipet 4 mL of this solution, add methanol to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at the wavelength of 295 nm as directed under the Ultraviolet-visible Spectroscopy.

Amount (mg) of clomifene citrate ($C_{26}H_{28}ClNO \cdot C_6H_8O_7$)
= Amount (mg) of clomifene citrate RS $\times \frac{A_T}{A_S}$

Packaging and storage Preserve in tight containers.

Clomipramine Hydrochloride
클로미프라민염산염



Clomipramine Hydrochloride $C_{19}H_{23}ClN_2 \cdot HCl$: 351.31
(3-{5-Chloro-2-azatricyclo[9.4.0.0^{3,8}]pentadeca-1(11),3(8),4,6,12,14-hexaen-2-yl}propyl)dimethyl-amine hydrochloride [*17321-77-6*]

Clomipramine Hydrochloride, when dried, contains NLT 98.5% and NMT 101.0% of clomipramine hydrochloride ($C_{19}H_{23}ClN_2 \cdot HCl$).

Description Clomipramine Hydrochloride occurs as a white to pale yellow crystalline powder and is odorless.
It is very soluble in acetic acid(100), freely soluble in

water, methanol or chloroform, soluble in ethanol(95), sparingly soluble in acetic anhydride, slightly soluble in acetone, and practically insoluble in ethyl acetate or ether.

Identification (1) Dissolve 3 mg of Clomipramine Hydrochloride in 1 mL of nitric acid; the resulting solution exhibits a dark blue color.

(2) Determine the absorption spectra of solutions of Clomipramine Hydrochloride and clomipramine hydrochloride RS in 0.1 mol/L hydrochloric acid TS (3 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Transfer 1 g of Clomipramine Hydrochloride to a separatory funnel, dissolve in 10 mL of water, add 5 mL of sodium hydroxide TS, and extract twice with 30 mL of ether each. [The water layer is used in the Identification (4)]. Combine the ether extracts, add 20 mL of water, shake to mix, then take the ether layer separately, dry it with a small amount of anhydrous sodium sulfate, and filter. Warm the filtrate on a steam bath to evaporate the ether. Perform the test with the residue as directed under the Flame Coloration (2); a green color is observed.

(4) Neutralize the water layer obtained in (3) with dilute nitric acid; the resulting solution responds to the Qualitative Analysis for chloride.

Melting point Between 192 and 196 ℃.

pH Dissolve 1.0 g of Clomipramine Hydrochloride in 10 mL of water; the pH of this solution is between 3.5 and 5.0.

Purity (1) ***Clarity and color of solution*—**Dissolve 1.0 g of Clomipramine Hydrochloride in 10 mL of water; the solution is clear and colorless to pale yellow.

(2) ***Heavy metals*—**Proceed with 2.0 g of Clomipramine Hydrochloride according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Arsenic*—**Proceed with 1.0 g of Clomipramine Hydrochloride according to Method 3 and perform the test (NMT 2 ppm).

(4) ***Related substances***—Dissolve 0.20 g of Clomipramine Hydrochloride in exactly 10 mL of methanol and use this solution as the test solution. Separately, dissolve 20 mg of imipramine hydrochloride RS in methanol to make exactly 100 mL and use this solution as the standard solution (1). Then, pipet 1mL of the test solution, and add methanol to make exactly 50 mL. Pipet 5 mL of this solution, add methanol to make 50 mL, and use this solution as the standard solution (2). With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution, the standard solution (1) and the standard solution (2) on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Then, develop the plate with a mixture of ethyl acetate, acetone and ammonia water(28) (15 : 5 : 1) as a developing solvent to a distance of about 10 cm, air-dry the plate, and sprinkle potassium dichromate-sulfuric acid TS evenly on the plate; the spot obtained from the test solution, of which location corresponds to that of the spot from the standard solution (1), is not more intense than the spot obtained from the standard solution (1), and the spots other than the principal spot and the above spot obtained from the test solution are not more intense than the spots from the standard solution (2).

Loss on drying NMT 0.5% (1 g, 105 ℃, 3 hours).

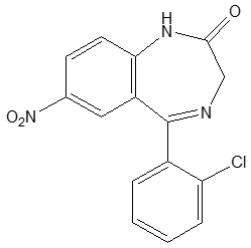
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately 0.5 g of Clomipramine Hydrochloride, previously dried, dissolve in 50 mL of a mixture of acetic anhydride and acetic acid(100) (7 : 3), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 1 mol/L perchloric acid VS
= 35.131 mg of $C_{19}H_{23}ClN_2 \cdot HCl$

Packaging and storage Preserve in light-resistant, well-closed containers.

Clonazepam
클로나제팜



$C_{15}H_{10}ClN_3O_3$: 315.71

5-(2-Chlorophenyl)-7-nitro-1,3-dihydro-1,4-benzodiazepin-2-one [*1622-61-3*]

Clonazepam, when dried, contains NLT 99.0% and NMT 101.0% of clonazepam ($C_{15}H_{10}ClN_3O_3$).

Description Clonazepam occurs as white to pale yellow crystals or a crystalline powder.
It is sparingly soluble in acetic anhydride or acetone, slightly soluble in methanol or ethanol(95), very slightly soluble in ether, and practically insoluble in water.
It is gradually colored by light.

Melting point—About 240 ℃ (with decomposition).

Identification (1) Determine the absorption spectra of solutions of Clonazepam and clonazepam RS in methanol (1 in 100000) as directed under the Ultraviolet-visible

Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) Determine the infrared spectra of Clonazepam and clonazepam RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) Perform the Flame Coloration 2) with Clonazepam; it exhibits a green color.

Purity (1) ***Chloride***—Take 1.0 g of Clonazepam, add 50 mL of water, and allow to stand for 60 minutes with occasional shaking, and filter. Discard the first 20 mL of the filtrate, then add 6 mL of dilute nitric acid and water to the subsequent filtrate to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution by adding 6 mL of dilute nitric acid and water to 0.25 mL of 0.01 mol/L hydrochloric acid solution to make 50 mL (NMT 0.022%).

(2) ***Heavy metals*—**Proceed with 1.0 g of Clonazepam as directed under Method 4 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Related substances***—Dissolve 0.25 g of Clonazepam in 10 mL of acetone and use this solution as the test solution. Pipet 1 mL of this solution, and add acetone to make exactly 100 mL. Pipet 1 mL of this solution, add acetone to make exactly 10 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of nitromethane and acetone (10 : 1) as the developing solvent to a distance of about 12 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 0.3% (1 g, 105 ℃, 4 hours).

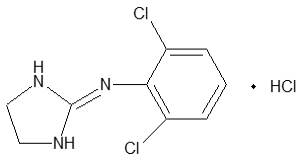
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.5 g of Clonazepam, previously dried, dissolve in 70 mL of acetic anhydride, and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under Titrimetry). Perform a blank test in the same manner.

Each mL of 0.1 mol/L perchloric acid VS
= 31.57 mg of $C_{15}H_{10}ClN_3O_3$

Packaging and storage Preserve in light-resistant, well-closed containers.

Clonidine Hydrochloride
클로니딘염산염



$C_9H_9Cl_2N_3 \cdot HCl$: 266.56

N-(2,6-Dichlorophenyl)-4,5-dihydro-1*H*-imidazol-2-amine hydrochloride [*4205-91-8*]

Clonidine hydrochloride, when dried, contains NLT 99.0% and NMT 101.0% of clonidine hydrochloride ($C_9H_9N_2O_3 \cdot HCl$).

Description Clonidine Hydrochloride occurs as white crystals or a crystalline powder.
It is freely soluble in methanol, soluble in water or ethanol(95), slightly soluble in acetic acid(100), and practically insoluble in acetic anhydride or ether.

Identification (1) Take 5 mL of an aqueous solution of Clonidine Hydrochloride (1 in 1000) and add 6 drops of Dragendorff's TS; an orange precipitate is formed.

(2) Determine the absorption spectra of solutions of Clonidine Hydrochloride and clonidine hydrochloride RS in 0.01 mol/L hydrochloric acid VS (3 in 10000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared spectra of Clonidine Hydrochloride and clonidine hydrochloride RS, previously dried, as directed in the potassium chloride disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(4) An aqueous solution of Clonidine Hydrochloride (1 in 50) responds to the Qualitative Analysis for chloride.

pH Dissolve 1.0 g of Clonidine Hydrochloride in 20 mL of water; the pH of this solution is between 4.0 and 5.5.

Loss on drying NMT 0.5% (1 g, 105 ℃, 4 hours).

Residue on ignition NMT 0.1% (1 g).

Purity (1) ***Clarity and color of solution*—**Dissolve 1.0 g of Clonidine Hydrochloride in 20 mL of water; the solution is clear and colorless.

(2) ***Heavy metals*—**Proceed with 2.0 g of Clonidine Hydrochloride as directed under Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Arsenic*—**Proceed with 0.5 g of Clonidine Hydrochloride as directed under Method 3 and perform the test (NMT 4 ppm).

(4) ***Related substances***—Dissolve 0.20 g of Clonidine Hydrochloride in 2 mL of methanol and use this solution as the test solution. Pipet 1 mL of this solution and add methanol to make exactly 100 mL, pipet 1 mL and 2 mL of this solution, and add methanol to each to make exactly 20 mL. Use these solutions as the standard solution (1) and the standard solution (2), respectively. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 2 μL each of the test solution, the standard solution (1), and the standard solution (2) on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of toluene, acetone, ethanol(99.5) and ammonia water(28) (10 : 8 : 2 : 1) as the developing solvent to a distance of about 12 cm, and air-dry the plate. Dry the plate for 1 hour at 100 ℃, spray evenly sodium hypochlorite TS on the plate, then air-dry for 15 minutes. Spray evenly potassium iodide starch TS on the plate; the spots other than the principal spot and the spots of the starting point from the test solution are not more intense than the spots from the standard solution (2), and among the spots other than the principal spot and spots of the starting point, NMT 3 are more intense than the spots from the standard solution (1).

Loss on drying NMT 0.5% (1 g, 105 ℃, 4 hours).

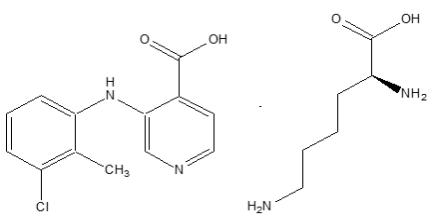
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.4 g of Clonidine Hydrochloride, previously dried, add 30 mL of acetic acid(100) and dissolve by warming. After cooling, add 70 mL of acetic anhydride, and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 26.656 mg of $C_9H_9Cl_2N_3 \cdot HCl$

Packaging and storage Preserve in tight containers.

Clonixin Lysinate
클로닉신리시네이트



$C_{19}H_{25}ClN_4O_4$: 408.88
2-[(3-Chloro-2-methylphenyl)amino]-3-pyridinecarboxylic acid lysine salt, [*55837-30-4*]

Clonixin Lysinate contains NLT 98.0% and NMT 101.0% of clonixin lysinate ($C_{19}H_{25}ClN_4O_4$), calculated on the anhydrous basis.

Description Clonixin Lysinate occurs as an amorphous, pale yellow to pale white powder. It has a slightly characteristic odor.
It is freely soluble in water and soluble in methanol.

Melting point—Between 205 and 210 ℃ (with decomposition).

Identification (1) Dissolve 1 g of Clonixin Lysinate in 2 mL of water and add 5 mL of 1 mol/L hydrochloric acid. Filter the precipitate, wash with water several times, and dry at 105 ℃ to a constant mass; the measured melting point is between 233 and 236 ℃.

(2) Spray evenly 1% methanol solution on the filtration paper of (1), dry, and then, spray evenly 1% ninhydrin acetone solution; it exhibits purple spots.

Absorbance $E_{1cm}^{1\%}$ (252 nm): Between 350 and 370 (1 mol/L hydrochloric acid methanol solution).

Optical rotation $[\alpha]_D^{20}$: Between +5.0° and +5.4° (10% aqueous solution).

pH Between 7.3 and 7.6 (1% aqueous solution).

Purity (1) ***Heavy metals***—Proceed with 1 g of Clonixin Lysinate according to Method 3, and perform the test. Prepare the control solution with 1.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Related substances***—Use 1% aqueous solution of Clonixin Lysinate as the test solution. Use a 1% aqueous solution of L-lysine hydrochloride RS and a 1% ethanol solution of clonixin lysinate RS as the standard solutions, respectively. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography (with a fluorescent indicator) (105 ℃, activation for 30 minutes). Next, develop the plate with a mixture of 1-propanol and ammonia water(28) (67 : 33) as the developing solvent, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the principal spots from the test solution and clonixin lysinate RS are the same in R_f value. Spray evenly 1-butanol solution (add 3 mL of 3% acetic acid(100)-1-butanol solution) of 0.3% ninhydrin and heat at 105 ℃ for 10 minutes. The R_f value of the purple spots obtained from the test solution and L-lysine hydrochloride RS is the same and the spots obtained from the test solution is not more intense than that from the L-lysine hydrochloride RS.

Water NMT 1.0% (0.2 g, volumetric titration, direct titration).

Residue on ignition NMT 1.0% (1.0 g).

Assay Weigh accurately about 0.2 g of Clonixin Lysinate, put into a 100-mL beaker, dissolve in 60 mL of acetic acid(100), and titrate with 0.1 mol/L of perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 13.629 mg of $C_{19}H_{25}ClN_4O_4$

Packaging and storage Preserve in tight containers.

Clonixin Lysinate Tablets
클로닉신리시네이트 정

Clonixin Lysinate Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of clonixin lysinate ($C_{19}H_{25}ClN_4O_4$: 408.88)

Method of preparation Prepare as directed under Tablets, with Clonixin Lysinate.

Identification Weigh the amount equivalent to 10 mg of clonixin lysinate according to the labeled amount of Clonixin Lysinate Tablets, add a mixture of methanol and 1 mol/L hydrochloric acid (99 : 1) to make 10 mL, shake, and filter. Use the filtrate as the test solution. Weigh 10 mg of clonixin lysinate RS, add a mixture of methanol and 1 mol/L hydrochloric acid (99 : 1) to make 10 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop using a mixture of 1-propanol and 40% ammonia (7 : 3) as the developing solvent, and air-dry the thin-layer chromatographic plate. Examine the plate under ultraviolet light or spray 0.3% ninhydrin in 1-butanol solution evenly; the R_f values and colors of the spots obtained from the test solution and the standard solution are the same.

Dissolution Perform the test with 1 tablet of Clonixin Lysinate Tablets at 50 revolutions per minute according to Method 2 under the Dissolution, using 900 mL of the second solution as the dissolution solution. Take the dissolved solution 30 minutes after the start of the Dissolution and filter. Discard the first 10 mL of the filtrate, pipet V mL of the subsequent filtrate, and add the Solution 2 in the Dissolution to obtain exactly V′ mL of a solution containing about 100 μg of clonixin lysinate per mL according to the labeled amount, and use this solution as the test solution. Separately, weigh accurately about 10 mg of clonixin lysinate RS, dissolve in the Solution 2 in the Dissolution to make 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of clonixin lysinate in each solution. Meets the requirements if the dissolution rate of Clonixin Lysinate Tablets in 30 minutes is NLT 80%.

Dissolution rate (%) with respect to the labeled amount of clonixin lysinate ($C_{19}H_{25}ClN_4O_4$)

$$= W_S \times \frac{V'}{V} \times \frac{A_T}{A_S} \times \frac{1}{C} \times 900$$

W_S: Amount (mg) of clonixin lysinate RS
C: Labeled amount (mg) of clonixin lysinate ($C_{19}H_{25}ClN_4O_4$) in 1 tablet

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 252 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: A mixture of methanol and 0.3% acetic acid (36: 36 : 28).

Flow rate: 1.5 mL/min

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 Clonixin Lysinate Tablets, and powder. Weigh accurately an amount equivalent to about 12.5 mg of clonixin lysinate ($C_{19}H_{25}$ ClN_4O_4), add water to make 100 mL, filter, and use the filtrate as the test solution. Separately, weigh accurately about 125 mg of clonixin lysinate RS, and add water to make exactly 100 mL. Pipet 10 mL of this solution, add water to make 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography, and calculate the peak areas, A_T and A_S, of clonixin lysinate, respectively, from each solution.

Amount (mg) of clonixin lysinate ($C_{19}H_{25}ClN_4O_4$)
= Amount (mg) of clonixin lysinate RS $\times \frac{A_T}{A_S} \times \frac{1}{10}$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 252 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: A mixture of methanol, 0.3% acetic acid and acetonitrile (36 : 36 : 28).

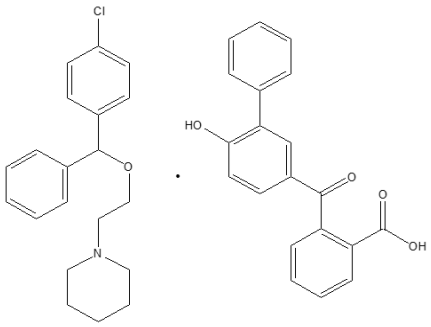
Flow rate: 1.5 mL/min

System suitability

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution under the above operating conditions; the relative standard deviation of the peak areas of clonixin lysinate is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Cloperastine Fendizoate
클로페라스틴펜디조산염



$C_{20}H_{24}ClNO \cdot C_{20}H_{14}O_4$: 648.19

2-[(6-Hydroxy[1,1'-biphenyl]-3-yl)carbonyl]-benzoic acid with 1-[2-[(4-chlorophenyl)phenylmethoxy]ethyl]piperidine (1:1), [*85187-37-7*]

Cloperastine Fendizoate, when dried, contains NLT 98.0% and NMT 101.0% of cloperastine fendizoate ($C_{20}H_{24}ClNO \cdot C_{20}H_{14}O_4$).

Description Cloperastine Fendizoate occurs as white or pale yellow crystals or a crystalline powder, which is odorless.

It is freely soluble in isopropylamine, slightly soluble in acetic acid(100), and practically insoluble in water, methanol, ethanol or ether.

Identification (1) To 0.1 mg of Cloperastine Fendizoate, add 1 mL of dilute hydrochloric acid and 10 mL of water, shake to mix on a steam bath, heat for 10 minutes, cool, and then filter. To 5 mL of the filtrate, add 5 drops of Reinecke salt TS; a pale red precipitate is produced.

(2) To 1 g of Cloperastine Fendizoate, add 20 mL of sodium hydroxide TS and 10 mL of ether, shake to mix, separate the water layer, wash the water layer with 10 mL of ether, and then add 25 mL of dilute hydrochloric acid; a white precipitate is produced. Filter the precipitate, wash with water, dry at 105 ºC for 3 hour; the melting point is between 260 and 263 ºC.

Melting point Between 185 and 189 ºC.

Purity (1) ***Chloride***—To 2.0 g of Cloperastine Fendizoate, add 50 mL of water, warm at 70 ºC for 5 minutes, cool, and then filter. To 25 mL of the filtrate, add 6 mL of dilute nitric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 0.40 mL of 0.01 mol/L hydrochloric acid solution (NMT 0.014%).

(2) ***Heavy metals***—Weigh and proceed with 1.0 g of Cloperastine Fendizoate according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***p-Chlorobenzophenone***—Weigh accurately about 0.2 g of Cloperastine Fendizoate, dissolve in a mixture of methanol and isopropylamine (19 : 1) to make 10 mL, and use this solution as the test solution. Separately, weigh and dissolve 10.0 mg of *p*-chlorobenzophenone in methanol to make 200 mL, and use this solution as the standard solution. Spot 10 μL each of the test solution and the standard solution on a thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography as directed under the Thin Layer Chromatography, develop the plate with a mixture of ethyl acetate, methanol and strong ammonia water (90 : 10 : 1) as a developing solvent to a distance of about 12 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots obtained from the test solution do not appear at the same positions as those of the spots obtained from the standard solution, or they are not more intense nor larger than the spots from the standard solution even if they appear.

Loss on drying NMT 0.5% (1 g, 105 °C, 3 hours).

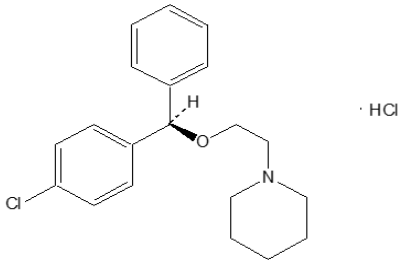
Residue on ignition NMT 0.10% (1 g).

Assay Weigh accurately about 1 g of Cloperastine Fendizoeate, previously dried, add 100 mL of acetic acid(100) for non-aqueous titration, warm to dissolve, and cool. Titrate with 0.1 mol/L perchloric acid VS (indicator: 3 drops of methylrosaniline chloride TS). However, the endpoint of the titration is when the bluish purple color of the solution changes to blue. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 64.82 mg of $C_{20}H_{24}ClNO \cdot C_{20}H_{14}O_4$

Packaging and storage Preserve in tight containers.

Cloperastine Hydrochloride
클로페라스틴염산염



and enantiomer

$C_{20}H_{24}ClNO \cdot HCl$: 366.33

1-[2-[(4-Chlorophenyl)-phenylmethoxy]ethyl] piperidine hydrochloride [*14984-68-0*]

Cloperastine Hydrochloride, when dried, contains NLT 98.5% and NMT 101.0% of cloperastine hydrochloride ($C_{20}H_{24}ClNO \cdot HCl$).

Description Cloperastine Hydrochloride occurs as white crystals or a crystalline powder.
It is very soluble in water, methanol ethanol(95) or acetic acid(100) and sparingly soluble in acetic anhydride.
An aqueous solution of Cloperastine Hydrochloride (1 in 10) shows no optical rotation.

Identification (1) Determine the absorption spectra of solutions of Cloperastine Hydrochloride and cloperastine hydrochloride RS in 0.1 mol/L hydrochloric acid TS (1 in 2500) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectrum of Cloperastine Hydrochloride and cloperastine hydrochloride RS, previously dried, as directed in the potassium bromide disk method under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) Add 2 mL of ammonia TS and 20 mL of ether to 10 mL of an aqueous solution of Cloperastine Hydrochloride (1 in 100), shake to mix, take the water layer separately, wash with 20 mL of ether, and filter. Acidify the filtrate with dilute nitric acid; the solution responds to the Qualitative Analysis for chloride.

Melting point Between 148 and 152 ℃.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Cloperastine Hydrochloride according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Related substances***—Dissolve 40 mg of Cloperastine Hydrochloride in 50 mL of the mobile phase and use this solution as the test solution. Pipet 1 mL of this solution, add the mobile phase to make exactly 200 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine each peak area in each solution as directed in the automatic integration method; the peak areas, having the ratio of relative retention times of about 0.8 and about 3.0 to cloperastine from the test solution are not larger than the peak area of cloperastine from the standard solution, and the area of the peak having the ratio of the relative retention times of about 2.0 from the test solution is not larger than 5/3 times the peak area of cloperastine from the standard solution. The peak areas other than cloperastine and the peaks mentioned above from the test solution are not larger than 3/5 times the peak area of cloperastine from the standard solution. Also, the total area of these peaks is not larger than 2 times the peak area of cloperastine from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 222 nm).

Column: A stainless steel column about 5 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: A mixture of methanol, 0.1 mol/L potassium dihydrogen phosphate TS and perchloric acid (500 : 250 : 1).

Flow rate: Adjust the flow rate so that the retention time of cloperastine is about 7 minutes.

System suitability

Selection of column: Dissolve 30 mg of Cloperastine Hydrochloride and 40 mg of benzophenone in 100 mL of the mobile phase. Pipet 2.0 mL of this solution and add the mobile phase to make 50 mL. Proceed with 20 μL of this solution under the above operating conditions; cloperastine and benzophenone are eluted in this order with the resolution being NLT 6.

Detection sensitivity: Adjust the sensitivity so that the peak height of cloperastine obtained from 20 μL of the standard solution is about 30% of the full scale.

Time span of measurement: About 4 times the retention time of cloperastine after the solvent peak.

Loss on drying NMT 0.5% (1 g, 105 °C, 3 hours).

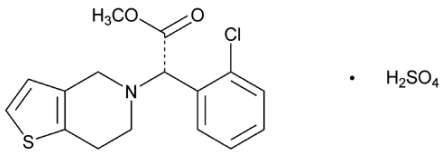
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.5 g of Cloperastine Hydrochloride, previously dried, and dissolve it in 70 mL of a mixture of acetic anhydride and acetic acid(100) (7 : 3), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 36.632 mg of $C_{20}H_{24}ClNO \cdot HCl$

Packaging and storage Preserve in light-resistant, tight containers.

Clopidogrel Bisulfate
클로피도그렐황산수소염



Clopidogrel Hydrogen Sulfate

$C_{16}H_{16}ClNO_2S.H_2SO_4$: 419.90

Methyl(2S)-2-(2-chlorophenyl)-2-{4*H*,5*H*,6*H*,7*H*-thieno[3,2-c]pyridin-5-yl}acetate; sulfuric acid [*120202-66-6*]

Clopidogrel Bisulfate contains NLT 97.0% and NMT 101.5% of clopidogrel bisulfate ($C_{16}H_{16}ClNO_2S.H_2SO_4$: 419.90) calculated on the anhydrous basis.

Description Clopidogrel Bisulfate occurs as a white powder.
It is freely soluble in water and methanol, and practically insoluble in ether.

Identification (1) Determine the infrared spectra of Clopidogrel Bisulfate and clopidogrel bisulfate RS as directed in the potassium bromide disk method under the Mid-infrared Absorption Spectrophotometry; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

(3) Clopidogrel Bisulfate responds to the Qualitative Analysis for sulfate.

Purity ***Related substances***—Weigh accurately about 0.1 g of Clopidogrel Bisulfate and dissolve in 5 mL of methanol, add the mobile phase to make exactly 200 mL, and use this solution as the test solution. Separately, weigh accurately appropriate amounts of clopidogrel bisulfate RS, clopidogrel related substance I {(+)-(*S*)-(*o*-chlorophenyl)-6,7-dihydrothieno[3,2-*c*]pyridine-5(4*H*)-acetic acid} RS, clopidogrel related substance II {methyl(±)-(*o*-chlorophenyl)4,5-dihydrothieno[2,3-*c*]pyridine-6(7*H*)-acetate, hydrochloride} RS, and clopidogrel related substance III {methyl(-)-(*R*)-(*o*-chlorophenyl)-6,7-dihydrothieno[3,2-*c*]pyridine-5(4*H*)-acetate, hydrogen sulfate}, dissolve in methanol, and dilute stepwise to make 20 μg, 40 μg, 120 μg and 200 μg per mL, respectively. To 5 mL of this solution, add the mobile phase to make exactly 200 mL to obtain solutions containing 0.5 μg, 1 μg, 3 μg and 5 μg per mL, respectively, and use these solution as the standard solutions. Perform the test with 10 μL each of the test solution and the standard solutions as directed under the Liquid Chromatography according to the following conditions. Determine the peak area of each solution as directed in the automatic integration method to calculate the amount of related substances in the test solution; the amount of clopidogrel related substance I having the relative retention time of about 0.5 to clopidogrel is NMT 0.2%, the amount of clopidogrel related substance III having the relative retention time of about 2.0 to clopidogrel is NMT 1.0%, the amount of a first enantiomer of clopidogrel related substance II having the relative retention time of about 0.8 to clopidogrel is NMT 0.3%, the amount of individual related substance is NMT 0.1%, and the amount of the total related substance is NMT 1.5%.

$$\text{Content (\%) of related substances I and III} = \frac{C_A}{C_T} \times \frac{A_U}{A_S} \times 100$$

C_A: Concentration (mg/mL) of each clopidogrel related substance in the standard solution

C_T: Concentration (mg/mL) of clopidogrel bisulfate in the test solution

A_U: Peak area of each related substance obtained from the test solution

A_S: Peak area of each clopidogrel related substance obtained from the standard solution

$$\text{Content (\%) of first enantiomer of related substance II} = \frac{C_B}{C_T} \times \frac{A_U}{A_S} \times 100 \times 0.5$$

C_B: Concentration (mg/mL) of clopidogrel related substance II in the standard solution

C_T: Concentration (mg/mL) of clopidogrel bisulfate in the test solution

A_U: Peak area of first enantiomer of clopidogrel related substance II obtained from the test solution

A_S: Peak area of first enantiomer of clopidogrel related substance II obtained from the standard solution

0.5: Correction factor of first enantiomer of clopidogrel related substance II

$$\text{Content (\%) of other related substances} = \frac{C}{C_T} \times \frac{A_U}{A_S} \times 100$$

C: Concentration (mg/mL) of clopidogrel bisulfate in the standard solution

C_T: Concentration (mg/mL) of clopidogrel bisulfate in the test solution

A_U: Peak area of clopidogrel related substances I, II and III, and the other individual related substances obtained from the test solution

A_S: Peak area of clopidogrel related substances obtained from the standard solution

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

Column: A stainless steel column, 4.6 mm in inter-

nal diameter and 15 cm in length, packed with silica gel for liquid chromatography bound to ovomucoid, chiral-recognition protein for liquid chromatography (5 μm in particle diameter).

Flow rate: 1.0 mL/min

For mobile phase and system suitability solution, proceed as directed in the operating conditions under the Assay.

System suitability

System performance: Proceed with 10 μL of system suitability solution according to the above operation conditions; the relative retention times of the first and second enantiomers of the clopidogrel related substance II to clopidogrel are about 0.8 and about 1.2, respectively, with the resolution between the peaks of clopidogrel and the first enantiomer of the clopidogrel related substance II being NLT 2.5.

System repeatability: Repeat the test 6 times according to the above conditions with 10 μL each of the standard solution; the relative standard deviation of the each peak area is NMT 15%.

Loss on drying NMT 0.5% (1 g, 105 °C, 2 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.1 g each of Clopidogrel Bisulfate and clopidogrel bisulfate RS, and add methanol to make exactly 100 mL. Pipet 5.0 mL each of this solution, add the mobile phase to make exactly 50 mL, and use each solution as the test solution and the standard solution. Perform the test with 10 μL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions and determine the peak areas, A_T and A_S, of clopidogrel bisulfate.

$$\text{Amount (mg) of clopidogrel bisulfate } (C_{16}H_{16}ClNO_2S\cdot H_2SO_4) = \text{Amount (mg) of clopidogrel bisulfate RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

Column: A stainless steel column, about 4.6 mm in internal diameter and about 15 cm in length, packed with silica gel for liquid chromatography bound to ovomucoid, chiral-recognition protein for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of phosphate buffer solution and acetonitrile (75 : 25).

Phosphate buffer solution—Dissolve 1.36 g of potassium dihydrogen phosphate in 500 mL of water and add water to make 1000 mL.

Flow rate: 1.0 mL/min

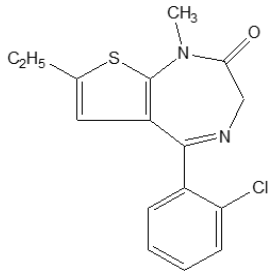
System suitability

System performance: Weigh accurately an appropriate amount of clopidogrel bisulfate RS and clopidogrel related substance II RS, and dissolve in methanol so that the solutions contain 100 μg and 200 μg per mL, respectively. Take 5 mL of this solution, add the mobile phase to make 200 mL, and use this solution as the system suitability solution. Proceed with 10 μL of this solution according to the above conditions; the relative retention times of the first and second enantiomers of the clopidogrel related substance II to clopidogrel are about 0.8 and about 1.2, respectively, with the resolution between the peaks of clopidogrel and the first enantiomer of the clopidogrel related substance II being NLT 2.5.

System repeatability: Repeat the test 6 times according to the above conditions with 10 μL each of the standard solution; the relative standard deviation of the peak areas of clopidogrel is NMT 1.0%.

Packaging and storage Preserve in well-closed containers.

Clotiazepam
클로티아제팜



$C_{16}H_{15}ClN_2OS$: 318.82

5-(2-Chlorophenyl)-7-ethyl-1-methyl-1*H*,2*H*,3*H*-thieno[2,3-e][1,4]diazepin-2-one [*33671-46-4*]

Clotiazepam, when dried, contains NLT 98.5% and NMT 101.0% of clotiazepam ($C_{16}H_{15}ClN_2OS$).

Description Clotiazepam occurs as white to pale yellowish white crystals or a crystalline powder, which is odorless and has a slightly bitter taste.
It is very soluble in chloroform, freely soluble in methanol, acetic acid(100), ethanol(95), acetone and ethyl acetate, soluble in ether, and practically insoluble in water.
It dissolves in 0.1 mol/L hydrochloric acid TS.
It is gradually colored by light.

Identification (1) Dissolve 10 mg of Clotiazepam in 3 mL of sulfuric acid and examine the solution under ultraviolet light; the resulting solution exhibits a pale red fluorescence.

(2) Determine the absorption spectra of the solutions of Clotiazepam and clotiazepam RS in 0.1 mol/L hydrochloric acid TS (1 in 100000) as directed under Ultraviolet-visible Spectrophotometry: both spectra exhibit simi-

lar intensities of absorption at the same wavelengths.

(3) Weigh and proceed with 10 mg of Clotiazepam as directed under the Oxygen Flask Combustion, using 10 mL of diluted hydrogen peroxide(30) (1 in 5) as the absorbent to prepare the test solution. Add a small amount of water to the upper part of the apparatus A, carefully open C, wash C, B and the inner wall of A with 15 mL of methanol, and use the resulting solution as the test solution. Add 0.5 mL of dilute nitric acid to 15 mL of the test solution; this solution responds to the Qualitative Analysis (2) for chloride. Also, the remaining test solution responds to the Qualitative Analysis (1) for sulfate.

Melting point Between 106 and 109 ºC.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Clotiazepam in 10 mL of ethanol(95); the solution is clear and the color is not more intense than the following control solution.

Control solution—Take 5 mL of the Matching Fluid for Color C and add 0.01 mol/L hydrochloric acid TS to make 10 mL.

(2) ***Chloride***—To 1.0 g of Clotiazepam, add 50 mL of water, shake for 30 minutes, and filter. To 30 mL of the filtrate, add 6 mL of dilute nitric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 0.25 mL of 0.01 mol/L hydrochloric acid (NMT 0.015%).

(3) ***Heavy metals***—Weigh and proceed with 2.0 g of Clotiazepam according to Method 4 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(4) ***Arsenic***—Weigh and proceed with 1.0 g of Clotiazepam according to Method 3 and perform the test (NMT 2 ppm).

(5) ***Related substances***—Dissolve 0.25 g of Clotiazepam in 10 mL of acetone and use this solution as the test solution. Pipet 1 mL of this solution, and add acetone to make exactly 20 mL. Pipet 2 mL of the resulting solution, add acetone to make exactly 50 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on a plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of chloroform and acetone (5 : 1) as a developing solvent to a distance of about 10 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); any spot other than the principal spot obtained from the test solution is not intense than the spot from the standard solutions.

Loss on drying NMT 0.5% (1 g, 80 °C, 3 hours).

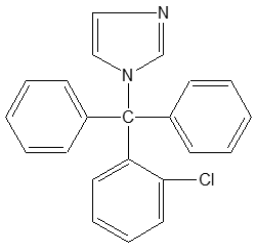
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.5 g of Clotiazepam, previously dried, dissolve in 80 mL of acetic acid(100), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid
= 31.882 mg of $C_{16}H_{15}ClN_2OS$

Packaging and storage Preserve in light-resistant, tight containers.

Clotrimazole
클로트리마졸



$C_{22}H_{17}ClN_2$: 344.84

1-[(2-Chlorophenyl)diphenylmethyl]-1*H*-imidazole [*23593-75-1*]

Clotrimazole, when dried, contains NLT 98.0% and NMT 101.0% of clotrimazole ($C_{22}H_{17}ClN_2$).

Description Clotrimazole occurs as a white crystalline powder, is odorless and tasteless.
It is freely soluble in acetic acid(100) or dichloromethane, soluble in methanol, ethanol(95) or *N*,*N*-dimethylformamide, slightly soluble in ether, and practically insoluble in water.

Identification (1) To 0.1 g of Clotrimazole, add 10 mL of 5 mol/L hydrochloric acid TS, and warm to dissolve. After cooling, add 3 drops of reinecke salt TS; pale red precipitates are formed.

(2) Determine the absorption spectra of solutions of Clotrimazole and clotrimazole RS in methanol (1 in 5000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared spectra of Clotrimazole and clotrimazole RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(4) Perform the test with Clotrimazole as directed under the Flame Coloration (2); a green color is observed.

Melting point Between 142 and 145 ºC.

Purity (1) ***Clarity and color of solution***—Dissolve 0.5 g

of Clotrimazole in 10 mL of dichloromethane; the resulting solution is clear and colorless.

(2) ***Chloride***—Dissolve 1.0 g of Clotrimazole in 40 mL of *N*,*N*-dimethylformamide, and add 6 mL of dilute nitric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution by adding 0.60 mL of 0.01 mol/L hydrochloric acid, 40 mL of *N*,*N*-dimethylformamide, 6 mL of dilute nitric acid and water to make 50 mL (NMT 0.021%).

(3) ***Sulfate***—Dissolve 0.5 g of Clotrimazole in 10 mL of methanol, and add 1 mL of dilute hydrochloric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 0.50 mL of 0.005 mol/L sulfuric acid, adding 10 mL of methanol, 1 mL of dilute hydrochloric acid and water to make 50 mL (NMT 0.048%).

(4) ***Heavy metals***—Proceed with 2.0g of Clotrimazole according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(5) ***Arsenic***—Proceed with 1.0 g of Clotrimazole according to Method 3 and perform the test (NMT 2 ppm).

(6) ***Imidazol***—Dissolve 0.1 g of Clotrimazole in exactly 10 mL of dichloromethane, and use this solution as the test solution. Separately, weigh accurately 25 mg of imidazol RS, dissolve in the dichloromethane to make exactly 50 mL. Pipet 5 mL of this solution, add dichloromethane to make exactly 50 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Develop the plate with a mixture of methanol and chloroform (3 : 2) as a developing solvent to a distance of about 10 cm, and air-dry the plate. Sprinkle sodium hypochlorite TS evenly on the plate, air-dry for 15 minutes, and then sprinkle potassium iodide starch TS evenly; the spot obtained from the test solution, of which location corresponds to that of the spot from the standard solution, is not more intense than the spot obtained from the standard solution.

(7) ***(2-Chlorophenyl)-diphenylmethanol***—Dissolve 0.2 g of Clotrimazole in exactly 10 mL of dichloromethane, and use this solution as the test solution. Separately, weigh 10 mg of (2-chlorophenyl)-diphenylethanol RS, dissolve in dichloromethane to make exactly 100 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate and ammonia water(28) (50 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm); the spot obtained from the test solution, of which location corresponds to that of the spot from the standard solution, is not more intense than the spot obtained from the standard solution.

Loss on drying NMT 0.5% (1 g, 105 ℃, 2 hours).

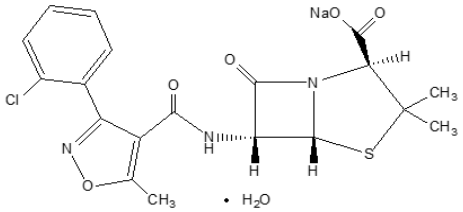
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.35 g of Clotrimazole, previously dried, dissolve in 80 mL of acetic acid(100), and titrate with 0.1 mol/L hydrochloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 34.484 mg of $C_{22}H_{17}ClN_2$

Packaging and storage Preserve in light-resistant, well-closed containers.

Cloxacillin Sodium Hydrate
클록사실린나트륨수화물



$C_{19}H_{17}ClN_3NaO_5S.H_2O$: 475.88

Sodium (2*S*,5*R*,6*R*)-6-[[3-(2-chlorophenyl)-5-methyl-2-oxazole-4-carbonyl]amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylatehydrate [*7081-44-9*]

Cloxacillin Sodium Hydrate contains NLT 900 μg and NMT 960 μg (potency) of cloxacillin ($C_{19}H_{18}ClN_3O_5S$: 435.88) per mg, calculated on the anhydrous basis.

Description Cloxacillin Sodium Hydrate occurs as white to light yellowish white crystals or a crystalline powder.
It is freely soluble in water, *N*,*N*-dimethylformamide or methanol, and sparingly soluble in ethanol(95).

Identification (1) Determine the absorption spectra of the solutions of Cloxacillin Sodium Hydrate and cloxacillin sodium hydrate RS in methanol (1 in 2500) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Cloxacillin Sodium Hydrate and cloxacillin sodium hydrate RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) Cloxacillin Sodium Hydrate responds to the Qualitative Analysis (1) for sodium salt.

Crystalline Meets the requirements.

Optical rotation $[\alpha]_D^{20}$: Between +163° and +171° (1 g calculated on the anhydrous basis, water, 100 mL, 100 mm).

pH Dissolve 1.0 g of Cloxacillin Sodium Hydrate in 10 mL of water; the pH of this solution is between 5.0 and 7.5.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Cloxacillin Sodium Hydrate in 10 mL of water; the solution is clear and colorless to pale yellow.

(2) ***Heavy metals***—Proceed with 1.0 g of Cloxacillin Sodium Hydrate according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Arsenic***—Proceed with 1.0 g of Cloxacillin Sodium Hydrate according to Method 5 and perform the test (NMT 2 ppm).

(4) ***Related substances***—Weigh accurately 50 mg of Cloxacillin Sodium Hydrate, dissolve in the mobile phase to make 50 mL, and use this solution as the test solution. Pipet 1.0 mL of this solution, add the mobile phase to make 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas of each solution by the automatic integration method; each peak area other than the cloxacillin peak detected from the test solution is not larger than the peak area of the cloxacillin detected from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 230 nm).

Column: A stainless steel column about 6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: Dissolve 4.953 g of dibasic ammonium phosphate in 700 mL of water, and add 250 mL of acetonitrile. Adjust the pH to 4.0 with phosphoric acid, and add water to make exactly 100 mL.

Flow rate: Adjust the flow rate so that the retention time of cloxacillin is about 24 minutes.

System suitability

Test for required detectability: Pipet 1 mL of the standard solution, and add the mobile phase to make exactly 10 mL. Proceed with 10 μL of this solution according to the above conditions, and confirm that the peak area of cloxacillin is equivalent to 7% - 13% of the peak area of cloxacillin from the standard solution.

System performance: Weigh exactly about of 50 mg of cloxacillin sodium RS, dissolve in an appropriate amount of the mobile phase, add 5 mL of a solution of guaifenesin in the mobile phase (1 in 200), add the mobile phase again to make exactly 50 mL, and use the resulting solution as the system suitability solution. Proceed with 10 μL of this solution according to the above conditions; guaifenesin and cloxacillin are eluted in this order with the resolution between these peaks being NLT 25.

System repeatability: Repeat the test 6 times with 10 μL each of the system suitability solutions according to the above operating conditions; the relative standard deviation of the ratios of the peak area of cloxacillin to that of guaifenesin is NMT 1.0%.

Time span of measurement: About 3 times the retention time of cloxacillin.

(5) ***Dimethylaniline***—Weigh accurately about 1.0 g of Cloxacillin Sodium Hydrate, add 5 mL of 1 mol/L sodium hydroxide TS and 1 mL of the internal standard solution, centrifuge, if necessary, and use the supernatant as the test solution. Separately, weigh accurately about 50 mg of dimethylaniline, add 2.0 mL of hydrochloric acid, and add water to make 50 mL. Pipet 5.0 mL of this solution and add water to make exactly 250 mL. Pipet 1.0 mL of this solution, add 5.0 mL of 1 mol/L sodium hydroxide TS, add 1.0 mL of the internal standard solution, centrifuge, if necessary, and use the supernatant as the standard solution. Perform the test with 1 μL each of the test solution and the standard solution as directed under the Gas Chromatography according to the following conditions, and calculate the ratios, Q_T and Q_S, of the peak area of dimethylaniline to that of the internal standard from the test solution and the standard solution, respectively (NMT 20 ppm).

$$\text{Content (ppm) of dimethylaniline} = \text{Amount (mg) of dimethylaniline taken} \times \frac{Q_T}{Q_S} \times \frac{Purity\ (\%)\ of\ dimethylaniline}{Amount\ (mg)\ of\ \text{Cloxacillin Sodium Hydrate taken}} \times 4$$

Internal standard solution—Dissolve 50.0 mg of naphthalene in cyclohexane to make 50 mL. Take 5.0 mL of this solution, add cyclohexane to make 100 mL, and use this solution as the internal standard solution.

Operating conditions

Detector: A flame ionization detector

Column: A column about 2 mm in internal diameter and about 2 m in length, packed with diatomaceous earth for gas chromatography, which is coated with 50% phenyl-50% methylpolysiloxane for gas chromatography equivalent to 3% of the mass of the diatomaceous earth for gas chromatography.

Column temperature: 120 °C

Temperatures of the sample injection port and the detector : 150 °C

Carrier gas: Nitrogen
Flow rate: 30 mL/min

Water NLT 3.0% and NMT 4.5% (0.2 g, volumetric titration, direct titration).

Sterility It meets the requirements when used in the manufacturing of sterile preparations. However, it is exempt from the requirements there is a terminal sterilization process in the manufacturing of sterile preparations.

Bacterial endotoxins It is less than 0.20 EU per mg of cloxacillin when used in the manufacturing of sterile preparations.

Assay Weigh accurately about 50 mg (potency) each of Cloxacillin Sodium Hydrate and cloxacillin sodium RS, dissolve each in water to make exactly 50 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions, and determine the peak areas, A_T and A_S, of cloxacillin sodium from the test solution and the standard solution, respectively.

Potency (μg) of cloxacillin ($C_{19}H_{17}ClN_3NaO_5S$)
= Potency (μg) of cloxacillin sodium RS × $\frac{A_T}{A_S}$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

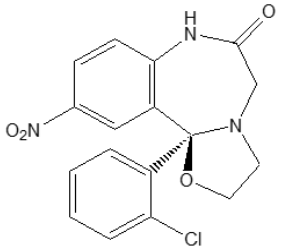
Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of 500 mL of acetonitrile and 1000 mL of a solution prepared by dissolving 2.72 g of potassium dihydrogen phosphate in water to make 1000 mL, and adjusting the pH to 5.0 with 8 mol/L potassium hydroxide.

Flow rate: 1.0 mL/min

Packaging and storage Preserve in tight containers.

Cloxazolam
클록사졸람



and enantiomer

$C_{17}H_{14}Cl_2N_2O_2$: 349.21

10-Chloro-11b-(2-chlorophenyl)-2,3,7,11b-tetrahydrobenzo[f]oxazolo[3,2-d][1,4]diazepin-6(5*H*)-one [*24166-13-0*]

Cloxazolam, when dried, contains NLT 99% and NMT 101.0% of cloxazolam ($C_{17}H_{14}Cl_2N_2O_2$).

Description Cloxazolam occurs as white crystals or a crystalline powder, and is odorless and tasteless.
It is freely soluble in acetic acid(100), sparingly soluble in dichloromethane, slightly soluble in anhydrous ethanol or ether, very slightly soluble in ethanol, and practically insoluble in water.
It dissolves in dilute hydrochloric acid.
It is gradually colored by light.

Melting point—About 200 °C (with decomposition).

Identification (1) To 10 mg of Cloxazolam, add 10 mL of anhydrous ethanol, dissolve by heating, and add one drop of hydrochloric acid; the resulting solution exhibits a pale yellow color. Expose to ultraviolet light (wavelength of 365 nm); the solution exhibits a yellowish green fluorescence. To this solution, add 1 mL of sodium hydroxide TS; the color and fluorescence of the solution disappear immediately.

(2) To 10 mg of Cloxazolam, add 5 mL of dilute hydrochloric acid, dissolve by heating on a steam bath for 10 minutes, and then cool the solution. 1 ml of the resulting solution responds to the Qualitative Analysis for primary aromatic amines.

(3) Place 2 g of Cloxazolam into a 200-mL flask, add 50 mL of ethanol and 25 mL of hydrochloric acid TS, connect the flask to a reflux condenser, and reflux for 4 hours. After cooling, neutralize the solution with dilute hydrochloric acid, and extract with 30 mL of dichloromethane. Dehydrate the extract with 3 g of anhydrous sodium sulfate, filter, and evaporate the dichloromethane. Add 5 mL of methanol to the residue, dissolve by heat on a steam bath, and cool in iced water rapidly. Filter the precipitated crystals, and dry the residue in vacuum at 60 ℃ for 1 hour; the melting point is between 87 and 91 ℃.

(4) Determine the absorption spectra of solutions of Cloxazolam and cloxazolam RS in anhydrous ethanol (1 in 100000) as directed under the Ultraviolet-visible Spec-

troscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(5) Perform the test with Cloxazolam as directed under the Flame Coloration (2); a green color is observed.

Absorbance $E_{1cm}^{1\%}$ (244 nm): Between 390 and 410 (1 mg after drying, anhydrous ethanol, 100 mL).

Purity (1) ***Chloride***—To 1.0 g of Cloxazolam, add 50 mL of water, and allow to stand for 1 hour with shaking occasionally, and filter the resulting solution. Pipet 25 mL of the filtrate, add 6 mL of dilute nitric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 0.20 mL of 0.01 mol/L hydrochloric acid solution (NMT 0.014%).

(2) ***Heavy metals*—**Proceed with 1.0 g of Cloxazolam according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Arsenic***—Weigh 1.0 g of Cloxazolam**,** put into a Kjeldahl flask, add 5 mL of sulfuric acid and 5 mL of nitric acid, and heat over low heat. While adding 2 mL - 3 mL portions of nitric acid from time to time, continue heating until the solution becomes colorless to pale yellow. After cooling, add 15 mL of saturated ammonium oxalate, heat to concentrate until thick white fumes are produced to make 2 mL - 3 mL. After cooling, add water to make 10 mL, and perform the test with this solution as the test solution (NMT 2 ppm).

(4) ***Related substances***—Dissolve 50 mg of Cloxazolam in 10 mL of dichloromethane and use this solution as the test solution. Pipet 1 mL of this solution, add dichloromethane to make exactly 200 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of toluene and acetone (5:1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Observe the plate under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot obtained from the test solution is not more intense than the spots from the standard solution.

Loss on drying NMT 0.5% (1 g, 105 °C, 3 hours).

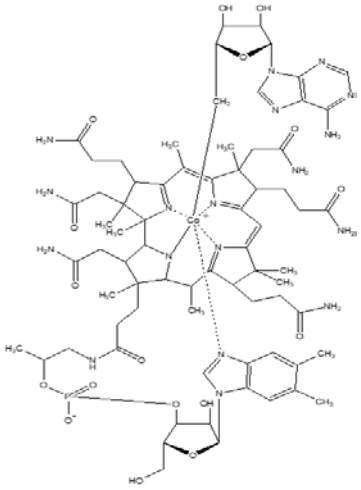
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.5 g of Cloxazolam, previously dried, dissolve in 50 mL of acetic acid(100), and titrate with 0.1 mol/L perchloric acid VS (indicator: 2 drops of methylosaniline chloride TS). The endpoint of the titration is when the color of the solution changes from violet through blue to bluish green. Perform a blank test in the same manner and make any necessary correction.

Each mL of 1 mol/L perchloric acid VS
= 34.921 mg of $C_{17}H_{14}Cl_2N_2O_2$

Packaging and storage Preserve in light-resistant, tight containers.

Cobamamide
코바마이드



Coenzyme B_{12} $C_{72}H_{100}CoN_{18}O_{17}P$: 1579.58
Co-(5′-deoxyadenosine-5′) derivative of 3′-ester of cobinamidedihydrogenphosphate(ester) with 5,6-dimethyl-1-alpha-*D*-ribofuranosyl-1*H*benzimidazole, inner salt, [*13870-90-1*]

Cobamamide contains NLT 95.0% and not more 101.0% of cobamamide ($C_{72}H_{100}CoN_{18}O_{17}P$), calculated on the dried basis.

Description Cobamamide occurs as a dark red crystal, or crystalline or amorphous powder.
It is sparingly soluble in water, very slightly soluble in ethanol, and practically insoluble in acetone, ether or chloroform.
It is extremely hygroscopic and is decomposed by light.

Identification (1) Determine the absorption spectra of the test solution and the standard solution from the Assay as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Add 50 mg of potassium hydrogen sulfate to 1 mg of Cobamamide to mix, and ignite to dissolve. After cooling, break up the molten product with a glass rod, add 3 mL of water, boil, add 1 drop of phenolphthalein TS, and drop sodium hydroxide TS until the solution exhibits a light red. Add 0.5 g of sodium acetate, 0.5 mL of dilute acetic acid and 0.5 mL of 1-nitroso-2-naphthol-3.6-disulfonic acid disodium solution (1 in 500); the solution immediately exhibits a red to orange red color. Add 0.5

mL more of hydrochloric acid, and boil for 1 minute; the red color of the solution does not disappear.

(3) Put 5 mg of Cobamamide in a 50-mL distillation flask, dissolve in 5 mL of water, add 2.5 mL of hypophosphoric acid, attach a short chiller, and immerse the tip of the chiller in 1 mL of sodium hydroxide solution (1 in 50) in a test tube. Next, boil at a low heat for 10 minutes, and distill until 1 mL of distillate is obtained. To the solution in the test tube, add 4 drops of saturated solution of ammonium ferrous sulfate, and shake gently to mix. Add 30 mg of sodium fluoride, heat to a boil, and immediately add diluted sulfuric acid (1 in 7) dropwise until the solution becomes clear. Add 3 to 5 drops of diluted sulfuric acid (1 in 7) again; the solution exhibits a blue to bluish green color.

Purity (1) ***Hydroxocobalamin***—Weigh 2.5 mg of Cobamamide, and dissolve in potassium chloride-hydrochloric acid buffer solution, pH 2.0, to make 50.0 mL. With this solution, determine the absorbance A_1 and A_2 at 352 nm and 460 nm as directed under Ultraviolet-visible Spectroscopy; A_2/A_1 is NLT 0.800. Perform all of the above in the dark.

(2) ***Colored impurities*—**Weigh accurately 10 mg each of Cobamamide and cyanocobalamin RS, dissolve in 0.50 mL of water, and use these solutions as the test solution and standard solution. Mark a horizontal line at 100 mm from the edge of a sheet of filter paper for chromatography (500 mm x 220 mm) using a pencil, and adsorb 0.25 mL of the test solution about 100 mm to the target, leaving 50 mm on one end. Then, spot 5 μL of the standard solution on the remaining portion of the same line, leaving 20 mm of space in between. After air-drying, test as directed under the descent method under the Paper Chromatography using a mixture of 2-butanol, water and acetic acid(100) (100 : 50 : 3) as the developing solvent. Cut and discard the cobamamide part with an R_f value of about 0.8, and the developed part of the standard solution. Cut the colored part of the remaining filter paper, and join the two ends to create a cylinder. Insert this cylindrical filter paper into a petri dish of diameter 120 mm and with a sheet of filter paper wet with water placed on the bottom. Allow to stand until the colored part rises and collects at the top portion of the filter paper. Next, cut the colored part and extract 3 times by shaking using 7 mL of water each time; combine the extracts, then add water to make 20 mL, and filter using a glass filter (G_3). Perform the test with the test solution and the standard solution as directed under the Ultraviolet-visible Spectroscopy, using the blank test solution as the control, and determine the absorbance at the absorbance maximum wavelength at about 525 nm. At the time, the absorbance is NMT 0.070. Perform all of the above in the dark.

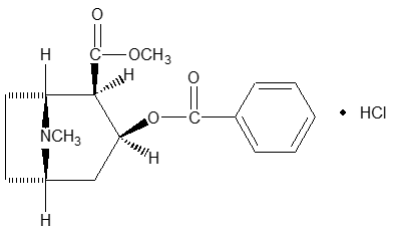
Loss on drying NMT 12.0% (0.1 g, in vacuum, NMT 0.67 kPa, phosphorus pentoxide, 60 ℃, 15 hours).

Assay Weigh accurately about 20 mg each of Cobamamide and cobamamide RS (Measure the loss on drying in the same manner as Cobamamide.), and add water to make exactly 50 mL. Pipet 5 mL of these solutions, add water to make exactly 25 mL, and use these solutions as the test solution and the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at 525 nm as directed under the Ultraviolet-visible Spectroscopy.

$$\text{Amount (mg) of cobamamide } (C_{72}H_{100}CoN_{18}O_{17}P) = \text{Amount (mg) of cobamamide RS, as calculated on the dried basis} \times \frac{A_T}{A_S}$$

Packaging and storage Preserve in light-resistant, tight containers.

Cocaine Hydrochloride
코카인염산염



$C_{17}H_{21}NO_4 \cdot HCl$: 339.81

Methyl (1*R*,3*R*,4*S*,5*S*)-3-Benzoyloxy-8-methyl-8-azabicyclo[3.2.1]octane-4-carboxylate hydrochloride [*53-21-4*]

Cocaine Hydrochloride, when dried, contains NLT 98.0% and NMT 101.0% of cocaine hydrochloride ($C_{17}H_{21}NO_4 \cdot HCl$).

Description Cocaine Hydrochloride occurs as colorless crystals or a white crystalline powder.
It is very soluble in water, freely soluble in ethanol(95) or acetic acid(100), slightly soluble in acetic anhydride, and practically insoluble in ether.

Identification (1) Determine the absorption spectra of solutions of Cocaine Hydrochloride and cocaine hydrochloride RS in 0.01 mol/L hydrochloric acid TS (1 in 10000) as directed under the Ultraviolet-visible spectrophotometry; both spectra exhibit similar intensities of absorption at the same wavelengths. In addition, determine the absorption spectra of the solutions of Cocaine Hydrochloride and cocaine hydrochloride RS in 0.01 mol/L hydrochloric acid (1 in 50000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Cocaine Hydrochloride and cocaine hydrochloride RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit

similar intensities of absorption at the same wavenumbers.

(3) An aqueous solution of Cocaine Hydrochloride (1 in 50) responds to the Qualitative Analysis (2) for chloride.

Optical rotation $[\alpha]_D^{20}$: -70° to -73° (0.5 g, after drying, water, 20 mL, 100 mm).

Purity (1) ***Acid***—Dissolve 0.5 g of Cocaine Hydrochloride in 10 mL of water, add 1 drop of methyl red TS and neutralize with 0.01 mol/L sodium hydroxide solution; the amount consumed is NMT 1.0 mL.

(2) ***Cinnamyl cocaine*—**Dissolve 0.10 g of Cocaine Hydrochloride in 5 mL of water, then add 0.3 mL of diluted sulfuric acid (1 in 20) and 0.10 mL of 0.02 mol/L potassium permanganate solution; the red color of the resulting solution does not disappear within 30 minutes.

(3) ***Isoatropyl cocaine*—**Weigh 0.10 g of Cocaine Hydrochloridee in a beaker, dissolve in 30 mL of water, and separately collect 5 mL of the resulting solution in a test tube. Add 30 mL of water again to the previous beaker, add 1 drop of ammonia TS to the test tube, and shake to mix. When precipitates are formed, add 10 mL of water, place in the previous beaker and wash the test tube with 10 mL of water by adding the washings to the beaker. Add 3 drops of ammonia TS and gently shake to mix; crystalline precipitates are formed. When allowed to stand for 1 hour, the supernatant is clear.

(4) ***Readily carbonizable substances*—**Weigh 0.5 g of Cocaine Hydrochloride and perform the test. The color of this solution is not more intense than that of the control solution F.

Loss on drying NMT 1.0% (1 g, 105℃, 4 hours).

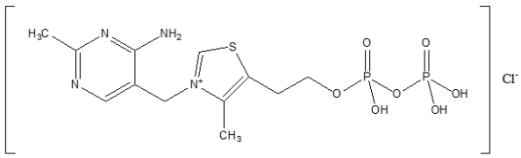
Residue on ignition NMT 0.1% (0.5 g).

Assay Weigh exactly about 0.5 g of Cocaine Hydrochloride, previously dried, dissolve in 50 mL of a mixture of acetic anhydride and acetic acid(100) (7 : 3), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 33.982 mg of $C_{17}H_{21}NO_4 \cdot HCl$

Packaging and storage Preserve in light-resistant, tight containers.

Cocarboxylase
코카르복실라제



Coenzyme B_1 $C_{12}H_{19}ClN_4O_7P_2S$: 460.77
3-[(4-Amino-2-methyl-5-pyrimidinyl)methyl]-4-methyl-5-(4,6,6-trihydroxy-3,5-dioxa-4,6-diphosphahex-1-yl)thiazolium chloride *P*,*P*′-dioxide, [*154-87-0*]

Cocarboxylase contains NLT 95.0% and NMT 101.0% of cocarboxylase ($C_{12}H_{19}ClN_4O_7P_2S$), calculated on the dried basis.

Description Cocarboxylase occurs as a white crystalline powder. It is odorless or has a slight characteristic odor and sour taste.
It is freely soluble in water, and practically insoluble in acetonitrile, anhydrous ethanol or ether.

Melting point—About 230 °C (with decomposition).

Identification (1) To 1 mL of aqueous solution of Cocarboxylase (1 in 500), add 1 mL of lead acetate TS and 1 mL of sodium hydroxide solution (1 in 10), and heat; the resulting solution turns yellow to brown, and blackish brown precipitates are formed when left to stand.

(2) To 10 mL of the aqueous solution of Cocarboxylase (1 in 300), add sodium acetate to adjust pH to between 4.5 and 5.0. Then, add 4 mL of enzyme TS and warm on a steam bath at 50 ℃ for 1 hour, and use this solution as the test solution. Take 5 mL of the test solution, add 2.5 mL of sodium hydroxide TS and 0.5 mL of tpotassium hexacyanoferrate(III) TS, add 5 mL of isubutanol and shake vigorously for 2 minutes to mix, and centrifuge. Take the isobutanol layer and examine under ultraviolet light (main wavelength: 365 nm); a bluish-purple fluorescence is exhibited. This fluorescence disappears when the solution is acidified and reappears when the solution is alkalized.

(3) To 7 mL of the test solution from (2), add 2 mL of strong ammonia water, shake to mix, and centrifuge; the clear supernatant responds to the Qualitative Analysis for phosphate.

(4) An aqueous solution of Cocarboxylase (1 in 50) responds to the Qualitative Analysis for chloride.

pH Between 1.0 and 1.4 (10% aqueous solution).

Purity (1) ***Clarity and color of solution*—**Dissolve 0.2 g of Cocarboxylase in 10 mL of water; the solution is clear and colorless.

(2) ***Sulfate***—Perform the test with 1.5 g of Cocarboxylase. Use 0.35 mL of 0.005 mol/L sulfuric acid as the control solution (NMT 0.011%).

(3) ***Heavy metals*—**Dissolve about 1.0 g of Cocar-

boxylase in 30 mL of water, and add ammonia TS to adjust pH to 3.5. Then, add 5 mL of hydrochloric acid-ammonium acetate buffer solution, pH 3.5, and add water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution by adding hydrochloric acid-ammonium acetate buffer solution, pH 3.5, and water to 2.0 mL of lead standard solution to make 50 mL (NMT 20 ppm).

(4) ***Free phosphoric acid***—Weigh accurately about 50 mg of Cocarboxylase, add water to make 100 mL, and use this solution as the test solution. Pipet 5.0 mL each of the test solution, diluted standard phosphoric acid solution (1 in 5) and water, transfer to a 25 mL volumetric flask, add 2.5 mL of ammonium molybdate-sulfuric acid TS and 1 mL of 1-amino-2-naphthol-4-sulfonic acid TS, shake to mix, and add water to make 25 mL. Allow the solutions to stand for 10 minutes at 20 ± 1 ℃, and determine the absorbances A_1, A_2, and A_3 of each solution at 740 nm, using water as the control, as directed under the Ultraviolet-visible Spectroscopy within 30 minutes; the amount of free phosphoric acid is NMT 1.5%.

$$\text{Content (\%) of free phosphoric acid } (H_3PO_4) = \frac{A_1 - A_3}{A_2 - A_3} \times \frac{1}{W} \times 51.56$$

W: Amount (mg) of sample, calculated on the dry basis

(5) ***Thiamine hydrochloride, thiamine monophosphate chloride and other related substances***—Dissolve 60 mg of Cocarboxylase in 100 mL of the mobile phase, and use this solution as the test solution. With 10 μL of the test solution, perform the test as directed under the Liquid Chromatography according to the following conditions. Determine the peak area of each solution according to the automatic integration method and determine the amounts of related substances; the amount of each related substance is NMT 0.5% for thiamine hydrochloride, NMT 4.0% for thiamine monophosphate chloride, and 1.5% for other related substances. The peak areas for retention time about 2 minutes (thiamine hydrochloride), about 3 minutes (thiamine monophosphate chloride), about 5 minutes (cocarboxylase) and related substances eluted later than cocarboxylase are A_1, A_2, A_3 and A_4, respectively.

$$\text{Amount (mg) of thiamine hydrochloride } (C_{12}H_{17}ClN_4OS\cdot HCl) = \frac{A_T}{A_S} \times 73$$

$$\text{Content (\%) of thiamine monophosphate chloride } (C_{12}H_{18}ClN_4O_4PS) = \frac{A_2}{A} \times 82$$

$$\text{Content (\%) of other related substances (\%)} = \frac{A_1}{A} \times 100$$

Operating conditions

Time span of measurement: About 5 times the retention time of cocarboxylase.

Other: Follow the operating conditions of Assay.

(6) ***Arsenic***—Weigh 0.65 g of Cocarboxylase and perform the test according to Method 3. However, use ethanol solution (1 in 5) of magnesium nitrate, and dissolve the residue after incineration using 10 mL of dilute hydrochloric acid (NMT 3.1 ppm).

Loss on drying NMT 2.0% (1 g, 130 ℃, 4 hours).

Assay Weigh accurately about 60 mg each of Cocarboxylase and cocarboxylase RS (measure loss on drying in advance), add the mobile phase to make 50 mL, add 10.0 mL of the internal standard solution to each, add the mobile phase to make 100 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions, and calculate the ratios, Q_T and Q_S, of the peak area of cocarboxylase to that of the internal standard.

$$\text{Amount (mg) of cocarboxylase } (C_{12}H_{19}ClN_4O_7P_2S) = \text{Amount (mg) of cocarboxylase (mg), calculated on the dry basis} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of caffeine in the mobile phase (3 in 2000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 280 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silical gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: Take 2.3 g of ammonium phosphate dibasic and 12 mL of tetrabutylammonium hydroxide TS for liquid chromatography, and add water to make 1000 mL. Add 100 mL of acetonitrile to 900 mL of this solution and mix.

Flow rate: Adjust the flow rate so that the retention time of cocarboxylase is about 5 minutes.

Selection of column: Proceed with 10 μL of the standard solution under the above operating conditions. Use a column giving elution of cocarboxylase and caffeine in this order with the resolution between these peaks being NLT 3.

Packaging and storage Preserve in light-resistant, tight containers.

Cod Liver Oil
간유

Cod Liver Oil is the fatty oils obtained from fresh livers and pyloric appendages of *Gadus macrocephalus* Tilesius or *Theragra chalcogramma* Pallas (Gadidae).
Cod Liver Oil contains NLT 2000 vitamin A units and NMT 5000 vitamin A units per g.

Description Cod Liver Oil occurs as a yellow to orange oily liquid, and has a characteristic, slightly fishy odor and a mild taste.
It is miscible with chloroform.
It is slightly soluble in ethanol(95) and practically insoluble in water.
Decomposition of Cod Liver Oil is accelerated by air or light.

Identification Dissolve 0.1 g of Cod Liver Oil in 10 mL of chloroform, take 1 mL of this solution, and add 3 mL of antimony(III) chloride TS; the solution immediately turn to blue, but the color disappears rapidly.

Specific gravity d_{20}^{20}: Between 0.918 and 0.928.

Acid value NMT 1.7.

Saponification value Between 180 and 192.

Unsaponifiable matter NMT 3.0%.

Iodine value Between 130 and 170.

Anisidine value Weigh accurately 0.5 g of Cod Liver Oil, add isooctane, dissolve to make exactly 25 mL, and use this solution as the test stock solution. Pipet 0.5 g of this solution, add 1 mL of a solution of *p*-anisidine in acetic acid(100) (2.5 in 1000), shake to mix, and use this solution as the test solution. Separately, pipet 0.5 mL of isooctane, add 1 mL of a solution of *p*-anisidine in acetic acid(100) (2.5 in 1000), shake to mix, and use this solution as the standard solution. Preserve the test and standard solutions, protected from light. With isooctane as the blank test solution, determine the absorbance A_{S1} of the test stock solution at 350 nm of wavelength. With the standard solution using as a control solution, 10 minutes exactly after preparing the test solution, determine the absorbance A_{S2} of the test solution at 350 nm of wavelength and calculate anisidine value according to the following equation; the anisidine value is NMT 30.

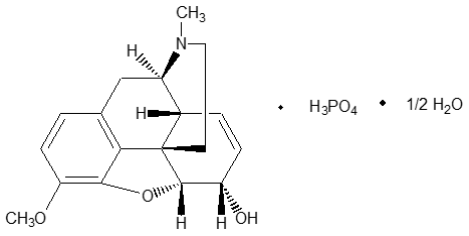
$$\text{Anisidine value} = 25 \times \frac{(1.2 \times A_{S2}) - A_{S1}}{\text{Amount of Cod Liver Oil taken (g)}}$$

Purity ***Rancidity***—No unpleasant odor of rancid oil is perceptible when warming Cod Liver Oil.

Assay Weigh accurately about 0.5 g of Cod Liver Oil and perform the test according to Method 2 under the Vitamin A Assay.

Packaging and storage Preserve in light-resistant, tight containers, as almost well-filled or under the nitrogen atmosphere.

Codeine Phosphate Hydrate
코데인인산염수화물



Codeine phosphate $C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot ½H_2O$: 406.37
(5*R*,6*S*)-4,5-Epoxy-3-methoxy-17-methyl-7,8-didehydromorphinan-6-ol monophosphate hemihydrate [*41444-62-6*]

Codeine Phosphate Hydrate contains NLT 98.0% and NMT 101.0% of codeine phosphate $C_{18}H_{21}NO_3 \cdot H_3PO_4$: 397.36), calculated on the anhydrous basis.

Description Codeine Phosphate Hydrate occurs as white to yellow crystals or a crystalline powder.
It is freely soluble in water or acetic acid(100), slightly soluble in methanol or ethanol(95), and practically insoluble in ether.
Dissolve 1.0 g of Codeine Phosphate Hydrate in 10 mL of water; the pH of this solution is between 3.0 and 5.0.
It is affected by light.

Identification (1) Determine the absorption spectra of aqueous solutions of Codeine Phosphate Hydrate and Codeine Phosphate Hydrate RS (1 in 10000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelength.

(2) Determine the infrared spectrum of Codeine Phosphate Hydrate and Codeine Phosphate Hydrate RS, previously dried for 4 hours at 105 ℃, as directed in the potassium bromide disk method under the Ultraviolet-visible spectrophotometry; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) A solution of Codeine Phosphate Hydrate (1 in 20) responds to the Qualitative Analysis (1) for phosphate.

Optical rotation $[\alpha]_D^{20}$: Between -98° and -102° (0.4 g, calculated on the anhydrous basis, 20 mL of water, 100

mm).

Purity (1) ***Chloride***—Perform the test with 0.5 g of Codeine Phosphate Hydrate. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid (NMT 0.021%).

(2) ***Sulfate***—Perform the test with 0.20 g of Codeine Phosphate Hydrate. Prepare the control solution with 1.0 mL of 0.005 mol/L sulfuric acid (NMT 0.240%).

(3**) *Related substances*—**Dissolve 0.20 g of Codeine Phosphate Hydrate in 10 mL of a mixture of hydrochloric acid TS and ethanol(99.5) (4 : 1), and use this solution as the test solution. Pipet 1 mL of this solution, add a mixture of 0.01 mol/L hydrochloric acid TS and ethanol(99.5) (4 : 1) to make exactly 100 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of ethanol(99.5), toluene, acetone, and ammonia water(28) (14 : 14 : 7 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot obtained from the test solution are not more intense than the spots from the standard solution.

Water Between 1.5% and 3.0% (0.5 g, volumetric titration, direct titration).

Assay Weigh accurately about 0.5 g of Codeine Phosphate Hydrate, dissolve in 70 mL of acetic acid(100), and titrate with 0.1 mol/L perchloric acid VS (indicator: 3 drops of methylrosaniline chloride TS). The endpoint of the titration is when the solution changes from violet to blue, then finally to greenish blue. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 39.736 mg of $C_{18}H_{21}NO_3 \cdot H_3PO_4$

Packaging and storage Preserve in light-resistant, tight containers.

1% Codeine Phosphate Powder
코데인인산염 100 배산

Codeine Phosphate 1%

1% Codeine Phosphate Powder contains NLT 0.90% and not more the 1.10% of Codeine Phosphate Hydrate ($C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot ½H_2O$: 406.37).

Method of preparation

Codeine Phosphate Hydrate	10 g
Lactose hydrate	An appropriate amount
Total amount	1000 g

Prepare as directed under Powders, with the above.

Identification Determine the absorption spectrum of an aqueous solution of 1% Codeine Phosphate Powder as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum at 283 nm to 287 nm.

Particle size distribution estimation by analytical sieving Meets the requirements.

Uniformity of dosage units (distribution) Meets the requirements.

Assay Weigh accurately about 5 g of 1% Codeine Phosphate Powder, dissolve in water to make exactly 100 mL, Pipet 10 mL of this solution, add exactly 10 mL of the internal standard solution, and use this solution as the test solution. Separately, weigh accurately about 50 mg of Codeine Phosphate Hydrate RS, previously determined the water content in the same manner as Codeine Phosphate Hydrate, dissolve in water to make exactly 100 mL, Pipet 10 mL of this solution, add exactly 10 mL of the internal standard solution, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the peak area ratios, Q_T and Q_S, of codeine to the peak area of the internal standard.

Amount (mg) of Codeine Phosphate Hydrate ($C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot ½H_2O$)
= Amount (mg) of Codeine Phosphate RS, calculated on the anhydrous basis× $1.0227 \times \frac{Q_T}{Q_S}$

Internal standard solution—An aqueous solution of etilefrine hydrochloride (3 in 10000).

Operating conditions

Proceed as directed under the operating conditions in the Assay under 10% Codeine Phosphate Powder.

Packaging and storage Preserve in tight containers.

10% Codeine Phosphate Powder
코데인인산염 10 배산

Codeine Phosphate 10%

10% Codeine Phosphate Powder contains NLT 9.3% and NMT 10.7% of Codeine Phosphate Hydrate ($C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot ½H_2O$: 406.37).

Method of preparation

Codeine Phosphate Hydrate	100 g

Lactose hydrate	An appropriate amount
Total amount	1000 g

Prepare as directed under Powders, with the above.

Identification Determine the absorption spectrum of an aqueous solution of 10% Codeine Phosphate Powder (1 in 1000) as directed under the Ultraviolet-visible spectrophotometry; it exhibits a maximum at 283 nm to 287 nm.

Particle size distribution estimation by analytical sieving Meets the requirements.

Uniformity of dosage units (distribution) Meets the requirements.

Assay Weigh accurately about 2.5 g of 1% Codeine Phosphate Powder, dissolve in water to make exactly 100 mL, Pipet 2 mL of this solution, add exactly 10 mL of the internal standard solution, add water to make 20 mL, and use this solution as the test solution. Separately, weigh accurately about 50 mg of Codeine Phosphate Hydrate RS (previously determine the water in the same manner as Codeine Phosphate Hydrate), dissolve in water to make exactly 100 mL, Pipet 10 mL of this solution, add exactly 10 mL of the internal standard solution, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the peak area ratios, Q_T and Q_S, of codeine to the peak area of the internal standard.

Amount (mg) of Codeine Phosphate Hydrate ($C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot ½H_2O$) = Amount (mg) of Codeine Phosphate RS, calculated on the anhydrous basis $\times 1.0227 \times \frac{Q_T}{Q_S} \times 5$

Internal standard solution—An aqueous solution of etilefrine hydrochloride (3 in 10000).

Operating conditions

Detector: An ultraviolet photometer (wavelength: 280 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 15 cm to 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 ℃.

Mobile phase: Dissolve 1.0 g of sodium lauryl sulfate in 500 mL of diluted phosphoric acid (1 in 1000), then add sodium hydroxide TS to adjust the pH to 3.0. To 240 mL of this solution, add 70 mL of tetrahydrofuran, and mix.

Flow rate: Adjust the flow rate so that the retention time of codeine is about 10 minutes.

System suitability

System performance: Proceed with 20 μL of the standard solution according to the above operating conditions; codein and the internal standard are eluted in this order with the resolution being NLT 4.

System repeatability: Repeat the test 5 times with 20 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area ratio of codeine to the internal standard is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Codeine Phosphate Tablets
코데인인산염 정

Codeine Phosphate Tablets contains NLT 93.0% and NMT 107.0% of the labeled amount of Codeine Phosphate Hydrate ($C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot ½H_2O$: 406.37).

Method of preparation Prepare as directed under Tablets, with Codeine Phosphate Hydrate.

Identification Powder Codeine Phosphate Tablets, weigh an amount of the powder, equivalent to 0.1 g of Codeine Phosphate Hydrate according to the labeled amount, add 20 mL of water, shake to mix, and filter. To 2 mL of this filtrate, add water to make 100 mL, and determine the absorption spectrum of the resulting solution as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum between 283 nm and 287 nm.

Dissolution Perform the test with 1 tablet of Codeine Phosphate Tablets at 50 revolutions per minute according to Method 2 under the Dissolution, using 900 mL of water as the dissolution medium. Take NLT 20 mL of the dissolved solution 30 minutes after starting the dissolution test and filter through a membrane filter with a pore diameter of NMT 0.45 μm. Discard the first 10 mL of the filtrate, take exactly V mL of the subsequent filtrate, and add water to make exactly V' mL of a solution containing about 5.6 μg of Codeine Phosphate Hydrate ($C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot 1/2H_2O$) per mL according to the labeled amount, and se this solution as the test solution. Separately, weigh accurately about 28 mg of the Codeine Phosphate RS (previously determined the water content in the same manner as for Codeine Phosphate Hydrate), dissolve in water to make exactly 100 mL. Pipet 2 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 100 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_s, of codeine in each solution. Meets the requirements if the dissolution rate of Codeine Phosphate Tablets in 30 minutes is NLT 80%.

Dissolution rate (%) with respect to the labeled amount of Codeine Phosphate Hydrate ($C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot 1/2H_2O$)

$$= WS \times \frac{A_T}{A_S} \times \frac{V'}{V} \times \frac{1}{C} \times 18 \times 1.0227$$

Ws: Amount (mg) of Codeine Phosphate RS, calculated on the anhydrous basis.

C: Labeled amount (mg) of Codeine Phosphate Hydrate ($C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot 1/2H_2O$) in 1 tablet

Operating conditions

Proceed as directed under the operating conditions under the Assay.

System suitability

System performance: Proceed with 100 μL of the standard solution under the above operating conditions; the number of theoretical plates and the symmetry factor are NLT 5000 and NMT 1.5, respectively.

System repeatability: Repeat the test 6 times with 100 μL of the standard solution according to the above operating conditions; the relative standard deviation of the peak areas of codeine is NMT 2.0%.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 tablets of Codeine Phosphate Tablets, and powder. Weigh accurately an amount of this powder, equivalent to about 0.1 g of Codeine Phosphate Hydrate ($C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot ½H_2O$), add 30 mL of water, sonicate for 10 minutes, and add water to make exactly 100 mL. Filter, pipet 2 mL of the filtrate, add exactly 10 mL of the internal standard solution, add water to make exactly 20 mL, and use this solution as the standard solution. Separately, weigh accurately about 50 mg of Codeine Phosphate RS (previously determine the water content in the same manner as for Codeine Phosphate Hydrate) and dissolve in water to make exactly 100 mL. Pipet 10 mL of this solution, add exactly 10 mL of the internal standard solution, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the peak area ratios, Q_T and Q_S, of codeine to the peak area of the internal standard.

Amount (mg) of codeine phosphate hydrate ($C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot ½H_2O$)
= Amount (mg) of codeine phosphate RS, calculated on the anhydrous basis $\times 1.0227 \times \frac{Q_T}{Q_S} \times 2$

Internal standard solution—An aqueous solution of etilefrine hydrochloride (3 in 10000).

Operating conditions

Detector: An ultraviolet photometer (wavelength: 280 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 15 cm to 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: Dissolve 1.0 g of sodium lauryl sulfate in 500 mL of diluted phosphoric acid (1 in 1000), then add sodium hydroxide TS to adjust the pH to 3.0. To 240 mL of this solution, add 70 mL of tetrahydrofuran, and mix.

Flow rate: Adjust the flow rate so that the retention time of codeine is about 10 minutes.

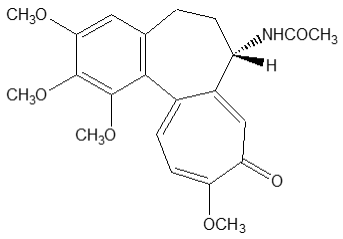
System suitability

System performance: Proceed with 20 μL of the standard solution according to the above operating conditions; codein and the internal standard are eluted in this order with the resolution being NLT 4.

System repeatability: Repeat the test 5 times with 20 μL each of the standard solution under the above operating conditions; the relative standard deviation of the ratios of the peak area of codein to that of the internal standard is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Colchicine
콜키신



$C_{22}H_{25}NO_6$: 399.44

N-{3,4,5,14-Tetramethoxy-13-oxotricyclo[9.5.0.0^{2,7}]hexadeca-1(16),2(7),3,5,11,14-hexaen-10-yl}acetamide [*64-86-8*]

Colchicine contains NLT 97.0% and NMT 102.0% of colchicine ($C_{22}H_{25}NO_6$), calculated on the anhydrous and ethyl acetic acid-free basis.

Description Colchicine occurs as a yellowish white powder.
It is very soluble in methanol, freely soluble in ethanol(95), acetic anhydride or *N*,*N*-dimethylformamide and sparingly soluble in water.
It is colored by light.

Identification (1) Determine the absorption spectra of Colchicine and ethanol(95) solution of colchicine RS as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the

same wavelengths.

(2) Add 0.5 mL of Colchicine and methanol solution (1 in 50) of colchicine RS to 1 g of potassium bromide for the Mid-infrared Spectroscopy, mix well, and dry under vacuum for 1 hour at 80 ℃; measure as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both exhibit similar intensities of absorption at the same wavenumbers.

Optical rotation $[\alpha]_D^{20}$: Between -235° and -250° (0.1 g, calculated on the anhydrous and ethyl acetic acid-free basis, ethanol(95), 10 mL, 100 mm).

Purity (1) ***Colchicine*—**Dissolve 0.10 g of Colchicine in 10 mL of water and add 2 drops of iron(III) chloride TS to 5 mL of this solution; the resulting solution does not exhibit a clear green color.

(2) ***Ethyl acetate and chloroform*—**Weigh accurately 0.6 g of Colchicine, dissolve in exactly 2 mL of internal standard solution, add *N*,*N*-dimethylformamide to make 10 mL, and use this solution as the test solution. Separately, add 0.30 g of chloroform to a 100-mL volumetric flask containing about 20 mL of *N*,*N*-dimethylformamide, and add *N*,*N*-dimethylformamide to make exactly 100 mL. Pipet 2 mL of this solution, add *N*,*N*-dimethylformamid to make exactly 200 mL and use this solution as the standard solution (1). Separately, add exactly about 1.8 g of ethyl acetate to a 100-mL volumetric flask containing about 20 mL of *N*,*N*-dimethylformamide, and add *N*,*N*-dimethylformamide to make exactly 100 mL. Take exactly 2 mL of this solution, add exactly 2 mL of the internal standard solution, add *N*,*N*-dimethylformamide to make 10 mL, and use this solution as the standard solution (2). Perform the test with 2 μL each of the standard solution (1) and the standard solution (2) as directed under the Gas Chromatography according to the following conditions. The peak area of chloroform from the test solution is not greater than the peak area of chloroform from the standard solution (1). Find the peak area ratios, Q_T and Q_S, of ethyl acetate to the peak area of the internal standard, for the test solution and standard solution (2). Determine the amount of ethyl acetate using the following formula; the amount is NMT 6.0%.

$$\text{Content (\%) of ethyl acetate } (C_4H_8O_2) = \frac{W_S}{W_T} \times \frac{Q_T}{Q_S} \times 2$$

W_S: Amount (g) of ethyl acetate
W_T: Amount (g) of colchicine

Internal standard solution—*N*,*N*-dimethylformamide solution (3 in 200) of 1-propanol.

Operating conditions

Detector: A flame ionization detector

Column: Coat the inside of a quartz glass column of 0.53 mm in internal diameter and 30 m in length with polyethylene glycol 20 M for gas chromatography to a thickness of 1.0 μm.

Column temperature: Maintain at 60 °C for 7 minutes, heat at a rate of 40 to 100 °C per minute, if necessary and keep at 100 °C for 10 minutes.

Sample injection port temperature: A constant temperature of about 130 ℃.

Detector temperature: A constant temperature of about 200 ℃.

Carrier gas: Helium

Flow rate: Adjust the flow rate so that the retention time of ethyl acetate is about 3 minutes.

Split ratio: About 1 : 20.

System suitability

Test for required detectability: Pipet 2 mL of the standard solution (2) and add *N*,*N*-dimethylformamide to make exactly 25 mL. Pipet 1 mL of this solution and add *N*,*N*-dimethylformamide to make exactly 50 mL. Confirm that the peak area of ethyl acetate obtained from 2 μL of this solution is equivalent to 0.11% to 0.21%.

System performance: Weigh 1 mL of chloroform and add *N*,*N*-dimethylformamide to make 10 mL. Take 1 mL of this solution and 2 mL of ethyl acetate, and add *N*,*N*-dimethylformamide to make 100 mL. Pipet 2 mL of this solution, add 2 mL of the internal standard solution, and add *N*,*N*-dimethyl formamide to make 10 mL. Proceed with 2 μL of this solution according to the above conditions; ethyl acetate, chloroform and the internal standard are eluted in this order, with the resolution between chloroform and the internal standard being NLT 2.0.

System reproducibility: Repeat the test 3 times with 2 μL each of the standard solution (2) according to the above conditions; the relative standard deviation of the peak area ratio of ethyl acetate to that of the internal standard is NMT 3.0%.

(3) ***Related substances*—**Dissolve 60 mg of Colchicine in 100 mL of diluted methanol (1 in 2). Pipet 1 mL of this solution, add diluted methanol (1 in 2) to make exactly 100 mL, and use this solution as the test solution. Take 20 μL of the test solution and perform the test as directed under the Liquid Chromatography according to the following conditions. Measure each peak area by the automatic integration method, and calculate the sum of peak areas other than colchicine by the percentage peak area method; the sum is NMT 5.0%.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: To 450 mL of 0.05 mol/L potassium dihydrogen phosphate TS, add methanol to make

1000 mL. To this solution, add diluted phosphoric acid (7 in 200) and adjust pH to 5.5.

Flow rate: Adjust the flow rate so that the retention time of colchicine is about 7 minutes.

System suitability

Test for required detectability: Pipet 1 mL of the test solution and add diluted methanol (1 in 2) to make exactly 50 mL. Confirm that the peak area of colchicine obtained from 20 mL of this solution is equivalent to 1.4% to 2.6% of the peak area of colchicine obtained from the test solution.

System performance: Proceed with 20 μL of the test solution under the above conditions; the number of theoretical plates and symmetry factor of the peak of colchicine are NLT 6000 and NMT 1.5, respectively.

System repeatability: Repeat the test 6 times according to the above conditions with 20 μL each of the test solution; the relative standard deviation of the peak area of colchicine is NMT 2.0%.

Time span of measurement: About 2 times the retention time of colchicine after the solvent peak.

Water NMT 2.0% (0.5 g, volumetric titration, back titration).

Assay Weigh accurately about 0.4 g of Colchicine, dissolve in 25 mL of acetic anhydride and titrate with 0.05 mol/L perchloric acid (potentiometric titration under Titrimetry). Perform a blank test in the same way and make necessary correction.

Each mL of 0.05 mol/L perchloric acid VS
= 19.97 mg of $C_{22}H_{25}NO_6$

Packaging and storage Preserve in light-resistant, tight containers.

Colchicine Tablets
콜키신 정

Colchicine Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of colchicine ($C_{22}H_{25}NO_6$: 399.44).

Method of preparation Prepare as directed under Tablets, with Colchicine.

Identification Weigh an amount of Colchicine Tablets, previously powdered, equivalent to 20 mg of colchicine, mix with 20 mL of water, allow the insoluble matter to settle, filter the clear supernatant, and place the filtrate in a separatory funnel. Extract the filtrate with 30 mL of chloroform, and evaporate the chloroform extracts to dryness. Determine the infrared spectra of this residue and colchicine RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Dissolution Perform the test with 1 tablet of Colchicine Tablets at 100 revolutions per minute according to Method 1 under the Dissolution, using 500 mL of water as the dissolution medium. Filter the dissolved solution through a membrane filter with a pore size NMT 0.8 μm 30 minutes after starting the Dissolution, pipet *V* mL of the filtrate, and extract three times with 15 mL each of chloroform. Combine the extracts, evaporate to dryness, dissolve in chloroform to make exactly 10 mL, and use this solution as the test solution. Separately, weigh accurately an appropriate amount of colchicine RS, previously dried at 105 ℃ for 3 hours, dissolve in the dissolution medium to make the same concentration with the test solution, and use this solution as the standard solution. Perform the test with the test solution and the standard solution as directed under the Ultraviolet-visible Spectroscopy, using chloroform as a control solution, and determine the ultraviolet absorbance at the absorbance maximum wavelength at about 350 nm.

It meets the requirements if the dissolution rate of Colchicine Tablets in 30 minutes is NLT 75%.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 Colchicine Tablets, and powder. Weigh accurately about 0.6 mg of colchicine ($C_{22}H_{25}NO_6$), add 50 mL of a mixture of methanol and water (1 : 1), and shake using a shaker for 15 minutes. Add a mixture of methanol and water (1 : 1) to make exactly 100 mL, and filter to use the filtrate as the test solution. (Prepare this solution immediately before use.) Separately, weigh accurately an appropriate amount of colchicine RS, previously dried at 105 °C for 3 hours, add a mixture of methanol and water (1 : 1) to make a solution containing 6 μg per mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of colchicine, in each solution.

Amount (mg) of colchicine ($C_{22}H_{25}NO_6$)
$$= 0.1\times C \times \frac{A_T}{A_S}$$

C: Concentration of the standard solution (μg/mL)

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm to 10 μm in particle diameter).

Mobile phase: Add water to 45 mL of 0.5 mol/L potassium dihydrogen phosphate solution to make 450 mL. Add 530 mL of methanol to this solution, mix, cool

to room temperature, and add methanol to make 1000 mL. Add 0.5 mol/L phosphoric acid to adjust pH to 5.5 ± 0.05.

Flow rate: 1 mL/min

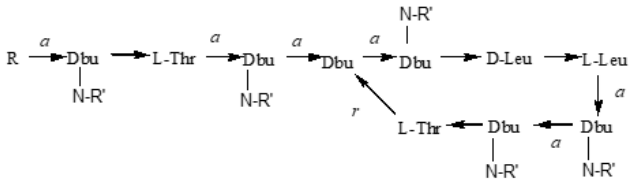
System suitability

System performance: Proceed with 20 µL of the standard solution under the above conditions; the retention time of colchicine is 5.5 to 9.5 minutes and the number of theoretical plates is NLT 4500.

System repeatability: Repeat the test 6 times according to the above conditions with 20 µL each of the standard solution; the relative standard deviation of the peak area is NMT 2.0%.

Packaging and storage Preserve in light-resistant, well-closed containers.

Colistin Sodium Methanesulfonate
콜리스틴메탄설포네이트나트륨



Colistin A: R = 6-methyloctanoic acid
R' = Sodium methanesulfonate
Colistin B: R = Methylheptanoic acid
R' = Sodium methanesulfonate
Dbu : L-α,γ-diaminobutyric acid
Thr : Threonine Leu : Leucine

$C_{58}H_{105}N_{16}Na_5O_{28}S_5$ (Colistin A) : 1749.82
$C_{57}H_{105}N_{16}Na_5O_{28}S_5$ (Colistin B) : 1735.80

Colistin A
Pentasodium [2-[(2*S*,5*R*,8*S*,11*S*,14*S*,17*S*,22*S*)-17-[(1*R*)-1-hydroxyethyl]-22-[[(2*S*)-2-[[(2*S*,3*R*)-3-hydroxy-2-[[(2*S*)-2-[[(6*R*)-6-methyloctanoyl]amino]-4-(sulfonatomethyl-amino)butanoyl]amino]butanoyl]amino]-4-(sulfonatomethylamino)butanoyl]amino]-5,8-*bis*(2-methylpropyl)-3,6,9,12,15,18,23-heptaoxo-11,14-*bis*[2-(sulfonatomethylamino)ethyl]-1,4,7,10,13,16,19-heptazacyclotricos-2-yl]ethylamino]methanesulfonate
Colistin B
Pentasodium [2-[(2*S*,5*R*,8*S*,11*S*,14*S*,17*S*,22*S*)-17-[(1*R*)-1-hydroxyethyl]-22-[[(2*S*)-2-[[(2*S*,3*R*)-3-hydroxy-2-[[(2*S*)-2-(6-methylheptanoylamino)-4-(sulfonatomethylamino)butanoyl]amino]butanoyl]amino]-4-(sulfonatomethyl-amino)butanoyl]amino]-5,8-*bis*(2-methylpropyl)-3,6,9,12,15,18,23-heptaoxo-11,14-*bis*[2-(sulfonatomethylamino)ethyl]-1,4,7,10,13,16,19-heptazacyclotricos-2-yl]ethylamino]methanesulfonate
[*8068-28-8*]

Colistin Sodium Methanesulfonate is a derivative sodium salt of colistin. Colistin Sodium Methanesulfonate is a mixture of colistin A sodium methanesulfonate and colistin B sodium methanesulfonate.

Colistin Sodium Methanesulfonate, when dried, contains NLT 11500 units per mg. However, the potency of Colistin Sodium Methanesulfonate indicates the amount of colistin A (R=6-methyloctanoic acid, R′=H, $C_{53}H_{100}N_{16}O_{13}$: 1169.46) in units.

Description Colistin Sodium Methanesulfonate occurs as a white to pale yellowish white powder. It is freely soluble in water and practically insoluble in ethanol(95).

Identification (1) Dissolve 20 mg of Colistin Sodium Methanesulfonate in 2 mL of water, add 0.5 mL of sodium hydroxide TS, shake to mix, and add 5 drops of copper(II) sulfate TS; the resulting solution exhibits a bluish purple color.

(2) Dissolve 40 mg of Colistin Sodium Methanesulfonate in 1 mL of 1 mol/L hydrochloric acid TS and add 0.5 mL of dilute iodine TS; the color of the iodine solution disappears.

(3) Determine the infrared spectra of Colistin Sodium Methanesulfonate and colistin sodium methanesulfonate RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(4) Colistin Sodium Methanesulfonate responds to the Qualitative Analysis (1) for sodium salt.

pH Dissolve 0.1 g of Colistin Sodium Methanesulfonate in 10 mL of water and allow to stand for 30 minutes; the pH of this solution is between 6.5 and 8.5.

Purity (1) ***Clarity and color of solution***—Dissolve 0.16 g of Colistin Sodium Methanesulfonate in 10 mL of water; the solution is clear and colorless.

(2) ***Heavy metals***—Proceed with 1.0 g of Colistin Sodium Methanesulfonate according to Method 4 and perform the test. Prepare the control solution with 3.0 mL of lead standard solution (NMT 30 ppm).

(3) ***Arsenic***—Proceed with 1.0 g of Colistin Sodium Methanesulfonate according to Method 4 and perform the test (NMT 2 ppm).

(4) ***Free colistin***—Dissolve 80 mg of Colistin Sodium Methanesulfonate in 3 mL of water, add 0.05 mL of silicon dioxide-tungstic acid hydrate (1 in 10) and immediately compare against the reference distillate of the test for pharmaceutical plastic containers; the turbidity of the solution is not more intense than that of the control solution (NMT 0.25%).

Loss on drying NMT 3.0% (0.1 g, in vacuum, 60 ℃, 3 hours).

Sterility It meets the requirements when used in a sterile preparation. However, it is excluded in cases where there is a terminal sterilization process in the manufacturing of sterile preparations.

Bacterial endotoxins It is less than 0.67 EU per 10000 units of colistin when used in the manufacturing of sterile preparations.

Assay Cylinder plate method (1) Test bacterium: Use *Escherichia coli* NIHJ or NCCP 14134 as the test bacterium.

(2) Medium: Weigh 10.0 g of peptone, 30.0 g of sodium chloride, 3.0 g of meat extract and 20.0 g of agar, add 1000 mL of water, then add sodium hydroxide TS to adjust pH to 6.5 to 6.6 after sterilization, and sterilize. Use this medium as the agar medium for the seed and base layer.

(3) Weigh accurately an appropriate amount of Dry Colistin Sodium Methanesulfonate, previously dried, dissolve in the phosphate buffer solution (pH 6.0) to obtain a solution containing about 100000 units per mL, and use this solution as the test stock solution. Take exactly an appropriate amount of the test stock solution, add 0.1 mol/L phosphate buffer solution (pH 6.0) to obtain solutions that contain 10000 units and 2500 units per mL, and use these solutions as the high concentration test solution and low concentration test solution, respectively. Separately dry colistin sodium methanesulfonate RS, weigh accurately an accurate amount, and dissolve in phosphate buffer solution (pH 6.0) to obtain a solution that contains 100,000 units per mL. Use this solution as the standard stock solution. Store the standard stock solution below 10 °C and use it within 7 days. For the Assay, pipet an appropriate amount of this standard stock solution and dilute with phosphate buffer solution (pH 6.0) to prepare solutions that contain 10000 units and 2500 units per mL, and use these solutions as the high-concentration standard solution and low-concentration standard solution, respectively. With these solutions, perform the test according to A) (8) under the Microbial Assays for Antibiotics.

Packaging and storage Preserve in tight containers.

Colistin Sodium Methanesulfonate for Injection
주사용 콜리스틴메탄설포네이트나트륨

Colistin Sodium Methanesulfonate for Injection is a preparation for injection, which is dissolved before use. It contains NLT 90.0% and NMT 120.0% of the labeled amount of colistin.

Method of preparation Prepare as directed under Injections, with Colistin Sodium Methanesulfonate.

Description Colistin Sodium Methanesulfonate for Injection occurs as a white to pale yellowish white powder.

Identification Perform the test as directed under the Identification of Colistin Sodium Methanesulfonate.

pH Dissolve 0.1 g of Colistin Sodium Methanesulfonate in 10 mL of water and allow to stand for 30 minutes; the pH of this solution is between 6.0 and 8.0.

Purity ***Heavy metals***—Proceed with 1.0 g of Colistin Sodium Methanesulfonate for Injection according to Method 2 and perform the test. Prepare the control solution with 3.0 mL of lead standard solution (NMT 30 ppm).

Loss on drying NMT 5.0% (0.1 g, 0.7 kPa, 60 ℃, 3 hours).

Sterility Meets the requirements.

Bacterial endotoxins Less than 0.67 EU per 10000 units of Colistin Sodium Methanesulfonate for Injection.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Perform the test as directed under the Assay of Colistin Sodium Methanesulfonate. However, weigh accurately an appropriate amount of Colistin Sodium Methanesulfonate for Injection, dilute with 1% phosphate buffer solution (pH 6.0) to prepare a solution containing 100000 units (potency) per mL. Pipet an appropriate amount of this solution, and dilute with 1% phosphate buffer solution (pH 6.0) to contain 10000 and 2500 units per mL, and use these solutions as the high-dose test solution and the low-dose test solution, respectively.

Packaging and storage Preserve in hermetic containers.

Compound Acetaminophen, Cyanocobalamin and Pyridoxine Hydrochloride Tablets
복방아세트아미노펜·시아노코발라민·피리독신염산염 정

Compound Acetaminophen, Cyanocobalamin and Pyridoxine Hydrochloride Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of acetaminophen ($C_8H_9NO_2$: 151.16), NLT 90.0% and NMT 150.0% of the labeled amount of cyanocobalamin ($C_{63}H_{88}CoN_{14}O_{14}P$: 1355.37), pyridoxine hydrochloride ($C_8H_{11}NO_3 \cdot HCl$: 205.64), and thiamine nitrate ($C_{12}H_{17}N_5O_4S$: 327.36).

Method of preparation Prepare as directed under Tablets, with Acetaminophen, Cyanocobalamin, Pyridoxine Hydrochloride, and Thiamine Nitrate.

Identification The major peaks obtained from the test solution and standard solution under the Assay are the same in the retention time.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay (1) ***Acetaminophen, pyridoxine hydrochloride, and thiamine nitrate—***Weigh accurately the mass of NLT 20 Compound Acetaminophen, Cyanocobalamin and Pyridoxine Hydrochloride Tablets, and powder. Weigh accurately an amount, equivalent to about 250 mg of acetaminophen ($C_8H_9NO_2$) [about 50 mg of pyridoxine hydrochloride ($C_8H_{11}NO_3$·HCl), about 25 mg of thiamine nitrate ($C_{12}H_{17}N_5O_4S$)], add methanol to make exactly 50 mL, sonicate for 20 minutes, and centrifuge for 5 minutes at 1000 rpm. Pipet 1 mL of the supernatant, evaporate to dryness, add water to make exactly 10 mL, and use this solution as the test solution. Separately, weigh accurately about 50 mg of acetaminophen RS, about 10 mg of pyridoxine hydrochloride RS, and 5 mg of thiamine nitrate RS, respectively, add water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to conditions from (2), and determine the peak areas of acetaminophen, pyridoxine hydrochloride, and thiamine nitrate, A_{T1}, A_{T2}, A_{T3}, A_{S1}, A_{S2}, and A_{S3}, in each solution.

$$\text{Amount (mg) of acetaminophen } (C_8H_9NO_2) = \text{Amount (mg) of acetaminophen RS} \times \frac{A_{T1}}{A_{S1}} \times 5$$

$$\text{Amount (mg) of pyridoxine hydrochloride } (C_8H_{11}NO_3\cdot HCl) = \text{Amount (mg) of pyridoxine hydrochloride RS} \times \frac{A_{T2}}{A_{S2}} \times 5$$

$$\text{Amount (mg) of thiamine nitrate } (C_{12}H_{17}N_5O_4S) = \text{Amount (mg) of thiamine nitrate RS} \times \frac{A_{T3}}{A_{S3}} \times 5$$

(2) ***Cyanocobalamin—***Weigh accurately the mass of NLT 20 Compound Acetaminophen, Cyanocobalamin and Pyridoxine Hydrochloride Tablets, and powder. Weigh accurately an amount, equivalent to about 2 mg of cyanocobalamin ($C_{63}H_{88}CoN_{14}O_{14}P$), add methanol to make exactly 20 mL, sonicate for 20 minutes, and centrifuge for 5 minutes at 1000 rpm. Pipet 1 mL of the supernatant, evaporate to dryness, add water to make exactly 10 mL, and use this solution as the test solution. Separately, weigh accurately about 10 mg of cyanocobalamin RS, and add water to make exactly 100 mL. Pipet 1 mL of this solution, add water to make exactly 10 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak area of cyanocobalamin, A_T and A_S, in each solution.

$$\text{Amount (mg) of cyanocobalamin } (C_{63}H_{88}CoN_{14}O_{14}P) = \text{Amount (mg) of cyanocobalamin RS} \times \frac{A_T}{A_S} \times \frac{1}{5}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 275 nm, but 210 nm for cyanocobalamin).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: Control the gradient by mixing the mobile phases A and B as directed under the following table.

Mobile phase A: Dissolve 0.25 mL of trifluoroacetic acid in 1000 mL of water, and adjust the pH to 2.6 with ammonium acetate.

Mobile phase B: Methanol

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0.0 - 5.0	100	0
5.0 - 11.0	100 → 75	0 → 25
11.0 - 19.0	75 → 60	25 → 40
19.0 - 19.1	60 → 100	40 → 0
19.1 - 30.0	100	0

Flow rate: 1.0 mL/min

System suitability

System performance: Proceed with 20 μL of the standard solution from (1) according to the above conditions; thiamine nitrate, pyridoxine hydrochloride, and acetaminophen peaks are eluted in this order with the resolution between the thiamine nitrate peak and the pyridoxine hydrochloride peak being NLT 10.0.

System repeatability: Repeat the test 6 times with 20 μL of the standard solutions from (2) according to the above conditions; the relative standard deviation of the peak area of cyanocobalamin is NMT 1.0%.

Packaging and storage Preserve in well-closed containers.

Compound Acetaminophen, Ethenzamide and Chlorpheniramine Maleate Tablets
복방아세트아미노펜·에텐자미드·클로르페니라민말레산염 정

Compound Acetaminophen, Ethenzamide and Chlorpheniramine Maleate Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of acetaminophen ($C_8H_9NO_2$: 151.16), ethenzamide ($C_9H_{11}NO_2$: 165.19), anhydrous caffeine ($C_8H_{10}N_4O_2$: 194.19), and chlorpheniramine maleate ($C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$: 390.86).

Method of preparation Prepare as directed under Tablets, with Acetaminophen, Ethenzamide, Anhydrous Caffeine, and Chlorpheniramine Maleate.

Identification (1) The major peaks of the test solution and the standard solution obtained under the Assay are the same in the retention time.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 tables of Compound Acetaminophen, Ethenzamide and Chlorpheniramine Maleate Tablets, and powder. Weigh accurately an amount equivalent to about 100 mg of acetaminophen ($C_8H_9NO_2$) [about 50 mg of ethenzamide ($C_9H_{11}NO_2$), about 15 mg of anhydrous caffeine ($C_8H_{10}N_4O_2$), about 1 mg of chlorpheniramine maleate ($C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$)], add methanol to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 100 mg of acetaminophen RS, about 50 mg of ethenzamide RS, and about 15 mg of anhydrous caffeine RS, and transfer into the 100-mL volumetric flask. Separately, add about 10 mg of chlorpheniramine maleate RS in methanol to make exactly 10 mL, pipet 1 mL of this solution, transfer into the same 100-mL volumetric flask, add methanol to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas of acetaminophen, ethenzamide, anhydrous caffeine, and chlorpheniramine maleate, A_{T1}, A_{T2}, A_{T3}, A_{T4}, A_{S1}, A_{S2}, A_{S3}, and A_{S4}, of each solution.

Amount (mg) of acetaminophen ($C_8H_9NO_2$)
= Amount (mg) of acetaminophen RS $\times \frac{A_{T1}}{A_{S1}}$

Amount (mg) of ethenzamide ($C_9H_{11}NO_2$)
= Amount (mg) of ethenzamide RS $\times \frac{A_{T2}}{A_{S2}}$

Amount (mg) of anhydrous caffeine ($C_8H_{10}N_4O_2$)
= Amount (mg) of anhydrous caffeine RS $\times \frac{A_{T3}}{A_{S3}}$

Amount (mg) of chlorpheniramine maleate ($C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$)
= Amount (mg) of chlorpheniramine maleate RS $\times \frac{A_{T4}}{A_{S4}} \times \frac{1}{10}$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: Use mobile phases A and B to control a stepwise or gradient elution-wise as follows.

Mobile phase A: Dissolve 1.361 g of potassium dihydrogen phosphate in 1000 mL of water, and add phosphoric acid or potassium hydroxide to adjust the pH to 3.0.

Mobile phase B: Methanol

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0.0 - 7.0	90 → 85	10 → 15
7.0 - 15.0	85 → 75	15 → 25
15.0 - 32.0	75 → 50	25 → 50
32.0 - 40.0	50 → 40	50 → 60
40.0 - 40.1	40 → 90	60 → 10
40.1 - 50.0	90	10

Flow rate: 1.0 mL/min

System suitability

System performance: Proceed with 20 μL of the standard solution according to the above conditions; the anhydrous caffeine, acetaminophen, chlorpheniramine maleate, and ethenzamide peaks are eluted in this order with the resolution between the chlorpheniramine maleate peak and the ethenzamide peak being NLT 10.7.

System repeatability: Repeat the test 6 times with 20 μL each of the standard solutions under the above conditions; the relative standard deviation of the peak area of chlorpheniramine maleate is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Compound Dried Aluminum Hydroxide Gel and Sodium Bicarbonate Tablets
복방건조수산화알루미늄겔·탄산수소나트륨 정

Compound Dried Aluminum Hydroxide Gel and Sodium Bicarbonate Tablets contain NLT 47.0% of aluminum oxide (Al_2O_3: 101.96) for the labeled amount of dried aluminum hydroxide gel, NLT 38.0% and NMT 46.0% of magnesium oxide (MgO: 40.30) for magnesium carbonate, and NLT 90.0% and NMT 110.0% of the labeled amount of sodium bicarbonate ($NaHCO_3$: 84.01) and precipitated calcium carbonate ($CaCO_3$: 100.09).

Method of preparation Prepare as directed under Tablets, with Dried Aluminum Hydroxide Gel, Magnesium Carbonate, Sodium Bicarbonate, and Precipitated Calcium Carbonate.

Identification (1) ***Dried aluminum hydroxide gel***—Weigh 1 g of Compound Dried Aluminum Hydroxide Gel and Sodium Bicarbonate Tablets, previously powdered, and carbonize. After cooling, add 30 mL of dilute hydrochloric acid to the residue, warm on a steam bath for 10 minutes, add water to make 50 mL, and filter. To the filtrate, add 1 drop of methyl orange TS, and slowly add ammonia TS until the color of the solution changes to yellow. A precipitate formed by warming on a steam bath responds to the Qualitative Analysis (1) and (4) for aluminum salt.

(2) ***Magnesium carbonate***—Warm the filtrate from (1) on a steam bath, add 5 mL of saturated ammonium hydroxide TS, and allow to stand on a steam bath for 1 hour to complete the precipitation. Filter when warm, and wash with warm water. Combine the washings with the filtrate. This solution responds to the Qualitative Analysis for magnesium salt.

(3) ***Precipitated calcium carbonate—***A precipitate from (2) responds to the Qualitative Analysis (3) for calcium salt.

(4) ***Sodium bicarbonate***—Weigh 1 g of Compound Dried Aluminum Hydroxide Gel and Sodium Bicarbonate Tablets, previously powdered, add 30 mL of water, dissolve at between 30 and 40 ℃, and filter. The filtrate responds to the Qualitative Analysis for sodium salt and hydrogen carbonate.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay (1) ***Dried aluminum hydroxide gel***—Weigh accurately the mass of NLT 20 Compound Dried Aluminum Hydroxide Gel and Sodium Bicarbonate Tablets, and powder. Weigh accurately an amount equivalent to about 0.5 g of dried aluminum hydroxide gel, and carbonize. After cooling, add 30 mL of dilute hydrochloric acid to the residue, and warm on a steam bath for 10 minutes. After cooling, add water to make 100 mL. Filter and use the filtrate as the test solution. Take 10 mL of the test solution, add 30.0 mL of 0.05 mol/L ethylenediaminetetraacetic acid disodium salt solution, add 20 mL of pH 4.8 acetic acid-ammonium acetate buffer solution, and then boil for 5 minutes. After cooling, add 55 mL of ethanol, and titrate with 0.05 mol/L zinc acetate VS (indicator: 2 mL of dithizone TS). However, the endpoint of the titration is when the pale dark green color of the solution changes to pale red. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS
= 2.5490 mg of Al_2O_3

(2) ***Magnesium carbonate***—Take 50.0 mL of the test solution from (1), add 1 drop of methyl orange TS and 2 g of ammonium chloride, and slowly add ammonia TS until the color of the solution changes to yellow. Warm on a steam bath, filter, and wash with water. Combine the filtrate and the washings, warm on a steam bath, add 5 mL of hot saturated ammonium hydroxide TS, and allow to stand on a steam bath for 1 hour to complete the precipitation. Filter when warm, add barium chloride TS to the washings, and wash with warm water until no white precipitate forms (the formed precipitation is used to quantify the precipitated calcium carbonate). To the filtrate and the washings, add 3 mL triethanolamine, 2 mL of potassium cyanide TS (5 in 100), and 10 mL of pH 10.7 ammonia-ammonium chloride buffer solution, and titrate with 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS (indicator: 40 mg of eryochrome black T-sodium chloride indicator). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS
= 2.0152 mg of MgO

(3) ***Precipitated calcium carbonate—***Dissolve the precipitate from (2) in 50 mL of dilute sulfuric acid, warm at between 60 and 80 ℃, and titrate with 0.1 mol/L potassium permanganate VS. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.02 mol/L potassium permanganate VS
= 5.005 mg of $CaCO_3$

(4) ***Sodium bicarbonate—***Weigh accurately the mass of NLT 20 Compound Dried Aluminum Hydroxide Gel and Sodium Bicarbonate Tablets, and powder. Weigh accurately an amount equivalent to about 0.1 g of sodium bicarbonate, add 50 mL of water, warm at between 35 and 40 ℃, and shake to mix for 10 minutes to dissolve. Filter the solution, wash 3 times each with 20 mL of water. Combine the filtrate and the washings, and titrate with 0.05 mol/L sulfuric acid VS (potentiometric titration

under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.05 mol/L sulfuric acid VS
= 8.401 of $NaHCO_3$

Packaging and storage Preserve in well-closed containers.

Compound Ascorbic Acid, Lysozyme Hydrochloride and Carbazochrome Capsules
복방아스코르브산·리소짐염산염·카르바조크롬 캡슐

Compound Ascorbic Acid, Lysozyme Hydrochloride and Carbazochrome Capsules contain NLT 90.0% and NMT 130.0% of lysozyme hydrochloride, NLT 90.0% and NMT 150.0% of ascorbic acid ($C_6H_8O_6$: 176.12) and tocopherol calcium succinate ($C_{66}H_{106}CaO_{10}$: 1099.62), NLT 90.0% and NMT 110.0% of carbazochrome ($C_{10}H_{12}N_4O_3$: 236.23), respectively, according to the labeled amount.

Method of preparation Prepare as directed under Capsules, with Ascorbic Acid, Lysozyme Hydrochloride, Carbazochrome and Tocopherol Calcium Succinate.

Identification (1) ***Lysozyme hydrochloride*—**Weigh an amount of Compound Ascorbic Acid, Lysozyme Hydrochloride and Carbazochrome Capsules, equivalent to about 50 mg of lysozyme hydrochloride, add 5 mL of 0.4 mol/L sodium chloride solution, shake enough to mix, and then centrifuge. Take the clear supernatant, add 5 mL of acetic acid-sodium acetate buffer solution, pH 5.4, and shake to mix. To 5 mL of this solution, add 1 mL of ninhydrin TS, and then heat; the resulting solution exhibits a reddish purple color.

(2) ***Carbazochrome*—**The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

(3) ***Tocopherol calcium succinate and ascorbic acid*—**Perform the test with Compound Ascorbic Acid, Lysozyme Hydrochloride and Carbazochrome Capsules as directed under the Analysis for Vitamins.

Disintegration Meets the requirements.

Uniformity of dosage units Meet requirements.

Assay (1) ***Ascorbic acid, lysozyme hydrochloride and carbazochrome*—**Weigh accurately the mass of NLT 20 capsules of Compound Ascorbic Acid, Lysozyme Hydrochloride and Carbazochrome Capsules. Weigh accurately an amount of Compound Ascorbic Acid, Lysozyme Hydrochloride and Carbazochrome Capsules, equivalent to about 75 mg of ascorbic acid ($C_6H_8O_6$), about 15 mg of lysozyme hydrochloride and about 1 mg of carbazochrome ($C_{10}H_{12}N_4O_3$), add 0.1% trifluoroacetic acid solution to make exactly 200 mL, sonicate for 30 minutes, and filter through a membrane filter with a pore size of NMT 0.45 μm. Use this solution as the test solution. Separately, weigh accurately about 75 mg of ascorbic acid RS, about 15 mg of lysozyme hydrochloride RS and about 1 mg of carbazochrome RS, add 0.1% trifluoroacetic acid solution to make exactly 200 mL, sonicate for 30 minutes, and filter through a membrane filter with a pore size of NMT 0.45 μm. Use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_{T1}, A_{T2}, A_{T3}, A_{S1}, A_{S2}, and A_{S3}, of ascorbic acid, lysozyme hydrochloride and carbazochrome in each solution.

$$\text{Amount (mg) of ascorbic acid } (C_6H_8O_6) = \text{Amount (mg) of ascorbic acid RS} \times \frac{A_{T1}}{A_{S1}}$$

$$\text{Amount (mg) of lysozyme hydrochloride} = \text{Amount (mg) of lysozyme hydrochloride RS} \times \frac{A_{T2}}{A_{S2}}$$

$$\text{Amount (mg) of carbazochrome } (C_{10}H_{12}N_4O_3) = \text{Amount (mg) of carbazochrome RS} \times \frac{A_{T3}}{A_{S3}}$$

Operating conditions

Detector: An ultraviolet absorption spectrophotometer (wavelength: 220 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 30 °C.

Mobile phase: Control the mixing ratio of mobile phase A and mobile phase B stepwise or via the gradient elution as follows.

Mobile phase A: 0.1% trifluoroacetic acid solution

Mobile phase B: To 1000 mL of acetonitrile, add 1 mL of trifluoroacetic acid.

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0.0	100	0
0.0 - 2.0	100 → 95	0→ 5
2.0 - 7.0	95 → 50	5 → 50
7.0 - 15.0	50	50

Flow rate: 1.0 mL/min

System suitability

System performance: Proceed with 10 μL of the

standard solution according to the above conditions; ascorbic acid, carbazochrome and lysozyme hydrochloride are eluted in this order with the resolution between the carbazochrome peak and the lysozyme hydrochloride peak being NLT 8.0.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak areas of ascorbic acid, carbazochrome and lysozyme hydrochloride is NMT 1.0%

(2) ***Tocopherol calcium succinate*—**Weigh accurately the mass of NLT 20 capsules of Compound Ascorbic Acid, Lysozyme Hydrochloride and Carbazochrome Capsules. Weigh accurately an amount of Compound Ascorbic Acid, Lysozyme Hydrochloride and Carbazochrome Capsules, equivalent to about 17 mg of tocopherol calcium succinate ($C_{66}H_{106}CaO_{10}$), add a mixture of anhydrous ethanol and diluted acetic acid(100) (1 in 5) (9 : 1) to make exactly 50 mL, and use this solution as the test solution. Separately, weigh accurately an amount equivalent to about 17 mg of tocopherol calcium succinate RS, add a mixture of anhydrous ethanol and diluted acetic acid(100) (1 in 5) (9 : 1) to make exactly 50 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of tocopherol succinate in each solution.

Amount (mg) tocopherol calcium succinate ($C_{66}H_{106}CaO_{10}$)
= Amount (mg) of tocopherol calcium succinate RS
$\times \frac{A_T}{A_S} \times 1.0358$

Operating conditions

Detector: An ultraviolet absorption spectrophotometer (wavelength: 284 nm).

Column: A stainless steel column about 4.0 mm in internal diameter and about 15 cm to 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm to 10 μm in particle diameter).

Column temperature: Room temperature

Mobile phase: A mixture of methanol, water and acetic acid(100) (97 : 2 : 1).

Flow rate: Adjust the flow rate so that the retention time of tocopherol succinate is about 8 minutes.

System suitability

System performance: Weigh 17 mg each of tocopherol calcium succinate and tocopherol, and dissolve in a mixture of anhydrous ethanol and diluted acetic acid(100) (1 in 5) (9 : 1) to make 50 mL. Proceed with 20 μL of this solution under the above operating conditions; tocopherol succinate and tocopherol are eluted in this order with the resolution being 2.0.

System repeatability: Repeat the test 6 times with 20 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak areas of tocopherol succinate is NMT 0.8%.

Packaging and storage Preserve in tight containers.

Compound Berberine Tannate, Bismuth Subnitrate and Ursodeoxycholic Acid Capsules
복방베르베린탄닌산염·비스무트차질산염·우르소데옥시콜산 캡슐

Compound Berberine Tannate, Bismuth Subnitrate and Ursodeoxycholic Acid Capsules contain NLT 90.0% and NMT 110.0% of the labeled amounts of berberine ($C_{20}H_{19}NO_5$: 357.37) in berberine tannate, bismuth (Bi : 208.98) in bismuth subnitrate and ursodeoxycholic acid ($C_{24}H_{40}O_4$: 392.57), and NLT 90.0% and NMT 130.0% of the labeled amounts of scopolia extract acid (total alkaloid [hyoscyamine ($C_{17}H_{23}NO_3$: 289.37) and scopolamine ($C_{17}H_{21}NO_4$: 303.35)]).

Method of preparation Prepare as directed under Capsules, with Berberine Tannate, Bismuth Subnitrate, Ursodeoxycholic Acid, and Scopolia Extract Acid.

Identification (1) ***Berberine tannate***—The retention time of major peak of the test solution correspond to that of the standard solution, as obtained in the Assay.

(2) ***Bismuth subnitrate***—Compound Berberine Tannate, Bismuth Subnitrate and Ursodeoxycholic Acid Capsules respond to the Qualitative Analysis for bismuth salt and nitrate.

(3) ***Ursodeoxycholic acid***—The retention time of major peak of the test solution correspond to that of the standard solution, as obtained in the Assay.

(4) ***Scopolia extract acid*—**(i) Put 2.0 g of the contents of Compound Berberine Tannate, Bismuth Subnitrate and Ursodeoxycholic Acid Capsules in a stoppered centrifuge tube, add 30 mL of ammonia TS, sonicate for 5 minutes, and centrifuge the filtrate. Put the clear supernatant in a separatory funnel, add 40 mL of ethyl acetate, shake and mix, and take the ethyl acetate layer separately. Add 3 g of anhydrous sodium sulfate, shake to mix, and filter after the ethyl acetate layer becomes clear. Evaporate ethyl acetate in vacuum, dissolve the residue in 1 mL of ethanol, and use this solution as the test solution. Separately, dissolve 2 mg of atropine sulfate hydrate RS and 1 mg of scopolamine hydrobromide hydrate RS each in 1 mL of ethanol, and use these solutions as the standard solution (1) and the standard solution (2), respectively. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of acetone, water and

strong ammonia water (90 : 7 : 3) as the developing solvent to a distance of about 10 cm, and dry the plate at 80 ºC for 10 minutes. After cooling, spray evenly Dragendorff's TS for spray on the plate the Rf values and colors of the two principal spots of the test solution correspond to those of the standard solution.

(ii) The retention time of major peak of the test solution correspond to that of the standard solution, as obtained in the Assay.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay (1) ***Berberine***—Weigh accurately the contents of NLT 20 capsules of Compound Berberine Tannate, Bismuth Subnitrate and Ursodeoxycholic Acid Capsules. Weigh accurately an amount equivalent to about 50 mg of berberine ($C_{20}H_{19}NO_5$), add 2 mL of 1 mol/L hydrochloric acid and 50 mL of methanol, and sonicate to extract for 30 minutes to make 100 mL. Filter to take 2 mL of the filtrate, add methanol to make 50 mL, and use this solution as the test solution. Separately, weigh accurately 50 mg of berberine chloride hydrate RS (measure the water in advance), dissolve in 2 mL of 1 mol/L hydrochloric acid, and add methanol to make 100 mL. Pipet 2 mL of this solution, add methanol to make 50 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of berberine in each solution.

Amount (mg) of berberine ($C_{20}H_{19}NO_5$)
= Amount (mg) of berberine chloride RS, calculated on the anhydrous basis$\times \frac{A_T}{A_S} \times 0.9504$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 280 nm).

Column: A stainless steel column about 3.9 mm in internal diameter and about 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm to 10 μm in particle diameter).

Mobile phase: A mixture of 0.01 mol/L phosphoric acid and acetonitrile (620 : 380).

Flow rate: 1.3 mL/min

(2) ***Bismuth subnitrate***—Weigh accurately the contents of NLT 20 capsules of Compound Berberine Tannate, Bismuth Subnitrate and Ursodeoxycholic Acid Capsules. Weigh accurately the amount equivalent to about 0.2 g of bismuth subnitrate, add 25 mL of nitric acid (2 in 5), warm and shake to dissolve, and add water to make 100 mL. Pipet 50 mL of this solution, add 200 mL of water, and titrate with 0.02 mol/L ethylenediaminetetraacetic acid disodium salt VS (indicator: 1 mL of xylenol orange TS). However, the endpoint of the titration when the color of the solution changes from reddish purple to yellow. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.02 mol/L ethylenediaminetetraacetic acid disodium salt VS
= 4.180 mg of Bi

(3) ***Ursodeoxycholic acid***—Weigh accurately the contents of NLT 20 capsules of Compound Berberine Tannate, Bismuth Subnitrate and Ursodeoxycholic Acid Capsules. Weigh accurately an amount equivalent to about 10 mg of ursodeoxycholic acid ($C_{24}H_{40}O_4$), add methanol, sonicate to extract for 30 minutes and make 50 mL, and use the filtrate as the test solution. Separately, weigh accurately about 10 mg of ursodeoxycholic acid RS, add methanol to make 50 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of ursodeoxycholic acid in each solution.

Amount (mg) of ursodeoxycholic acid ($C_{24}H_{40}O_4$)
= Amount (mg) of ursodeoxycholic acid RS$\times \frac{A_T}{A_S}$

Operating conditions

Detector: A differential refractometer

Column: A stainless steel column about 3.9 mm in internal diameter and about 150 mm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μ*m* to 10 μm in particle diameter).

Mobile phase: A mixture of water, acetonitrile and acetic acid (60 : 40 : 1).

Flow rate: 1.0 mL/min

(4) ***Scopolia extract acid***—Weigh accurately the mass of contents of NLT 20 capsules of Compound Berberine Tannate, Bismuth Subnitrate and Ursodeoxycholic Acid Capsules. Weigh accurately an amount equivalent to about 0.1 g of scopolia extract acid, put in a glass-stoppered centrifuge tube, add 15 mL of ammonia TS, and shake to mix. To the mixture, add 25 mL of ether, stopper, shake for 15 minutes, and take the ether layer separately. Repeat this procedure 3 times for the water layer with 25 mL of ether. Combine all the extracts and evaporate ether on a steam bath. Dissolve the residue in the mobile phase to make 25 mL, and use this solution as the test solution. Separately, weigh accurately 25 mg of hiyoscyamine RS and 25 mg of scopolamine hydrobromide hydrate RS, add the mobile phase to make 25 mL, and use this solution as the standard solution. Perform the test with the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions to calculate the peak areas A_{T1} $A_{T2,}$ A_{S1} and A_{S2} for hiyoscyamine and scopolamine hydrobromide in each solution.

Amount (mg) of hiyoscyamine ($C_{17}H_{23}NO_3$)
= Amount (mg) of hiyoscyamine RS× $\frac{A_{T1}}{A_{S1}} \times \frac{1}{5}$

Amount (mg) of scopolamine ($C_{17}H_{21}NO_4$)
= Amount (mg) of scopolamine hydrobromide hydrate RS× $\frac{A_{T2}}{A_{S2}} \times \frac{1}{5} \times 0.789$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 210 nm).

Column: A stainless steel column about 3.9 mm in internal diameter and about 150 mm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μ*m* to 10 μm in particle diameter).

Mobile phase: A mixture of acetonitrile and a solution prepared by dissolving 6.8 g of potassium dihydrogen phosphate in 900 mL of water, adding 10 mL of triethylamine, adjusting the pH to 3.5 with phosphoric acid, and adding water to make 1000 mL (9 : 1).

Flow rate: 1.0 mL/min

Packaging and storage Preserve in well-closed containers.

Compound Bilberry Fruit Dried Extract, Aceglutamide and DL-Phosphoserine Capsules
복방빌베리건조엑스·아세글루타미드·DL-포스포세린 캡슐

Compound Bilberry Fruit Dried Extract, Aceglutamide and DL-Phosphoserine Capsules contain NLT 90.0% of the labeled amount of total anthocyanosides in bilberry fruit dried extract and NLT 90.0% and NMT 130.0% of the labeled amounts of aceglutamid ($C_7H_{12}N_2O_4$: 188.18), cobamamide ($C_{72}H_{100}CoN_{18}O_{17}P$: 1579.58) and Dl-phosphoserine ($C_3H_8NO_6P$: 185.07).

Method of preparation Prepare as directed under Capsules, with Bilberry Fruit Dried Extract, Aceglutamid, Cobamamide and DL-Phosphoserine.

Identification (1) ***Bilberry fruit dried extract***—Weigh an amount of Compound Bilberry Fruit Dried Extract, Aceglutamide and DL-Phosphoserine Capsules equivalent to about 0.1 g of bilberry fruit dried extract according to the labeled amount, add 25 mL of a mixture of methanol, hydrochloric acid, and water (80 : 15 : 5), heat on a steam bath for 3 hours with a reflux condenser, and centrifuge. Warm on a steam bath to evaporate the clear supernatant, dissolve the residue in 5 mL of anhydrous ethanol, and use this solution as the test solution. Separately, weigh about 0.1 g of Bilberry Fruit Dried Extract, proceed in the same manner with the test solution, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on a plate made of cellulose MN_{300}. Develop the plate with a mixture of water, acetic acid(100) and hydrochloric acid (82 : 15 : 3) as the developing solvent, and air-dry the plate. Develop the plate again with 60% acetic acid as the developing solvent, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 365 nm); the colors and R_f values of the several spots obtained from the test solution and the spots from the standard solution are the same.

(2) ***Aceglutamide***—Dissolve 1 capsule of Compound Bilberry Fruit Dried Extract, Aceglutamide and DL-Phosphoserine Capsule in water to make 100 mL to filter, and use the filtrate as the test solution. Separately, weigh about 10 mg of aceglutamide RS in 10 mL of water, and use the solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on a plate made of cellulose MN_{300}. Develop the plate with the mixture of 1-butanol, acetone, water and diethylamine (45 : 45 : 22.5 : 9) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Spray evenly 0.2% ninhydrin-ethanol solution evenly on the plate; the R_f values and colors of the spots obtained from the test solution and the standard solution are the same.

(3) ***Cobamamide***—Dissolve the contents of 1 capsule of Compound Bilberry Fruit Dried Extract, Aceglutamide and DL-Phosphoserine Capsule in 2 mL of water to centrifuge, and use the clear supernatant as the test solution. Separately, add cobamamide RS to water to contain 500 μg per mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of 0.07 mol/L potassium dihydrogen phosphate solution, 1-butanol, acetic acid(100), and methanol (36 : 36 : 18 : 10) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Examine the plate under ultraviolet light; the R_f values and colors of the spots from the test solution and the standard solution are the same.

(4) ***DL-phosphoserine***—Dissolve the contents of 1 Compound Bilberry Fruit Dried Extract, Aceglutamide and DL-Phosphoserine Capsule in 50 mL of water to filter, and use the filtrate as the test solution. Separately, weigh about 50 mg of DL-phosphoserine RS, dissolve in 50 mL of water, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of 1-propanol and strong ammonia water (7 : 3) as a developing solvent to a distance of

about 10 cm, and air-dry the plate. Examine the plate under ultraviolet light; the R_f values and colors of the spots from the test solution and the standard solution are the same.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay (1) ***Total anthocyanosides in bilberry fruit dried extract***—Weigh accurately the contents of NLT 20 capsules of Compound Bilberry Fruit Dried Extract, Aceglutamide and DL-Phosphoserine Capsules. Weigh accurately an amount of Compound Bilberry Fruit Dried Extract, Aceglutamide and DL-Phosphoserine Capsules equivalent to about 20 mg of bilberry fruit dried extract according to the labeled amount, and dissolve in a mixture of anhydrous ethanol and 1.5 mol/L hydrochloric acid (17 : 3) to make 200 mL. Take 5 mL of this solution, add a mixture of anhydrous ethanol and 1.5 mol/L hydrochloric acid (17 : 3) to make 50 mL, and filter. Discard about 20 mL of the first filtrate, and use the next filtrate as the test solution. Separately, weigh accurately about 20 mg of bilberry fruit dried extract with a known content of anthocyanidin, proceed in the same manner with the test solution, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at the wavelength of 541 nm as directed under the Ultraviolet-visible Spectroscopy.

Amount (mg) of total anthocyanosides in bilberry fruit dried extract
= Amount (mg) of anthocyanidin RS$\times \frac{A_T}{A_S} \times 1.475$

(2) ***Cobamamide***—Weigh accurately the contents of NLT 20 capsules of Compound Bilberry Fruit Dried Extract, Aceglutamide and DL-Phosphoserine Capsules. Weigh accurately the amount of Compound Bilberry Fruit Dried Extract, Aceglutamide and DL-Phosphoserine Capsules equivalent to about 5 mg of cobamamide ($C_{72}H_{100}CoN_{18}O_{17}P$) according to the labeled amount, add water to make 50 mL, and filter. Then, put 10 mL of the filtrate in an ion exchange resin column, and elute it. Wash the column with 100 mL of water and 1 mol/L hydrochloric acid until no absorbance is detected at 240 to 370 nm, then add a mixture of 1 mol/L hydrochloric acid, water, and tetrahydrofuran (60 : 30 : 10) to the column, and elute it. The red band of cobamamide reaches the bottom of the column; connect a 50-mL volumetric flask to the outlet to receive the dissolved solution. Elute until the effluent exhibits no red color, then evaporate the tetrahydrofuran by heating on a steam bath, add water to make 50 mL, and use this solution as the test solution. Separately, weigh accurately about 50 mg of cobamamide RS, and dissolve in water to make 100 mL. Take 10.0 mL of this solution, add water to make 50 mL, and take 10 mL of this solution to place in an ion exchange resin column. Proceed in the same manner with the test solution below, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at the wavelength of 525 nm as directed under the Ultraviolet-visible Spectroscopy.

Amount (mg) of cobamamide ($C_{72}H_{100}CoN_{18}O_{17}P$)
= Amount (mg) of cobamamide RS$\times \frac{A_T}{A_S} \times \frac{1}{10}$

(3) ***Aceglutamid and DL-Phosphoserine—***Weigh accurately the contents of NLT 20 capsules of Compound Bilberry Fruit Dried Extract, Aceglutamide and DL-Phosphoserine Capsules, and perform the test as directed under the Identification and Assay for Amino Acids.

Packaging and storage Preserve in well-closed containers.

Compound Bilberry Fruit Dried Extract 3.0%, Riboflavin Sodium Phosphate and Retinol Palmitate Capsules
복방빌베리건조엑스3.0%·리보플라빈포스페이트나트륨·레티놀팔미테이트 캡슐

Compound Bilberry Fruit Dried Extract 3.0%, Riboflavin Sodium Phosphate and Retinol Palmitate Capsules contain NLT 90.0% and NMT 150.0% of the labeled amount of retinol palmitate ($C_{36}H_{60}O_2$: 524.86), NLT 90.0% and NMT 130.0% of the labeled amount of riboflavin sodium phosphate ($C_{17}H_{20}N_4NaO_9P$: 478.33), NLT 90.0% of bilberry fruit dried extract 3.0% and total anthocyanosides in bilberry fruit dried powder.

Method of preparation Prepare as directed under Capsules, with Bilberry Fruit Dried Extract 3.0%, Bilberry Fruit Dried powder, Riboflavin Sodium Phosphate and Retinol Palmitate.

Identification (1) ***Retinol palmitate and riboflavin sodium phosphate***—Perform the test under the Analysis for Vitamins.

(2) ***Bilberry fruit dried powder and bilberry fruit dried extract 3.0%***—Wash the contents of 5 capsules of Compound Bilberry Fruit Dried Extract 3.0%, Riboflavin Sodium Phosphate and Retinol Palmitate Capsules twice with 20 mL each of chloroform, then add the residue to 25 mL of a mixture of methanol, hydrochloric acid, and water (80 : 15 : 5), heat for 1 hour in a reflux condenser, and filter. Evaporate the filtrate to dryness on a steam bath, dissolve the residue in 5 mL of anhydrous ethanol, and warm it slightly. Use the filtrate as the test solution if necessary. Separately, weigh 0.1 g of Bilberry Fruit Dried Extract 3.0% and 0.2 g of Bilberry Fruit Dried Powder, proceed in the same manner as in the test solution, and

use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on a thin-layer chromatographic plate made of cellulose Mn_{300} with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of water, acetic acid(100) and hydrochloric acid (82 : 15 : 3) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Develop the plate again with 60% acetic acid as the secondary developing solvent to a distance of about 10 cm, and air-dry the plate; the colors and R_f values of the several spots obtained from the test solution and the spots from the standard solution are the same.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay (1) ***Retinol palmitate and riboflavin sodium phosphate—***Weigh accurately the contents of NLT 20 capsules of Compound Bilberry Fruit Dried Extract 3.0%, Riboflavin Sodium Phosphate and Retinol Palmitate Capsules, and perform the test as directed under the Analysis for Vitamins.

(2) ***Bilberry fruit dried extract 3.0% and total anthocyanosides in bilberry fruit dried powder—***Weigh accurately The mass of content of NLT 20 capsules of Compound Bilberry Fruit Dried Extract 3.0%, Riboflavin Sodium Phosphate and Retinol Palmitate Capsules. Weigh accurately an amount equivalent to about 20 mg of anthocyanosides, add a mixture of anhydrous ethanol and 1.5 mol/L hydrochloric acid (17 : 3) to make 50 mL, and shake to mix. Then, filter, discard the first 20 mL, and use the filtrate as the test solution. Separately, weigh accurately Bilberry Fruit Dried Extract 3.0% equivalent to about 20 mg of anthocyanosides, and add a mixture of anhydrous ethanol and 1.5 mol/L hydrochloric acid (17 : 3) to make 200 mL. Take 5 mL of this solution, add a mixture of anhydrous ethanol and 1.5 mol/L hydrochloric acid (17 : 3) to make 50 mL, and use this solution as the standard solution. Determine the absorbances, A_S and A_T, of the test solution and the standard solution, respectively, at the wavelength of 535 nm as directed under the Ultraviolet-visible Spectroscopy.

$$\text{Amount (mg) of anthocyanosides} = \text{Amount (mg) of anthocyanosides RS} \times \frac{A_T}{A_S}$$

Packaging and storage Preserve in well-closed containers.

Compound DL-Carnitine Hydrochloride, Cyanocobalamin and L-Lysine Hydrochloride Tablets

복방DL-카르니틴염산염·시아노코발라민·L-리신염산염 정

Compound DL-Carnitine Hydrochloride, Cyanocobalamin and L-Lysine Hydrochloride Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of cyproheptadine orotate hydrate ($C_{26}H_{25}N_3O_4 \cdot H_2O$: 461.51), NLT 90.0% and NMT 130.0% of L-lysine hydrochloride ($C_6H_{14}N_2O_2 \cdot HCl$: 182.65), and NLT 90.0% and NMT 150.0% of cyanocobalamin ($C_{63}H_{88}CoN_{14}O_{14}P$: 1355.37) and DL-carnitine hydrochloride ($C_7H_{16}NO_3Cl$: 197.66).

Method of preparation Prepare as directed under Tablets, with DL-Carnitine Hydrochloride, Cyanocobalamin, L-Lysine Hydrochloride, and Cyproheptadine Orotate Hydrate.

Identification (1) ***Cyproheptadine orotate hydrate—***Weigh an amount of Compound DL-Carnitine Hydrochloride, Cyanocobalamin and L-Lysine Hydrochloride Tablets equivalent to 25 mg of cyproheptadine orotate hydrate according to the labeled amount, add 25 mL of ethyl acetate, shake to dissolve, filter, and use the filtrate as the test solution. Separately, dissolve 10 mg of cyproheptadine orotate hydrate RS in 10 mL of ethyl acetate and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of ethyl acetate, diethylamine, and cyclohexane (18 : 1 : 1) as the developing solvent, and air-dry the plate with hot air. Examine the plate under ultraviolet light; the R_f values of the spots obtained from the test solution and the standard solution are the same.

(2) ***L-Lysine hydrochloride—***Weigh an amount of Compound DL-Carnitine Hydrochloride, Cyanocobalamin and L-Lysine Hydrochloride Tablets equivalent to 100 mg of L-lysine hydrochloride according to the labeled amount, dissolve in 10 mL of water, filter, and use the filtrate as the test solution. Separately, use 1% aqueous solution of L-lysine hydrochloride RS as the standard solution. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of 1-propanol and strong ammonia water (60 : 30) as the developing solvent, and air-dry the plate with hot air. Examine the plate under ultraviolet light (main wavelength: 254 nm); the R_f values of the spots obtained from

the test solution and the standard solution are the same.

(3) ***Cyanocobalamin, DL-carnitine hydrochloride***—With Compound DL-Carnitine Hydrochloride, Cyanocobalamin and L-Lysine Hydrochloride Tablets, perform the test as directed under the Analysis for Vitamins.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay (1) ***Cyproheptadine orotate hydrate*—**Weigh accurately the mass of NLT 20 tablets of Compound DL-Carnitine Hydrochloride, Cyanocobalamin and L-Lysine Hydrochloride Tablets, and powder. Weigh accurately an amount equivalent to 1.5 mg of cyproheptadine orotate hydrate ($C_{26}H_{25}N_3O_4 \cdot H_2O$), transfer into a separatory funnel, add 5 mL of water, and extract with chloroform, previously warmed, repeat the extraction until total volume of chloroform reaches 80 mL. To the filtrate, add chloroform to make 100 mL. Filter if necessary, discard the first 20 mL of the filtrate, take 10 mL of the subsequent filtrate, and transfer into a separatory funnel. Add 20 mL of chloroform, 10 mL of pH 5.4 phosphate buffer solution, and 5 mL of 0.05% bromocresol green TS, and extract by shaking to mix vigorously. Next, take chloroform filtrate in another separatory funnel, wash the water layer with 15 mL of chloroform, combine the washings with chloroform filtrate, and add 50 mL of 0.1 mol/L sodium hydroxide TS. Shake to mix, take the water layer, and use this solution as the test solution. Separately, weigh accurately about 15 mg of cyproheptadine orotate hydrate RS, make the same concentration as the test solution, proceed in the same manner as the test solution, and use this solution as the standard solution. Perform the test using the test solution and the standard solution as directed under the Ultraviolet-visible Spectroscopy, and measure the absorbances, A_T and A_S, at a wavelength of 615 nm.

$$\text{Amount (mg) of cyproheptadine orotate hydrate } (C_{26}H_{25}N_3O_4 \cdot H_2O) = \text{Amount (mg) of cyproheptadine orotate hydrate RS} \times \frac{A_T}{A_S} \times \frac{1}{10}$$

(2) ***L-l-lysine hydrochloride*—**Weigh accurately the mass of NLT 20 tablets of Compound DL-Carnitine Hydrochloride, Cyanocobalamin and L-Lysine Hydrochloride Tablets, and powder. Weigh accurately an amount equivalent to 0.2 g of L-lysine hydrochloride, and add pH 2.2 buffer solution for dilution to make 100 mL. Filter this solution, discard the initial 20 mL of the filtrate, take 5 mL of the subsequent filtrate, add pH 2.2 buffer solution for dilution to make 100 mL, and use this solution as the test solution. Separately, weigh accurately about 0.2 g of L-lysine hydrochloride RS, and add pH 2.2 buffer solution for dilution to make 100 mL. Take 5 mL of this solution, proceed in the same manner as the test solution, use this solution as the standard solution, and perform the test as directed under the Identification and Assay for Amino Acids.

$$\text{Amount (mg) of L-lysine hydrochloride } (C_6H_{14}N_2O_2 \cdot HCl) = \frac{H \times W}{C} \times M \times dilution\ factor \times \frac{1}{10^3}$$

H: Peak height of the test solution
W: Peak full width at half maximum of the test solution
C: H·W coefficient
M: Radius

(3) ***Cyanocobalamin and DL-carnitine hydrochloride*—**Weigh accurately the mass of NLT 20 Compound DL-Carnitine Hydrochloride, Cyanocobalamin and L-Lysine Hydrochloride Tablets, powder, and perform the test as directed under the Analysis for Vitamins.

Packaging and storage Preserve in well-closed containers.

Compound β-Carotene Suspension 30%, Ascorbic Acid and Selenium in Dried Yeast Capsules
복방β-카로틴현탁액30%·아스코르브산·셀레늄함유건조효모 캡슐

Compound β-Carotene Suspension 30%, Ascorbic Acid and Selenium in Dried Yeast Capsules contain NLT 90.0% and NMT 150.0% of the labeled amounts of *β*-carotene ($C_{40}H_{56}$: 536.87), selenium in dried yeast (Se : 78.96), ascorbic acid ($C_6H_8O_6$: 176.12) and tocopherol ($C_{29}H_{50}O_2$: 430.71).

Method of preparation Prepare as directed under Capsules, with selenium in dried yeast, *β*-Carotene Suspension 30%, Ascorbic Acid and Tocopherol.

Identification (1) ***Selenium in dried yeast***—Perform the test as directed under the Analysis for Minerals.

(2) ***β-carotene, ascorbic acid and tocopherol***—Perform the test as directed under the Analysis for Vitamins.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay (1) ***Selenium*—**Weigh accurately the contents of NLT 20 capsules of Compound β-Carotene Suspension 30%, Ascorbic Acid and Selenium in Dried Yeast Cap-

sules and perform the test as directed under the Analysis for Minerals.

(2) ***β-Carotene, ascorbic acid and tocopherol—*** Weigh accurately the contents with NLT 20 capsules of Compound β-Carotene Suspension 30%, Ascorbic Acid and Selenium in Dried Yeast Capsules and perform the test as directed under the Analysis for Vitamins.

Packaging and storage Preserve in well-closed containers.

Compound Cyanocobalamin, Taurine and Ergocalciferol Tablets
복방시아노코발라민·타우린·에르고칼시페롤 정

Compound Cyanocobalamin, Taurine and Ergocalciferol Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of total calcium (Ca: 40.08), NLT 90.0% and NMT 130.0% of taurine ($C_2H_7NO_3S$: 125.15), L-lysine hydrochloride ($C_6H_{14}N_2O_2$ ·HCl: 182.65), NLT 90.0% and NMT 150.0% of the thiamine nitrate ($C_{12}H_{17}N_5O_4S$: 327.36), pyridoxine hydrochloride ($C_8H_{11}NO_3$·HCl: 205.64), ergocalciferol ($C_{28}H_{44}O$: 396.65), and cyanocobalamin ($C_{63}H_{88}CoN_{14}O_{14}P$: 1355.37).

Method of preparation Prepare as directed under Tablets, with Cyanocobalamin, Taurine, Ergocalciferol, L-Lysine Hydrochloride, Pyridoxine Hydrochloride, Dibasic Calcium Phosphate Hydrate, Calcium Lactate Hydrate, and Thiamine Nitrate.

Identification (1) ***Cyanocobalamin, ergocalciferol, pyridoxine hydrochloride, and thiamine nitrate—***Perform the test with Compound Cyanocobalamin, Taurine and Ergocalciferol Tablets as directed under the Analysis for Vitamins.

(2) ***Taurine, L-lysine hydrochloride—***Perform the test with Compound Cyanocobalamin, Taurine and Ergocalciferol Tablets as directed under the Identification and Assay for Amino Acids.

(3) ***Dibasic calcium phosphate hydrate and calcium lactate hydrate—***Perform the test with Compound Cyanocobalamin, Taurine and Ergocalciferol Tablets as directed under the Analysis for Minerals.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay (1) ***Total calcium—***Weigh accurately the mass of NLT 20 Compound Cyanocobalamin, Taurine and Ergocalciferol Tablets, and powder. Weigh accurately an amount equivalent to about 0.1 g of calcium (Ca), and perform the test as directed under the Analysis for Minerals.

(2) ***Taurine, L-lysine hydrochloride—***Weigh accurately the mass of NLT 20 Compound Cyanocobalamin, Taurine and Ergocalciferol Tablets, powder, and perform the test as directed under the Identification and Assay for Amino Acids.

(3) ***Cyanocobalamin, ergocalciferol, pyridoxine hydrochloride, and thiamine nitrate—***Weigh accurately the mass of NLT 20 Compound Cyanocobalamin, Taurine and Ergocalciferol Tablets, powder, and perform the test as directed under the Analysis for Vitamins.

Packaging and storage Preserve in tight containers.

Compound Cyproheptadine Orotate, L-Lysine Hydrochloride and DL-Carnitine Hydrochloride Capsules
복방시프로헵타딘오로트산염·L-리신염산염·DL-카르니틴염산염 캡슐

Compound Cyproheptadine Orotate, L-Lysine Hydrochloride and DL-Carnitine Hydrochloride Capsules contain NLT 90.0% and NMT 110.0% of the labeled amount of cyproheptadine orotate ($C_{26}H_{25}N_3O_4$: 443.50), NLT 90.0% and NMT 130.0% of the labeled amounts of L-lysine hydrochloride ($C_6H_{14}N_2O_2$·HCl : 182.65) and cobamamide ($C_{72}H_{100}CoN_{18}O_{17}P$: 1579.58), and NLT 90.0% and NMT 150.0% of the labeled amount of DL-carnitine hydrochloride ($C_7H_{16}O_3NCl$: 197.66).

Method of preparation Prepare as directed under Capsules, with Cyproheptadine Orotate, L-Lysine Hydrochloride, DL-Carnitine Hydrochloride and Cobamamide.

Identification (1) ***Cyproheptadine orotate hydrate***—Weigh the contents of 1 capsule of Compound Cyproheptadine Orotate, L-Lysine Hydrochloride and DL-Carnitine Hydrochloride Capsule, shake, dissolve in 10 mL of methanol, and filter. Use the filtrate as the test solution. Separately, use a 0.015% solution of cyproheptadine orotate RS in methanol as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on a thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of chloroform and acetone (100 : 1.5) as a developing solvent to a distance of about 10 cm, and air-dry the plate. Examine the plate under ultraviolet light; the Rf value and color of the major spot of the test solution correspond to those of the standard solution.

(2) ***L-lysine hydrochloride***—Perform the test with L-Aspartate-L-Arginine Hydrate as directed under the Identification and Assay for Amino Acids.

(3) ***DL-carnitine hydrochloride***—Perform the test with Compound Cyproheptadine Orotate, L-Lysine Hy-

drochloride and DL-Carnitine Hydrochloride Capsules as directed under the Analysis for Vitamins.

(4) ***Aceglutamide***—Dissolve the contents of 5 capsules of Compound Bilberry Fruit Dried Extract, Aceglutamide and DL-Phosphoserine Capsule in water to make 5 mL, and filter. Use the filtrate as the test solution. Separately, use 0.1% acetic acid(100) of cobamamide RS as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography or alumina. Next, develop the plate with a mixture of benzene, methanol, acetic acid(100) and acetone (70 : 20 : 5 : 5) as the developing solvent to a distance of about 10 cm, air-dry the plate, and observe it with the naked eye; the Rf value and color of the major spot of the test solution correspond to those of the standard solution.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay (1) ***Cyproheptadine orotate*—**Weigh accurately the mass of content of NLT 20 capsules of Compound Cyproheptadine Orotate, L-Lysine Hydrochloride and DL-Carnitine Hydrochloride Capsules. Weigh accurately an amount equivalent to about 1.5 mg of cyproheptadine orotate ($C_{26}H_{25}N_3O_4$) and transfer to a separatory funnel. Add 5 mL of water, extract several times with 80 mL of warmed chloroform, and add chloroform to make 100 mL. If necessary, filter to discard the first 20 mL of the filtrate, take 10.0 mL of the next filtrate, transfer it to a separatory funnel, and add 20 mL of chloroform, 10 mL of phosphate buffer solution, pH 5.4, and 5 mL of 0.05% bromocresol green TS. Shake vigorously to mix, and pour the chloroform extract into another funnel. Transfer it in a separatory funnel, wash the water layer with 15 mL of chloroform, and combine the washed solution with the chloroform extract. Add 50 mL of 0.1 mol/L sodium hydroxide solution, shake to mix, take the water layer, and use this solution as the test solution. Separately, weigh accurately about 15 mg of cyproheptadine orotate RS to make the same concentration as the test solution, proceed in the same manner as in the test solution, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at the wavelength of 615 nm as directed under the Ultraviolet-visible Spectroscopy.

$$\text{Amount (mg) of cyproheptadine orotate } (C_{26}H_{25}N_3O_4) = \text{Amount (mg) of cyproheptadine orotate RS} \times \frac{A_T}{A_S} \times \frac{1}{10}$$

(2) ***L-lysine hydrochloride*—**Weigh accurately the contents of NLT 20 capsules of Compound Cyproheptadine Orotate, L-Lysine Hydrochloride and DL-Carnitine Hydrochloride Capsules, and perform the test as directed under the Identification and Assay for Amino Acids.

(3) ***DL-carnitine hydrochloride*—**Weigh accurately the contents of NLT 20 capsules of Compound Cyproheptadine Orotate, L-Lysine Hydrochloride and DL-Carnitine Hydrochloride Capsules, and perform the test as directed under the Analysis for Vitamins.

(4) ***Cobamamide*—**Proceed quickly all the operations under the light-resistant condition. Weigh accurately the mass of NLT 20 xxx Capsules, take out all of the content, and weigh accurately the mass of the empty capsules. Weigh accurately about 2 mg of cobamamide ($C_{72}H_{100}O_{17}N_{18}PCo$), transfer to a separatory funnel, add about 50 to 70 mL of ether to mix thoroughly, and extract 3 times sequentially by adding 20, 15, and 10 mL of hydrochloric acid-potassium chloride buffer solution, pH 2.0. Combine all extracts to place in a 50-mL volumetric flask, add hydrochloric acid-potassium chloride buffer solution, pH 2.0, and fill to the mark. Filter this solution, discard the first 10 mL of the filtrate, and use the subsequent filtrate as the test solution. Separately, weigh accurately about 20 mg of cobamamide RS, add hydrochloric acid-potassium chloride buffer solution, pH 2.0, and use this solution as the standard solution. Determine the absorbances, A_S and A_T, of the test solution and the standard solution, respectively, at the wavelength of 460 nm as directed under the Ultraviolet-visible Spectroscopy.

$$\text{Amount (mg) of cobamamide } (C_{72}H_{100}CoN_{18}O_{17}P) = \text{Amount (mg) of cobamamide RS} \times \frac{A_T}{A_S} \times \frac{1}{10}$$

Packaging and storage Preserve in tight containers.

Compound Diastase·protease 100, Magnesium Carbonate and Sodium Bicarbonate Tablets
복방디아스타제·프로테아제100·탄산마그네슘·탄산수소나트륨 정

Compound Diastase·protease 100, Magnesium Carbonate and Sodium Bicarbonate Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of sodium bicarbonate ($NaHCO_3$: 84.01) and magnesium carbonate ($MgCO_3$: 84.31), NLT 90.0% and NMT 130.0% of total alkaloids in scopolia extract [hyoscyamine ($C_{17}H_{23}NO_3$: 289.37) and scopolamine ($C_{17}H_{21}NO_4$: 303.35)], and NLT 90.0% of *α*-amylase, *β*-amylase, and protease in diastase·protease 100.

Method of preparation Prepare as directed under Tablets, with Diastase·Protease 100, Magnesium Carbonate, Sodium Bicarbonate, and Scopolia Extract.

Identification (1) ***Magnesium carbonate*—**Weigh an amount of Compound Diastase·protease 100, Magnesium Carbonate and Sodium Bicarbonate Tablets, equivalent to 0.54 g of magnesium carbonate according to the labeled

amount, dissolve in 50 mL of water, filter, and wash the precipitate in the filter paper 3 times each with 10 mL of water. Completely dissolve the residue in 15 mL of dilute hydrochloric acid, filter, wash the residue on the filter paper 3 times each with 10 mL of water, and combine the filtrate and the washings. Add enough hot ammonium hydroxide TS until no precipitate forms, combine the alkaline filtrate and the washings with ammonia water and make the solution acidic; the solution does not produce a precipitate when ammonium chloride TS is added, but produces a white crystalline precipitate when dibasic sodium phosphate TS is added. This precipitate is insoluble in ammonia TS.

(2) ***Sodium bicarbonate*—**Weigh an amount of Compound Diastase·protease 100, Magnesium Carbonate and Sodium Bicarbonate Tablets equivalent to 1.4 g of sodium bicarbonate according to the labeled amount, dissolve in 30 mL of water, and filter. This filtrate responds to the Qualitative Analysis for sodium salt and bicarbonate.

(3) ***Scopolia extract*—**Weigh an amount of Compound Diastase·protease 100, Magnesium Carbonate and Sodium Bicarbonate Tablets, equivalent to 20 mg of scopolia extract according to the labeled amount, extract 3 times with 50 mL each of ether in an ammonia alkaline solution, combine the filtrates to concentrate on a steam bath, and dissolve in 10 mL of ethanol. Use this solution as the test solution. Separately, weigh about 20 mg of scopolia extract RS, proceed in the same manner as in the test solution, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography (with a fluorescent indicator). Next, develop the plate using a mixture of chloroform, acetone, and diethylamine (5 : 4 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Spray Dragendorff's TS evenly onto the plate; the spot of the test solution exhibits an Rf value and color corresponding to that of the standard solution.

(4) ***α-Amylase, β-amylase, and protease in diastase·protease 100*—**Perform the test as directed under the Assay; each exhibits a positive reaction.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay (1) ***Magnesium carbonate*—**(i) Weigh accurately the mass of NLT 20 Compound Diastase·protease 100, Magnesium Carbonate and Sodium Bicarbonate Tablets, and powder. Weigh an amount equivalent to 0.18 g of magnesium carbonate ($MgCO_3$), transfer into a crucible, and ignite. After cooling, add 20 mL of water and 10 mL of hydrochloric acid, and evaporate on a steam bath. Concentrate, and dry the solution, dissolve in 10 mL of water and 4 mL of dilute hydrochloric acid, and add water to make 100 mL. Take 25.0 mL of this solution, add 50 mL of water and 5 mL of pH 10.7 ammonia-ammonium chloride buffer solution, and titrate with 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS to determine the consumed amount (indicator: 40 mg of eryochrome black T-sodium chloride indicator). Perform a blank test in the same manner and make any necessary correction.

From the consumed amount of the 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS, subtract the amount of 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS that is equivalent to calcium oxide (CaO) obtained as directed under the following (B).

(ii) Separately, weigh accurately about 0.25 g of Compound Diastase·protease 100, Magnesium Carbonate and Sodium Bicarbonate Tablets, previously ignited, add 6 mL of dilute hydrochloric acid, and dissolve by heating. After cooling, add 300 mL of water and 3 mL of L-tartaric acid solution (1 in 5), put 10 mL of triethanolamine solution (3 in 10) and 10 mL of 8 mol/L potassium hydroxide TS, allow it to stand for 5 minutes, and titrate with 0.01 mol/L ethylenediaminetetraacetic acid disodium salt VS (indicator: 0.1 g of NN indicator). The end-point of titration is when the color of the solution changes from reddish purple to blue. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS
= 4.2159 mg of MgCO3

Each mg of calcium oxide (CaO)
= 0.36 mL of 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS

(2) **Sodium bicarbonate** Weigh accurately the mass of NLT 20 Compound Diastase·protease 100, Magnesium Carbonate and Sodium Bicarbonate Tablets, and powder. Weigh accurately an amount equivalent to about 0.1 g of sodium bicarbonate ($NaHCO_3$), add 50 mL of water, warm at between 35 and 40 °C, and shake for 10 minutes to dissolve. After filtering, wash 3 times each with 20 mL of water. Combine the filtrate and the washings, and titrate with 0.05 mol/L sulfuric acid VS as directed in the potentiometric titration under the Titrimetry. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L sulfuric acid VS
= 8.401 mg of $NaHCO_3$

(3) ***Total alkaloids in scopolia extract (hyoscyamine and scopolamine)*—**Weigh accurately the mass of NLT 20 Compound Diastase·protease 100, Magnesium Carbonate and Sodium Bicarbonate Tablets, and powder. Weigh accurately an amount, equivalent to 0.2 mg of total alkaloids [hyoscyamine ($C_{17}H_{23}NO_3$: 289.37) and scopolamine ($C_{17}H_{21}NO_4$: 303.35)], and perform the test according to the Assay as directed under the Scopolia extract of the Korean Pharmacopoeia.

(4) ***Diastase·protease 100***—(i) α-Amylase Weigh accurately the mass of NLT 20 Compound Diastase·protease 100, Magnesium Carbonate and Sodium Bicarbonate Tablets, and powder. Weigh accurately an amount equivalent to 0.5 g of diastase·protease 100, dilute with 0.1% sodium chloride to make 40,000 to 80,000 times the concentration, and use this solution as the test solution. To 5 mL of 1% soluble starch TS, add 3 mL of McIlvaine buffer (pH 5.6) and 1 mL of 0.1% calcium chloride, allow it to stand at 37 ℃ for 5 minutes, add 1 mL of the test solution, and shake well to mix. Allow it to stand at 37 ℃ for 30 minutes, take 0.2 mL of the solution, and add to 10 mL of iodine TS. Perform the test with this solution as directed under the Ultraviolet-visible Spectroscopy using water as the control solution, and determine the absorbance, OD_1, at a wavelength of 660 nm. Proceed according to the above using water instead of the test solution, and determine the absorbance, OD_{ST}. Proceed according to the above by heating the test solution at 100 ℃ for 30 minutes to deactivate the solution, and determine the absorbance, OD_0. Calculate the amount of starch digested in mg using the following equation.

$$\text{Potency (unit/tab) of } \alpha\text{-amylase} = \frac{OD_0 - OD_1}{OD_{ST}} \times 50 \times \frac{1}{10} \times D \times \frac{Average\ weight\ (g)\ of\ 1\ tablet}{Amount\ (g)\ of\ sample\ taken}$$

D: Dilution factor

Definition of potency—Set the unit as 1 when 10 mg of starch is digested according to the above conditions for 30 minutes.

(ii) *β*-Amylase Weigh accurately about 1.0 g of Compound Diastase·protease 100, Magnesium Carbonate and Sodium Bicarbonate Tablets, add 0.1% sodium chloride to dilute so that the solution becomes 30000 times the concentration, and use this solution as the test solution. Transfer 10 mL of 2% soluble starch TS to a 100-mL Erlenmeyer flask, allow it to stand at 40 ℃ for 30 minutes, and add 2 mL of Fehling's alkaline copper TS to stop the enzyme action. Add 2 mL of Ferring's copper TS, and boil on fire for 2 minutes. After cooling with running water, add 2 mL of 30% potassium iodide and 2 mL of 25% sulfuric acid, and titrate free iodine with 0.05 mol/L sodium thiosulfate VS. Separately, add water instead of the test solution, proceed according to the above, perform a blank test, and determine the mg of the produced reducing sugar.

$$\text{Potency of (unit/tab) } \beta\text{-amylase} = 1.62 \times (\text{consumed amount of the blank test solution} - \text{Consumed amount of the test solution}) \times \frac{1}{10} \times \frac{Average\ weight\ (g)\ of\ 1\ tablet}{Amount\ (g)\ of\ sample\ taken} \times f \times D$$

f: Normality factor of 0.05 mol/L sodium thiosulfate VS

D: Dilution factor

Definition of potency—Set the activation unit as 1 when 10 mg of glucose is created according to the above conditions.

(iii) Protease Weigh accurately 0.5 g of Compound Diastase·protease 100, Magnesium Carbonate and Sodium Bicarbonate Tablets, dilute with 0.1% sodium chloride to obtain a concentration of 5000 to 10000 times, and use this solution as the test solution. Transfer 1mL of 0.6% casein solution in a test tube, previously warmed at 37 ℃ in a constant temperature water bath, add 1.0 mL of the test solution, and shake to mix well. Allow it to stand in a 37 ℃ constant temperature water bath for exactly 10 minutes, add 2 mL of 0.4 mol/L trichloroacetic acid TS, allow it to stand at 37 ℃ for 20 minutes, and filter. Transfer 1.0 mL of the filtrate into a test tube, add 5 mL of 0.4 mol/L sodium carbonate and 1 mL of Folin TS (1 in 3), and shake to mix well. Allow it to stand at 37 ℃ for 20 minutes, perform the test with the colored solution as directed under the Ultraviolet-visible Spectroscopy using water as the control solution, and determine the absorbance E at the wavelength of 660 nm. Separately transfer 1.0 mL of the test solution into a test tube, add 2 mL of 0.4 mol/L trichloroacetic acid TS, add 1 mL of 0.6% casein solution, and filter after 10 minutes. With 1 mL of the filtrate, proceed in the same manner, and determine the absorbance, E_0. Separately, weigh accurately 50 mg of tyrosine RS, add 0.02 mol/L hydrochloric acid TS to make 100 mL, take 10.0 mL of this solution, and add 0.02 mol/L hydrochloric acid to make 100 mL. Use this solution as the standard solution. Take 1 mL of this standard solution, color like the test solution, and determine the absorbance, E_S.

$$\text{Potency (unit/tab) of protease} = \frac{E - E_0}{E_S} \times 50 \times \frac{4}{10} \times D \times \frac{Average\ weight\ (g)\ of\ 1\ tablet}{Amount\ (g)\ of\ sample\ taken}$$

D: Dilution factor

Definition of potency—Set the unit as 1 for potency creating non-protein material that responds to 1 μg of tyrosine according to the above conditions.

Packaging and storage Preserve in tight containers.

Compound Diprophylline, Methoxyphenamine Hydrochloride and Noscapine Capsules
복방디프로필린·메톡시페나민염산염·노스카핀 캡슐

Compound Diprophylline, Methoxyphenamine Hydrochloride and Noscapine Capsules contain NLT 90.0% and NMT 110.0% of the labeled amounts of diprophylline ($C_{10}H_{14}N_4O_4$: 254.24), methoxyphenamine hydrochloride ($C_{11}H_{17}ON\cdot HCl$: 215.72), noscapine ($C_{22}H_{23}NO_7$: 413.42) and chlorpheniramine maleate ($C_{16}H_{19}ClN_2\cdot C_4H_4O_4$: 390.86).

Method of preparation Prepare as directed under Capsules, with Diprophylline, Methoxyphenamine Hydrochloride, Noscapine and Chlorpheniramine Maleate.

Identification ***Diprophylline, chlorpheniramine maleate, methoxyphenamine hydrochloride, and noscapine—***The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay ***Diprophylline, chlorpheniramine maleate, methoxyphenamine hydrochloride, and noscapine—***Weigh accurately the contents of NLT 20 capsules of Compound Diprophylline, Methoxyphenamine Hydrochloride and Noscapine Capsules Weigh accurately an amount equivalent to 0.1 g of diprophylline $C_{10}H_{14}N_4O_4$) [20 mg of noscapine ($C_{22}H_{23}NO_7$), 8 mg of chlorpheniramine maleate ($C_{16}H_{19}ClN_2\cdot C_4H_4O_4$), and 0.1 g of methoxyphenamine hydrochloride ($C_{11}H_{17}ON\cdot HCl$)], dissolve in a mixture of methanol and chloroform (2 : 1), sonicate for 20 minutes, and add a mixture of methanol and chloroform (2 : 1) to make 100 mL, and filter. Use the filtrate as the test solution. Separately, weigh accurately about 0.1 g of diprophylline RS, about 20 mg of noscapine RS, about 8 mg of chlorpheniramine maleate RS, and about 0.1 g of methoxyphenamine hydrochloride RS, add a mixture of methanol and chloroform (2:1) and sonicate it for 20 minutes to dissolve, add a mixture of methanol and chloroform (2:1) to make 100 mL, and filter. Use the filtrate as the standard solution. Perform the test as directed under the Liquid Chromatography according to the following conditions with the test solution and the standard solution; determine the peak areas of A_{T1}, A_{T2}, A_{T3}, A_{T4}, A_{S1}, A_{S2}, A_{S3}, and A_{S4} of diprophylline, methoxyphenamine hydrochloride, chlorpheniramine maleate, and noscapine in each solution.

Amount (mg) of diprophylline ($C_{10}H_{14}N_4O_4$)

$$= \text{Amount (mg) of diprophylline RS} \times \frac{A_{T1}}{A_{S1}}$$

Amount (mg) of methoxphenamine hydrochloride ($C_{11}H_{17}ON\cdot HCl$)

$$= \text{Amount (mg) of methoxphenamine hydrochloride RS} \times \frac{A_{T2}}{A_{S2}}$$

Amount (mg) of chlorpheniramine maleate ($C_{16}H_{19}ClN_2\cdot C_4H_4O_4$)

$$= \text{Amount (mg) of chlorpheniramine maleate RS} \times \frac{A_{T3}}{A_{S3}}$$

Amount (mg) of noscapine ($C_{22}H_{23}NO_7$)

$$= \text{Amount (mg) of noscapine RS} \times \frac{A_{T4}}{A_{S4}}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.0 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μ*m* to 10 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: A mixture of 0.1 mol/L potassium dihydrogen phosphate (pH 2.6) and acetonitrile (85 : 15).

Flow rate: 1 mL/min

Packaging and storage Preserve in tight containers.

Compound Dried Ergocalciferol, Calcium Gluconate and Calcium Lactate Tablets
복방건조에르고칼시페롤·글루콘산칼슘·락트산칼슘 정

Compound Dried Ergocalciferol, Calcium Gluconate and Calcium Lactate Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of total calcium (Ca: 40.08) and NLT 90.0% and NMT 150.0% of ergocalciferol ($C_{29}H_{44}O$: 396.65).

Method of preparation Prepare as directed under Tablets, with Calcium Lactate Hydrate, Calcium Gluconate Hydrate, Precipitated Calcium Carbonate, and Dried Ergocalciferol.

Identification (1) ***Calcium lactate hydrate, calcium gluconate hydrate, and calcium in precipitated calcium carbonate—***Perform the test with Compound Dried Ergocalciferol, Calcium Gluconate and Calcium Lactate Tablets; it responds to the Qualitative Analysis for calcium salt.

(2) ***Lactate in calcium lactate hydrate—***Weigh an amount of Compound Dried Ergocalciferol, Calcium

Gluconate and Calcium Lactate Tablets equivalent to 20 mg of calcium lactate hydrate, add 20 mL of water, dissolve by shaking to mix, and filter. The filtrate responds to the Qualitative Analysis for lactate and calcium salt.

(3) ***Carbonate in precipitated calcium carbonate***—Perform the test with Compound Dried Ergocalciferol, Calcium Gluconate and Calcium Lactate Tablets; it responds to the Qualitative Analysis for carbonate.

(4) ***Gluconate in calcium gluconate hydrate***—Weigh 0.5 g of Compound Dried Ergocalciferol, Calcium Gluconate and Calcium Lactate Tablets, dissolve in 5 mL of water by heating, add 0.65 mL of acetic acid(100) and 1 mL of freshly distilled phenylhydrazine, and heat on a steam bath for 30 minutes. After cooling, rub the inner wall with the glass rod; a crystal precipitates. Filter and collect the crystal, dissolve in 10 mL of hot water, add a small amount of activated charcoal, and filter. After cooling, rub the inner wall with the glass rod, filter and collect the precipitating crystals under suction, wash 3 times each with 10 mL of cold water, and dry; the melting point is between 187 and 199 ℃ (with decomposition).
An aqueous solution of Compound Dried Ergocalciferol, Calcium Gluconate and Calcium Lactate Tablets (1 in 40) responds to the Qualitative Analysis for calcium salt.

(5) ***Ergocalciferol—***Perform the test with Compound Dried Ergocalciferol, Calcium Gluconate and Calcium Lactate Tablets as directed under the Analysis for Vitamins.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay (1) ***Total calcium in calcium lactate hydrate, precipitated calcium carbonate, and calcium gluconate hydrate—***Weigh accurately the mass of NLT 20 Compound Dried Ergocalciferol, Calcium Gluconate and Calcium Lactate Tablets, powder, and perform the test as directed under the Analysis for Minerals.

(2) ***Ergocalciferol***—Weigh accurately the mass of NLT 20 Compound Dried Ergocalciferol, Calcium Gluconate and Calcium Lactate Tablets, powder, and perform the test as directed under the Analysis for Vitamins.

Packaging and storage Preserve in well-closed containers.

Compound Fursultiamine, Pyridoxine Hydrochloride and Tocopherol Acetate Capsules

복방푸르설티아민·피리독신염산염·토코페롤아세테이트 캡슐

Compound Fursultiamine, Pyridoxine Hydrochloride and Tocopherol Acetate Capsules contain NLT 90.0% and NMT 110.0% of sodium chondroitin sulfate and γ-oryzanol ($C_{40}H_{58}O_4$: 602.89), NLT 90.0% and NMT 130.0% of fursultiamine ($C_{17}H_{26}N_4O_3S_2$: 398.54) and riboflavin butyrate ($C_{33}H_{44}N_4O_{10}$: 656.72), NLT 90.0% and NMT 150.0% of nicotinamide ($C_6H_6N_2O$: 122.13), pyridoxine hydrochloride ($C_8H_{11}NO_3$·HCl: 205.64), calcium pantothenate ($C_{18}H_{32}CaN_2O_{10}$: 476.53), cyanocobalamin ($C_{63}H_{88}CoN_{14}O_{14}P$: 1355.37) and tocopherol acetate ($C_{31}H_{52}O_3$: 472.74), respectively, according to the labeled amount.

Method of preparation Prepare as directed under Capsules, with Sodium Chondroitin Sulfate, *Γ*-Oryzanol, Fursultiamine, Riboflavin Butyrate, Nicotinamide, Pyridoxine Hydrochloride, Calcium Pantothenate, Cyanocobalamin and Tocopherol Acetate.

Identification (1) ***γ-Oryzanol—***Weigh an amount of Compound Fursultiamine, Pyridoxine Hydrochloride and Tocopherol Acetate Capsules, equivalent to about 10 mg of γ-oryzanol, add 50 mL of n-heptane, shake to mix, and extract. Then, dehydrate with anhydrous sodium sulfate, filter, and use this filtrate as the test solution. Separately, weigh about 10 mg of γ-oryzanol RS, add n-heptane, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate using a mixture of n-heptane, ether and ethyl acetate (75 : 20 : 5) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Spray evenly potassium permanganate TS on the plate; the R_f values and the colors of the spots obtained from the sample and the standard solutions are the same.

(2) ***Sodium chondroitin sulfate—***(i) Weigh an amount of Compound Fursultiamine, Pyridoxine Hydrochloride and Tocopherol Acetate Capsules, equivalent to about 1 g of sodium chondroitin sulfate according to the labeled amount, add 60 mL of water, shake well to mix, extract, and filter. Extract and filter the residue 2 times each with 20 mL of water, combine these filtrates with the above filtrate, and add 1 mL of acriflavine solution (1 in 100); an orangey yellow acidic precipitate immediately forms, and this precipitate does not dissolve in dilute sodium hydroxide or dilute hydrochloric acid.

(ii) Weigh an amount of Compound Fursultiamine, Pyridoxine Hydrochloride and Tocopherol Acetate Capsules, equivalent to about 0.2 g of sodium chondroitin sulfate according to the labeled amount, and filter 2 times each with 20 mL of water while shaking to mix. Combine all the filtrates, add 50 mL of 3 mol/L hydrochloric acid TS, and react under evolving conditions with a reflux condenser for 2 hours. After cooling, neutralize with 3 mol/L potassium hydroxide TS, and use this solution as the test solution. Separately, weigh about 0.2 g of sodium chondroitin sulfate RS, proceed in the same manner as in the preparation of the test solution to make a neutralized solution having a concentration of about 5%, and use this solution as the standard solution. With these

solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of water, methanol and ammonia water (50 : 50 : 50) as a developing solvent to a distance of about 10 cm, air-dry the plate, and spray evenly potassium dichromate-sulfuric acid TS or naphthoresorcin-sulfuric acid TS; the R_f values and colors of the spots obtained from the test solution and standard solution are the same.

(3) ***Riboflavin butyrate, fursultiamine, nicotinamide, pyridoxine hydrochloride, calcium pantothenate, cyanocobalamin and tocopherol acetate***—Perform the test with Compound Fursultiamine, Pyridoxine Hydrochloride and Tocopherol Acetate Capsules as directed under the Analysis for Vitamins.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay (1) ***γ-Oryzanol***—Weigh accurately the mass of NLT 20 capsules of Compound Fursultiamine, Pyridoxine Hydrochloride and Tocopherol Acetate Capsules. Weigh accurately an amount of these capsules, equivalent to about 5 mg of γ-oryzanol ($C_{40}H_{58}O_4$), add the mobile phase to make exactly 50 mL, and use this solution as the test solution. Separately, weigh accurately about 5 mg of γ-oryzanol RS, add the mobile phase to make exactly 50 mL, and use this solution as the standard solution. Perform the test with 20 mL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of γ-oryzanol in each solution.

$$\text{Amount (mg) of } \gamma\text{-oryzanol } (C_{40}H_{58}O_4) = \text{Amount (mg) of } \gamma\text{-oryzanol RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption spectrophotometer (wavelength: 280 nm).

Column: A stainless steel column about 3.9 mm in internal diameter and about 30 cm in length, packed with aminopropylsilanized silica gel for liquid chromatography (3 μm in particle diameter).

Mobile phase: A mixture of cyclohexane, ethyl acetate and acetic acid (730 : 270 : 1).

Flow rate: 1.0 mL/min

(2) ***Sodium chondroitin sulfate***—Weigh accurately the mass of NLT 20 capsules of Compound Fursultiamine, Pyridoxine Hydrochloride and Tocopherol Acetate Capsules. Weigh accurately an amount of these capsules, equivalent to about 80 mg of sodium chondroitin sulfate, add 150 mL of water, sonicate for 10 minutes, and add water to make exactly 200 mL. Then, centrifuge. Pipet 5 mL of the clear supernatant, add 5 mL of 6 mol/L hydrochloric acid TS, fill nitrogen, then close the stopper, and warm at 100 ± 1 ℃ for 16 hours. After cooling, adjust the pH to 3.5 with sodium hydroxide TS, transfer into a 100-mL volumetric flask (wash the stoppered Erlenmeyer flask with water, and combine the washings into the volumetric flask), add 5 mL of the internal standard solution, and then add water to make exactly 100 mL. Use this solution as the test solution. Separately, weigh accurately about 80 mg of sodium chondroitin sulfate RS, and add water to make exactly 200 mL. Pipet 5 mL of this solution, transfer into a stoppered Erlenmeyer flask, add 5 mL of 6 mol/L hydrochloric acid TS, and fill nitrogen. Then, proceed in the same manner as in the preparation of the test solution, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the ratios, Q_T and Q_S, of the peak area of sodium chondroitin sulfate to the peak area of the internal standard, respectively.

$$\text{Amount (mg) of sodium chondroitin sulfate} = \text{Amount (mg) of sodium chondroitin sulfate RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—*dl*-3-amino-*n*-butyric acid solution (1 in 12500).

Operating conditions

Detector: A fluorometer (excitation wavelength 345 nm, fluorescence wavelength 445 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 15 cm in length, packed with strongly acidic ion-exchange resin composed of sulfonated polystyrene (about 10 μm in particle diameter).

Column temperature: A constant temperature of about 50 °C.

Reaction vessel temperature: A constant temperature about 50 ℃ (use a reaction coil with about 0.5 mm in internal diameter and about 2 m in length).

Mobile phase: Citrate buffer solution

Reaction regent: o-phthalaldehyde solution

Flow rate: Adjust the flow rate so that the peak retention time of the substance derived from sodium chondroitin sulfate is about 6 minutes.

Flow rate of reaction regent: About 1.0 mL/min.

Selection of column: Proceed with 10 μL of the standard solution according to the above conditions; internal standard and the substance derived from sodium chondroitin sulfate are eluted in this order, and each peak is completely separated.

(3) ***Riboflavin butyrate, fursultiamine, nicotinamide, pyridoxine hydrochloride, calcium pantothenate, cyanocobalamin and tocopherol acetate***—Weigh accurately the mass of NLT 20 capsules of Compound Fursultiamine, Pyridoxine Hydrochloride and Tocopherol Acetate Capsules, and perform the test as directed under the

Analysis for Vitamins.

Packaging and storage Preserve in light-resistant, tight containers.

Compound Fursultiamine, Pyridoxine Hydrochloride and γ-Oryzanol Capsules
복방푸르설티아민·피리독신염산염·γ-오리자놀 캡슐

Compound Fursultiamine, Pyridoxine Hydrochloride and γ-Oryzanol Capsules contain NLT 90.0% and NMT 110.0% of sodium chondroitin sulfate and γ-oryzanol ($C_{40}H_{58}O_4$: 602.89), NLT 90.0% and NMT 130.0% of fursultiamine ($C_{17}H_{26}N_4O_3S_2$: 398.54) and riboflavin butyrate ($C_{33}H_{44}N_4O_{10}$: 656.72), NLT 90.0% and NMT 150.0% of nicotinamide ($C_6H_6N_2O$: 122.13), pyridoxine hydrochloride ($C_8H_{11}NO_3$·HCl: 205.64), calcium pantothenate ($C_{18}H_{32}CaN_2O_{10}$: 476.53), cyanocobalamin ($C_{63}H_{88}CoN_{14}O_{14}P$: 1355.37) and inositol ($C_6H_{12}O_6$: 180.16), respectively, according to the labeled amount.

Method of preparation Prepare as directed under Capsules, with Sodium Chondroitin Sulfate, *Γ*-Oryzanol, Fursultiamine, Riboflavin Butyrate, Nicotinamide, Pyridoxine Hydrochloride, Calcium Pantothenate, Cyanocobalamin and Inositol.

Identification (1) ***γ-Oryzanol*—**Weigh an amount of Compound Fursultiamine, Pyridoxine Hydrochloride and γ-Oryzanol Capsules, equivalent to about 10 mg of γ-oryzanol according to the labeled amount, add 50 mL of 1-heptane, shake to mix, and extract. Then, dehydrate with anhydrous sodium sulfate, filter, and use this filtrate as the test solution. Separately, weigh about 10 mg of γ-oryzanol RS, add n-heptane, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of 1-heptane, ether and ethyl acetate (75 : 20 : 5) (as the developing solvent) to a distance of about 10 cm, and air-dry the plate. Spray evenly a potassium permanganate TS onto the plate; the R_f values and colors of the spots obtained from the test solution and the standard solution are the same.

(2) ***Sodium chondroitin sulfate*—**(i) Weigh an amount of Compound Fursultiamine, Pyridoxine Hydrochloride and γ-Oryzanol Capsules, equivalent to about 1 g of sodium chondroitin sulfate according to the labeled amount, add 60 mL of water, shake well to mix, extract, and filter. Extract and filter the residue 2 times each with 20 mL of water, combine these filtrates with the above filtrate, and add 1 mL of acriflavine solution (1 in 100); a orangey yellow acidic precipitate immediately forms, and this precipitate does not dissolve in dilute sodium hydroxide or dilute hydrochloric acid.

(ii) Perform the test as directed under the Assay (2); the retention times of the major peaks obtained from the test solution and the standard solution are the same.

(3) ***Riboflavin butyrate, fursultiamine, nicotinamide, pyridoxine hydrochloride, calcium pantothenate, cyanocobalamin and inositol*—**Perform the test with Compound Fursultiamine, Pyridoxine Hydrochloride and γ-Oryzanol Capsules as directed under the Analysis for Vitamins.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay (1) ***γ-Oryzanol*—**Weigh accurately the mass of NLT 20 capsules of Compound Fursultiamine, Pyridoxine Hydrochloride and γ-Oryzanol Capsules. Weigh accurately an amount of these capsules, equivalent to about 5 mg of γ-oryzanol ($C_{40}H_{58}O_4$), add the mobile phase to make exactly 50 mL, and use this solution as the test solution. Separately, weigh accurately about 5 mg of γ-oryzanol RS, add the mobile phase to make exactly 50 mL, and use this solution as the standard solution. Perform the test with the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak area, A_T and A_S, of γ-oryzanol in each solution.

$$\text{Amount (mg) of } \gamma\text{-oryzanol } (C_{40}H_{58}O_4) = \text{Amount (mg) of } \gamma\text{-oryzanol} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption spectrophotometer (wavelength: 280 nm).

Column: A stainless steel column about 3.9 mm in internal diameter and about 30 cm in length, packed with aminopropylsilanized silica gel for liquid chromatography (3 μm in particle diameter).

Mobile phase: A mixture of cyclohexane, ethyl acetate, and acetic acid (730 : 270 : 1).

Flow rate: 1.0 mL/min

(2) ***Sodium chondroitin sulfate*—**Weigh accurately the mass of NLT 20 capsules of Compound Fursultiamine, Pyridoxine Hydrochloride and γ-Oryzanol Capsules. Weigh accurately an amount of these capsules, equivalent to about 80 mg of sodium chondroitin sulfate, add 150 mL of water, sonicate for 10 minutes, and add water to make exactly 200 mL. Then, centrifuge. Take 5 mL of the clear supernatant, add 5 mL of 6 mol/L hydrochloric acid TS, fill nitrogen, then close the stopper, and warm at 100 ± 1 °C for 16 hours. After cooling, adjust the pH to 3.5 with sodium hydroxide TS, transfer into a 100-mL volumetric flask (wash the stoppered Erlenmeyer flask with water, and combine the washings into the vol-

umetric flask), add 5 mL of the internal standard solution, and then add water to make exactly 100 mL. Use this solution as the test solution. Separately, weigh accurately about 80 mg of sodium chondroitin sulfate RS, and add water to make exactly 200 mL. Transfer 5 mL of this solution into a stoppered Erlenmeyer flask, add 5 mL of 6 mol/L hydrochloric acid TS, then proceed in the same manner as in the preparation of the test solution, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the ratios, Q_T and Q_S, of the peak area of sodium chondroitin sulfate to the peak area of the internal standard, respectively.

$$\text{Amount (mg) of sodium chondroitin sulfate} = \text{Amount (mg) of sodium chondroitin sulfate RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—*dl*-3-amino-n-butyric acid solution (1 in 12500).

Operating conditions

Detector: A fluorometer (excitation wavelength: 345 nm, emission wavelength: 445 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 15 cm in length, packed with strongly acidic ion-exchange resin composed of sulfonated polystyrene (about 10 μm in particle diameter).

Column temperature: A constant temperature of about 50 °C.

Reaction vessel temperature: A constant temperature of about 50 ℃ (use a reaction coil with about 0.5 mm in internal diameter and about 2 m in length).

Mobile phase: Citrate buffer solution

Reaction regent: *O*-phthalaldehyde solution

Flow rate: Adjust the flow rate so that the peak retention time of sodium chondroitin sulfate is about 6 minutes.

Flow rate of reaction regent: About 1.0 mL/min.

Selection of column: Proceed with 10 μL of the standard solution according to the above conditions; internal standard and sodium chondroitin sulfate are eluted in this order, and each peak is completely separated.

(3) ***Nicotinamide, pyridoxine hydrochloride, fursultiamine and riboflavin butyrate***—Weigh accurately the mass of NLT 20 capsules of Compound Fursultiamine, Pyridoxine Hydrochloride and γ-Oryzanol Capsules. Weigh accurately an amount of these capsules, equivalent to about 50 mg of nicotinamide ($C_6H_5N_2O$), about 25 mg of pyridoxine hydrochloride ($C_8H_{11}NO_3 \cdot HCl$), about 50 mg of fursultiamine ($C_{17}H_{26}N_4O_3S_2$) and about 6 mg of riboflavin butyrate ($C_{33}H_{44}N_4O_{10}$), and add 20% methanol to make exactly 100 mL. Sonicate this solution at 60 ℃ for about 20 minutes, filter through a membrane filter with a pore size of NMT 0.45 μm, discard the first 2 mL of the filtrate, and use the subsequent filtrate as the test solution. Separately, weigh accurately about 50 mg of nicotinamide RS, about 25 mg of pyridoxine hydrochloride RS, about 50 mg of fursultiamine RS, and about 6 mg of riboflavin butyrate RS, add 20% methanol to make exactly 100 mL, sonicate at 60 ℃ for about 20 minutes, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_{T1}, A_{S1}, A_{T2}, A_{S2}, A_{T3}, A_{S3}, A_{T4}, and A_{S4}, of nicotinamide, pyridoxine hydrochloride, fursultiamine and riboflavin butyrate in each solution.

$$\text{Amount (mg) of nicotinamide } (C_6H_5N_2O) = \text{Amount (mg) of nicotinamide RS} \times \frac{A_{T1}}{A_{S1}}$$

$$\text{Amount (mg) of pyridoxine hydrochloride } (C_8H_{11}NO_3 \cdot HCl) = \text{Amount (mg) of pyridoxine hydrochloride RS} \times \frac{A_{T2}}{A_{S2}}$$

$$\text{Amount (mg) of fursultiamine } (C_{17}H_{26}N_4O_3S_2) = \text{Amount (mg) of fursultiamine RS} \times \frac{A_{T3}}{A_{S3}}$$

$$\text{Amount (mg) of riboflavin butyrate } (C_{33}H_{44}N_4O_{10}) = \text{Amount (mg) of riboflavin butyrate RS} \times \frac{A_{T4}}{A_{S4}}$$

Operating conditions

Detector: An ultraviolet absorption spectrophotometer (wavelength: 270 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 30 °C.

Mobile phase: Control the mixing ratio of mobile phase A and mobile phase B stepwise or via the gradient elution as follows.

Mobile phase A: Dissolve 1.9 g of sodium 1-hexanesulfonate in 800 mL of water, add 1.0 mL of formic acid, and then add water to make 1000 mL. Add 100 mL of methanol to 900 mL of this solution.

Mobile phase B: Methanol

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 - 3	100	0
3 - 10	100 → 0	0 → 100
10 - 15	0	100

Flow rate: 1.0 mL/min

System suitability

System performance: Proceed with 10 μL of the standard solution according to the above conditions; nicotinamide, pyridoxine hydrochloride, fursultiamine and

riboflavin butyrate are eluted in this order with the resolution between the pyridoxine hydrochloride peak and the fursultiamine peak being NLT 13.0.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution under the above conditions; the relative standard deviation of the peak areas of nicotinamide, pyridoxine hydrochloride, fursultiamine and riboflavin butyrate is NMT 1.0%.

(4) ***Cyanocobalamin***—Weigh accurately the mass of NLT 20 capsules of Compound Fursultiamine, Pyridoxine Hydrochloride and γ-Oryzanol Capsules. Weigh accurately an amount of these capsules, equivalent to about 150 μg of cyanocobalamin ($C_{63}H_{88}CoN_{14}O_{14}P$), and add water to make exactly 10 mL. Sonicate this solution for about 20 minutes, centrifuge at 13,000 rpm for 5 minutes, filter the lower layer through a membrane filter with a pore size of NMT 0.45 μm, and discard the first 2 mL of the filtrate. Use the subsequent filtrate as the test solution. Separately, weigh accurately about 15 mg of cyanocobalamin RS, and add water to make exactly 100 mL. Pipet 10 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of cyanocobalamin in each solution.

Amount (mg) of cyanocobalamin ($C_{63}H_{88}CoN_{14}O_{14}P$)
= Amount (mg) of cyanocobalamin RS× $\frac{A_T}{A_S} \times \frac{1}{100}$

Operating conditions

Detector: An ultraviolet absorption spectrophotometer (wavelength: 360 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 30 °C.

Mobile phase: Control the mixing ratio of mobile phase A and mobile phase B in stages or gradient elution as follows.

Mobile phase A: 10% methanol
Mobile phase B: 90% methanol

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 - 1	90	10
1 - 4	90 → 10	10 → 90
4 - 5	10	90

Flow rate: 1.0 mL/min

System suitability

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak areas of cyanocobalamin is NMT 1.0%

(5) ***Calcium pantothenate***—Weigh accurately the mass of NLT 20 capsules of Compound Fursultiamine, Pyridoxine Hydrochloride and γ-Oryzanol Capsules. Weigh accurately an amount of these capsules, equivalent to about 15 mg of calcium pantothenate ($C_{18}H_{32}CaN_2O_{10}$), and add water to make exactly 100 mL. Sonicate this solution for about 20 minutes, filter through a membrane filter with a pore size of NMT 0.45 μm, discard the first 2 mL of the filtrate, and use the subsequent filtrate as the test solution. Separately, weigh accurately about 15 mg of calcium pantothenate RS, add water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of calcium pantothenate in each solution.

Amount (mg) of calcium pantothenate ($C_{18}H_{32}CaN_2O_{10}$)
= Amount (mg) of calcium pantothenate RS× $\frac{A_T}{A_S}$

Operating conditions

Detector: An ultraviolet absorption spectrophotometer (wavelength: 210 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 30 °C.

Mobile phase: A mixture of methanol and 0.1% phosphoric acid (80 : 20).

Flow rate: 1.0 mL/min

System suitability

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak areas of calcium pantothenate is NMT 1.0%

(6) ***Inositol***—Weigh accurately the mass of NLT 20 capsules of Compound Fursultiamine, Pyridoxine Hydrochloride and γ-Oryzanol Capsules and perform the test as directed under the Analysis for Vitamins.

Packaging and storage Preserve in tight containers.

Compound Ginkgo Biloba Leaf Extract, Heptaminol Hydrochloride and Troxerutin Tablets

복방은행엽엑스·헵타미놀염산염·트록세루틴 정

Compound Ginkgo Biloba Leaf Extract, Heptaminol Hydrochloride and Troxerutin Tablets contain heptaminol hydrochloride ($C_8H_{20}NOCl$: 181.70) and troxerutin ($C_{33}H_{42}O_{19}$: 742.70) equivalent to 22.0% to 27.0% of the total gingoflavone glycosides in ginkgo leaf extract (total amount of quercetin glycoside, kaempferol glycoside, and isorhamnetin glycoside, average molecular weight 756.7) and 90.0% to 110.0% of the labeled amount.

Method of preparation Prepare as directed under Tablets, with Ginkgo Biloba Extract, Heptaminol Hydrochloride, and Troxerutin.

Identification (1) ***Ginkgo leaf extract***—Perform the test as directed under the identification for ginkgo leaf extract tablets, with Compound Ginkgo Biloba Leaf Extract, Heptaminol Hydrochloride and Troxerutin Tablets.

(2) ***Heptaminol hydrochloride***—(i) Put 1 mL of 10% aqueous solution of Compound Ginkgo Biloba Leaf Extract, Heptaminol Hydrochloride and Troxerutin Tablets, previously powdered, in a test tube, and add 8 mL of water, 1 mL of nitric acid, and 0.5 mL of silver nitrate solution; a white precipitate that is insoluble in nitric acid but soluble in ammonia water (chloride) is formed.

(ii) Weigh an amount of Powder Compound Ginkgo Biloba Leaf Extract, Heptaminol Hydrochloride and Troxerutin Tablets, previously powdered, equivalent to 200 mg of heptaminol hydrochloride according to the labeled amount, add 10 mL of methanol, and use the solution as the test solution. Separately, weigh 0.2 g of heptaminol hydrochloride RS, add 10 mL of methanol, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of ethyl acetate, isopropanol, and ammonia water (50 : 50 : 10) as the developing solvent to a distance of about 10 cm and air-dry the plate. Spray evenly iodine vapor onto plate, cool, and examine it under ultraviolet light (main wavelength 254 nm); the R_f value and the color of the spots obtained from the test solution and the standard solutions are the same.

(3) ***Troxerutin***—Weigh an amount of Compound Ginkgo Biloba Leaf Extract, Heptaminol Hydrochloride and
Troxerutin Tablets, previously powdered, equivalent to 100 mg of troxerutin, add in 100 mL of water, and use this solution as the test solution. Separately, weigh about 0.1 g of troxerutin RS, add water to make 100 mL and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of 1-propanol, water, ethyl acetate (100), and acetoc acod (100) (40 : 30 : 30 :1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength 254 nm) or spray 0.5% methanol solution of diphenyl boric acid aminoethyl ester; the test solution and the standard solution exhibit yellow spots at the same R_f value.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay (1) ***Ginkgo leaf extract***—Weigh accurately the mass of NLT 20 Compound Ginkgo Biloba Leaf Extract, Heptaminol Hydrochloride and Troxerutin Tablets, and power. Perform the test as directed in the paragraph (1) under the Assay of Ginkgo Leaf Extract Tablet.

(2) ***Heptaminol hydrocholride***—Weigh accurately the mass of NLT 20 Compound Ginkgo Biloba Leaf Extract, Heptaminol Hydrochloride and Troxerutin Tablets, and powder. Weigh accurately an amount equivalent to about 150 mg of heptaminol hydrochloride, put it in a beaker, dissolve in 45 mL of acetic acid(100) for non-aqueous titration, add 5 mL of mercury(II) acetate TS for non-aqueous titration, and titrate with 0.1 mol/L perchloric acid solution as directed in the potentiometric titration method under the Titration. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 18.170 mg of $C_8H_{19}NO \cdot HCl$

(3) ***Troxerutin***—Weigh accurately the mass of NLT 20 tablets of Compound Ginkgo Biloba Leaf Extract, Heptaminol Hydrochloride and Troxerutin Tablets, and powder. Weigh accurately an amount equivalent to about 0.2 g of troxerutin and add water to make 100 mL. Take 5.0 mL of this solution and add ethanol to make 100 mL, take 5.0 mL of this solution, and add 12.5 mL of a mixture of 0.1 mol/L sodium hydroxide solution, 0.05 mol/L sodium bicarbonate solution, and methanol (1 : 1 : 1) and ethanol to make 25 mL. Use the solution as the test solution. Separately, weigh accurately about 0.2 g of troxerutin RS, proceed in the same manner as in the test solution, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at the wavelength of 248 nm as directed under the Ultraviolet-visible Spectroscopy.

Amount (mg) of troxerutin ($C_{33}H_{42}O_{19}$)
$= \text{Amount (mg) of troxerutin RS} \times \frac{A_T}{A_S}$

Packaging and storage Preserve in tight containers.

Compound Glycine, L-Leucine and L-Cysteine Hydrochloride Injection
복방글리신·L-류신·L-시스테인염산염 주사액

Compound Glycine, L-Leucine and L-Cysteine Hydrochloride Injection contains NLT 90.0% and NMT 130.0% of the labeled amount of L-leucine ($C_6H_{13}NO_2$: 131.17), L-methionine ($C_5H_{11}NO_2S$: 149.21), L-valine ($C_5H_{11}NO_2$: 117.15), L-serine ($C_3H_7NO_3$: 105.09), L-arginine ($C_6H_{14}N_4O_2$: 174.20), glycine ($C_2H_5O_2N$: 75.07), L-alanine ($C_3H_7NO_2$: 89.09), L-cysteine hydrochloride hydrate ($C_3H_7NO_2S \cdot HCl \cdot H_2O$: 175.64), L-isoleucine ($C_6H_{13}NO_2$: 131.17), L-lysine acetate ($C_6H_{14}N_4O_4 \cdot C_2H_4O_2$: 206.24), L-threonine ($C_6H_{14}N_4O_4 \cdot C_2H_4O_2$: 206.24), L-tryptophan ($C_{11}H_{12}N_2O_2$: 204.23), L-phenylalanine ($C_9H_{11}NO_2$: 165.19), L-proline ($C_5H_9NO_2$: 115.13) and L-histidine ($C_6H_9N_3O_2$: 155.16).

Method of preparation Prepare as directed under Injections, with L-Leucine, L-Methionine, L-Valine, L-Serine, L-Arginine, Glycine, L-Alanine, L-Cysteine Hydrochloride Hydrate, L-Isoleucine, L-Lysine Acetate, L-Threonine, L-Tryptophan, L-Phenylalanine, L-Proline and L-Histidine.

Identification (1) ***Amino acids***—Perform the test with Compound Glycine, L-Leucine and L-Cysteine Hydrochloride Injection as directed under the Identification and Assay for Amino Acids.

(2) ***Chloride and acetate***—Compound Glycine, L-Leucine and L-Cysteine Hydrochloride Injection responds to the Qualitative Analysis for chloride and acetate.

pH Between 5.5 and 7.5.

Sterility Meets the requirements.

Bacterial endotoxins Less than 0.5 EU per mL of Compound Glycine, L-Leucine and L-Cysteine Hydrochloride Injection.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets requirements.

Extractable volume of injections Meets the requirements.

Assay Take exactly an amount of Compound Glycine, L-Leucine and L-Cysteine Hydrochloride Injection, and perform the test as directed under the Identification and Assay for Amino Acids.

Packaging and storage Preserve in hermetic containers.

Compound Lysozyme Hydrochloride, Ascorbic Acid and Tocopherol Acetate Capsules
복방리소짐염산염·아스코르브산·토코페롤아세테이트 캡슐

Compound Lysozyme Hydrochloride, Ascorbic Acid and Tocopherol Acetate Capsules contain NLT 90.0% and NMT 130.0% of the labeled amount of lysozyme hydrochloride, NLT 90.0% and NMT 150.0% of the labeled amounts of ascorbic acid ($C_6H_8O_6$: 176.12) and tocopherol acetate ($C_{31}H_{52}O_3$: 472.74), and NLT 90.0% and NMT 110.0% of the labeled amount of chlorophylline copper complex sodium.

Method of preparation Prepare as directed under Capsules, with Lysozyme Hydrochloride, Ascorbic Acid, Tocopherol Acetate, and Chlorophyllin Copper Complex Sodium.

Identification (1) ***Lysozyme hydrochloride*—**Weigh an amount of Compound Lysozyme Hydrochloride, Ascorbic Acid and Tocopherol Acetate Capsules equivalent to about 50 mg of lysozyme hydrochloride, add 5 mL of 0.4 mol/L sodium chloride solution, shake to mix well, and centrifuge the solution. Take the clear supernatant, add 5 mL of acetic acid and sodium acetate buffer solution (pH 5.4), and shake to mix to. Add 1 mL of ninhydrin TS to 5 mL of this solution, and heat; this solution exhibits a reddish-purple color.

(2) ***Ascorbic acid, tocopherol acetate*—**Perform the test with Compound Lysozyme Hydrochloride, Ascorbic Acid and Tocopherol Acetate Capsules as directed under the Analysis for Vitamins.

(3) ***Chlorophylline copper complex sodium*—**Add 60 mL of acetic acid(100) to Compound Lysozyme Hydrochloride, Ascorbic Acid and Tocopherol Acetate Capsules, shake to dissolve, take 2 mL of the filtrate, and add acetic acid(100) to make 100 mL. Use acetic acid(100) as a control solution and determine the absorption spectrum as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum absorbance around a wavelength of 405 nm.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay (1) ***Lysozyme hydrochloride, ascorbic acid***—Weigh accurately the contents of NLT 20 capsules of Compound Lysozyme Hydrochloride, Ascorbic Acid and Tocopherol Acetate Capsules. Weigh accurately the amount equivalent to about 15 mg of lysozyme hydro-

chloride and about 75 mg of ascorbic acid ($C_6H_6O_6$), add 0.1% trifluoroacetic acid solution to make 100 mL, sonicate for 30 minutes, and filter through a membrane filter with a pore size of NMT 0.45 μm. Use this solution as the test solution. Separately, weigh accurately 15 mg of lysozyme hydrochloride RS and 75 mg of ascorbic acid RS, add 0.1% trifluoroacetic acid solution to make 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions.

$$\text{Amount (mg) of lysozyme hydrochloride} = \text{Amount (mg) of lysozyme hydrochloride RS} \times \frac{A_{T1}}{A_{S1}}$$

$$\text{Amount (mg) of ascorbic acid } (C_6H_6O_6) = \text{Amount (mg) of ascorbic acid RS} \times \frac{A_{T3}}{A_{S3}}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 30 °C.

Mobile phase: Control the gradient elution by modifying the mixing ratio of mobile phases A and B as follows.

Mobile phase A: 0.1% trifluoroacetic acid solution

Mobile phase B: Add 1 mL of trifluoroacetic acid to 1000 mL of acetonitrile.

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 - 2	100 → 95	0 → 5
2 - 7	95 → 50	5 → 50
7 - 15	50	50

Flow rate: 1.0 mL/min

System suitability

System performance: Proceed with 10 μL of the standard solution under the above operating conditions; Ascorbic acid and lysozyme hydrochloride are eluted in this order with the resolution being NLT 21.

System repeatability: Repeat the test 6 times with 10 μL of the standard solution according to the above conditions; the relative standard deviation of the peak area of lysozyme is NMT 1.0%.

(2) ***Tocopherol acetate*—**Weigh accurately the contents of NLT 20 capsules of Compound Lysozyme Hydrochloride, Ascorbic Acid and Tocopherol Acetate Capsules. Weigh accurately the amount equivalent to about 50 mg of tocopherol acetate ($C_{31}H_{52}O_3$), add methanol to make 100 mL, sonicate for 30 minutes, filter through a membrane filter of NMT 0.45 μm, and use this solution as the test solution. Separately, weigh accurately the amount equivalent to about 50 mg of tocopherol acetate RS and add methanol to make 100 mL and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak area of tocopherol acetate A_T and A_S, in each solution.

$$\text{Amount (mg) of tocopherol acetate } (C_{31}H_{52}O_3) = \text{Amount (mg) of tocopherol acetate} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 30 °C.

Mobile phase: Methanol

Flow rate: 1.0 mL/min

System suitability

System repeatability: Repeat the test 6 times with 10 μL of the standard solution according to the above conditions; the relative standard deviation of the peak area of tocopherol acetate is NMT 1.0%.

(3) ***Chlorophylline copper complex sodium*—**Weigh accurately the contents of NLT 20 Compound Lysozyme Hydrochloride, Ascorbic Acid and Tocopherol Acetate Capsules, and powder. Weigh accurately the amount equivalent to about 20 mg of chlorophylline copper complex sodium, add 30 mL of hexane, and shake to mix, discard the hexane layer, add 40 mL of a mixture of methyl cellosolve and dilute hydrochloric acid (50 : 2) to the residue, shake to mix, and perform the centrifuge. Pipet 1.0 mL of the clear supernatant, and add phosphate buffer solution (pH 7.5) to make 50 mL. Separately, weigh accurately about 20 mg of chlorophylline copper complex salt RS and prepare it in the same manner as the test solution. Use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, at a wavelength of 405 nm as directed under the Ultraviolet-visible Spectroscopy, using phosphate buffer solution (pH 7.5) as the control solution.

$$\text{Amount (mg) of chlorophylline copper complex sodium} = \text{Amount (mg) of chlorophylline copper complex sodium RS} \times \frac{A_T}{A_S}$$

Packaging and storage Preserve in tight containers.

Compound Miconazole Nitrate, Lidocaine and Crotamiton Cream
복방미코나졸질산염·리도카인·크로타미톤 크림

Compound Miconazole Nitrate, Lidocaine and Crotamiton Cream contains NLT 90.0% and NMT 110.0% of the labeled amount of miconazole nitrate ($C_{18}H_{14}Cl_4N_2O \cdot HNO_3$: 479.14), lidocaine ($C_{14}H_{22}N_2O$: 234.34), crotamiton ($C_{13}H_{17}NO$: 203.28) and dipotassium glycyrrhizinate ($C_{42}H_{60}K_2O_{16}$: 899.11).

Method of preparation Prepare as directed under Creams, with Miconazole Nitrate, Lidocaine, Crotamiton and Dipotassium Glycyrrhizinate.

Identification The major peaks obtained from the test solution and standard solution under the Assay are the same in retention time.

Assay Weigh accurately an amount of Compound Miconazole Nitrate, Lidocaine and Crotamiton Cream, equivalent to about 10 mg of miconazole nitrate ($C_{18}H_{14}Cl_4N_2O \cdot HNO_3$) [about 20 mg of lidocaine ($C_{14}H_{22}N_2O$), about 100 mg of crotamiton ($C_{13}H_{17}NO$) and about 5 mg of dipotassium glycyrrhizinate ($C_{42}H_{60}K_2O_{16}$)], add methanol to make exactly 100 mL, sonicate for 30 minutes, then filter with a membrane filter of pore size 0.45 μm, and use the filtrate as the test solution. Separately, weigh accurately about 10 mg of miconazole nitrate RS, about 20 mg of lidocaine RS, about 100 mg of crotamiton RS, and about 5 mg of dipotassium glycyrrhizinate RS, respectively, add methanol to make exactly 100 mL, and use these solutions as the standard solutions. With exactly 10 μL each of the test solution and the standard solutions, perform the test as directed under the Liquid Chromatography according to the following conditions, and measure the peak areas of miconazole nitrate, lidocaine, crotamiton and dipotassium glycyrrhizinate, A_{T1}, A_{T2}, A_{T3}, A_{T4}, A_{S1}, A_{S2}, A_{S3} and A_{S4}, from each solution.

Amount (mg) of miconazole nitrate ($C_{18}H_{14}Cl_4N_2O \cdot HNO_3$)
= Amount (mg) of miconazole nitrate RS × $\frac{A_{T1}}{A_{S1}}$

Amount (mg) of lidocaine ($C_{14}H_{22}N_2O$)
= Amount (mg) of lidocaine RS × $\frac{A_{T2}}{A_{S2}}$

Amount (mg) of crotamiton ($C_{13}H_{17}NO$)
= Amount (mg) of crotamiton RS × $\frac{A_{T3}}{A_{S3}}$

Amount (mg) of dipotassium glycyrrhizinate ($C_{42}H_{60}K_2O_{16}$)
= Amount (mg) of dipotassium glycyrrhizinate RS × $\frac{A_{T4}}{A_{S4}}$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm, but 220 nm for miconazole nitrate).

Column: A stainless steel column about 4.6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 30 °C.

Mobile phase: Control the mixing ratio of mobile phase A and mobile phase B stepwise or via the gradient elution.

Mobile phase A: Dissolve 1.361 g of potassium dihydrogen phosphate in 1000 mL of water and add phosphoric acid to adjust pH to 2.5.

Mobile phase B: Methanol

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0.0 - 20.0	100 → 0	0 → 100
20.0 - 25.0	0	100
25.0 - 25.1	0 → 100	100 → 0
25.1 - 35.0	100	0

Flow rate: 1.0 mL/min

System suitability

System performance: Proceed with 10 μL of the standard solution according to the above conditions; the lidocaine, crotamiton, dipotassium glycyrrhizinate and miconazole nitrate peaks are eluted in this order with the resolution between crotamiton and dipotassium glycyrrhizinate peaks being NLT 5.3.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution under the above operating conditions; the relative standard deviation of the peak areas of dipotassium glycyrrhizinate is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Compound Milk-thistle Fruit Extract, Nicotinamide and Riboflavin Capsules
복방밀크시슬엑스·니코틴산아미드·리보플라빈 캡슐

Compound Milk-thistle Fruit Extract, Nicotinamide, and Riboflavin Capsules contain NLT 90.0% and NMT 150.0% of the labeled amounts of thiamine hydrochloride ($C_{12}H_{17}ClN_4OS \cdot HCl$: 337.27), nicotinic acid amide ($C_6H_6N_2O$: 122.13), riboflavin ($C_{17}H_{20}N_4O_6$: 176.13), and pyridoxine hydrochloride ($C_{17}H_{20}N_4O_6$: 176.13), pantothenate ($C_{18}H_{32}CaN_2O_{10}$: 476.54), and cyanocobalamin ($C_{63}H_{88}CoN_{14}O_{14}P$: 1,355.38), NLT 90.0% and

NMT 110.0% of the labeled amounts of silymarin [as silybin ($C_{25}H_{22}O_{10}$: 482.40)] in milk thistle extract. (However, among the content of silymarin, the sum of silydianin ($C_{25}H_{22}O_{10}$: 482.40) and silycristine ($C_{25}H_{22}O_{10}$: 482.40) is NLT 20.0% and NMT 45.0%, the sum of silybcin A ($C_{25}H_{22}O_{10}$: 482.40), and silybin B ($C_{25}H_{22}O_{10}$: 482.40) is NLT 40.0% and NMT 65.0%, and the sum of isosilybin A ($C_{25}H_{22}O_{10}$: 482.40) and isosilybin B ($C_{25}H_{22}O_{10}$: 482.40) is NLT 10.0% and NMT 20.0%.)

Method of preparation Prepare as directed under Capsules, with Milk Thistle Extract, Thiamine Hydrochloride, Nicotinic Acid Amide, Riboflavin, Pyridoxine Hydrochloride, Calcium Pantothenate, Cyanocobalamin.

Identification (1) ***Milk-thistle Fruit Extract*—**(i) Weigh an amount of Compound Milk-thistle Fruit Extract, Nicotinamide and Riboflavin Capsules equivalent to about 30 mg of milk thistle extract, shake to mix with 10 mL of methanol, sonicate for 10 minutes, and use this solution as the test solution. Allow the test solution to stand for at least 15 minutes before use. Separately, weigh 2 mg of silibin RS, 5 mg of taxifolin RS, add 10 mL of methanol, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on a plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate using a mixture of dichloromethane, acetone, and formic acid (75 : 16.5 : 8.5) as the developing solvent to a distance of about 10 cm, dry the plate between 100 and 105 ℃. Spray evenly 1% methanolic diphenylboric acid 2-aminoethyl ester solution on the plate, spray evenly 5% methanolic PEG 400 solution on to the plate, and examine it under ultraviolet light (main wavelength 365 nm); the R_f values and the light green fluorescence of the silybin spots obtained from the test solution and the standard solution are the same, and the test solution exhibits a relatively weakly fluorescent area above the silybin spot. The R_f values and yellowish brown fluorescence of taxifolin spots obtained from the test solution correspond to those of the standard solution, and in the test solution, a light green fluorescent spot (silicristin) exhibits below taxifolin.

(ii) Perform the test as directed under the Assay (1) with Compound Milk-thistle Fruit Extract, Nicotinamide and Riboflavin Capsules; the peaks of silycristine, silydianine, silybin A, silybin B, isosilybin A, and isosilybin B are appeared in this order in the test solution.

(2) ***Thiamine hydrochloride, nicotinic acid amide, riboflavin, pyridoxine hydrochloride, calcium pantothenate, cyanocobalamin*—**Perform the test as directed under the Analysis for Vitamins, with Compound Milk-thistle Fruit Extract, Nicotinamide and Riboflavin Capsules.

Disintegration Meets the requirements.

Uniformity of dosage units Meets requirements.

Assay (1) ***Silymarin (as silybin) in milk thistle extract*—**Weigh accurately the mass of NLT 20 capsules of Compound Milk-thistle Fruit Extract, Nicotinamide and Riboflavin Capsules equivalent to about 10 mg of silybin, add 90 mL of methanol, perform ultrasonic extraction for 20 minutes, cool to 20 °C, an filter. Add methanol to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 10 mg of silybin RS (previously dried in a silica gel desiccator for 24 hours) and milk thistle extract control solution equivalent to about 10 mg of silybin, add methanol to make exactly 100 mL, and use these solutions as the standard solution and the milk thistle extract control solution, respectively. Perform the test as directed under the Liquid Chromatography according to the following conditions with 10 μL each of the test solution, standard solution, and control solution and determine the peak area of the test solution and the standard solution using the peaks of silicristin, silydianine, silybin A, silybin B, isosilybin A, and isosilybin B confirmed in the milk thistle extract control solution.

$$\text{Content (\%) of silymarin [as silybin } (C_{25}H_{22}O_{10})] = \frac{(F_1 + F_2 + F_3 + F_4 + F_5 + F_6) \times m_1}{F_7 + F_8 \times m_2} \times 100$$

$$\text{Amounts (\%) of silychristin } (C_{25}H_{22}O_{10}) \text{ and silydianin} (C_{25}H_{22}O_{10}) = \frac{F_1 + F_2}{(F_1 + F_2 + F_3 + F_4 + F_5 + F_6)} \times 100$$

$$\text{Amounts (\%) of silybin A } (C_{25}H_{22}O_{10}) \text{ and silybin B} (C_{25}H_{22}O_{10}) = \frac{F_3 + F_4}{(F_1 + F_2 + F_3 + F_4 + F_5 + F_6)} \times 100$$

$$\text{Amounts (\%) isosilybin A } (C_{25}H_{22}O_{10}) \text{ and isosilybin B } (C_{25}H_{22}O_{10}) = \frac{F_5 + F_6}{(F_1 + F_2 + F_3 + F_4 + F_5 + F_6)} \times 100$$

F_1 = Peak area of silicristin in the test solution
F_2 = Peak area of silidianine in the test solution
F_3 = Peak area of silybin A in the test solution
F_4 = Peak area of silybin B in the test solution
F_5 = Peak area of iosilybin A in test solution
F_6 = Peak area of isosilybin B in the test solution
F_7 = Peak area of silybin A in the standard solution
F_8 = Peak area of silybin B in the standard solution
m_1 = Mass (g) of silybin standard
m_2 = Mass (g) of milk thistle extract

Operating conditions

Detector: UV spectrophotometer (wavelength: 288 nm).

Column: A stainless steel column about 4 mm to 6

mm in internal diameter and 12 cm to 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm to 10 μm in particle diameter).

Mobile phase: Use mobile phases A and B to control a stepwise or gradient elution-wise as follows.

Mobile phase A: A mixture of water, methanol, and 85% phosphoric acid (65 : 35 : 0.5).

Mobile phase B: A mixture of water, methanol, and 85% phosphoric acid (50 : 50 : 0.5).

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 - 28	100 → 0	0 → 100
28 - 35	0	100
35 - 36	0 → 100	100 → 0
36 - 51	100	0

Flow rate: 0.8 mL/min

Injection volume: 10 μL

System suitability: At least 1.8 minutes (difference in retention time between peaks of silybin A and silybin B). The retention time of silybin B should be about 30 minutes. If necessary, change the gradient elution of the mobile phase.

(2) ***Thiamine hydrochloride, nicotinic acid amide, riboflavin, pyridoxine hydrochloride, calcium pantothenate, cyanocobalamin*—**Weigh accurately the Mass of the content of NLT 20 capsules of Compound Milk-thistle Fruit Extract, Nicotinamide and Riboflavin Capsules and perform the test as directed under the Analysis for Vitamins.

Packaging and storage Preserve in light-resistant, tight containers.

Compound Nicotinamide, *d*-Biotin and Pyridoxine Hydrochloride Capsules
복방니코틴산아미드·*d*-비오틴·피리독신염산염 캡슐

Compound Nicotinamide, *d*-Biotin and Pyridoxine Hydrochloride Capsules contain NLT 90.0% and NMT 150.0% of the labeled amounts of nicotinamide ($C_6H_6N_2O$: 122.13), *d-biotin* ($C_{10}H_{16}N_2O_3S$: 244.31), pyridoxine hydrochloride ($C_8H_{11}NO_3 \cdot HCl$: 205.64), and NLT 90.0% and NMT 130.0% of the labeled amount of riboflavin butyrate ($C_{33}H_{44}N_4O_{10}$: 656.72) and NLT 90.0% and NMT 110.0% of the labeled amount of ursodeoxycholic acid (UDCA) ($C_{24}H_{40}O_4$: 392.57).

Method of preparation Prepare as directed under Capsules, with Nicotinamide, *D*-Biotin, Pyridoxine Hydrochloride, Ursodeoxycholic Acid, and Riboflavin Butyrate.

Identification (1) ***Pyridoxine hydrochloride, nicotinamide, d-biotin, riboflavin butyrate*—**Perform the test with Compound Nicotinamide, *d*-Biotin and Pyridoxine Hydrochloride Capsules as directed under the Analysis for Vitamins.

(2) ***Ursodeoxycholic acid*—**Weigh accurately an amount of Compound Nicotinamide, *d*-Biotin and Pyridoxine Hydrochloride Capsules equivalent to 10 mg of ursodeoxycholic acid according to the labeled amount, add 20 mL of ethanol, extract, and filter. Evaporate the filtrate on a steam bath to dryness, dissolve in 10 mL of ethanol, and use this solution as the test solution. Separately, weigh 10 mg of ursodeoxycholic acid RS, dissolve in 10 mL of ethanol, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on a thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of ethyl acetate, acetic acid(100), isooctane (40 : 30 : 30) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Spray evenly phosphomolybdic acid in 50% saturated sulfuric acid solution on the plate; the R_f values and the colors of the spots obtained from the test solution and the standard solution are the same.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay (1) ***Pyridoxine hydrochloride, nicotinamide, d-biotin, riboflavin butyrate*—**Weigh accurately the mass of NLT 20 capsules of Compound Nicotinamide, *d*-Biotin and Pyridoxine Hydrochloride Capsules and perform the test as directed under the Analysis for Vitamins.

(2) ***Ursodeoxycholic acid*—**Weigh accurately the contents of NLT 20 capsules of Compound Nicotinamide, *d*-Biotin and Pyridoxine Hydrochloride Capsules. Weigh accurately 50.0 mg of ursodeoxycholic acid ($C_{24}H_{40}O_4$), add 40 mL of methanol, shake well to mix for 30 minutes, and dissolve. Add 5.0 mL of the internal standard solution and 50 mL of methanol and use this solution as the test solution. Separately, weigh accurately 50.0 mg of ursodeoxycholic acid, dissolve in 40 mL of methanol, add 5.0 mL of the internal standard solution and methanol to make 50 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the ratios, Q_T and Q_S of the peak area of ursodeoxycholic acid to that of the internal standard.

$$\text{Amount (mg) of ursodeoxycholic acid } (C_{24}H_{40}O_4) = \text{Amount (mg) of ursodeoxycholic acid RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—Weigh accurately 0.5 g

of cholic acid and dissolve in methanol to make 50 mL.

Operating conditions

Detector: A differential refractometer

Column: A stainless steel column about 4 mm in internal diameter and about 15 cm to 30 cm in length, packed with octasilanized silica gel for liquid chromatography (5 μm to 10 μm in particle diameter).

Mobile phase: A solution adjusted to pH 3.5 with phosphoric acid added to 500 mL of a mixture of methanol and water (70 : 30).

Flow rate: 1.0 mL/min

Packaging and storage Preserve in tight containers.

Compound Nicotinamide, Cyanocobalamin and Pyridoxine Hydrochloride Capsules
복방니코틴산아미드·시아노코발라민·피리독신염산염 캡슐

Compound Nicotinamide, Cyanocobalamin and Pyridoxine Hydrochloride Capsules contain NLT 90.0% and NMT 150.0% of the labeled amounts of nicotinamide ($C_6H_6N_2O$:122.13), cyanocobalamin ($C_{63}H_{88}CoN_{14}O_{14}P$: 1355.37), pyridoxine hydrochloride ($C_8H_{11}NO_3 \cdot HCl$: 205.64), and thiamine nitrate ($C_{12}H_{17}N_5O_4S$: 327.36), and NLT 90.0% and NMT 110.0% of the labeled amounts of calcium pantothenate ($C_{18}H_{32}CaN_2O_{10}$: 476.53), silymarin [Silybin ($C_{25}H_{22}O_{10}$: 482.40)] in milk thistle extract. (However, among the content of silymarin, the sum of silydianin ($C_{25}H_{22}O_{10}$: 482.40) and silicristin ($C_{25}H_{22}O_{10}$: 482.40) is 20.0% to 45.0%, the sum of silybin A ($C_{25}H_{22}O_{10}$: 482.40) and silybin B ($C_{25}H_{22}O_{10}$: 482.40) is 40.0% to 65.0%, and the sum of isosilybin A ($C_{25}H_{22}O_{10}$: 482.40) and isosilybin B ($C_{25}H_{22}O_{10}$: 482.40) is 10.0% to 20.0%.

Method of preparation Prepare as directed under Capsules, with Nicotinamide, Cyanocobalamin, Pyridoxine Hydrochloride, Thiamine Nitrate, Calcium Pantothenate and Milk Thistle Extract.

Identification (1) ***Milk thistle extract*—**(i) Weigh an amount of Compound Nicotinamide, Cyanocobalamin and Pyridoxine Hydrochloride Capsules equivalent to about 30 mg of milk thistle extract according to the labeled amount, shake to mix with 10 mL of methanol, sonicate for 10 minutes, and use this solution as the test solution. Allow the test solution to stand for at least 15 minutes before use. Separately, weigh 2 mg of silibin RS and 5 mg of taxifolin RS, dissolve in 10 mL of methanol, and use this solution as the standard solution (1) and the standard solution (2). With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on a plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate using a mixture of dichloromethane, acetone, and formic acid (75 : 16.5 : 8.5) as the developing solvent to a distance of about 10 cm, dry the plate between 100 and 105 ℃, and air-dry the plate. Spray evenly 1% methanolic diphenylboric acid 2-aminoethyl ester solution on the plate, then spray evenly 5% methanolic polyethylene glycol 400 solution on the plate, and examine under ultraviolet light (main wavelength: 365 nm); the R_f values and pale green fluorescence of the silybin spot obtained from the test solution and the standard solution are the same, and the test solution exhibits a relatively weakly fluorescent area above the silybin spot. The R_f values and yellowish brown fluorescence of taxifolin spots obtained from the test solution and the standard solution are the same, and in the test solution, a light green fluorescent spot (silicristin) exhibits below taxifolin.

(ii) With Compound Nicotinamide, Cyanocobalamin and Pyridoxine Hydrochloride Capsules, perform the test as directed under the Assay (1); silycristine, silydianine, silybin A, silybin B, isosilybin A, and isosilybin B are eluted in this order in the test solution.

(2) ***Nicotinamide, cyanocobalamin, pyridoxine hydrochloride, thiamine nitrate, calcium pantothenate*—**Perform the test as directed under the Assay; the retention times of the major peak of each principal component obtained from the test solution and standard solution are the same.

Disintegration Meets the requirements.

Uniformity of dosage units Meet requirements.

Assay (1) ***Silymarin (as silybin) in milk thistle extract*—**Weigh accurately the mass of NLT about 20 capsules of Compound Nicotinamide, Cyanocobalamin and Pyridoxine Hydrochloride Capsules Weigh accurately an amount equivalent to about 10 mg of silybin, add 90 mL of methanol, sonicate for 20 minutes, cool to 20 ℃, filter, and add methanol to make exactly 100 mL. Use this solution as the test solution. Separately, silibin standard RS (dried in a silica gel desiccator for 24 hours in advance) Weigh accurately Milk Thistle Extract equivalent to about 10 mg and about 10 mg of silybin, add methanol to make exactly 100 mL, and use these solutions as the standard solution and milk thistle extract control solution, respectively. With each 10 μL of the test solution, the standard solution, and the control solution, perform the test as directed under the Liquid Chromatography according to the following conditions; determine the peak area of the test solution and the standard solution using the peaks of silicristin, silydianin, silybin A, silybin B, isosilybin A, and isosilybin B confirmed in the milk thistle extract control solution.

$$\text{Content (\%) of silymarin [as silybin } (C_{25}H_{22}O_{10})] = \frac{(F_1 + F_2 + F_3 + F_4 + F_5 + F_6) \times m_1}{(F_7 + F_8) \times m_2} \times 100$$

Content (%) of silicristine ($C_{25}H_{22}O_{10}$) and silidianin ($C_{25}H_{22}O_{10}$)

$$= \frac{F_1 + F_2}{(F_1 + F_2 + F_3 + F_4 + F_5 + F_6)} \times 100$$

Content (%) of silybin A ($C_{25}H_{22}O_{10}$) and silybin B ($C_{25}H_{22}O_{10}$)

$$= \frac{F_3 + F_4}{(F_1 + F_2 + F_3 + F_4 + F_5 + F_6)} \times 100$$

Content (%) of isosilybin A ($C_{25}H_{22}O_{10}$) and isosilybin B ($C_{25}H_{22}O_{10}$)

$$= \frac{F_5 + F_6}{(F_1 + F_2 + F_3 + F_4 + F_5 + F_6)} \times 100$$

F_1 = Peak area of silicristin in the test solution
F_2 = Peak area of silidianine in the test solution
F_3 = Peak area of silybin A in the test solution
F_4 = Peak area of silybin B in the test solution
F_5 = Peak area of iosilybin A in test solution
F_6 = Peak area of isosilybin B in the test solution
F_7 = Peak area of silybin A in the standard solution
F_8 = Peak area of silybin B in the standard solution
m_1 = Mass (g) of silybin standard
m_2 = Mass (g) of milk thistle extract

Operating conditions

Detector: An ultraviolet absorption spectrophotometer (wavelength: 288 nm).

Column: A stainless steel column about 4 mm to 6 mm in internal diameter and about 12 cm to 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm to 10 μm in particle diameter).

Mobile phase: Use mobile phases A and B to control a stepwise or gradient elution-wise as follows.

Mobile phase A: A mixture of water, methanol, and 85% phosphoric acid (65 : 35 : 0.5).

Mobile phase B: A mixture of water, methanol, and 85% phosphoric acid (50 : 50 : 0.5).

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 - 28	100 → 0	0 → 100
28 - 35	0	100
35 - 36	0 → 100	100 → 0
36 - 51	100	0

Flow rate: 0.8 mL/min

System suitability: At least 1.8 minutes (difference in retention time between peaks of silybin A and silybin B). The retention time of silybin B should be about 30 minutes. If absolutely necessary, change the gradient elution of the mobile phase.

(2) ***Nicotiniamide, cyanocobalamin, pyridoxine hydrochloride, thiamine nitrate, calcium pantothenate—***Weigh accurately the mass of NLT 20 capsules of Compound Nicotinamide, Cyanocobalamin and Pyridoxine Hydrochloride Capsules and perform the test as directed under the Analysis for Vitamins.

Packaging and storage Preserve in light-resistant, tight containers.

Compound Nicotinamide, Riboflavin and Oyster Shell Powder Tablets
복방니코틴산아미드·리보플라빈·모려가루 정

Compound Nicotinamide, Riboflavin and Oyster Shell Powder Tablets contain NLT 90.0% and NMT 150.0% of the labeled amount of nicotinamide ($C_6H_6N_2O$: 122.13), riboflavin ($C_{17}H_{20}N_4O_6$: 376.36), ascorbic acid ($C_6H_8O_6$: 176.12), pyridoxine hydrochloride ($C_8H_{11}NO_3 \cdot HCl$: 205.64), thiamine nitrate ($C_{12}H_{17}N_5O_4S$: 327.36), tocopherol acetate ($C_{31}H_{52}O_3$: 472.74), cholecalciferol ($C_{27}H_{44}O$: 384.64), and retinol palmitate ($C_{36}H_{60}O_2$: 524.86), NLT 90.0% and NMT 150.0% of iron (Fe: 55.85) in ferrous fumarate ($C_4H_2FeO_4$: 169.90), magnesium (Mg: 24.31), manganese (Mn: 54.94) in manganese sulfate hydrate, zinc (Zn: 65.38) in zinc sulfate hydrate, and NLT 90.0% of calcium (Ca: 40.078) in oyster shell powder.

Method of preparation Prepare as directed under Tablets, with Nicotinamide, Riboflavin, Oyster Shell Powder, Magnesium Oxide, Ascorbic Acid, Pyridoxine Hydrochloride, Thiamine Nitrate, Tocopherol Acetate, Cholecalciferol, Retinol Palmitate, Ferrous Fumarate, Manganese Sulfate Hydrate, and Zinc Sulfate Hydrate.

Identification (1) ***Nicotinamide, riboflavin, ascorbic acid, pyridoxine hydrochloride, thiamine nitrate, tocopherol acetate, cholecalciferol, and retinol palmitate—***Perform the test with Compound Nicotinamide, Riboflavin and Oyster Shell Powder Tablets as directed under the Analysis for Vitamins. However, use retinol palmitate RS for vitamin A.

(2) ***Ferrous fumarate, magnesium oxide, manganese sulfate hydrate, and zinc sulfate hydrate—***Perform the test with Compound Nicotinamide, Riboflavin and Oyster Shell Powder Tablets as directed under the Analysis for Minerals.

(3) ***Calcium in oyster shell powder***—Weigh an amount of Compound Nicotinamide, Riboflavin and Oyster Shell Powder Tablets equivalent to about 0.5 g of oyster shell, add 20 mL of dilute hydrochloric acid, dissolve by warming, and filter. Wash the residue 2 times each with 10 mL of dilute hydrochloric acid, combine the filtrate and the washings, add ammonia water to make it alkaline, and add excess hot ammonium hydroxide solution; a white precipitate forms, and this precipitate is insoluble in dilute acetic acid, but it is soluble in dilute hydrochloric acid or dilute sulfuric acid.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay (1) ***Nicotinamide, riboflavin, ascorbic acid, pyridoxine hydrochloride, thiamine nitrate, tocopherol acetate, retinol palmitate, and cholecalciferol***—Weigh accurately the mass of NLT 20 Compound Nicotinamide, Riboflavin and Oyster Shell Powder Tablets, powder, and perform the test as directed under the Analysis for Vitamins.

(2) ***Iron, magnesium, manganese, and zinc***—Weigh accurately the mass of NLT 20 Compound Nicotinamide, Riboflavin and Oyster Shell Powder Tablets, powder, and perform the test as directed under the Analysis for Minerals.

(3) ***Calcium in oyster shell powder***—Weigh accurately the mass of NLT 20 Compound Nicotinamide, Riboflavin and Oyster Shell Powder Tablets, and powder. Weigh accurately an amount equivalent to about 0.5 g of calcium (Ca), add 20 mL of dilute hydrochloric acid, dissolve by warming, and filter. Wash the residue 2 times each with 10 mL of dilute hydrochloric acid, combine the filtrate and the washings, add ammonia water to make it alkaline, and add excess ammonium hydroxide solution to generate a white precipitate. Filter the precipitate, and heat. After cooling, add water to make 200 mL. Pipet 20 mL of this solution, add 40 mL of water, 2 mL of 8 mol/L potassium hydroxide TS, and 0.1 g of indicator, and immediately titrate with 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS. The endpoint of titration is when the color of the solution changes from reddish purple to blue. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS
= 2.004 mg of Ca

Packaging and storage Preserve in well-closed containers.

Compound Nicotinamide, Royal Jelly and Riboflavin Capsules
복방니코틴산아미드·로얄젤리·리보플라빈 캡슐

Compound Nicotinamide, Royal Jelly and Riboflavin Capsules contain NLT 90.0% of the labeled amount of 10-hydroxy-2-decenoic acid ($C_{10}H_{18}O_3$: 186.25) in royal jelly, and NLT 90.0% and NMT 150.0% of the labeled amounts of ascorbic acid ($C_6H_8O_6$: 176.12), thiamine hydrochloride ($C_{12}H_{17}ClN_4OS \cdot HCl$: 337.27), tocopherol acetate ($C_{31}H_{52}O_3$: 472.74), riboflavin ($C_{17}H_{20}N_4O_6$: 376.36), nicotinamide ($C_6H_6N_2O$: 122.13), pyridoxine hydrochloride ($C_8H_{11}NO_3 \cdot HCl$: 205.64), and cyanocobalamin ($C_{63}H_{88}CoN_{14}O_{14}P$: 1355.37).

Method of preparation Prepare as directed under Capsules, with Nicotinamide, Royal Jelly, Riboflavin, Cyanocobalamin, Ascorbic Acid, Thiamine Hydrochloride, Pyridoxine Hydrochloride, and Tocopherol Acetate.

Identification (1) ***Royal jelly***—(i) Weigh the contents of Compound Nicotinamide, Royal Jelly and Riboflavin Capsules, equivalent to 50 mg of royal jelly, add 50 mL of acetone, shake, extract, and filter. Evaporate to concentrate the filtrate under reduced pressure to make about 10 mL and use this solution as the test solution. Separately, weigh about 50 mg of Royal Jelly, add 50 mL of acetone, extract, and then filter. Evaporate to concentrate the filtrate under reduced pressure to make about 10 mL and use this solution as the test solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of 1-propanol and strong ammonia water (7 : 3) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Examine the plate under ultraviolet light and evenly spray iodine vapor on the plate; the colors and R_f values of several spots from the test solution and the standard solution are the same.

(ii) The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

(2) ***Ascorbic acid, thiamine hydrochloride, riboflavin, nicotinamide, pyridoxine hydrochloride, tocopherol acetate, and cyanocobalamin***—With the contents of Compound Nicotinamide, Royal Jelly and Riboflavin Capsules, perform the test according to the Analysis for Vitamins.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay (1) ***10-hydroxy-2-decenoic acid in royal jelly***—Weigh accurately the contents of NLT 20 capsules of Compound Nicotinamide, Royal Jelly and Riboflavin Capsules. Weigh accurately about 5 mg of 10-hydroxy-2-decenoic acid, add 40 mL of methanol, sonicate for 20 minutes, and add methanol to make exactly 50 mL. Centrifuge this solution, pipet 2 mL of the clear supernatant, add 10 mL of methanol to make exactly 10 mL, and use this solution as the test solution. Separately, weigh accurately about 5 mg of 10-hydroxy-2-decenoic acid RS and dissolve in methanol to make exactly 50 mL. Pipet 2 mL of this solution, add methanol to make 10 mL, use this solution as the test solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak area of in-

dobufen, A_T and A_S, in each solution.

Amount (mg) of 10-hydroxy-2-decenoic acid ($C_{10}H_{18}O_3$)
= Amount (mg) of 10-hydroxy-2-decenoic acid RS ($C_{10}H_{18}O_3$) $\times \frac{A_T}{A_S}$

Operating conditions

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Detector: An ultraviolet absorption spectrophotometer (wavelength: 214 nm).

Mobile phase: A mixture of 2.5 mmol/L potassium dihydrogen phosphate TS (pH 3.0) and methanol (1 : 1).

Flow rate: 1.0 mL/min

System suitability

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area of 10-hydroxy-2-decenoic acid is NMT 1.0%.

2.5 mmol/L potassium dihydrogen phosphate TS (pH 3.0)—Dissolve 0.340 g of potassium dihydrogen phosphate in water to make 1000 mL and add phosphoric acid to adjust the pH to 3.0.

(2) **Tocopherol acetate, ascorbic acid, thiamine hydrochloride, riboflavin, nicotinic acid amide, pyridoxine hydrochloride and cyanocobalamin*n*—**Weigh accurately the contents of NLT 20 capsules of Compound Nicotinamide, Royal Jelly and Riboflavin Capsules, perform the test as directed under the Analysis for Vitamins.

Packaging and storage Preserve in well-closed containers.

Compound Pancreatin, Dimethicone and Hemicellulase Tablets
복방판크레아틴·디메티콘·헤미셀룰라제 정

Compound Pancreatin, Dimethicone and Hemicellulase Tablets contain starch digestion activity, fat digestion activity, protein digestion activity, and hemicellulase in pancreatin equivalent to more than 90.0% of the labeled amount, and cholic acid ($C_{24}H_{40}O_5$: 408.57) in ox-bile extract. Dimethicone is polydimethylsiloxane ([-(CH_3)-SiO-]$_n$) and contains 85.0% to 115.0% of the labeled amount.

Compound Pancreatin, Dimethicone and Hemicellulase Tablets are delayed-release preparations.

Method of preparation Prepare as directed under Tablets, with Pancreatin, Ox-Bile Extract, Dimethicone, and Hemicellulase.

Identification (1) ***Starch digestion activity, fat digestion activity, protein digestion activity in pancreatin—*** Perform the test with Compound Pancreatin, Dimethicone and Hemicellulase Tablets, previously powdered, as direct under the Assay; the result is positive.

(2) ***Hemicellulase—***Perform the test with Compound Pancreatin, Dimethicone and Hemicellulase Tablets, previously powdered, as direct under the Assay; the result is positive.

(3) ***Ox-bile extract***—According to the labeled amount of Compound Pancreatin, Dimethicone and Hemicellulase Tablets, previously powdered, pipet an amount equivalent to 50 mg of ox-bile extract, add ethanol to make 20 mL, and use this solution as the test solution. Separately, weigh about 25 mg of Ox-bile Extract, add ethanol to make 10 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Paper Chromatography. Spot 10 μL each of the test solution and the standard solution on Whatman filter paper No. 1 or similar filter paper (impregnated with 2 mol/L acetic acid(100), washed with water, and dried in the shade). Next, develop the plate using a mixture of isopropanol, hydrochloric acid, and water (170 : 41 : 39) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Spay 50% of sulfuric acid solution evenly onto the plate; several spots from the test solution have the same color and R_f value as the spots from the standard solution.

(4) ***Dimethicone—***Powder Compound Pancreatin, Dimethicone and Hemicellulase Tablets and determine the absorption spectrum as directed under the Assay; the standard solution and the test solution exhibit similar intensities of absorption as the same wavenumbers.

Disintegration Meets the requirements.

Uniformity of dosage units Meet requirements.

Assay (1) ***Pancreatin—***(i) Starch digestibility power (α-amylase): Weigh accurately the mass of NLT 20 Compound Pancreatin, Dimethicone and Hemicellulase Tablets, and powder. Weigh accurately the amount equivalent to 110 to 130 mg of Compound Pancreatin, Dimethicone and Hemicellulase Tablets as pancreatin according to the potency, put it in a 200-mL volumetric flask, add 1/15 mol/L phosphate buffer solution (pH 6.8) to make exactly 200 mL, and stir it for 30 minutes. Each mL of this solution does not exceed 20 FIP units of starch digestibility power, and the test solution is used in the test immediately after preparation.

Take 25 mL of 1% soluble starch solution, put it in a test tube (about 22 mm × 200 mm), add 10 mL of 0.2 mol/L phosphate buffer solution (pH 6.8) and 1 mL of 0.2 mol/L sodium chloride solution, close with an elastomeric closure, and allow to stand in a constant temperature water bath at 25 ℃. When the temperature of the solution reaches 25 ℃, take exactly 1 mL of the test solution to add, and at the same time, a stopwatch and shake to mix well to a constant temperature. Exactly 10 minutes after

adding the test solution, add 2 mL of 1 mol/L hydrochloric acid solution to stop the reaction. Transfer this solution to a glass-stoppered 300-mL Erlenmeyer flask, wash the test tube with about 20 mL of water, and combine it to the Erlenmeyer flask. Add accurately 10 mL of 0.05 mol/L iodine solution while stirring well, immediately add 45 mL of 0.1 mol/L sodium hydroxide solution, allow to stand in the dark for 15 minutes, then add 4 mL of 20% sulfuric acid solution and titrate with 0.1 mol/L sodium thiosulfate solution. Separately, take 25 mL of 1% soluble starch solution, put it in a test tube, add 10 mL of 0.2 mol/L phosphate buffer solution (pH 6.8) and 1 mL of 0.2 mol/L sodium chloride solution, close an elastomeric closure, and allow to stand in a constant temperature water bath at 25 °C. When the temperature of the solution reaches 25 °C, add 2 mL of 1 mol/L hydrochloric acid solution, shake to mix, immediately add 1 mL of the test solution to mix, and then perform a blank test by following the same procedures as for the test solution.

Potency of starch digestibility power in one tablet of Compound Pancreatin, Dimethicone and Hemicellulase Tablets (FIP unit/tablet)

$$= \frac{5(\mathrm{b}-\mathrm{a})}{1-0.03(\mathrm{b}-\mathrm{a})} \times 200 \times \frac{\mathrm{W}}{\mathrm{S}}$$

a: Volume (mL) of 0.1 mol/L sodium thiosulfate solution consumed in determination of the test solution

b: Volume (mL) of 0.1 mol/L sodium thiosulfate solution consumed in the blank test

S: Amount (mg) of sample taken

w: Average (mg) mass of 1 tablet

0.03: Correction factor

200: Dilution factor

5: $0.1 \times 1000 \times \frac{1}{10} \times \frac{1}{2}$

Definition of potency—1 FIP starch digestion activity unit refers to the amount of enzyme required to decompose starch at a rate that hydrolyzes 1 microequivalent of glycoside for 1 minute.

(ii) Fat digestibility power: Weigh accurately the mass of NLT 20 Compound Pancreatin, Dimethicone and Hemicellulase Tablets, and powder. Weigh accurately 70 to 90 mg of Compound Pancreatin, Dimethicone and Hemicellulase Tablets, put it in a mortar, add 8 to 10 mL of water at 5 °C, grind well for 10 minutes, then put in a 200-mL volumetric flask, and add cold water to make exactly 200 mL. Each mL of this solution contains about 12 FIP fat digestion activity units. Shake to mix well this solution for several minutes, and store it at 4°C. Prepare the test solution and use it for each test. The temperature when used for the test is 20 °C.

Put 10 mL of olive oil emulsion in a glass container of about 50 mL, buffer it with 8 mL of tris buffer solution and 2 mL of 8 W/V% sodium taurocholate solution, and then dilute with water so that the total amount diluted with water is (30 - X) mL. Put in a constant temperature water bath at 37±0.1 °C so that the temperature of the solution is 37±0.1 °C. Adjust the pH to 9.05 with 0.05 to 0.1 mol/L sodium hydroxide solution, but adjust to pH with a microburet to 9.0, and then adjust the pH to 9.05 again with an automatic microburet. Add accurately X mL of the test solution (containing 8 to 16 FIP lipase units) to the solution adjusted to 9.05 and titrate it with 0.1 mol/L sodium hydroxide solution to maintain the pH of 9.0 using an automatic microburet. Determine the number of mL of 0.1 mol/L sodium hydroxide solution consumed per minute. Perform titration by stirring with a stirrer at a constant speed in a nitrogen stream or in a closed container. Repeat 4 to 5 times, discard the first one, and take the average of the remaining times. After completing the preliminary experiment, adjust the amount of the test solution so that the volume (mL) consumed per minute of 0.1 mol/L sodium hydroxide solution is 0.08 to 0.16 mL and then proceed again in the same manner as above. Separately, proceed with pancreatin RS in the same manner as above, and make any necessary correction.

Potency of fat digestion activity in one tablet of this medicine (FIP unit/tablet)

$$= \frac{\mathrm{b} \times 100{,}000}{\mathrm{a}} \times \frac{200}{\mathrm{X}} \times \mathrm{F} \times \mathrm{w}$$

a: Amount (mg) of sample taken

b: Volume (mL) of 0.1 mol/L sodium hydroxide solution consumed per minute

X: Volume (mL) of test solution taken

F: $\frac{Theoretical\ potency\ of\ RS}{Experimental\ potency\ of\ RS}$

w: Average weight (mg) of 1 tablet

100,000: 0.1 × 1000 ×1000

200: Dilution factor

Definition of potency—The amount of enzyme that liberates 1 microequivalent of fatty acid per minute under the conditions of temperature 37 °C and pH 9.0 is considered as 1 FIP fat digestion activity unit.

(iii) Protein digestion activity: Weigh accurately the mass of NLT 20 Compound Pancreatin, Dimethicone and Hemicellulase Tablets, and powder. Weigh accurately about 0.1 g of Compound Pancreatin, Dimethicone and Hemicellulase Tablets, put it in a cooled mortar, add cold 0.02 mol/L calcium hydrochloride solution, and grind and shake to mix well to make 100 mL. Add 10 mL of enterokinase solution to 10 mL of this solution, activate it, shake to mix well, and allow to stand at 35 °C for 90 minutes. Add 30 to 40 μ*g* of pancreatin per mL diluted with borate buffer solution, pH 7.5, in this solution.
Separately, weigh accurately about 0.1 of the pancreatin RS (1.65 FIP protease unit/mg), put it in the cooled mortar, add 0.02 mol/L calcium chloride solution, grind and shake to mix well, add to a 100-mL volumetric flask, and wash with 0.02 mol/L calcium chloride solution to make 100 mL. Pipet 3 to 4 mL of this solution, put it in a 100-

mL volumetric flask, add cold borate buffer solution, pH 7.5, and shake to mix to make 100 mL. Each mL of this solution contains 30 to 40 μg of pancreatin, and the absorbance is 0.15 to 0.60.
Prepare 8 test tubes, divide them into 2 groups of 4 each, and test as follows.

Blank test solution group—S_1B, S_2B, S_3B, UB

Test solution group—S_1, S_2, S_3, U

The blank test solution group is operated as follows.

Test tube	Borate Buffer solution	Standard solution	Test solution	5% of trichloroacetic add solution	Casein solution of pH 8.0
S_1B	2 mL	1 mL	-	5 mL	2 mL
S_2B	1 mL	2 mL	-	5 mL	2 mL
S_3B	-	3 mL	-	5 mL	2 mL
UB	1 mL	-	2 mL	5 mL	2 mL

Add boate buffer solution, standard solution, and test solution to each test tube in the blank test solution group as above, add 5% of trichloroacetic acid again, shake to mix well, maintain 35 °C in a constant temperature water bath, and then add accurately 2 mL each of casein solution, pH 8.0. Shake to mix well, remove from a constant temperature water bath, cool, and filter to use as blank test solution. The test solution group is operated as follows.

Test tube	Borate Buffer solution	Standard solution	Test solution	Casein solution of pH 8.0	5% of trichloroacetic add solution
S_1	2 mL	1 mL	-	2 mL	5 mL
S_2	1 mL	2 mL	-	2 mL	5 mL
S_3	-	3 mL	-	2 mL	5 mL
U	1 mL	-	2 mL	2 mL	5 mL

Add the borate buffer solution, standard solution, and test solution to each test tube in the test solution group as above, maintain the temperature at 35 °C in a constant temperature water bath, add 2 mL each of casein solution, pH 8.0, allow to stand for exactly 30 minutes, and then add 5 mL each of 5% trichloroacetic acid solution. Remove from the water bath, allow to stand at room temperature for about 20 minutes to completely precipitate the protein, and then filter twice with the same filter paper. For the blank test solution group and the filtrate of the test solution group, determine each absorbance at a layer length of 1 cm and a wavelength of 280 nm using the reagent blank test solution as a control. Shake to mix 3 mL of borate buffer solution, 5 mL of 5% trichloroacetic acid solution, and 2 mL of casein solution, pH 8.0, to prepare the reagent blank test solution.

Potency of protein digestion activity in one tablet of Compound Pancreatin, Dimethicone and Hemicellulase Tablets (FIP unit)

$$= \frac{\mathrm{UA}}{\mathrm{SA}} \times \mathrm{C} \times Amount\ (mg)\ of\ RS \times \frac{Dilution\ factor\ of\ test\ solution}{Dilution\ factor\ of\ standard\ solution} \times \frac{Average\ mass\ (mg)\ of\ 1\ tablet}{Amount\ (mg)\ of\ sample\ taken}$$

UA: U-UB

SA: $\frac{(S_1-S_1B)+(S_2-S_2B)+(S_3-S_3B)}{3}$

C: Unit of protease of 1 mg of reference standard (FIP unit)

Definition of potency—Determine the unit by comparing it with pancreatin RS of NF. 1 FIP protein digestion activity unit is the amount of enzyme required to decompose casein to an absorbance equivalent to 1 micro tyrosine per minute.

Filter paper—Filter a 5% trichloroacetic acid solution through filter paper and determine the absorbance of the filtrate at 280 nm using an unfiltered 5% trichloroacetic acid solution as a control. Use filter paper whose absorbance does not exceed 0.04.

(2) ***Hemicellulase***—Weigh accurately the mass of NLT 20 tablets of Compound Pancreatin, Dimethicone and Hemicellulase Tablets, and powder. According to the potency, weigh accurately about 0.1 to 0.2 g of hemicellulase, put in a mortar, add with water, shake to mix well, then put in a 100-mL volumetric flask. Wash the mortar with water, and add the washed solutions to make 100 mL with water. Take 5 mL of this solution, put it in a 100-mL volumetric flask, and add water to make 100 mL. Before testing, filter with Whatman filter paper No. 1 and use the filtrate as the test solution. 1 mL of this solution should be able to change the relative fluidity of 0.18 to 0.22 for 5 minutes when tested under the test conditions. If not, the amount of the test is adjusted. Put the viscometer vertically in a constant temperature water bath (40 ± 1 ℃) and wash thoroughly with water. Add 20 mL of substrate solution and 4 mL of acetic acid and sodium acetate buffer solution (pH 4.5) to two 50 mL stoppered Erlenmeyer flasks for the test solution and one 50 mL stoppered Erlenmeyer flask for the test solution, and warm and allow to stand in a constant temperature water bath (40 ± 1°C) for 15 minutes.
Add 1 mL of the test solution to the flask for the test solution, immediately operate the stopwatch 1 and shake to mix the solution well. Immediately, take 10 mL of this solution and put it into the wide opening of the viscometer. After about 2 minutes, when the pressure is reduced through the rubber tube connected to the mouth side, and

when the reaction solution passes the upper half scale; operate stopwatch 2 and at the same time determine the reaction time (minutes) (Tr) of the stopwatch 1. When the meniscus of the reaction solution passes the lower scale, determine the time (seconds) (Tt) of the stopwatch 2. Immediately, re-aspirate the reaction solution, raise it to the upper half of the viscometer, and repeat the operation as above. The total reaction time (Tr) of these four tests should not exceed 15 minutes. Add 1 mL of water to the blank test substrate solution flask, take 10 mL of this solution, put it into the wide mouth of the viscometer, reduce the pressure through the rubber tube connected to the narrow mouth, bring this solution up to the upper half scale, and then let it flow naturally. When the meniscus passes the upper scale of the viscometer, operate the stopwatch, and determine the time (seconds) (Ts) until it passes the lower scale. Perform this test 5 times and determine the average value. Determine the time (seconds) (Tw) using 10 mL of equilibrated water and operate in the same manner as for the substrate solution for the blank test solution above. Perform this test 5 times as well and determine the average value.

$$T_N = 1/2\ (Tt/60\ \text{seconds/minutes}) + Tr$$

Fr: Relative flow rate for each reaction time

Ts: Average flow time (seconds) for substrate solution for blank test

Tw: Average flow time (seconds) for water for blank test

Tt: Flow time (seconds) of the reacted test solution

Tr: Time from when the test solution is added to the substrate solution until the flow time (Tt) is measured on the viscometer.

T_N: Response time (minutes) (Tr) plus 1/2 of the flow time converted to minutes

With the four Fr values and four T_N values obtained using the formula above, draw a calibration curve with the T_N values as the horizontal axis and the Fr values as the vertical axis. At the time, the calibration curve is a straight line. From this calibration curve, obtain the Fr value when the T_N value is 5 and 10 minutes and calculate the potency according to the following formula. At the time, the difference between the Fr values at 5 minutes of T_N value and 10 minutes of T_N value is 0.18 to 0.22.

One hemicellulase unit (HCU) per Compound Pancreatin, Dimethicone and Hemicellulase Tablet

$$= \frac{M(Fr_{10} - Fr_5) \times dilution\ factor}{W}$$

Fr_5: Relative fluidity after 5 minutes of reaction time

Fr_{10}: Relative fluidity after 10 minutes of reaction time

M: Average weight of 1 tablet (g)

W: Sample collection amount (g)

Definition of potency—When tested as directed under specified test conditions using locust bean gum as a substrate solution, the activity unit that gives a change in relative fluidity of 1.0 in 5 minutes is referred as 1 hemicellulase unit.

Substrate solution—Take 12.5 mL of 0.2 mol/L hydrochloric acid and 250 mL of warm water (72 to 75 °C) and put in a blender. Weigh accurately 2.0 g of locust bean gum, calculated on the anhydrous basis, add it slowly, and mix carefully at low speed not to let the solution flow out. Wipe the rim of the container with a small amount of warm water using a rubber spatula and shake to mix at high speed for 5 minutes. Transfer to a 1000-mL beaker, cool to room temperature, and adjust pH to 6.0 with 0.2 mol/L sodium hydroxide. Transfer this solution to a 1000-mL volumetric flask, add water to make 1000.0 mL, and shake to mix well. Filter through gauze before use.

(3) ***Bromelain***—Weigh accurately the mass of NLT 20 Compound Pancreatin, Dimethicone and Hemicellulase Tablets and Bromelain Tablets, and powder. Weigh accurately the amount equivalent to about 50 mg of cholic acid ($C_{24}H_{40}O_5$) and add 60% acetic acid solution to make exactly 100 mL. Filter, if necessary, and use the filtrate as the test solution. Separately, weigh accurately about 50 mg of the cholic acid RS, put it in a 100-mL volumetric flask, dissolve it in 60% acetic acid solution, and then add 60% acetic acid solution to make exactly 100 mL and use this solution as the standard solution. This solution can be used for several months if stored in a cool, dark place. Take 1 mL each of the standard solution and the test solution, put in glass-stopped test tubes, add 1 mL each of the newly prepared furfural solution (1 in 100) to each test tube, cool in an ice bath for about 5 minutes, and dissolve it in dilute sulfuric acid. (Dissolve 50 mL of sulfuric acid in 65 mL of water.) Add 13 mL each. Shake to mix the contents thoroughly in the test tube, react on a steam bath at 70 °C for 10 minutes, cool in an ice bath for 2 minutes, and then perform the test as directed under the Ultraviolet-visible Spectroscopy using a dilute sulfuric acid solution as a control and determine the absorbance A_T and A_S at a wavelength of 660 nm.

$$\text{Amount (mg) of cholic acid } (C_{24}H_{40}O_5) = \text{Amount (mg) of cholic acid RS} \times \frac{A_T}{A_S} \times 10$$

(4) ***Bromelain***—Weigh accurately the mass of NLT 20 Compound Pancreatin, Dimethicone and Hemicellulase Tablets, and powder. Hereinafter, perform the test as directed under the Assay of United States Pharmacopoeia simethicone.

Packaging and storage Preserve in tight containers.

Compound Polysaccharide Iron Complex, Folic Acid and Cyanocobalamin Capsules
복방폴리사카리드철착염·폴산·시아노코발라민 캡슐

Compound Polysaccharide Iron Complex, Folic Acid and Cyanocobalamin Capsules contain NLT 90.0% and NMT 110.0% of iron in polysaccharide iron complex (Fe: 55.85) and NLT 90.0% and NMT 150.0% of folic acid ($C_{19}H_{19}N_7O_6$: 441.40) and cyanocobalamin ($C_{63}H_{88}CoN_{14}O_{14}P$: 1,355.37), respectively, according to the labeled amount.

Method of preparation Prepare as directed under Capsules, with Polysaccharide Iron Complex, Folic Acid and Cyanocobalamin.

Identification (1) ***Iron in polysaccharide iron complex*—**Weigh an amount of Compound Polysaccharide Iron Complex, Folic Acid and Cyanocobalamin Capsules, equivalent to 0.2 g of polysaccharide iron complex, and perform the test as directed under the Identification of Polysaccharide Iron Complex Tablets.

(2) ***Folic acid and cyanocobalamin***—Perform the test with Compound Polysaccharide Iron Complex, Folic Acid and Cyanocobalamin Capsules as directed under the Analysis for Vitamins.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay (1) ***Iron in polysaccharide iron complex*—**Weigh accurately the mass of NLT 20 capsules of Compound Polysaccharide Iron Complex, Folic Acid and Cyanocobalamin Capsules, and perform the test as directed under the Assay of Polysaccharide Iron Complex Tablets.

(2) ***Folic acid and cyanocobalamin*—**Weigh accurately the mass of NLT 20 capsules of Compound Polysaccharide Iron Complex, Folic Acid and Cyanocobalamin Capsules, and perform the test as directed under the Analysis for Vitamins.

Packaging and storage Preserve in tight containers.

Compound Ranitidine Hydrochloride, Magnesium Oxide and Magnesium Aluminosilicate Tablets
복방라니티딘염산염·산화마그네슘·규산알루민산마그네슘 정

Compound Ranitidine Hydrochloride, Magnesium Oxide and Magnesium Aluminosilicate Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of ranitidine hydrochloride ($C_{13}H_{22}N_4O_3S$·HCl: 350.87). One tablet of Magnesium Oxide and Magnesium Aluminosilicate Tablet contains NLT 61.5 mg and NMT 75.1 mg of total aluminum oxide in magnesium aluminosilicate ($2MgO·Al_2O_3·SiO_2·xH_2O$) and magnesium aluminum hydrate (Al_2O_3: 101. 96), and NLT 99.1 mg and NMT 121.1 mg of magnesium aluminosilicate, magnesium aluminum hydrate, and magnesium oxide (MgO: 40.30).

Method of preparation Prepare as directed under Tablets, with Ranitidine Hydrochloride, Magnesium Oxide, Magnesium Aluminosilicate, and Magnesium Aluminum Hydrate.

Identification (1) ***Ranitidine hydrochloride*—**Perform the test with Compound Ranitidine Hydrochloride, Magnesium Oxide and Magnesium Aluminosilicate Tablets as directed under the Identification of ranitidine hydrochloride tablets under the United States Pharmacopeia.

(2) ***Aluminum oxide in magnesium aluminosilicate and magnesium aluminum hydrate*—**Weigh about 0.5 g of Compound Ranitidine Hydrochloride, Magnesium Oxide and Magnesium Aluminosilicate Tablets, add 10 mL of dilute hydrochloric acid, and dissolve by warming; the resulting solution responds to the Qualitative Analysis for aluminum salt and magnesium salt.

(3) ***Aluminum oxide in magnesium aluminosilicate, magnesium oxide, and magnesium aluminum hydrate*—**Weigh about 0.5 g of Compound Ranitidine Hydrochloride, Magnesium Oxide and Magnesium Aluminosilicate Tablets, add 10 mL of dilute hydrochloric acid, and dissolve by warming; the resulting solution responds to the Qualitative Analysis for aluminum salt and magnesium salt.

(4) ***Silicic acid*—**Mix Compound Ranitidine Hydrochloride, Magnesium Oxide and Magnesium Aluminosilicate Tablets by shaking well. To 0.125g of Compound Ranitidine Hydrochloride, Magnesium Oxide and Magnesium Aluminosilicate Tablets, add 5 mL of dilute sulfuric acid (1 in 3), and heat until white smoke is produced. After cooling, add 20 mL of water, and filter. Wash the residue with 30 mL of water, add 2 mL of methylene blue solution (1 in 10000), and then wash with 30 mL of water again; a precipitate exhibits a blue color.

Acid-neutralizing capacity For a daily dose of Compound Ranitidine Hydrochloride, Magnesium Oxide and Magnesium Aluminosilicate Tablets (2 tablets), the consumed amount of 0.1 mol/L hydrochloric acid is NLT 146 mL.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay (1) ***Ranitidine hydrochloride*—**Weigh accurately the mass of NLT 20 Compound Ranitidine Hydrochloride, Magnesium Oxide and Magnesium Aluminosilicate

Tablets, powder, and perform the test as directed under the Assay of ranitidine hydrochloride tablets under the United States Pharmacopeia.

(2) ***Aluminum oxide in magnesium aluminosilicate and magnesium aluminum hydrate (Al_2O_3)***—Weigh accurately the mass of NLT 20 Compound Ranitidine Hydrochloride, Magnesium Oxide and Magnesium Aluminosilicate Tablets, and powder. Weigh accurately an amount equivalent to about 4 Compound Ranitidine Hydrochloride, Magnesium Oxide and Magnesium Aluminosilicate Tablets (amount equivalent to 0.5 g of magnesium aluminosilicate and 0.4 g of magnesium aluminum hydrate), add 30 mL of dilute hydrochloric acid, dissolve by heating, and add water to make 250 mL. Use this solution as the test solution. Take 15.0 mL of the test solution, add 25 mL of 0.05 mol/L ethylenediaminetetraacetic acid disodium salt and 20 mL of acetic acid-ammonium acetate buffer solution, pH 4.8, and boil for 5 minutes. After cooling, add 55 mL of ethanol, and titrate with 0.05 mol/L zinc sulfate VS (indicator: 2 mL of dithizone TS). The endpoint of titration is when the solution changes from pale dark green to pale purple. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS
= 2.5490 mg of Al_2O_3

(3) ***Magnesium oxide (MgO) in magnesium aluminosilicate, magnesium oxide, magnesium aluminum hydrate***—Take 10.0 mL of the test solution prepared from the assay of aluminum oxide mentioned above, add a small amount of water, add 5 mL of triethanolamine solution (1 in 2), and shake to mix. With ammonia water, make the pH 10, and titrate with 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS (indicator: 40 mg of eriochrome black T-sodium chloride TS). The endpoint of titration is when the solution changes from reddish purple to blue. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS
= 2.0152 mg of MgO

Packaging and storage Preserve in well-closed containers.

Compound Selenium in Dried Yeast, Retinol Palmitate and Ascorbic Acid Capsules
복방셀레늄함유건조효모·레티놀팔미테이트·아스코르브산 캡슐

Compound Selenium in Dried Yeast, Retinol Palmitate and Ascorbic Acid Capsules contain NLT 90.0% and NMT 150.0% of the labeled amounts of selenium (Se : 78.96) of selenium in dried yeast, retinol palmitate ($C_{36}H_{60}O_2$: 524.86), ascorbic acid ($C_6H_8O_6$: 176.12) and tocopheryl acetate ($C_{31}H_{52}O_3$: 472.74).

Method of preparation Prepare as directed under Capsules, with Selenium in Dried Yeast, Retinol Palmitate, Ascorbic Acid and Tocopheryl Acetate.

Identification (1) ***Selenium of selenium in dried yeast***—Weigh an amount of Compound Selenium in Dried Yeast, Retinol Palmitate and Ascorbic Acid Capsules, equivalent to 1 mg of selenium according to the labeled amount, and perform the test as directed under the Analysis for Minerals.

(2) ***Ascorbic acid, tocopheryl acetate and retinol palmitate***—Perform the test with Compound Selenium in Dried Yeast, Retinol Palmitate and Ascorbic Acid Capsules as directed under the Analysis for Vitamins.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay (1) ***Ascorbic acid, tocopheryl acetate and retinol palmitate***—Weigh accurately the contents of NLT 20 capsules of Compound Selenium in Dried Yeast, Retinol Palmitate and Ascorbic Acid Capsules, and perform the test as directed under the Analysis for Vitamins.

(2) ***Selenium***—Weigh accurately the contents of NLT 20 capsules of Compound Selenium in Dried Yeast, Retinol Palmitate and Ascorbic Acid Capsules, and perform the test as directed under the Analysis for Minerals.

Packaging and storage Preserve in tight containers.

Compound Trimebutine Maleate, Magnesium Aluminometasilicate and Precipitated Calcium Carbonate Tablets
복방트리메부틴말레산염·메타규산알루민산마그네슘·침강탄산칼슘 정

Compound Trimebutine Maleate, Magnesium Aluminometasilicate and Precipitated Calcium Carbonate Tablets contains trimebutine maleate ($C_{22}H_{29}O_5N \cdot C_4H_4O_4$: 503.54), sodium bicarbonate ($NaHCO_3$: 84.01), precipitated calcium carbonate ($CaCO_3$: 100.09), and magnesium oxide (MgO: 40.30) and aluminum oxide (Al_2O_3: 101.96) in magnesium aluminometasilicate equivalent to 90.0% to 110.0% of the labeled amount, contains total alKoids [hyoscyamine ($C_{17}H_{23}NO_3$: 289.37) and scopolamine ($C_{17}H_{21}NO_4$: 303.35)] in scopolia extract equivalent to 45.0 to 65.0 μ*g* per tablet, and glycyrrhizic acid ($C_{42}H_{62}O_{16}$: 822.93) in licorice powder equivalent to NLT 90.0%, and contains NLT 90.0% of starch saccharifying activity (pH 4.5) of 278 units, protein digestibility power (pH 3.0) of 170 units, and fat

digestion activity (pH 6.0) of 45 units.

Method of preparation Prepare as directed under Tablets, with Trimebutine Maleate, Magnesium Aluminome Tasilicate, Precipitated Calcium Carbonate, Sodium Bicarbonate, Powdered Glycyrrhiza, Scopolia Extract, Diastase, Protease, Cellulase 2000 IV and Lipase II.

Identification (1) ***Trimebutine maleate*—**Weigh an amount of Compound Trimebutine Maleate, Magnesium Aluminometasilicate and Precipitated Calcium Carbonate Tablets, equivalent to about 0.1 g of trimebutine maleate, according to the labeled amount, add 20 mL of chloroform, shake to mix, extract, and filter. Use the filtrate as the test solution. Separately, dissolve 0.1 g of trimebutine maleate RS in 20 mL of 95% ethanol and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of 1-butanol and water (8 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm) or spray Dragendorff's TS evenly; the colors and R_f values of the spots obtained from the test solution and the standard solution are the same.

(2) ***Magnesium metasilicate aluminate***—(i) Aluminum: Powder 2 tablets of Compound Trimebutine Maleate, Magnesium Aluminometasilicate and Precipitated Calcium Carbonate Tablets, add 30 mL of water, dissolve the soluble content, filter, and wash the residue with water. Add 10 mL of sodium hydroxide solution (1 in 6) to the residue, warm to dissolve, cool, filter, add hydrochloric acid to the filtrate to make it acidic, and filter again. Neutralize this filtrate with ammonia TS and responds to the Qualitative Analysis for aluminum salt.

(ii) Magnesium: Take 5 tablets of Compound Trimebutine Maleate, Magnesium Aluminometasilicate and Precipitated Calcium Carbonate Tablets, add 50 mL of water, dissolve the soluble content, filter, and wash the residue with water. Add 10 mL of hydrochloric acid to this residue, boil the solution for 1 minute, cool, filter, and add ammonia TS to the filtrate, and responds to the Chemical identification responds for magnesium salt.

(iii) Silicon: Take 2 tablets of Compound Trimebutine Maleate, Magnesium Aluminometasilicate and Precipitated Calcium Carbonate Tablets, add 30 mL of water, elute and filter the soluble content, wash the residue thoroughly with warm water, and then dry. Separately, round the platinum wire to create a melting hole for sodium ammonium hydrogen phosphate, and then apply the dried material to melt it again; it exhibits an insoluble part floating in the lump, and when cooling this melting hole, it becomes opaque.

(3) ***Scopolia extract***—Weigh an amount of Compound Trimebutine Maleate, Magnesium Aluminometasilicate and Precipitated Calcium Carbonate Tablets, equivalent to 0.6 g of scopolia extract, according to the labeled amount, add 30 mL of water, shake to mix evenly, add 200 mL of ether and 15 g of sodium chloride, seal, shake to mix for 2 hours, add 10 g of tragacantha powder, and shake to mix vigorously. Take 150 mL of the clearly separated ether layer, evaporate to dryness on a steam bath, then dissolve in 100 mL of ethanol and use the solution as the test solution. Separately, weigh 0.6 g of 10% Scopolia Extract Powder from the Korean Pharmacopoeia and treat it in the same manner as the above test solution to use this solution as the standard solution. However, during operation, add 200 mL of ether, add 15 mL of ammonia TS, and extract under alkalinity. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of ethyl acetate, ethanol, dimethylformamide, and diethylamie (2 : 1 : 1 : 1) as the developing solvent to a distance of about 10 cm and air-dry the plate. Spray Dragendorff's TS evenly onto the plate; the R_f value and the color of the spots obtained from the sample and the standard solutions are the same.

(4) ***Precipitated calcium carbonate***—Weigh 1 g of Compound Trimebutine Maleate, Magnesium Aluminometasilicate and Precipitated Calcium Carbonate Tablets and carbonize. After cooling, add 30 mL of diluted hydrochloric acid to the residue, warm on a steam bath for 10 minutes, add water to make 50 mL, and filter. Allow this filtrate to stand on a steam bath for 1 hour to complete precipitation. (Precipitation responds to the Qualitative Analysis (3) for sodium salt.

(5) ***Sodium bicarbonate*—**Weigh 1 g of Compound Trimebutine Maleate, Magnesium Aluminometasilicate and Precipitated Calcium Carbonate Tablets, add 30 mL of water, dissolve at 30 to 40 °C, and filter. The filtrate responds to the Qualitative Analysis for sodium salt and hydrogen carbonate.

(6) ***Powdered licorice*—**Weigh the amount equivalent to about 1.0 g of licorice, add 100 mL of 80% ethanol, attach a reflux condenser, and extract under reflux on a steam bath for 1 hour. Add 20 mL of 10% sulfuric acid, attach a reflux condenser, and heat for 2 hours to hydrolyze. After cooling, extract with 30 mL of chloroform three times, filter, and concentrate under reduced pressure. Add 2 mL of a mixture of chloroform and methanol (1 : 1) to the residue and dissolve it. Use this solution as the test solution. Separately, weigh about 1.0 g of Licorice and proceed in the same manner as in the preparation of the test solution, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of chloroform and methanol (19 : 1) as the developing solvent to a distance of about 10 cm and dry the plate at 105 ºC for 10 minutes. Spray 4-

methoxybenzaldehyde and sulfuric acid TS evenly onto the plate; the R_f value and the color of the spots obtained from the sample and the standard solutions are the same.

(7) ***Diastase, protease, cellulase 2000 IV and lipase II***—It exhibits a positive reaction when tested as directed under the Assay.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Acid-neutralizing capacity Take NLT 20 tablets of Compound Trimebutine Maleate, Magnesium Aluminometasilicate and Precipitated Calcium Carbonate Tablets, weigh accurately the mass, powder, and perform the test as directed under the Acid-neutralizing Capacity; the consumption of 0.1 mol/L hydrochloric acid per daily dose (6 tablets) is NLT 80 mL.

Assay (1) ***Trimebutine maleate***—Weigh accurately the mass of NLT 20 tablets of Compound Trimebutine Maleate, Magnesium Aluminometasilicate and Precipitated Calcium Carbonate Tablets, and powder. Weigh accurately an amount equivalent to about 0.1 g of trimebutine maleate ($C_{22}H_{29}NO_5 \cdot C_4H_4O_4$), dissolve in a mixture of 0.01 mol/L hydrochloric acid and acetonitrile (13 : 7) to make 100 mL, filter, and use the filtrate as the test solution. Separately, weigh accurately about 0.1 g of trimebutine maleate RS, proceed in the same manner as the test solution, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions, and determine the peak areas, A_T and A_S, of trimebutine and maleic acid, respectively.

$$\text{Amount (mg) of trimebutine maleate } (C_{22}H_{29}NO_5 \cdot C_4H_4O_4) = \text{Amount (mg) of trimebutine maleate RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption spectrophotometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 15 to 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 to 10 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: Add ammonium acetate solution (1 in 1000) to dilute perchloric acid (17 in 20000) and adjust the pH to 3.0. Dissolve 1 g of sodium 1-pentanesulfonate in 650 mL of this solution and filter through a membrane filter. Add 350 mL of acetonitrile to 650 mL of the filtrate.

Flow rate: Adjust the flow rate so that the retention time of trimebutine is about 9 minutes.

Time span of area measurement: About 2 times the retention time of trimebutine following the maleic acid peak.

Selection of column: Dissolve 40 mg of Compound Trimebutine Maleate, Magnesium Aluminometasilicate and Precipitated Calcium Carbonate Tablets and 20 mg of imipramine hydrochloride in a mixture of 0.01 mol/L hydrochloric acid TS and acetonitrile (13 : 7) to make 100 mL. Proceed with 20 μL of this solution under the above operating conditions; use a column from which trimebutine and imipramine are eluted in this order with the resolution being NLT 2.5.

Detection sensitivity: Adjust the detection sensitivity so that the peak height of trimebutine obtained from 20 μL of the standard solution is between 2 mm and 6 mm.

(2) ***Aluminum oxide and magnesium oxide in magnesium metasilicate aluminate***—(i) Weigh accurately the mass of NLT 20 tablets of Compound Trimebutine Maleate, Magnesium Aluminometasilicate and Precipitated Calcium Carbonate Tablets, and powder. Weigh accurately the amount equivalent to 10 tablets, dissolve the soluble components in 50 mL of dilute hydrochloric acid, and evaporate to dryness on a steam bath. Add 30 mL of hydrochloric acid again to the residue, evaporate to dryness, add 25 mL of boiling water to the residue, filter it through quantitative filter paper, and wash the precipitate 4 times with 10 mL of hot water, respectively. Transfer the precipitate back to the evaporation dish, add 50 mL of water, boil on a steam bath for 15 minutes, filter through quantitative filter paper, and wash the precipitate with hot water. Combine the filtrate and washings, add water to make 500 mL, and use this solution as the test solution. Take 50.0 mL of the test solution, add 25.0 mL of 0.05 mol/L disodium ethylenediaminetetraacetate VS, add 25 mL of acetic acid and ammonium acetate buffer solution (pH 4.5), heat on a steam bath, cool, add 100 mL of ethanol and 2 mL of dithizone TS, and titrate with 0.05 mol/L zinc sulfate VS. However, the endpoint of titration is when the color changes from green to bright pink. Perform a blank test in the same manner and make any necessary correction.

$$\text{Each mL of 0.05 mol/L ethylenediaminetetraacetic acid disodium VS} = 2.5490 \text{ mg of } Al_2O_3$$

(ii) Magnesium oxide: Take 50.0 mL of the test solution in (1), put it in a beaker, add water to make about 70 mL, add 10 mL of ammonium chloride solution (1 in 10) and 1 to 2 drops of methyl red TS and heat to boiling. Add ammonia water (10%) until the color of the solution changes form red to yellow, boil for about 1 hour, cool, filter, and wash the precipitate 3 times with ammonium chloride solution (1 in 50). Combine the filtrate and the washed solution, add 3 drops of triethanolamine, 2 mL of potassium cyanide solution (5 in 100), and strong ammonia water to adjust the pH to 10, and titrate with 0.01 mol/L disodium ethylenediaminetetraacetate VS. (indicator: Eriochrome black T) However, the endpoint of titra-

tion is when the color changes from purple to blue. Perform a blank test in the same manner and make any necessary correction.

Each mL 0.01 mol/L of ethylenediaminetetraacetic acid disodium VS
= 0.4030 mg of MgO

(3) ***Precipitated calcium carbonate—***Weigh accurately the mass of NLT 20 tablets of Compound Trimebutine Maleate, Magnesium Aluminometasilicate and Precipitated Calcium Carbonate Tablets, and powder. Weigh accurately an amount equivalent to about 0.5 g of dried aluminum hydroxide gel and carbonize. After cooling, add 30 mL of dilute hydrochloric acid to the residue, warm on a steam bath for 10 minutes, cool, and add water to make 100 mL. Filter and use the filtrate as the test solution. Take 50.0 mL of this test solution, add 1 drop of methyl orange TS and 2 g of ammonium chloride, and slowly add ammonia TS until the color changes to yellow. Warm on a steam bath, filter and wash with water. Warm the filtrate and washings on a steam bath, add 5 mL of heat-saturated ammonium oxalate TS, and allow to stand in the water bath for 1 hour to complete precipitation. Dissolve this precipitate in 50 mL of dilute sulfuric acid, warm to 60 to 80 °C, and titrate with 0.1 mol/L potassium permanganate VS. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.02 mol/L potassium permanganate VS
= 5.005 mg of $CaCO_3$

(4) ***Sodium bicarbonate—***Weigh accurately the mass of NLT 20 tablets of Compound Trimebutine Maleate, Magnesium Aluminometasilicate and Precipitated Calcium Carbonate Tablets, and powder. Weigh accurately the amount equivalent to about 0.1 g of sodium bicarbonate according to the labeled amount of Compound Trimebutine Maleate, Magnesium Aluminometasilicate and Precipitated Calcium Carbonate Tablets, add 50 mL of water, warm at 35 to 40 ℃, and shake for 10 minutes to dissolve. Filter and wash 3 times with 20 mL of water, respectively. Combine the filtrate and the washings and titrate with 0.05 mol/L sulfuric acid as directed in the potentiometric titration under the Titrimetry. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.05 mol/L sulfuric acid VS
= 8.401 of $NaHCO_3$

(5) ***Total alkoids (hyoscyamine and scopolamine) in scopolia extract—***Weigh accurately the mass of NLT 20 Compound Trimebutine Maleate, Magnesium Aluminometasilicate and Precipitated Calcium Carbonate Tablets, and powder. Weigh accurately 0.4 g of Compound Trimebutine Maleate, Magnesium Aluminometasilicate and Precipitated Calcium Carbonate Tablets and perform the test as directed under the Assay in the Korean Pharmacopoeia, 10% Scopolia Extract Powder.

(6) ***Glycyrrhizic acid in powdered licorice—***Weigh accurately the mass of NLT 20 tablets of Compound Trimebutine Maleate, Magnesium Aluminometasilicate and Precipitated Calcium Carbonate Tablets, and powder. Weigh accurately an amount equivalent to about 30 mg of glycyrrhizic acid ($C_{42}H_{62}O_{166}$), add 50 mL of water, attach a reflux condenser, extract under reflux on a steam bath for 3 hours, then add 50 mL of 3 mol/L sulfuric acid and hydrolyze on a steam bath for 1 hour. After cooling, add 50 mL of chloroform and reflux and extract on a steam bath for 30 minutes. After cooling, transfer to a separatory funnel to take the chloroform layer, extract again with 30 mL of chloroform 3 times, collect all chloroform layers, and filter through anhydrous sodium sulfate. Evaporate the filtrate to dryness and dissolve the residue in methanol to make exactly 50 mL. Separately, weigh about 30 mg of glycyrrhizic acid RS and proceed in the same manner as in the preparation of the test solution, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak areas, A_T and A_S, for the test solution and the standard solution, respectively.

Amount (mg) of glycrrhizic acid ($C_{42}H_{62}O_{16}$)
= Amount (mg) of glycrrhizic acid RS $\times \frac{A_T}{A_S}$

Operating conditions

Detector: An ultraviolet absorption spectrophotometer (wavelength: 254 nm).

Column: A stainless steel column 4 to 6 mm in internal diameter and 15 to 20 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 to 10 mm in particle diameter).

Mobile phase: A mixture of methanol, water, and acetic acid(100) (78 : 19 : 3).

Flow rate: 1.0 mL/min

(7) ***Starch saccharifying activity, protein digestion activity and fat digestion activity in Diastase·Protease·Cellulase 2000 IV and Lipase II—***(i) Weigh accurately NLT 20 tablets of Compound Trimebutine Maleate, Magnesium Aluminometasilicate and Precipitated Calcium Carbonate Tablets, and powder. Weigh accurately an amount of Compound Trimebutine Maleate, Magnesium Aluminometasilicate and Precipitated Calcium Carbonate Tablets, equivalent to about 30 mg of diastase·protease·cellulase 2000 IV, add 50 mL of test solution (pH 4.5), shake to mix well for 10 minutes, and centrifuge. Take 5 mL of the clear supernatant, add water to make 100.0 mL, and use this solution as the test solution. Add 10 mL of 1% potato starch solution (pH 4.5) to a test tube, allow to stand at 37 ± 0.5 ℃ for 10 minutes, add 1.0 mL of the test solution, shake to mix, and make reaction at 37 ± 0.5 ℃ for 10 minutes. Next,

add 2 mL of alkaline tartrate solution in the Fehling's TS, immediately shake to mix, add 2.0 mL of copper solution in the Fehling's TS, heat on a steam bath for 15 minutes, cool, add 2.0 mL of potassium iodide TS and 2.0 mL of dilute sulfuric acid (1 in 6), and titrate with 0.05 mol/L sodium thiosulfate VS. Separately, proceed in the same manner as above and perform the test using 10 mL of water instead of 10 mL of 1% potato starch solution (pH 4.5).

Definition of potency—When amylase reacts with potato starch at 37 ℃, the amount of enzymes that bring about an increase in reducing power equivalent to 1 mg of glucose for the initial 1 minute of reaction is defined as 1 unit.

$$\text{Starch saccharifying activity (pH 4.5) (unit/g)} = (a - b)\times 1.6\times \frac{1}{10} \times \frac{1}{Amount\ (g)\ of\ sample\ in\ 1\ mL\ of\ test\ solution}$$

a: Amount (mL) of 0.05 mol/L sodium thiosulfate VS consumed in the blank test.

b: Amount (mL) of 0.05 mol/L sodium thiosulfate consumed in determination of the test solution.

c: Molarity factor of 0.05 mol/L sodium thiosulfate

(ii) Protein digestion activity (pH 3.0): Weigh accurately the mass of NLT 20 Compound Trimebutine Maleate, Magnesium Aluminometasilicate and Precipitated Calcium Carbonate Tablets, and powder. Weigh accurately an amount of Compound Trimebutine Maleate, Magnesium Aluminometasilicate and Precipitated Calcium Carbonate Tablets, equivalent to about 100 mg of diastase·protease·cellulase 2000 IV, add 50 mL of the test solution (pH 4.5), shake to mix for 20 minutes, filter, and use the filtrate as the test solution. Take 5.0 mL of casein solution, pH 3.0, allow to stand at 37 ± 0.5 ℃ for 10 minutes, add 1.0 mL of the test solution, and shake to mix. Allow this solution to stand at 37 ± 0.5 ℃ for 10 minutes, add 5 mL, shake to mix, allow to stand again at 37 ± 0.5 ℃ for 30 minutes and filter. Take 2 mL of the filtrate, add 5.0 mL of 0.55 mol/L sodium carbonate solution and 1 mL of Folin's TS (1 in 3), allow to stand at 37 ± 0.5 ° C for 30 minutes, perform the test as directed under the Ultraviolet-visible Spectroscopy using water as a control solution, and determine the absorbance A_T at a wavelength of 660 nm. Separately, take 1.0 mL of the test solution, add 5 mL of trichloroacetic acid TS, shake to mix, and add 5 mL of pH 3.0 casein solution. Allow to stand at 37 ± 0.5 ℃ for 30 minutes, proceed in the same manner as above, and determine the absorbance A_B.

Definition of potency—The amount of enzymes that bring about an increase in non-protein, Folin TS readily carbonizable substances equivalent to 1 μg of tyrosine in the first minute of the reaction is defined as 1 unit under the above conditions.

Tyrosine calibration curve—Weigh accurately 0.500 g of tyrosine RS, previously dried at 105 °C for 3 hours, add 0.2 mol/L hydrochloric acid TS to make 500 mL. Take 1.0 mL, 2.0 mL, 3.0 mL, and 4.0 mL each of this solution, and add 0.2 mol/L hydrochloric acid TS to make 100 mL, respectively. Take 2.0 mL each of these solutions, add 5.0 mL of 0.55 mol/L sodium carbonate TS and 1.0 mL of Folin's TS (1 in 3), allow to stand at 37 ± 0.5 ℃ for 30 minutes. Perform the test as directed under the Ultraviolet-visible Spectroscopy and determine the absorbances A_1, A_2, A_3 and A_4 at the wavelength of 660 nm. Separately, proceed with 2.0 mL of 0.2 mol/L hydrochloric acid TS in the same manner as above and determine the absorbance A_0. Create a calibration curve with the absorbance differences A_1-A_0, A_2-A_0, A_3-A_0, and A_4-A_0 on the vertical axis and the amount of tyrosine (μg) in 2 mL on the horizontal axis. Calculate the amount of tyrosine (μg) when the absorbance difference is 1.000.

$$\text{Protein digestion activity (pH 3.0) (unit/g)} = (A_B\text{-}A_T)\times F\times \frac{11}{2} \times \frac{1}{10} \times \frac{1}{Amount\ (g)\ of\ sample\ in\ test\ solution}$$

F: Amount (μg) of tyrosine when the absorbance difference is 1.000 in the tyrosine calibration curve

(iii) Fat digestion activity (pH 6.0): Weigh accurately the mass of NLT 20 tablets of Compound Trimebutine Maleate, Magnesium Aluminometasilicate and Precipitated Calcium Carbonate Tablets, and powder. Weigh accurately about 30 mg of lipase II, add water to make 50 mL, and use the filtrate as the test solution. Put 0.5 mL of olive oil emulsion and 4 mL of phosphate buffer solution, pH 6.0, into a test tube (30 × 12 mm), shake to mix, allow to stand at 37 ± 0.5 ℃ for exactly 20 minutes, add 10 mL of a mixture of acetone and ethanol (1 : 1), and shake to mix. Titrate with 0.05 mol/L hydrochloric acid (b mL). Separately, put 5.0 mL of olive oil emulsion and 4.0 mL of phosphate buffer solution, pH 6.0, into a test tube, shake to mix, allow to stand at 37 ± 0.5 ℃ for 30 minutes, add 10 mL of a mixture of acetone and ethanol (1: 1), add 1.0 mL of test solution, and shake to mix. Proceed in the same manner as above and titrate (a mL).

$$\text{Fat digestion power (unit/g)} = 50 \times (a - b) \times 1/20 \times F \times D$$

50: Equivalent amount (μmol) of fatty acid in 1 mL of 0.05 mol/L hydrochloric acid

f: Factor of 0.05 mol/L hydrochloric acid

D: Dilution factor of the sample

1/ 20: Conversion factor

Definition of potency—When lipase acts with olive oil under the above conditions; the amount of enzymes

that bring about an increase in 1 μmol of fatty acid for the initial 1 minute of reaction is defined as 1 unit of fat digestion activity.

Packaging and storage Preserve in tight containers.

Compound Ursodeoxycholic Acid·Taurine·Ginseng 30% Ethanol Extract Capsules
복방우르소데옥시콜산·타우린·인삼30%에탄올엑스 캡슐

Compound Ursodeoxycholic Acid·Taurine·Ginseng 30% Ethanol Extract Capsules contain NLT 90.0% and NMT 110.0% of ursodeoxycholic acid ($C_{24}H_{40}O_4$: 392.58), NLT 90.0% and NMT 130.0% of taurine ($C_{12}H_7NO_3S$:125.14), NLT 90.0% and NMT 150.0% of inocitol ($C_6H_{12}O_6$: 180.16) and thiamine nitrate ($C_{12}H_{17}N_5O_4S$:327.36), NLT 90.0% of ginsenoside Rb_1 in ginseng 30% ethanol extract ($C_{54}H_{92}O_{23}$: 1,109.31), respectively, according to the labeled amount.

Method of preparation Prepare as directed under Capsules, with Ursodeoxycholic Acid, Taurine, Inocitol, Thiamine Nitrate and Ginseng 30% Ethanol Extract.

Identification (1) ***Ursodeoxycholic acid***—Weigh an amount of Compound Ursodeoxycholic Acid·Taurine·Ginseng 30% Ethanol Extract Capsules, equivalent to 10 mg of ursodeoxycholic acid, transfer into a Soxhlet extractor, add 70 mL of ethyl acetate, and extract for 1 hour. Then, remove ethyl acetate, dissolve this residue with 10 mL of acetic anhydride, and use this solution as the test solution. Separately, weigh 10 mg of ursodeoxycholic acid RS, dissolve with acetic anhydride to make 10 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Develop the plate with a mixture of toluene, acetone and acetic acid (60 : 30 : 1) to a distance of about 15 cm, dry at 110 ºC for 20 minutes, and cool. Spray evenly sulfuric acid on the plate; the R_f values and the colors of the spots obtained from the test solution and the standard solution are the same.

(2) ***Taurine*—**Perform the test with Compound Ursodeoxycholic Acid·Taurine·Ginseng 30% Ethanol Extract Capsules as directed under the Identification for taurine in compound thioctic acid-orotic acid choline-taurine solution.

(3) ***Ginseng 30% ethanol extract***—**Method 1** Weigh an amount of Compound Ursodeoxycholic Acid·Taurine·Ginseng 30% Ethanol Extract Capsules, equivalent to about 1 g of ginseng, add 100 mL of 80% ethanol, and extract under a reflux condenser for 1 hour. After cooling, filter, evaporate the filtrate to concentrate about 20 mL, add 20 mL of 20% ethanolic sulfuric acid, and hydrolyze on a steam bath for 30 minutes. After cooling, extract 3 times each with 20 mL of ether, combine all ether layers, transfer into a separatory funnel, and wash 3 times each with 10 mL of sodium bicarbonate. Concentrate the ether layer in vacuum, dissolve the residue with 2 mL of ethanol, and use this solution as the test solution. Separately, weigh about 1.0 g of Ginseng, proceed in the same manner as in the preparation of the test solution, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel G. Next, develop the plate with a mixture of chloroform and acetone (4 : 1) as the developing solvent to a distance of about 10 cm, and heat the plate at 105 ℃ for 10 minutes. Spray evenly vanillin-sulfuric acid TS on the plate; the R_f values and the colors of the spots obtained from the test solution and the standard solution are the same.

Method 2 Weigh an amount of Compound Ursodeoxycholic Acid·Taurine·Ginseng 30% Ethanol Extract Capsules, equivalent to about 1 g of ginseng, add 50 mL of methanol, and extract under a reflux condenser for 30 minutes. After cooling, concentrate the filtrate in vacuum, dissolve the residue with 2 mL of methanol, and use this solution as the test solution. Separately, weigh about 1.0 g of Ginseng, proceed in the same manner as in the preparation of the test solution, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel G. Next, develop the plate with a mixture of chloroform, methanol and water (13 : 7 : 2) as the developing solvent to a distance of about 10 cm, and heat the plate at 105 ℃ for 10 minutes. Spray evenly sulfuric acid TS for spraying onto the plate; the R_f values and the colors of the spots obtained from the test solution and the standard solution are the same.

(4) ***Inocitol and thiamine nitrate*—**The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

Disintegration Meets the requirements.

Uniformity of dosage units Meet requirements.

Assay (1) ***Ursodeoxycholic acid***—Weigh accurately the mass of NLT 20 capsules of Compound Ursodeoxycholic Acid·Taurine·Ginseng 30% Ethanol Extract Capsules. Weigh accurately an amount of Compound Ursodeoxycholic Acid·Taurine·Ginseng 30% Ethanol Extract Capsules, equivalent to about 50 mg of ursodeoxycholic acid ($C_{24}H_{40}O_4$), add 40 mL of methanol, shake for 30 minutes to dissolve, and then add 5.0 mL of the internal standard solution and methanol to make exactly 50 mL. Then, filter, and use the filtrate as the test solution. Separately,

weigh accurately about 50 mg of ursodeoxycholic acid RS, dissolve in 40 mL of methanol, add 5.0 mL of the internal standard solution and methanol to make exactly 50 mL, and use this solution as the standard solution. Perform the test with 60 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak area, A_T and A_S, of ursodeoxycholic acid in each solution.

Amount (mg) of ursodeoxycholic acid ($C_{24}H_{40}O_4$)
= Amount (mg) of ursodeoxycholic acid RS× $\frac{A_T}{A_S}$

Operating conditions

Detector: A differential refractometer

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 μm to 10 μm in particle diameter).

Mobile phase: Take 500 mL of a mixture of methanol and water (70 : 30) and adjust the pH to 3.5 with 0.1 mol/L phosphoric acid.

Flow rate: 1.0 mL/min

Internal standard solution—Weigh 500 mg of cholic acid, and dissolve in methanol to make 50 mL.

(2) ***Taurine*—**Weigh accurately the mass of NLT 20 capsules of Compound Ursodeoxycholic Acid·Taurine·Ginseng 30% Ethanol Extract Capsules, weigh accurately an amount of these capsules, equivalent to about 50 mg of taurine ($C_{12}H_7NO_3S$), dissolve in water to make exactly 100 mL. After filtering, pipet 5 mL of the filtrate, add 10 mL of diluent, then add sodium carbonate solution (3 in 300) to make exactly 100 mL, and warm at 90 ℃ for 30 minutes. Then, cool at ordinary temperature, 15 ~ 25 ℃. Next, filter through a membrane filter with a pore size of 0.45 μm, and use this solution as the test solution. Separately, weigh accurately about 50 mg of taurine RS, proceed in the same manner as in the preparation of the test solution, and use this solution as the standard solution. Perform the test with each 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of taurine in each solution.

Amount (mg) of taurine ($C_{12}H_7NO_3S$)
= Amount (mg) of taurine RS× $\frac{A_T}{A_S}$

Operating conditions

Detector: An ultraviolet absorption spectrophotometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and 15 cm to 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm to 10 μm in particle diameter).

Mobile phase: A mixture of 1% acetic acid and acetonitrile (70 : 30).

Efflux rate: 1.0 mL/min

Diluent—Dissolve 0.6 g of dansyl chloride in acetone to make 100 mL.

(3) ***Inocitol and thymine nitrate*—**Weigh accurately the mass of NLT 20 capsules of Compound Ursodeoxycholic Acid·Taurine·Ginseng 30% Ethanol Extract Capsules, and perform the test as directed under the Assay for inocitol and thiamine nitrate under the Analysis for Vitamins.

(4) ***Ginsenoside Rb_1 in ginseng 30% ethanol extract*—**Weigh accurately the mass of NLT 20 capsules of Compound Ursodeoxycholic Acid·Taurine·Ginseng 30% Ethanol Extract Capsules. Weigh accurately an amount of these capsules, equivalent to about 1 mg of ginsenoside Rb_1 in ginseng 30% ethanol extract ($C_{54}H_{92}O_{23}$), transfer into a 25-mL volumetric flask, add methanol, and sonicate to dissolve. Then, add methanol exactly to the gauge line, and use this solution as the test solution. Separately, weigh accurately about 6 mg of ginsenoside Rb_1 RS, and dissolve in methanol to make exactly 50 mL. Pipet 5 mL of this solution, add methanol to make exactly 15 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of ginsenoside Rb_1 in each solution.

Operating conditions

Detector: An ultraviolet absorption spectrophotometer (wavelength: 203 nm).

Column: A stainless steel column about 7 mm in internal diameter and about 33 mm in length, packed with octadecylsilanized silica gel for liquid chromatography (1.5 μm in particle diameter).

Mobile phase: Control the mixing ratio of mobile phase A and mobile phase B stepwise or via the gradient elution as follows.

Mobile phase A: Acetonitrile

Mobile phase B: Water

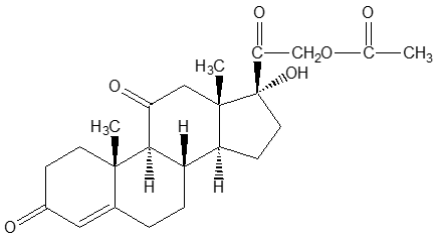
Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 - 10	20 → 25	80 → 75
10 - 25	25 → 37	75 → 63
25 - 35	37	63
35 - 36	37 → 20	63 → 80
36 - 40	20	80

Flow rate: 1.2 mL/min

Amount (mg) of ginsenoside Rb_1 ($C_{54}H_{92}O_{23}$)
= Amount (mg) of ginsenoside Rb_1 RS× $\frac{A_T}{A_S}$ × $\frac{1}{6}$

Packaging and storage Preserve in tight containers.

Cortisone Acetate
코르티손아세테이트



$C_{23}H_{30}O_6$: 402.48

[2-[(8*S*,9*S*,10*R*,13*S*,14*S*,17*R*)-17-Hydroxy-10,13-dimethyl-3,11-dioxo-1,2,6,7,8,9,12,14,15,16-decahydrocyclopenta[a]phenanthren-17-yl]-2-oxoethyl] acetate [*50-04-4*]

Cortisone Acetate, when dried, contains NLT 97.0% and NMT 102.0% of cortisone acetate ($C_{23}H_{30}O_6$).

Description Cortisone Acetate occurs as white crystals or a crystalline powder.
It is sparingly soluble in methanol, slightly soluble in ethanol(99.5) and practically insoluble in water.

Melting point—About 240 °C (with decomposition).

Identification (1) Add 2 mL of sulfuric acid to 2 mg of Cortisone Acetate and allow to stand for a while; the solution exhibits a yellowish green and slowly changes to orange yellow. This solution has a light green fluorescence under ultraviolet light. Carefully add 10 mL of water to this solution; the solution loses its orange yellow color and becomes clear.

(2) Determine the absorption spectra of solutions of Cortisone Acetate and Cortisone Acetate RS in methanol (1 in 50000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared spectra of Cortisone Acetate and Cortisone Acetate RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers. If any difference appears, dissolve each in acetone, then evaporate the acetone and repeat the test using the residue on evaporation.

Optical rotation $[\alpha]_D^{20}$: Between +207° and +216° (0.1 g, after drying, methanol, 10 mL, 100 mm).

Purity ***Related substances***—Dissolve 25 mg of Cortisone Acetate in a mixture of acetonitrile, water and acetic acid(100) (70 : 30 : 1), and use this solution as the test solution. Pipet 10 mL of this solution, add a mixture of acetonitrile, water and acetic acid(100) (70 : 30 : 1) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 15 μL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak area of each solution by automatic integration method; each peak area other than the peak of Cortisone Acetate from the test solution is not greater than 1/2 of the peak area of Cortisone Acetate from the standard solution. The total area of the peaks other than the peak of Cortisone Acetate from the test solution is not greater than 1.5 times the peak area of Cortisone Acetate from the standard solution.

Operating conditions

Detector: An ultraviolet photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: Control the mixing ratio of mobile phase A and mobile phase B in stages or gradient elution as follows.

Mobile phase A: A mixture of water and acetonitrile (7 : 3).

Mobile phase B: A mixture of acetonitrile and water (7 : 3).

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 - 5	90	10
5 - 25	90 → 10	10 → 90
25 - 30	10	90

Flow rate: 1 mL/min

System suitability

Test for required detectability: Pipet 1 mL of the standard solution and add a mixture of acetonitrile, water and acetic acid(100) (70 : 30 : 1) to make exactly 10 mL. Confirm that the peak area of cortisone acetate obtained from 15 μL of this solution is equivalent to between 8% and 12% of the peak area of cortisone acetate obtained from the standard solution.

System performance: Proceed with 15 μL of the standard solution under the above operating conditions; the number of theoretical plates and symmetry factor of the peak of cortisone acetate are NLT 10000 and NMT 1.3, respectively.

System repeatability: Repeat the test 3 times with 15 μL of the standard solution according to the above operating conditions; the relative standard deviation of the peak area for cortisone acetate is NMT 5.0%.

Time span of measurement: About 3 times the retention time of cortisone acetate after the solvent peak.

Loss on drying NMT 1.0% (0.5 g, 105 °C, 3 hours).

Residue on ignition NMT 0.1% (0.5 g).

Assay Dissolve about 10 mg each of Cortisone Acetate and cortisone acetate RS, previously dried and accurately weighed, in 50 mL of methanol, add exactly 5 mL each of the internal standard solution, and add methanol to make 100 mL. Use these solutions as the test solution and the standard solution, respectively. Perform the test with 10 μL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the ratio of the peak area, Q_T and Q_S of cortisone acetate to that of the internal standard.

$$\text{Amount (mg) of cortisone acetate } (C_{23}H_{30}O_6) = \text{Amount (mg) of cortisone acetate RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of butyl parahydroxybenzoate in methanol (3 in 5000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: A mixture of water and acetonitrile (13 : 7).

Flow rate: Adjust the flow rate so that the retention time of cortisone acetate is about 12 minutes.

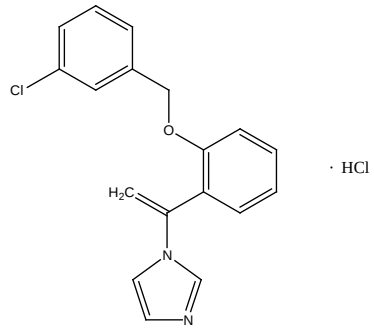
System suitability

System performance: Proceed with 10 μL of the standard solution under the above operating conditions; cortisone acetate and the internal standard are eluted in this order with the resolution being NLT 4.

System repeatability: Repeat the test 6 times with 10 μL of the standard solution under the above operating conditions; the relative standard deviation of the peak area of cortisone acetate to that of the internal standard is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Croconazole Hydrochloride
크로코나졸염산염



$C_{18}H_{15}ClN_2O \cdot HCl$: 347.24

1-[1-[2-[(3-Chlorophenyl)methoxy]phenyl] ethenyl]imidazole hydrochloride [*77174-66-4*]

Croconazole Hydrochloride, when dried, contains NLT 98.5% and NMT 101.0% of croconazole hydrochloride ($C_{18}H_{15}ClN_2O \cdot HCl$).

Description Croconazole Hydrochloride occurs as white to pale yellow crystals or a crystalline powder.
It is very soluble in water, freely soluble in methanol, acetic acid(100) or acetone, and practically insoluble in ether.

Identification (1) Determine the absorption spectra of methanol solutions of Croconazole Hydrochloride and croconazole hydrochloride RS (1 in 20000) as directed under the Ultraviolet-visible spectrophotometry; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectrum of Croconazole Hydrochloride and croconazole hydrochloride RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) Dissolve 50 mg of Croconazole Hydrochloride in 10 mL of water, add 2 mL of sodium hydroxide TS, add 20 mL of ether, and shake to mix. Separately collect the aqueous layer, wash 2 times with 10 mL of ether each time, and add 2 mL of dilute nitric acid to acidify; the solution responds to the Qualitative Analysis for chloride.

Melting point Between 148 and 153 ℃.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Croconazole Hydrochloride according to Method 4 and perform the test. Prepare the control solution with 1.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Related substances***—Weigh accurately 50 mg of Croconazole Hydrochloride, dissolve in 10 mL of methanol, and use this solution as the test solution. Pipet 1 mL of this solution, add methanol to make exactly 100 mL, and use this solution as the standard solution. With

these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, hexane, methanol and ammonia water(28) (30 : 15 : 5 :1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Examine the plate under ultraviolet light (principal wavelength: 254 nm); the spots other than the principal spot and the spot of the starting point from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 0.5% (1.0 g, 60 ℃, 4 hours).

Residue on ignition NMT 0.1% (1.0 g).

Assay Weigh accurately about 0.6 g of Croconazole Hydrochloride, previously dried, dissolve in 10 mL of acetic acid(100), add 40 mL of acetic anhydride, and titrate with 0.1 mol/L perchloric acid VS [indicator: 1 to 2 drops of a solution of malachite green oxalate in acetic acid(100) (1 in 100)]. However, the endpoint of titration is when the bluish green of the solution turns to green and then finally to yellowish green. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 34.724 mg of $C_{18}H_{15}ClN_2O \cdot HCl$

Packaging and storage Preserve in light-resistant, tight containers.

Crotamiton Ointment
크로타미톤 연고

Crotamiton Ointment contains NLT 90.0% and NMT 110.0% of the labeled amount of crotamiton ($C_{13}H_{17}NO$: 203.28).

Method of preparation Prepare as directed under Ointments, with Crotamiton.

Identification The retention times of the major peaks from the test solution and the standard solution obtained in the Assay are the same.

Assay Weigh accurately an amount of Crotamiton Ointment equivalent to about 50 mg of crotamiton ($C_{13}H_{17}NO$), dissolve in methanol to make 50.0 mL, take 20 mL of this solution, and filter. Take 10.0 mL of this solution, add 5.0 mL of the internal standard solution, add methanol to make 50 mL, and use this solution as the test solution. Separately, take an appropriate amount of crotamiton RS and dissolve in methanol to obtain a solution having a concentration of 1 mg per mL. Take 10.0 mL of this solution, add 5.0 mL of the internal standard solution, add methanol to make 50 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the peak area ratios, Q_T and Q_S, of crotamiton to that of the internal standard, respectively.

Amount (mg) of crotamiton ($C_{13}H_{17}NO$)
$= \text{Amount (mg) of crotamiton RS} \times \frac{Q_T}{Q_S} \times 50$

Internal standard solution—Take an appropriate amount of butyl benzoate and dissolve in methanol to make a solution having a concentration of 17.5 mg per mL.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 nm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 μm to 10 μm in particle diameter).

Mobile phase: A mixture of acetonitrile and water (3 : 2).

System suitability

System performance: Proceed with the standard solution according to the above conditions; the resolution between crotamiton and butyl benzoate is NLT 2.0.

System repeatability: Repeat the test 6 times with the standard solution according to the above conditions; the relative standard deviation of the peak areas of crotamiton and butyl benzoate is NMT 2.0%.

Packaging and storage Preserve in tight containers.

Cupric Oxide
산화제이구리

CuO : 79.55

Copper oxide, [*1317-38-0*]

Cupric Oxide contains NLT 97.5% and NMT 101.0% of cupric oxide (CuO).

Description Cupric Oxide occurs as a dark black powder or grain.
It is freely soluble in dilute nitric acid and slowly soluble in ammonia water.

Identification Add an excessive amount of ammonia water to a solution of Cupric Oxide in dilute nitric acid; the solution exhibits an intense blue color. Also, add potassium ferrocyanide solution to a solution of Cupric Oxide in acetic acid; a reddish brown precipitate is produced.

Purity (1) ***Water solubles*—**To 10 g of Cupric Oxide, add 100 mL of water, shake for 1 minute to mix, and filter. Take 50 mL of the filtrate, put in a porcelain crucible, previously measured in the mass, evaporate to dryness on a steam bath, ignite, and cool in a desiccator. Measure the mass; the mass difference before and after the measure is NMT 2 mg (NMT 0.04%).

(2) ***Hydrochloric acid insolubles*—**Weigh 5 g of Cupric Oxide, add 25 mL of hydrochloric acid and NMT 15 mL of water, heat on a steam bath to dissolve, and add water to make 100 mL. Filter this solution, wash the residue with water, dry to a constant mass at 105 ℃, and measure the mass; the mass is NMT 1 mg (NMT 0.02%) (Store this solution and use it for the test of ammonia precipitate.).

(3) ***Free alkali*—**Weigh 3 g of Cupric Oxide, add 30 mL of water, boil, and cool. Take 20 mL of the clear supernatant, add 2 drops of phenolphthalein TS; the solution does not exhibit a red color.

(4) ***Chloride*—**Weigh 1 g of Cupric Oxide and dissolve in 20 mL of water and 5 mL of nitric acid (filter if necessary). Add water to make 40 mL and perform the test; the solution is not more intense than the control solution. Prepare the control solution with 0.14 mL of 0.01 mol/L hydrochloric acid VS (NMT 0.005%).

(5) ***Sulfate*—**Weigh 2 g of Cupric Oxide, add 10 mL of hydrochloric acid and 5 mL of water, and heat to dissolve. Add water to make 100 mL, and heat at about 70 ℃ to saturate the hydrogen sulfide and to completely sink the copper as a precipitate. After cooling, add hydrogen sulfide TS to make 200 mL, shake well to mix, and filter. Take 100 mL of the filtrate, add 5 drops of sulfuric acid, evaporate to dryness in a sand bath, and ignite. Measure the mass; the residue is NMT 2 mg (NMT 0.2%).

(6) ***Ammonia precipitate*—**To the filtrate obtained from the Hydrochloric acid insolubles in (2), add ammonia water until the first produced precipitate dissolves, and filter. Wash the residue with water containing a small amount of ammonia water, dry, ignite, and measure the mass; the residue is NMT 10 mg (NMT 0.2%).

(7) ***Total amount of carbon*—**Weigh 5 g of Cupric Oxide, put in the center of a porcelain combustion tube, and heat the porcelain combustion tube at 1000 to 1,100 ℃ for 10 minutes while passing oxygen at the speed of 100 mL per minute. Slowly, lower the temperature to 900 ℃ and keep the temperature for 30 minutes. While maintaining the temperature, pass the gas generated from heating through chromic acid saturated sulfuric acid solution through a mixture of 30 mL of carbon dioxide free water and 1 mL of ammonia water. To the mixture of carbon dioxide free water and ammonia water, add carbon dioxide free water to make the final volume of 50 mL. Place 25 mL of this solution into a stoppered test tube, add 5 mL of 10% barium chloride solution, and allow to stand for 10 minutes. The solution is not more intense than the control solution. Prepare the control solution by adding 5 mL of 10% barium chloride solution to 2.5 mL of standard carbonate solution (0.1 mg CO_3/mL) (NMT 0.002%).

(8) ***Total sulfur content*—**Dissolve 5 g of Cupric Oxide in 10 mL of hydrochloric acid and 5 mL of nitric acid, heat to dissolve, and evaporate to dryness on a steam bath. Dissolve the residue in 100 mL of water and 1 mL of hydrochloric acid, and if necessary, filter. Wash the residue with water, combine the filtrate with the washings, and boil. Add 10 mL of 10% barium chloride solution and allow to stand over night. Filter, wash the precipitate with water, dry, and ignite at 700 ℃. The residue is NMT 1.5 mg (NMT 0.03%).

(9) ***Cupric dioxide*—**To 1 g of Cupric Oxide, add 7 mL of hydrochloric acid and 50 mL of water, and titrate with 0.02 mol/L potassium permanganate VS; the consumed amount is NMT 0.1 mL. Use o-toluidine hydrochloride solution as the indicator.

(10) ***Total nitrogen*—**Perform the test as directed under the Nitrogen Determination; the result is NMT 0.02%.

Assay Weigh accurately about 1 g of Cupric Oxide, add 15 mL of phosphoric acid, and heat on a steam bath to dissolve. After cooling, add water to make exactly 100 mL. Pipet 10 mL of this solution, add 50 mL of water, 3 mL of ammonia water (1 in 2), 6 mL of acetic acid (1 in 2) and 3 g of potassium iodide, and titrate with 0.1 mol/L sodium thiosulfate VS (indicator: starch TS). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L sodium thiosulfate VS
= 7.955 mg of CuO

Packaging and storage Preserve in tight containers.

Cyanamide
시아나미드

CH_2N_2 : 42.04

Cyanamide [*420-04-2*]

Cyanamide contains NLT 97.0% and NMT 101.0% of cyanamide (CH2N2), calculated on the anhydrous basis.

Description Cyanamide occurs as white crystals or a crystalline powder and has a faint, characteristic odor.
It is very soluble in water, methanol or ethanol(95) and freely soluble in ether.
Dissolve about 1.0 g of Cyanamide in 100 mL of water; the pH of this solution is between 5.0 and 6.5.
It is hygroscopic.

Melting point—About 46 °C.

Identification (1) To 1 mL of a solution of Cyanamide

(1 in 100), add 1 mL of potassium 1,2-naphthoquinone-4-sulfonate TS and 0.2 mL of sodium hydroxide TS; the solution exhibits a deep red color.

(2) Spot one or two drops each of solutions of Cyanamide and cyanimide RS in acetone (1 in 100) onto potassium bromide disks prepared as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy, and air-dry the disks. Determine the infrared spectra of the disks as directed under the film method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Cyanamide in 10 mL of water; the solution is clear and colorless.

(2) ***Heavy metals***—Proceed with 2.0 g of Cyanamide according to Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

Water NMT 1.0% (1 g, volumetric titration, direct titration).

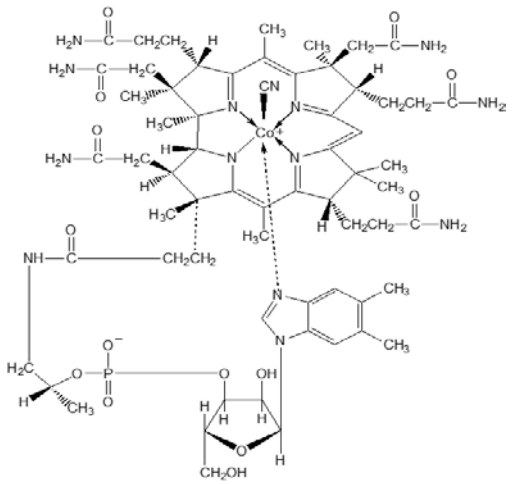
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 1 g of Cyanamide and add water to make exactly 250 mL. Pipet 15 mL of this solution, add 2 to 3 drops of dilute nitric acid, and then add 10 mL of ammonia TS. Next, add exactly 50 mL of 0.1 mol/L silver nitrate, allow to stand for 15 minutes with occasional shaking, add water to make exactly 100 mL, and filter. Discard the first 20 mL of the filtrate and pipet 50 mL of the subsequent filtrate. After neutralizing this solution with dilute nitric acid, add 3 mL of dilute nitric acid, and titrate the excess silver nitrate with 0.1 mol/L ammonium thiocyanate VS (indicator: 2 mL of ammonium iron(III) sulfate TS). Perform a blank test in the same manner.

Each mL of 0.1 mol/L silver nitrate VS
= 2.1020 mg of CH_2N_2

Packaging and storage Preserve in tight containers and store in a cold place.

Cyanocobalamin
시아노코발라민



Vitamin B_{12} $C_{63}H_{88}CoN_{14}O_{14}P$: 1355.37
Cobalt(3+);[5-(5,6-dimethylbenzimidazol-1-yl)-4-hydroxy-2-(hydroxymethyl)oxolan-3-yl][(2*S*)-1-[3-[(2*R*,3*R*,4*Z*,7*S*,9*Z*,12*S*,13*S*,14*Z*,17*S*,18*S*,19*R*)-2,13,18-tris(2-amino-2-oxoethyl)-7,12,17-tris(3-amino-3-oxopropyl)-3,5,8,8,13,15,18,19-octa-methyl-2,7,12,17-tetrahydro-1*H*-corrin-21-id-3-yl]propanoylamino]propan-2-yl]phosphate; cyanide [*68-19-9*]

Cynocobalamin contains NLT 96.0% and NMT 102.0% of Cynocobalamin ($C_{63}H_{88}CoN_{14}O_{14}P$), calculated on the dried basis.

Description Cynocobalamin occurs as dark red crystals or a crystalline powder.
It is sparingly soluble in water and slightly soluble in ethanol(95).
It is hygroscopic.

Identification (1) Determine the absorption spectra of the test solution and the standard solution as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) Mix 1 mg of Cynocobalamin with 50 mg of potassium hydrogen sulfate, and fuse by igniting. After cooling, break up the fused mass with a glass rod, dissolve in 3 mL of water by boiling, and add 1 drop of phenolphthalein TS. Put sodium hydroxide TS dropwise until the solution shows pale light red, and add 0.5 g of sodium acetate trihydrate, 0.5 mL of dilute acetic acid and 0.5 mL of 1-nitroso-2-naphthol-3,6-disulfonic acid disodium (1 in 500); the resulting solution exhibits red to orange immediately. Then add 0.5 mL of hydrochloric acid and boil for 1 minute; the red color of the solution does not disappear.

(3) Put 5 mg of Cynocobalamin into a 50-mL distillation flask, dissolve in 5 mL of water, add 2.5 mL of hypophosphorous acid, connect the flask with a short

condenser, and dip the condenser's tip into 1 mL of sodium hydroxide solution (1 in 50) in a test tube. Next, boil at a low temperature for 10 minutes and distill 1 mL to a test tube To the solution in the test tube, add 4 drops of a saturated solution of ammonium iron(II) sulfate hexahydrate, shake gently to mix, add 30 mg of sodium fluoride, and heat to boiling. Add immediately diluted sulfuric acid (1 in 7) dropwise until the solution becomes clear, and then add again 3 to 5 drops of diluted sulfuric acid (1 in 7); the resulting solution exhibits blue to bluish green.

pH Dissolve 0.10 g of Cynocobalamin in 20 mL of freshly boiled and cooled water; the pH of the resulting solution is between 4.2 and 7.0.

Purity (1) ***Clarity and color of solution*—**Dissolve 20 mg of Cynocobalamin in 10 mL of water; the resulting solution is clear and exhibits a red color.

(2) **Related substances—**This test uses light-resistant containers. Weigh 10 mg of Cynocobalamin, dissolve accurately in 10 mL of the mobile phase, and use this solution as the test solution. Take exactly 3 mL of this solution, dissolve exactly in the mobile phase to make 100 mL, use this solution as the standard solution. With 20 μL each of the test solution and the standard solution, perform the test as directed under the Liquid Chromatography according to the following conditions. Determine peak area of each solution by the automatic integration method; the total area of the peaks other than Cyanocobalamin from the test solution is not larger than the peak area of Cyanocobalamin from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 361 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silical gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 30 °C.

Mobile phase: Weigh 10 g of anhydrous sodium dihydrogen phosphate, dissolve in 1000 mL of water, and adjust the pH to 3.5 with phosphoric acid. To 147 mL of this solution, add 53 mL of methanol.

Flow rate: Adjust the flow rate so that the retention time of Cyanocobalamin is about 7 minutes.

System suitability

Test for required detectability: Pipet 1 mL of the test solution, dissolve in the mobile phase to make 100 mL, use this solution as the system suitability solution. Pipet 1 mL of this solution and dissolve in the mobile phase to make exactly 10 mL. Confirm that the peak area of cyanocobalamin obtained from 20 μL of this solution is 7% to 13% of the peak area of cyanocobalamin from the system suitability solution.

System performance: Perform the test quickly after preparing the solution. Dissolve 25 mg of Cyanocobalamin in 10 mL of water by warming if necessary, cool, add 0.5 mL of sodium toluenesulfonchloramide TS and 0.5 mL of 0.05 mol/L hydrochloric acid TS, add water to make 25 mL, shake to mix, and allow to stand for 5 minutes. To 1 mL of this solution, add the mobile phase to make 10 mL. With 20 μL of the resulting solution, proceed according to the above conditions; two major peaks appear, and their peak resolution is NLT 2.5.

System repeatability: Repeat the test 6 times with 20 μL each of the system suitability solution according to the above conditions; the relative standard deviation of the cyanocobalamin peaks is not more 3.0%.

Time span of measurement: About 4 times of the retention time of cyanocobalamin after the solvent peak.

Loss on drying NMT 12% (50 mg, NMT 0.67 kPa, phosphorus oxide, 100 °C, 4 hours).

Assay Weigh accurately about 20 mg each of Cyanocobalamin and cyanocobalamin RS (previously measure the loss on drying in the same manner as Cyanocobalamin), dissolve in water to make exactly 1000 mL, and use them as the test solution and the standard solution. Perform the test with these solutions as directed under the Ultraviolet-visible Spectroscopy, and determine the absorbances AT and AS at a wavelength of 361 nm.

Amount (mg) of cynocobalamin ($C_{63}H_{88}CoN_{14}O_{14}P$) = Amount (mg) of cyanocobalamin RS, calculated on the dried basis $\times \frac{A_T}{A_S}$

Packaging and storage Preserve in light-resistant, tight containers.

0.1% Cyanocobalamin Powder
시아노코발라민 1000배산

0.1% Cyanocobalamin Powder contains NLT 1 mg of cyanocobalamin ($C_{63}H_{88}CoN_{14}O_{14}P$) per g.

Method of preparation Prepare by finely dispersing cyanocobalamin in an excipient such as citric acid. 0.1% Cyanocobalamin Powder is a drug substance.

Description 0.1% Cyanocobalamin Powder occurs as a pink, odorless powder.

Identification Determine the absorption spectra as directed under the Assay; the standard solution and the test solution exhibit absorption maxima at the same wavelengths.

Purity ***Clarity and color of solution*—**The test solution from the Assay does not contain insoluble substances.

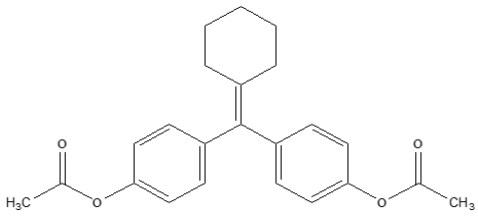
Loss on drying NMT 5.0% (1 g, 105 °C, 4 hours).

Assay Weigh accurately an amount of 0.1% Cyanocobalamin Powder, equivalent to about 1 mg of cyanocobalamin ($C_{63}H_{88}CoN_{14}O_{14}P$), dissolve in water to make 50 mL, and use this solution as the test solution. Separately, weigh accurately about 20 mg of cyanocobalamin RS and dissolve in water to make 100 mL. Pipet 5 mL of this solution, add water to make exactly 50 mL, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution at the wavelength of 361 nm as directed under the Ultraviolet-visible Spectroscopy, using water as a control solution.

$$\text{Amount (mg) of cyanocobalamin } (C_{63}H_{88}CoN_{14}O_{14}P) = \text{Amount (mg) of cyanocobalamin RS} \times \frac{A_T}{A_S} \times \frac{1}{20}$$

Packaging and storage Preserve in light-resistant, tight containers.

Cyclofenil
시클로페닐



$C_{23}H_{24}O_4$: 364.43

4,4'-(Cyclohexylidenemethylene)bis-phenol-1,1'-diacetate, [*2624-43-3*]

Cyclofenil, when dried, contains NLT 98.0% and NMT 101.0% of cyclofenil ($C_{23}H_{24}O_4$).

Description Cyclofenil occurs as white crystals and is odorless. It is freely soluble in chloroform or dimethylformamide, soluble in acetic acid(100), sparingly soluble in ether, slightly soluble in methanol or ethanol(95), and practically insoluble in water.

Identification (1) To 1 mL of an ethanol(95) solution (1 in 1000) of cyclofenil, add 0.5 mL each of an ethanol saturated solution of hydroxyammonium hydrochloride and an ethanol saturated solution of sodium hydroxide, and dissolve by heating on a steam bath for 1 minute. After cooling, add 0.1 mL of iron(III) chloride solution (1 in 100) diluted with 1 mL of 1 mol/L hydrochloric acid TS to make it acidic; the solution exhibits a reddish purple color.

(2) Add 1 drop of potassium permanganate TS to 5 mL of acetic acid(100) solution (1 in 500) of Cyclofenil, a red color of the solution disappears soon.

(3) Determine the absorption spectra of the test solution according to the Assay as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum between 243 and 247 nm.

Melting point Between 137 and 141 °C.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Cyclofenil in 5 mL of chloroform; the solution is colorless and clear.

(2) ***Chloride***—Dissolve 0.5 g of Cyclofenil in 40 mL of dimethylformamide, add 6 mL of dilute nitric acid and dimethylformamide to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution by adding 6 mL of dilute nitric acid and dimethylformamide to 0.25 mL of 0.01 mol/L hydrochloric acid to make 50 mL (NMT 0.018%).

(3) ***Sulfate***—Dissolve 40 mL of dimethylformamide in 1.0 g of Cyclofenil, add 1 mL of dilute hydrochloric acid and dimethylformamide to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution by adding 1 mL of dilute hydrochloric acid and dimethylformamide to 0.40 mL of 0.01 mol/L sulfuric acid to make 50 mL (NMT 0.019%).

(4) ***Heavy metals***—Proceed with 1.0 g of Cyclofenil as directed under Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(5) ***Arsenic***—Proceed with 1.0 g of Cyclofenil according to Method 3 and perform the test (NMT 2 ppm).

(6) ***Related substances***—Dissolve 0.10 g of Cyclofenil in 10 mL of chloroform, and use this solution as the test solution. Separately, pipet 1.0 mL of this solution, add chloroform to make exactly 100 mL, and use this solution as the standard solution. Spot 10 μL each of the test solution and the standard solution on a thin-layer chromatographic plate made of silica gel for thin-layer chromatography (fluorescent indicator added). Next, develop the plate with a mixture of hexane, acetone and methanol (20 : 10 : 3) as the developing solvent to a distance of about 12 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength 254 nm); the spots other than the principal spot obtained from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 0.5% (10 g, 105 °C, 3 hours).

Residue on ignition NMT 0.10% (1 g).

Assay Weigh accurately about 10 mg of Cyclofenil, previously dried, and dissolve in methanol to make exactly 100 mL. Pipet 5.0 mL of this solution, add methanol to make 50 mL, and use this solution as the test solution. Separately, weigh accurately about 10 mg of cyclofenil RS, previously dried, proceed in the same manner as in the test solution, and use this solution as the standard solution. With methanol as the control solution, perform the test with the test solution and the standard solution as directed under the Ultraviolet-visible Spectroscopy, and

determine the absorbance, A_T and A_S at a wavelength of 245 nm.

$$\text{Amount (mg) of cyclofenil } (C_{23}H_{24}O_4) = \text{Amount (mg) of cyclofenil RS} \times (A_T / A_S)$$

Packaging and storage Preserve in tight containers.

Cyclofenil Tablets
시클로페닐 정

Cyclofenil Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of cyclofenil ($C_{23}H_{24}O_4$: 364.43).

Method of preparation Prepare as directed under Tablets, with Cyclofenil.

Identification (1) To 1 mL of a solution of Cyclofenil Tablets in ethanol(95) (1 in 100), add 0.5 mL each of ethanol saturated solution of hydroxyammonium hydrochloride and ethanol saturated solution of sodium hydroxide, and dissolve by warming on a steam bath for 1 minute. Add 1 mL of 1 mol/L hydrochloric acid to make it acidic, then add 0.1 mL of dilute iron(III) chloride solution (1 in 100); the solution exhibits a reddish purple color.

(2) Determine the absorption spectra of the test solution according to the Assay as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum at the wavelength of between 243 and 247 nm.

Disintegration Meets the requirements.

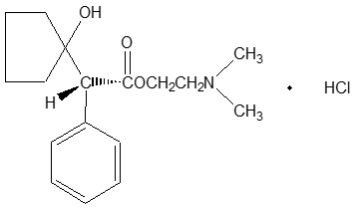
Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 tablets of Cimetidine Tablets and powder. Weigh accurately a portion of powder, equivalent to about 0.1 mg of cyclofenil ($C_{23}H_{24}O_4$), dissolve in about 60 mL of methanol, and shake to mix by warming on a steam bath. After colling, add methanol to make exactly 100 mL, and filter. Pipet 5 mL of this solution, add methanol to make exactly 50 mL, and use this solution as the test solution. Separately, weigh accurately about 0.1 g of cyclofenil RS, previously dried at 105 °C for 3 hours, and proceed in the same manner as the test solution. Use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at 245 nm as directed under the Ultraviolet-visible Spectroscopy, using methanol as a control solution.

$$\text{Amount (mg) of cyclofenil } (C_{23}H_{24}O_4) = \text{Amount(mg) of cyclofenil RS} \times (A_T / A_S)$$

Packaging and storage Preserve in well-closed containers.

Cyclopentolate Hydrochloride
시클로펜톨레이트염산염



and enantiomer

$C_{17}H_{25}NO_3 \cdot HCl$: 327.85

2-(Dimethylamino)ethyl (1-hydroxycyclopentyl) phenylacetate hydrochloride [*5870-29-1*]

Cyclopentolate Hydrochloride, when dried, contains NLT 98.5% and NMT 101.0% of cyclopentolate hydrochloride ($C_{17}H_{25}NO_3 \cdot HCl$).

Description Cyclopentolate Hydrochloride occurs as a white crystalline powder and is odorless or has a characteristic odor.
It is very soluble in water, freely soluble in ethanol(95) or acetic acid(100), slightly soluble in acetic anhydride, and practically insoluble in ether.

Identification (1) Add 1 mL of Reinecke salt TS to 1 mL of an aqueous solution of Cyclopentolate Hydrochloride (1 in 100); a pale red precipitate develops.

(2) Dissolve 0.2 g of Cyclopentolate Hydrochloride in 2 mL of water, add 2 mL of sodium hydroxide TS, and boil for 5 minutes. After cooling, add two drops of nitric acid; an odor like phenylacetic acid is perceptible.

(3) Determine the infrared spectra of Cyclopentolate Hydrochloride and cyclopentolate hydrochloride RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(4) An aqueous solution of Cyclopentolate Hydrochloride (1 in 50) responds to the Qualitative Analysis for chloride.

pH Dissolve 0.20 g of Cyclopentolate Hydrochloride in 20 mL of water; the pH is between 4.5 and 5.5.

Melting point Between 135 and 138 ºC.

Purity (1) ***Clarity and color of solution*—**Dissolve 1.0 g of Cyclopentolate Hydrochloride in 10 mL of water; the solution is clear and colorless.

(2) ***Heavy metals*—**Proceed with 1.0 g of Cyclopentolate Hydrochloride according to Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Related substances*—**Dissolve 0.20 g of Cyclo-

pentolate Hydrochloride in 10 mL of chloroform and use this solution as the test solution. Pipet 1 mL of this solution and add chloroform to make exactly 20 mL. Pipet 1 mL of this solution, add chloroform to make exactly 10 mL, and use this solution as the standard solution. Perform the test directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on a plate made of silica gel for thin-layer chromatography. Develop the plate with a mixture of 2-propanol, acetic acid, n-butyl acetate, water and ammonia water(28) (100 : 60 : 23 : 17) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Spray evenly sulfuric acid in ethanol(99.5) solution (1 in 10) on the plate, heat the plate at 120 ℃ for 30 minutes, and examine the plate under ultraviolet light (wavelength 254 nm); spots other than the principal spot obtained from the test solution are not more intense than the spot from the standard solution.

Loss on drying NMT 0.5% (1 g, 105 ℃, 4 hours).

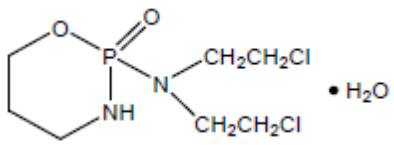
Residue on Ignition NMT 0.05% (1 g).

Assay Weigh accurately about 0.5 g of Cyclopentolate Hydrochloride, previously dried, dissolve in 50 mL of a mixture of acetic anhydride and acetic acid(100) (4 : 1), and titrate with 0.1 mol/L perchloric acid VS (indicator: two drops of Methylrosaniline chloride TS). The endpoint of the titration is when the purple color of this solution turns bluish green to yellowish green. Perform a blank test in the same manner and make any necessary correction.

Each mL of 1 mol/L perchloric acid VS
= 32.79 mg of $C_{17}H_{25}NO_3 \cdot HCl$

Packaging and storage Preserve in tight containers.

Cyclophosphamide Hydrate
시클로포스파미드수화물



Cyclophosphamide $C_7H_{15}Cl_2N_2O_2P \cdot H_2O$: 279.10
2-[*N*,*N*-Bis(2-chloroethyl)]amino-2-oxo-1,3,
$2\lambda^5$-oxazaphosphinane hydrate [*6055-19-2*]

Cyclophosphamide Hydrate, when dried, contains NLT 97.0% and NMT 101.0% of cyclophosphamide hydrate ($C_7H_{15}Cl_2N_2O_2P \cdot H_2O$).

Description Cyclophosphamide Hydrate occurs as white crystals or a crystalline powder and is odorless. It is very soluble in acetic acid(100), freely soluble in acetic anhydride, ethanol(95) or chloroform and soluble in water or ether.

Melting point—Between 45 and 53 ℃.

Identification (1) Dissolve 0.1 g of Cyclophosphamide Hydrate in 10 mL of water, and add 5 mL of silver nitrate TS; precipitates are not formed. Boil this solution; precipitates are formed. Separately, take a portion of the precipitates and add dilute nitric acid; it still does not dissolve. Add excess ammonia TS to the remaining portion; the precipitates dissolve.

(2) Add 1 mL of diluted sulfuric acid (1 in 25) to 20 mg of Cyclophosphamide Hydrate and heat until white fumes are produced. After cooling, add 5 mL of water, shake to mix, neutralize with ammonia TS, and acidify it with dilute nitric acid. This solution responds to the Qualitative Analysis (2) for phosphate.

(3) Determine the infrared spectra of Cyclophosphamide Hydrate and cyclophosphamide hydrate RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Purity (1) ***Clarity and color of solution***—Dissolve 0.20 g of Cyclophosphamide Hydrate in 10 mL of water; the solution is clear and colorless.

(2) ***Chloride***—Proceed with 0.40 g of Cyclophosphamide Hydrate at below 20℃ and perform the test. Prepare the control solution with 0.40 mL of 0.01 mol/L hydrochloric acid (NMT 0.036%).

(3) ***Heavy metals*—**Proceed with 1.0 g of Cyclophosphamide Hydrate according to Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

Water Between 5.5% and 7.0% (0.5 g, volumetric titration, direct titration).

Assay Weigh accurately about 0.1 g of Cyclophosphamide Hydrate, previously dried, put in a 300-mL Erlenmeyer flask, and add 50 mL of sodium hydroxide solution (1 in 100) of ethylene glycol. Install a reflux condenser and heat at a low heat for 30 minutes. After cooling, wash the lower end of the reflux condenser and the upper end of the Erlenmeyer flask with 30 mL of water, transfer the washings to the Erlenmeyer flask, add 75 mL of 2-propanol, 15 mL of dilute nitric acid and exactly 10 mL of 0.1 mol/L silver nitrate, and titrate the excess silver nitrate with 0.1 mol/L ammonium thiocyanate VS (Indicator: 2 mL of ammonium iron(III) sulfate TS).

Each mL of 0.1 mol/L silver nitrate VS
= 13.955 mg of $C_7H_{15}Cl_2N_2O_2P \cdot H_2O$

Packaging and storage Preserve in tight containers and store at below 30 ℃.

Cyclophosphamide for Injection
주사용 시클로포스파미드

Cyclophosphamide for Injection is a preparation for injection which is dissolved before use and Cyclophosphamide for Injection contains NLT 90.0% and NMT 110.0% of the labeled amount of anhydrous cyclophosphamide ($C_7H_{15}Cl_2N_2O_2P$: 261.09).

Method of preparation Prepare as directed under Injections, by mixing Cyclophosphamide Hydrate and Sodium Chloride.

Description Cyclophosphamide for Injection occurs as a white powder.

Identification (1) Determine the infrared spectra of Cyclophosphamide for Injection and cyclophosphamide hydrate RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) The retention times of the major peaks obtained from the test solution and the standard solution prepared as directed under the Assay are the same.

pH Weigh accurately an amount of Cyclophosphamide for Injection, equivalent to 0.2 g of anhydrous cyclophosphamide, dissolve in 10 mL of water, and measure the pH after 30 minutes; the pH of the solution is between 3.0 and 9.0.

Sterility Meets the requirements.

Bacterial endotoxins Less than 0.20 EU per mg of cyclophosphamide.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately an amount of Cyclophosphamide for Injection, equivalent to 0.1 g of anhydrous cyclophosphamide ($C_7H_{15}Cl_2N_2O_2P$) and perform the test as directed under the Assay Cyclophosphamide Tablets.

Packaging and storage Preserve in hermetic containers below 30 ℃.

Not exceeding 25℃ is recommended.

Cyclophosphamide Tablets
시클로포스파미드 정

Cyclophosphamide Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of anhydrous cyclophosphamide ($C_7H_{15}Cl_2N_2O_2P$: 261.09).

Method of preparation Cyclophosphamide Tablets are prepared as directed under Tablets, with Cyclophosphamide Hydrate.

Identification (1) Powder Cyclophosphamide Tablets, weigh a portion of powder, equivalent to 50 mg of cyclophosphamide, extract with 25 mL of chloroform, filter, mix 2 mL of filtrate with 0.5 g of potassium bromide, and evaporate chloroform to dryness. Remove carefully the solvent completely in a small vacuum flask. Determine the residue and cyclophosphamide hydrate RS (previously dried) as directed in the potassium chloride disk method under the Mid-infrared Spectroscopy at the wavenumber in a range between 700 and 1600 cm^{-1}; both exhibit similar intensities of absorption at the same wavenumbers.

(2) The retention times of the major peaks obtained from the test solution and the standard solution in the Assay are the same.

Dissolution Perform the test with 1 tablet of Cychlphosphamide Tablets using 900 mL of deaerated water as the test solution, according to Method 1 under the Dissolution. Take NLT 20 mL of the dissolved solution 45 minutes after starting the Dissolution and filter using a 0.8-μm membrane filter. Discard the first 10 mL of the filtrate and use the subsequent filtrate as the test solution. Separately, weigh accurately an appropriate amount of cyclophosphamide RS, dissolve in water to make it the same concentration as the test solution, and use this solution as the standard solution. Perform the test with 50 μL each of the test solution and the standard solution according to the following operating conditions as directed under the Liquid Chromatography, and determine the peak areas, A_T and A_S, of cyclophosphamide. It meets the requirements when the dissolution rate in 45 minutes is NLT 75% (Q).

Dissolution rate (%) with respect to the labeled amount of cyclophosphamide ($C_7H_{15}Cl_2N_2O_2P$)

$$= C_S \times \frac{A_T}{A_S} \times \frac{1}{C} \times 90000$$

C_S: Concentration of the standard solution (mg/mL)

C: Labeled amount (mg) of cyclophosphamide ($C_7H_{15}Cl_2N_2O_2P$) in 1 tablet

Operating conditions

Proceed as directed under the operating conditions under the Assay.

System suitability

System performance: Proceed with 50 μL of the standard solution according to the above conditions; the symmetry factor is NMT 2.0.

System repeatability: Repeat the test 5 times with 50 μL of the standard solution according to the above operating conditions; the relative standard deviation of the peak area of cyclophosphamide is NMT 2.0%.

Uniformity of dosage units It meets the requirements

when the Content uniformity test is performed according to the following procedure.

Take 1 tablet of Cyclophosphamide Tablets, put in an appropriately sized volumetric flask with a final concentration of about 500 μg/mL, add water to 2/3 of the volume, shake well to mix until the tablet is completely disintegrated, and add water to the gauge line. Filter this solution, discard the first 10 mL of the filtrate, and use the subsequent filtrate as the test solution. Separately, dissolve an appropriate amount of cyclophosphamide hydrate RS in water to make about 500 mL, and use this solution as the standard solution. Take 2.0 mL each of the test solution, the standard solution and water (blank test solution), add 0.7 mL of perchloric acid solution to each solution, shake to mix, heat for 10 minutes at 95 °C and then cool. Mix with 1.6 mL of sodium acetate TS and 1.6 mL of 4-(*p*-nitrobenzile)pyridine solution, heat for 10 minutes at 95 °C and then cool. Mix with 8.0 mL of sodium hydroxide solution and shake, and perform the test as directed under the Ultraviolet-visible Spectroscopy within 4 minutes. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at the absorbance maximum wavelength (λmax) of around 560 nm with the blank test solution as a control.

$$C\text{: Amount (mg) of cyclophosphamide } (C_7H_{15}Cl_2N_2O_2P\text{: } 261.09) \text{ in 1 tablet} = \frac{T}{500} \times C \times \frac{A_T}{A_S}$$

T: Labeled amount (mg) of anhydrous cyclophosphamide in 1 tablet

C: Concentration of cyclophosphamide in the cyclophosphamide standard solution (μg/mL), calculated on the anhydrous basis

Assay Weigh accurately the mass of NLT 20 tablets of Cyclophosphamide Tablets and powder. Weigh accurately a portion of the powder, equivalent to about 0.1 g of anhydrous cyclophosphamide ($C_7H_{15}Cl_2N_2O_2P$), add about 50 mL of methanol, mix by shaking for about 30 minutes, and add water to make exactly 100 mL. Filter with a filter paper immediately, discard the first 40 to 50 mL of the filtrate. Pipet 25 mL of the subsequent filtrate, add 5.0 mL of the internal standard solution and water to make exactly 50 mL. Use this solution as the test solution. Separately, weigh accurately about 25 mg of cyclophosphamide hydrate RS (determined for water), dissolve in 25 mL of water, add 5.0 mL of the internal standard solution and water to make exactly 50 mL. Use this solution as the standard solution. Perform the test with 25 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions, and calculate the ratios, Q_T and Q_S, of the peak area of cyclophosphamide to that of the internal standard.

$$\text{Amount (mg) of cyclophosphamide } (C_7H_{15}Cl_2N_2O_2P) = \text{Amount (mg) of cyclophosphamide hydrate RS, calculated on the anhydrous basis} \times \frac{Q_T}{Q_S} \times 4$$

Internal standard solution—Dissolve ethylparaben TS in 250 mL of ethanol(95) and add water to make 1000 mL.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 195 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm to 10 μm in particle diameter).

Mobile phase: A mixture of water and acetonitrile (70 : 30).

Flow rate: 1.5 mL/minute

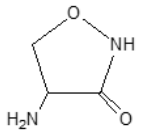
System suitability

System performance: Proceed with 25 μL of the standard solution according to the above operating conditions; cyclophosphamide and the internal standard are eluted in this order with the resolution being NLT 2.0.

System repeatability: Repeat the test 6 times with 25 μL each of the standard solution under the above operating conditions; the relative standard deviation of the peak area ratios is NMT 2.0%.

Packaging and storage Preserve in tight containers and store at below 30 °C.

Cycloserine
시클로세린



$C_3H_6N_2O_2$: 102.09

(4*R*)-4-Amino-1,2-oxazolidin-3-one [*68-41-7*]

Cycloserine, when dried, contains NLT 950 μg and NMT 1020 μg (potency) of Cycloserine ($C_3H_6N_2O_2$: 102.09) per mg.

Description Cycloserine occurs as white to pale yellowish white crystals or a crystalline powder.

It is soluble in water and sparingly soluble in ethanol(95).

Identification Determine the infrared spectra of Cycloserine and cycloserine RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

Crystallinity Meets the requirements.

Optical rotation $[\alpha]_D^{20}$: Between +108° and +114° (2.5

g, calculated on the dried basis, 2mol/L sodium hydroxide TS, 50 mL, 100 mm).

pH Dissolve 0.5 g (potency) of Cycloserine in 10 mL of water; the pH of the solution is between 5.0 and 7.4.

Purity (1) ***Heavy metals*—**Proceed with 1.0 g of Cycloserine according to Method 4 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Condensation*—**Weigh 20 mg of Cycloserine and dissolve in sodium hydroxide TS to make exactly 50 mL. Perform the test with this solution as directed under the Ultraviolet-visible Spectroscopy; the absorbance at a wavelength of 285 nm is NMT 0.8.

Loss on drying NMT 1.5% (0.5 g, in vacuum, 60 ℃, 3 hours).

Residue on ignition 0.5% (1g).

Assay ***Cylinder plate method*** (1) Medium Agar media for seed and base layer Use the medium in (A) (2) (a) ① ⓐ under the Microbial Assays for Antibiotics. However, adjust the pH to 6.0 to 6.1.

(2) ***Test organism*—**Use *Bacillus subtilis* ATCC 6633 as the test organism.

(3) Weigh accurately about 40 mg (potency) of Cycloserine, and dissolve it in sterile purified water to make a solution containing 400 μg (potency) per mL. Pipet an appropriate amount of this solution, dilute with 1% phosphate buffer solution, pH 6.0 to contain 100.0 and 50.0 μg (potency) per mL, and use them as the high-concentration test solution and the low-concentration test solution, respectively. Separately, weigh about 40 mg (potency) of the cycloserine RS and dissolve in sterile purified water to prepare a standard stock solution containing 400 μg (potency) per mL. Store this standard stock solution at below 5 ℃ and use it within 24 hours. Pipet an appropriate amount of this standard stock solution and dilute with 1% phosphate buffer solution (pH 6.0) to contain 100.0 and 50.0 μg (potency) per mL, and use them as the high-concentration standard solution and the low-concentration standard solution, respectively. Perform the test with these solutions according to the Microbial Assays for Antibiotics (A)(8).

Packaging and storage Preserve in tight containers.

Cycloserine Capsules
시클로세린 캡슐

Cycloserine Capsules contain NLT 90.0% and NMT 120.0% of the labeled amount of cycloserine ($C_3H_6N_2O_2$: 102.09).

Method of preparation Prepare as directed under Capsules, with Cycloserine.

Identification (1) Weigh an amount of Cycloserine Capsules, equivalent to about 10 mg (potency), add 2 mL of water, shake to mix, and filter. To the filtrate, add 1 to 2 drops of iron(III) chloride TS; the resulting solution exhibits a dark red color.

(2) Weigh an amount of Cycloserine Capsules, equivalent to 5 mg (potency) of cycloserine, and dissolve in 10 mL of sodium hydroxide solution (1 in 250). To 1 mL of this solution, add 3 mL of dilute acetic acid, shake to mix, and add 1 mL of cycloserine reaction TS; the resulting solution exhibits a blue color.

Loss on drying NMT 1.0% (0.1 g, 0.7 kPa, 60 ℃, 3 hours).

Dissolution Perform the test with 1 capsule of Cycloserine Capsules at 100 revolutions per minute according to Method 1 under the Dissolution, using 900 mL of pH 6.8 phosphate buffer solution as the dissolution medium. Take the dissolved solution 30 minutes after starting the test, and filter. Discard the first 10 mL of the filtrate, and use the subsequent filtrate as the test solution. Separately, weigh accurately an appropriate amount of cycloserine RS, dissolve in pH 6.8 phosphate buffer solution to make a solution containing about 0.25 mg (potency) of cycloserine per mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of cycloserine, respectively. The acceptable dissolution criterion of Cycloserine Capsules is NLT 80% (Q) dissolved in 30 minutes.

$$\text{Dissolution rate (\%) of the labeled amount of cycloserine } (C_3H_6N_2O_2) = C_S \times \frac{A_T}{A_S} \times \frac{1}{C} \times 90000$$

Cs: Concentration [mg (potency)/mL] of the standard solution

C: Labeled amount [mg (potency)] of cycloserine ($C_3H_6N_2O_2$) in 1 tablet

pH 6.8 phosphate buffer solution—Mix 50 mL of 0.2 mol/L potassium dihydrogen phosphate TS and 22.4 mL of 0.2 mol/L sodium hydroxide solution, and add water to make 200 mL.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 219 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5

μm in particle diameter).

Mobile phase: Dissolve 0.5 g of sodium 1-decanesulfonate in 800 mL of water, add 50 mL of acetonitrile and 5 mL of acetic acid(100), mix well, and adjust the pH to 4.4 with 1 mol/L sodium hydroxide. Filter and degas the solution.

Flow rate: 1 mL/min

Column temperature: A constant temperature of about 30 °C.

System suitability

System performance: Proceed with 10 μL of the standard solution according to the above conditions; the symmetry factor is NMT 1.8.

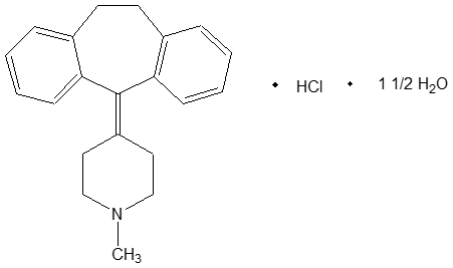
System repeatability: Repeat the test 5 times with 10 μL each of the standard solutions according to the above conditions; the relative standard deviation of the peak area of cycloserine is NMT 2.0%.

Uniformity of dosage units Meets the requirements.

Assay ***Cylinder plate method—***Perform the test as directed under the Assay of Cycloserine. However, weigh accurately the mass of NLT 20 Cycloserine Capsules, weigh accurately an amount equivalent to about 40 mg (potency) of the labeled potency, add sterile purified water to make exactly 100 mL, shake vigorously to mix, and filter, if necessary. Pipet an appropriate amount of this solution, dilute it with 1% phosphate buffer solution (pH 6.0) to make the concentration of (3), and use this solution as the test solution.

Packaging and storage Preserve in tight containers.

Cyproheptadine Hydrochloride Hydrate
시프로헵타딘염산염수화물



Cyproheptadine Hydrochloride

$C_{21}H_{21}N \cdot HCl \cdot 1½H_2O$: 350.88

4-(5*H*-Dibenzo[a,d]cyclohepten-5-ylidene)-1-methylpiperidine hydrochloride sesquihydrate [*41354-29-4*]

Cyproheptadine Hydrochloride Hydrate, when dried, contains NLT 98.5% and NMT 101.0% of cyproheptadine hydrochloride ($C_{21}H_{21}N \cdot HCl$: 323.86).

Description Cyproheptadine Hydrochloride Hydrate occurs as a white to pale yellow crystalline powder. It is odorless and has a slightly bitter taste.
It is freely soluble in methanol or acetic acid(100), soluble in chloroform, sparingly soluble in ethanol(95), slightly soluble in water, and practically insoluble in ether.

Identification (1) Dissolve about 0.1 g of Cyproheptadine Hydrochloride Hydrate in 10 mL of methanol, apply 1 drop of this solution to a filter paper and dry with air. Examine the solution under ultraviolet light (main wavelength: 254 nm); the resulting solution exhibits a pale blue fluorescent.

(2) Put 0.1 g of Cyproheptadine Hydrochloride Hydrate into the separatory funnel, dissolve in 5 mL of chloroform, add 4 mL of water and 1 mL of sodium carbonate TS, and shake to mix well. Separate the chloroform layer into the separatory funnel, wash with 4 mL water, and shake to mix and wash. Filter the chloroform layer first with the absorbent cotton, previously moistened with chloroform, and evaporate the filtrate to dryness. Add 8 mL of dilute ethanol to the residue and dissolve it by warming at 65 °C; then rub the inside wall with a glass rod while cooling. Allow it to stand for 30 minutes when crystals begin to be produced. Filter and take crystals and dry them at 80 °C for 2 hours; the crystals melt between 111 and 115 °C.

(3) Determine the absorption spectra of ethanol(95) solutions of Cyproheptadine Hydrochloride Hydrate and cyproheptadine hydrochloride hydrate RS (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(4) The saturated solution of Cyproheptadine Hydrochloride Hydrate responds to the Qualitative Analysis (2) for chloride.

Purity (1) ***Acid***—Dissolve about 2.0 g of Cyproheptadine Hydrochloride Hydrate in 25 mL of methanol, and add 1 drop of methyl red TS and 0.30 mL of 0.1 mol/L sodium hydroxide solution; the resulting solution exhibits yellow.

(2) ***Heavy metals—***Weigh and proceed with 1.0 g of Cyproheptadine Hydrochloride Hydrate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

Loss on drying Between 7.0% and 9.0% (1 g, NMT 0.67 kPa, 100 °C, 5 hours).

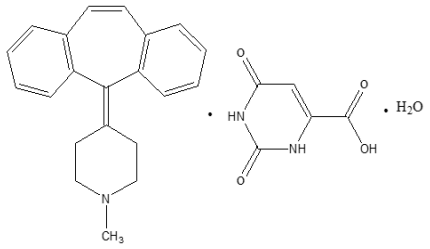
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.5 g of Cyproheptadine Hydrochloride Hydrate, previously dried, add 20 mL of acetic acid(100), and dissolve by warming at 50 °C. After cooling, add 40 mL of acetic anhydride and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 32.386 mg of $C_{21}H_{21}N \cdot HCl$

Packaging and storage Preserve in well-closed containers.

Cyproheptadine Orotate Hydrate
시프로헵타딘오로트산염수화물



$C_{26}H_{25}N_3O_4 \cdot H_2O$: 461.51
4-(5*H*-Dibenzo[a,d]cyclohepten-5-ylidene)-1-methylpiperidine with orotic acid hydrate, [*129-03-3* cyproheptadine, *65-86-1* orotic acid]

Cyproheptadine Orotate Hydrate contains NLT 63.5% and NMT 66.1% of cyproheptadine ($C_{21}H_{21}N$: 287.40), and NLT 34.5% and NMT 35.9% of orotic acid ($C_5H_4N_2O_4$: 156.10), calculated on the anhydrous basis.

Description Cyproheptadine Orotate Hydrate occurs as a white crystalline powder.
It is freely soluble in chloroform and slightly soluble in acid.

Identification (1) Weigh 10 mg of Cyproheptadine Orotate Hydrate, dissolve in 10 mL of methanol, and use this solution as the test solution. Separately, use 0.1% methanol solution of cyproheptadine orotate hydrate RS as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot the test solution and the standard solution on a plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of methanol and ammonia water(28) (100 : 1.5), and dry the plate with hot-air. Examine the plate under ultraviolet light; the R_f values and colors of the spots from the test solution and the standard solution are the same.

(2) Determine the absorption spectrum of the methanol solution (5 in 100000) of Cyproheptadine Orotate Hydrate as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum at the wavelength of about 284 nm.

Purity (1) ***Heavy metals***—Proceed with 2.0 g of Cyproheptadine Orotate Hydrate according to Method 3 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Arsenic***—Proceed with 1.0 g of Cyproheptadine Orotate Hydrate according to Method 3 under the Arsenic and perform the test (NMT 2 ppm).

Water NMT 5.0% (0.2 g, volumetric titration, direct titration).

Residue on ignition NMT 0.1% (1 g).

Assay (1) ***Cyproheptadine—***Weigh accurately about 0.5 g of Cyproheptadine Orotate Hydrate, dissolve in 50 mL of acetic acid(100), and titrate with 0.1 mol/L perchloric acid VS (indicator: two drops of methylrosaniline chloride TS). However, the endpoint of titration is when the color of the solution changes to green. Perform a blank test in the same manner and make any necessary correction.

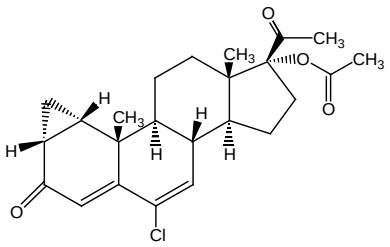
Each mL of 0.1 mol/L perchloric acid VS
= 28.74 mg of $C_{21}H_{21}N$

(2) ***Orotic acid—***Weigh accurately about 0.5 g of Cyproheptadine Orotate Hydrate, dissolve in 100 mL of acetone, and titrate with 0.1 mol/L tetrabutylammonium hydroxide VS (indicator: three drops of thymol blue TS). However, the endpoint of titration is when the color of the solution changes to blue. Perform a blank test in the same manner and make any necessary correction.

Each of 0.1 mol/L of Tetrabutylammonium hydroxide TS
= 15.61 mg of C5H4N2O4

Packaging and storage Preserve in tight containers.

Cyproterone Acetate
시프로테론아세테이트



$C_{24}H_{29}ClO_4$: 416.94
17-Acetyloxy-6-chloro-1α,2α-methylenepregna-4,6-diene-3,20-dione [*427-51-0*]

Cyproterone Acetate, contains NLT 97.0% and NMT 103.0% of cyproterone acetate ($C_{24}H_{29}ClO_4$), calculated on the dried basis.

Description Cyproterone Acetate occurs as white crystals or a crystalline powder.
It is very soluble in dichloromethane, freely soluble in acetone, soluble in methanol, sparingly soluble in ethanol(95) and practically insoluble in water.

Identification (1) Take 1 mg of Cyproterone Acetate, add 2 mL of sulfuric acid, heat on a steam bath for 2 minutes, and cool. Add carefully the resulting solution to 4 mL of water and shake well to mix; it exhibits a violet color.

(2) Determine the infrared spectra of Cyproterone Acetate and cyproterone acetate RS according to the potassium bromide disk method as directed under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) Dissolve 20 mg of Cyproterone Acetate in water to make 10 mL, and use this solution as the test solution. Separately, weigh 10 mg of cyproterone acetate RS, dissolve in dichloromethane to make 5 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on a thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of cyclohexane and ethyl acetate (50 : 50) as a developing solvent to a distance of about 15 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254nm); the R_f values of the principal spots obtained from the test solution and the standard solution are the same.

(4) Mix 30 mg of Cyproterone Acetate with 0.3 g of anhydrous sodium carbonate, heat it for about 10 minutes over a flame. After cooling, dissolve the residue in 5 mL of dilute nitric acid, and filter it. Add 1 mL of water to 1 mL of the filtrate and mix; the resulting solution responds to the Chemical identification reaction (2) for chloride.

(5) Put 15 mg of Cyproterone Acetate and 0.15 mL of phosphoric acid into a test tube (about 180 mm × 18 mm) and close it with a stopper equipped with a small test tube (about 100 mm × 10 mm) containing water to which 1 drop of 5 w/v% lanthanum nitrate solution is added. Allow this device to stand for 5 minutes on a steam bath and take out the small tube. Transfer the liquid drop from the outside of the test tube onto the porcelain plate and mix with 0.05 mL of 0.01 mol/L iodine solution. Spot 0.05 mL of 2 mol/L ammonia TS on the edge; after 1 or 2 minutes, a blue color persisting for a while develops at the interface of the two solutions.

Optical rotation $[\alpha]_D^{20}$: Between -152° and +157° (After drying, 0.25 g, acetone, 20 mL, 100 mm).

Purity ***Related substances*—**Dissolve 10.0 mg of Cyproterone Acetate in acetonitrile to make exactly 10 mL, and use this solution as the test solution. Add acetonitrile to 1.0 mL of the test solution to make exactly 100 mL, and use this solution as the standard solution (1). Separately, dissolve 5.0 mg of medroxyprogesterone acetate RS in acetonitrile to make exactly 50 mL. Add the standard solution (1) to 1.0 mL of this solution to make exactly 10 mL, and use this solution as the standard solution (2). Perform the test with 20 μL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions. The total area of peaks other than the major peak from the test solution is not greater than 0.5 times the area of the major peak from the standard solution (1) (0.5%). However, exclude any peak having an area smaller than 0.05 times the area of the major peak from the standard solution (1).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 125 mm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 μm in particle diameter).

Mobile phase: A mixture of water and acetonitrile (60 : 40).

Flow rate: 1.5 mL/min

System suitability

Perform the test with the standard solution (1) and the standard solution (2) according to the operation conditions defined above. Adjust the detection sensitivity so that the height of the major peak from the standard solution (1) is NLT 50% of the full scale. The resolution between cyproterone acetate peak and medroxyprogesterone acetate peak obtained from the standard solution (2) is NLT 3.0.

Loss on drying NMT 0.5% (1 g, 80 °C, NMT 0.67 kPa, constant mass).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh exactly about 50.0 mg of Cyproterone Acetate and dissolve in methanol to make exactly 50 mL. Add methanol to 1.0 mL of this solution to make exactly 100 mL, and use this solution as the test solution. With the test solution and methanol with a control solution, measure the absorbance A at 282 nm as directed under the Ultraviolet-visible Spectroscopy.

$$\text{Amount (mg) of cyproterone acetate } (C_{24}H_{29}ClO_4) = \frac{A}{414} \times 50000$$

Packaging and storage Preserve in light-resistant, well-closed containers.

L-Cysteine, Ascorbic Acid and Calcium Pantothenate Tablets
L-시스테인·아스코르브산·판토텐산칼슘 정

L-Cysteine, Ascorbic Acid and Calcium Pantothenate Tablets contains NLT 90.0% and NMT 130.0% of the labeled amounts of L-cysteine ($C_3H_7NO_2S$: 121.16), and NLT 90.0% and NMT 150.0% of the labeled amount of ascorbic acid ($C_6H_8O_6$: 176.12) and calcium pantothe-

nate ($C_{18}H_{32}CaN_2O_{10}$: 476.53).

Method of preparation Prepare as directed under Tablets, with L-Cysteine, Ascorbic Acid, and Calcium Pantothenate.

Identification (1) ***L-cysteine***—Perform the test with L-Cysteine, Ascorbic Acid and Calcium Pantothenate Tablets as directed under the Identification and Assay for Amino Acids.

(2) ***Ascorbic acid and calcium pantothenate***—Perform the test with L-Cysteine, Ascorbic Acid and Calcium Pantothenate Tablets as directed under the Analysis for Vitamins.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of 20 tablets of L-Cysteine, Ascorbic Acid and Calcium Pantothenate Tablets and powder. Weigh accurately a portion of powder, equivalent to about 100 mg of L-cysteine ($C_3H_7NO_2S$) [about 125 mg of ascorbic acid ($C_6H_8O_6$) and about 10 mg of calcium pantothenate ($C_{18}H_{32}CaN_2O_{10}$)], add water to make exactly 100 mL, sonicate for 30 minutes, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Use the filtrate as the test solution. Separately, weigh accurately about 100 mg of L-cysteine RS, about 125 mg of ascorbic acid RS, and about 10 mg of calcium pantothenate RS, add water to make exactly 100 mL, and use this solution as the standard solution. Take exactly 10 μL each of the test solution and the standard solution, perform the test as directed under the Liquid Chromatography according to the following operating conditions, and determine the peak areas of L-cysteine, ascorbic acid and calcium pantothenate, A_{T1}, A_{S1}, A_{T2}, A_{S2}, A_{T3} and A_{S3}, for each solution.

Amount (mg) of L-cysteine ($C_3H_7NO_2S$)
= Amount (mg) of L-cysteine RS × (A_{T1} / A_{S1})

Amount (mg) of ascorbic acid ($C_6H_8O_6$)
= Amount (mg) of ascorbic acid RS × (A_{T2} / A_{S2})

Amount (mg) of calcium pantothenate ($C_{18}H_{32}CaN_2O_{10}$)
= Amount (mg) of calcium pantothenate RS × (A_{T3} / A_{S3})

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 30 °C.

Mobile phase: Use mobile phases A and B to control a stepwise or gradient elution-wise as follows.

Mobile phase A: Dissolve 1.36 g of potassium dihydrogen phosphate in 1000 mL and adjust the pH to 2.0 with a saturated solution of potassium phosphate or hydroxide.

Mobile phase B: Methanol

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0-5	100	0
5-10	100 → 50	0 → 50
10-20	50	50

Flow rate: 1.0 mL/min

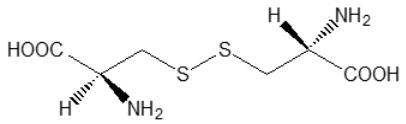
System suitability

System performance: Proceed with 10 μL of the standard solution according to the above operating conditions; L-cysteine, ascorbic acid and calcium pantothenate peaks are eluted in this order with the resolution being NLT 3.1.

System repeatability: Repeat the test 6 times with 10 μL of the standard solution under the above operating conditions; the relative standard deviation of the peak areas of L-cysteine, ascorbic acid and calcium pantothenate is NMT 1.0%.

Packaging and storage Preserve in well-closed containers.

L-Cystine
L-시스틴



$C_6H_{12}N_2O_4S_2$: 240.30

Cystine [*56-89-3*]

L-Cystine, when dried, contains NLT 98.5% and NMT 101.0% of L-cystine ($C_6H_{12}N_2O_4S_2$).

Description L-Cystine occurs as a white crystalline powder.
It is practically insoluble in water or ethanol(95).
It dissolves in dilute sodium hydroxide TS.

Identification (1) Determine the infrared spectra of L-Cystine and L-cystine RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) The principal spot from the test solution (2) is the same in color and R_f value as the spot from the standard solution (1) in the thin-layer chromatograms obtained from ninhydrin-positive substances under the Purity (2).

(3) To 0.1 g of L-Cystine, add carefully 1 mL of

strong hydrogen peroxide TS and 0.1 mL of iron(III) chloride TS, and allow to cool. Add 1 mL of dilute hydrochloric acid, 5 mL of water and 1 mL of barium chloride TS; the solution becomes turbid or produces a white precipitate within 3 minutes.

Optical Rotation $[\alpha]_D^{20}$: Between -218° and -224° (after drying 0.5 g, 1 mol/L hydrochloric acid, 25 mL, 100 mm).

Purity (1) ***Clarity and color of solution*—**Dissolve 1.0 g of L-Cystine in 10 mL of dilute hydrochloric acid TS; the solution is clear and is not more intense than the matching fluid F.

(2) ***Ninhydrin-positive substances*—**Dissolve 0.1 g of L-Cystine in 10 mL of 1 mol/L hydrochloric acid TS, and use this solution as the test solution (1). Pipet 1 mL of the test solution, add water to make 50 mL, and use this solution as the test solution (2). Separately, dissolve 10 mg of L-cystine RS in 1 mL of 1 mol/L hydrochloric acid TS, add water to make 50 mL, and use this solution as the standard solution (1). To 2 mL of the test solution (2) add water to make 20 mL, and use this solution as the standard solution (2). Dissolve 10 mg of L-cystine RS and 10 mg of arginine hydrochloride in 1 mL of 1 mol/L hydrochloric acid TS, add water to make 25 mL and use this solution as the standard solution (3) With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution (1), the test solution (2), the standard solution (1), the standard solution (2) and the standard solution (3) on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of ammonia water(28) and 2-propanol (30 : 70) as the developing solvent to a distance of about 15 cm, and air-dry the plate. Spray evenly with ninhydrin TS on the plate and heat the plate at 100 to 150 °C for 15 minutes; the spots other than the principal spot from the test solution (1) are not more intense than the spot from the standard solution (2) and the chromatogram obtained from the standard solution (3) shows two clearly separated spots.

(3) ***Chloride*—**Perform the test with 0.50 g of L-Cystine. Prepare the control solution with 0.29 mL of 0.01 mol/L hydrochloric acid (NMT 0.020%).

(4) ***Sulfate*—**Weigh 0.50 g of L-Cystine, add 5 mL of dilute hydrochloric acid and water to make 15 mL, and use this solution as the test solution. Prepare the control solution with 0.32 mL of 0.005 mol/L sulfuric acid VS, 5 mL of dilute hydrochloric acid and add water to make 15 mL (NMT 0.030%).

(5) ***Ammonium*—**Perform the test with 0.25 g of L-Cystine. Prepare the control solution with 5.0 mL of ammonium standard solution (NMT 0.020%).

(6) ***Heavy metals*—**Proceed with 2.0 g of L-Cystine according to Method 1 under Heavy Metals Limit Test and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(7) ***Iron*—**Weigh 1.0 g of L-Cystine, put into a separatory funnel, dissolve in 10 mL of dilute hydrochloric acid, and extract three times with each 10 mL of 4-methyl-2-pentanone for 3 minutes. To the 4-methyl-2-pentanone layer, add 10 mL of water and shake to mix for 3 minutes. Take the water layer, add 30 mL of acetic acid-sodium acetate buffer solution, pH 4.5, and use this solution as the test solution. Perform the test according to Method B. Prepare the control solution with 1.0 mL of iron standard solution (NMT 10 ppm).

Loss on drying NMT 0.5% (1 g, 105 °C, constant mass).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.1 g of L-Cystine, previously dried, transfer to a capped flask, and dissolve in 2 mL of dilute sodium hydroxide TS and 10 mL of water. Add 10 mL of potassium bromide solution (2 in 10), 50.0 mL of 1/60 mol/L potassium bromate and 15 mL of dilute hydrochloric acid, place a stopper on top of the flask, cool in iced water, and allow to stand in the dark for 10 minutes. Next, add 1.5 g of potassium iodide and after 1 minute, titrate with 0.1 mol/L sodium thiosulfate VS (indicator: 2 mL of starch TS). Perform a blank test in the same manner and make any necessary correction.

Each mL of 1/60 mol/L potassium bromate VS
= 2.4030 mg of $C_6H_{12}N_2O_4S_2$

Packaging and storage Preserve in light-resistant, well-closed containers.

L-Cystine Capsules
L-시스틴 캡슐

L-Cystine Capsules contain NLT 90.0% and NMT 130.0% of the labeled amount of L-cystine ($C_6H_{12}N_2O_4S_2$: 240.30).

Method of preparation Prepared as directed under Capsules, with L-Cystine.

Identification Perform the test with L-Cystine Capsules as directed under the Identification and Assay for Amino Acids.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 capsules of L-Cystine Capsules, and powder. Weigh accurately an amount equivalent to about 0.5 g of L-cystine ($C_6H_{12}N_2O_4S_2$), add 10 mL of 1 mol/L hydrochloric acid and water, sonicate, and add water to make exactly 100 mL. Then, filter. Pipet 10 mL of the filtrate, add 0.1 mol/L hydrochloric acid to make exactly 100 mL, and use

this solution as the test solution. Separately, weigh accurately about 0.5 g of L-cystine RS, proceed in the same manner as in the preparation of the test solution, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of L-cysteine in each solution.

$$\text{Amount (mg) of L-cystine } (C_6H_{12}N_2O_4S_2) = \text{Amount (mg) of L-cystine RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 240 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A solution of 0.005 mol/L hexanesulfonate in a mixture of 0.1% phosphoric acid solution and acetonitrile (95 : 5).

Flow rate: 0.8 mL/min

Packaging and storage Preserve in tight containers.

L-Cystine and Choline Tartrate Capsules
L-시스틴·콜린타르타르산염 캡슐

L-Cystine and Choline Tartrate Capsules contain NLT 90.0% and NMT 130.0% of the labeled amount of L-cystine ($C_6H_{12}N_2O_4S_2$: 240.30) and NLT 90.0% and NMT 150.0% of choline tartrate ($C_9H_{19}NO_7$: 253.30).

Method of preparation Prepared as directed under Capsules, with L-Cystine and Choline Tartrate.

Identification (1) ***L-Cystine*—**Weigh an amount of L-Cystine and Choline Tartrate Capsules, equivalent to about 10 mg of L-cystine, dissolve in 10 mL of 0.1 mol/L hydrochloric acid, centrifuge, and use the clear supernatant as the test solution. Separately, weigh 10 mg of L-cystine RS, dissolve in 10 mL of 0.1 mol/L of hydrochloric acid, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of ethanol(95), water, and ammonia water(28) (7 : 2 : 1) as the developing solvent to a distance of about 15 cm, and air-dry the plate. Spray evenly a ninhydrin TS on the plate; the R_f value and color of the spots obtained from the test solution and the standard solution are the same.

(2) ***Choline tartrate*—**Weigh an amount of L-Cystine and Choline Tartrate Capsules, equivalent to about 0.1 g of choline tartrate, powder, and perform the test as directed under the Analysis for Vitamins.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay (1) ***L-Cystine*—**Weigh accurately the mass of NLT 20 capsules of L-Cystine and Choline Tartrate Capsules. Weigh accurately an amount equivalent to about 0.2 g of L-Cystine ($C_6H_{12}N_2O_4S_2$), and perform the test as directed under the Identification and Assay for Amino Acids.

(2) ***Choline tartrate*—**Weigh accurately the mass of NLT about 20 capsules of L-Cystine and Choline Tartrate Capsules. Weigh accurately an amount equivalent to about 50 mg of choline tartrate ($C_9H_{19}NO_7$), and perform the test as directed under the Analysis for Vitamins.

Packaging and storage Preserve in well-closed containers.

L-Cystine and Pyridoxine Hydrochloride Tablets
L-시스틴·피리독신염산염 정

L-Cystine and Pyridoxine Hydrochloride Tablets contain NLT 90.0% and NMT 130.0% of the labeled amount of L-cystine ($C_6H_{12}N_2O_4$: 240.30) and NLT 90.0% and NMT 150.0% of the labeled amount of pyridoxine hydrochloride($C_8O_11NO_3$·HCl: 205.64).

Method of preparation Prepare as directed under Tablets, with L-Cystine and Pyridoxine Hydrochloride.

Identification (1) ***L-cystine***—Perform the test with L-Cystine and Pyridoxine Hydrochloride Tablets as directed under the Identification and Assay for Amino Acids.

(2) ***Pyridoxine hydrochloride***—Perform the test with L-Cystine and Pyridoxine Hydrochloride Tablets as directed under the Analysis for Vitamins.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay (1) ***L-cystine and pyridoxine hydrochloride*—**Weigh accurately the mass of NLT 20 tablets of L-Cystine and Pyridoxine Hydrochloride Tablets, and powder. Weigh accurately a portion of powder, equivalent to about 0.5 g of L-cystine ($C_6H_{12}N_2O_4S_2$) [about 0.1 g of pyridoxine hydrochloride ($C_8O_{11}NO_3$·HCl)], dissolve in about 10 mL of 1 mol/L hydrochloric acid TS and water, sonicate, add water to make 100 mL, and filter. Pipet 10 mL of the filtrate, add 0.1 mol/L hydrochloric acid TS to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 500 mg of

L-cystine and about 100 mg of pyridoxine hydrochloride RS, proceed in the same manner as the test solution, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions and determine the peak areas, A_T and A_S, for the test solution and the standard solution, respectively.

$$\text{Amount (mg) of L-cystine } (C_6H_{12}N_2O_4S_2) = \text{Amount (mg) of L-cystine RS} \times \frac{A_{T1}}{A_{S1}}$$

$$\text{Amount (mg) of pyridoxine hydrochloride } (C8H11NO3{\cdot}HC1) = \text{Amount (mg) of pyridoxine hydrochloride RS} \times \frac{A_{T2}}{A_{S2}}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 238 nm).

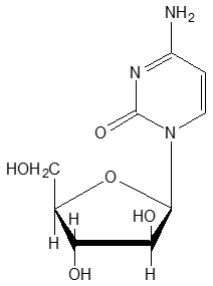
Column: A stainless steel column about 4 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of 0.1% phosphate solution of 0.005 mol/L of sodium octanesulfonate acetonitrile (85 : 15).

Flow rate: 1.0 mL/min

Packaging and storage Preserve in well-closed containers.

Cytarabine
시타라빈



$C_9H_{13}N_3O_5$: 243.22

4-Amino-1-[(2*R*,3*S*,4*S*,5*R*)-3,4-dihydroxy-5-(hydroxymethyl)oxolan-2-yl]pyrimidin-2-one [*147-94-4*]

Cytarabine contains NLT 98.5% and NMT 101.0% of cytarabine ($C_9H_{13}N_3O_5$), calculated on the dried basis.

Description Cytarabine occurs as white crystals or a crystalline powder.

It is freely soluble in water, soluble in acetic acid(100), very slightly soluble in ethanol(95) and practically insoluble in ether.

Melting point—About 214 °C (with decomposition).

Identification (1) Determine the absorption spectra of Cytarabine and cytarabine RS in 0.1 mol/L hydrochloric acid (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Cytarabine and cytarabine RS according to the potassium bromide disk method as directed under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Optical rotation $[\alpha]_D^{20}$: Between +154° and +160° (after drying, 0.1 g, water, 10 mL, 100 mm).

pH Dissolve 0.20 g of Cytarabine in 20 mL of water; the pH of this solution is between 6.5 and 8.0.

Absorbance $E_{1cm}^{1\%}$ (282 nm): Between 530 nm and 570 nm (after drying, 2 mg, 0.1 mol/L hydrochloric acid TS, 200 mL).

Purity (1) ***Clarity and color of solution*—**Dissolve 1.0 g of Cytarabine in 10 mL of water: the solution is clear and colorless.

(2) ***Chloride*—**Perform the test with 1.0 g of Cytarabine. Prepare the control solution with 0.25 mL of 0.01 mol/L hydrochloric acid (NMT 0.009%).

(3**)** ***Heavy metals*—**Proceed with 1.0 g of Cytarabine according to Method 1 and perform the test. Prepare the control solution with 1.0 mL of lead standard solution (NMT 10 ppm).

(4) ***Arsenic*—**Prepare the test solution with 1.0 g of Cytarabine according to Method 3 and perform the test (NMT 2 ppm).

(5) ***Related substances*—**Dissolve 0.10 g of Cytarabine in 10 mL of water, and use this solution as the test solution. Pipet 1 mL of this solution, add water to make exactly 200 mL, and use this solution as the standard solution. Perform the test directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Then, develop the plate with water-saturated 1-butanol as the developing solvent to a distance of about 12 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot from the test solution are not more intense than the spots from the standard solution. Spray evenly acidic potassium permanganate TS on the plate; no spots other than the principal spot are observed in the test solution.

Loss on drying NMT 1.0% (1 g, in vacuum, silica gel, 4 hours).

Residue on ignition NMT 0.5% (1 g).

Assay Weigh accurately about 0.2 g of Cytarabine, pre-

viously dried, dissolve in 50 mL of acetic acid(100), and titrate with 0.05 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.05 mol/L perchloric acid VS
= 12.161 mg of $C_9H_{13}N_3O_5$

Packaging and storage Preserve in tight containers.

Cytarabine for Injection
주사용 시타라빈

Cytarabine for Injection is a preparation for injection which is dissolved before use. Cytarabine for Injection contains NLT 90.0% and NMT 110.0% of the labeled amount of cytarabine ($C_9H_{13}N_3O_5$: 243.22).

Method of preparation Prepare as directed under Injections, with Cytarabine.

Description Cytarabine for Injection occurs as a white powder.

Identification (1) The retention times of the major peaks obtained from the test solution and the standard solution prepared as directed under the Assay are the same.

pH Weigh accurately an amount of Cytarabine for Injection, equivalent to 0.2 g (potency) of cytarabine, and dissolve in 20 mL of water; the pH of the solution is between 4.0 and 6.0.

Water NMT 3.0% (1 g, volume titration, direct titration).

Sterility Meets the requirements.

Bacterial endotoxins Less than 0.07 EU per mg of cytarabine.

Uniformity of dosage units Meets the requirements.

Assay Take 10 units of Cytarabine for Injection, dissolve in water to prepare solution A having known concentration of about 10 mg of cytarabine ($C_9H_{13}N_3O_5$) per mL, according to the labeled amount. Pipet 5 mL of this solution and add water to make exactly 50 mL. Pipet 3.0 mL of this solution, add 5.0 mL of the internal standard solution and mobile phase to make exactly 25 mL, and use this solution as the test solution. Separately, weigh accurately about 50 mg of cytarabine RS, previously dried at 60 °C and at a pressure not higher than 0.67 kPa, for 3 hours and dissolve in water to make exactly 50 mL. Pipet 3 mL of this solution, add 5.0 mL of the internal standard solution and the mobile phase to make exactly 25 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under Liquid Chromatography according to the following conditions and calculate the ratios, QT and QS, of the peak area of Cytarabine to that of the internal standard for the test solution and the standard solution, respectively.

Amount (mg) of cytarabine ($C_9H_{13}N_3O_5$) in 1 mL of solution A
= Amount (mg) of cytarabine RS$\times \frac{Q_T}{Q_S} \times \frac{1}{5}$

Internal standard solution—0.14% *p*-toluic acid in methanol.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column, about 4 to 4.6 mm in internal diameter and 25 to 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 to 10 μm in particle diameter).

Mobile phase: Dissolve 0.69 g of potassium dihydrogen phosphate and 1.34 g of dibasic sodium phosphate in about 950 mL of water. To this solution, add 50 mL of methanol and mix.

Flow rate: 1 mL/min

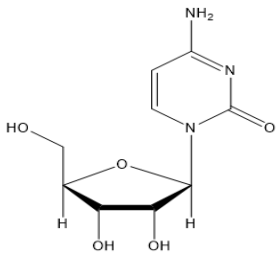
System suitability

System performance: Weigh a sufficient portion of Uracylarabinoside RS and Cytarabine RS, dissolve in water to make a solution containing 10 μg and 600 μg per mL, respectively, dilute with same volume of internal standard solution, mix with about four times volume of mobile phase. When the procedure is run with 10 mL of this solution under the above operating condition, cytarabine, uracylarabinoside and p-toluenic acid are eluted in this order with a resolution between cytarabine and uracylarabinoside peaks being NLT 2.5.

System repeatability: Repeat the test 6 times with each 10 μL of the standard solution according to the above operating conditions; the relative standard deviation of the peak area ratio is NMT 2.0%.

Packaging and storage Preserve in hermetic containers.

Cytidine
시티딘



$C_9H_{13}N_3O_5$: 243.22

4-Amino-1-β-*D*-ribofuranosyl-2-(1*H*)-pyrimidinone, [*65-46-3*]

Cytidine contains NLT 99.0% of cytidine ($C_9H_{13}N_3O_5$), calculated on the anhydrous basis.

Description Cytidine occurs as a white, crystalline powder and is odorless.
It is very soluble in water, and slightly soluble in ethanol(95).

Identification (1) Dissolve 0.2 g of Cytidine in 2 mL of hydrochloric acid with stirring, add 10 mL of saturated trinitrophenol solution, recrystallize, and dry; the melting point is about 180 °C.

(2) To 5 mL of a solution containing 0.1% Cytidine, add 0.1% iron(III) chloride TS and 5 mL of hydrochloric acid containing 0.1% orcin, warm on a steam bath; it turns green after 45 minutes.

(3) With a solution of Cytidine in 0.001% 0.1 mol/L hydrochloric acid, determine the absorption spectrum as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum at a wavelength of 280 nm. Furthermore, the ratios of the absorbances at wavelengths of 250 nm, 260 nm and 280 nm are as follows.

$$A_{250}/A_{260} = 0.45 \pm 0.04$$
$$A_{280}/A_{260} = 2.10 \pm 0.07$$

(4) A solution of Cytidine in 0.001% 0.05 mol/L phosphate buffer solution, pH 7.0, exhibits a maximum at a wavelength of 271 nm.

Melting point Between 210 and 220 ℃.

Optical rotation $[\alpha]_D^{20}$: Between +30° and +35° (0.5 g, water, 25 mL, 100 mm).

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Cytidine according to Method 1 and perform the test. Prepare the control solution with 1.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Nitrogen content***—Perform the test with Cytidine as directed under the Nitrogen Determination; the content of nitrogen (N) is 17.3 ± 2%.

Water NMT 0.5% (1 g).

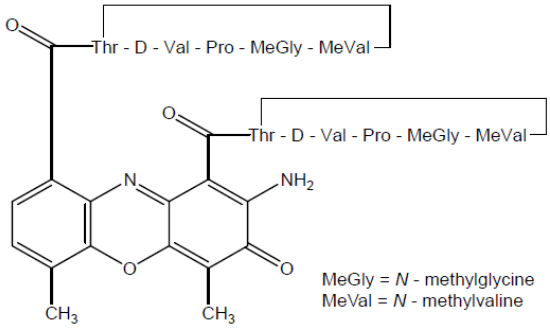
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.35 g of Cytidine, dissolve in 30 mL of acetic acid(100), and titrate with 0.1 mol/L perchloric acid VS (indicator: methylrosaniline chloride TS). Perform a blank test in the same manner and make any necessary correction.

Each mL of 1 mol/L perchloric acid VS
= 24.32 mg of $C_9H_{13}N_3O_5$

Packaging and storage Preserve in tight containers.

Dactinomycin
닥티노마이신



$C_{62}H_{86}N_{12}O_{16}$: 1255.42

2-Amino-*N*,*N*'-*bis*[(6*S*,9*R*,10*S*,13*R*,18a*S*)-6,13-diisopropyl-2,5,9-trimethyl-1,4,7,11,14-pentaoxohexadecahydro-1*H*-pyrrolo[2,1-i][1,4,7,10,13]oxatetraazacyclohexadecin-10-yl]-4,6-dimethyl-3-oxo-3*H*-phenoxazine-1,9-dicarboxamide [*50-76-0*]

Dactinomycin is a peptide compound with antitumor activity obtained from the incubation of *Streptomyces parvulus*. Daptomycin, when dried, contains NLT 950 μg and NMT 1030 μg (potency) per mg of dactinomycin ($C_{62}H_{86}N_{12}O_6$: 1255.42).

Description Dactinomycin occurs as an orange to red crystalline powder. It is freely soluble in acetone, sparingly soluble in acetonitrile or methanol, slightly soluble in ethanol(95), and practically insoluble in water.

Identification (1) Determine the absorption spectra of Dactinomycin and dactinomycin RS in methanol (3 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Dissolve 0.1 g of Dactinomycin and dactinomycin RS in 10 mL of acetone and use these solutions as the test solution and the standard solution, respectively. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Then, develop the plate with a mixture of 1-butanol, water and methanol (4 : 2 : 1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm); the R_f value of the principal spot obtained from the test and the spots from standard solutions are identical.

Optical rotation $[\alpha]_D^{20}$: Between -292° and -317° (10 mg after drying, methanol, 10 mL, 100 mm).

Loss on drying NMT 5.0% (1 g, in vacuum, 60 ºC, 3

hours).

Sterility It meets the requirements when Daptomycin Hydrochloride is used in a sterile preparation.

Bacterial endotoxins Less than 100 per mg (potency) of dactinomycin when used in a sterile preparation.

Assay Weigh accurately about 60 mg each of Dactinomycin and dactinomycin RS, previously dried, dissolve in the mobile phase to make exactly 50 mL, and use each solution as the test solution and the standard solution. Perform the test with 25 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions, and determine the area of the peak of dactinomycin in the test solution, A_T, and in the standard solution, A_S.

$$\text{Potency (μg) of dactinomycin } (C_{62}H_{86}N_{12}O_{16}) = \text{Potency (μg) of dactinomycin RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 3.9 mm in internal diameter and 30 cm in length, packed with octylsilanized silica gel for liquid chromatography (10 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: A mixture of 0.02 mol/L acetic acid, sodium acetate TS and acetonitrile (25 : 23).

Flow rate: Adjust the flow rate so that the retention time of dactinomycin is about 23 minutes.

System suitability

System performance: Proceed with 25 μL of the standard solution under the above operating conditions; the number of theoretical plates for the dactinomycin peak is NLT 2000 and the symmetry factor is NMT 1.5.

System repeatability: Repeat the test 5 times with 25 μL of the standard solution according to the above operating conditions; the relative standard deviation of the peak area of dactinomycin is NMT 2.0%

Packaging and storage Preserve in light-resistant, tight containers.

Dactinomycin for Injection
주사용 닥티노마이신

Dactinomycin for Injection contains NLT 90.0% and NMT 120.0% of dactinomycin ($C_{62}H_{86}N_{12}O_{16}$: 1255.42), calculated as dissolved injections.

Method of preparation Prepare Dactinomycin for Injection as directed under Injections, with Dactinomycin.

Description Dactinomycin for Injection occurs as a yellow to bright red powder.

Identification (1) Dilute Dactinomycin for Injection with methanol, and perform the test according to the Identification test (1) of Dactinomycin where 1 mL contains 25 μg (potency).

(2) Perform the test according to the Identification test (2) of Dactinomycin.

pH Dissolve 5.0 mg (potency) of dactinomycin in Dactinomycin for Injection in 11 mL of water; the pH of this solution is between 5.5 and 7.5.

Loss on drying NMT 4.0% (0.1 g, 0.7 kPa, 60 ºC, 3 hours).

Sterility Meets the requirements

Bacterial endotoxins NMT 100 EU per mg (potency) of dactinomycin.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately about 250 μg (potency) of Dactinomycin for Injection, add exactly 10 mL of mobile phase, make it the concentration of 25 μg (potency) per mL, and use this solution as the test solution. Separately, weigh accurately about 250 μg (potency) of dactinomycin RS, add exactly 10 mL of mobile phase, make it the concentration of 25 μg (potency) per mL, and use this solution as the standard solution. Prepare the test solution and the standard solution in the dark. Perform the test with exactly 10 μL each of the test solution and standard solution as directed under the Assay of dactinomycin according to the following operating conditions.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 mm).

Column: A stainless steel column about 4 mm in internal diameter and about 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 to 10 μm in particle diameter).

Mobile phase: A mixture of acetonitrile and water (6 : 4).

Flow rate: 2.5 mL/min

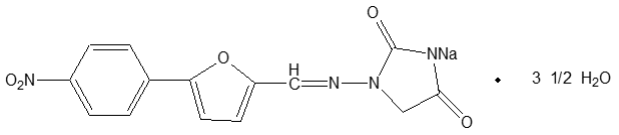
System suitability

System performance: Proceed with 10 μL of the standard solution under the above operating conditions; the number of theoretical plates for the dactinomycin peak is NLT 1200 and the symmetry factor is NMT 2.

System repeatability: Repeat the test 6 times with 10 µL each of the standard solutions according to the above operating conditions; the relative standard deviation of the peak area of dactinomycin is NMT 3.0%

Packaging and storage Preserve in light-resistant, hermetic containers.

Dantrolene Sodium Hydrate
단트롤렌나트륨수화물



$C_{14}H_9N_4NaO_5 \cdot 3½H_2O$: 399.29

Sodium(*E*)-1-(((5-(4-nitrophenyl)furan-2-yl)methylene)amino)imidazolidine-2,4-dionehemiheptahydrate

[*24868-20-0*]

Dantrolene Sodium contains NLT 98.0% and NMT 101.0% of dantrolene sodium ($C_{14}H_9N_4NaO_5$: 336.24), calculated on the anhydrous basis.

Description Dantrolene Sodium Hydrate occurs as a yellowish orange to deep orange, crystalline powder.
It is soluble in propylene glycol, sparingly soluble in methanol, slightly soluble in ethanol(95), very slightly soluble in water or acetic acid(100) and practically insoluble in acetone, tetrahydrofuran or ether.

Identification (1) Determine the absorption spectra of Dantrolene Sodium Hydrate and dantrolene sodium hydrate RS in methanol (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Dantrolene Sodium Hydrate and dantrolene sodium hydrate RS as directed in the potassium bromide disk method under Mid-infrared Spectroscopy; both exhibit similar intensities of absorption at the same wavenumbers.

(3) To about 0.1 g of Dantrolene Sodium Hydrate, add 20 mL of water and 2 drops of acetic acid(100), shake well to mix, and filter. The filtrate responds to the Qualitative Analysis (1) for sodium salt.

Purity (1) ***Alkali***—To about 0.7 g of Dantrolene Sodium Hydrate, add 10 mL of water, mix well by shaking, and centrifuge or pass through a membrane filter. Take 5 mL of the clear supernatant or the filtrate, add 45 mL of water and 3 drops of phenophthalein TS and 0.10 mL of 0.1 mol/L hydrochloric acid VS; the resulting solution does not exhibit a red color.

(2) ***Heavy metals***—Proceed with 1.0 g of Dantrolene Sodium Hydrate according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Related substances***—Dissolve 50.0 mg of Dantrolene Sodium Hydrate in 20 mL of tetrahydrofuran and 2 mL of acetic acid(100), add ethanol(99.5) to make exactly 100 mL. and use this solution as the test solution. Pipet 1 mL of this solution, add ethanol(99.5) to make exactly 50 mL, and use this solution as the standard solution. Perform the test with exactly 10 µL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak area of each solution as directed in the automatic integration method; the total area of all peaks other than the peak of dantrolene from the test solution is not greater than the peak area of dantrolene from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 300 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 15 cm in length, packed with silica gel for liquid chromatography (5 µm in particle diameter).

Column temperature: A constant temperature of about 30 °C.

Mobile phase: A mixture of hexane, acetic acid(100), and ethanol(99.5) (90 : 10 : 9).

Flow rate: Adjust the flow rate so that the retention time of dantrolene is about 8 minutes.

System suitability

Detection sensitivity: Adjust the sensitivity so that the peak height of dantrolene from 10 µL of the standard solution is between 10% and 40% of the full scale.

System performance: Dissolve about 5 mg of Dantrolene Sodium Hydrate and 0.1 g of theophylline in 20 mL of tetrahydrofuran and 2 mL of acetic acid(100) and add ethanol(99.5) to make 100 mL. Pipet 10 mL of this solution and add in ethanol(99.5) to make 100 mL. Proceed with 10 µL of this solution under the above operating conditions; theophylline and dantrolene are eluted in this order with a resolution being 6.

Time span of measurement: About 2 times the retention time of dantrolene after the solvent peak.

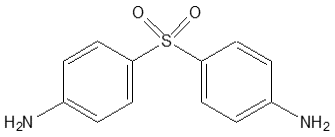
Water Between 14.5% and 17.0% (0.2 g, volumetric titration, direct titration).

Assay Weigh accurately about 0.7 g of Dantrolene Sodium Hydrate, dissolve in 180 mL of a mixture of propylene glycol and acetone (1 : 1) and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 33.624 mg of $C_{14}H_9N_4O_5$

Packaging and storage Preserve in tight containers.

Dapsone
답손



D.D.S $C_{12}H_{12}N_2O_2S$: 248.30
4-(4-Aminophenyl)sulfonylaniline [*80-08-0*]

Dapsone contains NLT 98.0% and NMT 102.0% of dapsone ($C_{12}H_{12}N_2O_2$), calculated on the dried basis.

Description Dapsone occurs as a white or pale yellow crystalline powder.
It is freely soluble in acetone, sparingly soluble in ethanol(95) and very slightly soluble in water.
It is soluble in dilute hydrochloric acid.

Identification (1) Determine the absorption spectra of Dapsone and dapsone RS in methanol (1 in 200000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Dapsone and dapsone RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Melting point Between 175 and 181 ℃.

Purity (1) ***Selenium***—Add 0.5 mL of a mixture of perchloric acid and sulfuric acid (1 : 1), 2 mL of nitric acid to about 0.10 g of Dapsone and heat on a steam bath. Cool the solution until a brown gas is not produced and the solution becomes clear with a light yellow color. Then, add 4 mL of nitric acid and water to make exactly 50 mL and use this solution as the test solution. Separately, pipet 3 mL of selenium standard solution, add 0.5 mL of a mixture of perchloric acid and sulfuric acid (1 : 1), 6 mL of nitric acid, and add water to make exactly 50 mL. Use this solution as the standard solution. Perform the test on the test and the standard solution as directed under the Atomic Absorption Spectroscopy. Measure the absorbance A_T for the test solution and A_S for the standard solution when the reading of the display rapidly rises and then reaches a plateau; A_T is less than A_S (NMT 30 ppm). This test is performed using a hydride generator and a heating absorption cell.

Lamp: Selenium hollow cathode lamp
Wavelength: 196.0 nm
Atomizing temperature: About 1000 ℃ when an electric furnace is used.
Carrier gas: Nitrogen or argon

(2) ***Related substances***—Dissolve about 0.5 g of Dapsone in 5 mL methanol to make 50 mL and use this solution as the test solution. Pipet 1 mL of this solution, add methanol to make 100 mL, and use this solution as the standard solution (1). Pipet 10 mL of the standard solution (1), add methanol to make 50 mL, and use this solution as the standard solution (2). With these solutions, perform the test according to the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solutions (1) and (2) on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, *n*-heptane, methanol and 13.5 mol/L ammonia water (20 : 20 : 6 : 1) as a developing solvent, and air-dry the plate. Spray evenly 0.1% 4-dimethylaminocinnamaldehyde solution of a mixture of ethanol(95) and hydrochloric acid (99 : 1); the spot that showed a strong intensity second to the principal spot from the test solution is not more intense than that from the standard solution (1). Also, the spots other than the above two spots from the test solution are not more intense than that from the standard solution (2).

Loss on drying NMT 1.5% (1 g, 100 - 105 °C, constant mass).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 50 mg of Dapsone and dissolve in methanol to make exactly 200 mL. Pipet 5 mL of this solution, add methanol to make exactly 50 mL, and use this solution as the test solution. Separately, proceed in the same manner as in the preparation of the test solution with about 50 mg of dapsone RS and use this solution as the standard solution. Perform the test with 10 mL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions, and determine the area of the peak of dapsone, A_T and A_S in the test and standard solutions.

$$\text{Amount (mg) of dapsone } (C_{12}H_{12}N_2O_2S) = \text{Amount (mg) of dapsone RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 30 cm in length, packed with octylsilanized silica gel for liquid chromatography (10 μm in particle diameter).

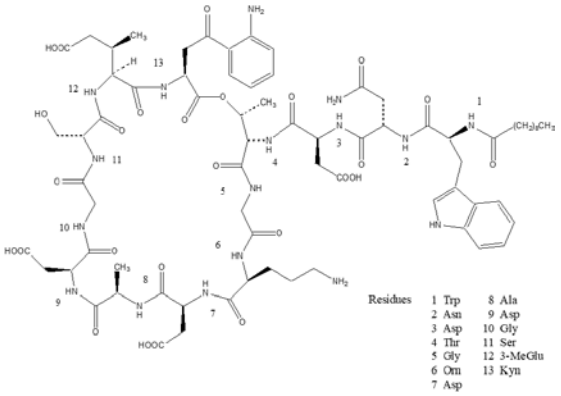
Mobile phase: Mix 100 mL of 2-propanol, 100 mL of ethylacetate and 100 mL of acetonitrile, add pentane to make 1000 mL, and cool at room temperature.

System suitability

System repeatability: Repeat the test 6 times with 10 μL of the standard solution each according to the above operating conditions; the relative standard deviation of the peak area of dapsone is NMT 2.0%.

Packaging and storage Preserve in light-resistant, well-closed containers.

Daptomycin
답토마이신



$C_{72}H_{101}N_{17}O_{26}$: 1620.67

Daptomycin contains NLT 870 μg and NMT 1050 μg (potency) per mg of daptomycin ($C_{72}H_{101}N_{17}O_{26}$: 1620.67), calculated on the anhydrous basis.

Description Daptomycin occurs as a light yellow to light brown crystalline powder.

Identification Weigh 10 mg (potency) each of Daptomycin and daptomycin RS, add a suitable amount of methanol, shake, and make exactly 200 mL with methanol. Use these solutions as the test solution and the standard solution. Determine the absorption spectra of the test solution and the standard solution as directed under the Ultraviolet-visible Spectroscopy; both exhibit an absorption maximum and minimum at the same wavelengths.

Optical rotation $[\alpha]_D^{25}$: Between + 8° and +13° (100 mg, calculated on the anhydrous basis, methanol, 10 mL, 100 mm).

pH Dissolve Daptomycin in water to make 130 mg (potency)/mL; the pH of the solution is between 2.6 and 3.6.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Daptomycin according to Method 2 and perform the test. Prepare the control solution with 3.0 mL of lead standard solution (NMT 30 ppm).

(2) ***Related substances***—Weigh accurately about 0.23 g (potency) of Daptomycin, dissolve in the mobile phase B to make exactly 200 mL and use this solution as the test solution. Perform the test according to the following conditions with 20 μL of the test solution as directed under the Liquid Chromatography and determine the peak area in the test solution. However, store the test solution in a refrigerator before the test and calculate only the peak NLT 0.05% (anhydrodaptomycin NMT 4.0%. β-isomer NMT 2.0% lactone hydrolysate NMT 1.5% any other individual related substances NMT 1.0%, total related substances NMT 8.0%).

Relative retention time and structure of each of the related substances

Component	Relative Retention time	Structure
Lactone Hydrolysate	0.68	β-isomer	0.85	anhydrodaptomycin	1.32	
Content of each related substance (%)

$$= \frac{A_S}{A_T} \times 100$$

A_T: Total sum of all peak areas excluding the solvent peak in the test solution

A_S: Peak area of individual related substance in the test solution

Total content (%) of related substances
= Sum of concentration (%) for any other individual related substances

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 214 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 250 mm in length, packed with octylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: Adjust the mobile phase A and the mobile phase B in a suitable rate so the peak retention time of daptomycin is about 36 minutes.

Mobile phase A: Weigh 9 g of ammonium dihydrogen phosphate, dissolve in 1500 mL of water, adjust the pH to 3.25 with 0.1 mol/L phosphoric acid, and add water to make 2000 mL. Add 1000 mL of acetonitrile to 1000 mL of this solution and mix.

Mobile B: Weigh 9 g of ammonium dihydrogen phosphate, dissolve in 1500 mL of water, adjust the pH to 3.25 with 0.1 mol/L phosphoric acid, and add water to make 2000 mL. Add 400 mL of acetonitrile to 1600 mL of this solution and mix.

Flow rate: About 1.5 mL/min

Temperature of automatic injector: Between 3 and 7 °C.

Time span of measurement: 75 min

System suitability

System performance: Dissolve the mobile phase B in daptomycin RS to make 20 μL of 1 mg (potency)/mL solution and perform the test according to the above operating conditions; the peak retention time is about 24 minutes for lactone hydrolysate, about 30 minutes for β-isomer, 36 minutes for daptomycin, and about 48 minutes for anhydrodaptomycin. The tailing factor of the daptomycin peak is NMT 2.0, the resolution between β-isomer and daptomycin peak is NLT 2.0, and the resolution between daptomycin and anhydrodaptomycin peak is NLT 3.0.

Microbiological examination of non-sterile products The total aerobic microbial count is NMT 10 in 100 mL and *Escherichia coli*, *Salmonella*, *Staphylococcus aureus* and *Pseudomonas aeruginosa* are not detected when the test is performed as directed under the Microbiological Examination of Non-sterile Products. However, do not perform the test when the Sterility is performed.

Sterility It meets the requirements when Daptomycin is used in a sterile preparation. However, it is excluded in cases where there is a final sterilization process in the manufacturing of a sterile preparation.

Bacterial endotoxins It meets the requirements when Daptomycin is used in a sterile preparation. However, Daptomycin is less than 0.30 EU per mg (potency) of daptomycin.

Water NMT 5.0% (0.2 g, volumetric titration, direct titration).

Residue on ignition NMT 0.5% (1 g).

Assay Weigh accurately about 30 mg (potency) each of Daptomycin and daptomycin RS and dissolve in water to make exactly 10 mL. Pipet 2 mL of this solution, add the internal standard solution to make exactly 100 mL, and use each solution as the test solution and the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Calculate the ratios, Q_T and Q_S, of the peak area of daptomycin to that of the internal standard, for the test solution and the standard solution. However, store the test solution and the standard solution in a refrigerator before the test.

$$\text{Potency (μg) of daptomycin } (C_{72}H_{101}N_{17}O_{26}) = \text{Potency (μg) of daptomycin RS} \times \frac{Q_T}{Q_S}$$

Weigh about 25 mg of the internal standard solution ethylparaben and dissolve the mobile phase A to make 1000 mL.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 214 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 250 mm in length, packed with octylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: Adjust the mobile phase A and the mobile phase B in a suitable rate so the peak retention time of daptomycin is about 15 minutes.

Mobile phase A: Weigh 9 g of ammonium dihydrogen phosphate, dissolve in 1500 mL of water, adjust the pH to 3.25 with 0.1 mol/L phosphoric acid, and add water to make 2000 mL. Mix 1000 mL of acetonitrile to 1000 mL of this solution.

Mobile B: Weigh 9 g of ammonium dihydrogen phosphate, dissolve in 1500 mL of water, adjust the pH to 3.25 with 0.1 mol/L phosphoric acid, and add water to make 2000 mL. Mix 400 mL of acetonitrile to 1600 mL of this solution.

Flow rate: Adjust the flow rate so that the retention time of daptomycin is about 15 minutes.

Temperature of automatic injector: Between 3 and 7 °C.

System suitability

System performance: Perform the test according to the above operating conditions with 20 μL of the standard solution; the peak retention time of daptomycin is about 15 minutes, the peak retention time of ethylparaben is about 5.5 minutes, the tailing factor of daptomycin peak is NMT 1.6, and the resolution of the peak between daptomycin and ethylparaben is NLT 5.0.

System repeatability: Repeat the injection 5 times with 20 μL of the standard solution according to the above operating conditions; the relative standard deviation (RSD) of daptomycin and ethylparaben is NMT 2.0%.

Packaging and storage Preserve in hermetic containers.

Daptomycin for Injection
주사용 답토마이신

Daptomycin for Injection is an injection used by

dissolving and contains NLT 90.0% and NMT 120.0% of daptomycin ($C_{72}H_{101}N_{17}O_{26}$: 1620.67).

Method of preparation Prepare Daptomycin for Injection as directed under Injections, with Daptomycin.

Identification (1) Perform the test according to the Identification test of Daptomycin.

(2) Determine the infrared spectra of Daptomycin for Injection and daptomycin RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

pH Dissolve Daptomycin for Injection according to the labeled amount; the pH of this solution is between 4.5 and 5.5.

Purity Perform the test according to the purity test (2) of the related substances Daptomycin. Weigh accurately 0.5 g (potency) of Daptomycin for Injection and dissolve in water to make 200 mL. Take exactly 2 mL of this solution, add water to make 10 mL, and use this solution as the test solution. (NMT 3.5% of anhydrodaptomycin, NMT 2.0% of β-isomer, NMT 1.5% of lactone hydrolysate, NMT 0.5% of RS-2, NMT 0.4% of RS-3, NMT 0.15% of any other individual related substances, and NMT 8.0% of the total related substances)

Relative retention time and structure of RS-2 and RS-3

Component	Relative Retention time	Structure
RS-2	0.54	RS-3	0.60	
Sterility Meets the requirements.

Bacterial endotoxins Daptomycin for Injection is NMT 0.30 EU per mg (potency) of daptomycin.

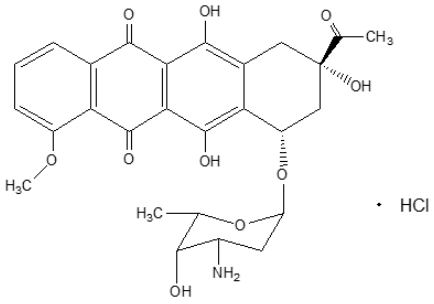
Uniformity of dosage units It meets the requirements when tested according to the Content uniformity test.

Water NMT 2.0% (0.2 g, volumetric titration, direct titration).

Assay Perform the test as directed under the Assay of Daptomycin under the Liquid Chromatography. But weigh accurately 0.5 g (potency) of Daptomycin for Injection and dissolve in water to make 200 mL. Pipet 2 mL of this solution, add the internal standard solution to make exactly 100 mL, and use this solution as the test solution.

Packaging and storage Preserve in hermetic containers.

Daunorubicin Hydrochloride
다우노루비신염산염



$C_{27}H_{29}NO_{10}\cdot HCl$: 563.98

(7*S*,9*S*)-9-Acetyl-7-[(2*R*,4*S*,5*S*,6*S*)-4-amino-5-hydroxy-6-methyloxan-2-yl]oxy-6,9,11-trihydroxy-4-methoxy-8,10-dihydro-7*H*-tetracene-5,12-dione hydrochloride [*23541-50-6*]

Daunorubicin Hydrochloride is the hydrochloride of an anthracycline compound with antitumor property obtained by growing *Streptomyces peucetius*.

Daunorubicin Hydrochloride contains NLT 940 μg (potency) and NMT 1050 μg (potency) per mg of daunorubicin hydrochloride ($C_{27}H_{29}NO_{10}\cdot HCl$), calculated on the dried basis.

Description Daunorubicin Hydrochloride occurs as a red powder.
It is soluble in water or methanol and slightly soluble in ethanol(99.5).

Identification (1) Determine the absorption spectra of solutions of Daunorubicin Hydrochloride and daunorubicin hydrochloride RS in methanol (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) The aqueous solution of Daunorubicin Hydrochloride (1 in 50) responds to the Qualitative Analysis (2) for chloride.

Optical rotation $[\alpha]_D^{20}$: Between +250° and +275° (15

mg, calculated on the dried basis, methanol, 10 mL, 100 mm).

pH Dissolve 0.15 g of Daunorubicin Hydrochloride in 30 mL of water; the pH is between 4.5 and 6.0.

Absorbance $E_{1cm}^{1\%}$ (495 nm): Between 210 and 250 (10 mg, calculated on the dried basis, methanol, 500 mL).

Purity (1) ***Clarity and color of solution***—Dissolve about 20 mg of Daunorubicin Hydrochloride in 10 mL of water; the resulting solution is clear and exhibits a red color.

(2) ***Heavy metals***—Proceed with 1.0 g of Daunorubicin Hydrochloride as directed under Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Related substances***—Dissolve 10 mg of Daunorubicin Hydrochloride in 5 mL of methanol and use this solution as the test solution. Pipet 3 mL of the test solution, add methanol to make exactly 100 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solutions and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of chloroform, methanol, water and acetic acid (15 : 5 : 1 : 1) as a developing solvent to a distance of about 10 cm, and air-dry the plate. Observe the plate with the naked eyes; the spots other than the principal spot obtained from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 7.5% (0.1 g, NMT 0.67 kPa, 60 °C, 3 hours).

Sterility It meets the requirements when used in sterile preparations.

Bacterial endotoxins Less than 4.3 EU per mg (potency) of daunorubicin hydrochloride when used in sterile preparations.

Histamine It meets the requirements when used in sterile preparations. Weigh an appropriate amount of Daunorubicin Hydrochloride, make a solution containing 5.0 mg (potency) per mL, and use this solution as the test solution.

Assay Weigh accurately Daunorubicin Hydrochloride and about 20 mg (potency) of daunorubicin hydrochloride RS, add exactly 4 mL of the internal standard solution, and make exactly 20 mL with the mobile phase. Use these solutions as the test solution and the standard solution, respectively. Perform the test with 5 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions and calculate the ratios, Q_T and Q_S, of the peak area of Daunorubicin Hydrochloride to that of the internal standard.

$$\text{Potency (μg) of daunorubicin hydrochloride } (C_{27}H_{29}NO_{10}\cdot HCl) = \text{Potency (μg) of daunorubicin hydrochloride RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—Weigh 1 g of 2-naphthalenesulfonic acid hydrate and dissolve in the mobile phase to make 100 mL.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 30 cm in length, packed with octylsilanized silica gel for liquid chromatography (10 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: A mixture of water and acetonitrile (31 : 19), adjusted pH to 2.2 with phosphoric acid.

Flow rate: Adjust the flow rate so that the retention time of daunorubicin is about 9 minutes.

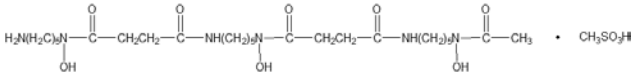
System suitability

System performance: Proceed with 5 μL of the standard solution according to the above conditions; 2-naphthalenesulfonic acid hydrate and daunorubicin are eluted in this order with the resolution being NLT 2.0.

System repeatability: Repeat the test 6 times with 5 μL each of the standard solutions according to the above conditions; the relative standard deviation of the ratios of the peak area of daunorubicin to that of the internal standard is NMT 2.0%.

Packaging and storage Preserve in tight containers.

Deferoxamine Mesilate
데페록사민메실산염



$C_{25}H_{46}N_6O_8\cdot CH_4O_3S$: 656.79

N-[5-[[4-[5-[Acetyl(hydroxy)amino]pentylamino]-4-oxobutanoyl]-hydroxyamino]pentyl]-*N'*-(5-aminopentyl)-*N*'-hydroxybutanediamide;methanesulfonic acid [*138-14-7*]

Deferoxamine Mesilate contains NLT 98.0% and NMT 102.0% of deferoxamine mesilate ($C_{25}H_{46}N_6O_8\cdot CH_4O_3S$), calculated on the anhydrous basis.

Method of preparation If there is a possibility that alkyl methanesulfonate esters (such as methyl, ethyl, and isopropyl) of methanesulfonic acid are introduced as poten-

tial impurities during the manufacturing process of Deferoxamine Mesilate, cautions should be taken with the starting materials, manufacturing process and intermediate product control to minimize residual impurities in consideration of the risk assessment result. If necessary, the manufacturing process can be validated with study data demonstrating that there's no quality risk to the final drug substance.

Description Deferoxamine Mesilate occurs as a white to pale yellow, crystalline powder.
It is freely soluble in water and practically insoluble in ethanol(99.5), 2-propanol or ether.

Melting point—About 147 °C (with decomposition).

Identification (1) To 5 mL of Deferoxamine Mesilate aqueous solution (1 in 500), add 1 drop of iron(III) chloride TS; the solution appears deep red.

(2) Deferoxamine Mesilate responds to the Qualitative Analysis (1) for mesilate.

(3) Determine the infrared spectra of Deferoxamine Mesilate and deferoxamine mesilate RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both exhibit similar intensities of absorption at the same wavenumbers.

pH Dissolve 1.0 g of Deferoxamine Mesilate in 10 mL of water; the pH of this solution is between 3.5 and 5.5.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Deferoxamine Mesilate in 10 mL of water; the solution is clear, and colorless to pale yellow.

(2) ***Chloride***—Perform the test with 1.0 g of Deferoxamine Mesilate. Prepare the control solution with 0.90 mL of 0.01 mol/L hydrochloric acid VS (NMT 0.032%).

(3) ***Sulfate***—Perform the test with 0.6 g of Deferoxamine Mesilate. Prepare the control solution with 0.50 mL of 0.005 mol/L sulfuric acid VS (NMT 0.040%).

(4) ***Heavy metal***—Proceed with 2.0 g of Deferoxamine Mesilate according to Method 4 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(5) ***Arsenic***—Prepare the test solution with 1.0 g of Deferoxamine Mesilate according to Method 3 and perform the test. Use a solution of magnesium nitrate in ethanol(95) (1 in 10) (NMT 2 ppm).

(6) ***Related substances***—Dissolve 50 mg of Deferoxamine Mesilate in 50 mL of the mobile phase and use this solution as the test solution. Pipet 3 mL of the test solution, add the mobile phase to make exactly 50 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak area obtained from each solution according to the automatic integration method; the sum of peak areas other than deferoxamine for the test solution is not larger than the peak area of deferoxamine for the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 230 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 20 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: Dissolve 1.32 g of ammonium dihydrogen phosphate, 0.37 g of ethylenediaminetetraacetic acid disodium salt dihydrate and 1.08 g of sodium 1-heptanesulfonate in 950 mL of water. Adjust the pH of this solution with phosphoric acid to 2.8, take 800 mL of this solution, and add 100 mL of 2-propanol.

Flow rate: Adjust the flow rate so that the retention time of deferoxamine is about 15 minutes.

System suitability

Detection sensitivity: Adjust the sensitivity so that the peak height of deferoxamine obtained from 20 μL of the standard solution is between 5 mm and 20 mm.

System performance: Dissolve 16 mg of Deferoxamine Mesilate and 4 mg of methylparahydroxybenzoate in 50 mL of the mobile phase. Proceed with 20 μL of this solution under the above conditions; deferoxamine and methyl *p*-hydroxybenzoate are eluted in the order with the resolution being NLT 4.

Time span of measurement: About 2 times the retention time of deferoxamine after the solvent peak.

Water NMT 2.0% (0.2 g, volumetric titration, direct titration).

Residue on ignition NMT 0.1% (1 g).

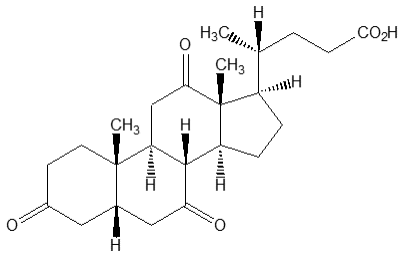
Assay Weigh accurately about 60 mg each of Deferoxamine Mesilate and deferoxamine mesilate RS (determine the content of water before use, in the same manner as Deferoxamine Mesilate), dissolve each in 20 mL of water, add exactly 10 mL of 0.05 mol/L sulfuric acid TS and add water to make exactly 50 mL. Pipet 5 mL of each solution, add exactly 5 mL of 0.05 mol/L sulfuric acid TS and 0.2 mL of iron(III) chloride TS, and add water to make exactly 50 mL. Use each solution as the test solution and the standard solution, respectively. Perform the test with the solutions as directed under the Ultraviolet-visible Spectroscopy, using a solution prepared by adding 0.05 mol/L sulfuric acid TS to 0.2 mL of iron(III) chloride TS to make exactly 50 mL as a control solution, and determine the absorbances, A_T and A_S, for the test solution and the standard solution, respectively, at 430 nm.

Amount (mg) of deferoxamine mesylate ($C_{25}H_{46}N_6O_8 \cdot CH_4O_3S$)
= Amount (mg) of deferoxamine mesylate RS,

as calculated on the anhydrous basis$\times \frac{A_T}{A_S}$

Packaging and storage Preserve in tight containers.

Dehydrocholic Acid
데히드로콜산



$C_{24}H_{34}O_5$: 402.52

(4*R*)-4-[(5*S*,8*R*,9*S*,10*S*,13*R*,14*S*,17*R*)-10,13-Di-methyl-3,7,12-trioxo-1,2,4,5,6,8,9,11,14,15,16,17-dodecahydro-cyclopenta[a]phenanthren-17-yl]pentanoic acid [*81-23-2*]

Dehydrocholic Acid, when dried, contains NLT 98.5% and NMT 101.0% of dehydrocholic acid ($C_{24}H_{34}O_5$).

Description Dehydrocholic Acid occurs as a white, crystalline, odorless powder, with a bitter taste.
It is sparingly soluble in 1,4-dioxane, slightly soluble in ethanol(95) and practically insoluble in water or ether.
It is soluble in sodium hydroxide TS.

Identification (1) Dissolve 5 mg of Dehydrocholic Acid by adding 1 mL of sulfuric acid and 1 drop of formaldehyde solution and allow the solution to stand for 5 minutes. Add 5 mL of water to the resulting solution; the solution exhibits a yellow color with bluish green fluorescence.

(2) To 20 mg of Dehydrocholic Acid, add 1 mL of ethanol(95) and shake to mix. To this, add 5 drops of *m*-dinitrobenzene TS and 0.5 mL of sodium hydroxide solution (1 in 8) and allow it to stand; the solution exhibits a purple to reddish purple color, which gradually changes to brown.

Optical rotation $[\alpha]_D^{20}$: Between +27° and +30° (after drying, 0.2 g, sodium hydroxide TS, 10 mL, 100 mm).

Melting point Between 233 and 242 °C.

Purity (1) ***Odor***—To 2.0 g of Dehydrocholic Acid, add 100 mL of water and boil for 2 minutes; the solution is odorless.

(2) ***Clarity and color of solution***—Weigh 0.10 g of Dehydrocholic Acid, previously powdered, add 30 mL of ethanol(95) and dissolve by shaking for 10 minutes; the solution is clear and colorless.

(3) ***Chloride***—To 2.0 g of Dehydrocholic Acid, add 100 mL of water, shake to mix for 5 minutes and filter. Take 25 mL of the filtrate, add 6 mL of dilute nitric acid, and heat on a steam bath for 6 minutes. After cooling, filter it and take a clear filtrate. Wash the residue with 10 mL of water, combine the washings with the filtrate, and add water to make 50 mL. Use the resulting solution as the test solution and perform the test. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid (NMT 0.021%).

(4) ***Sulfate***—Add 1 mL of dilute hydrochloric acid to 25 mL of the test solution obtained from (3), and heat on a steam bath for 6 minutes. After cooling, filter and take a clear filtrate. Wash the residue with 10 mL of water, combine the washings with the filtrate, and add water to make 50 mL. Use the resulting solution as the test solution and perform the test. Prepare the control solution with 0.50 mL of 0.005 mol/L sulfuric acid VS (NMT 0.048%).

(5) ***Heavy metal***—Proceed with 1.0 g of Dehydrocholic Acid according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(6) ***Barium***—To the solution obtained from (1), add 2 mL of hydrochloric acid and boil for 2 minutes. After cooling, filter and wash with water until 100 mL of the filtrate is obtained. To 10 mL of this solution, add 1 mL of dilute sulfuric acid; no turbidity is produced.

Loss on drying NMT 1.0% (1 g, 105 °C, 2 hours).

Residue on ignition NMT 0.2% (1 g).

Assay Weigh accurately about 0.5 g of Dehydrocholic Acid, previously dried, add 40 mL of neutralized ethanol and 20 mL of water and heat to dissolve. Add 2 drops of phenolphthalein TS, titrate with 0.1 mol/L sodium hydroxide VS, add 100 mL of freshly boiled and then cooled water near the endpoint, and titrate again.

Each mL of 0.1 mol/L sodium hydroxide VS
= 40.25 mg of $C_{24}H_{34}O_5$

Packaging and storage Preserve in well-closed containers.

Deoxyribonuclease
데옥시리보뉴클레아제

Deoxyribonuclease is an enzyme extracted from bovine pancreases, with the molecular weight of 62000 and isoelectric point (pl) between pH 4.7 and 5.0.

Each mg of Deoxyribonuclease contains NLT 3000 Kunitz units.

Description Deoxyribonuclease occurs as a white or pale yellow, amorphous, odorless powder.
It is soluble in water and insoluble in organic solvent.

Identification Dissolve 0.2 g of Sodium Deoxyribonucleate in water in a mortar, transfer it to a 100-mL volumetric flask, and use it as the substrate solution. Separately, weigh equivalent to about 0.1 g of Deoxyribonuclease and perform extraction with 100 mL of 0.02 mol/L magnesium chloride solution. Pipet 1 mL of this solution, transfer it to a 100-mL volumetric flask, add 0.02 mol/L magnesium chloride solution up to the gauge line, and use the solution as the test solution.
Put 2 mL of the substrate solution and 2 mL of pH 7.0 phosphate buffer solution into a test tube, and mix well. After heating it in a 35 ℃ water bath for 1 hour, add 2 mL of 50% trichloroacetic acid, and put the test tube in iced water for 15 minutes. Filter the solution with a filter paper. To 20 mL of the filtrate, add 4 mL of Dische reagent, and warm for 10 minutes on a steam bath; the solution exhibit a dark blue color.

Loss on drying NMT 0.3% (1 g, 60 ℃, 4 hours).

Residue on ignition NMT 1.0% (1 g).

Assay The amount of enzyme required for decreasing the relative viscosity by 1° when 0.1 mL of the test solution and 2.4 mL of the substrate solution are put for reaction at 30 ℃ for 10 minutes is expressed in 1 Kunitz unit.

Weigh accurately about 0.15 g of Sodium Deoxyribonucleate, put it in a mortar, add barbital buffer solution, (pH 7.5), and grind well for mixing. To this, add buffer solution to make 100 mL. To this solution, add magnesium sulfate to make the final concentration 0.03 mol/L, and use it as the substrate solution (This solution has a viscosity between 4.1 and 5.7 at 30 ℃). Separately, weigh accurately about 0.1 g of Deoxyribonuclease, transfer it into a volumetric flask, dilute with water to 100 mL, and use this solution as the test solution.

Pipet 2.4 mL of the substrate solution into the Ostwald viscometer that is scale marked at the top to have a flow rate of bubble and distilled water of 1.5 mL volume per between 18 and 20 seconds, put this viscometer in a constant temperature water bath adjusted to 30 ± 0.2 ℃ for 10 minutes, and add 0.1 mL of water (control solution). Put this viscosimeter again into the constant temperature water bath under the above conditions, and measure the flow rate at 1, 3, 5, 7 and 10 minutes. Perform the same procedure with 0.1 mL of the test solution instead of 0.1 mL of water and measure the flow rate. As seen in the table below, the viscosity decrease of the substrate solution is constant during the test (decreased by between 0.2 and 1° within 10 minutes).

If 0.1 mL of the test solution decreased the relative viscosity of 2.4 mL of the substrate solution by 0.9 at 30 ℃ for 10 minutes, 0.1 mL of the test solution contains 0.9 units of Deoxyribonuclease.

	Flow rate relative viscosity

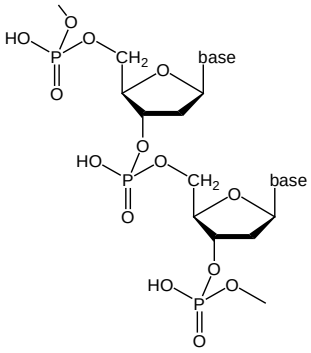
Deoxyribonucleic Acid
데옥시리보핵산



[9007-49-2]

Deoxyribonucleic Acid, when dried, contains NLT 14.5% of nitrogen (N : 14.00) and NLT 9.0% of phosphorus (P : 30.97).

Description Deoxyribonucleic Acid occurs as a white to yellow powder.
It is insoluble in most organic solvents.
It is insoluble in the acid of about pH 2, soluble in alkaline solution and alkali-activated salt solution (acetate, phosphate, and glycerol phosphate), and stable under alkalinity.

Identification (1) Dissolve 10 mg of Deoxyribonucleic Acid in 5 mL of 10% trichloroacetic acid solution, put 1 mL of this solution into a test tube, add 2 mL of diphenylamine-acetic acid(100) TS, and heat on a steam bath for 10 minutes; the solution exhibits a dark blue color.

(2) Dissolve 10 mg of Deoxyribonucleic Acid in 5 mL of 10% trichloroacetic acid solution, put 1 mL of this solution into a test tube, add 5 mL of xanthydrol TS, and heat on a steam bath for 3 minutes; the solution exhibits a red color.

Purity (1) ***Protein impurities***—Put 1 g of Deoxyribonucleic Acid in a test tube, add 1 mL of 95% ethanol, add 10 mL of 10% sodium acetate solution, while stirring; the

solution is clear, and colorless or pale yellow.

(2) ***Simple protein***—To 4 mL of the solution obtained as above, add 2 mL of sodium hydroxide TS, boil, and add 2 to 3 drops of copper-alkali TS; the solution does not turn to purple.

(3) ***RNA***—Dissolve 10 mg of Deoxyribonucleic Acid in 0.2 mL of sodium hydroxide TS (1 in 4) by shaking. To this solution, dissolve 2 mL of orcinol-hydrochloric acid solution by shaking, add 2 mL of orcinol-hydrochloric acid solution, and heat on a steam bath with shaking. After cooling, add 10 mL of water and perform extraction with isoamyl alcohol; the solution exhibits a greenish yellow color.

Loss on drying NMT 7.0% (1 g, 105 °C, 4 hours).

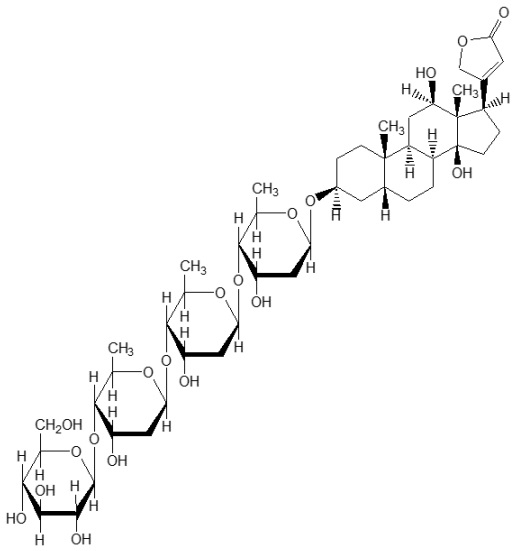
Residue on ignition NMT 0.5% (1 g, 450 °C - 500 °C).

Assay (1) ***Nitrogen***—Weigh accurately about 0.25 g of Deoxyribonucleic Acid, previously dried, and perform the test according to the Nitrogen Determination method (semi-micro Kjeldahl method).

(2) ***Phosphorus***—Perform the test with a suitable amount of Deoxyribonucleic Acid, previously dried, according to the Analysis for Minerals.

Packaging and storage Preserve in well-closed containers.

Deslanoside
데슬라노시드



$C_{47}H_{74}O_{19}$: 943.08

3-[(3*S*,5*R*,8*R*,9*S*,10*S*,12*R*,13*S*,14*S*,17*R*)-12,14-Dihydroxy-3-[(2*R*,4*S*,5*S*,6*R*)-4-hydroxy-5-[(2*S*,4*S*,5*S*,6*R*)-4-hydroxy-5-[(2*S*,4*S*,5*S*,6*R*)-4-hydroxy-6-methyl-5-[(2*S*,3*R*,4*S*,5*S*,6*R*)-3,4,5-trihydroxy-6-(hydroxymethyl)oxan-2-yl]oxyoxan-2-yl]oxy-6-methyloxan-2-yl]oxy-10,13-dimethyl-1,2,3,4,5,6,7,8,9,11,12,15,16,17-tetradecahydrocyclopenta[a]phenanthren-17-yl]-2*H*-furan-5-one [*17598-65-1*]

Deslanoside, when dried, contains NLT 90.0% and NMT 102.0% of deslanoside ($C_{47}H_{74}O_{19}$).

Description Deslanoside occurs as colorless to white crystals or a crystalline powder.
It is freely soluble in pyridine anhydrous, sparingly soluble in methanol, slightly soluble in ethanol(95) and practically insoluble in water or ether.
It is hygroscopic.

Identification Take about 1 mg of Deslanoside in a small test tube about 10 mm in internal diameter, dissolve 1 mL of acetic acid(100) of iron(III) chloride hexahydrate solution (1 in 10000), and add 1 mL of sulfuric acid to make two layers; at the boundary layer of two liquids, a brown ring is shown and the color of the upper layer near to the contact zone changes gradually to blue through purple and the entire acetic acid(100) layer changes to a bluish green color through a deep blue color.

Optical rotation $[\alpha]_D^{20}$: Between + 6.5° and + 8.5° (0.5 g after drying, pyridine anhydrous, 25 mL, 100 mm).

Purity (1) ***Clarity and color of solution***—Dissolve 20 mg of Deslanoside in 10 mL of ethanol(95) and 3 mL of water by warming, cool and add water to make 100 mL; the solution is clear and colorless.

(2) ***Related substances***—Dissolve 10 mg of Deslanoside in exactly 5 mL of methanol and use this solution as the test solution. Separately, weigh about 1.0 mg of deslanoside RS, add exactly 5 mL of methanol, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 20 μL each of the test solution and the standard solution on a plate of silica gel for thin-layer chromatography. Then, develop the plate with a mixture of dichloromethane, methanol and water (84 : 15 : 1) as a developing solvent to a distance of about 13 cm, and air-dry the plate. Spray evenly dilute sulfuric acid on the plate and heat the plate at 110 ℃ for 10 minutes; the spots other than the principal spot from the test solution are not larger than and not more intense than the spot from the standard solution.

Loss on drying NMT 8.0% (0.5 g, in vacuum, phosphorus oxide (V), 60 ℃, 4 hours).

Residue on ignition NMT 0.5% (0.1 g).

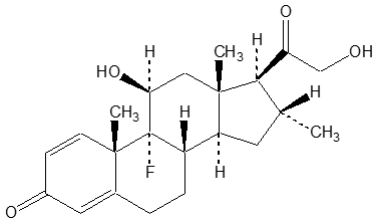
Assay Weigh accurately about 12 mg of Deslanoside and deslanoside RS, previously dried, dissolve in 20 mL each of methanol, add water to make exactly 100 mL, and use these solutions as the test solution and the standard solution, respectively. Pipet 5.0 mL each of the test solution

and the standard solution, transfer to a 25 mL light-resistant volumetric flasks, add and shake well to mix with 5 mL each of 2,4,6-trinitrophenol TS and 0.5 mL each of sodium hydroxide solution (1 in 10), and add diluted methanol (1 in 4) to make exactly 25 mL. Allow the solution to stand at a temperature between 18 and 22 ℃ for 25 minutes. With these solutions, perform the test as directed under the Ultraviolet-visible Spectroscopy, using a solution prepared with 5 mL of methanol (1 in 5) in the same manner as a control solution. Determine the absorbances, A_T and A_S, of each solution, obtained from the test solution and the standard solution, at 485 nm.

$$\text{Amount (mg) of deslanoside } (C_{47}H_{74}O_{19}) = \text{Amount (mg) of deslanoside RS} \times \frac{A_T}{A_S}$$

Packaging and storage Preserve in tight containers.

Desoximetasone
데속시메타손



$C_{22}H_{29}FO_4$: 376.46

(8*S*,9*R*,10*S*,11*S*,13*S*,14*S*,16*R*,17*R*)-9-Fluoro-11,17-dihydroxy-17-(2-hydroxyacetyl)-10,13,16-trimethyl-6,7,8,9,10,11,12,13,14,15,16,17-dodecahydro-3*H*-cyclopenta[a]phenanthren-3-one [*382-67-2*]

Desoximetasone contains NLT 97.0% and NMT 103.0% of desoximetasone ($C_{22}H_{29}FO_4$), calculated on the dried basis.

Description Desoximetasone occurs as a white or almost white, crystalline powder.
It is very soluble in ethanol(95), acetone or chloroform and practically insoluble in water.

Identification (1) Determine the infrared spectra of Desoximetasone and desoximetasone RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) Dissolve about 0.1 g of Desoximetasone in a mixture of chloroform and ethanol(95) (3 : 1) to make 10 mL, and use this solution as the test solution. Separately, dissolve about 0.1 g of desoximetasone RS in a mixture of chloroform and ethanol(95) (3 : 1) to make 10 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under the Thin Layer Chromatography. Spot 20 μL each of the test solution and the standard solution on a plate made of silica gel for thin-layer chromatography (with fluorescence agent). Then, develop the plate with a mixture containing chloroform and ethyl acetate (1 : 1) as a developing solvent to a distance of about 10 cm, and air-dry the plate. Expose the plate with ultraviolet light (main wavelength: 254 nm) and spray evenly the plate with p-toluenesulfonic acid monohydrate in ethanol(95) (1 in 5); the R_f value of the principal spot obtained from the test solution corresponds to that from the standard solution.

Optical rotation $[\alpha]_D^{25}$: Between + 107° and -112° (0.1 g after drying, chloroform, 20 mL, 100 mm).

Melting point Between 206 and 218 ℃. However, the range of temperature from the initiation of solubility and the end of fusion is NMT 4 ℃.

Purity ***Heavy metals***—Proceed with 1.0 g of Desoximetasone according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

Loss on drying NMT 1.0% (1 g, 105 °C, constant mass).

Residue on ignition NMT 0.2% (1 g).

Assay Weigh accurately about 40 mg of Desoximetasone, dissolve methanol to make exactly 100 mL, pipet 10.0 mL of this solution, and add a mixture of methanol and acetonitrile (1 : 1) to make exactly 100 mL. Use this solution as the test solution. Separately, weigh accurately about 40 mg of desoximetasone RS, dissolve methanol to make exactly 100 mL, pipet 10.0 mL of this solution, and add a mixture of methanol and acetonitrile (1 : 1) to make exactly 100 mL. Use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography, and determine the peak height of desoximetasone, H_T, and H_S in the test and standard solutions.

$$\text{Amount (mg) of desoximetasone } (C_{22}H_{29}FO_4) = \text{Amount (mg) of desoximetasone RS} \times \frac{H_T}{H_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 to 10 μm in particle diameter).

Mobile phase: A mixture of methanol, water, and acetic acid(100) (65 : 35 : 1). However, adjust so the retention time of desoximetasone is NMT 6 minutes.

Flow rate: 1 mL/min

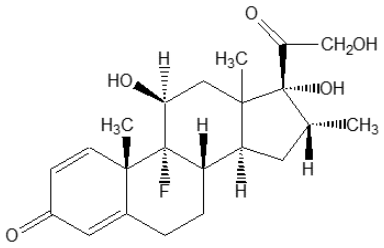
System suitability

System performance: Proceed with 10 μL of the standard solution under the above operating conditions; the symmetry factor for desoximetasone peak is NMT 1.5.

System repeatability: Repeat the test 5 times with 10 μL each of the standard solution under the above operating conditions; the relative standard deviation (RSD) of the peak height of desoximetasone is NMT 2.0%.

Packaging and storage Preserve in well-closed containers.

Dexamethasone
덱사메타손



$C_{22}H_{29}FO_5$: 392.46

(8*S*,9*R*,10*S*,11*S*,13*S*,14*S*,16*R*,17*R*)-9-Fluoro-11,17-dihydroxy-17-(2-hydroxyacetyl)-10,13,16-trimethyl-6,7,8,9,10,11,12,13,14,15,16,17-dodecahydro-3*H*-cyclopenta[a]phenanthren-3-one [*50-02-2*]

Dexamethasone, when dried, contains NLT 97.0% and NMT 102.0% of dexamethasone ($C_{22}H_{29}FO_5$).

Description Dexamethasone occurs as white to pale yellow crystals or a crystalline powder.
It is sparingly soluble in methanol, ethanol(95) or acetone and practically insoluble in water.

Melting point—About 245 °C (with decomposition).

Identification (1) Proceed with 10 mg of Dexamethasone as directed under the Oxygen Flask Combustion, using a mixture of 0.5 mL of 0.01 mol/L sodium hydroxide TS and 20 mL of water as an absorbent; the solution responds to the Qualitative Analysis for fluoride.

(2) Dissolve 1.0 mg each of Dexamethasone and dexamethasone RS in 10 mL of ethanol(95). To 2.0 mL of this solution, add 10 mL of phenylhydrazinium hydrochloride TS, mix by shaking, and heat on a steam bath at 60 ℃ for 20 minutes. After cooling, determine the absorption spectra of these solutions as directed under the Ultraviolet-visible Spectroscopy, using a solution prepared with 2.0 mL of ethanol(95) in the same manner, as a control solution; both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared spectra of Dexamethasone and dexamethasone RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers. If any difference appears, dissolve Dexamethasone and dexamethasone RS in acetone, respectively, evaporate to dryness and repeat the test using the residue on evaporation.

Optical rotation $[\alpha]_D^{20}$: Between +86° and +94° (after drying, 0.1 g, methanol, 10 mL, 100 mm).

Purity (1) ***Heavy metal***—Proceed with 1.0 g of Dexamethasone according to Method 2 and perform the test. Prepare the control solution with 3.0 mL of lead standard solution (NMT 30 ppm).

(2) ***Related substances***—Dissolve 0.18 g of Dexamethasone in 100 mL of acetonitrile. Pipet 33 mL of this solution, add ammonium formate buffer solution (pH 3.6) to make 100 mL, and use this solution as the test solution. Pipet 1 mL of the test solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak area from each solution according to the automatic integration method; the peak area other than dexamethasone from the test solution is not larger than the peak area of dexamethasone from the standard solution, and the sum of peak areas other than dexamethasone from the test solution is not larger than 2 times the peak area of dexamethasone from the standard solution.

Ammonium formate buffer solution—Add water to 1.32 g of ammonium formate, pH 3.6 to make 1000 mL and adjust the pH to 3.6 with formic acid.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column, 4.6 mm in internal diameter and 25 cm in length, packed with phenylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: Dissolve 1.32 g of ammonium formate in 1000 mL of water and adjust the pH to 3.6 with formic acid. To 670 mL of this solution, add 330 mL of acetonitrile.

Flow rate: Adjust the flow rate so that the retention time of dexamethasone is about 13 minutes.

System suitability

Detection sensitivity: Pipet 1 mL of the standard solution and add the mobile phase to make exactly 10 mL. Confirm that the peak area of dexamethasone obtained from 10 μL of this solution is equivalent to 8 - 12% of the peak area of dexamethasone obtained from the standard solution.

System performance: Proceed with 10 μL of the standard solution under the above operating conditions; the number of theoretical plates of dexamethasone peak is

NLT 5000 with the symmetry factor being NMT 1.5.

System repeatability: Repeat the test 6 times according to the above conditions with 10 μL of the standard solution each time; the relative standard deviation of the peak areas of dexamethasone is NMT 1.0%.

Time span of measurement: About 4 times the retention time of dexamethasone after the solvent peak.

Loss on drying NMT 0.5% (0.2 g, 105 °C, 3 hours).

Residue on ignition NMT 0.1% (0.2 g, platinum crucible).

Assay Weigh accurately about 10 mg each of Dexamethasone and dexamethasone RS, previously dried, dissolve by adding diluted methanol (1 in 2) to make exactly 100 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak area of dexamethasone, A_T and A_S, in each solution.

Amount (mg) of dexamethasone ($C_{22}H_{29}FO_5$)
= Amount (mg) of dexamethasone RS × A_T / A_S

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column, 4 mm in internal diameter and 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: A mixture of water and acetonitrile (2 : 1).

Flow rate: Adjust the flow rate so that the retention time of dexamethasone is about 6 minutes.

System suitability

System repeatability: Repeat the test 6 times according to the above conditions with 10 μL of the standard solution each time; the relative standard deviation of the peak areas of dexamethasone is NMT 2.0%.

Packaging and storage Preserve in light-resistant tight containers.

Dexamethasone Tablets
덱사메타손 정

Dexamethasone Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of dexamethasone ($C_{22}H_{29}FO_5$: 392.46).

Method of preparation Prepare Dexamethasone Tablets as directed under Tablets, with Dexamethasone.

Identification Take 10 mL of the methanol extract obtained by the preparation of the test solution under the Assay, evaporate to dryness on a steam bath, dissolve by putting 1 mL of chloroform, and use this solution as the test solution. Separately, weigh an appropriate amount of dexamethasone RS and dissolve in chloroform to make a solution containing 500 μg per mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL of the test solution and 20 μL of the standard solution on a plate of made silica gel for thin-layer chromatography. Next, develop the plate with a mixture of methylene chloride and methanol (45 : 4) to a distance of about 15 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254nm); the R_f values of the principal spots obtained from the test solution and the standard solution are the same.

Dissolution Perform the test with 1 tablet of Dexamethasone Tablets and 500 mL of hydrochloric acid diluted with the test solution (1 in 100) at 100 revolutions per minutes according to Method 1. Take the dissolved solution 45 minutes after starting the test, filter, discard the first 10 mL of filtrate and take exactly V mL of the subsequent filtrate. Add methanol diluted to contain 0.75 μg of dexamethasone per mL according to the labeled amount (1 in 10), make exactly V' mL, and use this solution as the test solution. Separately, weigh accurately about 15 mg of dexamethasone RS, previously dried at 105 °C for 3 hours, and dissolve in 10 mL of methanol, and put water to make exactly 100 mL. Pipet 1 mL of this solution, add diluted methanol (1 in 10) to obtain the same concentration as the test solution, and use this solution as the standard solution. Perform the test with 50 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak area of dexamethasone, A_T and A_S, in each solution. It meets the requirements when the dissolution rate of Dexamethasone Tablets in 45 minutes is NLT 70%.

Dissolution rate (%) for the labeled amount of dexamethasone ($C_{22}H_{29}FO_5$)
= C_S × A_T / A_S × V' / V × 1 / C × 50000

C_S: Concentration of the standard solution (mg/mL)

C: Labeled amount (mg) of dexamethasone ($C_{22}H_{29}FO_5$) in 1 tablet

Operating conditions

For the column, column temperature and mobile phase, proceed as directed in the operating conditions under the Assay of Dexamethasone.

Detector: An ultraviolet absorption photometer (wavelength: 240 nm).

Flow rate: 1.5 mL/min

System suitability

System repeatability: Repeat the test 6 times according to the above conditions with 50 μL of the standard solution; the relative standard deviation of the peak areas of dexamethasone is NMT 2.0%.

Uniformity of dosage units Perform the procedure for content uniformity with Dexamethasone Tablets as directed under the Assay; it meets requirements.

Assay Weigh accurately the mass of NLT 20 Dexamethasone Tablets and powder. Weigh accurately an amount of Dexamethasone Tablets, equivalent to about 10 mg of dexamethasone ($C_{22}H_{29}FO_5$), transfer to a 100-mL volumetric flask, add 30 mL of diluted methanol (1 in 2), and shake to mix for 30 minutes. To this, add diluted methanol (1 in 2) up to the gauge line, and mix. Filter and use the filtrate as the test solution. Separately, weigh accurately about 10 mg of dexamethasone RS, transfer to a 100-mL volumetric flask and dissolve in 30 mL of diluted methanol (1 in 2). To this, add diluted methanol (1 in 2) up to the gauge line, mix, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak area of dexamethasone, A_T and A_S, in each solution.

Amount (mg) of dexamethasone ($C_{22}H_{29}FO_5$)
= Amount (mg) of dexamethasone RS × A_T / A_S

Operating conditions

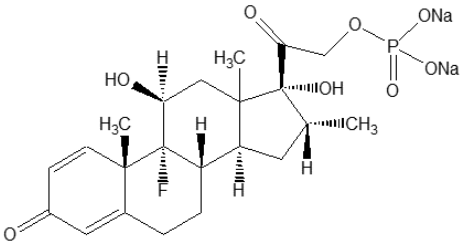
Use the operating conditions as directed under the Assay of Dexamethasone.

System suitability

System repeatability: Repeat the test 6 times according to the above conditions with 10 μL of the standard solution each time; the relative standard deviation of the peak areas of dexamethasone is NMT 2.0%.

Packaging and storage Preserve in well-closed containers.

Dexamethasone Phosphate Disodium
덱사메타손포스페이트이나트륨



Dexamethasone Sodium Phosphate

$C_{22}H_{28}FNa_2O_8P$: 516.41

Sodium 2-[(8*S*,9*R*,10*S*,11*S*,13*S*,14*S*,16*R*,17*R*)-9-fluoro-11,17-dihydroxy-10,13,16-trimethyl-3-oxo-6,7,8,11,12,14,15,16-octahydrocyclopenta[a]phenanthren-17-yl]-2-oxoethyl] phosphate [*2392-39-4*]

Dexamethasone Phosphate Disodium contains NLT 97.0% and NMT 102.0% of dexamethasone phosphate disodium ($C_{22}H_{28}FNa_2O_8P$), calculated on the anhydrous and ethanol-free basis.

Description Dexamethasone Phosphate Disodium occurs as a white or pale yellow, crystalline powder, with no odor or a slight odor of ethanol.
It is freely soluble in water, slightly soluble in ethanol(95), very slightly soluble in 1,4-dioxane, and practically insoluble in chloroform and in ether.
It is very hygroscopic.

Identification (1) Put 20 mg of Dexamethasone Phosphate Disodium in a 15-mL centrifuge tube, add 5.0 mL of alkaline phosphatase TS, shake hard to mix, and allow it to stand for 30 minutes. Add 5.0 mL of ethyl acetate, shake hard to mix, centrifuge, and use the ethyl acetate layer as the test solution. Separately, put 15 mg of dexamethasone RS in a 5 mL volumetric flask, dissolve in ethyl acetate, add ethyl acetate again up to the gauge line for mixing, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on a plate made of silica gel for thin-layer chromatography, develop the plate with a mixture of chloroform, methanol and water (180 : 15 : 1) to a distance of about 15 cm, take out the plate, and air-dry the plate. Observe the plate under ultraviolet light (main wavelength: 254nm); the R_f values of the principal spots obtained from the test solution and the standard solution are the same.

(2) Residue on ignition of Dexamethasone Phosphate Disodium responds to the Qualitative Analysis for sodium salt and phosphate.

pH The pH of a solution of Dexamethasone Phosphate Disodium (1 in 100) is between 7.5 and 10.5.

Optical rotation $[\alpha]_D^{20}$: Between +74° and +82° (on the anhydrous and ethanol-free basis, 0.1 g, water, 10 mL, 100 mm).

Purity (1) ***Ethanol***—Weigh accurately about 50 mg of Dexamethasone Phosphate Disodium, add exactly 5 mL of the internal standard solution, add water to make exactly 25 mL, and use it as the test solution. Separately, add exactly water to exactly 2 mL of ethanol(99.5) to make 100 mL and use it as the standard stock solution. With this solution, measure the specific gravity at 25 ℃ to obtain the content of ethanol. Pipet 0.25 mL of the standard stock solution, add exactly 5 mL of the internal standard solution, add water to make exactly 25 mL, and use this solution as the standard solution. Perform the test with 1 μL each of the test solution and the standard solu-

tion as directed under the Gas Chromatography according to the following conditions, and determine the ratio of peak area of ethanol from the test solution and the standard solution versus peak area of the internal standard, Q_T and Q_S, respectively; the amount of ethanol (C_2H_5OH) in Dexamethasone Phosphate Disodium is NMT 8.0%.

$$\text{Content (\%) of ethanol } (C_2H_5OH) = 0.25 \times S / W \times Q_T / Q_S$$

S: Content (%) of ethanol in the standard stock solution

W: Amount (g) of Dexamethasone Phosphate Disodium in the test solution

Internal standard solution—1-propanol solution (1 in 1000).

Operating conditions

Detector: A hydrogen flame-ionization detector

Column: A fused silica column 0.53 mm in internal diameter and 30 m in length, coated inside with 6% cyanopropylphenyl and 94% dimethylpolysiloxane for gas chromatography to a thickness of 3.0 μm.

Column temperature: Maintain at 50 °C for 5 minutes, then raise to 200 °C by 50 °C per minute, and keep at 200 °C for 5 minutes.

Sample injection port temperature: 210 °C

Detector temperature: 280 °C

Split ratio: 1 : 5

Carrier gas: Nitrogen

Flow rate: 5 mL/min

System suitability

System performance: Proceed with 1 μL of the standard solution under the above operating conditions; ethanol and the internal standard are eluted in this order.

System repeatability: Repeat the test 6 times under the above conditions with 1 μL each of the standard solution; the relative standard for the ratio of peak area is NMT 4.0%.

(2) ***Phosphate ion***—Weigh accurately about 50 mg of Dexamethasone Phosphate Disodium, transfer it to a 25 mL volumetric flask, add 10 mL of water, and shake to mix. To this, add 5 mL of 1 mol/L sulfuric acid and dissolve by heating, if necessary. After cooling, add 1 mL each of the phosphate TS A and phosphate TS B, add water up to the gauge line, and mix. Allow this solution to stand for 30 minutes at room temperature, and use the resulting solution as the test solution. Separately, pipet 5 mL of phosphate standard solution, proceed with it n the same manner as the test solution, and use it as the standard solution. Perform the test with the test solution and standard solution as directed under the Ultraviolet-visible Spectroscopy and determine the absorbance of each solution at the wavelength of 730 nm, using water as a control solution; the absorbance of the test solution is not greater than that of the standard solution (PO_4 NMT 1.0%).

Phosphate standard solution—Add water to 143.3 mg of potassium dihydrogen phosphate, previously dried, and dissolve to make 1000 mL (0.10 mg PO_4/mL).

Phosphate TS A—Weigh 5 g of ammonium heptamolybdate tetrahydrate, dissolve in 0.5 mol/L sulfuric acid to make 100 mL.

Phosphate B—Weigh 0.35 g of *p*-methylaminophenol sulfate, dissolve in 50 mL of water, add 20 g of sodium sulfite heptahydrate, mix by dissolving, and add water to make 100 mL.

(3) ***Free dexamethasone***—Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the conditions under the Assay, and determine the peak area of dexamethasone, A_T and A_S, in each solution, respectively (NMT 1.0%).

$$\text{Amount (μg) of dexamethasone } (C_{22}H_{29}FO_5) = 1000 \times C \times \frac{A_T}{A_S}$$

C: Concentration of the standard solution (μg/mL)

(4) ***Related substances***—Dissolve exactly 25 mg of Dexamethasone Phosphate Disodium in the mobile phase A to make 25 mL, and use this solution as the test solution. Perform the test with 15 μL of the test solution by the percentage peak area method under the Liquid Chromatography according to the following conditions; each of the related substances is NMT 1.0% and the total amount of related substances is NMT 2.0%.

$$\text{Content (\%) of each related substance} = 100 \times \frac{A_i}{A_S}$$

A_i: Peak area of each related substance obtained from the test solution.

A_S: Sum of all peak areas obtained from the test solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: Use the mobile phases A and B to control stepwise or based on the gradient elution as follows.

Mobile phase A: A mixture of water, methanol and buffer (7 : 7 : 6).

Mobile phase B: A mixture of methanol and buff-

er (7 : 3).

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0	90	10
0 - 3.5	90	10
3.5 - 23.5	90 → 60	10 → 40
23.5 - 34.5	60 → 5	40 → 95
34.5 - 59.5	5	95
59.5 - 60	5 → 90	95 → 10

Flow rate: 1 mL/min

System suitability

System performance: Proceed with 15 μL of the test solution according to the above operation conditions; the resolution between the major peak and the peak of the closest related substance is NLT 1.0.

System repeatability: Repeat the test 6 times according to the above conditions with 15 μL each of the test solution; the relative standard deviation of the peak area is NMT 4.0%.

Buffer solution—Dissolve 7.0 g of ammonium acetate in 1000 mL of water and add acetic acid(100) to adjust the pH to 4.0.

Water NMT 16.0% (including the content of ethanol, 0.4 g, volumetric titration, direct titration).

Assay Weigh accurately about 50 mg of Dexamethasone Phosphate Disodium, and dissolve in the mobile phase to make exactly 100 mL. Pipet 5 mL of this solution, add the mobile phase to make exactly 50 mL, and use this solution as the test solution. Separately, weigh accurately an appropriate amount of dexamethasone phosphate RS, previously dried at 40 ℃ and 0.67 kPa to a constant weight, and dissolve in the mobile phase to make a solution containing 0.5 mg per mL (Solution 1). Separately, weigh accurately a suitable amount of dexamethasone RS, previously dried at 105 ℃ for 3 hours, and dissolve in a mixture of water and methanol (1 : 1) to make a solution containing 50 μg per mL (Solution 2). Pipet 10.0 mL of Solution 1 and 1.0 mL of Solution 2, respectively, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak area of dexamethasone phosphate for each of the solutions, A_T and A_S, respectively.

Amount (mg) of dexamethasone phosphate disodium ($C_{22}H_{28}FNa_2O_8P$)

$$= \frac{516.41}{472.45} \times C \times \frac{A_T}{A_S}$$

C: Concentration (μg/mL) of the standard solution

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.5 mm in internal diameter and about 25 cm in length, packed with phenylated silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: Add water to 7.5 mL of triethylamine to make 1000 mL, and adjust the pH to 5.4 with phosphoric acid. Mix this solution with methanol in the ratio of 74 : 26.

Flow rate: 1.2 mL/min

System suitability

System performance: Proceed with 10 μL of the standard solution under the above operating conditions; dexamethasone and dexamethasone phosphate are eluted in this order with the resolution between their peaks being NLT 1.8.

System repeatability: Repeat the test 6 times according to the above conditions with 10 μL of the standard solution each time; the relative standard deviation of the peak area is NMT 1.0%.

Packaging and storage Preserve in hermetic containers.

Dexamethasone Phosphate Disodium Injection
덱사메타손포스페이트이나트륨 주사액

Dexamethasone Phosphate Disodium Injection, as an aqueous injection, contains Dexamethasone Phosphate Disodium in the amount equivalent to NLT 90.0% and NMT 115.0% of the labeled amount of dexamethasone phosphate ($C_{22}H_{30}FO_8P$: 472.45).

Method of preparation Prepare Dexamethasone Phosphate Disodium Injection with as directed under Injections, with Dexamethasone Phosphate Disodium.

Description Dexamethasone Phosphate Disodium Injection occurs as a clear, colorless liquid.

Identification Take Dexamethasone Phosphate Disodium Injection in the amount equivalent to 10 mg of dexamethasone phosphate disodium, transfer to a 100-mL volumetric flask, add water to make 100 mL and shake to mix. Take 5 mL of this solution, put in a 125 mL separatory funnel, and perform washing twice with 10 mL of methylene chloride, previously washed with water. After discarding the washings, transfer the solution into a 50-mL glass stoppered test tube, add 5 mL of alkaline phosphatase solution prepared by dissolving 50 mg of alkaline phosphatase in 50 mL of magnesium buffer solution, pH 9.0, allow it to stand at 37 ℃ for 45 minutes, and perform extraction with 25 mL of dichloromethane. Evaporate 15 mL of dichloromethane extract to dryness

on a steam bath, and dissolve the residue in 1 mL of dichloromethane. Dissolve an appropriate amount each of this solution and dexamethasone RS in dichloromethane to obtain the standard solution containing 300 μg per mL. Spot 5 μL each of the standard solution on a plate made of silica gel for thin-layer chromatography. Develop the plate with a mixture of acetone, chloroform and water (50 : 50 : 1) to a distance of 15 cm, take out the plate, and air-dry it. Spray dilute sulfuric acid (1 in 2) onto this plate, and heat at 105 ℃ until a brown or black spot appears. The principal spots obtained from the test solution and standard solution are the same in the R_f value.

pH Between 7.0 and 8.5.

Sterility Meets the requirements.

Bacterial endotoxins Less than 31.3 EU per mg of dexamethasone phosphate.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Extractable volume of injections Meets the requirements.

Assay Take Dexamethasone Phosphate Disodium Injection exactly in the amount equivalent to about 8 mg of dexamethasone phosphate ($C_{22}H_{30}FO_8P$), add the mobile phase to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately an appropriate amount of dexamethasone phosphate RS, previously dried at 40 ℃ and 0.67 kPa to a constant weight, dissolve in the mobile phase to make a solution containing 80 μg per mL, and use this solution as the standard solution. Prepare the standard solution before use. Perform the test with 20 μL each of the test and standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak area of dexamethasone for each of the solutions, A_T and A_S, respectively.

$$\text{Amount (mg/mL) of dexamethasone phosphate } (C_{22}H_{30}FO_8P) = \frac{0.1 \times C}{V} \times \frac{A_T}{A_S}$$

C: Concentration (μg/mL) of the standard solution
V: Amount (mL) of sample

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 to 10 μm in particle diameter).

Mobile phase: 0.01 mol/L potassium dihydrogen phosphate solution using a mixture of water and methanol (1 : 1) as a solvent.

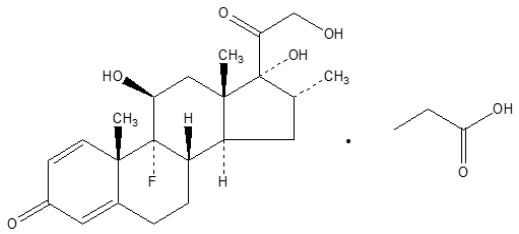
Flow rate: 1.6 mL/min

System suitability

System repeatability: Repeat the test 5 times according to the above conditions with 20 μL of the standard solution each time; the relative standard deviation of the peak area is NMT 1.5%.

Packaging and storage Preserve in light-resistant, hermetic containers.

Dexamethasone Propionate
덱사메타손프로피오네이트



$C_{22}H_{29}FO_5 \cdot C_3H_6O_2$: 466.55

(11β,16α)-9-Fluoro-11,17,21-trihydroxy-16-methylpregna-1,4-diene-3,20-dione propionic acid, [*15423-89-9*]

Dexamethasone Propionate, when dried, contains NLT 96.0% and NMT 104.0% of dexamethasone propionate ($C_{22}H_{29}FO_5 \cdot C_3H_6O_2$) as well as NLT 3.4% and NMT 4.1% of fluorine (F : 18.998).

Description Dexamethasone Propionate occurs as a white, crystalline, odorless powder.
It is freely soluble in dichloromethane, chloroform or acetone, soluble in ethyl acetate or methanol, sparingly soluble in ethanol, and slightly soluble in ether.
It is practically insoluble in water.

Melting point— Between 200 and 206 °C.

Identification (1) Dissolve 0.01 g of Dexamethasone Propionate in methanol to make 100 mL. To 2 mL of this solution, add 5 mL of isoniazid TS, and heat; the solution exhibits a yellow color.

(2) Dissolve 0.01 g of Dexamethasone Propionate in 0.5 mL of methanol, add 1 mL of Fehling's TS, and heat; a reddish brown precipitate is produced.

(3) Decompose 0.01 g of Dexamethasone Propionate according to the Oxygen Flask Combustion by using a mixture of 0.5 mL of 0.1 mol/L sodium hydroxide TS and 20 mL of water as the absorbent, and shake well to mix, and absorb; the resulting solution responds to the Qualitative Analysis 2) for fluoride.

(4) Add 2 mL of potassium hydroxide-ethanol TS to

0.05 g of Dexamethasone Propionate, and heat on a steam bath for 5 minutes. After cooling, add 2 mL of diluted sulfuric acid (2 in 7), and boil still for 1 minute; the odor of ethyl propionate is perceptible.

(5) Determine the absorption spectrum as directed under Ultraviolet-visible spectroscopy using a solution of Dexamethasone Propionate in methanol (3 in 200000); it exhibits a maximum between 236 nm and 240 nm.

Optical rotation $[\alpha]_D^{20}$: Between + 31° and + 37° (after drying, 0.1 g, dioxane, 10 mL, 100 mm).

Purity (1) ***Clarity and color of solution***—Dissolve 0.1 g of Dexamethasone Propionate in 10 mL of chloroform; the resulting solution is colorless and clear.

(2) ***Heavy metal***—Proceed with 0.7 g of Dexamethasone Propionate according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 28 ppm).

(3) ***Arsenic***—Proceed with 0.5 g of Dexamethasone Propionate according to Method 3 and perform the test (NMT 4 ppm).

(4) ***Other steroids***—Weigh accurately 50 mg of Dexamethasone Propionate, dissolve in 25 mL of methanol, and use this solution as the test solution. Pipet 1 mL of this solution, add methanol to make exactly 50 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. The sum of peak area other than the peak area of Dexamethasone Propionate in the test solution is not larger than the peak area of Dexamethasone Propionate in the standard solution.

Operating conditions

Detector: An ultraviolet -visible spectrometer (wavelength: 254 nm).

Column: A stainless steel column, about 4 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 μm in particle diameter).

Mobile phase: A mixture of methanol and 0.1% potassium dihydrogen phosphate (13 : 7).

Flow rate: Adjust the flow rate so that the retention time of Dexamethasone Propionate is about 5.5 minutes.

Time span of measurement: About 2 times the retention time of Dexamethasone Propionate after the solvent peak.

Selection of column: Dissolve 0.05 g of Dexamethasone Propionate and 0.01 g of butyl *p*-hydroxybenzoate in 25 mL of methanol, take exactly 2 mL of this solution, and add methanol to make exactly 50 mL. Proceed with 20 μL of this solution under the above operating conditions; butyl *p*-hydroxybenzoate and Dexamethasone Propionate are eluted in this order with the resolution being NLT 3.5.

Detection sensitivity: Adjust the sensitivity so that the peak height of Dexamethasone Propionate obtained from 20 μL of the standard solution is between 20 and 60 mm.

Loss on drying NMT 0.5% (0.5 g, 105 °C, 3 hours).

Residue on ignition NMT 0.2% (0.5 g).

Assay (1) ***Dexamethasone Propionate***—Weigh accurately 25 mg each of Dexamethasone Propionate and previously dried dexamethasone propionate RS, dissolve in 30 mL of methanol, add exactly 10 mL of the internal standard solution, and add methanol to make exactly 50 mL. Use these solutions as the test solution and the standard solution, respectively. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the ratio of peak area of Dexamethasone Propionate, Q_T and Q_S, to that of the internal standard in each solution.

$$\text{Amount (mg) of dexamethasone propionate } (C_{22}H_{29}FO_5 \cdot C_3H_6O_2) = \text{Amount (mg) of dexamethasone propionate RS} \times (Q_T / Q_S)$$

Internal standard solution—A solution of fluorene in methanol (3 in 5000).

Operating conditions

Detector: An ultraviolet-visible spectrometer (wavelength: 254 nm).

Column: A stainless-steel column, about 4 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 μm in particle diameter).

Mobile phase: A mixture of methanol and 0.1% potassium dihydrogen phosphate (13 : 7).

Flow rate: Adjust the flow rate so that the peak retention time of Dexamethasone Propionate is about 5.5 minutes.

System suitability

System performance: Dissolve 50 mg of Dexamethasone Propionate and 10 mg of butyl *p*-hydroxybenzoate in methanol to make 100 mL. Proceed with 10 μL of this solution under the above operating conditions; butyl *p*-hydroxybenzoate and Dexamethasone Propionate are eluted in this order with the resolution being NLT 3.5.

(2) ***Fluorine***—Weigh accurately about 10 mg of Dexamethasone Propionate, previously dried, proceed according to the Oxygen Flask Combustion by using a mixture of 0.5 mL of 0.01 mol/L sodium hydroxide TS and 20 mL of water as the absorbent to prepare the test solution. Separately, prepare the blank test solution by proceeding in the same manner without using Dexamethasone Propionate. Put the test solution and the blank test solution in a 100-mL volumetric flask, respectively, wash the combustion flask with water, and add washings and water to make 100 mL. Use each resulting solution as

the test solution and the calibration solution, respectively. Perform the test with 8 mL each of the test solution and the calibration solution and 5.0 mL of standard fluorine solution as directed under the 3) fluorine quantification method under the Oxygen Flask Combustion.

Packaging and storage Preserve in tight containers.

Dexamethasone Propionate Cream
덱사메타손프로피오네이트 크림

Dexamethasone Propionate Cream contains NLT 90.0% and NMT 110.0% of equivalent to the labeled amount of dexamethasone propionate ($C_{22}H_{29}FO_5 \cdot C_3H_6O_2$: 466.55).

Method of preparation Prepare as directed under Creams, with Dexamethasone Propionate.

Identification (1) Weigh an amount equivalent to 1 mg of Dexamethasone Propionate according to the labeled amount, add 10 mL of methanol and 25 mL of hexane, shake to mix, and take the methanol layer. To 2 mL of this solution, add 5 mL of isoniazid TS, and heat; the solution exhibits a yellow color.

(2) The retention time of major peak of the test solution and the standard solution for Assay is the same.

Assay Weigh accurately equivalent to about 2 mg of dexamethasone propionate ($C_{22}H_{29}FO_5 \cdot C_3H_6O_2$) according to the labeled amount, add 15 mL of a mixture of methanol and water (3 : 2) and 25 mL of hexane, shake to mix for 10 minutes, and take the separated lower layer. Add 15 mL of the mixture of methanol and water (3 : 2) again to the upper layer, mix by shaking, and take the separated lower layer. Repeat the process twice, add 2 mL of the internal standard solution, add the mixture of methanol and water (3 : 2) to make 50 mL, and use this solution as the test solution. Separately, weigh accurately about 50 mg of dexamethasone propionate RS, add methanol to make 50 mL, and use this solution as the standard solution. Perform the test with the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the ratio, Q_T and Q_S, of the peak area of Dexamethasone Propionate to that of the internal standard for the test solution and the standard solution.

$$\text{Amount (mg) of dexamethasone propionate } (C_{22}H_{29}FO_5 \cdot C_3H_6O_2) = \text{Amount (mg) of dexamethasone propionate RS} \times (Q_T / Q_S) \times (1 / 25)$$

Internal standard solution—A solution of diphenyl in methanol (1 in 2500).

Operating conditions

Detector: An ultraviolet-visible spectrometer (wavelength: 254 nm).

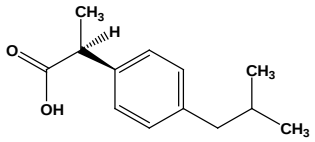
Column: A stainless steel column, about 4.6 mm in internal diameter and about 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: To 350 mL of 0.01 mol/L potassium dihydrogen phosphate solution, add methanol to make 1.0 L.

Flow rate: Adjust the flow rate so that the retention time of Dexamethasone Propionate is about 5.5 minutes.

Packaging and storage Preserve in tight containers.

Dexibuprofen
덱시부프로펜



(S)-Ibuprofen $C_{13}H_{18}O_2$: 206.28
(+)-α-Methyl-4-(2-methylpropyl)benzeneacetic acid,
[*51146-56-6*]

Dexibuprofen contains NLT 98.5% and NMT 101.0% of dexibuprofen ($C_{13}H_{18}O_2$), calculated on the dried basis.

Description Dexibuprofen occurs as a white crystalline powder.
It is freely soluble in acetone, ether, methanol, or dichloromethane and practically insoluble in water.

Identification (1) Determine the infrared spectra of Dexibuprofen and dexibuprofen RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) The retention time of major peak of the test solution and the standard solution for Section (i) and (ii) of Purity (3) is same.

Melting point Between 50 and 54 ℃.

Optical rotation $[\alpha]_D^{20}$: Between +55.0° and +60.0° (2.5 g, methanol, 50 mL, 100 mm).

Purity (1) ***Clarity and color of solution***—Dissolve 1.5 g of Dexibuprofen in 15 mL of water. The solution is clear and colorless.

(2) ***Heavy metals***—Proceed with about 1.5 g of Dexibuprofen, add methanol, and dissolve to make 15.0 mL. Pipet 12.0 mL of this solution and perform the test according to the Method 2 under the Heavy Metals. Prepare the control solution with 1.2 mL of lead standard

solution (NMT 10 ppm).

(3) ***Related substances*—**(i) 2-(4-butylphenyl)-propionic acid and other related substances: Weigh accurately about 50 mg, dissolve in 5 mL of methanol, add the mobile phase to make 25 mL, and use this solution as the test solution. Pipet 2.0 mL of the test solution, add the mobile phase to make 200 mL, and use this solution as the standard solution (1). Separately, weigh accurately about 20 mg of dexibuprofen RS, add 2 mL of acetonitrile and dissolve, add 1.0 mL of 0.006% 2-(4-butylphenyl)-propionic acid-acetonitrile and the mobile phase to make 10 mL, and use this solution as the standard solution (2). Perform the test with 20 μL each of the test solution, the standard solution (1) and the standard solution (2) as directed under the Liquid Chromatography according to the following conditions, determine the peak areas from the these solutions, and calculate the content of each related substance according to the following equation; 2-(4-butylphenyl)-propionic acid is NMT 0.3%, other each related substance is NMT 0.3%, and the sum of other related substances is NMT 0.7%. However, ignore the peaks attributed to the solvent on chromatogram from the test solution and the peaks less than 0.1-fold of peak area from the standard solution (1).

$$\text{Content (\%) of 2-(4-butylphenyl)-propionic acid} = \frac{\text{Peak area of 2-(4-butylphenyl)-propionic acid in test solution}}{\text{Peak area of 2-(4-butylphenyl)-propionic acid in standard solution (2)}} \times \frac{\text{Concentration of 2-(4-butylphenyl)-propionic acid in standard solution (2)}}{\text{Concentration of test solution}} \times 100$$

$$\text{Content (\%) of each related substance} = \frac{\text{Peak area of each related substance in test solution}}{\text{Peak area of dexibuprofen in standard solution (1)}} \times \frac{\text{Concentration of standard solution (1)}}{\text{Concentration of test solution}} \times 100$$

Operating conditions

Detector: An ultraviolet-visible spectrometer (wavelength: 214 nm).

Column: A stainless steel column, about 4.6 mm in internal diameter and about 20 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: Mix 0.5 mL of phosphoric acid, 340 mL of acetonitrile, and 600 mL of water, and add water to make 1000 mL.

Flow rate: 2 mL/minute

(ii) (R)-ibuprofen and (S)-ibuprofen: Weigh accurately about 50 mg of Dexibuprofen, add methanol, dissolve to make 100 mL, filter, and use the filtrate as the test solution. Weigh accurately about 48.5 mg of dexibuprofen RS, add 1 mL of a solution of 0.15% (R,S)-ibuprofen RS in methanol and methanol, dissolve to make 100 mL, filter, and use the filtrate as the standard solution. Perform the test with 20 μL each of the test and standard solutions as directed under the Liquid Chromatography, determine each peak area, and calculate the content of each related substance; (R)-ibuprofen is NMT 1.5% and (S)-ibuprofen is NLT 98.5% for the total peak area from the test solution.

Operating conditions

Detector: An ultraviolet-visible spectrometer (wavelength: 225 nm).

Column: A stainless steel column, about 4 mm in internal diameter and about 10 cm in length, packed with silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: Mix 2.9 g of potassium dihydrogen phosphate, 1.6 g of *N*,*N*-dimethyloctylamine, 4 mL of 2-propanol, and 750 mL of water by shaking, and add water to make 1000 mL.

Flow rate: 0.9 mL/minute

$$\text{Content (\%) of (}R\text{)-ibuprofen} = \frac{\text{Peak area of } (R)\text{-ibuprofen in test solution}}{\text{Peak area of } (R)\text{-ibuprofen in test solution} + \text{Peak area of } (S)\text{-ibuprofen}} \times 100$$

$$\text{Content (\%) of (}S\text{)-ibuprofen} = \frac{\text{Peak area of } (S)\text{-ibuprofen in test solution}}{\text{Peak area of } (R)\text{-ibuprofen in test solution} + \text{Peak area of } (S)\text{-ibuprofen}} \times 100$$

(iii) α-Methyl benzenemethanamine and *N*-(1-Phenylethyl)-ibuprofenamide: Weigh accurately about 5 g of Dexibuprofen, dissolve in the diluent to make 2 mL, and use this solution as the test solution. Separately, weigh accurately about 0.15 g each of α-methyl benzenemethanamine RS and *N*-(1-phenylethyl)-Ibuprofenamide RS, add methanol, dissolve to make 250 mL, and use these solutions as the standard solution (1) and the standard solution (2), respectively. Pipet 2.0 mL each of the standard solutions (1) and (2), add the diluent to make 250 mL, and use this solution as the standard solution (3). Pipet 5.0 mL each of the standard solutions (1) and (2), add the diluent make 100 mL, and use this solution as the standard solution (4). Perform the test with 20 μL each of the test solution and the standard solutions (3) and (4) as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas of these solutions. Calculate with the standard solutions (3) and (4) based on the calibration curve; the amount of α-benzenemethanamine and *N*-(1-phenylethyl)-ibuprofenamide in the test solution is NMT 100 ppm.

Diluent—Weigh 2.5 g of sodium 1-hexanesulfonate, dissolve in 100 mL of water, and add methanol to make 500 mL.

Operating conditions

Detector: An ultraviolet-visible spectrometer (wavelength: 214 nm).

Column: A stainless steel column, about 4.0 mm in internal diameter and about 25 cm in length, packed with octylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 35 °C.

Mobile phase: Adjust the concentration of Solvent A in Solvent B from 10% to 64% for the initial 12 minutes, retain it for 33 minutes, and adjust the concentration of Solvent A in Solvent B from 64% to 10% for the next 15 minutes.

Solvent A: Methanol

Solvent B: Weigh 0.941 g of sodium 1-hexanesulfonate, 7.8 g of sodium dihydrogen phosphate hydrate and 0.3 g of potassium hydrogen sulfate, and add water to make 1000 mL.

Flow rate: 1.5 mL/minute

Loss on drying NMT 0.6% (1 g, in vacuum, phosphorus pentoxide, 4 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.45 g of Dexibuprofen, dissolve in 50 mL of methanol and 0.4 mL of 1% phenolphthalein ethanol, and titrate with 0.1 mol/L sodium hydroxide VS until the color of solution becomes red. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS
= 20.628 mg of $C_{13}H_{18}O_2$

Packaging and storage Preserve in well-closed containers.

Dextran 40
덱스트란 40

[*9004-54-0*]

Dextran 40 is a product of partial decomposition of polysaccharide, which is produced by sucrose fermentation by *Leuconostoc mesenteroides* van Tieghem (*Lactobacillaceae*), and has the average molecular weight of about 40000.

Dextran 40, when dried, contains NLT 98.0% and NMT 102.0% of dextran 70.

Description Dextran 40 occurs as a white, amorphous, odorless and tasteless powder.
It is practically insoluble in ethanol(95) or ether.
It dissolves gradually in water.
It is hygroscopic.

Identification Take 1 mL of the aqueous solution (1 in 3000) of Dextran 40 and add 2 mL of anthrone TS; the solution exhibits a bluish green color, which slowly changes to dark bluish green. Add 1 mL of diluted sulfuric acid (1 in 2) or 1 mL of acetic acid(100); the solution does not change in color.

Optical rotation $[\alpha]_D^{20}$: Between +195° and +203° (0.2 g, water, 10 mL, 100 mm), dissolve by warming on a steam bath, if necessary.

pH Dissolve 1.0 of Dextran 40 in 10 mL of water; the pH of this solution is between 5.0 and 7.0.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Dextran 40 in 10 mL of water by warming: the solution is clear and colorless.

(2) ***Chloride***—Perform the test with 2.0 g of Dextran 40. Prepare the control solution with 1.0 mL of 0.01 mol/L hydrochloric acid VS (NMT 0.018%).

(3) ***Heavy metal***—Proceed with 2.0 of Dextran 40 according to Method 1 and perform the test. Prepare the control solution with 1.0 mL of lead standard solution (NMT 5 ppm).

(4) ***Arsenic***—Prepare the test solution with 1.5 g of Dextran 40 according to Method 1 and perform the test (NMT 1.3 ppm).

(5) ***Nitrogen***—Weigh accurately 2 g of Dextran 40, previously dried, and perform the test according to the Nitrogen Determination; the amount of nitrogen (N : 14.007) is NMT 0.010%. The amount of sulfuric acid used for decomposition should be 10 mL and the amount of added sodium hydroxide solution (2 in 5) should be 45 mL.

(6) ***Reducing substances***—Weigh exactly 3.00 g of Dextran 40, previously dried, dissolve in water to make exactly 50 mL, and use this solution as the test solution. Separately, weigh accurately 0.450 g of glucose, dissolve in water to make exactly 500 mL, and use this solution as the control solution. Pipet 5 mL each of the test solution and control solution, and add water to make exactly 50 mL. Pipet 5 mL each of these solutions, add exactly 5 mL of alkaline copper TS, and heat for 15 minutes on a steam bath. After cooling, add 1 mL of potassium iodine solution (1 in 40) and 1.5 mL of dilute sulfuric acid and titrate with 0.005 mol/L sodium thiosulfate VS (indicator: 2 mL of starch TS): The titrant consumed for the test solution is NLT that for the control solution.

Loss on drying NMT 5.0% (1, 105 °C, 6 hours).

Residue on ignition NMT 0.1% (1 g).

Bacterial endotoxins Less than 2.5 EU per g of dextran 40 when Dextran 40 is used in a sterile preparation.

Antigenicity Dissolve 10.0 g of Dextran 40 in isotonic sodium chloride injection to make 100 mL, sterilize it, and use this solution as the test solution. Inject 1.0 mL of

the test solution at Days 1, 3 and 5 into the peritoneal cavity of each of 4 well-nourished, healthy guinea pigs weighing between 250 g and 300 g. Separately, inject 0.10 mL of horse serum into the peritoneal cavity of each of 4 guinea pigs in another group as a control. Inject 0.2 mL of the test solution intravenously to each of 2 guinea pigs in the test solution group at Day 15 and each of the remaining 2 guinea pigs in the test solution group at Day 22, and inject 0.2 mL of horse serum intravenously in the same manner to each guinea pig in the horse serum group. Observe the signs of respiratory distress, collapse or death of the animals for 30 minutes after each intravenous injection and 24 hours later; animals in the test solution group exhibit no signs mentioned above. All of the 4 animals in the horse serum group exhibit symptoms of respiratory distress or collapse and NLT 3 animals die.

Microbiological examination of non-sterile products When Dextran 40 is used in the manufacturing of injections, the total aerobic microbial count is NMT 1000 CFU, and the total combined yeasts/molds count is NMT 100 CFU per g of Dextran 40. Also, *Escherichia coli*, *Salmonella*, *Pseudomonas aeruginosa* and *Staphylococcus aureus* are not detected.

Viscosity (1) ***Dextran 40***—Weigh accurately about 0.2 to 0.5 g of Dextran 40, previously dried, dissolve in water to make exactly 100 mL, and use this solution as the test solution. Perform the test solution with water as directed in Method 1 under the Viscosity at 25 ℃; the intrinsic viscosity is between 0.16 and 0.19.

(2) ***High-molecular fraction***—Weigh accurately about 6 g of Dextran 40, previously dried, dissolve in water to make exactly 100 mL, and transfer to a flask. Slowly add an enough amount of methanol to obtain 7% to 10% of the precipitate (usually 80 to 90 mL) at 25 ± 1 ℃ with stirring for mixing. Next, dissolve the precipitate at 35 ℃ on a steam bath with occasional shaking and allow it to stand for NLT 15 hours at 25 ± 1 ℃. Discard the clear supernatant at the top by decantation and evaporate the precipitate in the lower layer to dryness on a steam bath. Dry the residue and determine the intrinsic viscosity of the dried substance as directed in (1); the value is NMT 0.27.

(3) ***Low-molecular fraction***—Weigh accurately about 6 g of Dextran 40, previously dried, dissolve in water to make exactly 100 mL and transfer to a flask. Slowly add an enough amount of methanol to obtain 90% to 93% of the precipitate (usually 115 to 135 mL) at 25 ± 1 ℃ with stirring for mixing. Centrifuge at 25 ℃ and evaporate the clear supernatant at the top to dryness on a steam bath. Dry the residue and determine the intrinsic viscosity of the dried substance as directed in (1); the value is NLT 0.09.

Assay Weigh accurately about 3 g of Dextran 40, previously dried, dissolve in water to make exactly 50 mL, and use this solution as the test solution. Determine the optical rotation α_D with the test solution as directed under the Optical Rotation at the layer length of 100 mm at 20 ± 1 ℃.

$$\text{Amount (mg) of dextran 40} = \alpha_D \times 253.8$$

Packaging and storage Preserve in tight containers.

Dextran 40 Injection
덱스트란 40 주사액

Dextran 40 Injection is an aqueous solution for injection, which contains NLT 9.5 w/v% and NMT 10.5 w/v% of dextran 40.

Method of preparation

Dextran 40	10 g
Isotonic Sodium Chloride Injection	A sufficient quantity
Total volume	100 mL

Prepare as directed under Injections, with the above.
No preservative is added.

Description Dextran 40 Injection occurs as a clear and colorless liquid, and is slightly viscous.

Identification (1) Add water to 1 mL of Dextran 40 Injection to make 200 mL. To 1 mL of this solution, add 2 mL of anthrone TS; the solution exhibits a bluish green color which gradually changes to dark bluish green. To this solution, add 1 mL of diluted sulfuric acid (1 in 2) or 1 mL of acetic acid(100); the solution does not change in color.

(2) Dextran 40 Injection responds to the Qualitative Analysis for sodium salt and chloride.

pH Between 4.5 and 7.0.

Purity (1) ***5-Hydroxymethylfururals***—Take Dextran 40 Injection in the amount equivalent to 1.0 g of Dextran 40 according to the labeled amount, and add water to make exactly 500 mL. Perform the test with this solution as directed under the Ultraviolet-visible Spectroscopy; the absorbance at a wavelength of 284 nm is NMT 0.25.

(2) ***Heavy metal***—Proceed with 2.0 g of Dextran 40 Injection according to Method 2 and perform the test. Prepare the control solution with 1.0 mL of lead standard solution (NMT 5 ppm).

Sterility Meets the requirements.

Bacterial endotoxins Less than 0.50 EU per mL of Dextran 40 Injection.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Extractable volume of injections Meets the requirements.

Viscosity Take 2 mL to 5 mL of Dextran 40 Injection, add isotonic sodium chloride injection to make exactly 100 mL, and use this solution as the test solution. Perform the test with the test solution and isotonic sodium chloride injection according to Method 1 under the Viscosity at 25 ℃; the intrinsic viscosity is between 0.16 and 0.19. Calculate the concentration (g/100 mL) of the test solution as directed under the Assay.

Assay Take exactly 30 mL of Dextran 40 Injection, add water to make exactly 50 mL, and use this solution as the test solution. Determine the optical rotation α_D with the test solution as directed under the Optical Rotation at the layer length of 100 mm at 20 ± 1 ℃.

Amount (mg) of dextran 40 in 100 mL of Dextran 40 Injection
$= \alpha_D \times 846.0$

Packaging and storage Preserve in hermetic containers. Plastic containers for aqueous injections may be used. Avoid storage in a place under a highly variable temperature.

Dextran 70
덱스트란 70

[*9004-54-0*]

Dextran 70 is a product of partial decomposition of polysaccharide, which is produced by sucrose fermentation by *Leuconostoc mesenteroides* van Tieghem (*Lactobacillaceae*), and has the average molecular weight of about 70000.

Dextran 70, when dried, contains NLT 98.0% and NMT 102.0% of dextran 70.

Description Dextran 70 occurs as a white, amorphous, odorless and tasteless powder.
It is practically insoluble in ethanol(95) or ether.
It dissolves gradually in water.
It is hygroscopic.

Identification Perform the test according to the Identification of Dextran 40.

Optical rotation $[\alpha]_D^{20}$: Between +195° and +203° (0.2 g, water, 10 mL, 100 mm), dissolve by warming on a steam bath, if necessary.

pH Dissolve 3.0 of Dextran 70 in 50 mL of water; the pH of this solution is between 5.0 and 7.0.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Dextran 70 in 10 mL of water with warming; the solution is clear and colorless.

(2) ***Chloride***—Perform the test with 2.0 g of Dextran 70. Prepare the control solution with 1.0 mL of 0.01 mol/L hydrochloric acid (NMT 0.018%)

(3) ***Heavy metal***—Proceed with 2.0 of Dextran 70 according to Method 1 and perform the test. Prepare the control solution with 1.0 mL of lead standard solution (NMT 5 ppm).

(4) ***Arsenic***—Prepare the test solution with 1.5 g of Dextran 70 according to Method 1 and perform the test (NMT 1.3 ppm).

(5) ***Nitrogen***—Weigh accurately 2 g of Dextran 70, previously dried, and perform the test according to the Nitrogen Determination; the amount of nitrogen (N : 14.007) is NMT 0.010%. The amount of sulfuric acid used for decomposition should be 10 mL and the amount of added sodium hydroxide solution (2 in 5) should be 45 mL.

(6) ***Reducing substances***—Weigh exactly 3.00 g of Dextran 70, previously dried, dissolve in water to make exactly 50 mL, and use this solution as the test solution. Separately, weigh accurately 0.300 g of glucose, previously dried, dissolve in water to make exactly 500 mL, and use this solution as the control solution. Pipet 5 mL each of the test solution and control solution, and add water to make exactly 50 mL. Pipet 5 mL each of these solutions, add exactly 5 mL of alkaline copper TS, and heat for 15 minutes on a steam bath. After cooling, add 1 mL of potassium iodine solution (1 in 40) and 1.5 mL of dilute sulfuric acid and titrate with 0.005 mol/L sodium thiosulfate VS (indicator: 2 mL of starch TS): The titrant consumed for the test solution is NLT that for the control solution.

Loss on drying NMT 5.0% (1, 105 ℃, 6 hours).

Residue on ignition NMT 0.1% (1 g).

Bacterial endotoxins Less than 0.5 EU per mL of a solution prepared by diluting Dextran 70 with isotonic Sodium Chloride Injection to 6 w/v% when Dextran 70 is used in a sterile preparation.

Antigenicity Dissolve 6.0 g of Dextran 70 in isotonic sodium chloride injection to make 100 mL, sterilize, and use this solution as the test solution. Perform the test with the test solution according to the Antigenicity of Dextran 40.

Microbiological examination of non-sterile products When Dextran 70 is used in the manufacturing of injections, the total aerobic microbial count is NMT 1000 CFU, and the total combined yeasts/molds count is NMT

100 CFU per g of Dextran 70. Also, *Escherichia coli*, *Salmonella*, *Pseudomonas aeruginosa* and *Staphylococcus aureus* are not detected.

Viscosity (1) ***Dextran 70***—Weigh accurately about 0.2 to 0.5 g of Dextran 70, previously dried, dissolve in water to make exactly 100 mL, and use this solution as the test solution. Perform the test with the test solution and water as directed in Method 1 under the Viscosity at 25 ℃; the intrinsic viscosity is between 0.21 and 0.26.

(2) ***High-molecular fraction***—Weigh accurately about 6 g of Dextran 70, previously dried, dissolve in water to make exactly 100 mL, and transfer to a flask. Slowly add an enough amount of methanol to obtain 7% to 10% of the precipitate (usually 75 to 85 mL) at 25 ± 1 ℃ with stirring for mixing. Next, dissolve the precipitate at 35 ℃ on a steam bath with occasional shaking and allow it to stand for NLT 15 hours at 25 ± 1 ℃. Discard the clear supernatant at the top by decantation and evaporate the precipitate in the lower layer to dryness on a steam bath. Dry the residue and determine the intrinsic viscosity of the dried substance as directed in (1); the value is NMT 0.35.

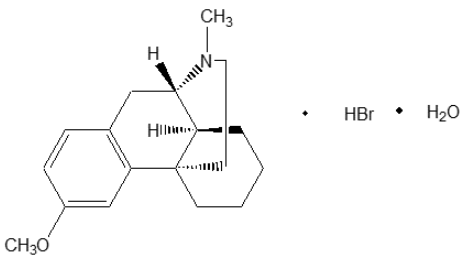
(3) ***Low-molecular fraction***—Weigh accurately about 6 g of Dextran 70, previously dried, dissolve in water to make exactly 100 mL and transfer to a flask. Slowly add an enough amount of methanol to obtain 90% to 93% of the precipitate (usually 110 to 130 mL) at 25 ± 1 ℃ with stirring for mixing. Centrifuge at 25 ℃ and evaporate the clear supernatant at the top to dryness on a steam bath. Dry the residue and determine the intrinsic viscosity of the dried substance as directed in (1); the value is NLT 0.10.

Assay Weigh accurately about 3 g of Dextran 70, previously dried, dissolve in water to make exactly 50 mL, and use this solution as the test solution. Determine the optical rotation α_D with the test solution as directed under the Optical Rotation at the layer length of 100 mm at 25 ± 1 ℃.

$$\text{Amount (mg) of dextran 70} = \alpha_D \times 253.8$$

Packaging and storage Preserve in tight containers.

Dextromethorphan Hydrobromide Hydrate
덱스트로메토르판브롬화수소산염수화물



Dextromethorphan Hydrobromide
$C_{18}H_{25}NO \cdot HBr \cdot H2O$: 370.32
[*6700-34-1*]

Dextromethorphan Hydrobromide Hydrate contains NLT 98.0% and NMT 101.0% of dextromethorphan hydrobromide ($C_{18}H_{25}NO \cdot HBr$: 352.31), calculated on the anhydrous basis.

Description Dextromethorphan Hydrobromide Hydrate occurs as white crystals or a crystalline powder.
It is very soluble in methanol, freely soluble in ethanol(95) or acetic acid(100), sparingly soluble in water, and practically insoluble in ether.

Melting point—About 126 ℃ (Insert the capillary tube into the bath at 116 ℃ and continue heating so that the temperature rise by approximately 3°C per minute).

Identification (1) Determine the absorption spectra of solutions of Dextromethorphan Hydrobromide Hydrate and dextromethorphan hydrobromide hydrate RS (1 in 10000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelength.

(2) Determine the infrared spectra of Dextromethorphan Hydrobromide Hydrate and dextromethorphan hydrobromide hydrate RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both exhibit similar intensities of absorption at the same wavenumbers.

(3) Take 50 mL of a solution of Dextromethorphan Hydrobromide Hydrate (1 in 100), add 2 drops of phenolphthalein TS and then sodium hydroxide TS until a red color appears. After adding 50 mL of chloroform and shake to mix, take 40 mL of the water layer and add 5 mL of dilute nitric acid; the solution responds to the Qualitative Analysis for bromide.

Optical rotation $[\alpha]_D^{20}$: Between +26° and +30° (0.34 g, calculated on the anhydrous basis, water, 20 mL, 100 mm).

pH Dissolve 1.0 g of Dextromethorphan Hydrobromide Hydrate in 100 mL of water; the pH of this solution is between 5.2 and 6.5.

Purity (1) ***Clarity and color of solution***—Dissolve 0.20 g of Dextromethorphan Hydrobromide Hydrate in 20 mL of water; the solution is clear and colorless.

(2) ***Dimethylaniline***—To 0.50 g of Dextromethorphan Hydrobromide Hydrate, add 20 mL of water, and dissolve by heating on a steam bath. After cooling, add 2 mL of dilute acetic acid, 1 mL of sodium nitrite TS and water to make 25 mL; the color of the solution is not more intense than that of the following control solution.

Control solution—Dissolve 0.10 g of dimethylaniline in 400 mL of water by warming in the water bath, cool down, and add water to make 500 mL. Pipet 5 mL of

this solution and add water to make 200 mL. To 1.0 mL of this solution, add 2 mL of dilute acetic acid, 1 mL of sodium nitrite TS, and water to make 25 mL.

(3) ***Heavy metal***—Proceed with 1.0 g of Dextromethorphan Hydrobromide Hydrate and perform the test according to the Method 4. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(4) ***Phenolic compounds***—Dissolve 5 mg of Dextromethorphan Hydrobromide Hydrate in 1 drop of dilute hydrochloric acid and 1 mL of water, add 2 drops of iron(III) chloride TS and 2 drops of potassium hexacyanoferrate(III) TS, shake to mix, and allow to stand for 15 minutes; no bluish green color is observed.

(5) ***Related substances***—Dissolve 0.25 g of Dextromethorphan Hydrobromide Hydrate in exactly 10 mL of methanol and use this solution as the test solution. Pipet 1 mL of this solution, add methanol to make exactly 200 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on a plate made of silica gel for thin-layer chromatography. Develop the plate with a mixture of toluene, methanol, dichloromethane and 13.5 mol/L ammonia TS (55 : 20 : 13 : 10 : 2) to a distance of about 15 cm, and air-dry the plate. Spray bismuth potassium iodide TS evenly and then spray hydrogen peroxide TS evenly on the plate; spots other than the principal spot from the test solution are not more intense than the spots from the standard solution.

Water Between 4.0% and 5.5% (0.2 g, volumetric titration, reverse titration).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.5 g of Dextromethorphan Hydrobromide Hydrate, dissolve in 10 mL of acetic acid(100), add 40 mL of acetic anhydride, and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 1 mol/L perchloric acid VS
= 35.231 mg of $C_{18}H_{25}NO \cdot HBr$

Packaging and storage Preserve in well-closed containers.

Dextrose, Sodium Chloride and Sodium Lactate Injection
포도당·염화나트륨·락트산나트륨 주사액

Dextrose, Sodium Chloride and Sodium Lactate Injection contains NLT 90.0% and NMT 110.0% of the labeled amounts of glucose ($C_6H_{12}O_6$: 180.16), sodium chloride (NaCl : 58.44) and sodium lactate ($C_3H_5NaO_3$: 112.06).

Method of preparation Prepare as directed under Injections, with Glucose, Sodium Chloride and Sodium Lactate.

Identification (1) Evaporate Dextrose, Sodium Chloride and Sodium Lactate Injection to concentration to about 1/2 the volume on a steam bath; 5 mL of the solution responds to the Qualitative Analysis for sodium salt, chloride and lactate.

(2) Dissolve an amount of Dextrose, Sodium Chloride and Sodium Lactate Injection equivalent to about 0.1 g of glucose and add 10 mL of hot Fehling's TS; a red precipitate is formed.

pH Between 4.0 and 6.0.

Sterility Meets the requirements.

Pyrogen Meets the requirements.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Extractable volume of injections Meets the requirements.

Assay (1) ***Glucose*—**Pipet an amount of Dextrose, Sodium Chloride and Sodium Lactate Injection equivalent to about 2.5 g of glucose ($C_6H_{12}O_6$) and perform the test as directed under the Korean Pharmacopoeia (KP) for Glucose Injections.

(2) ***Sodium chloride*—**Pipet an amount of Dextrose, Sodium Chloride and Sodium Lactate Injection equivalent to about 0.1 g of sodium chloride (NaCl), add 30 ml of water and 25 mL of 0.1 mol/L silver nitrate, then add 3 mL of nitric acid and 5 mL of nitrobenzene and titrate with 0.1 mol/L ammonium thiocyanate VS. (Indicator: ammonium iron(III) sulfate TS). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L silver nitrate
= 5.844 mg of NaCl

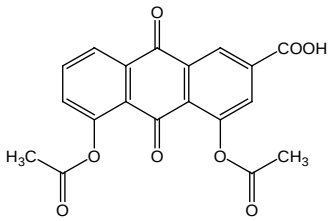
(3) ***Sodium lactate*—**Pipet an amount of Dextrose, Sodium Chloride and Sodium Lactate Injection equivalent to about 0.2 g of sodium lactate ($C_3H_5NaO_3$), evaporate to dryness on a steam bath, slowly ignite and carbonize the residue. Wet the residue with 25 mL of water, add 25.0 mL of 0.05 mol/L sulfuric acid, and heat for 30 minutes on a steam bath, stirring thoroughly with a glass rod. Wash the resulting solution with hot water until the filtrate is neutral, filter, collect the filtrate and washings, then add excess sulfuric acid and titrate with 0.1 mol/L sodium hydroxide VS (indicator: methyl orange TS).

Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.05 mol/L sulfuric acid
= 11.206 mg of $C_3H_5NaO_3$

Packaging and storage Preserve in hermetic containers.

Diacerein
디아세레인



$C_{19}H_{12}O_8$: 368.29

4,5-Bis(acetyloxy)-9,10-dihydro-9,10-dioxo-2-anthracenecarboxylic acid; 9,10-Dihydro-4,5-dihydroxy-9,10-dioxo-2-anthroic acid diacetate, [*13739-02-1*]

Diacerein contains NMT 96.0% and NLT 101.0% of diacerein ($C_{19}H_{12}O_8$), calculated on the anhydrous basis.

Description Diacerein occurs as a yellow crystalline powder and is almost odorless.
It is freely soluble in acetic acid, ethanol or acetone.
It is soluble in a dilute alkaline solution.

Melting point—Between 242 and 248 ℃ (with decomposition).

Identification (1) Dissolve Diacerein in 0.5 mol/L sodium hydroxide; the resulting solution exhibits a dark red color.

(2) Weigh 10 mg of Diacerein, dissolve in 100 mL of *N*,*N*-dimethylacetamide, and use this solution as the test solution. Separately, weigh 10 mg of diacerein RS, dissolve in 100 mL of *N*,*N*-dimethylacetamide, and use this solution as the standard solution. Perform the test with these solutions as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate of silica gel for thin-layer chromatography (with a fluorescent indicator). Develop the plate with a mixture of n-Propanol, ethyl acetate and water (30 : 15 : 1) to a distance of about 17cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the colors and R_f values of the spots obtained from the test solution and the standard solution are the same.

(3) Determine the absorption spectrum of Diacerein in ethanol (1 in 100,000) as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum at about 217 nm, 255 nm and 340 nm.

(4) Determine the absorption spectra of Diacerein and diacerein RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Purity ***Free rhein***—Weigh accurately about 0.2g of Diacerein, dissolve in *N*,*N*--Dimethylacetamide to make exactly 50 mL, and use this solution as the test solution. Separately, weigh accurately 25 mg of the rhein RS, dissolve in *N*,*N*-Dimethylacetamide to make 50 mL. Pipet 1.0 mL of this solution, add the mobile phase to make 50 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography under the Assay, and determine the peak areas (or heights) A_T and A_S of diacerein; the amount of free rhein is NMT 2.0% of the labeled amount of diacerein.

$$\text{Amount (mg) of rhein } (C_{15}H_8O_6) = \text{Amount (mg) of diacerein RS} \times \frac{A_T}{A_S} \times \frac{1}{50}$$

Loss on drying NMT 2.0% (0.3 g, 60 ℃, in vacuum, 3 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 50 mg of Diacerein, dissolve in *N*,*N*-Dimethylacetamide to make 50 mL, and use this solution as the test solution. Separately, weigh accurately 50 mg of diacerein RS, dissolve in *N*,*N*-Dimethylacetamid to make 50 mL, and use this solution as the standard solution. Proceed with 20 μL each of the test solution and the standard solution, and perform the test as directed under the Liquid Chromatography to determine the peak areas (or heights) A_T and A_S, of diacerein in these solutions.

$$\text{Amount (mg) of diacerein } (C_{19}H_{12}O_8) = \text{Amount (mg) of diacerein RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 272 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 to 10 μm in particle diameter).

Mobile phase: A mixture of buffer solution and acetonitrile (55 : 45).

Buffer solution—Mix 19.6 mL of 0.1 mol/L citric acid and 0.4 mL of 0.2 mol/L dibasic sodium phosphate.

Packaging and storage Preserve in well-closed containers.

Diacerein Capsules
디아세레인 캡슐

Diacerein Capsules contain NLT 90.0% and NMT 110.0% the labeled amount of diacerein ($C_{19}H_{12}O_8$: 368.29).

Method of preparation Prepare as directed under Capsules, with Diacerein.

Identification (1) Weigh an amount of the contents of Diacerein Capsules equivalent to 50 mg of diacerein, dissolve in *N*,*N*-dimethylacetamide to make 50 mL, filter, and use the filtrate as the test solution. Separately, weigh 25 mg of diacerein RS, add *N*,*N*-Dimethylacetamide to make 25 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography, develop the plate with a mixture of n-propanol, ethyl acetate and water (30 : 15 : 1) (as the developing solvent) to a distance of about 17cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots obtained from the test solution exhibits R_f values and the colors corresponding to that of the standard solution.

(2) The retention times of the major peaks from the test solution corresponding to those of the standard solution, as obtained in the Assay.

Purity ***Free rhein***—Weigh accurately the contents of NLT 20 capsules of Diacerein Capsules. Weigh accurately an amount equivalent to about 0.2 g of diacerein ($C_{19}H_{12}O_8$), add *N*,*N*-dimethylacetamide, dissolve to make 50 mL, filter, and use the filtrate as the test solution. Separately, weigh accurately about 25 mg of rhein RS, dissolve in *N*,*N*-dimethylacetamide to make 50 mL. Take 1.0 mL of this solution, add the mobile phase to make 50 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the condition under the Assay, and determine the peak areas (or heights) A_T and A_S of each rhein; the amount of free rhein is NMT 2.0% of the labeled amount of diacerein.

$$\text{Amount (mg) of rhein } (C_{15}H_8O_6) = \text{Amount (mg) of rhein RS} \times \frac{A_T}{A_S} \times \frac{1}{50}$$

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the content of NLT 20 capsules of Diacerein Capsules. Weigh accurately an amount equivalent to about 50 mg diacerein ($C_{19}H_{12}O_8$), add *N*,*N*-dimethylacetamide, dissolve to make 50 mL, and filter. Take 2.0 mL of the filtrate, add the mobile phase to make 50 mL, and use this solution as the test solution. Separately, weigh accurately about 50 mg of diacerein RS, proceed in the same manner as in the test solution, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following condition, and determine the peak heights (or areas) A_T and A_S, of diacerein in each solution.

$$\text{Amount (mg) of diacerein } (C_{19}H_{12}O_8) = \text{Amount (mg) of diacerein RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 272 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 to 10 μm in particle diameter).

Mobile phase: A mixture of buffer solution and acetonitrile (55 : 45).

Buffer solution—Mix 19.6 mL of 0.1 mol/L citric acid TS and 0.4 mL of 0.2 mol/L dibasic sodium phosphate.

Packaging and storage Preserve in well-closed containers.

Diastase
디아스타제

Diastase is an enzyme mainly prepared from malt and has an amylolytic activity. Diastase contains NLT 440 starch saccharifying activity units per g. Diastase is typically diluted with suitable diluents.

Description Diastase occurs as a pale yellow to pale brown powder.
It is hygroscopic.

Purity ***Rancidity*—**Diastase has no unpleasant or rancid odor and has no unpleasant or rancid taste.

Loss on drying NMT 4.0% (1 g, 105 ℃, 5 hours).

Assay (1) ***Substrate solution***—Use potato starch solution TS for starch digestion activity.

(2) ***Test solution***—Weigh accurately about 0.1 g of Diastase and dissolve in water to make exactly 100 mL.

(3) ***Procedure***—Proceed as directed in (A) Measurement of starch saccharifying activity of (1)

starch digestibility test under the Digestive Power.

Packaging and storage Preserve in tight containers at below 30℃.

Diastase·Protease
디아스타제·프로테아제

Diastase·protease is a complex enzyme prepared from *Aspergillus oryzae* or *Bacillus subtilis*, and has starch digestive activity and protein digestive activity. Diastase·protease contains NLT 90.0% of digestive activity units of the labeled amount.

Description Diastase·protease occurs as a white to yellowish white powder and has a characteristic odor.

Identification Perform the test as directed under the Assay; it exhibits a positive response.

Loss on drying NMT 7.0% (1 g, 105 ℃, 3 hours).

Residue on ignition NMT 30.0% (1.0 g).

Assay (1) ***Starch saccharifying activity***—(i) Test solution: Dissolve Diastase·protease in 0.1% sodium chloride solution, adjust to contain 0.4 to 0.8 starch saccharifying activity unit/mL, and use this solution as the test solution.

(ii) Substrate solution: Weigh accurately about 1 g of potato starch in advance, dry at 105 °C for 2 hours, and then measure the loss in weight. Weigh accurately the potato starch, equivalent to about 2.0 g of the dried, dissolve in 20 mL of water, transfer to 30 mL of boiling water, and gelatinize it for NLT 5 minutes. After cooling, add 10 mL of pH 5.6 Mcllvaine buffer solution and water to make exactly 100 mL. Prepare before use.

(iii) Procedure: Proceed as directed under (A) Measurement of starch saccharifying activity of (1) Assay for starch digestion activity under the Digestive Power.

(2) ***Protein digestive activity***—(i) Test solution: Dissolve Diastase·protease in 0.1% sodium chloride solution, adjust to contain 15 to 25 protein digestive activity units/mL, and use this solution as the test solution.

(ii) Substrate solution: Use the substrate solution 2 of the Assay for protein digestive activity under the Digestive Power. However, adjust the pH to 7.2.

(iii) Procedure: Proceed as directed under the Assay for protein digestive activity under the Digestive Power. However, use trichloroacetic acid TS A as the precipitation reagent.

Packaging and storage Preserve in light-resistant, tight containers.

Diastase·Protease 100
디아스타제·프로테아제100

Diastase·protease 100 is a digestive enzyme obtained from culture of *Bacillus subtilis* and mixed a diluent. It contains NLT 100,000 unit of α-amylase, NLT 12000 unit of β-amylase, and NLT 100,000 unit of protease per g.

Description Diastase·protease 100 occurs as a white to yellowish white powder.

Identification Diastase·protease 100 shows positive when tested as directed under the Assay of α-amylase, β-amylase, and protease.

Loss on drying NMT 7.0% (2 g, 105 °C, constant mass).

Residue on ignition NMT 30.0% (2 g).

Assay (1) ***α-amylase***—Weigh accurately about 0.5 g of Diastase·protease 100, add 0.1% sodium chloride, dilute so that the concentration becomes NLT 40000 and NMT 80000 times, and use this solution as the test solution. Add 3 mL of Mcilvaine buffer (pH 5.6) and 1 mL of 0.1% calcium chloride of to 5 mL of 1% soluble starch solution, allow it to stand at 37 ℃ for 5 minutes, add 1 mL of the test solution, and mix well by shaking. Allow the solution to stand at 37 ℃ for 30 minutes, take 0.2 mL of the solution, and add to 10 mL of iodine solution. Use this solution as the control and perform the test as directed under the Ultraviolet-visible Spectroscopy. The absorbance at wavelength 660 nm is A_1 and when operated with water instead of the test solution, the absorbance is A_{ST}. Heat the solution at 100 ℃ for 30 minutes and when the test solution that lost activation is operated according to the above, the absorbance is A_0. Calculate as mg of starch digested according to the following formula.

$$\text{mg of digested starch} = \frac{A_0 - A_1}{A_{ST}} \times 50 \times \text{dilution factor}$$

Definition of potency: Set the unit as 1 when 10 mg of starch is digested according to the above conditions for 30 minutes.

(2) ***β-amylase***—Weigh accurately about 1.0 g of Diastase·protease 100, add 0.1% sodium chloride, dilute so that the concentration becomes 30000 times, and use this solution as the test solution. Transfer 10 mL of 2% soluble starch solution to a 100-mL Erlenmeyer flask, previously warmed at 40 ℃ on a thermostat, add 1.0 mL of the test solution, allow to stand at 40 ℃ for 30 minutes, and add 2 mL of Fehling's alkaline tartaric acid TS to stop the enzyme action. Add 2 mL of Fehling's copper TS and boil on fire for 2 minutes. After cooling with running water, add 2 mL of 30% potassium iodide

and 2 mL of 25% sulfuric acid, and titrate the liberated iodine with 0.05 mol/L sodium thiosulfate. Separately, add water instead of the test solution, operate according to the above, perform a blank test and make any necessary correction. Determine the mg of the produced reducing sugar.

mg of the produced reducing sugar
= 1.6200 (Blank the test solution measurement - Test solution measurement)

Definition of potency: Set the activation as 1 when 10 mg of glucose is created according to the above conditions.

(3) ***Protease***—Weigh accurately about 0.5 g of Diastase·protease 100, add 0.1% sodium chloride, dilute so that the concentration becomes NLT 5000 and NMT 10000 times, and use this solution as the test solution. Transfer 1mL of 0.6% casein solution in a test tube, previously warmed at 37 ℃ on a warm bath, add 1.0 mL of the test solution, and mix well by shaking. Add in a warm water bath at 37 ℃, operate for exactly 10 minutes, add 2 mL of 0.4 mol/L trichloroacetic acid, allow it to stand at 37 ℃ for 20 minutes, and filter. Transfer 1.0 mL of the filtrate in a test tube, add 5 mL of 0.4 mol/L sodium carbonate and 1 mL of Folin's TS (1 in 3), and mix well by shaking. Allow it to stand at 37 ℃ for 20 minutes and perform the test as directed under the Ultraviolet-visible Spectroscopy with the colored solution and water as the control. Determine the absorbance A at the wavelength 660 nm. Separately transfer 1.0 mL of the test solution into a test tube, add 2 mL of 0.4 mol/L trichloroacetic acid, add 1 mL of 0.6% casein solution, and filter after 10 minutes. Operate in the same manner with 1 mL of the filtrate and determine the absorbance A_0. Separately, add 50 mg of tyrosine RS in 0.02 mol/L hydrochloric acid to make 100 mL, pipet 10.0 mL of this solution, add 0.02 mol/L hydrochloric acid to make 100 mL, and use this solution as the standard solution. To 1.0 mL of this standard solution, color like the test solution, perform the test as directed under the Ultraviolet-visible Spectroscopy, and determine the absorbance A_S.

$$\text{Potency (unit)} = \frac{A-A_0}{A_S} \times 50 \times \frac{1}{10} \times \text{dilution factor}$$

Definition of potency: Set the unit as 1 for potency creating non-protein material that responds to 1 μg of tyrosine in the above condition.

Packaging and storage Preserve in tight containers

Diastase·Protease 500
디아스타제·프로테아제500

Diastase·protease 500 concentrated and dried *Bacillus subtilis* (hay bacillus) in amylum maydi and soya bean meal and performed concentration drying. Diastase·protease 500 contains 5000 unit of *α*-amylase, 6000 unit of *β*-amylase, and NLT 16000 unit of protease per g.

Description Diastase·protease 500 occurs as a white to yellowish white fine powder.

Identification Diastase·protease 500 shows a positive reaction when tested as directed under the Assay of α-amylase, β-amylase, and protease.

Loss on drying NMT 7.0% (1 g, 105 °C, 1 hours).

Residue on ignition NMT 2.0%.

Assay (1) α-amylase Weigh accurately about 0.5 g of Diastase·protease 500, dissolve in 50 mL of sodium chloride, mix by shaking, and filter with 100 mL of 0.1 mol/L sodium chloride. Pipet 0.6 mL of the filtrate and add 0.1 mol/L sodium chloride to make 100 mL, and use this solution as the test solution. Separately, to 5 mL of 1% soluble starch solution, add 3 mL of McIlvaine buffer solution, pH 5.6, and 1 mL of 0.1% calcium chloride, warm at 37 ℃, and add 1 mL of the test solution. Mix well by shaking and allow it to stand at 37 ℃ for 30 minutes. Add 10 mL of iodine solution to 0.2 mL of this solution, perform the test as directed under the Ultraviolet-visible Spectroscopy using the color solution and water as the control. Determine the absorbance A_1 at the wavelength 660 nm. Separately, perform the test as directed under the Ultraviolet-visible Spectroscopy in the same manner with water, instead of the test solution, and determine the absorbance A_{ST}. Heat the test solution at 100 ℃ for 30 minutes and determine the absorbance A_0 with the test solution that lost activation.

$$\text{Potency of α-amylase} = \frac{A_0-A_1}{A_{ST}} \times 50 \times \text{dilution factor} \times \frac{1}{10}$$

Definition of potency: Set the unit as 1 when 10 mg of starch is decomposed according to the above conditions for 30 minutes.

(2) ***β-amylase***—Weigh accurately Diastase·protease 500 equivalent to about 0.1 g, add 80 mL of 0.1% sodium chloride, mix by shaking, add 100 mL of 0.1% sodium chloride solution, and filter. Take 15.0 mL of this filtrate and add 0.1% sodium chloride to make 100 mL and use this solution as the test solution. Separately, transfer 10 mL of 2% soluble starch solution to a 100-mL Erlenmeyer flask, previously warmed at 40 ℃ on a thermostat, add 1.0 mL of the test solution, allow it to stand at 40 ℃ for 30 minutes, and add 2 mL of Fehling's alkaline tartaric acid TS to stop the enzyme action. Add 2 mL of Fehling's copper TS and boil on fire for 2 minutes. After cooling with running water, add 2 mL of 30% potassium

iodide and 2 mL of sulfuric acid, and titrate the liberated iodine with 0.05 mol/L sodium thiosulfate VS. Separately, add 10 mL of water instead of enzyme liquid, operate in the same manner according to the above conditions, perform a blank test, and make any necessary correction. Determine the mg of the produced reducing sugar.

$$\text{mg of the produced reducing sugar} = 1.6 \times (\text{Measured value of the blank test solution} - \text{Measured value of the test solution})$$

$$\text{}\textit{B-amylase}\text{-amylase potency} = \frac{\text{Produced reducing sugar (mg)}}{10} \times \text{dilution factor}$$

Definition of potency: Set the activation as 1 when 10 mg of glucose is created according to the above conditions.

(3) ***Protease***—Weigh accurately about 0.1 g of Diastase·protease 500, add 80 mL of 0.1% sodium chloride, mix by shaking, add 100 mL of 0.1% sodium chloride solution, and filter. Take 25.0 mL of this filtrate and add 0.1% sodium chloride to make 100 mL and use this solution as the test solution. Separately, put 1 mL of 0.6% casein solution in a test tube, previously warmed at 37 ℃ warm bath, add 1.0 mL of the test solution, and shake well to mix. Add in a warm water bath at 37 ℃, operate it for exactly 10 minutes, add 2.0 mL of 0.4 mol/L trichloroacetic acid, allow it to stand at 37 ℃ for 25 minutes, and filter. Transfer 1.0 mL of the filtrate in a test tube, add 5 mL of 0.4 mol/L sodium carbonate and 1 mL of Folin's TS (1 in 3), and shake well to mix. Allow it to stand at 37 ℃ for 20 minutes and perform the test as directed under the Ultraviolet-visible Spectroscopy with the colored solution and water as the control solution. Determine the absorbance *A*at the wavelength 660 nm. Separately, put 1.0 mL of the test solution in a test tube, add 2.0 mL of 0.4 mol/L trichloroacetic acid solution, mix, add 1 mL of 0.6% casein solution, and filter after 10 minutes. Pipet 1 mL of the filtrate, perform the test in the same manner as directed under the Ultraviolet-visible Spectroscopy, and determine the absorbance A_0. Separately, make tyrosine RS with 50 μg per mL. Pipet 1.0 mL of this solution, color like the test solution, perform the test as directed under the Ultraviolet-visible Spectroscopy, and determine the absorbance A_S.

$$\text{Potency (unit) of protease} = \frac{A-A_0}{A_S} \times 50 \times \frac{1}{10} \times \text{dilution factor}$$

Definition of potency: Set the unit as 1 for potency creating non-protein Folin TS color material that respond to 1 μg of tyrosine for 1 minute.

Packaging and storage Preserve in light-resistant, tight containers.

Diastase·Protease N_1
디아스타제·프로테아제N_1

Perform the test with Diastase·protease N as directed under the Digestive Power; Diastase·protease N contains NLT 7000 unit and NMT 8800 unit per g for starch saccharifying activity and NLT 32300 unit and NMT 43700 unit per g for protein digestion activity.

Description Diastase·protease N occurs as a pale yellow to yellowish brown powder and has a unique odor.
It is hydroscopic.

Identification (1) Put 1 g of potato starch into two 200-mL glass stoppered Erlenmeyer flask (A and B), respectively, add 5 mL of 40 ℃ water to disperse, and add 15 mL of hot water slowly while shaking to compound. Put a funnel into the opening of flask, heat on a steam bath for 30 minutes, cool to 37 ± 1 ℃, and add 1 mL of acetic acid-sodium acetate buffer solution, pH 5.0. Separately, add 8 mL of acetic acid-sodium acetate buffer solution, pH 5.0 and 4 mL of dilute acetic acid to 1.0 g of Diastase·protease N, shake well occasionally to mix for 10 minutes, allow it to stand, and filter. Put 1 mL of the filtrate into the flask A above, shake intensely to mix for 1 minute, allow it to stand at 37 ± 1 ℃ for 1 hour, and add 2 mL of sodium hydroxide (1 in 10). Put 2 mL of sodium hydroxide (1 in 10) into flask B, shake to mix for 30 minutes, add 1 mL of the above filtrate, shake intensely to mix for 1 minute, and allow it to stand at 37 ± 1 ℃ for 1 hour; the content of flask A exhibits the state of the aqueous solution, but the content of flask B stays in full state. (starch dextrinizing activity).

(2) Add 150 mL of warm water and 1 mL of 3,6-Dinitrophthalic acid-pyridine (1 : 1) to flask A and B in (1), respectively, stopper the flasks, shake well to mix, and heat on a steam bath for 3 minutes; the content of flask A exhibits a red color, but the content of flask B does not exhibit color reactions (starch saccharifying activity).

(3) Add water to 1 mL of casein solution prepared in the protein digestion activity under the Digestive Power to make 10 mL, add 5 mL of this solution in a test tube, and allow it to stand at 37 ± 1 ℃ for 10 minutes. Add 50 mL of 0.1 mol/L phosphate buffer solution, pH 6.0 to 1 g of Diastase·protease N, adjust the pH to 6.0, add 0.1 mol/L phosphate buffer solution, pH 6.0 to make 100 mL, filter, and add 2 mL of the filtrate. Shake well to mix for 15 seconds, allow it to stand at 37 ± 1 ℃ for 1 hour, and add 5 mL of 7.2% trichloroacetate solution; the resulting solution does not become turbid at all (protein digestion activity).

Purity ***Spoilage***—Diastase·protease N does not have a spoiled odor.

Loss on drying NMT 10.0% (1 g, 105 °C, 3 hours).

Digestive power (1) ***Starch saccharifying activity***—Weigh accurately about 0.3 g of Diastase·protease N, and dissolve in water to make 200.0 mL. Pipet 5.0 mL of this solution, add water to make 100.0 mL, and use this solution as the test solution.

Allow 10 mL of potato starch solution, 1% to stand at exactly 37 ± 0.5 ℃ for 10 minutes, add 1.0 mL of the test solution, and shake well to mix. Allow this solution to stand at exactly 37 ± 0.5 ℃ for 10 minutes, add 2.0 mL of Fehling's alkaline tartaric acid solution, shake well to mix, and add 2.0 mL of Ferring's copper solution. After shaking intensely to compound, put a funnel into the opening of a test tube, heat on a steam bath for exactly 15 minutes, and cool with running water to below 25℃. Then, add 2.0 mL of concentrated potassium iodide TS and 2.0 mL of diluted sulfuric acid (1 in 6), and titrate the isolated iodine with 0.05 mol/L sodium thiosulfate VS. However, the endpoint of titration is when the blue color, formed by 1 - 2 drops of starch TS, is decolorized, and make 0.05 mol/L sodium thiosulfate solution used for the test b mL. Separately, proceed in the same manner above with 10 mL of water, instead of 10 mL of potato starch solution, 1% and make 0.05 mol/L sodium thiosulfate solution used for the test b mL.

$$\text{Glucose (mg)} = (a - b) \times 1.6$$

$$\text{Starch saccharifying activity (unit/g)} = \text{Glucose (mg)} \times \frac{1}{10} \times \frac{1}{W}$$

W: Amount (g) of sample in 1mL of the test solution

However, when amylase reacts with potato starch at 37 ℃, the amount of enzymes that bring about an increase in reducing power equivalent to 1 mg of glucose for the initial 1 minute of reaction is defined as 1 unit of starch saccharifying activity.

(2) ***Protein digestion activity***—Weigh accurately about 0.35 g of Diastase·protease N and dissolve in water to make 100 mL. Take exactly 10.0 mL of this solution, add water to make 100 mL, and use this solution as the test solution.

Pipet 5.0 mL of casein solution and allow it to stand at 37 ± 0.5 ℃ for 10 minutes, add 1.0 mL of the test solution, and shake intensely to compound. Allow this solution to stand at 37 ± 0.5 ℃ for 10 minutes, add 5.0 mL of trichloroacetic acid solution, 7.2%, and shake well to compound again. Allow it to stand at 37 ± 0.5 ℃ for 30 minutes, and filter after cooling. Take 2.0 mL of this filtrate, add 5.0 mL of 0.55 mol/L sodium carbonate solution and 1.0 mL of Folin's TS (1 in 3), respectively, and allow it to stand at 37 ± 0.5 ℃ for 30 minutes. Determine the absorption spectrum of this solution, A_T, as directed under the Ultraviolet-visible Spectroscopy at 660 nm wavelength, using water as the control solution. Separately, take 1.0 mL of the test solution, add exactly 5 mL of trichloroacetic acid solution, 7.2%, and shake well to compound. Add 5.0 mL of casein solution, shake well to compound, and allow it to stand at 37 ± 0.5 ℃ for 30 minutes. Determine the absorbance, A_B. in the same manner.

$$\text{Protein digestion activity (unit/g)} = (A_T\text{-}A_B) \times F \times \frac{11}{2} \times \frac{1}{10} \times \frac{1}{W}$$

F: Amount (μg) of tyrosine for absorbance difference of 1 determined from the tyrosine calibration curve

W: Amount (g) of sample in 1mL of the test solution

However, when protease reacts with milk casein at 37 ℃, the amount of enzymes that bring about an increase in non-protein, Folin's TS readily carbonizable substances equivalent to 1 μg of tyrosine for the initial 1 minute of reaction is defined as 1 unit of protein digestion activity.

Creation of tyrosine calibration curve—Dry tyrosine RS at 105 ℃ for 3 hours, weigh accurately 0.5 g of the dried matter, and dissolve in 0.2 mol/L hydrochloric acid TS to make 500 mL. Take 1.0 mL, 2.0 mL, 3.0 mL, and 4.0 mL each of this solution, and add 0.2 mol/L hydrochloric acid TS to make 100.0 mL, respectively. 2 mL each of the solution contains 20 μg, 40 μg, 60 μg and 80 μg of tyrosine. Take 2.0 mL each of the solution, add 5.0 mL of 0.55 mol/L sodium carbonate TS and 1.0 mL of Folin's TS (1 in 3), and allow it to stand at 37 ± 0.5 ℃ for 30 minutes. After cooling, determine the absorption spectra of these solutions, A_1, A_2, A_3 and A_4, as directed under the Ultraviolet-visible Spectroscopy at the 660 nm wavelength. Separately, proceed with 2 mL of 0.2 mol/L hydrochloric acid in the same manner above and determine the absorbance A_0. Measure A_1-A_0, A_2-A_0, A_3-A_0 and A_4-A_0, and create a calibration curve with the difference of absorbance on the longitudinal axis and the amount of tyrosine (μg) in 2 mL of each solution on the horizontal axis. Calculate the amount (F : μg) of tyrosine for the absorbance difference of 1 from this calibration curve.

Packaging and storage Preserve in tight containers.

Diastase·Protease·Cellulase
디아스타제·프로테아제·셀룰라제

Diastase·protease·cellulase is a complex enzyme prepared from beneficial strains of the genus *Aspergillus* or *Trichoderma koningi* with starch digestive activity, protein digestive activity, and cellulose digestive activity. In addition, it may have fat digestive activity. Diastase·protease·cellulase contains NLT 90.0% of digestive activity units of the labeled amount.

Description Diastase·protease·cellulase occurs as a pale yellow powder and has a characteristic odor.

Identification Perform the test as directed under the Assay; it exhibits a positive response.

Purity (1) ***Heavy metals*—**Proceed with 1.0 g of Diastase·protease·cellulase according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Arsenic***—Proceed with 2.0 g of Diastase·protease·cellulase according to Method 3 and perform the test (NMT 1 ppm).

Loss on drying NMT 10.0% (1.0 g, 105 ℃, 4 hours).

Residue on ignition NMT 10.0% (1.0 g).

Assay (1) ***Starch saccharifying activity***—(i) Test solution: Dissolve Diastase·protease·cellulase in acetic acid-sodium acetate buffer solution, pH 5.0, adjust to contain 0.4 to 0.8 starch saccharifying activity unit/mL, and use this solution as the test solution.

(ii) Substrate solution: Use potato starch TS for starch digestion activity.

(iii) Procedure: Proceed as directed under (i) Measurement of starch saccharifying activity of (1) starch digestive activity under the Digestive Power.

(2) **Protein digestive activity**—(i) Test solution: Dissolve Diastase·protease·cellulase in acetate buffer solution, pH 6.0, adjust to contain 15 to 25 protein digestive activity units/mL, and use this solution as the test solution.

(ii) Substrate solution: Use the substrate solution 2 of the Assay for protein digestive activity under the Digestive Power. However, adjust the pH to 6.0.

(iii) Procedure: Proceed as directed under the Assay for protein digestive activity under the Digestive Power. However, use trichloroacetic acid TS A as the precipitation reagent.

(3) ***Cellulose saccharifying activity***—Weigh accurately about 0.1 g of Diastase·protease·cellulase and add water to make 100 mL, and use this solution as the test solution. Take 4 mL of sodium carboxymethyl cellulose solution, allow to stand at 37 ± 0.5 ℃ for 10 minutes, add 1 mL of the test solution, shake to mix, and allow to stand at 37 ± 0.5 ℃ for 30 minutes. Add 2 mL of alkaline copper solution of Fehling's TS, shake to mix, heat on a steam bath for 30 minutes, and cool with running water. Add 2 mL of arsenic molybdate TS, shake well to mix, add 3 mL of 0.5 mol/L sodium hydroxide TS, shake again to mix, dissolve the precipitate, allow to stand for 20 minutes, and add acetic acid-sodium acetate buffer solution, pH 4.5 to make 25 mL. Pipet 1 mL of this solution, add 9 mL of acetic acid-sodium acetate buffer solution, pH 4.5, shake well to mix, and determine the absorbance A_T at the wavelength of 750 nm as directed under the Ultraviolet-visible Spectroscopy. Separately, pipet 1 mL of the test solution, add 2 mL of alkaline copper solution of Fehling's TS, add 4 mL of sodium carboxymethyl cellulose solution, and shake to mix. Proceed in the same manner, and determine the absorbance A_B. Determine the amounts (mg) of glucose, G_T and G_B, corresponding to A_T and A_B, using the glucose calibration curve.

$$\text{Cellulose saccharifying activity (unit/g)} = (G_T - G_B)/30 \times 1/0.18 \times 1/W$$

W: Amount (g) of the sample per mL of the test solution.

Definition of potency—Under the conditions specified above, one cellulose saccharifying activity unit is the amount of enzyme that catalyzes the increases of reducing activity equivalent to 1 μmole of glucose per minute.

Glucose calibration curve—Weigh accurately about 50 mg of the glucose RS, previously dried at 105 °C for 6 hours, and dissolve in water to make exactly 50 mL. Pipet 1, 2, 3, 4, and 5 mL of this solution separately, add water to make exactly 10 mL, respectively, and use these solutions as the standard solutions for the calibration curve. Pipet 1 mL of water and the standard solutions for the calibration curve, separately, add 4 mL of sodium carboxymethyl cellulose solution and 2 mL of alkaline copper solution of Fehling's TS, shake to mix, and heat on a steam bath for 30 minutes, cool with water, add 2 mL of arsenic molybdate TS, and shake to mix. Add 3 mL of 0.5 mol/L sodium hydroxide TS, dissolve the precipitate, allow to stand for 20 minutes, and add acetic acid-sodium acetate buffer solution, pH 4.5 to make 25 mL. Pipet 1 mL of each of these solutions, add 9 mL of acetic acid-sodium acetate buffer solution, pH 4.5, shake to mix, and determine the absorbances, A_0, A_1, A_2, A_3, A_4, and A_5, at the wavelength of 750 nm as directed under the Ultraviolet-visible Spectrophotometry. Construct a calibration curve by plotting the absorbance values $A_1 - A_0$, $A_2 - A_0$, $A_3 - A_0$, $A_4 - A_0$, and $A_5 - A_0$ versus the amounts (mg) of glucose (mg).

Packaging and storage Preserve in tight containers.

Diastase·Protease·Cellulase 1000
디아스타제·프로테아제·셀룰라제1000

Diastase·protease·cellulase 1000 is a digestive enzyme prepared from *Aspergilus aryzae*. About 1 g of Diastase·protease·cellulase 1000, when dried, contains between 7800 and 11000 units of starch saccharifying activity (pH 5.0), between 15000 and 24000 units of starch dextrinizing activity (pH 5.0), between 7000 and 11000 units of protein digestive activity (pH 3.0), between 14000 and 24000 units of protein digestive activity (pH 6.0),between 10000 and 20000 units of protein digestive activity (pH 8.0), and between 60 and 120 units of cellulose saccharifying activity(pH 4.5).

Description Diastase·protease·cellulase 1000 occurs as a pale yellow powder and has a characteristic odor. It is soluble in water and practically insoluble in ethanol.

Identification Perform the test with as directed under the Assay; it exhibits a positive response.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Diastase·protease·cellulase 1000 according to Method 2 and perform the test. Prepare the control solution with 5.0 mL of lead standard solution (NMT 50 ppm).

(2) ***Arsenic***—Proceed with 1.0 g of Diastase·protease·cellulase 1000 according to Method 3 and perform the test (NMT 2 ppm).

Loss on drying NMT 10.0% (1.0 g, 105 °C, 4 hours).

Residue on ignition NMT 10.0% (1.0 g).

Assay (1) ***Starch saccharifying activity***—Weigh accurately about 0.5 g of Diastase·protease·cellulase 1000 and add water to make 100 mL. Pipet 1.0 mL of this solution, add water to make 100 mL, and use this solution as the test solution. Pipet 10.0 mL of 1% potato starch solution, allow to stand at 37 ± 0.5 ℃ for 10 minutes, add 1 mL of the test solution, and shake to mix. Allow to stand at 37 ± 0.5 ℃ for exactly 10 minutes, add 2.0 mL of alkaline tartrate solution of Fehling's TS, and shake to mix. Add 2.0 mL of copper solution of Fehling's TS and shake to mix. Insert a funnel into the mouth of the test tube, heat the solution on a steam bath for exactly 15 minutes, cool with running water to below 25 ℃, add 2.0 mL of concentrated potassium iodide TS and 2.0 mL of dilute sulfuric acid (1 in 6), and titrate the liberated iodine with 0.05 mol/L sodium thiosulfate VS. As the endpoint is approached, add 1 to 2 drops of soluble starch TS, and continue the titration to the discharge of blue color. Separately, pipet 10.0 mL of water instead of 10.0 mL of 1% potato starch solution, proceed in the same manner, and titrate (a mL).

$$\text{Starch saccharifying activity (unit/g)} = (a - b) \times 1.6 \times \frac{1}{10} \times \frac{1}{\text{Amount (g) of sample in 1 mL of test solution}}$$

Definition of potency—When amylase reacts with potato starch at 37 ℃, one saccharifying activity unit is the amount of enzyme that catalyzes the increase of reducing activity equivalent to 1 mg of glucose for the initial 1 minute of reaction.

(2) ***Starch dextrinizing activity***—Weigh accurately about 0.5 g of Diastase·protease·cellulase 1000 and add water to make 150 mL. Pipet 1.0 mL of this solution, add water to make 200 mL, and use this solution as the test solution. Pipet 10.0 mL of 1% potato starch solution, allow to stand at 37 ± 0.5 ℃ for 10 minutes, add 1.0 mL of the test solution, shake to mix, and allow to stand at 37 ± 0.5 ℃ for exactly 10 minutes. Pipet 1.0 mL of this solution, add 10.0 mL of 0.1 mol/L hydrochloric acid TS, and shake to mix. Pipet 0.5 mL of this solution, add 10 mL of 0.0002 mol/L iodine TS, shake to mix, and immediately determine the absorbance A_T at the wavelength of 660 nm. Separately, take water instead of the test solution, proceed in the same manner, and determine the absorbance A_B.

$$\text{Starch dextrinizing activity (unit/g)} = \frac{A_B - A_T}{A_B} \times \frac{100}{10 \times 10} \times \frac{1}{\text{Amount (g) of sample in 1 mL of test solution}}$$

Definition of potency—When amylase reacts with 0.1 g of potato starch at 37 ℃, one starch dextrinizing unit is the amount of enzyme required to reduce the coloration of potato starch by iodine by 10% for initial 1 minute of reaction.

(3) ***Protein digestive activity (pH 3.0)***—Weigh accurately about 0.5 g of Diastase·protease·cellulase 1000 and add water to make 75 mL. Pipet 10.0 mL of this solution, add water to make 50 mL, and use this solution as the test solution. Pipet 5.0 mL of casein solution, pH 3.0, allow to stand at 37 ± 0.5 ℃ for 10 minutes, add 1.0 mL of the test solution, and shake to mix. Allow the solution to stand at 37 ± 0.5 ℃ for 10 minutes, add 5 mL of trichloroacetic acid TS, and shake to mix. Allow to stand at 37 ± 0.5 ℃ for 30 minutes and filter. Take 2 mL of the filtrate, add 5 mL of 0.55 mol/L sodium carbonate TS and 1 mL of diluted Folin's TS (1 in 3), allow to stand at 37 ± 0.5 ℃ for 30 minutes, and determine the absorbance A_T at the wavelength of 660 nm. Separately, take 1.0 mL of the test solution, add 5 mL of trichloroacetic acid TS, shake to mix, and add 5 mL of casein solution, pH 3, allow to stand at 37 ± 0.5 ℃ for 30 minutes, proceed in the same manner, and determine the absorbance A_B.

$$\text{Protein digestive activity (unit/g)} = (AT - AB) \times F \times \frac{11}{2} \times \frac{1}{10} \times 750$$

F: Amount (μg) of tyrosine for absorbance difference of 1.000 determined from the tyrosine calibration curve

750: Dilution factor of sample (per g)

$\frac{11}{2}$, $\frac{1}{10}$: Unit conversion factor

Definition of potency—When protease reacts with milk casein at 37 ℃, one protein digestive activity unit is the amount of enzyme that produces non-protein, Folin's TS colorable substance equivalent to 1 μg tyrosine for the initial 1 minute of reaction.

Tyrosine calibration curve—Weigh accurately

about 0.5 g of tyrosine RS, previously dried at 105 ℃ for 4 hours, and dissolve in 0.2 mol/L hydrochloric acid TS to make 500 mL. Pipet 1.0 mL, 2.0 mL, 3.0 mL, and 4.0 mL of this solution separately and add 0.2 mol/L hydrochloric acid TS to make 100 mL. Pipet 2.0 mL of each solution, add 5.0 mL of 0.55 mol/L sodium carbonate TS and 1.0 mL of dilute Folin's TS (1 in 3), allow to stand at 37 ± 0.5 ℃ for 30 minutes, and determine the absorbances A_1, A_2, A_3 and A_4 at the wavelength of 660 nm. Separately, proceed with 2 mL of 0.2 mol/L hydrochloric acid TS in the same manner, and determine the absorbance A_0. Construct a calibration curve by plotting the difference of absorbance versus the content of tyrosine, and determine the amount of tyrosine (F) corresponding to the absorbance difference of 1.000.

(4) ***Protein digestion activity (pH 6.0)***—Weigh accurately about 0.5 g of Diastase·protease·cellulase 1000 and add water to make 75 mL. Pipet 10.0 mL of this solution, add water to make 50 mL, and use this solution as the test solution. Take 5.0 mL of casein solution, pH 6.0, proceed as directed under the protein digestive activity (pH 3.0) under the Assay, and determine the absorbances A_T and A_B.

$$\text{Protein digestive activity (pH 6.0) (unit/g)} = (A_T - A_B) \times F \times \frac{11}{2} \times \frac{1}{10} \times 750$$

F: Amount (μg) of tyrosine for absorbance difference of 1.000 determined from the tyrosine calibration curve

(5) ***Protein digestion activity (pH 8.0)***—Weigh accurately about 0.5 g of Diastase·protease·cellulase 1000 and add water to make 75 mL. Take 10.0 mL of this solution, add water to make 50 mL, and use this solution as the test solution. Take 5.0 mL of casein solution, pH 8.0, proceed as directed under the protein digestive activity (pH 3.0) under the Assay, and determine the absorbances A_T and A_B.

$$\text{Protein digestive activity (pH 8.0) (unit/g)} = (A_T - A_B) \times F \times \frac{11}{2} \times \frac{1}{10} \times 750$$

F: Amount (μg) of tyrosine for absorbance difference of 1.000 determined from the tyrosine calibration curve

(6) ***Cellulose saccharifying activity***—Weigh accurately about 0.5 g of Diastase·protease·cellulase 1000 and add water to make 100 mL. Pipet 1.0 mL of this solution, add water to make 100 mL, and use this solution as the test solution. Take 4.0 mL of sodium carboxymethylcellulose solution, allow to stand at 37 ± 0.5 ℃ for 10 minutes, add 1.0 mL of the test solution, shake to mix, and allow to stand at 37 ± 0.5 ℃ for exactly 30 minutes. Add 2.0 mL of alkaline copper solution of Fehling's TS, shake to mix, heat on a steam bath for 30 minutes, and cool with running water. Add 2.0 mL of arsenic molybdate TS, shake to mix, add 3.0 mL of 0.5 mol/L sodium hydroxide TS, shake again to mix, dissolve the precipitate, allow to stand for 20 minutes, and add acetic acid-sodium acetate buffer solution, pH 4.5 to make 25 mL. Pipet 1.0 mL of this solution, add 9.0 mL of acetic acid-sodium acetate buffer solution, pH 4.5, shake well to mix, and determine the absorbance A_T at the wavelength of 750 nm. Separately, pipet 1.0 mL of the test solution, add 2.0 mL of alkaline copper solution of Fehling's TS, add 4.0 mL of sodium carboxymethyl cellulose solution and shake to mix. Proceed in the same manner, and determine the absorbance A_B. Determine the amount of glucose, G_T and G_B, corresponding to A_T and A_B using the glucose calibration curve.

$$\text{Cellulose saccharifying activity (unit/g)} = \frac{G_T - G_B}{30} \times \frac{1}{0.18} \times \frac{1}{\text{Amont (g) of sample in 1 mL of test solution}}$$

Definition of potency—When cellulase reacts with sodium carboxymethylcellulose at 37 ℃, one cellulose saccharifying activity unit is the amount of enzyme that catalyzes the increases of reducing activity equivalent to 1 μmol of glucose for the initial 1 minute of reaction.

Glucose calibration curve—Weigh accurately about 1.0 g of glucose RS, previously dried at 105 ℃ for 6 hours, and dissolve in water to make 1.0 L. Pipet 1.0, 2.0 mL, 3.0 mL, 4.0 mL, and 5.0 mL of this solution separately, and add water to make 10 mL, respectively. Pipet 1.0 mL of each solution, add 4.0 mL of sodium carboxymethylcellulose solution and 2.0 mL alkaline copper solution of Fehling's TS, shake to mix, insert the stopper, heat on a steam bath for 30 minutes and cool with water. Add 2.0 mL of arsenic molybdate TS, shake to mix, add 3.0 mL of 0.5 mol/L sodium hydroxide TS, dissolve the precipitate, allow to stand for 20 minutes and add acetic acid-sodium acetate buffer solution, pH 4.5 to make 25 mL. Pipet 1.0 mL of each solution and add 9.0 mL of acetic acid-sodium acetate buffer solution, pH 4.5, shake to mix, and determine the absorbances A_1, A_2, A_3, A_4 and A_5 at the wavelength of 750 mm. Separately, proceed in the same manner with 1 mL of water instead of 1 mL of the glucose solution, and determine the absorbance A_0. Construct a calibration curve with the difference of absorbance versus the amounts of glucose.

Packaging and storage Preserve in tight containers.

Diastase·Protease·Cellulase 2000 II
디아스타제·프로테아제·셀룰라제2000II

Diastase·protease·cellulase 2000 II is a digestive

enzyme purified from the enzyme obtained by culturing several fungi belonging to the genus *Aspergillus* in a special media. It contains starch digestive enzymes, α-amylase and *β*-amylase, and also contains a protein digestive enzyme, trypsin and a fat digestive enzyme, lipase.

About 1 g of Diastase·protease·cellulase 2000 II contains between 3900 and 5500 units of starch saccharifying activity (pH 5.0), between 7000 and 12000 units of starch dextrinizing activity (pH 5.0), between 7000 and 12000 units of protein digestive activity (pH 6.0), and between 30 and 60 units of cellulose saccharifying activity.

Description Diastase·protease·cellulase 2000 II occurs as a pale yellowish brown powder. It is soluble in water and insoluble in ethanol.

Identification Perform the test with Diastase·protease·cellulase 2000 II as directed under the Assay; it exhibits a positive response.

Purity (1) ***Heavy metals***—Proceed with 0.4 g of Diastase·protease·cellulase 2000 II according to Method 2 and perform the test. Prepare the control solution with 5.0 mL of lead standard solution (NMT 50 ppm).

(2) ***Arsenic***—Proceed with 1.0 g of Diastase·protease·cellulase 2000 II according to Method 3 and perform the test (NMT 2 ppm).

Loss on drying NMT 10.0% (1 g, 105 °C, 4 hours).

Assay (1) ***Starch saccharifying activity***—Weigh accurately about 0.2 g of Diastase·protease·cellulase 2000 II and add acetic acid-sodium acetate buffer solution, pH 5.0, to make 200 mL. Pipet 10 mL of this solution, add acetic acid-sodium acetate buffer solution, pH 5.0 to make 100 mL, and use this solution as the test solution. Pipet 10.0 mL of 1% potato starch solution, allow to stand at 37 ± 0.5 ℃ for 10 minutes, add 1 mL of the test solution, and shake to mix. Allow to stand at 37 ± 0.5 ℃ for exactly 10 minutes, add 2.0 mL of alkaline tartrate solution of Fehling's TS, and shake to mix. Add 2.0 mL of copper solution of Fehling's TS, and shake to mix. Insert a funnel into the mouth of the test tube, heat the solution on a steam bath for exactly 15 minutes, cool with running water to below 25 ℃, add 2.0 mL of concentrated potassium iodide TS and 2.0 mL of dilute sulfuric acid (1 in 6), and titrate the liberated iodine with 0.05 mol/L sodium thiosulfate VS. As the endpoint is approached, add 1 to 2 drops of soluble starch TS, and continue the titration to the discharge of blue color. Separately, pipet 10 mL of water instead of 10 mL of 1% potato starch solution, proceed in the same manner, and titrate (a mL).

$$\text{Starch saccharifying activity (unit/g)} = (a-b) \times 1.6 \times \frac{1}{10} \times \frac{1}{\text{Amount (g) of sample in 1 mL of test solution}}$$

Definition of potency—When amylase reacts with potato starch at 37 ℃, one saccharifying activity unit is the amount of enzyme that catalyzes the increase of reducing activity equivalent to 1 mg of glucose for the initial 1 minute of reaction.

(2) ***Starch dextrinizing activity***—Weigh accurately about 0.1 g of Diastase·protease·cellulase 2000 II, add acetic acid-sodium acetate buffer solution, pH 5.0 to make 200 mL. Pipet accurately 10.0 mL of this solution, add acetic acid-sodium acetate buffer solution, pH 5.0 to make 100 mL, and use this solution as the test solution. Pipet 10 mL of 1% potato starch solution, allow to stand at 37 ± 0.5 ℃ for 10 minutes, add 1.0 mL of the test solution, shake to mix, and allow to stand at 37 ± 0.5 ℃ for exactly 10 minutes. Pipet 1.0 mL of this solution, add 10 mL of 0.1 mol/L hydrochloric acid TS, and shake to mix. Pipet 0.5 mL of this solution, add 10 mL of 0.0002 mol/L iodine TS, shake to mix, and immediately determine the absorbance A_T at the wavelength of 660 nm. Separately, take water instead of the test solution, proceed in the same manner, and determine the absorbance A_B.

$$\text{Starch dextrinizing activity (unit/g)} = \frac{A_B - A_T}{A_B} \times \frac{100}{10 \times 10} \times \frac{1}{\text{Amount (g) of sample in 1 mL of test solution}}$$

Definition of potency—When amylase reacts with 0.1 g of potato starch at 37 ℃, one starch dextrinizing unit is the amount of enzyme required to reduce the coloration of potato starch by iodine by 10% for the initial 1 minute of reaction.

(3) ***Protein digestive activity (pH 6.0)***—Weigh accurately about 0.5 g of Diastase·protease·cellulase 2000 II, add acetate buffer solution, pH 6.0 to make 200 mL, and use this solution as the test solution. Take 5.0 mL of casein solution, pH 6.0, allow to stand at 37 ± 0.5 ℃ for 10 minutes, add 1.0 mL of the test solution, and shake to mix. Allow the solution to stand at 37 ± 0.5 ℃ for exactly 10 minutes, add 5 mL of trichloroacetic acid TS, and shake to mix. Allow to stand at 37 ± 0.5 ℃ for 30 minutes and filter. Take 2.0 mL of the filtrate, add 5.0 mL of 0.55 mol/L sodium carbonate TS and 1 mL of diluted Folin's TS (1 in 3), allow to stand at 37 ± 0.5 ℃ for 30 minutes, and determine the absorbance A_T at the wavelength of 660 nm. Separately, take 1.0 mL of the test solution, add 5 mL of trichloroacetic acid TS, shake to mix, and add 5 mL of casein solution, allow to stand at 37 ± 0.5 ℃ for 30 minutes, proceed in the same manner, and determine the absorbance A_B.

$$\text{Protein digestive activity (unit/g)} = (AT - AB) \times F \times \frac{11}{2} \times \frac{1}{10} \times \frac{1}{\text{Amount (g) of sample in 1 mL of test solution}}$$

F: Amount (μg) of tyrosine for absorbance difference of 1.000 determined from the tyrosine calibration curve

Tyrosine calibration curve—Weigh accurately about 0.5 g of tyrosine RS, previously dried at 105 ℃ for 3 hours, and dissolve in 0.2 mol/L hydrochloric acid TS to make 500 mL. Pipet 1.0 mL, 2.0 mL, 3.0 mL, and 4.0 mL this solution separately and add 0.2 mol/L hydrochloric acid TS to make100 mL. Pipet 2.0 mL of each solution, add 5 mL of 0.55 mol/L sodium carbonate TS and 2.0 mL of diluted Folin's TS (1 in 3), allow to stand at 37 ± 0.5 ℃ for 30 minutes, and determine the absorbances A_1, A_2, A_3 and A_4 at the wavelength of 660 nm. Separately, proceed with 2.0 mL of 0.2 mol/L hydrochloric acid TS in the same manner, and determine the absorbance A_0. Construct a calibration curve by plotting the difference of absorbance versus the content of tyrosine.

(4) ***Cellulose saccharifying activity***—Weigh accurately about 0.1 g of Diastase·protease·cellulase 2000 II, add water to make 100 mL, and use this solution as the test solution. Take 4.0 mL of sodium carboxymethylcellulose solution, allow to stand at 37 ± 0.5 ℃ for 10 minutes, add 1.0 mL of the test solution, shake to mix, and allow to stand at 37 ± 0.5 ℃ for exactly 30 minutes. Add 2.0 mL of alkaline copper TS, shake to mix, heat on a steam bath for 30 minutes, and cool with running water. Add 2.0 mL of arsenic molybdate TS, shake to mix, add 3.0 mL of 0.5 mol/L sodium hydroxide TS, shake again to mix, dissolve the precipitate, allow to stand for 20 minutes, and add 25.0 mL of acetic acid-sodium acetate buffer solution, pH 4.5 to make 25.0 mL. Pipet 1.0 mL of this solution, add 9.0 mL of acetic acid-sodium acetate buffer solution, pH 4.5, shake well to mix, and determine the absorbance A_T at the wavelength of 750 nm. Separately, pipet 1.0 mL of the test solution, add 2.0 mL of alkaline copper TS, and mix. Add 4.0 mL of sodium carboxymethylcellulose solution and shake to mix. Proceed in the same manner, and determine the absorbance A_B. Determine the amount of glucose, G_T and G_B, corresponding to A_T and A_B using the glucose calibration curve.

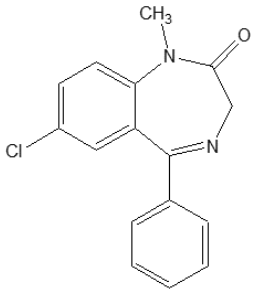
$$\text{Cellulose saccharifying activity (unit/g)} = \frac{G_T - G_B}{30} \times \frac{1}{0.18} \times \frac{1}{\text{Amount (g) of sample in 1 mL of test solution}}$$

Definition of potency—When cellulase reacts with sodium carboxymethylcellulose at 37 ℃, one cellulose saccharifying activity unit is the amount of enzyme that catalyzes the increases of reducing activity equivalent to 1 μmol of glucose for the initial 1 minute of reaction.

Glucose calibration curve—Weigh accurately about 1.0 g of glucose RS, previously dried at 105 ℃ for 6 hours, and add water to make 1000 mL. Pipet 1.0, 2.0 mL, 3.0 mL, 4.0 mL, and 5.0 mL of each solution, and add water to make 10 mL, respectively. Pipet 1.0 mL of each solution, add 4.0 mL of sodium carboxymethylcellulose solution and 2.0 mL of alkaline copper TS, shake to mix, and insert the stopper, heat on a steam bath for 30 minutes and cool with water. Add 2.0 mL of arsenic molybdate TS, shake to mix, add 3.0 mL of 0.5 mol/L sodium hydroxide TS, and dissolve the precipitate, allow to stand for 20 minutes, and add acetic acid-sodium acetate buffer solution, pH 4.5 to make 25 mL. Pipet 1.0 mL of each solution and add 9.0 mL of acetic acid-sodium acetate buffer solution, pH 4.5, shake to mix, and determine the absorbances A_1, A_2, A_3, A_4 and A_5 at the wavelength of 750 mm. Separately, proceed in the same manner with 1 mL of water instead of 1 mL of the glucose solution, and determine the absorbance A_0. Construct a calibration curve y plotting the difference of absorbance versus the amount of glucose.

Packaging and storage Preserve in tight containers.

Diazepam
디아제팜



$C_{16}H_{13}ClN_2O$: 284.74

7-Chloro-1-methyl-5-phenyl-3*H*-1,4-benzo-diazepin-2-one [*439-14-5*]

Diazepam, when dried, contains NLT 98.5% and NMT 101.0% of diazepam ($C_{16}H_{13}ClN_2$ O).

Description Diazepam occurs as a white to pale yellow crystalline powder, is odorless and has a slightly bitter taste.

It is freely soluble in acetone, soluble in ethanol(95) and acetic anhydride, sparingly soluble in ethanol, slightly soluble in ethanol(99.5), and practically insoluble in water.

Identification (1) Dissolve about 10 mg of Diazepam in 3 mL of sulfuric acid and examine the solution under ultraviolet light (wavelength of 365 nm); the resulting solution exhibits a yellowish green fluorescent color.

(2) Dissolve 2 mg each of Diazepam and diazepam RS in 200 mL solution of sulfuric acid in ethanol(99.5) (3 in 1000), and determine the absorption spectra as directed under the Ultraviolet-visible Spectroscopy; both spectra

exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared spectra of Diazepam and diazepam RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(4) Perform the test with Diazepam as directed under the Flame Coloration (2); it exhibits a blue to bluish green color.

Melting point Between 130 and 134 ℃.

Absorbance $E_{1cm}^{1\%}$ (285 nm): Between 425 and 445 [2 mg, after drying, solution of sulfuric acid in ethanol(99.5) (3 in 1000), 200 mL].

Purity (1) ***Clarity and color of solution***—Dissolve about 0.10 g of Diazepam in 20 mL of acetone (95); the resulting solution is clear.

(2) ***Chloride***—Take 1.0 g of Diazepam, add 50 mL of water, allow to stand for 1 hour with occasional shaking to mix, and filter. To 25 mL of the filtrate, add 6 mL of dilute nitric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 0.20 mL of 0.01 mol/L hydrochloric acid (NMT 0.014%).

(3) ***Heavy metals***—Proceed with 1.0 g of Diazepam according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(4) ***Related substances***—Dissolve about 0.10 g of Diazepam in 10 mL of acetone and use this solution as the test solution. Pipet 1 mL of this solution, and add acetone to make exactly 100 mL. Pipet 1 mL of this solution, add acetone to make exactly 10 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Then, develop the plate with a mixture of ethyl acetate and hexane (1 :1) to a distance of about 12 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot obtained from the test solution are not more intense than the spot from the standard solution.

Loss on drying NMT 0.5% (1 g, 105 °C, 2 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.6 g of Diazepam, previously dried, dissolve in 60 mL of acetic anhydride, and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid

= 28.474 mg of $C_{16}H_{13}ClN_2O$

Packaging and storage Preserve in light-resistant, tight containers.

Diazepam Injection
디아제팜 주사액

Diazepam Injection contains NLT 90.0% and NMT 110.0% of diazepam ($C_{16}H_{13}ClN_2O$: 284.74).

Method of preparation Prepare Diazepam Injection as directed under the Injections, with Diazepam.

Description Diazepam Injection occurs as a clear, colorless liquid.

Identification (1) The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

(2) Take an appropriate amount equivalent to 10 mg of diazepam according to the labeled amount of Diazepam Injection, transfer to a separatory funnel, add 20 mL of water, and shake well to mix. Add 20 mL of chloroform and shake vigorously. Filter and add the chloroform layer with 5 g of anhydrous sodium sulfate, wash anhydrous sodium sulfate with 20 mL of chloroform, and add the washings with the filtrate. Evaporate the filtrate on a steam bath in air so that it becomes about 5 mL and evaporate the beaker to dryness on a steam bath in air. Strongly rake in the oil layer with a spatula, and dry in vacuum at 60 ℃ for 4 hours in a desiccator with phosphorus pentoxide as a drier. Separately, perform the test in the same manner in the preparation of the sample with diazepam RS and use as the reference standard. Determine the spectra with the sample and reference standards as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

pH Between 6.2 and 6.9.

Sterility Meets the requirements.

Bacterial endotoxins Less than 11.6 EU per mg of diazepam.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Extractable volume of injections Meets the requirements.

Assay Take exactly an amount of Diazepam Injection,

equivalent to about 10 mg of diazepam ($C_{16}H_{13}ClN_2O$), add 10.0 mL of the internal standard solution and methanol to make exactly 50 mL, and use this solution as the test solution. Separately, weigh accurately an appropriate amount of diazepam RS, and dissolve in methanol to make a solution containing 1 mg per mL. Pipet 5 mL of this solution, add exactly 5.0 mL of the internal standard solution, add methanol to make exactly 25 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions, and calculate the ratios, Q_T and Q_S, of the peak area of diazepam to that of the internal standard for the test solution and the standard solution, respectively.

$$\text{Amount (mg) of diazepam } (C_{16}H_{13}ClN_2O) = \text{Amount (mg) of diazepam RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of *p*-tolualdehyde in methanol (3 in 10000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 3.9 mm in internal diameter and about 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 - 10 μm in particle diameter).

Mobile phase: A mixture of methanol and water (65 : 35).

Flow rate: 1.4 mL/min

System suitability

System performance: Proceed with 20 μL of the standard solution according to the above conditions; the internal standard and diazepam are eluted in this order with the resolution being NLT 5.0.

System repeatability: Repeat the test 6 times with 20 μL each of the standard solution under the above operating conditions; the relative standard deviation of the ratios of the peak area of diazepam to that of the internal standard is NMT 2.0%.

Packaging and storage Preserve in light-resistant, hermetic containers.

Diazepam Tablets
디아제팜 정

Diazepam Tablets contains NLT 95.0% and NMT 105.0% of diazepam ($C_{16}H_{13}ClN_2O$: 284.74).

Method of preparation Prepare as directed under Tablets, with Diazepam.

Identification Weigh an amount of Diazepam Tablets, previously powdered, equivalent to 50 mg of diazepam according to the labeled amount, add 50 mL of acetone, shake to mix, and filter. Take 1 mL of the filtrate, evaporate to dryness in a water bath, and dissolve the residue in 100 mL of sulfuric acid in ethanol(95) (3 in 1000). Determine the absorption spectra of this solution as directed under the Ultraviolet-visible Spectroscopy; it exhibits maxima between 240 nm and 244 nm, between 283 nm and 287 nm, and between 360 nm and 370 nm.

Dissolution Perform the test with 1 tablet of Diazepam Tablets at 100 revolutions per minute according to Method 1, using 900 mL of 0.1 mol/L hydrochloric acid as the dissolution medium. Use the dissolved solution 30 minutes after starting the dissolution test as the test solution by suitably diluting with the dissolution medium, if necessary. Separately, weigh accurately an appropriate amount of diazepam RS, dissolve in 0.1 mol/L hydrochloric acid to make it the same concentration as the test solution, and use this solution as the standard solution. Perform the test with the test solution and the standard solution as directed under the Ultraviolet-visible Spectroscopy, using 0.1 mol/L hydrochloric acid as the control solution, and determine the absorbance at the absorbance maximum wavelength of about 242 nm.

It meets the requirements if the dissolution rate of Diazepam Tablets in 30 minutes is NLT 85%.

Uniformity of dosage units It meets the requirements when the Content uniformity test is performed according to the following procedure. Take 1 tablet of Diazepam Tablets, add 5 mL of water, and disintegrate by shaking to mix. Add 30 mL of methanol, shake for 10 minutes, add methanol to make exactly 50 mL, and centrifuge. Take *V* mL of the clear supernatant, equivalent to 0.4 mg of diazepam ($C_{16}H_{13}ClN_2O$), add 5 mL of internal standard solution, add methanol to make 20 mL, and use this solution as the test solution. Separately, weigh accurately about 20 mg of diazepam RS, previously dried at 105 °C for 2 hours, and dissolve in methanol to make exactly 100 mL. Pipet 2 mL of this solution, add exactly 5 mL of the internal standard solution, add methanol to make exactly 20 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions and calculate the ratios, Q_T and Q_S, of the peak area of diazepam to that of the internal standard from the test solution and the standard solution, respectively.

$$\text{Amount (mg) of diazepam } (C_{16}H_{13}ClN_2O) = \text{Amount (mg) of diazepam RS} \times \frac{Q_T}{Q_S} \times \frac{1}{V}$$

Internal standard solution—A solution of ethylparaben in methanol (1 in 25000).

Operating conditions

Proceed as directed under the operating conditions

under the Assay.

System suitability

System performance: Proceed with 10 μL of the standard solution according to the above conditions; the internal standard and diazepam are eluted in this order with the resolution between these peaks being NLT 6.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution according to the above conditions; the relative standard deviation of the ratios of the peak area of diazepam to that of the internal standard is NMT 1.0%.

Assay Weigh accurately and powder NLT 20 tablets of Diazepam Tablets. Weigh accurately a portion of this powder, equivalent to about 50 mg of diazepam ($C_{16}H_{13}ClN_2O$), dissolve in 10 mL of water by shaking to mix, add 60 mL of methanol, shake to mix for 10 minutes, add methanol to make exactly 100 mL, and centrifuge. Pipet 5 mL of the clear supernatant, add exactly 5 mL of the internal standard solution, add methanol to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 50 mg of diazepam RS, previously dried at 105 ℃ for 2 hours, add 10 mL of water, and add methanol to make exactly 100 mL. Pipet 5 mL of this solution, add exactly 5 mL of the internal standard solution, add methanol to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the ratios Q_T and Q_S, of the peak area of diazepam to the peak area of the internal standard from each solution.

$$\text{Amount (mg) of diazepam } (C_{16}H_{13}ClN_2O) = \text{Amount (mg) of diazepam RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of ethylparaben in methanol (1 in 5000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless-steel column about 4 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: A mixture of methanol and water (13 : 7).

Flow rate: Adjust the flow rate so that the retention time of diazepam is about 10 minutes.

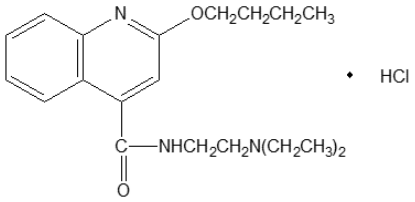
System suitability

System performance: Proceed with 10 μL of the standard solution according to the above conditions; the internal standard and diazepam are eluted in this order with the resolution being NLT 6.

System repeatability: Repeat the test 6 times with 10 μL of the standard solution each time according to the above conditions; the relative standard deviation of the peak areas of diazepam is NMT 1.0%.

Packaging and storage Preserve in light-resistant, tight containers.

Dibucaine Hydrochloride
디부카인염산염



Cinchocaine Hydrochloride $C_{20}H_{29}N_3O_2 \cdot HCl$: 379.92
2-Butoxy-*N*-(2-(diethylamino)ethyl)quinoline-4-carboxamide hydrochloride [*61-12-1*]

Dibucaine Hydrochloride, when dried, contains NLT 98.0% and NMT 101.0% of dibucaine hydrochloride (C20H29N3O2·HCl).

Description Dibucaine Hydrochloride occurs as white crystals or a crystalline powder.
It is very soluble in water, ethanol(95) or acetic acid(100), freely soluble in acetic anhydride and practically insoluble in ether.
It is hygroscopic.

Identification (1) Determine the absorption spectra of Dibucaine Hydrochloride and dibucaine hydrochloride RS in 1 mol/L hydrochloric acid (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Dibucaine Hydrochloride and dibucaine hydrochloride RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) An aqueous solution of Dibucaine Hydrochloride (1 in 10) responds to the Qualitative Analysis chloride.

Melting point Between 95 and 100 ℃. Put Dibucaine Hydrochloride into a capillary tube for melting point determination, and dry in vacuum over phosphorus pentoxide at 80 °C for 5 hours. Seal immediately the open end of the tube and determine the melting point.

pH Dissolve 1.0 g of Dibucaine Hydrochloride in 50 mL of water; the pH of this solution is between 5.0 and 6.0.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Dibucaine Hydrochloride in 20 mL of water; the resulting solution is clear and colorless Perform the test with this solution as directed under the Ultraviolet-visible Spectroscopy, using water as the control solution; the absorbance at the wavelength of about 430 nm is NMT 0.03.

(2) ***Sulfate***—Weigh 0.3 g of Dibucaine Hydrochloride and perform the test. Prepare the control solution with 0.35 mL of 0.005 mol/L sulfuric acid (NMT 0.056%).

(3) ***Heavy metals***—Proceed with 1.0 g of Dibucaine Hydrochloride as directed under Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(4) ***Related substances***—Dissolve 0.2 g of Dibucaine Hydrochloride in 5 mL of ethanol(95) and use this solution as the test solution. Pipet 1 mL of the test solution, and add ethanol(95) to make exactly 20 mL. Pipet 2 mL of this solution, add ethanol(95) to make exactly 20 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, water and acetic acid(100) (3 : 1 : 1) to a distance of about 10 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot obtained from the test solution are not more intense than the spot from the standard solution.

Loss on drying NMT 2.0% (1 g, in vacuum, phosphorus pentoxide, 80 ℃, 5 hours).

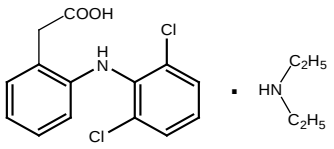
Residue on ignition NMT 0.1% (1 g).

Assay Weigh exactly about 0.3 g of Dibucaine Hydrochloride, previously dried, dissolve in 50 mL of a mixture of acetic anhydride and acetic acid(100) (7 : 3), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 19.00 mg of $C_{20}H_{29}N_3O_2 \cdot HCl$

Packaging and storage Preserve in tight containers.

Diclofenac Diethylammonium
디클로페낙디에틸암모늄



$C_{18}H_{22}Cl_2N_2O_2$: 369.29
Diethylammonium 2-[(2,6-dichloroanilino) phenyl] acetate, [*78213-16-8*]

Diclofenac Diethylammonium, when dried, contains NLT 99.0% and NMT 101.0% of diclofenac diethylammonium ($C_{18}H_{22}Cl_2N_2O_2$).

Description Diclofenac Diethylammonium occurs as a pale yellow crystalline powder.
It is freely soluble in methanol, ethanol(95) and chloroform, and slightly soluble in acetic acid(100), acetone and water.
It is practically insoluble in 1 mol/L sodium hydroxide.
A solution of Diclofenac Diethylammonium in methanol (1 in 20) is clear.

Melting point—About 154 °C.

Identification Dissolve 25 mg of Diclofenac Diethylammonium in 100 mL of methanol, take 1 mL of this solution, and add methanol to make 10 mL. Determine the absorption spectrum with this solution as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum at the wavenumber of about 282 nm.

pH Between 6.5 and 8.3 (1% aqueous solution).

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Diclofenac Diethylammonium according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Related substances***—Weigh accurately about 0.10 g of Diclofenac Diethylammonium, dissolve in the mobile phase to make 100 mL, and use this solution as the test solution. Pipet 2 mL of this solution, add the mobile phase to make exactly 100 mL, then pipet1.0 mL of this solution, add the mobile phase to make exactly 10 mL, and use this solution as the standard solution. Perform the test with exactly 20 mL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak areas by the automatic integration method; the peak area of each related substance other than the major peak from the test solution is NMT the major peak area from the standard solution (NMT 0.2%). The sum of peak areas of related substances other than the major peak from the test solution is not greater than 2.5 times the major peak area from the standard solution (NMT 0.5%). But exclude small peaks that are smaller than 0.25 times the major peak area from the standard solution (NMT 0.05%).

Operating conditions

Detector: An ultraviolet absorption photometer

(wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of a solution, where 0.1% phosphoric acid solution and 0.16% sodium dihydrogen phosphate buffer solution are mixed in the same volume with the pH adjusted to 2.5, and methanol (17 : 33).

Flow rate: 1 mL/minute (the retention time of diclofenac: about 25 minutes, the retention time of related substances A (1-(2,6-dichlorophenyl)-1,3-dihydro-2H-indole-2-one): about 12 minutes).

System suitability

System performance: Weigh 1 mg of related substances A (1-(2,6-dichlorophenyl)-1,3-dihydro-2H-indole-2-one) RS, dissolve in the mobile phase, add 1mL of the test solution and the mobile phase to make exactly 200 mL, and use this solution as the system suitability solution. Proceed with 20 μL of this solution according to the above conditions; the resolution between diclofenac and elated substances A (1-(2,6-dichlorophenyl)-1,3-dihydro-2H-indole-2-one) is NLT 6.5.

Detection sensitivity: Adjust the detection sensitivity so that the peak heights are about 50% of the full scale when proceeding with 20 μL of the system suitability solution according to the above conditions.

Time span of measurement: About 1.5 times the retention time of diclofenac.

Loss on drying NMT 0.1% (3 g, room temperature, 24 hours, in vacuum).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.2 g of Diclofenac Diethylammonium, previously dried, dissolve in 30 mL of acetic acid(100) for non-aqueous titration, and titrate with 0.1 mol/L perchloric acid VS as directed in the potentiometric titration under the Titrimetry. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 36.929 mg of $C_{18}H_{22}Cl_2N_2O_2$

Packaging and storage Preserve in well-closed containers, protected from heat.

Diclofenac Diethylammonium Cream
디클로페낙디에틸암모늄 크림

Diclofenac Diethylammonium Cream contains NLT 95.0% and NMT 105.0% of the labeled amount of diclofenac diethylammonium ($C_{18}H_{22}Cl_2N_2O_2$: 369.29).

Method of preparation Prepare as directed under Creams, with Diclofenac Diethylammonium.

Identification Weigh an amount of Diclofenac Diethylammonium Cream, equivalent to 50 mg of diclofenac diethylammonium, add 25 mL of 0.5 mol/L lithium chloride-methanol solution, shake to mix to make a homogeneous suspension, then add chloroform to make 50 mL. Shake this solution vigorously to mix, centrifuge for 10 minutes, and use the clear supernatant as the test solution. Separately, weigh accurately 50 mg of diclofenac diethylammonium RS, add 25 mL of 0.5 mol/L lithium chloride-methanol solution, add chloroform to make 50 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution onto a thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of toluene, formic acid and *n*-hexane (20 : 3 : 2) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Spray 0.5% potassium dichromate-sulfuric acid TS on the plate; the R_f values and colors of the spots from the test solution and the standard solution are the same.

Assay Weigh accurately an amount of Diclofenac Diethylammonium Cream, equivalent to about 50 mg of diclofenac diethylammonium ($C_{18}H_{22}Cl_2N_2O_2$), and add water to make 500 mL. Filter this solution, take 10.0 mL of the filtrate, add methanol to make 20 mL, and use this solution as the test solution. Separately, weigh accurately about 50 mg of diclofenac diethylammonium RS and dissolve in a mixture of water and methanol (1 : 1) to make 100 mL. Pipet 10.0 mL of the resulting solution, add a mixture of water and methanol (1 : 1) to make 100 mL, and use this solution as the standard solution. Perform the test with 25 μL each of the test solution and the standard solution as directed under the Liquid Chromatography and determine the peak area of diclofenac diethylammonium, A_T and A_S, for each solution.

$$\text{Amount (mg) of diclofenac diethylammonium } (C_{18}H_{22}Cl_2N_2O_2) = \text{Amount (mg) of diclofenac diethylammonium} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

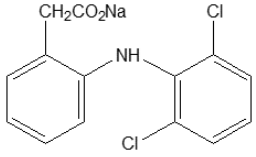
Column: A stainless steel column about 4 mm in internal diameter and about 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 to 10 μm in particle diameter).

Mobile phase: A mixture of 0.1 mol/L sodium acetate-methanol and water (1 : 1).

Flow rate: 2 mL/min

Packaging and storage Preserve in tight containers.

Diclofenac Sodium
디클로페낙나트륨



$C_{14}H_{10}Cl_2NNaO_2$: 318.13
Sodium 2-(2-(2,6-dichlorophenylamino)phenyl)acetate
[*15307-79-6*]

Diclofenac Sodium, when dried, contains NLT 98.5% and NMT 101.0% of diclofenac sodium ($C_{14}H_{10}Cl_2NNaO_2$).

Description Diclofenac Sodium occurs as white to pale yellow crystals or a crystalline powder.
It is freely soluble in methanol or ethanol(95), sparingly soluble in acetic acid(100) and practically insoluble in ether.
It is hygroscopic.

Identification (1) Take 1 mL of Diclofenac Sodium in methanol solution (1 in 250), and add 1 mL of nitric acid; the resulting solution exhibits a dark red color.

(2) Perform the Flame Coloration (2) with 5 mg of Diclofenac Sodium; it exhibits a pale green color.

(3) Determine the infrared spectra of Diclofenac Sodium and diclofenac sodium RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(4) An aqueous solution of Diclofenac Sodium (1 in 100) to the Qualitative Analysis for sodium salt.

Purity (1) ***Clarity and color of solution***—Dissolve about 1.0 g of Diclofenac Sodium in 20 mL of methanol; the resulting solution exhibits a colorless to pale yellow color. Perform the test with this solution as directed under the Ultraviolet-visible Spectroscopy; the absorbance at the wavelength of 440 nm is NMT 0.050.

(2) ***Heavy metals***—Proceed with about 2.0 g of Diclofenac Sodium and perform the test according to Method 2. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Arsenic***—Proceed with about 1.0 g of Diclofenac Sodium according to Method 3 and perform the test (NMT 2 ppm).

(4) ***Related substances***—Dissolve about 50 mg of Diclofenac Sodium in 50 mL of the mobile phase, and use this solution as the test solution. Pipet 1.0 mL of this solution and add the mobile phase to make exactly 50 mL. Pipet5 mL of the test solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions. Determine each peak area of each solution by the automatic integration method; the total area of the peaks other than diclofenac sodium obtained the test solution is NMT the peak area from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 240 nm).

Column: A stainless steel column about 4 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (7 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: A mixture of methanol and diluted acetic acid(100) (3 in 2500) (4 : 3).

Flow rate: Adjust the flow rate so that the retention time of diclofenac is about 20 minutes.

System suitability

System performance: Dissolve 35 mg of ethylparaben and 50 mg of propyl p-hydroxybenzoate in 100 mL of the mobile phase and take 1 mL of this solution to make 50 mL. Proceed with 20 μL of this solution according to the above operating conditions, ethylparaben and propyl p-hydroxybenzoate are eluted in this order with the resolution between these peaks being NLT 5.

System repeatability: Perform the test six times with 20 μL of the standard solution according to the above operating conditions, the relative standard deviation of the peak area of diclofenac is NMT 2.0%

Time span of measurement: About 2 times of the retention time of diclofenac beginning after the solvent peak.

Loss on drying NMT 0.5% (1 g, 105 °C, 3 hours).

Assay Weigh accurately about 0.5 g of Diclofenac Sodium, previously dried, transfer to a separatory funnel, dissolve in 40 mL of water, and add 2 mL of dilute hydrochloric acid. Extract the precipitate with 50 mL of chloroform. Extract 2 times with 20 mL each of chloroform, and filter the extracts using a cotton wool wet with chloroform each time. Wash the end of the separatory funnel and the cotton wool with 15 mL of chloroform, add the washings to the extract, add 10 mL of 1 mol/L hydrochloric acid in ethanol(99.5) solution (1 in 100), and titrate with 0.1 mol/L potassium hydroxide and ethanol VS (99.5) from the equivalence point 1 to the equivalence point 2 (potentiometric titration under the Titrimetry).

Each mL of 0.1 mol/L potassium hydroxide VS
= 31.813 mg of $C_{14}H_{10}Cl_2NNaO_2$

Packaging and storage Preserve in tight containers.

Diclofenac Sodium Injection
디클로페낙나트륨 주사액

Diclofenac Sodium Injection contains NLT 95.0% and NMT 105.0% the labeled amount of diclofenac sodium ($C_{14}H_{10}Cl_2NNaO_2$: 318.13).

Method of preparation Prepare Diclofenac Sodium Injection as directed under Injections, with Diclofenac Sodium.

Identification Weigh an amount of Diclofenac Sodium Injection, equivalent to 50 mg of diclofenac sodium, add methanol to make 25 mL, and use this solution as the test solution. Separately, weigh 50 mg of diclofenac sodium RS, add methanol to make 25 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, methanol and acetic acid(100) (30 : 10 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the R_f value and the color of the spots obtained from the test and the standard solutions are the same.

pH Between 8.0 and 9.0.

Sterility Meets the requirements.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

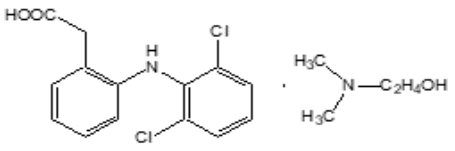
Extractable volume of injections Meets the requirements.

Assay Weigh accurately an amount of Diclofenac Sodium Injection, equivalent to 50 mg of diclofenac sodium ($C_{14}H_{10}Cl_2NNaO_2$), add 0.01 mol/L methanolic sodium hydroxide to make exactly 200 mL. Pipet 5 mL of this solution, add 0.01 mol/L methanolic sodium hydroxide to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 50 mg of diclofenac sodium RS, add 0.01 mol/L methanolic sodium hydroxide to make exactly 200 mL. Pipet 5 mL of this solution, add 0.01 mol/L methanolic sodium hydroxide to make 100 mL, and use this solution as the standard Solution. With the test solution and the standard solution, perform the test as directed under the Ultraviolet-visible Spectroscopy, using 0.01 mol/L methanolic sodium hydroxide solution as the control solution, and determine the absorbances, A_T and A_S at a wavelength of 282 nm.

Amount (mg) of diclofenac sodium ($C_{14}H_{10}Cl_2NNaO_2$)
= Amount (mg) of diclofenac sodium RS × (A_T / A_S)

Packaging and storage Preserve in hermetic containers.

Diclofenac β-Dimethylaminoethanol
디클로페낙β-디메틸아미노에탄올



$C_{18}H_{22}Cl_2N_2O_3$: 385.28
2-[(2,6-Dichlorophenyl)amino]-benzeneacetic acid 2-dimethylaminoethanol salt, [*81811-14-5*]

Diclofenac β-Dimethylaminoethanol contains NLT 99.0% and NMT 101.0% of diclofenac β-dimethylaminoethanol when weighing with diclofenac ($C_{14}H_{11}Cl_2NO_2$: 296.15) and *β*-dimethylaminoethanol ($C_4H_{11}NO$: 89.14) (1 : 1), calculated on the anhydrous basis.

Description Diclofenac β-Dimethylaminoethanol occurs as a white crystalline powder and has a slight, characteristic odor.
It is very soluble in ethanol, methanol, chloroform and acetic acid(100), soluble in hot water, and practically insoluble in ether.
It is soluble in 0.1 mol/L sodium hydroxide and practically insoluble in 0.1 mol/L hydrochloric acid.

Identification (1) Determine the absorption spectra of Diclofenac β-Dimethylaminoethanol in ethanol solution (1 in 67000) as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum at the wavelength of 282 nm.

(2) Determine the infrared spectra of Diclofenac β-Dimethylaminoethanol and diclofenac β-dimethylaminoethanol RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both exhibit similar intensities of absorption at the same wavenumbers.

Melting point Between 119 and 127 ℃.

Purity (1) ***Heavy metals***—Add 3 mL of 2 mol/L hydrochloric acid in the residue of the ignition test, and dissolve by warming. Cool, add 2 mL of water, 5 mL of 2 mol/L ammonia water, and 2 drops of sodium sulfide TS; the resulting solution does not exhibit a change in color.

Sodium sulfide TS—Dissolve sodium sulfide in a mixture of glycerin and water (35 : 65) to make the concentration of the solution 6%.

(2) ***Related substances***—Dissolve about 0.5 g of Diclofenac β-Dimethylaminoethanol in 10 mL of ethanol and use this solution as the test solution. Separately, weigh accurately about 25 mg of diclofenac β-dimethylaminoethanol RS and add ethanol to make 100.0 mL. Take 5.0 mL of this solution, add ethanol to make 50.0 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of benzene, dioxane, and acetic acid(100) (90 : 25 : 4) to a distance of about 15 cm, and air-dry the plate. Examine the plate under ultraviolet light (wavelength 254 nm, diclofenac), and soak in iodine steam (β-dimethylaminoethanol) saturation; the spots other than the principal spot is not more intense or larger than the major peak from the standard solution.

Water NMT 1.0% (0.2 g, volumetric titration, direct titration).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 200 mg of Diclofenac β-Dimethylaminoethanol, dissolve in 80 mL of acetic acid(100) for non-aqueous titration and 10 mL of acetic anhydride, and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 38.528 mg of $C_{18}H_{22}Cl_2N_2O_3$

Packaging and storage Preserve in tight containers.

Diclofenac β-Dimethylaminoethanol Injection
디클로페낙 β-디메틸아미노에탄올 주사액

Diclofenac β-Dimethylaminoethanol Injection contains NLT 95.0% and NMT 105.0% the labeled amount of diclofenac β-dimethylaminoethanol ($C_{18}H_{22}Cl_2N_2O_3$: 385.28).

Method of preparation Prepare as directed under Injections, with Diclofenac β-dimethylaminoethanol.

Identification Determine the absorption spectrum of the test solution in the Assay as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum at the wavelength of about 282 nm.

pH Between 7.5 and 9.5.

Sterility Meets the requirements.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

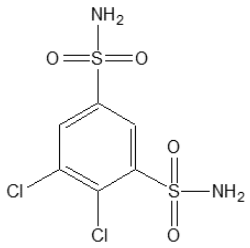
Extractable volume of injections Meets the requirements.

Assay Weigh accurately an amount of Diclofenac β-Dimethylaminoethanol Injection, equivalent to 0.15 g of diclofenac β-dimethylaminoethanol, and add ethanol(95) to make exactly 100 mL. Take 2 mL of this solution, add ethanol(95) to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 0.15 g of diclofenac β-dimethylaminoethanol, proceed in the same manner as in the test solution, and use this solution as the standard solution. Perform the test with the test solution and standard solution as directed under the Ultraviolet-visible Spectroscopy, using ethanol(95) as a control solution, and determine the absorbances, A_T and A_S at a wavelength of 282 nm.

Amount (mg) of Diclofenac *β*-dimethylaminoethanol ($C_{18}H_{22}Cl_2N_2O_3$)
= Amount (mg) of diclofenac *β*-dimethylaminoethanol RS × (A_T / A_S)

Packaging and storage Preserve in light-resistant, hermetic containers.

Diclofenamide
디클로페나미드



$C_6H_6Cl_2N_2O_4S_2$: 305.16
4,5-Dichlorobenzene-1,3-disulfonamide [*120-97-8*]

Diclofenamide, when dried, contains NLT 98.0% and NMT 101.0% of diclofenamide ($C_6H_6Cl_2N_2O_4S_2$).

Description Diclofenamide occurs as a white crystalline powder.
It is very soluble in *N*,*N*-dimethylformamide, soluble in ethanol(95), slightly soluble in ether, and very slightly soluble in water.
It dissolves in sodium hydroxide TS.

Identification (1) Dissolve 10 mg of Diclofenamide and diclofenamide RS in 100 mL of 0.01 mol/L sodium hydroxide TS. To 10 mL each of these solutions, add 0.1 mL of hydrochloric acid, and determine the absorption spectra as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Diclofenamide and diclofenamideRS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Melting point Between 237 and 240 ℃.

Purity (1) ***Chloride***—Dissolve about 0.10 g of Diclofenamide in 10 mL of *N*,*N*-Dimethylformamide and add 6 mL of dilute nitric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 0.45 mL of 0.01 mol/L hydrochloric acid VS, 10 mL of *N*,*N*-Dimethylformamide, 6 mL of dilute nitric acid and water to make 50 mL (NMT 0.160%).

(2) ***Selenium***—Add 0.5 mL of a mixture of 0.5 mL of perchloric acid and sulfuric acid (1 : 1), 2 mL of nitric acid to about 0.10 g of Diclofenamide, and heat on a steam bath. When a brown gas is not produced and the solution becomes clear with a pale yellow color, cool the solution. Then, add 4 mL of nitric acid and water to make exactly 50 mL, and use this solution as the test solution. Separately, pipet 3 mL of selenium standard solution, add 0.5 mL of a mixture of perchloric acid and sulfuric acid (1 : 1), 6 mL of nitric acid and water to make exactly 50 mL, and use this solution as the standard solution. Perform the test with the standard and the test solution as directed under the Atomic Absorption Spectroscopy, and determine the absorbance A_T for the test solution and A_S for the standard solution when the reading of the display rapidly rises and, then, reaches a plateau; A_T is less than A_S (NMT 30 ppm). This test is performed using a hydride generator and a heating cell.

Lamp: Selenium hollow-cathode lamp
Wavelength: 196.0 nm
Atomizing temperature: When an electric furnace is used, the temperature is set at about 1000℃.
Carrier gas: Nitrogen or argon

(3) ***Heavy metals***—Proceed with about 2.0 g of Diclofenamide and perform the test according to Method 2. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(4) ***Related substances***—Dissolve about 0.10 g of Diclofenamide in 50 mL of the mobile phase and use this solution as the test solution. Pipet 2 mL of the test solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions. Determine each peak area of each solution by the automatic integration method; the total area of the peaks other than the peak of diclofenamide from the test solution is not greater than the peak area of diclofenamide from the standard solution.

Operating conditions
For the detector, column, column temperature, mobile phase and flow rate, proceed as directed in the operating conditions under the Assay.
System suitability
For system performance, follow the system suitability under the Assay.
Test for required detectability: Pipet 5 mL of the standard solution and add water to make 100 mL. Confirm that the peak area of diclofenamide obtained with 10 μL of this solution is equivalent to NLT 3.5% and NMT 6.5% of the peak area of diclofenamide in the standard solution.
System repeatability: Perform the test six times with 10 μL of the standard solution according to the above conditions; the relative standard deviation of the peak area of diclofenamide is NMT 1.0%.
Time span of measurement: About 5 times the retention time of diclofenamide.

Loss on drying NMT 1.0% (1 g, NMT 0.67 kPa, 100 ℃, 5 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Dissolve about 50 mg each of Diclofenamide and diclofenamide RS, previously dried and accurately weighed, in 30 mL of the mobile phase, add exactly 10 mL each of the internal standard solution, and add the mobile phase to make 50 mL. Use these solutions as the test solution and the standard solution, respectively. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the ratios, Q_T and Q_S, of the peak area of the internal standard to diclofenamide peak area.

$$\text{Amount (mg) of diclofenamide } (C_6H_6Cl_2N_2O_4S_2) = \text{Amount (mg) of diclofenamide} \times \frac{Q_T}{Q_S}$$

Internal Standard solution—A solution of butyl p-hydroxybenzoate in the mobile phase (3 in 5000).

Operating conditions
Detector: An ultraviolet absorption photometer (wavelength: 280 nm).
Column: A stainless steel column about 4 mm in internal diameter and 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: A mixture of sodium phosphate TS and acetonitrile (1 : 1).

Flow rate: Adjust the flow rate so that the retention time of diclofenamide is about 7 minutes.

System suitability

System performance: Proceed with 10 μL of the standard solution according to the above operating conditions; diclofenamide and internal standard are eluted in this order with the resolution between their peaks being NLT 9.

System repeatability: Perform the test six times with 10 μL of the standard solution according to the above conditions; the relative standard deviation of the peak area of diclofenamide is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Diclofenamide Tablets
디클로페나미드 정

Diclofenamide Tablets contain NLT 92.0% and NMT 108.0% of dichlorphenamide ($C_6H_6Cl_2N_2O_4S_2$: 305.16) of the labeled amount.

Method of preparation Diclofenamide Tablets are prepared as directed under Tablets, with Dichlorphenamide.

Identification Weigh an amount of Diclofenamide Tablets, previously powdered, equivalent to 0.2 g of dichlorphenamide according to the labeled amount, add 20 mL of methanol, shake to mix, and filter. Evaporate the filtrate on a steam bath to dryness and dissolve 10 mg of the residue in 100 mL of 0.01 mol/L sodium hydroxide TS. To 10 mL of this solution, add 0.1 mL of hydrochloric acid and determine the absorption spectrum of this solution as directed under the Ultraviolet-visible Spectroscopy; it exhibits maxima between 284 nm and 288 nm and 293 nm and 297 nm.

Dissolution Perform the test with 1 tablet of Diclofenamide Tablets at 50 revolutions per minute according to Method 2, using 900 mL of water as the dissolution medium. Take NLT 20 mL of the dissolved solution 60 minutes after starting the test and filter by a membrane filter with a pore size of not exceeding 0.8 μm. Discard the first 10 mL of the filtrate, pipet *V* mL of the subsequent filtrate, add the dissolution solution to make exactly *V'* mL to obtain a solution having known concentration of 55 μg of diclofenamide per mL, and use this solution as the test solution. Separately, weigh accurately about 55 mg of diclofenamide RS, previously dried at a pressure not exceeding 0.67 kPa at 100 °C for 5 hours, dissolve in 10 mL of ethanol(95) and add water to make exactly 100 mL. Pipet 10 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at 285 nm as directed under the Ultraviolet-visible Spectroscopy.

It meets the requirements if the dissolution rate of Glimepiride Tablets in 60 minutes is NLT 70%.

Dissolution rate (%) with respect to the labeled amount of diclofenamide

$$= W_S \times \frac{A_T}{A_S} \times \frac{1}{C} \times 90$$

*W*s: Amount (mg) of dichlorphenamide RS

C: Labeled amount (mg) of dichlorphenamide ($C_6H_6Cl_2N_2O_4S_2$) in 1 tablet.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately NLT 20 tablets of Diclofenamide Tablets and powder. Weigh accurately an amount of Diclofenamide Tablets equivalent to about 50 mg of diclofenamide ($C_6H_6Cl_2N_2O_4S_2$), add exactly 25 mL of the mobile phase and shake for 15 minutes and centrifuge. Pipet 10.0 mL of the clear supernatant, add 4.0 mL of the internal standard solution and the mobile phase to make exactly 20 mL and use this solution as the test solution. Separately, weigh accurately about 50 mg of diclofenamide RS, previously dried at 100 °C at a pressure not exceeding 0.67 kPa for 5 hours, dissolve in 30 mL of the mobile phase, add 10.0 mL of the internal standard solution and the mobile phase to make exactly 50 mL and use this solution as the standard solution. Perform the test as directed under the Assay of Dichlorphenamide.

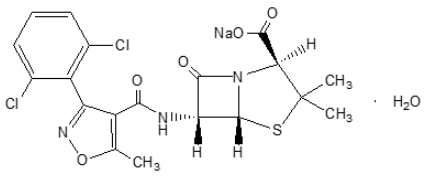
Amount (mg) of diclofenamide ($C_6H_6Cl_2N_2O_4S_2$)

$$= \text{Amount (mg) of diclofenamide} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of butyl p-hydroxybenzoate in the mobile phase (3 in 5000).

Packaging and storage Preserve in well-closed containers.

Dicloxacillin Sodium Hydrate
디클록사실린나트륨수화물



$C_{19}H_{16}Cl_2N_3NaO_5S \cdot H_2O$: 510.33

Sodium(2*S*,5*R*,6*R*)-6-[[3-(2,6-dichlorophenyl)-5-methyl-1,2-oxazole-4-carbonyl]amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-

carboxylate hydrate [*13412-64-1*]

Dicloxacillin Sodium Hydrate contains NLT 910 μg and NMT 1020 μg (potency) of dicloxacillin ($C_{19}H_{17}Cl_2N_3O_5S$: 470.33) per mg, calculated on the anhydrous basis.

Description Dicloxacillin Sodium Hydrate occurs as a white to pale yellow crystalline powder.
It is freely soluble in water and methanol, and soluble in ethanol(95).

Identification (1) Determine the absorption spectra of aqueous solutions of Dicloxacillin Sodium Hydrate and dicloxacillin sodium RS (1 in 2500) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelength.

(2) Determine the infrared spectra of Dicloxacillin Sodium Hydrate and dicloxacillin sodium RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) An aqueous solution of Dicloxacillin Sodium Hydrate responds to the Qualitative Analysis (1) for sodium salt.

Crystallinity Meets the requirements.

pH Dissolve 1.0 g of Dicloxacillin Sodium Hydrate in 10 mL of water; the pH of this solution is between 4.5 and 7.5.

Purity ***Dimethylaniline***—Weigh accurately about 1.0 g of Dicloxacillin Sodium Hydrate, add 5 mL of 1 mol/L sodium hydroxide TS and 1 mL of the internal standard solution, centrifuge, if necessary, and use the clear supernatant as the test solution. Separately, weigh accurately about 50 mg of dimethylaniline, add 2.0 mL of hydrochloric acid, and add water to make 50 mL. Pipet 5.0 mL of this solution and add water to make exactly 250 mL. Pipet 1.0 mL of this solution, add 5.0 mL of 1 mol/L sodium hydroxide TS and 1.0 mL of the internal standard solution, centrifuge, if necessary, and use the clear supernatant as the standard solution. Perform the test with 1 μL each of the test solution and the standard solution as directed under the Gas Chromatography according to the following conditions, and calculate the ratios of the peak area, Q_T and Q_S, of dimethylaniline to that of the internal standard in the test solution and the standard solution, respectively (NMT 20 ppm).

$$\text{Content (ppm) of dimethylaniline} = \text{Amount (mg) of dimethylaniline taken} \times \frac{Q_T}{Q_S} \times \frac{\text{Purity (\%) of dimethylaniline}}{\text{Amount (mg) of Dicloxacillin Sodium Hydrate}} \times 4$$

Internal standard solution—Dissolve 50.0 mg of naphthalene in cyclohexane to make 50 mL. Take 5.0 mL of this solution, add cyclohexane to make 100 mL, and use this solution as the internal standard solution.

Operating conditions

Detector: A flame ionization detector

Column: A column about 2 mm in internal diameter and about 2 m in length, packed with diatomaceous earth for gas chromatography, which is coated with 50% phenyl-50% methylpolysiloxane for gas chromatography equivalent to 3% of the mass of the diatomaceous earth for gas chromatography.

Column temperature: 120 °C

Temperatures of the sample injection port and the detector: 150 °C

Carrier gas: Nitrogen

Flow rate: 30 mL/min

Water Between 3.0% and 4.5% (0.1 g, volumetric titration, direct titration).

Sterility It meets the requirements when used in the manufacturing of sterile preparations. However, it is excluded in cases where there is a terminal sterilization process in the manufacturing process of sterile preparations.

Pyrogen It meets the requirements when used in the manufacturing of sterile preparations. Weigh an appropriate amount of Dicloxacillin Sodium Hydrate, dissolve in isotonic sodium chloride injection to prepare a solution containing 20 mg (potency) per mL, and use this solution as the test solution. However, the test solution injected to a rabbit should be 1.0 mL per kg of the rabbit weight.

Assay Weigh accurately about 230 mg (potency) each of Dicloxacillin Sodium Hydraten and dicloxacillin sodium RS, dissolve each in 0.1% phosphate buffer solution (pH 5.0), and add water to make exactly 200 mL. Use this solution as the test solution. Use these solutions promptly after preparation. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S of dicloxacillin sodium from each solution, respectively.

$$\text{Potency (μg) of dicloxacillin } (C_{19}H_{16}Cl_2N_3NaO_5S) = \text{Potency (μg) of dicloxacillin sodium RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 225 nm).

Column: A stainless-steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of 0.02 mol/L potassium dihydrogen phosphate buffer solution and acetonitrile (65 : 35).

Flow rate: 1.0 mL/min

System suitability

System performance: Proceed with 20 μL of the standard solution according to the above operating conditions; the number of theoretical plates is NLT 700 and the symmetry factor is NMT 2.0.

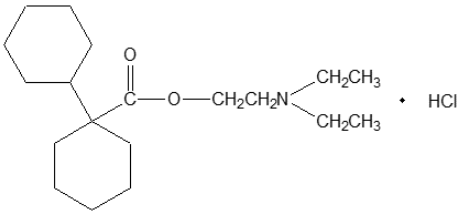
System repeatability: Repeat the test 6 times with 20 μL of the standard solution according to the above operating conditions; the relative standard deviation of the peak areas of dicloxacillin is NMT 2.0%.

1% phosphate buffer solution (pH 5.0)—Dissolve 5.444 g of potassium dihydrogen phosphate in water to make 2000 mL, and add phosphoric acid to adjust the pH to 5.0.

0.20 mol/L potassium dihydrogen phosphate buffer solution—Dissolve 2.7 g of potassium dihydrogen phosphate to make 1000 mL, and add phosphoric acid to adjust the pH to 5.0.

Packaging and storage Preserve in tight containers.

Dicyclomine Hydrochloride
디시클로민염산염



$C_{19}H_{35}NO_2 \cdot HCl$: 345.95

2-(Diethylamino)ethyl-1-cyclohexylcyclohexane-1-carboxylate hydrochloride [*67-92-5*]

Dicyclomine Hydrochloride contains NLT 99.0% and NMT 102.0% of dicyclomine hydrochloride ($C_{19}H_{35}NO_2 \cdot HCl$), calculated on an anhydrous basis.

Description Dicyclomine Hydrochloride occurs as a white fine crystalline powder, which is odorless and has a bitter taste.

It is soluble in water, freely soluble in ethanol(95) or chloroform, and very slightly soluble in ether.

Identification (1) To 5 mL of an aqueous solution of Dicyclomine Hydrochloride (1 in 500), add 2 mL of 2 mol/L nitric acid, mix, and 2 mL of silver nitrate TS; a white precipitate is formed. The precipitate does not dissolve in nitric acid and dissolves in an excessive amount of ammonia TS.

(2) Determine the infrared spectra of Dicyclomine Hydrochloride and dicyclomine hydrochloride RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Melting point Between 169 and 174 ℃.

pH Dissolve 1.0 g of Dyclomine Hydrochloride in 100 mL of water; the pH of this solution is between 5.0 and 5.5.

Purity ***Readily carbonizable substances***—Proceed with 0.5 g of Dicyclomine Hydrochloride and perform the test. The color of the solution is not more intense than that of the matching fluids for D.

Loss on drying NMT 1.0% (1 g, 105 ℃, 4 hours).

Assay Weigh accurately about 40 mg of Dicyclomine Hydrochloride, add dilute solution to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 10 mg of dicyclomine hydrochloride RS, add dilute solution to make exactly 25 mL, and use this solution as the standard solution. Perform the test with 50 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas of dicyclomine dydrochloride A_T and A_S.

Amount (mg) of dyclomine hydrochloride ($C_{19}H_{35}NO_2 \cdot HCl$)
= Amount (mg) of dyclomine hydrochloride RS
× (A_T / A_S) × 4

Diluent—A mixture of acetonitrile and water (7 : 3).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 215 nm).

Column: A stainless-steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octylsilane silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of acetonitrile and potassium dihydrogen phosphate buffer solution, pH 7.5 (70 : 30).

Potassium dihydrogen phosphate buffer solution, pH 7.5—Dissolve 2.72 g of potassium dihydrogen phosphate in 900 mL of water, adjust pH to 7.5 by adding sodium hydroxide (1 in 10), and then add water to make 1000 mL.

Flow rate: 1 mL/min

System suitability

System performance: Proceed with 50 μL of the standard solution according to the above conditions; the symmetry factor of the dicyclomine hydrochloride peak is NMT 2.0.

System repeatability: Perform the test six times with 50 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area of dicyclomine hydrochloride is NMT 2.0%.

Packaging and storage Preserve in well-closed containers.

Dicyclomine Hydrochloride and Papaverine Hydrochloride Tablets
디시클로민염산염·파파베린염산염 정

Dicyclomine Hydrochloride and Papaverine Hydrochloride Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of dicyclomine hydrochloride ($C_{19}H_{35}NO_2$·HCl : 345.95) and papaverine hydrochloride ($C_{20}H_{21}NO_4$·HCl : 375.85).

Method of preparation Prepare as directed under Tablets, with Dicyclomine Hydrochloride and Papaverine Hydrochloride.

Identification The retention times of the major peaks of dicyclomine hydrochloride and papaverine hydrochloride, and the ultraviolet absorption spectrum between 190 and 300 nm obtained from the test solution and the standard solution under the Assay are the same.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 tablets of Dicyclomine Hydrochloride and Papaverine Hydrochloride Tablets, and powder. Weigh accurately a portion of the powder, equivalent to about 10 mg of dicyclomine hydrochloride ($C_{19}H_{35}NO_2$·HCl) and 30 mg of papaverine hydrochloride ($C_{20}H_{21}NO_4$·HCl), and add 50% methanol to make 100 mL. Sonicate this solution for 20 minutes, filter through a membrane filter with a pore size of NMT 0.45 μm, discard the first 2 mL of the filtrate, and use the subsequent filtrate as the test solution. Separately, weigh accurately about 10 mg of dicyclomine hydrochloride RS and about 30 mg of papaverine hydrochloride RS respectively, add 50% methanol to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions, and determine the peak areas, A_{T1}, A_{S1}, A_{T2} and A_{S2} of dicyclomine hydrochloride and papaverine hydrochloride from each solution.

Amount (mg) of dicyclomine hydrochloride ($C_{19}H_{35}NO_2$·HCl)
= Amount (mg) of dicyclomine hydrochloride RS × $\frac{A_{T1}}{A_{S1}}$

Amount (mg) of papaverine hydrochloride ($C_{20}H_{21}NO_4$·HCl)
= Amount (mg) of papaverine hydrochloride RS × $\frac{A_{T2}}{A_{S2}}$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 220 nm). However, a photo-diode array detector (190 nm - 300 nm) is used when the Identification is performed.

Column: A stainless-steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 30 °C.

Mobile phase: Use mobile phases A and B to control a stepwise or gradient elution-wise as follows.

Mobile phase A: Dissolve 1.74 g of potassium monohydrogen phosphate in 900 mL of water, adjust the pH to 7.2 ± 0.1 with phosphoric acid, and add water to make 1000 mL. To 300 mL of this solution, add 700 mL of methanol.

Mobile phase B: Methanol

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 - 1	100	0
1 - 5	100 → 5	0 → 95
5 - 10	5	95

Flow rate: 1.0 mL/min

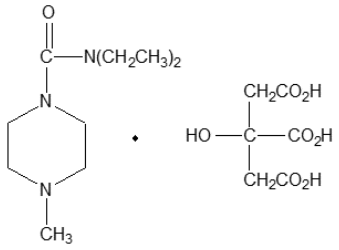
System suitability

System performance: Proceed with 10 μL of the standard solution under the above operating conditions; papaverine hydrochloride and dicyclomine hydrochloride are eluted in this order with the resolution between these peaks being NLT 31.0.

System repeatability: Repeat the test 6 times with each 10 μL of the standard solution according to the above conditions; the relative standard deviation of the peak areas of papaverine hydrochloride and dicyclomine hydrochloride is NMT 1.0%

Packaging and storage Preserve in well-closed containers.

Diethylcarbamazine Citrate
디에틸카르바마진시트르산염



$C_{10}H_{21}N_3O \cdot C_6H_8O_7$: 391.42

N,*N*-Diethyl-4-methylpiperazine-1-carboxamide; 2-hydroxypropane-1,2,3-tricarboxylic acid [*1642-54-2*]

Diethylcarbamazine Citrate, when dried, contains NLT 98.0% and NMT 101.0% of diethylcarbamazine citrate ($C_{10}H_{21}N_3O \cdot C_6H_8O_7$).

Description Diethylcarbamazine Citrate occurs as a white crystalline powder, which is odorless and has an acid and bitter taste.
It is very soluble in water, freely soluble in ethanol(95) and practically insoluble in acetone, chloroform and ether.
An aqueous solution of Diethylcarbamazine Citrate (1 in 20) is acidic.
It is hygroscopic.

Identification (1) Dissolve about 0.5 g of Diethylcarbamazine Citrate in 2 mL pf water, add 10 mL of sodium hydroxide TS, and extract 4 times with 5 mL of chloroform. Combine all the chloroform extracts, wash with 10 mL of water, evaporate the chloroform on a steam bath, and add 1 mL of ethyl iodide in the residue. Boil gently under a reflux condenser for 5 minutes. Evaporate excess ethyl iodide in a current of air, add 4 mL of ethanol(95), and cool in an ice water. Add ether while stirring until precipitate forms, and stir to mix until the precipitate becomes crystals. Allow to stand in iced water for 30 minutes, filter the crystals, dissolve the filtrate in 4 mL of ethanol(95), and repeat the same procedure. Recrystalize, dry at 105 ℃ for 4 hours; the melting point is between 151 and 155 ℃.

(2) Put dilute hydrochloric acid into the remaining solution, extracted with chloroform of (1), and neutralize the solution; the resulting solution responds to the Qualitative Analysis (2) and (3) for citrate.

Melting point Between 135.5 and 138.5 ℃.

Purity (1) ***Heavy metals***—Proceed with about 2.0 g of Diethylcarbamazine Citrate according to Method 4 and perform the test. Prepare the control solution with 4.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Related substances***—Weigh exactly 300 mg of Diethylcarbamazine Citrate, add 100 mL of phosphate buffer solution, mix, and filter or centrifuge. Use this solution as the test solution. Separately, weigh accurately an appropriate amount of diethylcarbamazine citrate RS, dissolve in phosphate buffer solution so that 1 mL of the solution contains about 3 μg of Diethylcarbamazine Citrate, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution according to the following conditions as directed under the Liquid Chromatography. Measure each peak area A_i other than the major peak obtained from the test solution and the peak area A_S of diethylcarbamazine from the standard solution, and calculate the amount of each related substances in the test solution according to the following formula; it is NMT 0.1%.

$$\text{Content (\%) of each related substance} = 10000 \times \frac{C}{W} \times \frac{A_i}{A_S}$$

C: Concentration (mg/mL) of diethylcarbamazine citrate in the standard solution.
W: Amount (mg) of Diethylcarbamazine Citrate.

Phosphate buffer solution—Dissolve 31.24 g of potassium dihydrogen phosphate in 1000 mL of water.

Operating conditions
Detector: An ultraviolet absorption photometer (wavelength: 220 nm).
Column: A stainless steel column about 3.9 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).
Mobile phase: A mixture of 1% potassium dihydrogen phosphate aqueous solution and methanol (900 : 100).
Flow rate: 0.8 mL/min
System suitability
System repeatability: Perform the test six times with 20 μL of the standard solution according to the above operating conditions; the relative standard deviation of the major peak area is NMT 2.0%.

Loss on drying NMT 1.0% (2 g, 105 °C, 4 hours).

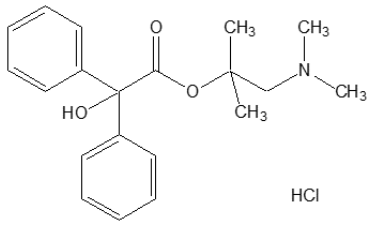
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.75 g of Diethylcarbamazine Citrate, dissolve in 50 mL of acetic acid(100), and dissolve by warming. Cool it down and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry) Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 39.142 mg of $C_{10}H_{21}N_3O \cdot C_6H_8O_7$

Packaging and storage Preserve in tight containers.

Difemerine Hydrochloride
디페메린염산염



$C_{20}H_{25}NO_3 \cdot HCl$: 363.88

α-Hydroxy-α-phenylbenzeneacetic acid 2-(dimethylamino)-2-methyl propyl ester hydrochloride, [*70280-88-5*]

Difemerine Hydrochloride, when dried, contains NLT 98.0% and NMT 102.0% of difemerine hydrochloride ($C_{20}H_{25}NO_3 \cdot HCl$: 363.88).

Description Difemerine Hydrochloride occurs as a white, crystalline powder. It is odorless and has a slightly bitter taste.

It is freely soluble in water, ethanol or chloroform, and sparingly soluble in isopropanol.

The pH of an aqueous solution of Difemerine Hydrochloride (5 in 100) is between 4.0 and 5.0.

Identification (1) Put a small portion of Difemerine Hydrochloride on the watch glass and add 1 mL of sulfuric acid; the red color appears.

(2) Add 0.5 mL of dilute nitric acid and 1 mL of silver nitrate TS to 2 mL of an aqueous solution of Difemerine Hydrochloride (5 in 100); white precipitates are formed, which are soluble in an excessive amount of ammonium hydroxide TS.

(3) Dissolve 0.5 g of Difemerine Hydrochloride in a mixture of methanol and diethylamine (100 : 0.2) to make 100 mL and use this solution as the test solution. Dissolve 0.5 g of Difemerine Hydrochloride RS in a mixture of methanol and diethylamine (100 : 2) to make 100 mL and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of methanol and diethylamine (100 : 0.2) and air-dry the plate. Spray a mixture of a solution prepared by dissolving 0.85 g of bismuth nitrate in 40 mL of water and 10 mL of acetic acid(100) and a solution prepared by dissolving 8.0 g of potassium iodide in 20 mL of water (1 : 1) on the plate; the *Rf* value and color of spots obtained from the test solution and the standard solution are the same.

(4) Determine the infrared spectra of Difemerine Hydrochloride and Difemerine Hydrochloride RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wave numbers.

Purity (1) ***Clarity and color of solution***—Dissolve 2.5 g of Difemerine Hydrochloride in 50 mL of water; the solution is colorless and clear.

(2) ***Heavy metals***—Proceed with 1.0 g of Difemerine Hydrochloride as directed under Method 1 of the Heavy Metals and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Benzilic acid***—Weigh accurately about 0.75 g of Difemerine Hydrochloride and dissolve by adding water to make 50.0 mL. Put 10.0 mL of this solution into a 20-mL volumetric flask, add 2.0 mL of 1.085% iron(III) chloride TS, and shake to mix. Add water to make 20 mL, and use this solution as the test solution. Separately, weigh accurately about 0.25 g of benzilic acid ($C_{14}H_{12}O_3$) RS, dissolve by adding 25 mL of ethanol, and put water to make 100.0 mL. Take 2.0 mL of this solution into a 20-mL volumetric flask, add 2.0 mL of 1.085% iron(III) chloride TS, and shake to mix. Add water to make 20 mL, and use this solution as the standard solution. Perform the test with the test solution and the standard solution as directed under the Ultraviolet-visible Spectroscopy, using a solution prepared by adding water to 2.0 mL of 1.085% iron(III) chloride TS to make 20.0 mL as the control solution, and determine the absorbances A_T and A_S at 376 nm wavelength. The content of benzilic acid in Difemerine Hydrochloride is NMT 0.5%.

(4) ***Isodifemerine hydrochloride***—Weigh accurately about 0.50 g of Difemerine Hydrochloride, dissolve in chloroform to make 5.0 mL, and use this solution as the test solution. Separately, weigh accurately about 0.50 g of Isodifemerine hydrochloride RS and dissolve by adding chloroform to make 100.0 mL. Take 10.0 mL of this solution, add chloroform to make 250.0 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak height from the chromatograms of the test solution (retention time: about 0.5 minutes) and the standard solution (retention time: about 2.5 minutes), respectively. The content of isodifemerine hydrochloride in Difemerine Hydrochloride is NMT 1.0%.

Operating conditions

Detector: A differential refractometer

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with porous silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of hexane, butanol, and triethylamine (87.5 : 12.5 : 0.2).

Flow rate: 2 mL/min

Loss on drying NMT 1.0% (1 g, 105 ℃ constant mass).

Assay Weigh accurately about 0.2 g of Difemerine Hy-

drochloride, previously dried, and dissolve by adding 30 mL of acetic acid(100) and 20 mL of acetic anhydride. Titrate with 0.1 mol/L perchloric acid VS (potentiometric titration in the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each of 0.1 mol/L perchloric acid
= 36.388 mg of $C_{20}H_{25}NO_3 \cdot HCl$

Packaging and storage Preserve in tight containers.

Difemerine Hydrochloride Capsules
디페메린염산염 캡슐

Difemerine Hydrochloride Capsules contain NLT 95.0% and NMT 105.0% the labeled amount of difemerine hydrochloride ($C_{20}H_{25}NO_3O6$ HCl : 363.88).

Method of preparation Prepared as directed under Capsules, with Difemerine Hydrochloride.

Identification (1) Put a small amount of Difemerine Hydrochloride Capsules on the watch glass and add 1 mL of sulfuric acid; the solution exhibits a red color.

(2) Add a small amount of Difemerine Hydrochloride Capsules in 5 mL of water, shake to mix, and filter. Take 2 mL of the filtrate in a test tube, add 0.5 mL of dilute nitric acid and 1 mL of silver nitrate TS; a white precipitate is formed and the precipitate dissolves in excess ammonia water.

(3) Weigh an amount of Difemerine Hydrochloride Capsules equivalent to 5 mg of difemerine hydrochloride, dissolve in the developing solvent, filter, and use the filtrate as the test solution. Separately, dissolve 0.5 g of difemerine hydrochloride RS in a mixture of methanol and diethylamine (100 : 2) to make 100 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot these solutions on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of methanol and ethylamine (100 : 0.2) as the developing solvent and air-dry the plate. Spray a mixture of a solution prepared by dissolving 0.85 g of bismuth nitrate in 40 mL of water and 10 mL of acetic acid(100) and a solution prepared by dissolving 8.0 g of potassium iodide in 20 mL of water (1 : 1) on the plate; the R_f values and colors of spots obtained from the test solution and the standard solution are the same.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 capsules of Difemerine Hydrochloride Capsules and shake well to mix. Weigh accurately an amount equivalent to 25 mg of difemerine hydrochloride ($C_{20}H_{25}NO_3 \cdot HCl$), add 50 mL of 50% methanol, and use this solution as the test solution. Separately, weigh accurately about 25 mg of difemerine hydrochloride, add 50% methanol to make 50 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas of difemerine hydrochloride from each solution, A_T and A_S, respectively.

Amount (mg) of difemerine hydrochloride ($C_{20}H_{25}NO_3 \cdot HCl$)
$= \text{Amount (mg) of difemerine hydrochloride RS} \times \frac{A_T}{A_S}$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column, about 4.0 μm in internal diameter and about 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography.

Mobile phase: A mixture of water, methanol and acetic acid (50 : 50 : 1).

Flow rate: 1.0 mL/min

Packaging and storage Preserve in tight containers.

Difemerine Hydrochloride Injection
디페메린염산염 주사액

Difemerine Hydrochloride Injection contains NLT 95.0% and NMT 105.0% the labeled amount of difemerine hydrochloride ($C_{20}H_{25}NO_3 \cdot HCl$: 363.88).

Method of preparation Prepare Difemerine Hydrochloride Injection as directed under Injections, with Difemerine Hydrochloride.

Description Difemerine Hydrochloride Injection occurs as a clear, colorless liquid.

Identification (1) Put 2 to 3 spots of Difemerine Hydrochloride Injection on a watch glass and add 1 mL of sulfuric acid; the resulting solution exhibits a red color.

(2) Add 0.5 mL of dilute nitric acid and 1 mL of silver nitrate TS to 2 mL of Difemerine Hydrochloride Injection; precipitates are formed, which are soluble in an excessive amount of ammonium hydroxide TS.

(3) Weigh an amount equivalent to about 0.5 g of difemerine hydrochloride according to the labeled amount, add a mixture of methanol and diethylamine (100 : 0.2) to make 100 mL, and use this solution as the test solution. Dissolve 0.5 g of difemerine hydrochloride RS in a mixture of methanol and diethylamine (100 : 0.2) to make 100 mL, and use this solution as the standard

solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of methanol and diethylamine (100 : 0.2) as the developing solvent and air-dry the plate. Spray a mixture of a solution prepared by dissolving 0.85 g of bismuth nitrate in 40 mL of water and 10 mL of acetic acid(100) and a solution prepared by dissolving 8.0 g of potassium iodide in 20 mL of water (1 : 1) on the plate; the R_f value and color of spots obtained from the test solution and the standard solution are the same.

pH Between 3.2 and 5.2.

Sterility Meets the requirements.

Bacterial endotoxins Less than 150 EU per mg of difemerine hydrochloride.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

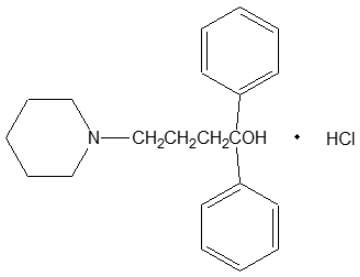
Extractable volume of injections Meets the requirements.

Assay Weigh accurately an amount equivalent to 10 mg of difemerine hydrochloride ($C_{20}H_{25}NO_3$·HCl) according to the labeled amount, transfer to a 25-mL volumetric flask, add water to make 25 mL, and use this solution as the test solution. Separately, weigh accurately about 10 mg of difemerine hydrochloride RS, add water to make 25 mL, and use this solution as the standard solution. Determine the absorbance of the test solution and the standard solution, A_T and A_S at 258 nm using water as a control solution as directed under the Ultraviolet-visible Spectroscopy.

$$\text{Amount (mg) of difemerine hydrochloride } (C_{20}H_{25}NO_3\cdot HCl) = \text{Amount (mg) of difemerine hydrochloride RS} \times \frac{A_T}{A_S}$$

Packaging and storage Preserve in hermetic containers.

Difenidol Hydrochloride
디페니돌염산염



$C_{21}H_{27}NO$·HCl: 345.91

1,1-Diphenyl-4-piperidin-1-ylbutan-1-ol hydrochloride [*3254-89-5*]

Difenidol Hydrochloride, when dried, contains NLT 98.5% and NMT 101.0% of difenidol hydrochloride ($C_{21}H_{27}NO$·HCl).

Description Difenidol Hydrochloride occurs as white crystals or a crystalline powder. It is odorless.
It is freely soluble in methanol, soluble in ethanol acid (95), sparingly soluble in water or acetic anhydride and practically insoluble in ether.

Melting point—About 217 °C (with decomposition).

Identification (1) Dissolve 10 mg of Difenidol Hydrochloride in 1 mL of sulfuric acid; the resulting solution exhibits an orange color. Add carefully 3 drops of water to this solution; the solution appears a yellowish brown color. Add 10 mL again; the solution appears as colorless.

(2) Add 2 mL of reinecke salt TS to 5 mL of an aqueous solution of Difenidol Hydrochloride (1 in 100); a pale red precipitate develops.

(3) Add 2 mL of sodium hydroxide TS to 10 mL of an aqueous solution of Difenidol Hydrochloride (1 in 100), and extract twice with 15 mL of chloroform. Combine the extracted solutions, wash three times with 10 mL each of water, evaporate chloroform on a steam bath, and dry the residue in a desiccator (in vacuum, silica gel, 55 ℃) for 5 hours; the melting point is between 103 and 106 ℃.

(4) An aqueous solution of Difenidol Hydrochloride (1 in 100) responds to the Qualitative Analysis for chloride.

pH Dissolve 1.0 g of Difenidol Hydrochloride in 100 mL of freshly boiled and cooled water; the pH of this solution is between 4.7 and 6.5.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Difenidol Hydrochloride in 10 mL of methanol; the solution is clear and colorless.

(2) ***Heavy metals***—Proceed with 1.0 g of Difenidol Hydrochloride as directed under Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Arsenic***—Proceed with 2.0 g of Difenidol Hydrochloride as directed under Method 3 and perform the test (NMT 1 ppm).

(4) ***Related substances***—Weigh 0.10 g of Difenidol Hydrochloride, dissolve in methanol to make exactly 10 mL, and use this solution as the test solution. Separately, weigh 10 mg of 1.1-diphenyl-4-piperidino-1-butene hydrochloride RS, dissolve in methanol to make exactly 20 mL. Pipet 1 mL of this solution, add methanol to make exactly 10 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography (fluorescent indicator added). Next, develop the plate with a mixture of toluene, methanol and acetic acid(100) (10 : 10 : 1) to a distance of about 15 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot obtained from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 0.5% (1 g, in vacuum, silica gel, 5 hours).

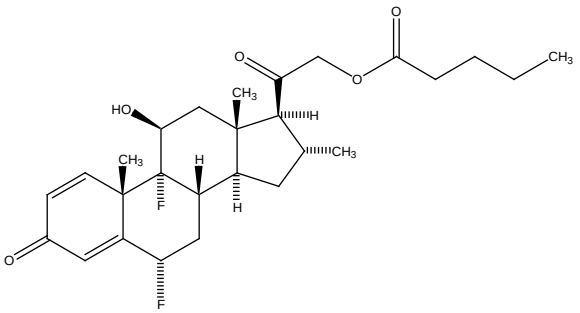
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.35 g of Difenidol Hydrochloride, previously dried, add 30 mL of acetic acid(100), and dissolve by warming, if necessary. After cooling, add 30 mL of acetic anhydride and titrate with 0.05 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.05 mol/L perchloric acid VS
= 17.295 mg of $C_{21}H_{27}NO \cdot HCl$

Packaging and storage Preserve in well-closed containers.

Diflucortolone Valerate
디플루코르톨론발레레이트



$C_{27}H_{36}F_2O_5$: 478.57

[2-[(6*S*,8*S*,9*R*,10*S*,11*S*,13*S*,14*S*,16*R*,17*S*)-6,9-Difluoro-11-hydroxy-10,13,16-trimethyl-3-oxo-7,8,11,12,14,15,16,17-octahydro-6*H*-cyclopenta[a]phenanthren-17-yl]-2-oxoethyl]pentanoate [*59198-70-8*]

Diflucortolone Valerate contains NLT 97.0% and NMT 102.0% of diflucortolone valerate ($C_{27}H_{36}F_2O_5$), calculated on the dried basis.

Description Diflucortolone Valerate occurs as a white crystalline powder.
It is freely soluble in dichloromethane or 1,4-dioxane, sparingly soluble in ether, slightly soluble in methanol and practically insoluble in water.

Identification (1) Determine the absorption spectra of solutions of Diflucortolone Valerate and Diflucortolone Valerate RS in methanol (1 in 50000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

Optical rotation $[\alpha]_D^{20}$: Between +110° and +115° (0.1 g, calculated on the dried basis, ethanol(95), 10 mL, 100 mm).

Purity (1) ***Heavy metals***—Proceed with 2.0 g of Diflucortolone Valerate according to Method 2 under the Heavy Metals and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Related substances***—Perform the test with 10 μL of the test solution obtained from the Assay as directed under the Liquid Chromatography according to the following conditions. Determine each peak area of the test solution as directed in the automatic integration method and calculate the amount of each peak according to the percentage peak area method; the amount of each peak of flucortolone valerate, 12α-diflucortolone valerate, and ⊿4-diflucortolone valerate is NMT 0.6%, and the amount of clocortolone valerate is NMT 0.3%. The amount of other individual related substances is NMT 0.1%, and the sum of the amounts of related substances other than diflucortolone valerate is NMT 2.0%.

Operating conditions

For the detector, column, column temperature, mobile phase and flow rate, proceed as directed under the operating conditions in the Assay.

System suitability

System performance and system repeatability: Proceed as directed under the system suitability in the Assay.

Test for required detectability: Pipet 1.0 mL of the test solution, add a mixture of water and acetonitrile (1 : 1) to make exactly 10 mL, and use this solution as the system suitability solution. Pipet 1 mL of the system suitability solution and add a mixture of water and acetonitrile (1 : 1) to make exactly 20 mL. Confirm that the peak area of diflucortolone valerate obtained from 10 μL of this solution is equivalent to between 3.5% and 6.5% of the peak area of diflucortolone valerate from the system suitability solution.

Relative retention time: The relative retention

time of flucortolone valerate, 12α-diflucortolone valerate, ⊿4-diflucortolone valerate, and clocortolone valerate for the diflucortolone valerate peak is about 0.97, 1.03, 1.05, and 1.09, respectively.

Time span of measurement: About 1.4 times the retention time of diflucortolone valerate after the solvent peak.

Loss on drying NMT 0.5% (1 g, 105 ℃, constant mass).

Residue on ignition NMT 0.1% (1 g, platinum crucible).

Assay Weigh accurately about 5 mg each of Diflucortolone Valerate and diflucortolone valerate RS (previously measure the loss on drying in the same manner as Diflucortolone Valerate), dissolve by adding a mixture of water and acetonitrile (1 : 1) to make exactly 10 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test as directed under the Liquid Chromatography according to the following conditions and calculate the peak areas of A_T and A_S of diflucortolone valerate from each solution.

$$\text{Amount (mg) of diflucortolone valerate } (C_{27}H_{36}F_2O_5) = W_S \times \frac{A_T}{A_S}$$

W_S: Amount (mg) of diflucortolone valerate RS taken, calculated on the dried basis.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 238 nm).

Column: A stainless steel column, 4.6 mm in internal diameter and 25 cm in length, packed with hexyl silyl silica gel for liquid chromatography bound to sulfonamides (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: Control the gradient elution by modifying the mixing ratio of mobile phases A and B as follows.

Mobile phase A: A mixture of 0.02 mol/L potassium dihydrogen phosphate TS, adjusted pH to 3.0 with phosphoric acid, and acetonitrile (11:9).

Mobile phase B: Acetonitrile

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
Between 0 and 10	100 → 90	0 → 10
Between 10 and 25	90	10
Between 25 and 45	90 → 35	10 → 65
Between 45 and 50	35	65

Flow rate: 1.0 mL/min

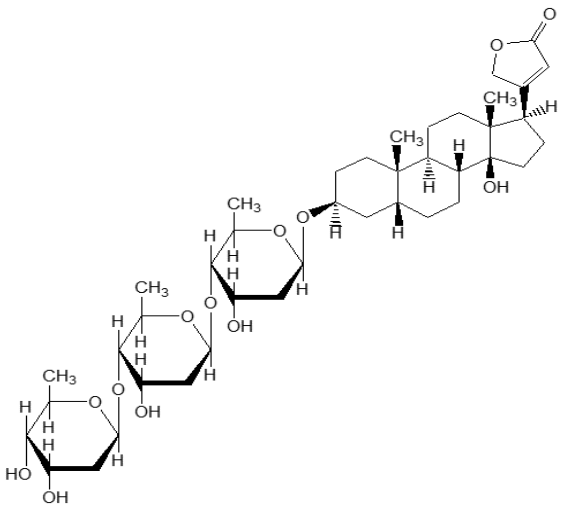
System suitability

System performance: Proceed with 10 μL of the standard solution according to the above conditions; the number of theoretical plates of diflucortolone valerate is NLT 10000 and the symmetry factor is NMT 1.5.

System repeatability: Repeat the test 6 times with 10 μL of the standard solution according to the above conditions; the relative standard deviation of the peak area of diflucortolone valerate is NMT 1.0%.

Packaging and storage Preserve in light-resistant, well-closed containers.

Digitoxin
디기톡신



$C_{41}H_{64}O_{13}$: 764.94

4-[(3*S*,5*R*,8*R*,9*S*,10*S*,13*S*,14*S*,17*S*)-3-[(2*S*,4*S*,5*R*,6*R*)-5-[(2*S*,4*S*,5*R*,6*R*)-5-[(2*S*,4*S*,5*R*,6*R*)-4,5-Dihydroxy-6-methyl-oxan-2-yl]oxy-4-hydroxy-6-methyl-oxan-2-yl]oxy-4-hydroxy-6-methyl-oxan-2-yl]oxy-14-hydroxy-10,13-dimethyl-1,2,3,4,5,6,7,8,9,11,12,15,16,17-tetradecahydrocyclopenta[a]phenanthren-17-yl]-5*H*-furan-2-one [*71-63-6*]

Digitoxin, when dried, contains NLT 90.0% and NMT 101.0% of digoxin ($C_{41}H_{64}O_{13}$).

Description Digitoxin occurs as a white to pale yellow crystalline powder and is odorless.
It is soluble in chloroform, sparingly soluble in methanol or ethanol(95) and practically insoluble in water or ether.

Identification (1) Transfer 1 mg of Digitoxin to a small test tube, about 10 mm in internal diameter, dissolve in 1 mL of a solution of iron(III) chloride hexahydrate in acetic acid(100) (1 in 10000), and underlay gently with 1 mL of sulfuric acid; at the boundary layer of the two liquids, a brown ring free from a reddish color is observed, and the color of the upper layer near the contact zone changes

to purple, and then to green. Finally, the color of the entire acetic acid layer turns dark blue, and then to green.

(2) To 2 mg of Digitoxin, add 25 mL of a freshly prepared solution of *m*-dinitrobenzene in ethanol(95) (1 → 100) and shake to dissolve. Take 2 mL of this solution, add 2 mL of a solution of Tetramethylammonium hydroxide in ethanol(95) (1 in 200), and shake to dissolve; this solution slowly turns reddish purple, and then becomes colorless.

(3) Dissolve 1 mg each of Digitoxin and digitoxin RS in a mixture of ethanol(95) and chloroform (1 : 1), and use these solutions as the test solution and the standard solution, respectively. Perform the test with these solutions as directed under the Thin-layer chromatography. Spot 20 μL each of the test solution and the standard solution on a thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate using a mixture of dichloromethane, methanol and water (84 : 15 : 1) as a developing solvent to a distance of about 10 cm, and air-dry the plate. Spray dilute sulfuric acid evenly on the plate, and heat it at 110 ℃ for 10 minutes; the R_f values of the spots obtained from the test and standard solutions are the same.

Specific optical rotation $[\alpha]_D^{20}$: Between +16° and +18° (after drying 0.5 g, chloroform, 20 mL, 200 mm).

Purity ***Digitonin***—Weigh 10 mg of Digitoxin and transfer it into a flawless test tube, dissolve it in 2 mL of a solution of cholesterol in ethanol(95) (1 in 200), mix gently, and allow it to stand for 10 minutes; the solution does not become cloudy.

Loss on drying NMT 1.5% (0.5 g, in vacuum, 100 ℃, 2 hours).

Ignition residue NMT 0.5% (0.1 g).

Assay Weigh accurately about 20 mg each of Digitoxin and digitoxin RS, previously dried, and dissolve in methanol to make exactly 200 mL. Pipet 5 mL each of these solutions, add exactly 10 ml of the internal standard solution to each, add 12.5 mL of water, add methanol to make 50 mL, and use these solutions as the test solution and the standard solution. Perform the test with 50 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the ratio of the peak area of digitoxin to that of the internal standard, Q_T and Q_S.

$$\text{Amount (mg) digitoxin } (C_{41}H_{64}O_{13}) = \text{Amount (mg) of digitoxin RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of acenaphthene in methanol (3 in 1000000).

Operating conditions

Detector: An ultraviolet absorption spectrophotometer (wavelength: 230 nm).

Column: A stainless steel column about 4 mm in internal diameter and 15 cm to 20 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

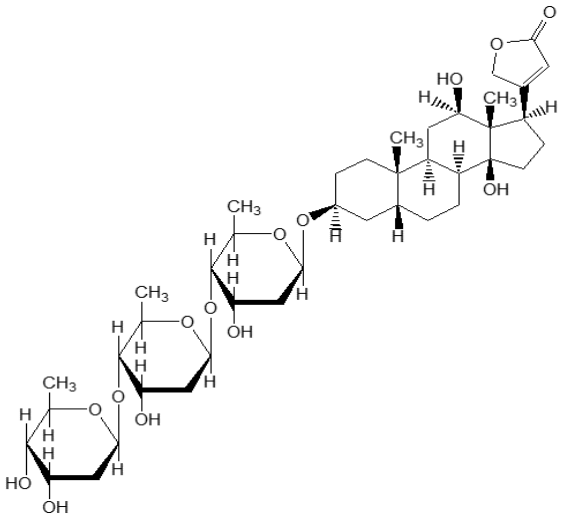
Mobile phase: A mixture of methanol and water (3 : 1).

Flow rate: Adjust the flow rate so that the retention time of digitoxin is about 5 minutes.

Selection of column: Proceed with 50 μL of the standard solution under the above operating conditions. At this time, use a column from which digitoxin and the internal standard are eluted in this order with the resolution between these peaks being NLT 6.

Packaging and storage Preserve in light-resistant, tight containers.

Digoxin
디곡신



$C_{41}H_{64}O_{14}$: 780.94

4-[(3*S*,5*R*,8*R*,9*S*,10*S*,12*R*,13*S*,14*S*,17*S*)-3-[(2*S*,4*S*,5*R*,6*R*)-5-[(2*S*,4*S*,5*R*,6*R*)-5-[(2*S*,4*S*,5*R*,6*R*)-4,5-Dihydroxy-6-methyl-oxan-2-yl]oxy-4-hydroxy-6-methyl-oxan-2-yl]oxy-4-hydroxy-6-methyl-oxan-2-yl]oxy-12,14-dihydroxy-10,13-dimethyl-1,2,3,4,5,6,7,8,9,11,12,15,16,17-tetradecahydrocyclopenta[a]phenanthren-17-yl]-5*H*-furan-2-one [*20830-75-5*]

Digoxin, when dried, contains NLT 96.0% and NMT 106.0% of digoxin ($C_{41}H_{64}O_{14}$).

Description Digoxin occurs as colorless to white crystals or a white, crystalline powder.

It is freely soluble in pyridine, slightly soluble in ethanol(95), very slightly soluble in acetic acid(100), and practically insoluble in water.

Identification (1) Transfer 1 mg of Digoxin to a small test tube, about 10 mm in internal diameter, dissolve in 1 mL of a solution of iron(III) chloride hexahydrate in acetic acid(100) (1 in 10000), and underlay gently with 1 mL of sulfuric acid; at the boundary layer of the two liquids, a brown ring free from a reddish color is observed, and the color of the upper layer near the contact zone changes to purple, and then to green. Finally, the color of the entire acetic acid layer turns dark blue, and then to green.

(2) Determine the infrared spectra of Digoxin and digoxin RS, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Optical rotation $[\alpha]_D^{20}$: Between + 10.0° and + 13.0° (after drying 0.2 g, pyridine, 10 mL, 100 mm).

Purity (1) ***Clarity and color of solution***—Dissolve 0.10 g of Digoxin in 15 mL of diluted ethanol(4 in 5) by warming to 70 ℃; the solution is clear and colorless.

(2) ***Related substances***—Weigh accurately about 25.0 mg of Digoxin, dissolve in 50 mL of warm ethanol, cool, and add ethanol(95) to make exactly 100 mL. Pipet 10 mL of this solution, add 10 mL of water, add dilute ethanol to make exactly 50 mL, and use this solution as the test solution. Separately, weigh accurately 5.0 mg of gitoxin RS, previously dried in vacuum at 105 ºC for 1 hour, and add a mixture of acetonitrile and water (7 : 3) to make exactly 200 mL. Pipet 2 mL of this solution, add dilute ethanol to make exactly 50 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography and determine the peak areas, A_T and A_S, of gitoxin in each solution; A_T is not larger than A_S. Also, the sum of the areas of all peaks obtained from the test solution, other than those of digoxin and gitoxin, is NMT 3%, when calculated by the percentage peak area method.

Operating conditions

For the detector, column, column temperature, mobile phase and flow rate, proceed as directed in the operating conditions under the Assay.

System suitability

Test for required detectability: Weigh accurately about 25.0 mg of Digoxin, dissolve in 50 mL of warm ethanol, cool, and add ethanol(95) to make exactly 100 mL. Pipet 10 mL of this solution, add 10 mL of water, add dilute ethanol to make exactly 50 mL, and use this solution as the system suitability solution. Pipet 2 mL of the system suitability solution, and add dilute ethanol to make exactly 100 mL. Pipet 5 mL of this solution, and add dilute ethanol to make exactly 100 mL. The peak area of digoxin obtained from 10 μL of this solution is between 0.07 - 0.13% of that obtained from the system suitability solution.

System performance: Take about 25 g of Digoxin, dissolve in 50 mL of warm ethanol, cool, and add ethanol(95) to make exactly 100 mL. Pipet 10 mL of this solution, add exactly 5 mL of propyl *p*-hydroxybenzoate in ethanol(95) (1 in 4000), add 10 mL of water, and add dilute ethanol to make 50 mL. Proceed with 10 μL of this solution under the above operating conditions; digoxin and propyl *p*-hydroxybenzoate are eluted in this order with the resolution between these peaks being NLT 5.

System repeatability: Repeat the test 6 times with 10 μL of the system suitability solution under the above operating conditions; the relative standard deviation of the peak area of digoxin is NMT 2.5%.

Time span of measurement: A range of about 4 times the retention time of digoxin after the solvent peak.

Loss on drying NMT 1.0% (0.5 g, in vacuum, 105 ℃, 1 hours).

Ignition residue NMT 0.5% (0.1 g).

Assay Weigh accurately about 25 mg of Digoxin and digoxin RS, previously dried, dissolve each in 50 mL of warm ethanol, cool, and add ethanol(95) to make exactly 100 mL. Pipet 10 mL each of these solutions, add exactly 5 ml of the internal standard solution to each, add 10 mL of water, add dilute ethanol to make 50 mL, and use these solutions as the test solution and the standard solutions. Perform the test with 10 μL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the ratio of the peak area of digoxin to that of the internal standard, Q_T and Q_S.

$$\text{Amount (mg) of digoxin } (C_{41}H_{64}O_{14}) = \text{Amount (mg) of digoxin RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of propyl *p*-hydroxybenzoate in ethanol(95) (1 in 4000).

Operating conditions

Detector: An ultraviolet absorption spectrophotometer (wavelength: 220 nm).

Column: A stainless steel column 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 30 ℃.

Mobile phase: A mixture of water and acetonitrile (7 : 3).

Flow rate: Adjust the flow rate so that the retention time of digoxin is about 10 minutes.

System suitability

System performance: Proceed with 10 μL of the standard solution under the above operating conditions; digoxin and the internal standard are eluted in this order with the resolution between these peaks being NLT 5.

System repeatability: Repeat the test 6 times with

10 μL of the standard solution under the above operating conditions; the relative standard deviation of the peak area of digoxin to that of the internal standard is NMT 1.0%.

Packaging and storage Preserve in light-resistant, tight containers.

Digoxin Injection
디곡신 주사액

Digoxin Injection is an aqueous injection and contains NLT 90.0% and NMT 105.0% the labeled amount of digoxin ($C_{41}H_{64}O_{14}$: 780.94).

Method of preparation Prepare as directed under the Injections, dissolving Digoxin between 10 and 50 vol% ethanol.

Description Digoxin Injection occurs as a clear, colorless liquid.

Identification (1) To contain 0.25 mg of digoxin per mL according to the labeled amount of Digoxin Injection, add methanol if necessary, and use this solution as the test solution. Separately, dissolve 0.5 mg of digoxin RS in 2 mL of methanol, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of methanol and water (7 : 3) as the developing solvent to a distance of about 10 cm, and air-dry the plate. To this, spray evenly a mixture of 4 volumes of a solution of trichloroacetic acid in ethanol(95) (1 in 4) and 1 volume of sodium toluenesulfonchloramide trihydratesolution (3 in 100), heat at 110 ℃ for 10 minutes, and examine the plate under ultraviolet light (wavelength: 366 nm); the R_f values of the principal spots obtained from the test solution to that of the standard solution are the same.

(2) The retention times of the major peaks obtained from the test solution and the standard solution in the Assay are the same.

Purity ***Related substances***—Take exactly an appropriate amount of Digoxin Injection equivalent to 2.5 mg of digoxin according to the labeled amount, dissolve in 50 mL of dilute ethanol, and use this solution as the test solution. With 10 μL of the test solution, perform the test as directed under the Liquid Chromatography according to the following conditions. Measure each of the peak area from the test solution according to the automatic integration method and obtain each amount according to the percentage peak area method; the total area of the peak of the related substance to that of the major peak is NMT 5%.

Operating conditions

For the detector, column, column temperature, mobile phase and flow rate, proceed as directed in the operating conditions under the Assay.

System suitability

Test for required detectability: Dissolve 25 mg of digoxin in 50 mL of warm ethanol(95), cool it down, and add ethanol(95) to make exactly 100 mL. Pipet 10 mL of this solution, add 10 mL of water, add dilute ethanol to make exactly 50 mL, and use this solution as the system suitability solution. Pipet 2 mL of the system suitability solution and add dilute ethanol to make exactly 100 mL. Pipet 5 mL of this solution and add dilute ethanol to make exactly 100 mL. The peak area of digoxin obtained from 10 μL of this solution is 0.07% to 0.13% of the peak area of digoxin from the system suitability solution.

System performance: Dissolve 25 mg of digoxin in 50 mL of warm ethanol(95), cool it down, and add ethanol(95) to make exactly 100 mL. Pipet 10 mL of this solution, add 5 mL of propyl *p*-hydroxybenzoate in ethanol(95) (1 in 4000), add 10 mL of water, and add dilute ethanol to make 50 mL. Proceed with 10 μL of this solution under the above operating conditions; digoxin and propyl *p*-hydroxybenzoate are eluted in this order with the resolution being NLT 5.

System repeatability: Repeat the test 6 times with 10 μL of the system suitability solution under the above operating conditions; the relative standard deviation of the peak area of digoxin is NMT 2.5%.

Time span of measurement: About 4 times of the retention time of digoxin after the solvent peak.

Sterility Meets the requirements.

Bacterial endotoxins Less than 200 EU per mg of digoxin.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Extractable volume of injections Meets the requirements.

Alcohol number Between 0.8 and 1.2 (Method 1).

Assay Take exactly an amount of Digoxin Injection equivalent to about 2.5 mg of digoxin ($C_{41}H_{64}O_{14}$), add exactly 5 mL of the internal standard solution and dilute ethanol to make exactly 50 mL, and use this solution as the test solution. Separately, dry digoxin RS at 105 ℃ for 1 hour in vacuum, weigh accurately 25 mg of digoxin RS, dissolve in 50 mL of warm ethanol, and cool it down. Add ethanol(95) to make exactly 100 mL. Pipet 10 mL of this solution, add 5 mL of the internal standard, add 10 mL of water, and dilute in ethanol to make 50 mL. Use

this solution as the internal standard solution. Perform the test with 10 μL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions and determine the ratio of the peak area of digoxin to that of the internal standard, Q_T and Q_S.

$$\text{Amount (mg) of digoxin } (C_{41}H_{64}O_{14}) = \text{Amount (mg) of digoxin RS} \times \frac{Q_T}{Q_S} \times \frac{1}{10}$$

Internal standard solution—A solution of propyl *p*-hydroxybenzoate in ethanol(95) (1 in 4000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

Column: A stainless steel column 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 30 °C.

Mobile phase: A mixture of water and acetonitrile (7 : 3).

Flow rate: Adjust the flow rate so that the retention time of digoxin is about 10 minutes.

System suitability

System performance: Proceed with 10 μL of the standard solution under the above operating conditions; digoxin and the internal standard are eluted in this order with the resolution being NLT 5.

System repeatability: Repeat the test 6 times with 10 μL of the standard solution under the above operating conditions; the relative standard deviation of the peak area of digoxin to that of the internal standard is NMT 1.0%.

Packaging and storage Preserve in light-resistant, hermetic containers.

Digoxin Tablets
디곡신 정

Digoxin Tablets contain NLT 90.0% and NMT 105.0% of the labeled amount of digoxin ($C_{41}H_{64}O_{14}$: 780.94).

Method of preparation Prepare Digoxin Tablets as directed under Tablets, with Digoxin.

Identification (1) Take a portion of powdered Digoxin Tablets, equivalent to 0.5 mg of Digoxin according to the labeled amount, add 2 mL of methanol, shake for 10 minutes, and filter. Use this solution as the test solution. Separately, dissolve about 0.5 mg of digoxin RS in 2 mL of methanol, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on a plate of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of methanol and water (7 : 3) as the developing solvent to a distance of about 10 cm, and air-dry the plate. To this, spray evenly a mixture of 1 volume of sodium toluenesulfonchloramide trihydrate (3 in 100), freshly prepared, and 4 volumes of a solution of trichloroacetic acid in methanol, heat at 110 ℃ for 10 minutes, and examine the plate under ultraviolet light (wavelength: 366 nm); the R_f value of spots obtained from the test solution and the standard solution are the same.

(2) The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

Purity (1) ***Related substances*—**Weigh accurately the mass of NLT 20 tablets of Digoxin Tablets and powder. Weigh accurately equivalent to about 2.5 mg of digoxin, add 30 mL of dilute ethanol, sonicate for 20 minutes, and shake well to mix for 5 minutes. Cool it down, add 50 mL of dilute ethanol, filter, and use this solution as the test solution. With 10 μL of the test solution, perform the test as directed under the Liquid Chromatography according to the following conditions. Measure each of the peak area from the test solution according to the automatic integration method and obtain each amount according to the percentage peak area method; the total area of the peak of the related substance to that of the major peak is NMT 5%.

Operating conditions

For the detector, column, column temperature, mobile phase and flow rate, proceed as directed in the operating conditions under the Assay.

System suitability

Test for required detectability: Weigh accurately 25.0 mg of Digoxin Tablets, dissolve in 50 mL of warm ethanol, cool, and add ethanol(95) to make exactly 100 mL. Pipet 10 mL of this solution, add 10 mL of water, add dilute ethanol to make exactly 50 mL, and use this solution as the system suitability solution. Pipet 2 mL of the system suitability solution and add dilute ethanol to make exactly 100 mL. Pipet 5 mL of this solution and add dilute ethanol to make exactly 100 mL. The peak area of digoxin obtained from 10 μL of this solution is between 0.07% and 0.13% of that obtained from the system suitability solution.

System performance: Weigh accurately 25.0 mg of Digoxin Tablets, dissolve in 50 mL of warm ethanol, cool, and add ethanol(95) to make exactly 100 mL. Pipet 10 mL of this solution, add exactly 5 mL of propyl *p*-hydroxybenzoate in ethanol(95) (1 in 4000), add 10 mL of water, and add dilute ethanol to make 50 mL. Proceed with 10 μL of this solution under the above operating conditions; digoxin and propyl *p*-hydroxybenzoate are eluted in this order with the resolution between these

peaks being NLT 5.

System repeatability: Repeat the test 6 times with 10 μL of the system suitability solution under the above operating conditions; the relative standard deviation of the peak area of digoxin is NMT 2.5%.

Time span of measurement: About 4 times the retention time of digoxin after the solvent peak.

Dissolution Perform the test with 1 tablet of Digoxin Tablets at 100 revolutions per minutes according to Method 1, with 500 mL of hydrochloric acid diluted with the dissolution medium (3 in 500). Take 30 mL of the dissolved solution 60 minutes after starting the Dissolution, filter through a membrane filter with a pore diameter of 0.8 μm, discard the first 10 mL of the filtrate, and use this solution as the test solution. Separately, dry digoxin RS at 105 ℃ for 1 hour in vacuum, weigh accurately 25 mg of digoxin RS, dissolve in a small amount of ethanol(95), and add a solution of 4 volumes of ethanol(95) and 1 volume of water to make exactly 500 mL. Pipet 5 mL of this solution, add the dissolution medium to make exactly 500 mL, and use this solution as the standard solution. Pipet 2 mL each of the test solution, the standard solution and the dissolution medium, and transfer to a test tube T, S and B with a brown stopper. To this, add exactly 10 mL each of 0.012 g/dL ascorbic acid-hydrochloric acid TS and shake well to mix. Add exactly 1 mL each of dilute hydrogen peroxide TS, shake well to mix, and allow it to stand for 45 minutes at a constant temperature of 25 to 30 ℃. Determine the fluorescence intensities, F_T, F_S and F_B, of these solutions, at 360 nm as the excitation wavelength and at 485 nm as the fluorescence wavelength as directed under the Fluorescence Spectroscopy.

It meets the requirements if the dissolution rate of Digoxin Tablets in 60 minutes is NLT 65%.

The retest requirements do not apply to Digoxin Tablets.

$$\text{Dissolution rate (\%) of the labeled amount of digoxin } (C_{41}H_{64}O_{14}) = W_S \times \frac{F_T - F_B}{F_S - F_B} \times \frac{1}{C}$$

W_S: Amount (mg) of digoxin RS

C: Labeled amount (mg) of digoxin ($C_{41}H_{64}O_{14}$) in 1 tablet

Uniformity of dosage units It meets the requirements when tested according to the following procedure. Take 1 tablet of Digoxin Tablets, add 0.5 mL of water to disintegrate, pipet 0.5 mL of the internal standard solution, and add V mL of dilute ethanol so that Each mL of the solution contains about 21 μg of digoxin ($C_{41}H_{64}O_{14}$). Sonicate, shake well to mix for 5 minutes, filter, and use the filtrate as the test solution. Separately, dry digoxin RS at 105 ℃ for 1 hour in vacuum, weigh accurately 25 mg of digoxin RS, dissolve in 50 mL of warm ethanol, and cool it down. Add ethanol(95) to make exactly 100 mL. Pipet 10 mL of this solution and add ethanol(95) to make exactly 20 mL. Pipet 1 mL of this solution, add exactly 0.5 mL of the internal standard solution, add 1.5 mL of water and *dilute ethanol (V*-2), and use this solution as the standard solution. Perform the test as directed under the Assay below.

$$\text{Amount (mg) of digoxin } (C_{41}H_{64}O_{14}) = \text{Amount (mg) of digoxin RS} \times \frac{Q_T}{Q_S} \times \frac{1}{200}$$

Internal standard solution—Dissolve 1 g of propyl p-hydroxybenzoate in ethanol(95) to make 40000/V.

Assay Weigh accurately NLT 20 tablets of Digoxin Tablets and powder them. Weigh accurately an amount, equivalent to ($C_{41}H_{64}O_{14}$) about 2.5 mg of digoxin ($C_{41}H_{64}O_{14}$), add 30 mL of dilute ethanol, sonicate for 20 minutes, and shake well to mix for 5 minutes. Add exactly 5 mL of the internal standard solution and add dilute ethanol to make exactly 50 mL. Centrifuge this solution, and use the clear supernatant as the test solution. Separately, dry digoxin RS at 105 ℃ for 1 hour in vacuum, weigh accurately 25 mg of digoxin RS, dissolve in 50 mL of warm ethanol, and cool it down. Add ethanol(95) to make exactly 100 mL. Pipet 10 mL of this solution, add 5 mL of the internal standard, add 10 mL of water, and dilute in ethanol to make 50 mL. Use this solution as the internal standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the ratio of the peak area, Q_T and Q_S, of digoxin to that of the internal standard.

$$\text{Amount (mg) of digoxin } (C_{41}H_{64}O_{14}) = \text{Amount (mg) of digoxin RS} \times \frac{Q_T}{Q_S} \times \frac{1}{10}$$

Internal standard solution—A solution of propyl *p*-hydroxybenzoate in ethanol(95) (1 in 4000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

Column: A stainless steel column 4.6 mm in internal diameter and 25 length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 30 °C.

Mobile phase: A mixture of water and acetonitrile (7 : 3).

Flow rate: Adjust the flow rate so that the retention time of digoxin is about 10 minutes.

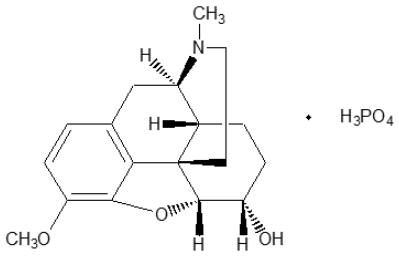
System suitability

System performance: Proceed with 10 μL of the standard solution under the above operating conditions; digoxin and the internal standard are eluted in this order with the resolution between these peaks being NLT 5.

System repeatability: Repeat the test 6 times with 10 μL of the standard solution under the above operating conditions; the relative standard deviation of the peak area of digoxin to that of the internal standard is NMT 1.0%.

Packaging and storage Preserve in light-resistant, tight containers.

Dihydrocodeine Phosphate
디히드로코데인인산염



$C_{18}H_{23}NO_3 \cdot H_3PO_4$: 399.38
4,5-alpha-Epoxy-3-methoxy-17-methyl-morphinan-6-ol
[*24204-13-5*]

Dihydrocodeine Phosphate contains NLT 98.0% and NMT 101.0% of dihydrocodeine phosphate ($C_{18}H_{23}NO_3 \cdot H_3PO_4$), calculated on the dried basis.

Description Dihydrocodeine Phosphate occurs as a white to yellow crystalline powder.
It is freely soluble in water or acetic acid(100), slightly soluble in ethanol and practically insoluble in ether.
Dissolve 1.0 g of Dihydrocodeine Phosphate in 10 mL of water; the pH of this solution is between 3.0 and 5.0.
It is affected by light.

Identification (1) Determine the absorption spectra of Dihydrocodeine Phosphate and an aqueous solution of Dihydrocodeine Phosphate RS (1 in 10000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelength.

(2) Determine the infrared spectra of Dihydrocodeine Phosphate and Dihydrocodeine Phosphate RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) A solution of Dihydrocodeine Phosphate (1 in 20) responds to the Qualitative Analysis (1) for phosphate.

Purity (1) ***Chloride***—Perform the test with 0.5 g of Dihydrocodeine Phosphate. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid (NMT 0.021%).

(2) ***Sulfate***—Perform the test with 0.20 g of Dihydrocodeine Phosphate. Prepare the control solution with 1.0 mL of 0.005 mol/L sulfuric acid (NMT 0.240%).

(3) ***Related substances***—Dissolve 0.2 g of Dihydrocodeine Phosphate in 10 mL of diluted ethanol (1 in 2) and use this solution as the test solution. Pipet 1 mL of this solution, add diluted ethanol (1 in 2) to make exactly 50 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography (fluorescent indicator added). Next, develop the plate with a mixture of anhydrous ethanol, toluene, acetone and strong ammonia water (14 : 14 : 7 : 1) as the developing solvent to a distance of about 15 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot obtained from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 1.0% (0.5 g, 105 ℃, 4 hours).

Assay Weigh accurately about 0.5 g of Dihydrocodeine Phosphate, dissolve in 70 mL of acetic acid(100), and titrate with 0.1 mol/L perchloric acid VS (indicator: 3 drops of methylrosaniline chloride TS). However, the endpoint of the titration is when the violet color changes to blue and then finally to greenish blue. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 39.938 mg of $C_{18}H_{23}NO_3 \cdot H_3PO_4$

Packaging and storage Preserve in light-resistant, tight containers.

1% Dihydrocodeine Phosphate Powder
디히드로코데인인산염 100 배산

1% Dihydrocodeine Phosphate

1% Dihydrocodeine Phosphate Powder contains NLT 0.90% and NMT 1.10% of Dihydrocodeine Phosphate ($C_{18}H_{23}NO_3 \cdot H_3PO_4$: 399.38).

Method of preparation

Dihydrocodeine phosphate	10 g
Lactose hydrate	A sufficient quantity
Total amount	1000 g

Prepare as directed under Powders, with the above ingredients.

Identification (1) Determine the absorption spectrum with an aqueous solution of 1% Dihydrocodeine Phosphate Powder (1 in 100) as directed under the Ultraviolet-

visible Spectroscopy; it exhibits a maximum between 281 nm and 285 nm.

Particle size distribution estimation by analytical sieving Meets the requirements.

Uniformity of dosage units (distribution) Meets the requirements.

Assay Weigh accurately about 5 g of 1% Dihydrocodeine Phosphate Powder and dissolve in water to make exactly 100 mL. Pipet 10 mL of this solution, add exactly 10 mL of the internal standard solution, and use this solution as the test solution. Separately, weigh accurately about 50 mg of Dihydrocodeine Phosphate RS (previously measured the loss on drying) and dissolve in water to make exactly 100 mL. Pipet 10 mL of this solution, add exactly 10 mL of the internal standard solution, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the peak area ratios, Q_T and Q_S, of Dihydrocodeine to the peak area of the internal standard.

Amount (mg) of Dihydrocodeine Phosphate ($C_{18}H_{23}NO_3 \cdot H_3PO_4$) = Amount (mg) of Dihydrocodeine Phosphate RS, calculated on the anhydrous basis $\times \frac{Q_T}{Q_S}$

Internal standard solution—An aqueous solution of etilefrine hydrochloride (3 in 10000).

Operating conditions

Proceed as directed under the Assay for 10% Dihydrocodeine Phosphate Powder.

Packaging and storage Preserve in tight containers.

10% Dihydrocodeine Phosphate Powder
디히드로코데인인산염 10 배산

10% Dihydrocodeine Phosphate

10% Dihydrocodeine Phosphate Powder contains NLT 9.3% and NMT 10.7% of Dihydrocodeine Phosphate ($C_{18}H_{23}NO_3 \cdot H_3PO_4$: 399.38).

Method of preparation

Dihydrocodeine phosphate	100 g
Lactose hydrate	A sufficient quantity
Tot	

Prepare as directed under Powders, with the above ingredients.

Identification (1) Determine the absorption spectrum with an aqueous solution of 10% Dihydrocodeine Phosphate Powder (1 in 1000) as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum between 281 nm and 285 nm.

Particle size distribution estimation by analytical sieving Meets the requirements.

Uniformity of dosage units (distribution) Meets the requirements.

Assay Weigh accurately about 2.5 g of 10% Dihydrocodeine Phosphate Powder and dissolve in water to make 100 mL exactly. Take exactly 2 mL of this solution, add exactly 10 mL of the internal standard solution, add water to make 20 mL, and use this solution as the test solution. Separately, weigh accurately about 50 mg of Dihydrocodeine Phosphate RS (previously measured the loss on drying) and dissolve in water to make exactly 100 mL. Pipet 10 mL of this solution, add exactly 10 mL of the internal standard solution, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the peak area ratios, Q_T and Q_S, of Dihydrocodeine to the peak area of the internal standard.

Amount (mg) of Dihydrocodeine Phosphate ($C_{18}H_{23}NO_3 \cdot H_3PO_4$) = Amount (mg) of Dihydrocodeine Phosphate RS, calculated on the dried basis $\times \frac{Q_T}{Q_S} \times 5$

Internal standard solution—An aqueous solution of etilefrine hydrochloride (3 in 10000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 280 nm).

Column: A stainless-steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: Dissolve 1.0 g of sodium lauryl sulfate in 500 mL of diluted phosphoric acid (1 in 1000), then adjust the pH to 3.0 with sodium hydroxide TS. Mix 70 mL of tetrahydrofuran to 240 mL of this solution.

Flow rate: Adjust the flow rate so that the retention time of Dihydrocodeine is about 9 minutes.

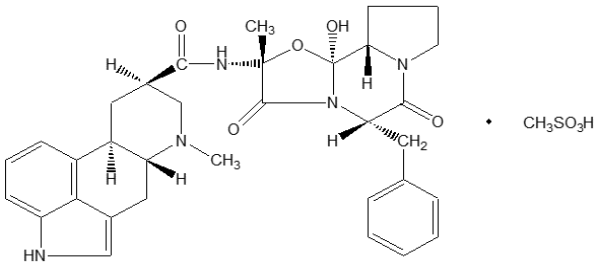
System suitability

System performance: Proceed with 20 μL of the standard solution according to the above operating conditions; dihydrocodeine and the internal standard are eluted in this order with the resolution between their peaks being NLT 4.

System repeatability: Repeat the test 6 times with 20 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area ratios of Dihydrocodeine to the peak area of the internal standard is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Dihydroergotamine Mesilate
디히드로에르고타민메실산염



$C_{33}H_{37}N_5O_5 \cdot CH_4O_3S$: 679.78

(2*R*,4*R*,7*R*)-*N*-[(1*S*,2*S*,4*R*,7*S*)-7-Benzyl-2-hydroxy-4-methyl-5,8-dioxo-3-oxa-6,9-diazatricyclo[7.3.0.02,6]dodecan-4-yl]-6-methyl-6,11-diazatetracyclo[7.6.1.02,7.012,16]hexadeca-1(16),9,12,14-tetraene-4-carboxamide; methanesulfonic acid [*6190-39-2*]

Dihydroergotamine Mesilate contains NLT 97.0% and NMT 101.0% of dihydroergotamine mesylate ($C_{33}H_{37}N_5O_5 \cdot CH_4O_3S$), calculated on the dried basis.

Method of preparation If there is any possibility of alkyl (methyl, ethyl, isopropyl, etc.) methanesulfonate esters to be mixed according to the manufacturing process of Dihydroergotamine Mesilate, take cautions for starting material, manufacturing process, and intermediate to minimize the residue of impurities in consideration of risk assessment results. If necessary, the manufacturing process may be verified by the test data proving that no quality risk exists in the final drug substance.

Description Dihydroergotamine Mesilate occurs as a white to yellowish white or pale gray to reddish white powder.

It is freely soluble in acetic acid(100), sparingly soluble in methanol or chloroform, slightly soluble in water or ethanol(95) and practically insoluble in acetic acid(100) or ether.

It is gradually affected by light.

Melting point—About 214 °C (with decomposition).

Identification (1) Dissolve about 1 mg of Dihydroergotamine Mesilate in 5 mL of L-tartaric acid (1 in 100), add 2 mL of 4-dimethylaminobenzaldehyde-iron(III) chloride TS to 1 mL of this solution, and shake to mix; the resulting solution exhibits the blue color.

(2) Put 0.4 g of sodium hydroxide in about 0.1 g of Dihydroergotamine Mesilate, stir well to mix, and heat gradually to incinerate. After cooling, add 10 mL of water to the residue, heat to boil, cool, and filter. Add 0.5 mL of hydrochloric acid to the filtrate; the resulting solution responds to the Qualitative Analysis for sulfate. Separately, add 5 mL of dilute hydrochloric acid to 0.1 g of Dihydroergotamine Mesilate, shake to mix for 5 minutes, and filter. Add 1 mL of barium chloride TS to the filtrate; the resulting solution is clear.

(3) Determine the absorption spectra of Dihydroergotamine Mesylate and a solution of Dihydroergotamine Mesilate RS in methanol (1 in 20000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(4) Determine the infrared spectra of Dihydroergotamine Mesylate and Dihydroergotamine Mesilate RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Optical rotation $[\alpha]_D^{20}$: Between -16.7° and -22.7° [0.5 g calculated on the dried basis, a mixture of ethanol(99.5), chloroform and ammonia water(28) (10 : 10 : 1), 20 mL, 100 mm].

pH Dissolve 50 mg of Dihydroergotamine Mesylate in 50 mL of water; the pH of this solution is between 4.4 and 5.4.

Purity (1) ***Clarity and color of solution***—Dissolve 0.10 g of Dihydroergotamine Mesylate in 0.1 mL of methanesulfonic acid (7 in 100) and 50 mL of water; the resulting solution is clear and the color is not more intense than that of Control solution (1) or (2) below.

Control solution (1)—Pipet 0.6 mL of iron(III) chloride hexahydrate colorimetric stock solution and 0.15 mL of cobaltous(II) chloride hexahydrate colorimetric stock solution to mix and add diluted hydrochloric acid (1 in 40) to make exactly 100 mL.

Control solution (2)—Pipet 0.6 mL of iron(III) chloride hexahydrate colorimetric stock solution, 0.25 mL of cobaltous(II) chloride hexahydrate colorimetric stock solution and 0.1 mL of copper(II) sulfate pentahydrate colorimetric stock solution, respectively, mix, and add diluted hydrochloric acid (1 in 40) to make exactly 100 mL.

(2) ***Related substances***—Proceed with light-resistant containers, away from the light. Dissolve 0.10 g of Dihydroergotamine Mesilate in 5 mL of a mixture of chloroform and methanol (9 : 1) and use this solution as the test solution. Pipet 1 mL of this solution, add a mixture of chloroform and methanol (9 : 1) to make exactly 200 mL, and use this solution as the standard solution (1).

Pipet 10 mL of this solution, add a mixture of chloroform and methanol (9 : 1) to make exactly 25 mL, and use this solution as the standard solution (2). With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution, the standard solution (1), and the standard solution (2) on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of dichloromethane, ethyl acetate, methanol, and ammonia water (50 : 50 : 6 : 1) as the developing solvent to a distance of about 15 cm, and dry the plate with cool air within 1 minute. In an instant, develop again the plate with a new mixture of dichloromethane, ethyl acetate, methanol and ammonia water (50 : 50 : 6 : 1) as the developing solvent to a distance of about 15 cm, and air-dry the plate. Spray evenly 4-dimethylaminobenzaldehyde TS for spraying and dry the plate with warm air; the spots other than the principal spot from the test solution are not more intense than the spots from the standard solution (1) and number of the spots, which are more intense than the spots from the standard solution (2), are NMT 2.

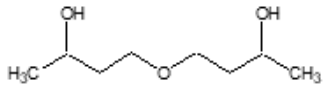
Loss on drying NMT 4.0% (0.5 g, NMT 0.67 kPa, 100 ℃, 6 hours).

Assay Weigh accurately 0.2 g of Dihydroergotamine Mesilate, dissolve in 170 mL of a mixture of acetic anhydride and acetic acid(100) (10 : 1), and titrate with 0.02 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.02 mol/L perchloric acid VS
= 13.596 mg of $C_{33}H_{37}N_5O_5 \cdot CH_4O_3S$

Packaging and storage Preserve in light-resistant, tight containers.

Dihydroxydibutyl Ether
디히드록시디부틸에테르



$C_8H_{18}O_3$: 162.23

4,4'-Oxybix-1-butanol; 4,4'-Dihydroxydibutyl ether, [*3403-82-5*]

Dihydroxydibutyl Ether contains dihydroxydibutyl ether ($C_8H_{18}O_3$: 162.23) NLT 95.0% and NMT 101.0%, calculated on the anhydrous basis.

Description Dihydroxydibutyl Ether occurs as a colorless and clear liquid, which is almost odorless and has a bitter taste.

It is soluble in general organic solvents such as water, acetic acid(100), ethanol(95), ether, acetone or chloroform etc. and practically insoluble in petroleum ether.

The specific gravity of Dihydroxydibutyl Ether is about 0.994 (20 ℃).

Identification (1) Use a solution of Dihydroxydibutyl Ether in 1% acetone as the test solution. Separately, weigh about 0.1 g of dihydroxydibutyl ether RS, dissolve in 10 mL of acetone, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Develop the plate with a mixture of *n*-butanol and water (9 : 1) to a distance of about 10 cm, and air-dry the plate. Allow the plate to stand for a while in a developing chamber for iodine vapor; the R_f values and colors of the spots from the test solution and the standard solution are the same.

(2) Weigh 0.125 g each of Dihydroxydibutyl Ether and dihydroxydibutyl ether RS, add acetone to make exactly 50 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 2 μL each of the test solution and the standard solution as directed under the Gas Chromatography according to the following the conditions; the retention times of peaks from the test solution and the standard solution are the same.

Operating conditions

Detector: A hydrogen flame ionization detector

Column: A steel column about 0.32 mm in internal diameter and about 30.0 m in length, coated with polyethylene glycol (0.25 μm in particle diameter).

Column temperature: Increase the temperature from 170 ℃ to 180 ℃ by 1 ℃ per minute and then to 240 ℃ by 60 ℃ per minute.

Sample injection port temperature: 240 ℃

Detector temperature: 250 ℃

Carrier gas: Nitrogen

Flow rate: 2 mL/min

Total flow: About 25 mL.

Refractive index $[\alpha]_D^{20}$: Between 1.4480 and 1.4495.

pH Between 5.0 and 7.0 (5% aqueous solution).

Boiling point Between 260 and 265 ℃.

Water NMT 0.5% (1 g, volumetric titration, direct titration).

Assay (1) ***Hydroxyl group*—**Weigh accurately 0.5 g of Dihydroxydibutyl Ether, transfer into a stoppered Erlenmeyer flask, put 5 mL of tetrahydrofuran and 20 mL of acetylation TS, and stopper the flask. After compounding, allow it to stand. Separately, put 5 mL of tetrahydrofuran and 20 mL of acetylation TS into a stoppered Erlenmeyer flask, stopper the flask, mix, and allow to stand. Heat

these two stoppered Erlenmeyer flasks on a steam bath at 67 ℃ for 2 hours, take out, and cool down at room temperature. After adding 5 mL of anhydrous pyridine to each flask, mix, and perform the test with Karl Fischer TS as directed under the Water. Remove the volume (mL) consumed by the blank test, obtain the amount of water produced by the reaction. 1 mL of water corresponds to 4.502 mg of dihydroxydibutyl ether.

Preparation of acetylation TS—Dissolve 100 g of trifluoroboron in acetic acid(100), add 1 - 2 mL of water, and put acetic acid(100) to make 1000 mL.

(2) ***Acid or alkali*—**Weigh accurately about 0.3 g of Dihydroxydibutyl Ether, transfer into a stoppered Erlenmeyer flask, add 5 mL of acetylation TS, and allow to stand for 30 minutes. Put 5 mL of water and 5 mL of a mixture of pyridine and water (3 : 1), allow to stand for 5 minutes, and titrate with 0.5 mol/L sodium hydroxide VS (indicator: phenolphthalein TS). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.5 mol/L sodium hydroxide VS
= 40.56 mg of $C_8H_{18}O_3$

Acetylation TS—Add 30 mL of acetic anhydride and 0.4 mL of 12% perchloric acid to 180 mL of ethyl acetate and agitate for 5 hours. After allowing to stand for 3 - 4 hours, and use it.

Packaging and storage Preserve in tight containers.

Dihydroxydibutyl Ether Capsules
디히드록시디부틸에테르 캡슐

Dihydroxydibutyl Ether Capsules contain NLT 95.0% and NMT 105.0% the labeled amount of dihydroxydibutyl ether ($C_8H_{18}N_3O6$: 162.23).

Method of preparation Prepare as directed under Capsules, with Dihydroxydibutyl Ether.

Identification Weigh an amount of the contents of Dihydroxydibutyl Ether Capsules equivalent to 0.5 g of dihydroxydibutyl ether, dissolve in 5 mL of acetone, and use this solution as the test solution. Separately, use a solution of dihydroxydibutyl ether RS in 1% acetone as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography, develop the plate with a mixture of *n*-butanol and water (100) (9 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Spray the iodine fume; the R_f values and colors of the spots from the test solution and the standard solution are the same.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the contents of NLT 20 capsules of Dihydroxydibutyl Ether Capsules. Weigh accurately an amount equivalent to about 0.125 g of dihydroxydibutyl ether ($C_8H_{18}O_3$), add 25 mL of acetone, sonicate, and add exactly 1 mL of the internal standard solution and acetone to make exactly 50 mL. Filter and use the filtrate as the test solution. Separately, weigh accurately 0.125 g of dihydroxydibutyl ether RS, add exactly 1 mL of the internal standard solution, add acetone to make exactly 50 mL, and use this solution as the standard solution. Perform the test with 2 μL each of the test solution and the standard solution according to the following operating conditions as directed under the Liquid Chromatography, and determine the ratio of peak areas for dihydroxydibutyl ether, Q_T and Q_S, to the internal reference for each solution.

Amount (mg) of dihydroxydibutyl ether ($C_8H_{18}O_3$)
= Amount (mg) of dihydroxydibutyl ether RS × (Q_T / Q_S)

Internal standard solution—A solution of phenol in acetone (1 in 5).

Operating conditions

Detector: A hydrogen flame ionization detector

Column: A column about 0.32 mm in internal diameter and about 30.0 m in length, packed with polyethylene glycol (0.25 μm in particle diameter).

Column temperature: Raise the temperature from 170 ℃ to 180 ℃ by 1 ℃ per minute and then to 240 ℃ by 60 ℃ per minute.

Sample injection port temperature: 240 ℃

Detector temperature: 250 ℃

Carrier gas: Nitrogen

Flow rate: 2 mL/min

Total flow: About 25 mL.

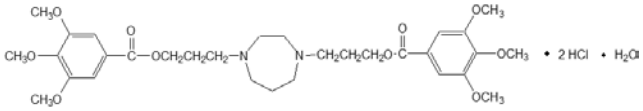
System suitability

System performance: Proceed with 2 μL of the standard solution under the above operating conditions; the internal standard and dihydroxydibutyl ether are eluted in this order.

System repeatability: Repeat the test 6 times with 2 μL each of the standard solution under the above operating conditions; the relative standard deviation of the peak area ratios of dihydroxydibutyl ether to that of the internal standard is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Dilazep Hydrochloride Hydrate
딜라제프염산염수화물



Dilazep Hydrochloride $C_{31}H_{44}N_2O_{10}\cdot 2HCl\cdot H_2O$: 695.63
3-[4-[3-(3,4,5-Trimethoxybenzoyl)oxypropyl]-1,4-diazepan-1-yl]propyl3,4,5-trimethoxybenzoate hydrate dihydrochloride [*20153-98-4*, anhydrous]

Dilazep Hydrochloride Hydrate contains NLT 98.0% and NMT 101.0% of dilazep hydrochloride ($C_{31}H_{44}N_2O_{10}\cdot 2HCl$: 677.61), calculated on the dried basis.

Description Dilazep Hydrochloride Hydrate occurs as a white crystalline powder, which is odorless.
It is freely soluble in acetic acid(100) or chloroform, soluble in water, slightly soluble in ethanol(95) or acetic anhydrideand practically insoluble in ether.

Melting point—Between 200 and 204 ℃. In a 110 ℃ bath fluid, heat to increase by about 3 ℃/min between 140 ℃and 150 ℃, about 10 ℃/min between 160 and 195 ℃, and about 1 ℃/min thereafter.

Identification (1) Add 0.1 mL of hydroxylamine hydrochloride (1 in 10) and 8 mol/L potassium hydroxide TS to 0.1 mL of an aqueous solution of Dilazep Hydrochloride Hydrate (1 in 100) and heat at 70 ℃ on a steam bath for 10 minutes. After cooling, add 0.5 mL of dilute hydrochloric acid and 0.1 mL of iron(III) chloride TS; the resulting solution exhibits a violet color.

(2) Add 0.3 mL of Reinecke salt TS to 5 mL of an aqueous solution of Dilazep Hydrochloride Hydrate (3 in 500); a pale red precipitate develops.

(3) Determine the absorption spectra of Dilazep Hydrochloride Hydrate and an aqueous solution of dilazep hydrochloride RS (1 in 50000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(4) Determine the infrared spectra of Dilazep Hydrochloride Hydrate and dilazep hydrochloride RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(5) An aqueous solution of Dilazep Hydrochloride Hydrate (1 in 50) responds to the Qualitative Analysis for chloride.

pH Dissolve 1.0 g of Dilazep Hydrochloride Hydrate in 100 mL of water; the pH is between 3.0 and 4.0.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Dilazep Hydrochloride Hydrate in 20 mL of water; the resulting solution is clear and colorless.

(2) ***Sulfate***—Perform the test with 0.5 g of Dilazep Hydrochloride Hydrate. Prepare the control solution with 0.50 mL of 0.005 mol/L sulfuric acid VS (NMT 0.048%).

(3) ***Heavy metals***—Proceed with 2.0 g of Dilazep Hydrochloride Hydrate as directed under Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(4) ***Arsenic***—Proceed with 1.0 g of Dilazep Hydrochloride Hydrate as directed under Method 3 and perform the test (NMT 2 ppm).

(5) ***Related substances***—Dissolve 0.40 g of Dilazep Hydrochloride Hydrate in 10 mL of chloroform and use this solution as the test solution. Pipet 1.0 mL of this solution, add chloroform to make exactly 200 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of methanol, ethyl acetate, dichloromethane and hydrochloric acid (500 : 200 : 100 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Spray evenly Dragendorff's TS for spray on the plate; the spots other than the principal spot from the test solution are not more intense than the spots from the standard solution.

Loss on drying Between 2.0% and 3.0% (1 g, 105 ℃, 3 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.3 g of Dilazep Hydrochloride Hydrate, dissolve in 40 mL of a mixture of acetic anhydride and acetic acid(100) (7 : 3), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 33.881 mg of $C_{31}H_{44}N_2O_{10}\cdot 2HCl$

Packaging and storage Preserver in tight containers.

Dilazep Hydrochloride Tablets
딜라제프염산염 정

Dilazep Hydrochloride Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of dilazep hydrochloride ($C_{31}H_{44}N_2O_{10}\cdot 2HCl$: 677.61).

Method of preparation Prepare as directed under Tablets, with Dilazep Hydrochloride.

Identification Weigh an amount of Dilazep Hydrochloride Tablets, equivalent to 50 mg of dilazep hydrochloride according to the labeled amount, dissolve in 5 mL of

ethyl acetate, centrifuge, and use the clear supernatant as the test solution. Weigh about 50 mg of dilazep hydrochloride RS, dissolve in 5 mL of ethyl acetate, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot the test solution and the standard solution on a thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of methanol, ethyl acetate, and hydrochloric acid (50 : 30 : 0.1) as the developing solvent and air-dry the plate. Examine the plate under ultraviolet light and spray chloroplatinic acid-potassium iodide TS; the R_f value and color (dark blue on a bright red background) of the spots obtained from the test solution and the standard solution are the same.

Dissolution Perform the test with 1 tablet of Dilazep Hydrochloride Tablets at 100 revolutions per minute according to Method 2 under the Dissolution, using 900 mL of the first solution as the dissolution solution. Take the dissolved solution after 60 minutes from the start of the test and filter. Discard the first 10 mL of the filtrate and pipet V mL of the next filtrate, add the first solution in the Dissolution to obtain a solution having known concentration of about 55 μg of dilazep hydrochloride per mL according to the labeled amount to make exactly *V' mL*, and use this solution as the test solution. Separately, weigh exactly 55 mg of dilazep hydrochloride RS and dissolve in the first solution in the dissolution test to make exactly 100 mL. Pipet 10 mL of this solution, add this to the first solution in the dissolution test to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the peak areas, A_T and A_S, of dilazep ($C_{31}H_{44}N_2O_{10}$) in each solution, respectively. Meets the requirements if the dissolution rate of Dilazep Hydrochloride Tablets in 60 minutes is NLT 75%.

Dissolution rate (%) with respect to the labeled amount of dilazep ($C_{31}H_{44}N_2O_{10}$)

$$= W_S \times (V' / V) \times (A_T / A_S) / C$$

W_S: Amount (mg) of dilazep hydrochloride RS

C: Labeled amount (mg) of dilazep ($C_{31}H_{44}N_2O_{10}$) in 1 tablet

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 265 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: A mixture of 0.05 mol/L sodium dihydrogen phosphate TS (pH 3.0) and acetonitrile (3 : 7).

Flow rate: 1.0 mL/min

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 tables of Dilazep Hydrochloride Tablets and powder. Weigh accurately an amount, equivalent to about 55 mg of dilazep hydrochloride ($C_{31}H_{44}N_2O_{10}\cdot 2HCl$), and add the mobile phase to make exactly 100 mL. After filtering this solution, pipet 10 mL of the filtrate, add the mobile phase to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 55 mg of dilazep hydrochloride RS and add the mobile phase to make exactly 100 mL. Pipet 10 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test as directed under the Liquid Chromatography with 10 mL each of the test solution and the standard solution under the following conditions, and determine the peak areas A_T and A_S of dilazep.

Amount (mg) of dilazep ($C_{31}H_{44}N_2O_{10}$)

$$= \text{Amount (mg) of dilazep RS} \times (A_T / A_S)$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 265 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: A mixture of 0.05 mol/L sodium dihydrogen phosphate TS (pH 3.0) and acetonitrile (3 : 7).

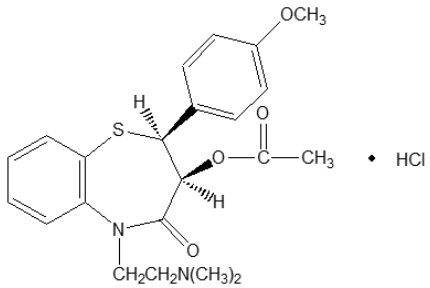
Flow rate: 1.0 mL/min

System suitability

System repeatability: Repeat the test 6 times with 10 mL each of the standard solutions according to the above conditions; the relative standard deviation of the peak areas of dilazep hydrochloride is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Diltiazem Hydrochloride
딜티아젬염산염



$C_{22}H_{26}N_2O_4S \cdot HCl$: 450.98

[(2*R*,3*R*)-5-[2-(Dimethylamino)ethyl]-2-(4-methoxyphenyl)-4-oxo-2,3-dihydro-1,5-benzothiazepin-3-yl]ethanoate hydrochloride [*33286-22-5*]

Diltiazem Hydrochloride, when dried, contains NLT 98.5% and NMT 101.0% of diltiazem hydrochloride ($C_{22}H_{26}N_2O_4S \cdot HCl$).

Description Diltiazem Hydrochloride occurs as a white crystals or a crystalline powder, which is odorless.
It is very soluble in formic acid, freely soluble in water, methanol, or chloroform, sparingly soluble in acetonitrile, slightly soluble in ethanol(99.5) or acetic anhydride and practically insoluble in ether.

Identification (1) Dissolve about 50 mg of Diltiazem Hydrochloride in 1 mL of 1 mol/L hydrochloric acid TS, add 2 mL of ammonium thiocyanate-cobalt nitrate TS and 5 mL of chloroform, shake well to mix, and allow to stand; the chloroform layer exhibits a blue color.

(2) Proceed with 30 mg of Diltiazem Hydrochloride as directed under the Oxygen Flask Combustion, using 20 mL of water as an absorbent to prepare the test solution. The test solution responds to the Qualitative Analysis (1) for sulfate.

(3) Dissolve Diltiazem Hydrochloride and 10 mg of Diltiazem Hydrochloride RS in 0.01 mol/L hydrochloric acid TS to make 100 mL. Pipet 2 mL of this solution and add 0.01 mol/L hydrochloric acid TS to make 20 mL. Determine the absorption spectrum of the resulting solution as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(4) Determine the infrared spectra of Diltiazem Hydrochloride and diltiazem hydrochloride RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(5) An aqueous solution of Diltiazem Hydrochloride (1 in 50) responds to the Qualitative Analysis (2) for chloride.

Optical rotation $[\alpha]_D^{20}$: Between +115° and +120° (0.20 g after drying, water, 20 mL, 100 mm).

Melting point Between 210 and 215 ℃ (with decomposition).

pH Dissolve 1.0 g of Diltiazem Hydrochloridein 100 mL of water; the pH is between 4.3 and 5.3.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Diltiazem Hydrochloride in 20 mL of water; the solution is clear and colorless.

(2) ***Sulfate***—Weigh 1.0 g of Diltiazem Hydrochlorideand perform the test. Prepare the control solution with 0.50 mL of 0.005 mol/L sulfuric acid (NMT 0.024%).

(3) ***Heavy metals***—Proceed with 2.0 g of Diltiazem Hydrochloride as directed under Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(4) ***Arsenic***—Put 1.0 g of Diltiazem Hydrochlorideinto a decomposition flask, add 5 mL of nitric acid and 2 mL of sulfuric acid, put a small funnel in the mouth of the flask, and heat carefully until white smoke is produced. After cooling, add 2 mL of nitric acid and heat. Repeat the above procedure twice, add 2 mL of strong hydrogen peroxide several times, and heat until the solution changes to colorless to pale yellow. After cooling, add 2 mL of saturated ammonium oxalate and heat again until white smoke is produced. After cooling, add water to make 5 mL. Perform the test with this resulting solution as the test solution; the solution is not more intense than the control solution below (NMT 2 ppm).

Control solution—Proceed in the same manner without using Diltiazem Hydrochloride, add 2.0 mL of arsenic standard solution and water to make 5 mL, and proceed according to the method of preparation of the test solution as follows.

(5) ***Related substances***—Dissolve 50 mg of Diltiazem Hydrochloride in 50 mL of diluted ethanol(99.5) (4 in 5) and use this solution as the test solution. Pipet 1 mL of this solution, add diluted ethanol(99.5) (4 in 5) to make exactly 200 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine peak area of each solution by the automatic integration method; the total area of the peaks other than diltiazem of the test solution is NMT three fifth of the peak area of diltiazem from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 240 nm).

Column: A stainless steel column about 4 mm internal diameter and 15 cm to 30 cm length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm to 10 μm in particle diameter).

Column temperature: A constant temperature of about 50 °C.

Mobile phase: Dissolve 8 g of sodium acetate trihydrate and 1.5 g of *d*-camphorsulfonic acid in 500 mL of water and filter through a membrane filter (0.4 μm in pore diameter). Add 250 mL of acetonitrile and 250 mL of methanol to the filtrate and adjust the pH to 6.6 by adding sodium acetate trihydrate. Adjustments can be made if necessary.

Flow rate: Adjust the flow rate so that the retention time of diltiazem is about 9 minutes.

System suitability

Test for required detectability: Pipet 2 mL of the standard solution and add diluted ethanol(99.5) (4 in 5) to make exactly 10 mL. Confirm that the peak area of diltiazem obtained from 20 μL of this solution is equivalent to 15% to 25% of the peak area of diltiazem from the standard solution.

System performance: Weigh 30 mg of Diltiazem Hydrochloride, 20 mg of *d*-3-hydroxy-cis-2,3-dihydro-5-[2-(dimethylamino)ethyl]-2-(*p*-methoxyphenyl)-1,5-benzodiazepine-4(5*H*)-diltiazem hydrochloride (hereafter, deacetylated agent) and 20 mg of phenyl benzoate, dissolve in 160 mL of ethanol(99.5), and add water again to make 200 mL. Proceed with 20 μL of this solution according to the above conditions; deacetylated agent, diltiazem and phenyl benzoate are eluted in this order with the resolution between deacetylated agent and diltiazem and between diltiazem and phenyl benzoate being NLT 2.5, respectively.

System repeatability: Repeat the test 6 times with 20 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area of diltiazem is NMT 2.0%.

Time span of measurement: About 2 times the retention time of diltiazem after the solvent peak.

Loss on drying NMT 0.5% (1 g, 105 ℃, 2 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.7 g of Diltiazem Hydrochloride, previously dried, dissolve in 2.0 mL of formic acid, add 60 mL of acetic anhydride, and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 45.10 mg of $C_{22}H_{26}N_2O_4S \cdot HCl$

Packaging and storage Preserve in light-resistant, tight containers.

Diltiazem Hydrochloride Extended-Release Tablets
딜티아젬염산염 서방정

Diltiazem Hydrochloride Extended-Release Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of diltiazem hydrochloride ($C_{22}H_{26}N_2O_4S \cdot HCl$: 450.98).

Method of preparation Prepare as directed under Tablets, with Diltiazem Hydrochloride.

Identification The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

Uniformity of dosage units Meets the requirements.

Related substances Weigh accurately the mass of NLT 20 tablets of Diltiazem Hydrochloride Extended-Release Tablets, and powder. Weigh accurately an amount equivalent to about 50 mg of diltiazem hydrochloride ($C_{22}H_{26}N_2O_4S \cdot HCl$), add 30 mL of anhydrous ethanol, warm it for 5 minutes, and shake to mix for 10 minutes. After cooling, add 10 mL of water and shake for 15 minutes. Add anhydrous ethanol to make 50 mL and filter. Discard the first 20 mL of the filtrate and use the subsequent filtrate as the test solution. Separately, weigh accurately about 5 mg of diltiazem hydrochloride RS and add anhydrous ethanol to make 100 mL. Pipet 15 mL of this solution, and add 10 mL of water and anhydrous ethanol to make 50 mL. Use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the operating conditions in the Assay. The peak area of the related substance of the test solution is NMT that of the standard solution (NMT 1.5%).

Dissolution Perform the test with 1 tablet of Diltiazem Hydrochloride Extended-Release Tablets at 100 revolutions per minute according to Method 2 under the Dissolution, using 900 mL of water as the dissolution medium. Take the dissolved solution 1, 3, and 10 hours after the start of the Dissolution, filter it, and use the filtrate as the test solution. Separately, weigh accurately about 0.10 g of diltiazem hydrochloride RS, and dissolve it in water to make 1000 mL. Use this solution as the standard solution. Determine the absorbances of the test solution and the standard solution at 280 nm and 320 nm, respectively, as directed under the Atomic Absorption Spectroscopy using water as the control solution. Put the test solution, of which absorbance is measured, into the dissolution tester again. The dissolution rate of Diltiazem Hydrochloride Extended-Release Tablets in 1, 3, and 10 hours should be between 30% and 50%, between 55% and 75%, and NLT 80%, respectively.

Amount (mg) of diltiazem hydrochloride ($C_{22}H_{26}N_2O_4S \cdot HCl$)
= Amount (mg) of diltiazem hydrochloride RS
$$\times \frac{A_{T280} - A_{T320}}{A_{S280} - A_{S320}}$$

Assay Weigh accurately the mass of NLT 20 tablets of Diltiazem Hydrochloride Extended-Release Tablets and powder. Weigh accurately an amount equivalent to about 30 mg of Diltiazem hydrochloride ($C_{22}H_{26}N_2O_4S \cdot HCl$), add 80 mL of anhydrous ethanol, and warm it. Shake for 10 minutes to mix. Add 40 mL of water, 20 mL of the internal standard solution, and anhydrous ethanol to make 200 mL. Filter, discard the first 20 mL of the filtrate, and use the subsequent filtrate as the test solution. Separately, weigh accurately about 30 mg of diltiazem hydrochloride RS, proceed in the same manner with the test solution, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography, and determine the peak area ratios, Q_T and Q_S, to the internal standard in each solution.

$$\text{Amount (mg) of diltiazem hydrochloride } (C_{22}H_{26}N_2O_4S \cdot HCl) = \text{Amount (mg) of diltiazem hydrochloride RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of phenyl benzoate in ethanol (1 in 1000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 240 nm).

Column: A stainless steel column about 4.0 mm in internal diameter and about 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 to 10 μm in particle diameter).

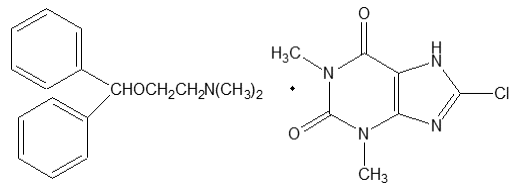
Column temperature: A constant temperature of about 50 °C.

Mobile phase: A solution prepared by dissolving 8 g of sodium acetate and 1.5 g of *d*-camphorsulfonic acid in 500 mL of water, filtering the solution, then adding 250 mL of methanol and 250 mL of acetonitrile and adjusting the pH to 6.6 with sodium acetate.

Flow rate: 1.0 mL/min

Packaging and storage Preserve in tight containers.

Dimenhydrinate
디멘히드리네이트



$C_{17}H_{21}NO \cdot C_7H_7ClN_4O_2$: 469.96

2-Benzhydryloxy-*N*,*N*-dimethylethanamine; 8-chloro-1,3-dimethyl-1*H*-purine-2,6(3*H*,7*H*)dione [*523-87-5*]

Dimenhydrinate, when dried, contains NMT 53.0% and NLT 55.5% of diphenhydramine ($C_{17}H_{21}NO$: 255.36) and NLT 44.0% and NMT 47.0% of 8-chlorotheophylline ($C_7H_7ClN_4O_2$: 214.61).

Description Dimenhydrinate occurs as a white crystalline powder, is odorless, and has a bitter taste.
It is very soluble in chloroform, freely soluble in ethanol(95), and slightly soluble in water or ether.

Identification Determine the infrared spectra of Dimenhydrinate and dimenhydrinate RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Melting point Between 102 and 107 ℃.

Purity (1) ***Chloride***—Transfer 50 mL of the filtrate obtained in the Assay (2) to a Nessler tube, add 1 mL of nitric acid, and allow to stand for 5 minutes; the turbidity of the solution is not greater than that of the following control solution.

Control solution—Dilute 0.25 mL of 0.01 mol/L hydrochloric acid with 6 mL of dilute nitric acid and with water to make 50 mL, add 1 mL of silver nitrate TS and allow to stand for 5 minutes (NMT 0.044%).

(2) ***Bromide and iodide*** —Place 0.10 g of Dimenhydrinate in a stoppered test tube and add 50 mg of sodium nitrite, 10 mL of chloroform and 10 mL of dilute hydrochloric acid. Stopper, shake well to mix, and allow to stand; the chloroform layer remains colorless.

Loss on drying NMT 0.5% (3 g, in vacuum, phosphorus pentoxide, 24 hours).

Residue on ignition NMT 0.3% (1 g).

Assay (1) ***Diphenhydramine***—Weigh accurately about 0.5 g of Dimenhydrinate, previously dried, transfer to a 250 mL separatory funnel, and add 50 mL of water, 3 mL of ammonia TS and 10 g of sodium chloride. Extract with six 15 mL portions of ether by shaking to mix. Combine all the ether extracts, wash the combined extract with three 50 mL portions of water, add accurately 25 mL of 0.05 mol/L sulfuric acid and 25mL of water to the ether extract, and shake well to mix. Evaporate the ether gently, allow to cool, and titrate the excess sulfuric acid with 0.1 mol/L sodium hydroxide VS (indicator: 3 drops of methyl red TS). Perform a blank test in the same manner.

$$\text{Each mL of 0.05 mol/L sulfuric acid VS} = 25.536 \text{ mg of } C_{17}H_{21}NO$$

(2) ***8-Chlorotheophylline*** —Weigh accurately about 0.8 g of Dimenhydrinate, previously dried, transfer to a 200-mL volumetric flask, add 50 mL of water, 3 mL of

ammonia TS and 6 mL of ammonium nitrate (1 in 10), and heat on a steam bath for 5 minutes. Add exactly 25.0 mL of 0.1 mol/L silver nitrate, and heat on a steam bath for 15 minutes with occasional shaking. After cooling, add water to make exactly 200 mL. Allow to stand overnight to settle the precipitate and filter through a dry filter paper. Discard the initial 20 mL of filtrate, take exactly 100 mL of the subsequent filtrate, acidify by adding nitric acid dropwise, add 3 mL of nitric acid, and titrate the excess silver nitrate with 0.1 mol/L ammonium thiocyanate VS (indicator: 2 mL of ammonium iron(III) sulfate TS). Perform a blank test in the same manner.

Each mL of 0.1 mol/L silver nitrate VS
= 21.461 mg of $C_7H_7ClN_4O_2$

Packaging and storage Preserve in well-closed containers.

Dimenhydrinate Tablets
디멘히드리네이트 정

Dimenhydrinate Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of dimenhydrinate ($C_{17}H_{21}NO \cdot C_7H_7ClN_4O_2$: 469.96).

Method of preparation Prepare Dimenhydrinate Tablets as directed under Tablets, with Dimenhydrinate.

Identification (1) Powder Dimenhydrinate Tablets, weigh an appropriate amount, equivalent to 0.5 g of dimenhydrinate, according to the labeled amount, dissolve in 25 mL of warm ethanol, mix by grinding, and filter. Add 40 mL of water to the filtrate, filter again, and use the filtrate as the test solution. Take 30 mL of the test solution, transfer into a separatory funnel, and perform the test as directed under the Identification (1) of Dimenhydrinate.

(2) Take 30 mL of the test solution from (1) and perform the test as directed under the Identification (2), (3) and (4) of Dimenhydrinate.

Dissolution Perform the test with 1 tablet of Dimenhydrinate Tablets at 50 revolutions per minute according to Method 2 under the Dissolution, using 900 mL of water as the dissolution medium. Take NLT 20 mL of the dissolved solution after 15 minutes from the start of the Dissolution, and filter through a membrane filter with a pore diameter of NMT 0.45 μm. Discard the first 10 mL of the filtrate, pipet V mL of the subsequent filtrate, add water to make exactly V' mL so that each mL contains about 28 μg of dimenhydrinate ($C_{17}H_{21}NO \cdot C_7H_7ClN_4O_2$) according to the labeled amount, and use this solution as the test solution. Separately, weigh accurately about 28 mg of dimenhydrinate RS (previously dry for 24 hours in vacuum using phosphorus pentoxide as the desiccating agent), and add water to make exactly 50 mL. Pipet 5 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at the absorbance maximum wavelength of about 276 nm as directed under the Ultraviolet-visible Spectroscopy, using the test solution as the control solution. Meets the requirements if the dissolution rate of Dimenhydrinate Tablets in 15 minutes is NLT 85%.

Dissolution rate (%) of the labeled amount of dimenhydrinate ($C_{17}H_{21}NO \cdot C_7H_7ClN_4O_2$)
= Amount (mg) of dimenhydrinate RS

$$\times \frac{A_T}{A_S} \times \frac{V'}{V} \times \frac{1}{C} \times 90$$

C: Labeled amount (mg) of dimenhydrinate ($C_{17}H_{21}NO \cdot C_7H_7O_4ClN_4O_2$) in 1 tablet.

Uniformity of dosage units Meets the requirements.

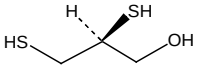
Assay Weigh accurately NLT 20 Dimenhydrinate Tablets and powder them. Weigh accurately an amount, equivalent to about 50 mg of dimenhydrinate ($C_{17}H_{21}NO \cdot C_7H_7ClN_4O_2$), add 80 mL of methanol, and shake well to mix. Add methanol again to make exactly 100 mL, and filter. Pipet 5 mL of the filtrate, add 5 mL of the internal standard solution, and use this solution as the test solution. Separately, weigh accurately about 25 mg of dimenhydrinate RS and dissolve in methanol to make exactly 50 mL. Pipet 5 mL of this solution, add 5 mL of the internal standard solution, and use this solution as the standard solution. Perform the test with exactly 25 μL each of the test solution and the standard solution as directed under the Assay of Dimenhydrinate Injections.

Amount (mg) of dimenhydrinate ($C_{17}H_{21}NO \cdot C_7H_7ClN_4O_2$)
= Amount (mg) of dimenhydrinate RS $\times \frac{A_T}{A_S} \times 2$

Internal standard solution—A solution of 2-hydroxybenzyl alcohol in methanol (2.0 mg/mL).

Packaging and storage Preserve in well-closed containers.

Dimercaprol
디메르카프롤



and enantiomer

$C_3H_8OS_2$: 124.23

2,3-Disulfanylpropan-1-ol [*59-52-9*]

Dimercaprol contains NLT 98.5% and NMT

101.5% of dimercaprol ($C_3H_8OS_2$).

Description Dimercaprol occurs as a colorless to pale yellow liquid and has a mercaptan-like, unpleasant odor.
It is soluble in peanut oil and sparingly soluble in water.
It is miscible with methanol or with ethanol(99.5).
It shows no optical rotation.

Identification (1) Add 1 drop of Dimercaprol to a mixture of 1 drop of a solution of cobalt chloride hexahydrate (1 in 200) and 5 mL of water; the resulting solution exhibits a yellowish brown color.

(2) Determine the infrared spectra of Dimercaprol and dimercaprol RS as directed under the liquid film method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Refractive index n_D^{20}: Between 1.570 and 1.575.

Specific gravity d_{20}^{20}: Between 1.238 and 1.248.

Purity (1) ***Clarity and color of solution*—**Dissolve 1.0 mL of Dimercaprol in 20 mL of peanut oil; the resulting solution is clear and colorless to pale yellow.

(2) ***Bromide*—**Add 25 mL of dilute potassium hydroxide-ethanol TS to 2.0 g of Dimercaprol, heat on a steam bath under a reflux condenser for 2 hours, and evaporate the ethanol in a current of warm air. Add 20 mL of water and allow to cool. Add a mixture of 10 mL of hydrogen peroxides (30) and 40 mL of water to this solution, boil gently under a reflux condenser for 10 minutes, and filter immediately after cooling. Wash the residue with two 10 mL portions of water, combine the washings with the filtrate, exactly add 10 mL of dilute nitric acid and 5 mL of 0.1 mol/L silver nitrate, and titrate the excess silver nitrate with 0.1 mol/L ammonium thiocyanate VS (Indicator: 2 mL of ammonium iron(III) sulfate TS). Perform a blank test in the same manner. NMT 1.0 mL of 0.1 mol/L silver nitrate is consumed.

(3) ***Heavy metals*—**Proceed with 1.0 g of Dimercaprol and perform the test according to Method 2. Prepare the control solution with 2.0 mL of the lead standard solution (NMT 20 ppm).

(4) ***1,2,3-Trimercaptopropane and other related substances*—**Weigh exactly 250 mg of hydrogen sulfide-free Dimercaprol, add the mobile phase to make exactly 5 mL, and use this solution as the test solution. Test Dimercaprol for the presence of hydrogen sulfide using lead acetate paper. If the paper darkens, this indicates the presence of hydrogen sulfide; remove hydrogen sulfide by bubbling dry, oxygen-free nitrogen or carbon dioxide through the liquid until a fresh strip of paper does not darken. Weigh accurately 20 g of 100-mesh silicic acid for column chromatography, dissolve in 20 mL of a solution prepared by dissolving 100 mg of sodium sulfite heptahydrate in 100 mL of pH 6.0 phosphate buffer solution, add 100 mL of chloroform, and use this as the filler. Transfer the filler to a column for liquid column chromatography, 13 mm in diameter and 600 mm in length, to pack tightly, and wash the column free from chloroform with the mobile phase, taking cautions to prevent air from entering. Put 2.0 mL of the test solution into the top of the prepared column and wash with the mobile phase. Collect 20 mL of eluate containing 1,2,3-trimercaptopropane and use this solution as the test solution (1), and collect 3 mL of eluate and use this solution as the test solution (2) for the separation test. Add the same volume of ethanol(95) to the test solution (1) and the test solution (2), respectively. Confirm that the test solution (2) is not decolorized by 1 drop of 0.1 mol/L iodine VS, and titrate the test solution (1) with 0.1 mol/L iodine VS until a yellow color is produced. Separately, perform a blank test with 20 mL of the solution that has been passed through the column in the same manner, and make any necessary correction; the amount of 1,2,3-trimercaptopropane is NMT 1.5%.

Each mL of 0.1 mol/L iodine VS
= 4.676 mg of $C_3H_8S_2$

Mobile phase—A mixture of diisopropyl ether and acid-washed hexane (1 : 1).

Diisopropyl ether—Put 100 mL of diisopropyl ether into a distilling flask and distill, retaining only that portion distilling between 68 and 69 °C. Do not evaporate to the point of dryness, since diisopropyl ether forms explosive peroxides. Use only the freshly distilled material.

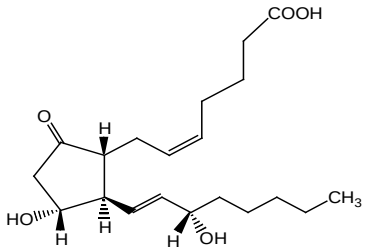
Acid-washed hexane—Put 100 mL of hexane and 10 mL of sulfuric acid into a separatory funnel, shake for NLT 12 hours to mix and allow the layers to be separated. Put the hexane layer into a distilling flask and distills slowly, retaining only the portion that distills between 35and 50 °C. Use only the freshly distilled portion.

Assay Weigh accurately about 0.15 g of Dimercaprol into a stoppered flask, dissolve in 10 mL of methanol, and titrate immediately with 0.05 mol/L iodine VS until a pale yellow color is observed. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.05 mol/L iodine VS
= 6.212 mg of $C_3H_8OS_2$

Packaging and storage Preserve in tight containers and store at below 5 ℃.

Dinoprostone
디노프로스톤



Prostaglandin E_2 $C_{20}H_{32}O_5$: 352.47

(*Z*)-7-((1*R*,2*R*,3*R*)-3-Hydroxy-2-((3*S*,*E*)-3-hydroxyoct-1-en-1-yl)-5-oxocyclopentyl)hept-5-enoic acid [*363-24-6*]

Dinoprostone contains NLT 97.0% and NMT 103.0% of dinoprostone ($C_{20}H_{32}O_5$), calculated on the anhydrous basis.

Description Dinoprostone occurs as a white or pale gray, crystalline powder and is odorless.

Identification (1) Determine the infrared spectra of Dinoprostone and dinoprostone RS, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

Optical rotation $[\alpha]_D^{20}$: Between -82° and -90° (0.1 g, ethanol(95) 20 mL, 100 mm).

Purity (1) ***Related substances***—Weigh 25.0 mg of Dinoprostone, add the mobile phase to make exactly 10 mL, and use this solution as the test solution. Separately, weigh 25.0 mg of dinoprostone RS, add the mobile phase to make exactly 10 mL, and use this solution as the standard solution (1). To 0.5 mL of the standard solution (1), add the mobile phase to make exactly 50 mL, and use this solution as the standard solution (2). Perform the test with 20 μL each of the test solution and the standard solution (2) as directed under the Liquid Chromatography according to the following conditions. Determine each peak area in each solution by the automatic integration method and calculate the amount of each related substance in the test solution with respect to dinoprostone; the sum of the dinoprostone related substance I {15-oxo-1-dinoprostone} having a relative retention time of about 0.79, the dinoprostone related substance II {15-epi-dinoprostone} having a relative retention time of about 0.85, and the dinoprostone related substance III {8-isodinoprostone} having a relative retention time of about 0.90 is NMT 1.0%, the dinoprostone related substance IV {5,6-trans-dinoprostone} having a relative retention time of about 1.15 is NMT 2.0%, and the dinoprostone related substance V {(5Z,13E,15S)-15-hydroxy-9-oxoprosta-5,10,13-triene-1-oic acid} having a relative retention time of about 1.80 and the related substance VI {(5Z,13E,15S)-15-hydroxy-9-oxoprosta-5,8(12),13-triene-1-oic acid} having a relative retention time of about 1.90 are 1.0% each. The amount of any other related substance is 0.1%. Determine the peak areas of the dinoprostone related substances I, II, V and VI by dividing the peak areas obtained from the automatic integration method by the correction factors 5, 1.1, 5 and 1.43, respectively.

$$\text{Content (\%) of each related substance} = \frac{\mathrm{C}}{\mathrm{W}} \times \frac{1}{\mathrm{F}} \times \frac{A_\mathrm{i}}{A_\mathrm{S}}$$

C: Concentration (μg/mL) of dinoprostone RS in the standard solution (2).

W: Weight (mg) of sample taken.

F: Relative correction factor

A_i: Peak area for each related substance obtained from the test solution.

A_S: Peak area for dinoprostone obtained from the standard solution.

Operating conditions

Detector: An ultraviolet absorption spectrophotometer (wavelength: 210 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 30 ℃.

Mobile phase: A mixture of methanol and 0.2% acetic acid(100) (58 : 42).

Flow rate: 1 mL/min

System suitability

System performance: When the procedure is run with 20 μL of the standard solution (1) under the above operating conditions, the number of theoretical plates is NLT 6000. The resolution between dinoprostone peak and any other adjacent peak in the chromatogram obtained from the injection of the test solution is NLT 1.0.

System repeatability: Repeat the test 5 times with 20 μL each of the standard solution (1) under the above operating conditions; the relative standard deviation of the areas of the major peaks is NMT 2.0%.

Water NMT 0.5% (0.5 g, volumetric titration, direct titration).

Ignition residue NMT 0.5% (1 g).

Assay Weigh accurately about 25 mg of Dinoprostone, add the mobile phase to make exactly 10 mL, and use this solution as the test solution. Separately, weigh 25 mg of dinoprostone RS, add the mobile phase to make exactly 10 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution according to the operating conditions for testing related substances under the Liquid Chromatography, and determine the peak areas, A_T and A_S, of dinoprostone in each solution.

Amount (mg) of dinoprostone ($C_{20}H_{32}O_5$)
= Amount (mg) of dinoprostone RS × $\frac{A_T}{A_S}$

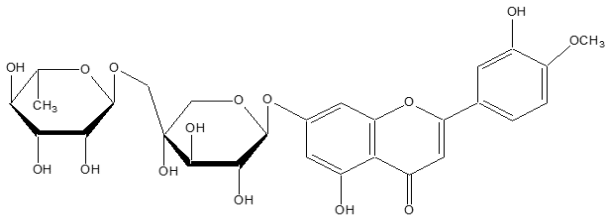
System suitability

System performance: Proceed with 20 μL of the standard solution under the operating conditions for testing related substances; the resolution between dinoprostone peak and any other adjacent peak is NLT 1.0.

System repeatability: Repeat the test 5 times with 20 μL each of the standard solution under the operating conditions for testing related substances; the relative standard deviation of the areas of the major peaks is NMT 2.0%.

Packaging and storage Preserve in light-resistant, well-closed containers.

Diosmin
디오스민



$C_{28}H_{32}O_{15}$: 608.55

5-Hydroxy-2-(3-hydroxy-4-methoxyphenyl)-7-[(2*S*,3*R*,4*S*,5*S*,6*R*)-3,4,5-trihydroxy-6-[[(2*R*,3*R*,4*R*,5*R*,6*S*)-3,4,5-trihydroxy-6-methyl-oxan-2-yl]oxy-methyl]oxan-2-yl]oxychromen-4-one [*520-27-4*]

Diosmin contains NLT 90.0% and NMT 102.0% of diosmin ($C_{28}H_{32}O_{15}$), calculated on the anhydrous basis.

Description Diosmin occurs as a pale grayish yellow or bright yellow powder.
It is soluble in dimethylsulfoxide and practically insoluble in water or ethanol(95).
It is soluble in dilute sodium hydroxide TS.
It is hygroscopic.

Identification (1) Determine the infrared spectra of Diosmin and diosmin RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) Proceed as directed under the Assay; the retention times of the major peaks obtained from the test solution and the standard solution are the same.

Purity (1) ***Heavy metals***—Proceed with about 2.0 g of Diosmin and perform the test according to Method 2. Prepare the control solution with 4.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Iodine***—Weigh about 0.1 g of Diosmin, prepare the solution with 50 mL of 0.02 w/v% hydrazine solution as an absorbent as directed under the Ooxygen flask combustion, and use this solution as the test solution. Separately, weigh exactly 1.66 g of potassium iodide and dissolve in water to make exactly 100 mL. Pipet 2 mL of this solution, add water to make exactly 100 mL, then pipet 10 mL of this solution, add water to make exactly 100 mL, and use this solution as the control solution. Weigh 20 g of potassium nitrate and dissolve in 0.1 mol/L nitric acid to make 100 mL. Transfer 30 mL of this solution in a beaker, soak iodine ion selective electrodes, stir for 10 minutes, and stir for 10 minutes until the transposition (n_{T1}) of this solution stabilizes. Add1 mL of the test solution and determine transposition (n_{T2}). Separately, weigh 20 g of potassium nitrate and dissolve in 0.1 mol/L nitric acid to make 100 mL. Transfer 30 mL of this solution in a beaker, soak iodine ion selective electrodes, stir for 10 minutes, and stir for 10 minutes until the transposition (n_{R1}) of this solution stabilizes. Add 80 μL of the control solution and determine the transposition (n_{R2}). Thea absolute value of $|n_{T2} - n_{T1}|$ is smaller than the absolute value of $|n_{R2} - n_{R1}|$.

(3) ***Related substances***—Weigh accurately about 25 mg of Diosmin, add dimethylsulfoxide to make exactly 25 mL, and use this solution as the test solution. Separately, weigh exactly 25 mg of diosmin RS and dissolve in dimethylsulfoxide to make exactly 25 mL. Pipet 5 mL of this solution, add dimethylsulfoxide to make 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak area of each solution according to the automatic integration method. However, when determining the content of related substances I and related substances VI, multiply 0.38 and 0.61 to each peak area and calibrate. Related substances I is NMT 0.2 times (1%) the peak area from the standard solution, related substances II is NMT (5%) of the peak area from the standard solution, related substances III, V and VI each is NMT 0.6 times (3%) the peak area from the standard solution. Any peak area from the related substances is NMT 0.2 times the major peak area from the standard solution, the total area of related substances I and related substances peak is NMT 0.2 (1%) times the major peak area from the standard solution, and the total sum area of related substances peak is NMT 2 times (10%) the major peak area from the standard solution. However, exclude the peak which is NMT 0.02 times the area of the major peak of the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 275 nm).

Column: A stainless steel column 4.6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 μm in

particle diameter).

Column temperature: 40 °C

Mobile phase: A mixture of water, methanol, acetic acid(100) and acetonitrile (66 : 28 : 6 : 2).

Flow rate: 1.5 mL/min

Relative retention time: The retention time of diosmin peak is about 4.6 minutes. The retention time of related substances I, II, III, IV, V and VI is about 0.5, 0.6, 0.8, 2.2, 2.6 and 4.5 minutes.

System suitability

System performance: Weigh 25 mg of diosmin and dissolve in dimethylsulfoxide to make 25 mL. Proceed with 10 μL of this solution according to the above operating conditions, the resolution between related substances II and III is NLT 2.5.

Water NMT 6.0% (0.3 g, volumetric titration, direct titration).

Residue on ignition NMT 0.2% (1 g).

Assay Weigh accurately about 25 mg of Diosmin and diosmin RS, dissolve in dimethylsulfoxide to make exactly 25 mL, and use these solutions as the test solution and the standard solution. Perform the test with 10 mL each of the test solution and the standard solution as directed under the Liquid Chromatography according to above the related substances' conditions, and determine the ratios, A_T and A_S, of the peak area of the test solution to that from the standard solution.

$$\text{Amount (mg) of diosmin } (C_{28}H_{32}O_{15}) = \text{Amount (mg) of diosmin RS} \times \frac{A_T}{A_S}$$

Packaging and storage Preserve in tight containers.

Diosmin Capsules
디오스민 캡슐

Diosmin Capsules contain NLT 95.0% and NMT 105.0% the labeled amount of diosmin ($C_{28}H_{32}O_{15}$: 608.55).

Method of preparation Prepare as directed under Capsules, with Diosmin.

Identification Weigh accurately an amount of the contents of Diosmin Capsules equivalent to 50 mg of diosmin, add 10 mL of 0.1 mol/L sodium hydroxide methanolic solution, warm on a steam bath, and cool. Filter and use this solution as the test solution. Separately, weigh 50 mg of diosmin RS, dissolve in 10 mL of 0.1 mol/L sodium hydroxide methanolic solution, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography (with fluorescence indicator), develop the plate with a mixture of ethyl acetate, methyl ethyl acetone, water and formic acid (5 : 3 : 1 : 1) (as the developing solvent) to a distance of about 10 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots obtained from the test solution exhibits R_f values and the colors corresponding to that of the standard solution.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the contents of NLT 20 capsules of Diosmin Capsules. Weigh accurately an amount equivalent to about 10 mg of diosmin ($C_{28}H_{32}O_{15}$), add 70 mL of 0.1 mol/L sodium hydroxide methanolic solution, warm on a steam bath, and dissolve. Cool it down and add 0.1 mol/L sodium hydroxide methanolic solution to make 100 mL. Filter this solution, take 10.0 mL of the filtrate, add 0.1 mol/L sodium hydroxide methanolic solution to make 50 mL, and use this solution as the test solution. Separately, weigh accurately an amount equivalent to 10 mg of diosmin RS, as a dried basis, proceed in the same manner as in the preparation of the test solution, and use this solution as the standard solution. Determine the absorbances, A_T and A_S of the test solution and the standard solution, at the wavelength of 374 nm as directed under the Ultraviolet-visible Spectroscopy, using 0.1 mol/L sodium hydroxide methanolic solution as a control solution.

$$\text{Amount (mg) of diosmin } (C_{28}H_{32}O_{15}) = \text{Amount (mg) of diosmin RS} \times \frac{A_T}{A_S}$$

Packaging and storage Preserve in well-closed containers.

Diosmin Tablets
디오스민 정

Diosmin Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of diosmin ($C_{28}H_{32}O_{15}$: 608.55).

Method of preparation Prepare as directed under Tablets, with Diosmin.

Identification Weigh an amount of Diosmin Tablets, equivalent to 50 mg of diosmin according to the labeled amount, add 10 mL of 0.1 mol/L methanolic sodium hydroxide solution, warm on a steam bath to dissolve, and use the filtrate as the test solution. Weigh a50 mg of diosmin RS, dissolve in 10 mL of 0.1 mol/L methanolic

sodium hydroxide solution, and use this solution as the standard solution. Perform the test with these solutions as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography, develop the plate with a mixture of ethyl acetate, methylethylacetone, water and formic acid (5 : 3 : 1 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the R_f value and the color of the spots obtained from the test and the standard solution are same.

Disintegration Meets the requirements. However, the disintegration time is 15 minutes.

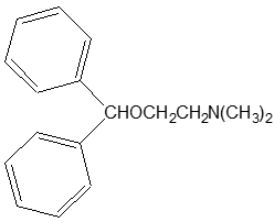
Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 tablets of Diosmin Tablets and powder. Weigh accurately an amount equivalent to 10 mg of diosmin ($C_{28}H_{32}O_{15}$), add 70 mL of 0.1 mol/L methanolic sodium hydroxide solution, warm on a steam bath to dissolve, cool, and add 0.1 mol/L methanolic sodium hydroxide solution to make exactly 100 mL. Filter this solution, pipet 10 mL of the filtrate, add 0.1 mol/L methanolic sodium hydroxide solution to make exactly 50 mL, and use this solution as the test solution. Separately, weigh accurately about 10 mg of diosmin RS, calculated on the dried basis, proceed in the same manner as in the test solution, and use this solution as the standard solution. Perform the test with the test solution and the standard solution as directed under the Ultraviolet-visible Spectroscopy, using 0.1 mol/L methanolic sodium hydroxide solution as the control solution, and determine the absorbances, A_T and A_S at a wavelength of 374 nm.

Amount (mg) of diosmin ($C_{28}H_{32}O_{15}$)
= Amount (mg) of diosmin RS × (A_T / A_S)

Packaging and storage Preserve in well-closed containers.

Diphenhydramine
디펜히드라민



$C_{17}H_{21}NO$: 255.36
2-Benzhydryloxy-*N*,*N*-dimethylethanamine [*58-73-1*]

Diphenhydramine contains NLT 96.0% and NMT 101.0% of diphenhydramine ($C_{17}H_{21}NO$).

Description Diphenhydramine occurs as a clear, pale yellow to yellow liquid with a characteristic odor, and has a tongue-burning taste at first, followed by slight sensation of numbness on the tongue.
It is miscible with ethanol(95), acetic acid(100), acetic anhydride or ether.
It is very slightly soluble in water.
Boiling point—About 162 ℃ (0.67 kPa).
Refractive index n_D^{20}: About 1.55.
It is gradually affected by light.

Identification Determine the infrared spectra of Diphenhydramine and Diphenhydramine RS as directed under the ART method under the mid-infrared absorption spectrophotometry; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Specific gravity d_{20}^{20}: Between 1.013 and 1.020.

Purity (1) ***β-Dimethylaminoethanol***—Dissolve 1.0 g of Diphenhydramine in 20 mL of ether, shake well with 10 mL each of water to mix, and extract twice. Combine the water extracts, and add 2 drops of phenolphthalein TS and 1.0 mL of 0.05 mol/L sulfuric acid; the resulting solution does not exhibit a red color.

(2) ***Benzhydrol***—Put 1.0 g of Diphenhydramine into a separatory funnel, dissolve in 20 mL of ether, shake well with 25 mL each of diluted hydrochloric acid (1 in 15) to mix, and extract twice. Separate the ether layer to take, evaporate gradually on a steam bath, and dry the residue in vacuum in a desiccator (silica gel); the amount is NMT 20 mg.

(3) ***Heavy metals***—Proceed with 1.0 g of Diphenhydramine as directed under Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

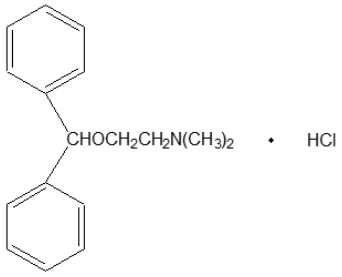
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.5 g of Diphenhydramine, dissolve in 50 mL of a mixture of acetic acid(100) and acetic acid(100) (7 : 3), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 25.536 mg of $C_{17}H_{21}NO$

Packaging and storage Preserve in almost well-filled and light-resistant, tight containers.

Diphenhydramine Hydrochloride
디펜히드라민염산염



$C_{17}H_{21}NO \cdot HCl$: 291.82
2-Benzhydryloxy-*N*,*N*-dimethyl-ethanamine hydrochloride [*147-24-0*]

Diphenhydramine Hydrochloride, when dried, contains NLT 98.0% and NMT 101.0% of diphenhydramine hydrochloride ($C_{17}H_{21}NO \cdot HCl$).

Description Diphenhydramine Hydrochloride occurs as white crystals or a crystalline powder. It is odorless, has a bitter taste, and paralyzes the tongue.
It is very soluble in methanol or acetic acid(100), freely soluble in water or ethanol(95), sparingly soluble acetic anhydride and practically insoluble in ether.
It is gradually affected by light.

Identification (1) Determine the absorption spectra of solutions of Diphenhydramine Hydrochloride and Diphenhydramine hydrochloride RS in methanol (1 in 2000) as directed under the Ultraviolet-visible Spectroscopy; both exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Diphenhydramine Hydrochloride and Diphenhydramine Hydrochloride RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) An aqueous solution of Diphenhydramine Hydrochloride (1 in 50) responds to the Qualitative Analysis for chloride.

Melting point Between 166 and 170 ℃.

pH Dissolve 1 g of Diphenhydramine Hydrochloride in 10 mL of water; the pH of this solution is between 4.0 and 5.0.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Diphenhydramine Hydrochloride in 10 mL of water; the solution is clear and colorless.

(2) ***Heavy metals***—Proceed with 1.0 g of Diphenhydramine Hydrochloride according to Method 4 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Related substances***—Dissolve 0.20 g of Diphenhydramine Hydrochloride in 10 mL of methanol and use this solution as the test solution. Pipet 1 mL of this solution, add methanol to make exactly 200 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with the upper layer of a mixture of hexane, ethyl acetate, methanol and ammonia water(28) (10 : 4 : 2 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Spray evenly iodine TS on the plate; the spots other than the principal spot and the spot at the starting point from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 0.5% (2 g, 105 ℃, 3 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.4 g of Diphenhydramine Hydrochloride, previously dried, dissolve by adding 50 mL of a mixture of acetic anhydride and acetic acid (7 : 3), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 29.182 mg of $C_{17}H_{21}NO \cdot HCl$

Packaging and storage Preserve in light-resistant, tight containers.

Diphenhydramine Hydrochloride Capsules
디펜히드라민염산염 캡슐

Diphenhydramine Hydrochloride Capsules contain NLT 90.0% and NMT 110.0% the labeled amount of diphenhydramine hydrochloride ($C_{17}H_{21}NO \cdot HCl$: 291.82).

Method of preparation Prepare as directed under Capsules, with Diphenhydramine Hydrochloride.

Identification (1) Weigh an amount equivalent to 50 mg of Diphenhydramine Hydrochloride according to the labeled amount and perform the test as directed under the Identification under Diphenhydramine Hydrochloride.

(2) The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

Dissolution Perform the test with 1 capsule of Diphenhydramine Hydrochloride Capsules at 100 revolutions per minute according to Method 1, using 500 mL of

water as the dissolution medium. Take the dissolved solution 30 minutes after starting the test, and filter. Discard the first 10 mL of the filtrate and use the subsequent filtrate as the test solution. Separately, weigh an appropriate amount of Diphenhydramine Hydrochloride RS, previously dried at 105 ℃ for 3 hours, and dissolve in water to obtain a solution with the same concentration as the test solution. Use this solution as the standard solution. Perform the test with 50 μL each of the test solution and the standard solution as directed under the Assay under Diphenhydramine Hydrochloride Injection. Meets the requirements if the dissolution rate of Diphenhydramine Hydrochloride Capsules in 30 minutes is NLT 80%.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of the contents of NLT 20 capsules of Diphenhydramine Hydrochloride Capsules. Weigh accurately an amount equivalent to 50 mg of Diphenhydramine Hydrochloride ($C_{17}H_{21}NO \cdot HCl$), dissolve in water, add water to make exactly 100 mL, and filter. Perform the test as directed under the Assay under Diphenhydramine Hydrochloride Injection.

$$\text{Amount (mg) of diphenhydramine hydrochloride } (C_{17}H_{21}NO \cdot HCl) = \text{Amount (mg) of diphenhydramine hydrochloride RS} \times \frac{A_T}{A_S}$$

Packaging and storage Preserve in tight containers.

Diphenhydramine Hydrochloride Injection
디펜히드라민염산염 주사액

Diphenhydramine Hydrochloride Injection is an aqueous solution for injection. Diphenhydramine Hydrochloride Injection contains NLT 90.0% and NMT 110.0% of the labeled amount of diphenhydramine hydrochloride ($C_{17}H_{21}NO \cdot HCl$: 291.82).

Method of preparation Prepare Diphenhydramine Hydrochloride Injection as directed under Injections, with Diphenhydramine Hydrochloride.

Description Diphenhydramine Hydrochloride Injection occurs as a clear, colorless liquid.

Identification (1) The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

(2) Weigh an amount of Diphenhydramine Hydrochloride Injection, equivalent to 50 mg of diphenhydramine hydrochloride, according to the labeled amount, and add 0.03 mol/L sulfuric acid to make 25 mL. Filter this solution, if necessary, and use it as the test solution. Separately, dissolve 50 mg of diphenhydramine hydrochloride RS in 0.01 mol/L hydrochloric acid to make 25 mL, and use this solution as the standard solution. Pipet 2 mL each of the test solution and the standard solution, add 2 mL of 1 mol/L sodium hydroxide and 4 mL of carbon disulfide, and shake well to mix for 2 minutes. If necessary, centrifuge, filter, and determine as directed under the solution method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

pH Between 4.0 and 6.5.

Sterility Meets the requirements.

Bacterial endotoxins Less than 3.4 EU per mg of Diphenhydramine Hydrochloride.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Extractable volume of injections Meets the requirements.

Assay Accurately take an amount, equivalent to 50 mg of Diphenhydramine Hydrochloride ($C_{17}H_{21}NO \cdot HCl$), according to the labeled amount, add water to make exactly 100 mL and use this solution as the test solution. Separately, weigh accurately 50 mg of Diphenhydramine Hydrochloride RS, previously dried at 105 ℃, add water to make 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions and determine the peak areas, A_T and A_S, of Diphenhydramine, respectively.

$$\text{Amount (mg) of Diphenhydramine Hydrochloride } (C_{17}H_{21}NO \cdot HCl) = \text{Amount (mg) of Diphenhydramine Hydrochloride RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with nitrile silica gel for liquid chromatography (5 to 10 μm in particle diameter).

Mobile phase: Adjust the pH to 6.5 with a mixture of water, acetonitrile and triethylamine (50 : 50 : 0.5) with acetic acid(100). Adjustments can be made if necessary.

Flow rate: 1 mL/min

System suitability

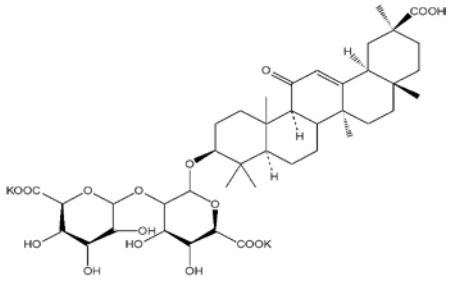
System performance: Dissolve 5 mg of benzophe-

none in 5 mL of acetonitrile, and add water to make 500 mL. To 1.0 mL of this solution, add 5 mg of Diphenhydramine Hydrochloride RS, and add water to make 10 mL. Proceed with 10 mL of this solution according to the above conditions; benzophenone and Diphenhydramine are eluted in this order with the resolution being NLT 2.0.

System repeatability: Repeat the test 6 times according to the above conditions with 10 µL each of the standard solution; the relative standard deviation of the peak area is NMT 2.0%

Packaging and storage Preserve in light-resistant, hermetic containers.

Dipotassium Glycyrrhizinate
글리시리진산이칼륨



$C_{42}H_{60}K_2O_{16}$: 899.13

(3β,20β)-20-Carboxy-11-oxo-30-norolean-12-en-3-yl-2-*O*-β-*D*-glucopyranuronosyl-α-*D*-glucopyranosiduronic acid potassium salt (1:2), [68797-35-3]

Dipotassium Glycyrrhizinate ($C_{42}H_{60}K_2O_{16}$) contains NLT 95.0% and NMT 101.0% of dipotassium glycyrrhizinate, calculated on the anhydrous basis.

Description Dipotassium Glycyrrhizinate occurs as a white to light yellow powder with no odor and has a sweet taste.

It is freely soluble in dilute ethanol and slightly soluble in ethanol, and practically insoluble in chloroform or ether.

Identification (1) The residue obtained after the ignition of Dipotassium Glycyrrhizinate responds to the Qualitative Analysis for potassium salt.

(2) Add 10 mL of 1 mol/L hydrochloric acid TS10 mL to 0.5 g of Dipotassium Glycyrrhizinate and boil for 10 minutes. After cooling, filter the precipitate, wash it with water, and dry it at 105 °C for 1 hour. Add 0.5 mL of 2,6-di-tert-butyl-p-cresol TS and 1 mL of sodium hydroxide solution (1 in 5) to 1 mL of the dried in ethanol solution (1 in 1000). Then, heat the mixture on a steam bath for 90 minutes; a reddish purple to purple precipitate forms suspension.

(3) Weigh 10 mg of Dipotassium Glycyrrhizinate, dissolve in 10 mL of methanol, and use this solution as the test solution. Separately, weigh about 10 mg of dipotassium glycyrrhizinate RS, dissolve in 10 mL of methanol, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 µL each of the test solution and standard solution on a plate of silica gel with a fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of methanol, toluene and acetic acid(100) (7 : 2 : 1) to about 15 cm, and air-dry the plate. Expose it to ultraviolet light (main wavelength: 254 nm); the color and R_f value of the spots obtained from the test solution and the standard solution are the same.

pH Between 5.0 and 6.0 (1% aqueous solution).

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Dipotassium Glycyrrhizinate in 20 mL of water; the solution is colorless to light yellow in color and clear.

(2) ***Chloride***—Add 6 mL of dilute nitric acid and 10 mL of water to 0.5 g of Dipotassium Glycyrrhizinate, boil the mixture for 10 minutes, then filter it. Wash the residue with a small amount of water twice, and combine the washings with the filtrate. If the filtrate is colored, add 1 mL of hydrogen peroxide and heat on a steam bath for 10 minutes. After cooling, filter the precipitate and wash the residue twice with a small amount of water. Combine the washings with the filtrate, and add water to make 50 mL. Use this as the test solution and perform the test according to the Chloride. Prepare the control solution by adding 6 mL of dilute nitric acid and water to 0.20 mL of 0.01 mol/L hydrochloric acid solution to make 50 mL (NMT 0.014%).

(3) ***Sulfate***—To 0.5 g of Dipotassium Glycyrrhizinate, add 5 mL of dilute nitric acid and 10 mL of water, dissolve for 10 minutes, and filter it. Wash the residue with a small amount of water twice, combine the washings with the filtrate, and neutralize it with ammonia TS. If the filtrate is colored, add 1 mL of hydrogen peroxide and heat on a steam bath for 10 minutes. After cooling, if necessary, filter it and wash the residue twice with a small amount of water. Collect the washings and the filtrate and add water to make 50 mL. Use this solution as the test solution, perform the test according to the Sulfate. Prepare the control solution with 0.30 mL of 0.005 mol/L sulfuric acid and 1 mL of dilute hydrochloric acid and add water to make 50 mL (NMT 0.029%).

(4) ***Heavy metals***—Dissolve the residue obtained from Residue on Ignition test in 2 mL of dilute Acetic Acid and add water, and filter it if necessary, to make a volume of 50 mL. Use this as the test solution and perform the test according to the Heavy Metals. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(5) ***Arsenic***—Proceed with 0.5 g of Dipotassium Glycyrrhizinate, and perform the test according to Method 3 (NMT 4 ppm).

Water NMT 8.0% (0.1 g, volumetric titration, direct titration).

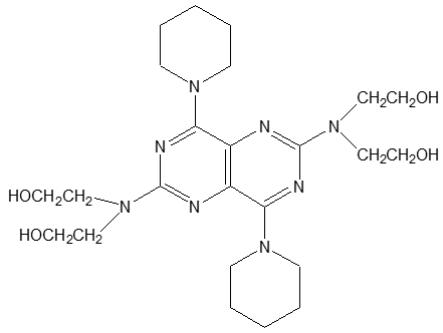
Residue on ignition Between 18.0% and 21.0% (2.0 g, calculated on the anhydrous basis).

Assay Weigh accurately about 0.1 g of Dipotassium Glycyrrhizinate and add water to make 500 mL. Take 10.0 mL of Dipotassium Glycyrrhizinate and add 50 mL of water. Use this solution as the test solution. After separately drying ncotinamide RS in a desiccator (in vacuum, silica gel) for 4 hours, weigh accurately about 20 mg of the nicotinamide RS and add water to make 200 mL. Take 10.0 mL of this solution, add water to make 50 mL, and use this solution as the standard solution. Perform the test according to the Ultraviolet-visible Spectroscopy, measure the absorbance A_T of the test solution at the absorption maximum wavelength around 257 nm and the absorbance A_S of the standard solution at the absorption maximum wavelength around 261 nm, respectively.

$$\text{Content (\%) of dipotassium glycyrrhizinate } (C_{42}H_{60}K_2O_{16}) = \frac{2A_T}{A_S \times 1.053} \times \left(\frac{Amount\ of\ nicotinamide\ RS\ taken\ (mg)}{\text{Amount of sample taken (mg)} - \text{water (mg)}} \right) \times 2.5 \times 100$$

Packaging and storage Preserve in tight containers.

Dipyridamole
디피리다몰



$C_{24}H_{40}N_8O_4$: 504.63

2-[[2-[*bis*(2-Hydroxyethyl)amino]-4,8-di(piperidin-1-yl)pyrimido[5,4-d]pyrimidin-6-yl]-(2-hydroxyethyl)amino]ethanol [*58-32-2*]

Dipyridamole, when dried, contains NLT 98.5% and NMT 101.0% of dipyridamole ($C_{24}H_{40}N_8O_4$).

Description Dipyridamole occurs as yellow crystals or a crystalline powder. It is odorless and has a slightly bitter taste.

It is freely soluble in chloroform, sparingly soluble in methanol or ethanol(99.5) and practically insoluble in water or ether.

Identification (1) Dissolve 5 mg of Dipyridamole in 2 mL of sulfuric acid, add 2 drops of nitric acid, and mix by shaking; the resulting solution exhibits a dark purple color.

(2) Determine the absorption spectra of solutions of Dipyridamole and Dipyridamole RS in a mixture of methanol and hydrochloric acid (99 : 1) (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared spectra of Dipyridamole and Dipyridamole RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Melting point Between 165 and 169 ℃.

Purity (1) ***Clarity and color of solution***—Dissolve 0.5 g of Dipyridamole in 10 mL of chloroform; the solution is clear and yellow.

(2) ***Chloride***—Dissolve 0.5 g of Dipyridamole in 5 mL of ethanol(95) and 2 mL of 2 mol/L nitric acid, and add 1 mL of silver nitrate TS; neither turbidity nor precipitate develops.

(3) ***Heavy metals***—Proceed with 2.0 g of Dipyridamole according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(4) ***Arsenic***—Proceed with 1.0 g of Dipyridamole according to Method 3 and perform the test (NMT 2 ppm).

(5) ***Related substances***—Dissolve 50 mg of Dipyridamole in 50 mL of mobile phase and use this solution as the test solution. Pipet 0.5 mL of this solution, add the mobile phase to it make exactly 100 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine each peak area of each solution as directed in the automatic integration method; the total area of the peak other than that of Dipyridamole from the test solution is not greater than the peak area of Dipyridamole from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 280 nm).

Column: A stainless steel column about 4 mm in internal diameter and 15 cm to 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm to 10 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: Dissolve 0.2 g of potassium dihydrogen phosphate in 200 mL of water and add 800 mL of methanol.

Flow rate: Adjust the flow rate so that the retention

time of dipyridamole is about 4 minutes.

System suitability

Detection sensitivity: Adjust the detection sensitivity so that the peak height of dipyridamole obtained from 20 μL of the standard solution is between 2 mm and 6 mm.

System performance: Weigh 7 mg of Dipyridamole and 3 mg of terphenyl, and dissolve in 50 mL of methanol. Proceed with 20 μL of this solution according to the above conditions; dipyridamole and terphenyl are eluted in this order with the resolution being NLT 5.

Time span of measurement: About 5 times the retention time of dipyridamole.

Loss on drying NMT 0.2% (1 g, 105 ℃, 3 hours).

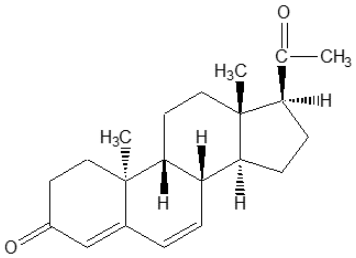
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.6 g of Dipyridamole, previously dried, dissolve in 70 mL of methanol, and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 50.46 mg of $C_{24}H_{40}N_8O_4$

Packaging and storage Preserve in light-resistant, well-closed containers.

Dirithromycin
디리트로마이신



$C_{42}H_{78}N_2O_{14}$: 835.09

(1*S*,2*R*,4*R*,5*R*,6*S*,7*S*,8*R*,11*R*,12*R*,15*R*,17*S*)-5-[(2*S*,3*R*,4*S*,6*R*)-4-(Dimethylamino)-3-hydroxy-6-methyloxan-2-yl]oxy-11-ethyl-4,12-dihydroxy-7-[(2*R*,4*R*,5*S*,6*S*)-5-hydroxy-4-methoxy-4,6-dimethyloxan-2-yl]oxy-15-(2-methoxyethoxymethyl)-2,4,6,8,12,17-hexamethyl-10,14-dioxa-16-azabicyclo[11.3.1]heptadecan-9-one [*62013-04-1*]

Dirithromycin contains NLT 96.0% and NMT 102.0% per mg of dirithromycin and epidirithromyciin ($C_{42}H_{78}N_2O_{14}$), calculated on the anhydrous basis.

Description Dirithromycin occurs as a white or pale gray crystalline powder. It is freely soluble in chloroform, soluble in methanol, slightly soluble in propanol or acetonitrile, and very slightly soluble in water or cyclohexane.

Identification (1) Determine the infrared spectra of Dirithromycin and dirithromycin RS, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

Crystallinity Meets the requirements.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Dirithromycin according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Related substances*—**Weigh accurately 0.1 g of Dirithromycin, dissolve in a mixture of acetonitrile and methanol (70 : 30) to make exactly 10 mL, and use this solution as the test solution. Separately, weigh accurately a suitable amount of dirithromycin RS, dissolve in a mixture of acetonitrile and methanol (70 : 30) to make a solution containing 0.2 mg per mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions. Determine each peak area in each solution by the automatic integration method and calculate the content (%) of each related substance according to the following equation; the content of 9-(S)-erythromycilamine is NMT 1.5%, the content of any other related substance is NMT 1.0%, and the total content of related substances is NMT 4.0%. However, dirithromycin 16S-epimer is not regarded as a related substance for calculation.

Content (%) of 9-(S)-erythromycilamine or other related substances (%)
$$= \frac{C}{W} \times \frac{A_i}{A_S} \times 1000$$

C: Concentration (mg /mL) of dirithromycin in the standard solution.

W: Amount (mg) of Dirithromycin taken.

A_i: Peak area of each related substance obtained from the test solution.

A_S: Peak area of dirithromycin (16R-epimer) obtained from the standard solution.

Operating conditions

For the detector, column and mobile phase, proceed as directed under the Assay.

Time span of measurement: About 3 times the retention time of dirithromycin (16R-epimer).

(3) ***Dirithromycin 16s-epimer*—**Determine the con-

tent (%) of dirithromycin 16S-epimer in Dirithromycin using the chromatogram obtained from the related substances test, according to the following equation (NMT 1.5%).

$$\text{Content (\%) of dirithromycin 16S-epimer} = \frac{C}{W} \times \frac{A_E}{A_S} \times 1000$$

A_E: Peak area of dirithromycin 16S-epimer in the test solution.

C: Concentration (mg /mL) of dirithromycin in the standard solution.

W: Amount (mg) of Dirithromycin taken.

A_S: Peak area of dirithromycin (16R-epimer) obtained from the standard solution.

Water NMT 1.0% (1.0 g, volumetric titration, direct titration).

Assay Weigh accurately about 20 mg each of Dirithromycin and dirithromycin RS, dissolve each in a mixture of acetonitrile and methanol (70 : 30) to make exactly 10 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions, and determine the peak areas, A_T and A_S, of dirithromycin (16R-epimer).

$$\text{Content (\%) of dirithromycin } (C_{42}H_{78}N_2O_{14}) = 1000 \times \frac{C}{W} \times \frac{A_T}{A_S} + P_E$$

CS: Concentration (mg/mL) of dirithromycin in the standard solution.

W: Amount (mg) of Dirithromycin taken.

P_E: Content (%) of dirithromycin 16S-epimer calculated in (3) under Purity above.

Operating conditions

Detector: An ultraviolet absorption spectrophotometer (wavelength: 205 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: A mixture of acetonitrile, phosphate buffer solution (pH 7.5) and ethanol (44 : 37 : 19).

Flow rate: 2 mL/min

System suitability

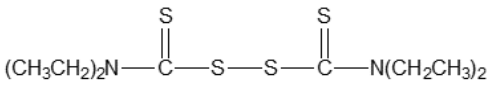
System performance: Proceed with 10 μL of the system suitability solution under the above operating conditions; the relative retention times of 9-(S)-erythromycilamine, dirithromycin (16R-epimer) and dirithromycin 16S-epimer are 0.7, 1.0 and 1.12, respectively. The resolution between the peaks of dirithromycin (16R-epimer) and dirithromycin 16S-epimer is NLT 2.0, the resolution between the peaks of dirithromycin (16R-epimer) and 9-(S)-erythromycilamine is NLT 5.0, and the symmetry factor of the dirithromycin (16R-epimer) peak is NMT 2.

System repeatability: Repeat the test 5 times with 10 μL of the system suitability solution under the above operating conditions; the relative standard deviation of the peak areas of dirithromycin (16R-epimer) is NMT 1.0%.

System suitability solution—Weigh accurately a suitable amount of dirithromycin RS and dissolve in the mobile phase to make a solution containing 2.5 mg per mL. Keep this solution at room temperature for 24 hours. The solution is an equilibrium mixture of dirithromycin (16R-epimer), dirithromycin 16S-epimer and 9-(S)-erythromycilamine, and may be used for 1 month at room temperature.

Packaging and storage Preserve in well-closed containers.

Disulfiram
디설피람



$C_{10}H_{20}N_2S_4$: 296.54

Diethylcarbamothioylsulfanyl-*N*,*N*-diethylcarbamo dithioate [*97-77-8*]

Disulfiram, when dried, contains NLT 99.0% and NMT 101.0% of disulfiramm ($C_{10}H_{20}N_2S_4$).

Description Disulfiram occurs as white to yellow crystals or a crystalline powder.

It is freely soluble in acetone or toluene, slightly soluble in methanol or ethanol(95) and practically insoluble in water.

Identification (1) Determine the absorption spectra of Disulfiram and disulfiram RS in ethanol(95) (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Disulfiram and disulfiram RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Melting point Between 70 and 73 ℃.

Purity (1) ***Heavy metals***—Proceed with 2.0 g of Disulfiram according to Method 2 and perform the test. Prepare

the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Arsenic***—Proceed with 1.0 g of Disulfiram according to Method 4 and perform the test (NMT 2 ppm).

(3) ***Diethyldithiocarbamic acid***—Dissolve 0.10 g of Disulfiram in 10 mL of toluene, add 10 mL of diluted sodium carbonate TS (1 in 20), and shake to mix. Take the water layer separately, wash with 10 mL of toluene, and add 5 drops of copper sulfate (1 in 250) and 2 mL of toluene. Shake to mix and allow to stand; the toluene layer does not exhibit a pale yellow color.

(4) ***Related substances***—Dissolve 50 mg of Disulfiram in 40 mL of ethanol, add water to make 50 mL, and use this solution as the test solution. Pipet 1 mL of the test solution, add the mobile phase to make exactly 200 mL, and use this solution as the standard solution. Pipet 10 μL each of the test solution and the standard solution and perform the test as directed under the Liquid Chromatography according to the following conditions. Determine the peak area of each solution according to the automatic integration method; the total area of the peaks other than disulfiram obtained from the test solution is not larger than the peak area of disulfiram from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 210 nm).

Column: A stainless steel column about 5 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: A mixture of methanol and water (7:3).

Flow rate: Adjust the flow rate so that the retention time of disulfiram is about 8 minutes.

Selection of column: Dissolve 50 mg each of Disulfiram and benzophenone in 40 mL of methanol, and add water to make 50 mL. Pipet 1 mL of this solution add the mobile phase to make 200 mL. Proceed with 10 μL each of this solution according to the above operating conditions, and calculate the resolution. Use a column giving elution of benzophenone and disulfiram in this order with the resolution between these peaks being NLT 4.

Detection sensitivity: Adjust the detection sensitivity so that the peak height of disulfiram obtained from 10 μL of the standard solution is 15 to 30 mm.

Time span of measurement: About 3.5 times of the retention time of disulfiram.

Loss on drying NMT 0.2% (2 g, silica gel, 24 hours).

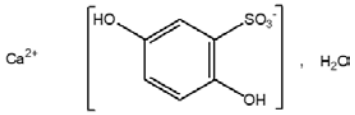
Residue on ignition NMT 0.1% (2 g).

Assay Weigh accurately about 0.2 g of Disulfiram, previously dried, in an iodine bottle, dissolve in 20 mL of acetone, add 1.5 mL of water and 1.0 g of potassium iodide, and dissolve by shaking thoroughly. To this solution, add 3.0 mL of hydrochloric acid, stopper the bottle tightly, shake to mix, and allow to stand in a dark place for 3 minutes. Add 70 mL of water and titrate with 0.1 mol/L sodium thiosulfate VS (potentiometric titration under the Titrimetry). Perform a blank test and make any necessary correction.

Each mL of 0.1 mol/L sodium thiosulfate VS
= 14.83 mg of $C_{10}H_{20}N_2S_4$

Packaging and storage Preserve in tight containers.

Dobesilate Calcium Hydrate
도베실산칼슘수화물



$C_{12}H_{10}O_{10}S_2Ca \cdot H_2O$: 436.43

Calcium di(2,5-dihydroxybenzenesulfonate) monohydrate, [*20123-80-2*]

Dobesilate Calcium Hydrate contains NLT 99.0% and NMT 101.0% of dobesilate calcium ($C_{12}H_{10}O_{10}S_2Ca$: 418.40), calculated on the anhydrous basis.

Description Dobesilate Calcium Hydrate occurs as a white crystalline powder. It is odorless.
It is freely soluble in water or ethanol and practically insoluble in ether and chloroform.

Melting point—About 300 °C (with decomposition).

Identification (1) A solution of Dobesilate Calcium Hydrate responds to the Qualitative Analysis for calcium hydrate.

(2) Determine the absorption spectrum of the solution (2.5 in 1000000) of Dobesilate Calcium Hydrate as directed under the Ultraviolet-visible Spectroscopy; it exhibits maxima between 218 nm and 222 nm and between 298 nm and 302 nm.

pH Between 4.3 and 5.1 (12% solution).

Purity (1) ***Heavy metals***—Proceed with 2.0 g of Dobesilate Calcium Hydrate according to the Method 1, and perform the test. Prepare the control solution with 3.0 mL of lead standard solution (NMT 15 ppm).

(2) ***Arsenic*—**Proceed with 0.4 g of Dobesilate Calcium Hydrate according to the Method 1 and perform the test (NMT 5 ppm).

(3) ***Sulfate***—Proceed with 0.5 g of Dobesilate Calcium Hydrate and perform the test. Prepare the control solution with 0.1 mL of 0.005 mol/L sulfuric acid (NMT 0.01%).

(4) ***Iron*—**Weigh accurately 10.0 g of Dobesilate

Calcium Hydrate and add 100 mL of water not containing carbon dioxide. Take 10 mL of this solution and add 2 mL of 200 g/L citric acid and 0.1 mL of thioglycolic acid. Alkalify the solution with 10.6 mol/L ammonia water, add 20 mL of water and shake, and use this solution as the test solution. Separately, take 1 mL of iron standard solution and prepare the control solution in the same way as the test solution. After allowing it to stand for 5 minutes, compare the colors of the test solution and the control solution against a pink background; the color of the test solution is not more intense than that of the control solution (NMT 10 ppm).

(5) ***Hydroquinone***—Weigh 1.0 g of Dobesilate Calcium Hydrate, dissolve in 10 mL of water, and use this solution as the test solution. Separately, weigh 10 mg of hydroquinone RS, dissolve in water to make 100 mL, and use this solution as the standard solution. With these solutions, spot 5 μL each of the test solution and the standard solution on a thin-layer chromatographic plate made of silica gel (with a fluorescence indicator) for thin-layer chromatography, develop the plate with a mixture of n-butanol, acetic acid and water (72 : 10 : 18), and air-dry the plate. Expose the plate to ultraviolet irradiation (254 nm) or spray a mixture of 1% ferric chloride, 1% potassium ferricyanide and nitric acid (50 : 50 : 5) on the plate; the spots other than the principal spot from the test solution are not more intense than the blue principal spot from the standard solution (NMT 0.1%).

Water NMT 6.0% (0.2 g, volumetric titration, direct titration).

Assay Weigh accurately about 0.9 g of Dobesilate Calcium Hydrate, previously dried, dissolve in 80 mL of water, add 2 mL of 8 mol/L potassium hydroxide TS and 0.1 g of N,N indicator, and titrate with 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS. The endpoint of titration is when the reddish purple color of solution turns into the blue color. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS
= 20.920 mg of $C_{12}H_{10}O_{10}S_2Ca$

Packaging and storage Preserve in tight containers.

Dobesilate Calcium Tablets
도베실산칼슘 정

Dobesilate Calcium Tablets contains NLT 95.0% and NMT 105.0% equivalent to the labeled amount of dobesilate calcium hydrate ($C_{12}H_{10}O_{10}S_2Ca \cdot H_2O$: 436.43).

Method of preparation Prepare as directed under Tablets, with Dobesilate Calcium Hydrate.

Identification (1) Take equivalent to about 40 mg of Dobesilate Calcium Hydrate according to the labeled amount of Dobesilate Calcium Tablets, add water to make 100 mL, and filter. Take 10 mL of the filtrate, and add water to make 100 mL. Determine the absorption spectra of this solution as directed under the Ultraviolet-visible Spectroscopy; it exhibits maxima around 220 ± 2 nm and 300 ± 2 nm wavenumbers.

(2) Weigh a portion of powdered Dobesilate Calcium Tablets, equivalent to 0.1 g of Dobesilate Calcium according to labeled amount, add 10 mL of water, filter, and use this filtrate as the test solution. Separately, weigh about 0.1 g of dobesilate calcium hydrate RS, dissolve in 10 mL of water, and use this solution as the standard solution. Spot 5 μL each of the test solution and the standard solution on a plate of silica gel with fluorescent indicator for thin-layer-chromatography. Develop the plate with the upper layer of a mixture of n-butanol, water and acetic acid (36 : 9 : 5) to a distance of about 17 cm and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm). The R_f values of the spots from the test solution and the standard solutions are the same.

Purity ***Hydroquinone***—Weigh the amount of Dobesilate Calcium Tablets, previously powdered, equivalent to 1.0 g of Dobesilate Calcium Hydrate, add 10 mL of water, shake to mix, centrifugate, and use the clear liquid at the top layer as the test solution. Separately, take 10 mg of hydroquinone RS, dissolve in water to make 100 mL, and use this solution as the standard solution. Perform the test with 5 μL each of the test solution and the standard solution as directed under the Thin Layer Chromatography according to the conditions of the Identification 2) and observe the solutions under ultraviolet light; spots other than the principal spot from the test solution is not more intense than the purple spots from the standard solution (NMT 0.1%).

Dissolution Perform the test with 1 tablet of Dobesilate Calcium Tablets at 50 revolutions per minute according to the Method 2 under the Dissolution Test, using 900 mL of water as the dissolution medium. Take the dissolved solution 30 minutes after starting the test, and filter. Pipet 5 mL of this solution, add water to make exactly 20 mL, and use this solution as the test solution. Separately, weigh accurately about 70 mg of dobesilate calcium hydrate RS and dissolve in water to make 100 mL. Pipet 10 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas of Dobesilate Calcium Hydrate from each solution, A_T and A_S, respectively.
It meets the requirements when the dissolution rate of Dobesilate Calcium Tablets in 30 minutes should be NLT 85%.

Dissolution rate (%) of dobesilate calcium hydrate ($C_{12}H_{10}S_2Ca \cdot H_2O$)
$= W_S \times (A_T/A_S) \times (1/C) \times 360$

W_S: Amount (mg) of dobesilate calcium hydrate RS.
C: Labeled amount (mg) of dobesilate calcium hydrate ($C_{12}H_{10}O_{10}S_2Ca \cdot H_2O$) per tablet.

Operating conditions

Detector: An ultraviolet-visible spectrophotometer (wavelength: 301 nm).

Column: A stainless steel column, about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: A mixture of 0.1% phosphoric acid and methanol (9 : 1).

Flow rate: 1.0 mL/minute

System suitability

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution under the above operating conditions, the relative standard deviation of the peak areas of Dobesilate Calcium Hydrate is NMT 2.0%.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately and powder NLT 20 Dobesilate Calcium Tablets. Weigh accurately equivalent to about 100 mg of dobesilate calcium hydrate ($C_{12}H_{10}O_{10}S_2Ca \cdot H_2O$), add 100 mL of water. Pipet 10 mL of the test solution, add the mobile phase to make exactly 100 mL and use this solution as the test solution. Separately, weigh accurately about 100 mg of dobesilate calcium hydrate RS, add water to make exactly 100 mL, take 10 mL of this solution, add water to make 100 mL, and use it as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions and determine, A_T and A_S, of the peak areas of Dobesilate Calcium.

Amount (mg) of dobesilate calcium hydrate ($C_{12}H_{10}O_{10}S_2Ca \cdot H_2O$)
= Amount (mg) of dobesilate calcium hydrate RS
$\times (A_T / A_S)$

Operating conditions

Detector: An ultraviolet-visible spectrophotometer (wavelength: 301 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: A mixture of 0.1% phosphoric acid and methanol (9 : 1).

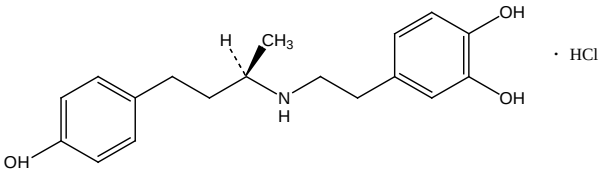
Flow rate: 1.0 mL/minute

System suitability

System repeatability: Repeat the test 6 times with 10 μL of the standard solution under the above operating conditions; the relative standard deviation of the peak areas is NMT 2.0.

Packaging and storage Preserve in light-resistant, tight containers.

Dobutamine Hydrochloride
도부타민염산염



and enantiomer

$C_{18}H_{23}NO_3 \cdot HCl$: 337.84

(*RS*)-4-[2-[4-(4-Hydroxyphenyl)butan-2-ylamino]ethyl]benzene-1,2-diol hydrochloride [*49745-95-1*]

Dobutamine Hydrochloride, when dried, contains NLT 98.0% and NMT 101.0% of dobutaime hydrochloride ($C_{18}H_{23}NO_3 \cdot HCl$).

Description Dobutamine Hydrochloride occurs as a white to very pale orange crystalline powder or grain.
It is freely soluble in methanol, sparingly soluble in water or ethanol(95), and practically insoluble in ether.
A solution of Dobutamine Hydrochloride (1 in 100) shows no optical rotation.

Identification (1) Determine the infrared spectra of Dobutamine Hydrochloride and dobutamine hydrochloride RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) A solution of Dobutamine Hydrochloride (1 in 50) responds to the Qualitative Analysis (2) for chloride.

Melting point Between 188 and 191 ℃.

pH Dissolve 1 g of Dopamine Hydrochloride in 100 mL of water; the pH of this solution is between 4.0 and 5.5.

Purity (1) ***Clarity and color of solution***—Dissolve 0.5 g of Dopamine Hydrochloride in 30 mL of water; the solution is clear and colorless.

(2) ***Heavy metals***—Dissolve 1.0 g of Dopamine Hydrochloride in 40 mL of water by warming, cool down, and add 2 mL of dilute acetic acid and water to make 50 mL. Use this solution as the test solution and

perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Related substances***—Dissolve 0.10 g of Dopamine Hydrochloride in 10 mL of methanol and use this solution as the test solution. Pipet 1 mL of this solution, add methanol to make exactly 200 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on a plate made of silica gel for thin-layer chromatography. Develop the plate with a mixture of chloroform, methanol and formic acid (78 : 22 : 5) to a distance of about 12 cm, and air-dry the plate. Allow the plate to stand for 5 minutes in iodine vapor; spots other than the principal spot from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 0.3% (1 g, 105 °C, 3 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.1 g of Dobutamine Hydrochloride and dobutamine hydrochloride RS, previously dried, dissolve in exactly 10 mL of the internal standard solution, add diluted methanol (1 in 2) to make 50 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 5 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the peak area ratios, Q_T and Q_S, of Dobutamine Hydrochloride to the internal standard, respectively.

$$\text{Amount (mg) of dobutamine hydrochloride } (C_{18}H_{23}NO_3.HCl) = \text{Amount (mg) of dobutamine hydrochloride RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of salicylamide in diluted methanol (1 in 2) (1 in 125).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 280 nm).

Column: A stainless steel column about 4.0 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silical gel for liquid chromatography (7 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: A mixture of tartaric acid buffer solution, pH 3.0 and methanol (7 : 3).

Flow rate: Adjust the flow rate so that the retention time of dobutamine is about 7 minutes.

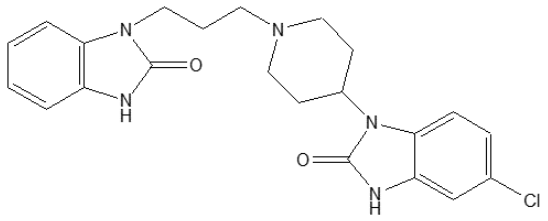
System suitability

System performance: Proceed with 5 μL of the standard solution under the above conditions; dobutamine and the internal standard are eluted in this order with the resolution being NLT 5.

System repeatability: Repeat the test 6 times with 5 μL each of the standard solution as directed under the above conditions, the relative standard deviation of peak area ratios of dobutamine to the internal standard is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Domperidone
돔페리돈



$C_{22}H_{24}ClN_5O_2$: 425.91

5-Chloro-1-(1-(3-(2-oxo-2,3-dihydro-1*H*-benzo[d]imidazol-1-yl)propyl)piperidin-4-yl)-1*H*-benzo[d]imidazol-2(3*H*)-one [*57808-66-9*]

Domperidone, when dried, contains NLT 99.0% and NMT 101.0% of domperidone ($C_{22}H_{24}ClN_5O_2$).

Description Domperidone occurs as a white to pale yellow crystalline powder.

It is soluble in *N*,*N*-dimethylformamide, slightly soluble in methanol and ethanol(95), and practically insoluble in water.

Identification Determine the infrared spectra of Domperidone and domperidone RS, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Melting point Between 218 and 248 ºC.

Purity (1) ***Clarity and color of solution***—Dissolve 0.2 g of Domperidone in 20 mL of *N*,*N*-dimethylformamide; the solution is colorless and clear.

(2) ***Heavy metals***—Proceed with about 2.0 g of Domperidone according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Related substances***—Prepare the solutions for the test immediately before use. Dissolve 0.1 g of Domperidone in 10 mL of *N*,*N*-dimethylformamide, and use this solution as the test solution. Pipet 1 mL of the test solution, and add *N*,*N*-dimethylformamide to make exactly 100 mL. Pipet 5 mL of this solution, add *N*,*N*-dimethylformamide to make exactly 20 mL, and use this solution as the standard solution (1). Perform the test with 10 μL each of *N*,*N*-dimethylformamide (as a blank test solution), the test solution and the standard solution (1) as

directed under the Liquid Chromatography according to the following conditions. Determine each peak area from each solution by the automatic integration method and calculate the amount of related substances in the test solution; none of the domperidone related substance I {5-chloro-1(piperidin-4-yl)-1,3-dihydro-2*H*-benzimidazol-2-one} having a relative retention time of about 0.4, the domperidone related substance II {4-(5-chloro-2-oxo2,3-dihydro-1*H*-benzimidazol-1-yl)-1-formylpiperidine} having a relative retention time of about 0.65, the domperidone related substance III {*cis*-4-(5-chloro-2-oxo-2,3-dihydro-1*H*-benzimidazol-1-yl)-1-[3-(2-oxo2,3-dihydro-1*H*-benzimidazol-1-yl)propyl]piperidine1-oxide} having a relative retention time of about 0.7, the domperidone related substance IV {5-chloro-3-[3-(2-oxo-2,3-dihydro-1*H*-benzimidazol-1-yl)propyl]-1-[1-[3-(2-oxo-2,3-dihydro-1*H*-benzimidazol-1-yl)propyl]piperidin-4-yl]-1,3-dihydro-2-benzimidazol-2-one} having a relative retention time of about 1.15, the domperidone related substance V {1-[3-[4-(5-chloro-2-oxo-2,3-dihydro-1*H*-benzimidazol-1-yl)piperidin-1-yl]propyl]-3-[3-(2-oxo-2,3-dihydro-1Hbenzimidazol-1-yl)propyl]-1,3-dihydro-2*H*-benzimidazol-2-one} having a relative retention time of about 1.2 and the domperidone related substance VI {1,3-bis[3-[4-(5-chloro2-oxo-2,3-diihydro-1*H*-benzimidazol-1-yl)piperidin-1-yl]propyl]-1,3-dihydro-2*H*-benzimidazol-2-one} having a relative retention time of about 1.3, with respect to domperidone, is greater than the peak area of domperidone from the standard solution (1) (0.25%). Each peak area of other related substances is not greater than 0.4 times the peak area of domperidone from the standard solution (1) (0.1%). The sum of the peak areas of the related substances is not greater than 2 times the peak area of domperidone from the standard solution (1) (0.5%). Disregard any peak in the chromatogram obtained with the blank test solution and any peak with an area less than 0.2 times the area of the peak of Domperidone from the standard solution (1).

Operating conditions

Detector: An ultraviolet absorption spectrophotometer (wavelength: 280 nm).

A stainless steel column, 4.6 mm in internal diameter and about 10 cm in length, packed with base-deactivated octadecylsilanized silica gel for liquid chromatography (3 μm in particle diameter).

Mobile phase: Apply a mixture of ammonium acetate (5 in 1000) and methanol (70 : 30) to the column at a flow rate of 1.5 mL per minute, then increase the ratio of methanol sequentially over 10 min, followed by elution with methanol for 2 minutes.

Flow rate: 1.5 mL/min. Apply methanol to the column for at least 30 min to reach an equilibrium, and then equilibrate it again with the initial mobile phase composition (a mixture of ammonium acetate (5 in 1000) and methanol (70 : 30) for at least 5 minutes.

Selection of column: Dissolve 10 mg of domperidone RS and 15 mg of droperidol RS in 100 mL of *N*,*N*-dimethylformamide, and use this solution as the standard solution (2). Proceed with 10 μL of the standard solution (2) under the above operating conditions. At this time, use a column from which the retention times for domperidone and droperidol is 6.5 minutes and 7 minutes, respectively, with the resolution between these peaks being NLT 2.0. If necessary, adjust the concentration of methanol in the mobile phase or control it through the gradient elution.

Detection sensitivity: Adjust the detection sensitivity so that the peak height of domperidone obtained from 10 μL of the standard solution (1) is NLT 50.0% of the full scale.

Loss on drying NMT 0.5% (1 g, 100 - 105 ºC, constant mass).

Ignition residue NMT 0.1% (1 g).

Assay Weigh accurately about 0.3 g of Domperidone, previously dried, dissolve in a mixture of 2-butanone and acetic acid(100) (7 : 1) to make 50 mL, and titrate with 0.1 mol/L perchloric acid VS (indictor: 0.2 mL of 1-naphtholbenzein TS). However, the endpoint of the titration is when the color changes from orange to green.

Each mL of 0.1 mol/L perchloric acid VS
= 42.59 mg of $C_{22}H_{24}ClN_5O_2$

Packaging and storage Preserve in light-resistant, well-closed containers.

Domperidone Oral Suspension
돔페리돈 현탁액

Domperidone Oral Suspension contains NLT 95.0% and NMT 105.0% of the labeled amount of domperidone ($C_{22}H_{24}ClN_5O_2$: 425.91).

Method of preparation Prepare as directed under Suspensions, with domperidone.

Identification Take 10 mL of Domperidone Oral Suspension, put in a 125-mL separatory funnel, add 10 mL of water and 2.5 mL of ammonia TS, and extract 3 times with 20 mL of ethyl acetate each time. Filter the extracts and evaporate to dryness. Dissolve the dried material in 5 mL of methanol, and use this solution as the test solution. Separately, dissolve 20 mg of domperidone RS in 10 mL of methanol, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on a thin-layer chromatographic plate made of silica gel with fluorescence indicator for thin-layer chromatography, develop the plate with a mixture of ethyl acetate, methanol and acetate buffer solution (pH 4.7) (100 : 15 : 5) as the developing solvent to a distance of about 17 cm, and air-dry

the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm) or spray Dragendorff's TS onto the plate; the R_f values and color of the spots obtained from the test solution and the standard solution are the same.

pH Between 5.2 and 7.2.

Assay Take exactly an amount of Domperidone Oral Suspension, equivalent to about 10 mg of domperidone ($C_{22}H_{24}ClN_5O_2$), put in a 100-mL volumetric flask, add 1 mL of 0.1 mol/L hydrochloric acid TS and 50 mL of methanol, and sonicate for 20 minutes. Then, add methanol to make exactly 100 mL. Centrifuge this solution, and use the supernatant as the test solution. Separately, weigh accurately about 10 mg of domperidone RS, add 1 mL of 0.1 mol/L hydrochloric acid TS and 50 mL of methanol, and sonicate for 20 minutes. Add methanol to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography and determine the peak areas, A_T and A_S of domperidone in each solution.

$$\text{Amount (mg) of domperidone } (C_{22}H_{24}ClN_5O_2) = \text{Amount (mg) of domperidone RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 280 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of 0.5% ammonium acetate solution and methanol (4 : 6).

Flow rate: 1.0 mL/min

Packaging and storage Preserve in light-resistant, tight containers.

Domperidone Tablets
돔페리돈 정

Domperidone Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of Domperidone ($C_{22}H_{24}ClN_5O_2$: 425.91).

Method of preparation Prepare as directed under Tablets, with Domperidone.

Identification Weigh a portion of powdered Domperidone Tablets, equivalent to 20 mg of Domperidone, dissolve in 10 mL of a mixture of ethyl acetate - methanol (1 : 1), and filter. Use the filtrate as the test solution. Separately, weigh about 20 mg of domperidone RS, dissolve in 10 mL of a mixture of ethyl acetate-methanol (1 : 1), and use the filtrate as the standard solution. Spot 10 μL each of the test solution and the standard solution on a thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of methanol-acetone -acetate (pH 3.9) (50 : 40 : 1) as the developing solvent to a distance of about 15 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the colors and R_f values of the spots obtained from the test solution and the standard solution are the same.

Dissolution Perform the test with 1 tablet of Domperidone Tablets at 50 revolutions per minute according to Method 2 under the Dissolution, using 900 mL of the first solution as the dissolution medium. Take the dissolved solution after 30 minutes from the start of the test, and filter. Discard the first 10 mL of the filtrate, pipet V mL of the subsequent filtrate, add the dissolution medium so that Each mL of the solution contains 11 μg of Domperidone according to the labeled amount. Make it exactly V' mL and use this solution as the test solution. Separately, weigh accurately about 11 mg of domperidone RS and dissolve in 50% methanol to make 100 mL. Pipet 10 mL of this solution, add the dissolution medium to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of domperidone from each solution. Meets the requirements if the dissolution rate of Domperidone Tablets in 30 minutes is NLT 75%.

$$\text{Dissolution rate (\%) of the labeled amount of domperidone } (C_{22}H_{24}ClN_5O_2) = W_S \times \frac{V'}{V} \times \frac{A_T}{A_S} \times \frac{1}{C} \times 90$$

Ws: Amount (mg) of domperidone RS.

C: The labeled amount (mg) of domperidone ($C_{22}H_{24}ClN_5O_2$) in 1 tablet.

Operating conditions

Detector: An ultraviolet-visible spectrometer (wavelength: 285 nm).

Column: A stainless-steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 35 °C.

Mobile phase: A mixture of 0.02 mol/L potassium dihydrogen phosphate-methanol (1 : 1) (pH 3.5).

Flow rate: 1.0 mL/minute

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 tables of

Domperidone Tablets and powder. Weigh accurately an amount equivalent to about 25 mg of Domperidone ($C_{22}H_{24}ClN_5O_2$), dissolve in 50% methanol, and make exactly 250 mL. Pipet 10 mL of the solution, add the mobile phase to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately 10 mg of domperidone RS and dissolve in 50% methanol to make exactly 100 mL. Pipet 10 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, AT and AS, for the test solution and the standard solution, respectively.

$$\text{Amount (mg) of domperidone } (C_{22}H_{24}ClN_5O_2) = \text{Amount (mg) of domperidone RS} \times \frac{A_T}{A_S} \times 2.5$$

Operating conditions

Detector: An ultraviolet-visible spectrometer (wavelength: 285 nm).

Column: A stainless-steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 35 °C.

Mobile phase: A mixture of 0.02 mol/L potassium dihydrogen phosphate-methanol (1 : 1) (pH 3.5).

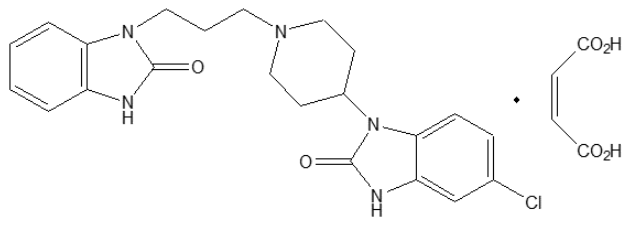
Flow rate: 1.0 mL/minute

System suitability

System repeatability: Repeat the test 6 times with 20 μL of the standard solution according to the above conditions; the relative standard deviation of the peak areas of Domperidone is NMT 1.5%.

Packaging and storage Preserve in tight containers.

Domperidone Maleate
돔페리돈말레산염



$C_{22}H_{24}ClN_5O_2 \cdot C_4H_4O_4$: 541.98

(*Z*)-But-2-enedioic acid; 5-chloro-1-(1-(3-(2-oxo-2,3-dihydro-1*H*-benzo[d]imidazol-1-yl) propyl)piperidin-4-yl)-1*H*-benzo[d]imidazol-2(3*H*)-one [*83898-65-1*]

Domperidone Maleate, when dried, contains NLT 99.0% and NMT 101.0% of domperidone maleate ($C_{22}H_{24}ClN_5O_2 \cdot C_4H_4O_4$).

Description Domperidone Maleate occurs as a white powder.

It is sparingly soluble in *N*,*N*-dimethylformamide, slightly soluble in methanol, and very slightly soluble in water or ethanol(95).

It shows polymorphism.

Identification (1) Triturate 0.1 g of Domperidone Maleate with a mixture of 1 mL of 10 mol/L sodium hydroxide solution and 3 mL of water, followed by extraction three times each with 5 mL of ether. Add 0.1 mL of the aqueous layer to 3 mL of resorcinol solution in sulfuric acid (1 in 300) and heat on a steam bath for 15 min; no color appears. To the remainder of the aqueous layer, add 2 mL of bromine TS, heat on a steam bath for 15 min, and then heat further to boiling. After cooling, add 0.1 mL of this solution to 3 mL of resorcinol solution in sulfuric acid (1 in 300) and heat on a steam bath for 15 min; a reddish purple color appears.

(2) Determine the infrared spectra of Domperidone Maleate and domperidone maleate RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers. If there is any difference between the spectra, dissolve Domperidone Maleate and domperidone maleate RS each in as little volume of 2-propanol as possible, evaporate to dryness on a steam bath, and perform the test with the residues in the same way above.

(3) Dissolve 20 mg of Domperidone Maleate in 10 mL of methanol, and use this solution as the test solution. Separately, dissolve 20 mg of domperidone maleate RS in 10 mL of methanol, and use this solution as the standard solution (1). Also, dissolve 20 mg of domperidone maleate RS and 20 mg of droperidole RS in 10 mL of methanol, and use this solution as the standard solution (2). Perform the test with these solutions as directed under the Thin-layer chromatography. Spot 5 μL each of the test solution, standard solution (1) and standard solution (2) on a thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate using a mixture of methanol, acetonitrile and ammonium acetate TS (40 : 40 : 20) as a developing solvent to a distance of about 15 cm, and air-dry the plate. Expose the plate with iodine vapor until spots appear and examine in day-light; the spot in the chromatogram obtained with the test solution corresponds in the size and the R_f value to that with the standard solution (1), and the two spots in the chromatogram obtained with the standard solution (2) are clearly separated with each other.

Purity (1) ***Clarity and color of solution***—Dissolve 0.2 g of Domperidone Maleate in 20 mL of *N*,*N*-dimethylformamide; the solution is clear and not darker than a solution made by mixing 5 mL of the mixed solution of 1 w/v% hydrochloric acid, iron(III) chloride hexahydrate colorimetric stock solution and cobalt(II) chloride

hexahydrate colorimetric stock solution (70 : 24 : 6) and 95 mL of 1 w/v% hydrochloric acid.

(2) ***Heavy metals***—Proceed with 1.0 g of Domperidone Maleate according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Related substances***—Prepare the solutions for the test immediately before use. Dissolve 0.1 g of Domperidone Maleate in 10 mL of *N*,*N*-dimethylformamide, and use this solution as the test solution. Pipet 1 mL of the test solution, and add *N*,*N*-dimethylformamide to make exactly 100 mL. Pipet 5 mL of this solution, add *N*,*N*-dimethylformamide to make exactly 20 mL, and use this solution as the standard solution (1). Perform the test with 10 μL each of *N*,*N*-dimethylformamide (as a blank test solution), the test solution and the standard solution (1) as directed under the Liquid Chromatography according to the following conditions. Determine each peak area from each solution by the automatic integration method; none of the peak areas, other than the peak area of domperidone maleate, obtained from the test solution is larger than the peak area of domperidone maleate obtained from the standard solution (1) (0.25%), and the sum of the areas of all peaks other than the peak of domperidone maleate from the test solution is not larger than 2 times the peak area of domperidone maleate from the standard solution (1) (0.5%). Disregard any peak in the chromatogram obtained with the blank test solution and any peak with an area less than 0.2 times the area of the peak of domperidone maleate from the standard solution (1).

Operating conditions

Detector: An ultraviolet absorption spectrophotometer (wavelength: 280 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 10 cm in length, packed with base-deactivated octadecylsilanized silica gel for liquid chromatography (3 μm in particle diameter).

Mobile phase: Apply a mixture of ammonium acetate (5 in 1000) and methanol (70 : 30) to the column at a flow rate of 1.5 mL per minute, then increase the ratio of methanol sequentially to 100% over 10 min, followed by elution with methanol for 2 minutes.

Flow rate: 1.5 mL/min. Apply methanol to the column for at least 30 min to reach an equilibrium, and then equilibrate it again with the initial mobile phase composition (a mixture of ammonium acetate (5 in 1000) and methanol (70 : 30) for at least 5 minutes.

System suitability

Detection sensitivity: Adjust the detection sensitivity so that the peak height of domperidone maleate obtained from 10 μL of the standard solution (1) is NLT 50.0% of that obtained from the water bath.

System performance: Dissolve 10 mg of domperidone maleate RS and 15 mg of droperidol RS in 100 mL of *N*,*N*-dimethylformamide, and use this solution as the standard solution (2). Proceed with 10 μL of this solution, as directed under the above operating conditions; domperidone maleate and droperidol are eluted in this order with the resolution between their peaks being NLT 2.

Loss on drying NMT 0.5% (1 g, 105 ºC, constant mass).

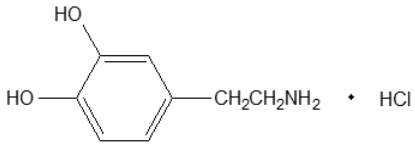
Ignition residue NMT 0.1% (1 g).

Assay Weigh accurately about 0.4 g of Domperidone Maleate, previously dried, dissolve in 50 mL of acetic acid(100), and titrate with 0.1 mol/L perchloric acid VS (indicator: 0.2 mL of 1-naphtholbenzein TS). However, the endpoint of the titration is when the color changes from orange to green.

Each mL of 0.1 mol/L perchloric acid VS
= 54.20 mg of $C_{26}H_{28}ClN_5O_6$

Packaging and storage Preserve in light-resistant, well-closed containers.

Dopamine Hydrochloride
도파민염산염



$C_8H_{11}NO_2 \cdot HCl$: 189.64
4-(2-Aminoethyl)benzene-1,2-diol hydrochloride [*62-31-7*]

Dobutamine Hydrochloride, when dried, contains NLT 98.5% and NMT 101.0% of dobutaime hydrochloride ($C_8H_{11}NO_2 \cdot HCl$).

Description Dobutamine Hydrochloride occurs as white crystals or a crystalline powder.
It is freely soluble in water or formic acid and sparingly soluble in ethanol(95).

Melting point—About 248 °C (with decomposition).

Identification (1) Determine the absorption spectra of solutions of Dopamine Hydrochloride and dopamine hydrochloride RS in 0.1 mol/L hydrochloric acid TS (1 in 25000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Dopamine Hydrochloride and dopamine hydrochloride RS, previously dried, as directed in the potassium chloride disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) An aqueous solution of Dopamine Hydrochloride (1 in 50) responds to the Qualitative Analysis (1) for

chloride.

pH Dissolve 1 g of Dopamine Hydrochloride in 50 mL of water; the pH of this solution is between 4.0 and 5.5.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Dopamine Hydrochloride in 10 mL of water; the solution is clear and colorless.

(2) ***Sulfate***—Prepare the test solution with 0.8 g of Dopamine Hydrochloride and perform the test. Prepare the control solution with 0.35 mL of 0.005 mol/L sulfuric acid (NMT 0.021%).

(3) ***Heavy metal***—Proceed with 1.0 g of Dopamine Hydrochloride according to the Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(4) ***Arsenic***—Proceed with 1.0 g of Dopamine Hydrochloride according to the Method 1 and perform the test (NMT 2 ppm).

(5) ***Related substances***—Dissolve 0.10 g of Dopamine Hydrochloride in 10 mL of water and use this solution as the test solution. Pipet 1 mL of this solution, add water to make exactly 250 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on a plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of *1*-butanol, water and acetic acid(100) (16 : 8 : 1) to a distance of about 10 cm, and air-dry the plate. Spray evenly a solution of ninhydrin in acetone (1 in 50) on the plate and heat at 90 °C for 10 minutes; spots other than the principal spot from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 0.5% (1 g, 105 °C, 3 hours).

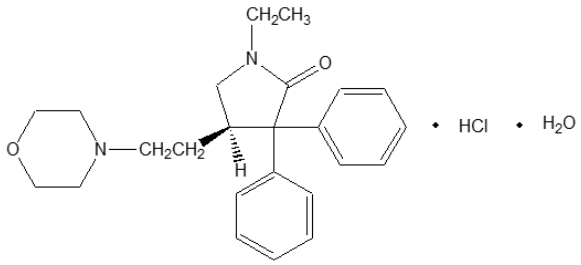
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.2 g of Dopamine Hydrochloride, previously dried, dissolve in 5 mL of formic acid, add exactly 15 mL of 0.1 mol/L perchloric acid, and heat on a steam bath for 15 minutes. After cooling, add 50 mL of acetic acid(100) and titrate the exceeding amount of perchloric acid with 0.1 mol/L sodium acetate VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 1 mol/L perchloric acid VS
= 18.964 mg of $C_8H_{11}NO_2 \cdot HCl$

Packaging and storage Preserve in light-resistant, tight containers.

Doxapram Hydrochloride Hydrate
독사프람염산염수화물



and enantiomer

Doxapram Hydrochloride

$C_{24}H_{30}N_2O_2 \cdot HCl \cdot H_2O$: 432.98

(*RS*)-1-Ethyl-4-(2-morpholin-4-ylethyl)-3,3-diphenylpyrrolidin-2-one hydrate hydrochloride [*7081-53-0*]

Doxapram Hydrochloride Hydrate contains NLT 98.0% and NMT 101.0% of doxapram hydrochloride (C24H30N2O2·HCl : 414.97), calculated on an anhydrous basis.

Description Doxapram Hydrochloride Hydrate occurs as white crystals or a crystalline powder.
It is freely soluble in methanol or acetic acid(100), sparingly soluble in water, ethanol(95), or acetic anhydride, and practically insoluble in ether.

Identification (1) Determine the absorption spectra of solutions of Doxapram Hydrochloride Hydrate and doxapram hydrochloride hydrate RS (1 in 2500) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectrum of Doxapram Hydrochloride Hydrate and doxapram hydrochloride hydrate RS as directed in the potassium bromide disk method under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) A solution of Doxapram Hydrochloride Hydrate (1 in 50) responds to the Qualitative Analysis for chloride.

Melting point Between 218 and 222 ºC.

pH Dissolve about 1.0 g of Doxapram Hydrochloride Hydrate in 50 mL of water; the pH of this solution is between 3.5 and 5.0.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Doxapram Hydrochloride Hydrate in 50 mL of water; the solution is clear and colorless

(2) ***Sulfate***—Proceed with about 1.0 g of Doxapram Hydrochloride Hydrate and perform the test. Prepare the control solution with 0.50 mL of 0.005 mol/L sulfuric acid (NMT 0.024%).

(3) ***Heavy metals***—Proceed with 1.0 g of Doxapram Hydrochloride Hydrate according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(4) ***Arsenic***—Proceed with 1.0 g of Doxapram Hydrochloride Hydrate according to Method 3 and perform the test (NMT 2 ppm).

(5) ***Related substances***—Dissolve 0.5 g of Doxapram Hydrochloride Hydrate in 10 mL of methanol and use this solution as the test solution. Pipet 3 mL of this solution and add methanol to make exactly 100 mL. Pipet 5 mL of this solution, add methanol to make exactly 50 mL, and use it as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 6 μL each of the test solution and the standard solution on a plate made of silica gel for the thin layer chromatography. Next, develop the plate with a mixture of chloroform, formic acid, ethyl formate and methanol (8 : 3 : 3 : 2) to a distance of about 10 cm, and air-dry the plate. Allow the plate to stand in iodine vapor; the spots other than the principal spot from the test solution are not more intense than that from the standard solution.

Water Between 3.5% and 4.5% (0.5 g, volumetric titration, direct titration).

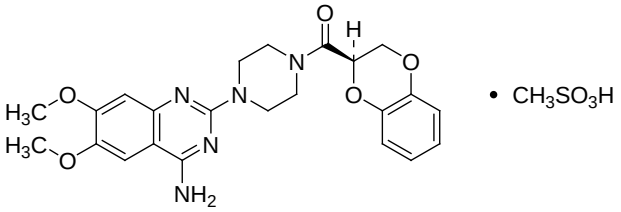
Residue on ignition NMT 0.3% (1 g).

Assay Weigh accurately about 0.8 g of Doxapram Hydrochloride Hydrate, dissolve in 50 mL of a mixture of acetic anhydride and acetic acid(100) (7 : 3), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 41.50mg of $C_{24}H_{30}N_2O_2 \cdot HCl$

Packaging and storage Preserve in tight containers.

Doxazosin Mesilate
독사조신메실산염



and enantiomer

$C_{23}H_{25}N_5O_5 \cdot CH_4O_3S$: 547.58

(*RS*)-[4-(4-Amino-6,7-dimethoxyquinazolin-2-yl)piperazin-1-yl]-(2,3-dihydro-1,4-benzo-dioxin-3-yl)methanone; methanesulfonic acid [*77883-43-3*]

Doxazosin Mesilate contains NLT 98.0% and NMT 102.0% of doxazosin mesilate ($C_{23}H_{25}N_5O_5 \cdot CH_4O_3S$), calculated on the dried basis.

Method of preparation If there is a possibility that alkyl (such as methyl, ethyl, and isopropyl) methanesulfonate esters are included as impurities during the manufacturing process of Doxazosin Mesilate, precautions must be taken in controlling the starting materials, manufacturing process, and intermediates in order to minimize the residue amounts of these impurities considering the results of risk assessment. If necessary, the validity of the manufacturing process can be demonstrated using test data that prove the absence of quality risk in the final drug substance.

Description Doxazosin Mesilate occurs as a white to pale yellow crystalline powder.
It is freely soluble in dimethylsulfoxide, slightly soluble in water or methanol, and very slightly soluble in ethanol(99.5).
A solution (1 in 20) of Doxazosin Mesilate in dimethylsulfoxide exhibits no optical rotation.

Melting point—About 272 ℃ (with decomposition).

Identification (1) Determine the absorption spectra of solutions of Doxazosin Mesilate and doxazosin mesilate RS in 0.01 mol/L hydrochloric acid-methanol TS (1 in 200000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Doxazosin Mesilate and doxazosin mesilate RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy ; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) Doxazosin Mesilate responds to the Qualitative Analysis (2) for phosphate.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Doxazosin Mesilate and perform the test according to Method 2. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Related substances***—Dissolve 20 mg of Doxazosin Mesilate in 5 mL of a mixture of methanol and acetic acid(100) (1 : 1), and use this solution as the test solution. Pipet 10 mL of this solution, add a mixture of methanol and acetic acid(100) (1 : 1) to make exactly 100 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography (with a fluorescence indicator). Next, develop the plate with a mixture of 4-methyl-2-pentanone, water and acetic acid(100) (2 : 1 : 1) as the developing solvent, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spot with an R_f value of about 0.15 obtained from the test solution

is not intense than the one obtained from the standard solution. Also, no spots other than the principal spot and a spot with an R_f value of about 0.15 are observed in the test solution.

Loss on drying NMT 1.0% (1 g, 105 ℃, 4 h.).

Residue on ignition NMT 0.2% (1 g).

Assay Weigh accurately about 25 mg each of Doxazosin Mesilate and doxazosin mesilate RS, previously dried, dissolve separately in methanol to make exactly 50 mL. Pipet 3 mL of these solutions, add the mobile phase to make them exactly 100 mL, and use them as the test solution and the standard solution, respectively. Proceed with 10 μL each of the test solution and the standard solution, and perform the test as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of doxazosin in the test solution and the standard solution.

$$\text{Amount (mg) of doxazosin mesilate } (C_{23}H_{25}N_5O_5\cdot CH_4O_3S) = \text{Amount (mg) of doxazosin mesilate RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 246 nm).

Column: A stainless steel column with about 3.9 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (4 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: A mixture of 0.05 mol/L potassium dihydrogen phosphate TS (pH 3.0), methanol and acetonitrile (12 : 8 : 3).

Flow rate: Adjust the flow rate so that the retention time of doxazosin is about 5 minutes.

System suitability

System performance: Proceed with 10 μL of the standard solution according to the above conditions; the number of theoretical plates of the doxazosin peak is NLT 2,000 plates with the symmetry factor being NMT 2.0.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area of doxazosin is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Doxazosin Mesilate Tablets
독사조신메실산염 정

Doxazosin Mesilate Tablets contain NMT 95.0% and NLT 105.0% of the labeled amount of doxazosin ($C_{23}H_{25}N_5O_5$: 451.48).

Method of preparation Prepare Doxazosin Mesilate Tablets as directed under Tablets, with Doxazosin Mesilate.

Identification Weigh an amount of Doxazosin Mesilate Tablets, previously powdered, equivalent to about 5 mg of doxazosin according to the labeled amount, put into 100 mL of 0.01 mol/L hydrochloric acid-methanol TS, shake to mix, and centrifuge. Pipet 4 mL of the clear supernatant, add 0.01 mol/L hydrochloric acid-methanol TS to make 50 mL, and determine the absorption spectrum as directed under the Ultraviolet-visible Spectroscopy; it exhibits an absorption maximum at wavelengths between 244 nm and 248 nm.

Dissolution Take 1 tablet of Doxazosin Mesilate Tablets and perform the test at 75 revolutions per minute according to Method 2 under the Dissolution, using 900 mL of 0.05 mol/L acetic acid-sodium acetate buffer solution, pH 4.0 as the dissolution medium. Take NLT 20 mL of the medium 15 minutes after starting the test, filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard the first 10 mL of the filtrate, pipet *V* mL of the subsequent filtrate, and add the dissolution medium to make exactly *V′ mL* so that the solution contains about 0.56 μg of doxazosin ($C_{23}H_{25}N_5O_5$) per mL according to the labeled amount. Pipet 5 mL of this solution, add 5 mL of methanol, and use it as the test solution. Separately, weigh accurately about 21 mg of doxazosin mesilate RS, previously dried at 105 °C for 4 hours, and dissolve in methanol to make exactly 50 mL. Pipet 2 mL of this solution and add methanol to make exactly 50 mL. Pipet 5 mL of this solution, add 5 mL of the dissolution medium, and use it as the standard solution. Proceed with 20 μL each of the test solution and the standard solution, respectively, and perform the test as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of doxazosin in the test solution and the standard solution. NLT 75% of the labeled amount of doxazosin ($C_{23}H_{25}N_5O_5$) is dissolved in 15 minutes.

$$\text{The dissolution rate (\%) of the labeled amount of doxazosin } (C_{23}H_{25}N_5O_5) = \text{Amount (mg) of doxazosin mesilate RS} \times \frac{A_T}{A_S} \times \frac{V'}{V} \times \frac{1}{C} \times \frac{72}{25} \times 0.825$$

C: Labeled amount (mg) of doxazosin ($C_{23}H_{25}N_5O_5$). in 1 tablet

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 246 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with

octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 35 °C.

Mobile phase: A mixture of methanol and buffer (55 : 45).

Buffer solution—Dissolve 3.4 g of potassium dihydrogen phosphate in 500 mL of water and adjust pH to 3.0 with diluted phosphoric acid (1 in 10).

Flow rate: Adjust the flow rate so that the retention time of doxazosin is about 5 minutes.

System suitability

System performance: Proceed with 20 μL of the standard solution according to the above conditions; the number of theoretical plates of the doxazosin peak is NLT 1000 plates with the symmetry factor being NMT 2.0.

System repeatability: Repeat the test 6 times with 20 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area of doxazosin is NMT 2.0%.

Uniformity of dosage units It meets the requirements when the procedure for content uniformity is performed according to the following procedure. Take 1 tablet of Doxazosin Mesilate Tablets, add 1 mL of water, shake to mix, and then add 0.01 mol/L hydrochloride-methanol TS to make exactly 100 mL, and shake to mix for 30 minutes. Centrifuge this solution, pipet V mL of clear supernatant, and add 0.01 mol/L hydrochloride-methanol TS to make exactly V′ mL so that the solution contains about 5 μg of doxazosin mesilate per mL, and use it as test solution. Separately, weigh accurately about 30 mg of doxazosin mesilate RS, previously dried at 105 °C for 4 hours, and dissolve it in 0.01 mol/L hydrochloric acid-methanol TS to make exactly 100 mL. Pipet 2 mL of this solution, add 0.01 mol/L hydrochloric acid-methanol TS to make exactly 100 mL, and use it as the standard solution. Perform the test as directed under the Assay described below.

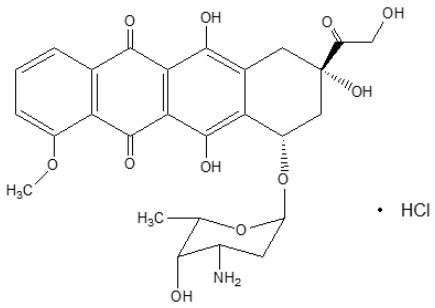
$$\text{Amount (mg) of doxazosin } (C_{23}H_{25}N_5O_5) = \text{Amount (mg) of doxazosin mesilate RS} \times \frac{A_T}{A_S} \times \frac{V'}{V} \times \frac{1}{50} \times 0.825$$

Assay Weigh accurately the mass of NLT 20 Doxazosin Mesilate Tablets, and power. Weigh accurately an amount, equivalent to about 5 mg of doxazosin ($C_{23}H_{25}N_5O_5$) and dissolve in 5 mL of 0.01 mol/L hydrochloric acid-methanol TS to make 100 mL, and shake to mix for 30 minutes. Centrifuge this solution, pipet 4 mL of the clear supernatant, add 0.01 mol/L hydrochloric acid-methanol TS to make exactly 50 mL, and use it as the test solution. Separately, weigh accurately about 24 mg of doxazosin mesilate RS, previously dried at 105 °C for 4 hours, and dissolve in 0.01 mol/L hydrochloric acid-methanol TS to make exactly 100 mL. Pipet 2 mL of this solution, add 0.01 mol/L hydrochloric acid-methanol TS to make exactly 100 mL, and use it as the standard solution. Using the test solution and the standard solution with 0.01 mol/L hydrochloric acid-methanol TS as a control solution, perform the test as directed under the Ultraviolet-visible Spectroscopy, and determine the absorbances, A_T and A_S, at 246 nm.

$$\text{Amount (mg) of doxazosin } (C_{23}H_{25}N_5O_5) = \text{Amount (mg) of doxazosin mesilate RS} \times \frac{A_T}{A_S} \times \frac{1}{4} \times 0.825$$

Packaging and storage Preserve in tight containers.

Doxorubicin Hydrochloride
독소루비신염산염



$C_{27}H_{29}NO_{11}\cdot HCl$: 579.98

(7*S*,9*S*)-7-[(2*R*,4*S*,5*S*,6*S*)-4-Amino-5-hydroxy-6-methyloxan-2-yl]oxy-6,9,11-trihydroxy-9-(2-hydroxyacetyl)-4-methoxy-8,10-dihydro-7*H*-tetracene-5,12-dione hydrochloride [*25316-40-9*]

Doxorubicin Hydrochloride is the hydrochloride of a derivative of daunorubicin.

Doxorubicin hydrochloride, when dried, contains NLT 980 μg and NMT 1080 μg (potency) of doxorubicin hydrochloride (C27H29NO11·HCl), calculated on the anhydrous basis.

Description Doxorubicin Hydrochloride occurs as an orange crystalline powder.

It is sparingly soluble in water, slightly soluble in methanol, very slightly soluble in ethanol(99.5), and practically insoluble in acetonitrile.

Identification (1) Determine the absorption spectra of solutions of Doxorubicin Hydrochloride and doxorubicin hydrochloride RS in methanol (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Doxorubicin Hydrochloride and doxorubicin hydrochloride RS as directed in the potassium chloride disk method under the

Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) An aqueous of Doxorubicin Hydrochloride (1 in 200) responds to the Qualitative Analysis (1) for chloride.

Crystallinity Meets the requirements.

Optical rotation $[\alpha]_D^{20}$: Between +240° and +290° (20 mg calculated on the anhydrous basis, methanol, 20 mL, 100 mm).

pH Dissolve 50 mg of Doxorubicin Hydrochloride in 10 mL of water; the pH of this solution is between 4.0 and 5.5.

Absorbance $E_{1cm}^{1\%}$ (495 nm): Between 200 and 230 (10 mg calculated on the anhydrous basis, methanol, 500 mL).

Purity (1) ***Clarity and color of solution***—Dissolve 50 mg of Doxorubicin Hydrochloride in 10 mL of water; the solution is clear and red.

(2) ***Related substances***—Dissolve 25 mg of Doxorubicin Hydrochloride in 100 mL of the mobile phase and use this solution as the test solution. Pipet 2 mL of this solution, add the mobile phase to make exactly 100 mL, and use it as the standard solution. Pipet 20 μL each of the test solution and the standard solution, perform the test as directed under the Liquid Chromatography under the following operating conditions, measure the peak areas of each peak of the solutions using the automatic integration method, and determine the peak areas of each solution; each peak area of the peaks other than that of doxorubicin in the test solution is not greater than one-fourth of the peak area of doxorubicin in the standard solution. Additionally, the sum of peak areas other than that of doxorubicin in the test solution is not greater than the peak area of doxorubicin in the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for the liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: A mixture of a solution of phosphoric acid diluted in 3 g of sodium lauryl sulfate and acetonitrile (1 : 1).

Flow rate: Adjust the flow rate so that the retention time of doxorubicin is about 8 minutes.

System suitability

Test for required detectability: Pipet 1 mL of the standard solution and add the mobile phase to make exactly 20 mL. Confirm that the peak area of doxorubicin obtained from 20 μL of this solution is in the range of 3.5% to 6.5% of the peak area of doxorubicin in the standard solution.

System performance: Dissolve 5 mg of Doxorubicin Hydrochloride in 20 mL of water, add 1.5 mL of phosphoric acid, and allow it to stand at room temperature for 30 minutes. Adjust the pH of this solution to 2.5 with 2 mol/L sodium hydroxide TS. Proceed with 20 μL of this solution under the above operating conditions; doxorubicinone, in which the relative retention time is about 0.6 with respect to doxorubicin, and doxorubicin are eluted in this order with the resolution between these peaks being NLT 5.

System repeatability: Repeat the test 6 times with 20 μL of the standard solution according to the above operating conditions; the relative standard deviation of the peak area for doxorubicin is NMT 2.0%.

Time span of measurement: About 3 times the retention time of doxorubicin.

Water NMT 3.0% (0.3 g, volumetric titration, direct titration).

Sterility It meets the requirements when used in a sterile preparation.

Bacterial endotoxins Less than 2.50 EU/mg of doxorubicin hydrochloride when used in a sterile preparation.

Histamine It meets the requirements when used in a sterile preparation. Proceed with an appropriate amount of Doxorubicin Hydrochloride to prepare a solution containing 2.0 mg (potency) per mL**.** Use the solution as the test solution. Use 0.5 mL of the solution for the test.

Assay Take exactly an amount of Doxorubicin Hydrochloride, equivalent to about 2.0 mg (potency) according to the labeled potency, dilute it with the mobile phase to make the concentration 0.1 mg (potency) per mL, and use this solution as the test solution. Separately, weigh accurately about 10 mg (potency) of doxorubicin hydrochloride RS, dilute it with the mobile phase to make the concentration 0.1 mg (potency) per mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions and determine the peak areas, A_T and A_S, of doxorubicin hydrochloride in the test solution and in the standard solution.

$$\text{Potency (μg) of doxorubicin hydrochloride } (C_{27}H_{29}NO_{11}\cdot HCl) = \text{Potency (μg) of doxorubicin hydrochloride RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with trimethylsilanized silica gel for liquid chromatography (5

μm to 10 μm in particle diameter).

Mobile phase: Dissolve 1 g of sodium lauryl sulfate in a mixture of water, acetonitrile, ethanol(95) and phosphoric acid (540 : 290 : 170 : 2), and adjust pH to 3.6 ± 0.1 with 2 mol/L sodium hydroxide TS.

Flow rate: About 1.5 mL/minute.

System suitability

System performance: Proceed with 20 μL of the resolution test solution under the above operating conditions; the relative retention time of doxorubicinone with respect to doxorubicin is about 0.6 with the resolution between these peaks being NLT 5.5, and the relative retention time of doxorubicinone to doxorubicin is about 0.6, and the resolution is NLT 5.5. The number of theoretical plates and the symmetric factor for the peak of doxorubicin are NLT 2250 and between 0.7 and 1.2, respectively.

System repeatability: Repeat the test 6 times with 20 μL each of the standard solutions under the above operating conditions; the relative standard deviation of the peak area of doxorubicin is NMT 1.0%.

Resolution test solution—Dissolve about 10 mg (potency) of Doxorubicin Hydrochloride in 5 mL of water, add 5 mL of phosphoric acid, and allow it to stand for about 30 minutes. Adjust pH to 2.6 ± 0.1 with 2 mol/L sodium hydroxide TS (about 37 mL), add 15 mL of acetonitrile and 10 mL of methanol, mix, filter, and use this solution as the resolution test solution. Store some of this solution in a freezer, and unfreeze and mix before use.

Packaging and storage Preserve in tight containers.

Doxorubicin Hydrochloride Injection
독소루비신염산염 주사액

Doxorubicin Hydrochloride Injection contains NLT 90.0% and NMT 120.0% of the labeled amount of doxorubicin hydrochloride ($C_{27}H_{29}NO_{11}$·HCl : 579.98).

Method of preparation Prepare as directed under Injections, with Doxorubicin Hydrochloride.

Description Doxorubicin Hydrochloride Injection occurs as an orange liquid.

Identification The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

pH Between 2.5 and 3.5.

Sterility Meets the requirements.

Bacterial endotoxins Less than 2.2 EU per mg (potency) of doxorubicin hydrochloride.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Extractable volume of injections Meets the requirements.

Assay Pipet the amount of Doxorubicin Hydrochloride Injection, equivalent to about 2.0 mg (potency) according to the labeled potency, dilute with the mobile phase to make a solution containing 0.1 mg (potency) per mL, and use this solution as the test solution. Separately, weigh accurately about 10 mg (potency) of doxorubicin hydrochloride RS, dilute with the mobile phase to make a solution containing 0.1 mg (potency) per mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions, and determine the peak areas, A_T and A_S, of doxorubicin in the test solution and the standard solution.

$$\text{Potency (μg) of doxorubicin hydrochloride } (C_{27}H_{29}NO_{11}\cdot HCl) = \text{Potency (μg) of doxorubicin hydrochloride RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with trimethylsilanized silica gel for liquid chromatography (5 μm to 10 μm in particle diameter).

Mobile phase: Dissolve 1 g of sodium lauryl sulfate in a mixture of water, acetonitrile, ethanol(95) and phosphoric acid (540 : 290 : 170 : 2) and adjust pH to 3.6 ± 0.1 with 2 mol/L sodium hydroxide TS.

Flow rate: About 1.5 mL/minute.

System suitability

System performance: Proceed with 20 μL of the resolution test solution under the above operating conditions; the relative retention time of doxorubicinone with respect to doxorubicin is about 0.6 with the resolution between these peaks being NLT 5.5. The number of theoretical plates of doxorubicin is 2250 and the symmetry factor is between 0.7 and 1.2.

System repeatability: Repeat the test 6 times with 20 μL each of the standard solutions; the relative standard deviation of the peak area of doxorubicin is NMT 1.0%.

Resolution test solution—Dissolve about 10 mg (potency) of Doxorubicin Hydrochloride in 5 mL of water, add 5 mL of phosphoric acid, and allow it to stand for about 30 minutes. Adjust pH to 2.6 ± 0.1 with 2 mol/L sodium hydroxide TS (about 37 mL), add 15 mL of acetonitrile and 10 mL of methanol, filter, and use this solu-

tion as the resolution test solution. Store some of this solution in a freezer and unfreeze before use.

Packaging and storage Preserve in hermetic containers.

Doxorubicin Hydrochloride for Injection
주사용 독소루비신염산염

Doxorubicin Hydrochloride for Injection is a preparation for injection, which is dissolved before use. Doxorubicin Hydrochloride for Injection contains NLT 90.0% and NMT 110.0% of the labeled amount of doxorubicin hydrochloride ($C_{27}H_{29}NO_{11}\cdot HCl$: 579.98).

Method of preparation Prepare as directed under Injections, with Doxorubicin Hydrochloride for Injection.

Description Doxorubicin Hydrochloride for Injection occurs as an orange powder or a mass.

Identification (1) Dissolve an amount of Doxorubicin Hydrochloride for Injection, equivalent to 10 mg (potency) of doxorubicin hydrochloride according to the labeled amount, in methanol to make 100 mL. To 5 mL of this solution, add methanol to make 50 mL, and determine the absorption spectrum of the solution as directed under the Ultraviolet-visible Spectroscopy; it exhibits absorption maxima at wavelengths of between 231 and 235 nm, between 250 and 254 nm, between 477 and 481 nm, between 493 and 497 nm, and between 528 and 538 nm.

(2) Both the test solution and the standard solution exhibit the same retention times in the chromatograms obtained by the test under the Assay.

pH Dissolve 50 mg of Doxorubicin Hydrochloride for Injection in 10 mL of water; the pH of this solution is between 5.0 and 6.0.

Purity ***Clarity and color of solution***—Take exactly an amount of Doxorubicin Hydrochloride for Injection, equivalent to about 50 mg of doxorubicin hydrochloride according to the labeled amount, and dissolve in 10 mL of water; the solution is clear and red.

Water NMT 4.0% (0.2 g, volumetric titration, direct titration).

Sterility Meets the requirements.

Bacterial endotoxins Less than 2.50 EU per mg (potency) of Doxorubicin Hydrochloride for Injection.

Uniformity of dosage units Meets the requirements.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Assay Weigh accurately the mass of the contents of NLT 10 vials of Doxorubicin Hydrochloride for Injection. Weigh accurately the amount equivalent to 10 mg (potency) of Doxorubicin Hydrochloride, add exactly 5 mL of the internal standard solution, dissolve in the mobile phase to make 100 mL. Use this solution as the test solution. Separately, weigh accurately an amount of doxorubicin hydrochloride RS, equivalent to 10 mg (potency), add exactly 5 mL of the internal standard solution, dissolve in the mobile phase to make 100 mL, and use this solution as the standard solution.
Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography, and determine the peak area ratios of doxorubicin, Q_T and Q_S, to the internal standard solution in each solution.

$$\text{Potency (μg) of doxorubicin hydrochloride } (C_{27}H_{29}NO_{11}\cdot HCl) = \text{Potency (μg) of doxorubicin hydrochloride RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of parahydroxybenzoic acid in the mobile phase (1 in 10000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: Dissolve the diluted phosphoric acid (7 in 5000) in 3 g of sodium lauryl sulfate. To this solution, add 1000 mL of acetonitrile.

Flow rate: Adjust the flow rate so that the retention time of doxorubicin is about 8 minutes.

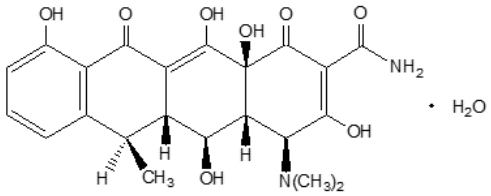
System suitability

System performance: Proceed with 10 μL of the standard solution under the above operating conditions; doxorubicin and the internal standard solution are eluted in this order with the resolution being NLT 5, and the symmetry factor for the doxorubicin peak is between 0.8 and 1.2.

System repeatability: Repeat the test 6 times with 10 μL of the standard solutions under the above operating conditions; the relative standard deviation of the ratio of the peak area of doxorubicin to that of the internal standard solution is NMT 1.0%.

Packaging and storage Preserve in hermetic containers.

Doxycycline Hydrate
독시사이클린수화물



$C_{22}H_{24}N_2O_8 \cdot H_2O$: 462.45

(4*S*,4a*R*,5*S*,5a*R*,6*R*,12a*S*)-4-(Dimethylamino)-3,5,10,12,12a-pentahydroxy-6-methyl-1,11-dioxo-1,4,4a,5,5a,6,11,12a-octahydrotetracene-2-carboxamide hydrate [*17086-28-1*]

Doxycycline Hydrate contains NLT 880 μg and NMT 980 μg (potency) per mg of doxycycline ($C_{22}H_{24}N_2O_8$: 444.44), calculated on the anhydrous basis.

Description Doxycycline Hydrate occurs as a yellow crystalline powder.
It is sparingly soluble in ethanol(95), very slightly soluble in water and practically insoluble in chloroform or ether.
It dissolves in dilute acid or alkaline solutions.

Identification Determine the infrared spectra of Doxycycline Hydrate and doxycycline RS, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Crystallinity Meets the requirements.

pH The pH of a suspension obtained by suspending 0.1 g of Doxycycline Hydrate in 10 mL of water is between 5.0 and 6.5.

Purity (1) ***Heavy metals*—**Weigh 0.5 g of Doxycycline Hydrate, mix with 4 mL of a solution of magnesium sulfate heptahydrate in dilute sulfuric acid (1 in 4), heat until a liquid is obtained, and then evaporate to dryness on a steam bath. Ignite the residue at below 800 °C to incinerate. Allow to cool and moisten the residue with a small amount of dilute sulfuric acid. Evaporate to dryness, incinerate for NMT 2 hours, and allow to cool. Extract the residue twice each with 5 mL of 2 mol/L hydrochloric acid TS, add 0.1 mL of phenolphthalein TS, and add ammonia water(28) until the solution turns pale red. Allow to cool, add acetic acid(100) until the color disappears, and add another 0.5 mL. Filter and wash, if necessary. Add water to make 20 mL and use this solution as the test solution. Separately, proceed in the same manner as the preparation of the test solution using 2.5 mL of lead standard solution instead of Doxycycline Hydrate. To 10 mL of this solution, add 2 mL of the test solution and use this solution as the control solution. Separately, add 2 mL of the test solution to 10 mL of water and use this solution as the blank test solution. To 12 mL each of the test solution, the standard solution and the blank test solution, add 2 mL of acetate buffer (pH 3.5), mix, add 1.2 mL of thioacetamide TS, mix immediately, and allow to stand for 2 minutes. The brown color of the test solution is not more intense than that of the control solution.

System suitability: The control solution shows a faint brown color compared to the blank test solution. Add 2.5 mL of lead standard solution to the test solution. To 10 mL of this solution, add 2 mL of the test solution, and use this solution as the system suitability solution. The system suitability solution is more intense than or has the same intensity as the control solution.

(2) ***Related substances*—**Weigh accurately about 55 mg of Doxycycline Hydrate, dissolve in 12 mL of 0.1 mol/L hydrochloric acid, add 0.01 mol/L hydrochloric acid to make exactly 50 mL, and use this solution as the test solution. Weigh accurately an appropriate amount of methacycline hydrochloride RS, dissolve in 0.01 mol/L hydrochloric acid to make a solution containing 1.2 mg per mL, and use this solution as the methacycline standard stock solution. Separately, weigh accurately about 12 mg of doxycycline RS, dissolve in 0.01 mol/L hydrochloric acid to make exactly 10 mL, and use this solution as the standard solution (1). Pipet 2.0 mL of standard solution (1) and 2.0 mL of the methacycline standard stock solution, add 0.01 mol/L hydrochloric acid to make exactly 100 mL, and use this solution as the standard solution (2). Perform the test with 20 μL each of the test solution and standard solution (2) as directed under the Liquid Chromatography according to the following operating conditions, and then determine the peak areas of methacycline A_M and A_U, obtained from standard solution (2) and the test solution, respectively. Likewise, determine the peak area of doxycycline A_S, obtained from standard solution (2) and the peak areas of each related substance other than methacycline A_i from the test solution. The content of methacycline is NMT 2.0%, the content of related substances eluted before methacycline is NMT 0.5%, the content of 6-epidoxycycline is NMT 2.0%, and the content of related substances eluted after the doxycycline peak is NMT 0.5%.

$$\text{Content (\%) of methacycline} = \frac{C_M}{W} \times \frac{A_U}{A_M} \times 5000$$

$$\text{Content (\%) of each related substance other than methacycline} = \frac{C_S}{W} \times \frac{A_i}{A_S} \times 5000$$

C_M: Concentration (mg/mL) of methacycline hydrochloride in standard solution (2)

W: Weight (mg) of Doxycycline Hydrate taken

C_S: Concentration (mg/mL) of doxycycline in standard solution (2)

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 270 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with spherical styrene-divinylbenzene copolymer for liquid chromatography (5 μm to 10 μm in particle diameter).

Column temperature: A constant temperature of about 60 ℃.

Mobile phase: Dissolve 2.72 g of potassium dihydrogen phosphate, 0.74 g of sodium hydroxide, 0.50 g of tetrabutyl ammonium hydrogen sulfate and 0.40 g of disodium dihydrogen ethylenediaminetetraacetate in 850 mL of water. To this solution, add 60 g of *t*-butyl alcohol, add water to make exactly 1000 mL, and adjust the pH to 7.0 - 9.0 with 1 mol/L sodium hydroxide solution.

Flow rate: 1 mL/min

System suitability

System performance: Proceed with 20 μL of the system suitability solution under the above operating conditions; the relative retention times of 4-epidoxycycline, methacycline, 6-epidoxycycline and doxycycline are 0.4, 0.6, 0.7 and 1.0, respectively, and the resolution between the peaks of 4-epidoxycycline and doxycycline is NLT 3.0 with the symmetry factor of the peaks being NMT 2.0.

System repeatability: Repeat the test 6 times with 20 μL each of standard solution (1) under the above operating conditions; the relative standard deviation of the peak area of doxycycline is NMT 2.0%.

Time span of measurement: About 1.7 times the retention time of doxycycline.

System suitability solution—Dissolve doxycycline RS in 0.01 mol/L hydrochloric acid to make a solution containing 6 mg per mL. Pipet 5 mL of this solution, warm on a steam bath for 60 minutes, and evaporate to dryness on a hot plate while taking care not to burn the residue. Dissolve the residue in 0.01 mol/L hydrochloric acid to make exactly 25 mL and use this solution as the system suitability solution. This solution contains 4-epidoxycycline, 6-epidoxycycline and doxycycline. Keep this solution in a refrigerator and use it within 14 days.

Water Between 3.6% and 4.6% (0.2 g, volumetric titration, direct titration).

Assay Weigh accurately an appropriate amount of Doxycycline Hydrate, equivalent to about 55 mg (potency), dissolve in 12 mL of 0.1 mol/L hydrochloric acid by shaking, add 0.01 mol/L hydrochloric acid to make exactly 50 mL, and filter through a filter with pore size of NMT 0.5 μm. Use the filtrate as the test solution. Separately, weigh accurately about 11 mg (potency) of doxycycline RS, add 6 mL of 0.01 mol/L hydrochloric acid, sonicate for 5 minutes to dissolve, and make exactly 10 mL. Use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography, and determine the peak areas, A_T and A_S of doxycycline in each solution.

$$\text{Potency (μg) of doxycycline } (C_{22}H_{24}N_2O_8) = \text{Potency (μg) of doxycycline RS} \times \frac{A_T}{A_S} \times 5$$

Operating conditions

Proceed as directed under the Assay under Doxycycline Hyclate Hydrate.

Packaging and storage Preserve in light-resistant, tight containers.

Doxycycline Capsules
독시사이클린 캡슐

Doxycycline Capsules contain NLT 90.0% and NMT 120.0% of the labeled amount of doxycycline ($C_{22}H_{24}N_2O_8$: 444.44).

Method of preparation Prepare as directed under Capsules, with Doxycycline Hydrate.

Identification (1) Weigh about 0.1 g (potency) each of Doxycycline Capsules and doxycycline RS, add 100 mL of methanol, shake well to mix, filter, and use the clear supernatant as the test solution and the standard solution, respectively. Perform the test with these solutions as directed under the Thin Layer Chromatography. Heat a plate coated with octylsilanized silica gel for liquid chromatography, 0.25 mm in thickness, at 130 °C for 20 minutes and allow to cool. Spot the test solution and the standard solution on the plate while the plate is still warm, develop the plate with a mixture of 0.5 mol/L oxalic acid (previously adjusted to pH 2.0 with ammonium hydroxide), methanol and acetonitrile (80 : 20 : 20) as a developing solvent. After air-drying the plate, expose it to ammonia vapor for 5 minutes and examine it under ultraviolet light (main wavelength: 254 nm); the spot obtained from the test solution shows the same R_f value as that obtained from the standard solution.

(2) The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

Loss on drying NMT 5.0% (0.1 g, 60 ℃, 2 hours).

Dissolution Perform the test with 1 tablet of Doxycycline Capsules at 75 revolutions per minute according to Method 2 under the Dissolution using 900 mL of 0.01 mol/L hydrochloric acid TS as the dissolution medium. Take the dissolved solution after 60 minutes from the start of the test and filter. Discard the first 10 mL of the filtrate, pipet *V* mL of the subsequent filtrate, add the dissolution medium to make exactly *V*'mL, and use this solution as the test solution. Separately, weigh accurately

an appropriate amount of doxycycline RS, dissolve it in the dissolution medium to make it the same concentration as the test solution, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at the absorbance maximum wavelength of about 268 nm as directed under the Ultraviolet-visible Spectroscopy, using the dissolution medium as the control solution. Doxycycline Capsules meet the requirement when the dissolution rate at 60 minutes is NLT 85% (Q).

Dissolution rate (%) with respect to the labeled amount of doxycycline ($C_{22}H_{24}N_2O_8$)

$$= C_S \times \frac{V'}{V} \times \frac{1}{C} \times 90000$$

Cs: Concentration [mg (potency)/mL] of the standard solution

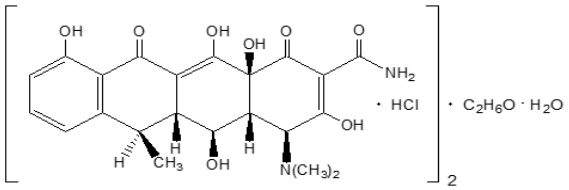
C: Labeled amount [mg (potency)] of doxycycline ($C_{22}H_{24}N_2O_8$) in 1 capsule

Uniformity of dosage units Meets the requirements.

Assay Perform the test as directed under the Assay under Doxycycline Hyclate Hydrate. In this case, weigh accurately the contents of NLT 20 Doxycycline Capsules. Weigh accurately an appropriate amount of the combined contents, equivalent to about 100 mg (potency), according to the labeled potency of Doxycycline Capsules, add 20 mL of 0.1 mol/L hydrochloric acid, sonicate for 5 minutes, shake for 15 minutes to dissolve, and add 0.01 mol/L hydrochloric acid to make exactly 100 mL. Filter this solution through a membrane filter with a pore size of NMT 0.5 μm and use the filtrate as the test solution. Separately, weigh accurately about 10 mg (potency) of doxycycline RS, add 6 mL of 0.01 mol/L hydrochloric acid, sonicate for 5 minutes to dissolve, make exactly 10 mL, and use this solution as the standard solution.

Packaging and storage Preserve in light-resistant, tight containers.

Doxycycline Hyclate Hydrate
독시사이클린하이클레이트수화물



Doxycycline Hyclate
$(C_{22}H_{24}N_2O_8 \cdot HCl)_2 \cdot C_2H_6O \cdot H_2O$: 1025.89
(4*S*,4a*R*,5*S*,5a*R*,6*R*,12a*S*)-4-(Dimethylamino)-3,5,10,12,12a-pentahydroxy-6-methyl-1,11-dioxo-1,4,4a,5,5a,6,11,12a-octahydrotetracene-2-carboxamide; ethanol; hydrate; dihydrochloride [*24390-14-5*]

Doxycycline Hyclate Hydrate is the hydrochloride of a derivative of oxytetracycline.

Doxycycline Hyclate Hydrate contains NLT 800 μg and NMT 920 μg (potency) per mg of doxycycline ($C_{22}H_{24}N_2O_8$: 444.43), calculated on the anhydrous basis and corrected by the amount of ethanol.

Description Doxycycline Hyclate Hydrate occurs as yellow to dark yellow crystals or a crystalline powder.
It is freely soluble in water and in methanol, and slightly soluble in ethanol(99.5).

Identification (1) Determine the infrared spectra of Doxycycline Hyclate Hydrate and doxycycline hyclate hydrate RS, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) An aqueous solution of Doxycycline Hyclate Hydrate (1 in 20) responds to the Qualitative Analysis for chlorides.

Crystallinity Meets the requirements.

Specific optical rotation $[\alpha]_D^{20}$: Between -105° and -120° (0.25 g calculated on the anhydrous basis and corrected by the amount of alcohol, 0.01 mol/L hydrochloric acid-methanol TS, 25 mL, 100 mm). Determine within 5 minutes after the test solution is prepared.

pH Dissolve 1.0 g of Doxycycline Hyclate Hydrate in 10 mL of water; the pH of this solution is between 2.0 and 3.0.

Absorbance $E_{1cm}^{1\%}$(249 nm): Between 285 and 315 (10 mg, 0.01 mol/L hydrochloric acid-methanol, 500 mL).

Purity (1) ***Ethanol***—Weigh accurately about 1.0 g of Doxycycline Hyclate Hydrate, dissolve in exactly 5 mL of the internal standard solution, add water to make exactly 25 mL, and use this solution as the test solution. Separately, pipet 2 mL of ethanol(99.5), add water to make exactly 100 mL., and use this solution as the standard stock solution. Pipet 0.25 mL of this standard stock solution, add exactly 5 mL of the internal standard solution, add water to make exactly 25 mL, and use this solution as the standard solution. Perform the test with 1 μL each of the test solution and the standard solution as directed under the Gas Chromatography according to the following conditions, and determine the ratio of the peak area of ethanol to that of the internal standard, Q_T and Q_S. The amount of ethanol is between 4.3% and 6.0%.

Content (%) of ethanol per g of Doxycycline Hyclate Hydrate

$$= 1 / W_T \times Q_T / Q_S \times 0.5 \times 0.79$$

W_T: Weight (g) of Doxycycline Hyclate Hydrate

taken

0.79: Density (g/mL) of ethanol at 20 ℃

Internal standard solution—1-propanol solution (1 in 1000).

Operating conditions

Detector: A flame-ionization detector

Column: A fused silica capillary column, 0.53 mm in internal diameter and 30 m in length, of which the inner surface is coated with 6% cyanopropylphenyl-94% polydimethylsiloxane for gas chromatography to a thickness of 3.0 μm.

Column temperature: Maintain at 50 °C for 5 minutes, then raise to 200 °C by 50 °C per minute, and keep at 200 °C for 5 minutes.

Sample injection port temperature: 210 ℃

Detector temperature: 280 °C

Split ratio: 1 : 5

Carrier gas: Nitrogen

Flow rate: 5 mL/min

System suitability

System performance: Proceed with 1 μL of the standard solution under the above operating conditions; ethanol and the internal standard are eluted in this order.

System reproducibility: Repeat the test 5 times with 1 μL of the standard solution under the above operating conditions; the relative standard deviation of the peak area of ethanol with respect to that of the internal standard is NMT 2.0%.

(2) ***Heavy metal***—Proceed with 1.0 g of Doxycycline Hyclate Hydrate according to Method 2 and perform the test. Prepare the control solution with 5.0 mL of lead standard solution (NMT 50 ppm).

(3) ***Related substances***—Weigh accurately about 120 mg (potency) each of Doxycycline Hyclate Hydrate and doxycycline RS, dissolve them each in 0.01 mol/L hydrochloric acid TS to make exactly 100 mL, and use these solutions as the test solution and standard solution (1). Separately, weigh an appropriate amount of methacycline hydrochloride RS and dissolve in 0.01 mol/L hydrochloric acid TS to make a solution containing 1.2 mg per mL. Pipet 2.0 mL of this solution and 2.0 mL of standard solution (1), dissolve in 0.01 mol/L hydrochloric acid TS to make 100 mL of a solution containing 0.024 mg of doxycycline and methacycline hydrochloride per mL, and use this solution as standard solution (2). Perform the test with exactly 20 μL each of the test solution and standard solution (2) as directed under the Liquid Chromatography according to the following operating conditions, and determine the peak area of methacycline obtained from standard solution (2), A_M, and that from the test solution, A_U. Likewise, determine the peak area of doxycycline obtained from standard solution (2), A_S, and the peak areas of each related substance other than methacycline obtained from the test solution, A_i; the content of methacycline is NMT 2.0%, the content of each related substance eluted before the methacycline peak is NMT 0.5%, the content of 6-epidoxycycline is NMT 2.0%, and the content of each related substance eluted after the doxycycline peak is NMT 0.5%.

$$\text{Content (\%) of methacycline} = \frac{C_M}{W} \times \frac{A_U}{A_M} \times 10000$$

$$\text{Content (\%) of each related substance other than methacycline (\%)} = \frac{C_S}{W} \times \frac{A_i}{A_S} \times 10000$$

C_M: Concentration (mg/mL) of methacycline hydrochloride in standard solution (2)

W: Weight [mg (potency)] of Doxycycline Hyclate Hydrate taken

C_S: Concentration [mg (potency)/mL] of doxycycline in standard solution (2)

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 270 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with spherical styrene-divinylbenzene copolymer for liquid chromatography (5 μm to 10 μm in particle diameter).

Column temperature: A constant temperature of about 60 ℃.

Mobile phase: Dissolve 2.72 g of potassium dihydrogen phosphate, 0.74 g of sodium hydroxide, 0.50 g of tetrabutylammonium hydrogen sulfate and 0.40 g of disodium dihydrogen ethylenediaminetetraacetate in 850 mL of water. To this solution, add 60 g of *t*-butyl alcohol, add water to make 1000 mL, and adjust the pH to 8.0 with 1 mol/L sodium hydroxide. If necessary, increase the resolution between the peaks of related substances and doxycycline and the retention time of doxycycline by reducing the proportion of *t*-butyl alcohol.

Flow rate: About 1.0 mL/min.

System suitability

System performance: Proceed with 20 μL of the system suitability solution under the above operating conditions; the relative retention times of 4-epidoxycycline, 6-epidoxycycline and doxycycline are about 0.4, 0.7 and 1.0, respectively, and the resolution between the peaks of 4-epidoxycycline and doxycycline is NLT 3.0 with the symmetry factor of doxycycline being NMT 2.0.

System repeatability: Repeat the test 6 times with a solution prepared by dissolving 12 mg of doxycycline RS in 10 mL of 0.01 mol/L hydrochloric acid; the relative standard deviation is NMT 2.0%.

Time span of measurement: About 1.7 times the retention time of doxycycline.

System suitability solution—Weigh an appropriate amount of doxycycline RS and dissolve in 0.01 mol/L hydrochloric acid to make a solution containing 6 mg of

doxycycline per mL. Take 5 mL of this solution, heat over a steam bath for 60 minutes, and evaporate to dryness on a hot plate while taking care not to burn the residue. Dissolve the residue in 0.01 mol/L hydrochloric acid to make exactly 25 mL, filter through a membrane filter with a pore size of NMT 0.5 μm, and use this solution as the system suitability solution. Keep this solution in a refrigerator and use it within 14 days.

Water Between 1.4% and 2.8% (0.3 g, volumetric titration, direct titration).

Residue on ignition NMT 0.3% (1 g).

Assay Weigh accurately about 0.120 g (potency) of Doxycycline Hyclate Hydrate, dissolve in 0.01 mol/L hydrochloric acid to make exactly 100 mL, filter through a membrane filter with a pore size of NMT 0.5 μm, and use the filtrate as the test solution. Separately, weigh accurately about 12 mg (potency) of doxycycline RS, add 6 mL of 0.01 mol/L hydrochloric acid, sonicate for 5 minutes to dissolve, make exactly 10 mL, and use this solution as the standard solution. Perform the test with 20 mL each of the test solution and the standard solution as directed under the Liquid Chromatography, and determine the peak areas A_T and A_S of doxycycline in each solution.

$$\text{Potency (μg) of doxycycline } (C_{22}H_{24}N_2O_8) = \text{Potency (μg) of doxycycline RS} \times \frac{A_T}{A_S} \times 10$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 270 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with spherical styrene-divinylbenzene copolymer for liquid chromatography (5 μm - 10 μm in particle diameter).

Column temperature: A constant temperature of about 60 °C.

Mobile phase: Dissolve 2.72 g of potassium dihydrogen phosphate, 0.74 g of sodium hydroxide, 0.50 g of tetrabutylammonium hydrogen sulfate and 0.40 g of disodium dihydrogen ethylenediaminetetraacetate in 850 mL of water. To this solution, add 60 g of *t*-butyl alcohol, add water to make 1000 mL, and adjust the pH to 8.0 ± 0.1 with 1 mol/L sodium hydroxide. If necessary, increase the resolution between the peaks of related substances and doxycycline and the retention time of doxycycline by reducing the proportion of *t*-butyl alcohol.

Flow rate: 1.0 mL/min

System suitability

System performance: Proceed with 20 μL of the system suitability solution under the above operating conditions; the relative retention times of 4-epidoxycycline, 6-epidoxycycline and doxycycline are about 0.4, 0.7 and 1.0, respectively, and the resolution between the peaks of 4-epidoxycycline and doxycycline is NLT 3.0 with the symmetry factor of the doxycycline peak being NMT 2.0.

System repeatability: Repeat the test 5 times with 20 μL of the standard solution under the above operating conditions; the relative standard deviation of the peak area of doxycycline is NMT 2.0%.

System suitability solution—Weigh an appropriate amount of doxycycline RS and dissolve in 0.01 mol/L hydrochloric acid to make a solution containing 6 mg of doxycycline per mL. Take 5 mL of this solution, heat over a steam bath for 60 minutes, and evaporate to dryness on a hot plate while taking care not to burn the residue. Dissolve the residue in 0.01 mol/L hydrochloric acid to make exactly 25 mL, filter through a membrane filter with a pore size of NMT 0.5 μm, and use this solution as the system suitability solution. Keep this solution in a refrigerator and use it within 14 days.

Packaging and storage Preserve in light-resistant, tight containers.

Doxycycline Hyclate Capsules
독시사이클린하이클레이트 캡슐

Doxycycline Hyclate Capsules contain NLT 90.0% and NMT 120.0% of the labeled amount of doxycycline ($C_{22}H_{24}N_2O_8$: 444.44).

Method of preparation Prepare as directed under Capsules, with Doxycycline Hyclate Hydrate.

Identification (1) Take the contents of 1 capsule of Doxycycline Hyclate Capsules and add 3 drops of sulfuric acid to the powdered contents; a yellow color is observed.

(2) Weigh about 10 mg (potency) of powdered Doxycycline Hyclate Capsules, dissolve in 20 mL of water, and add silver nitrate TS; the solution becomes turbid in white.

(3) The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

Water NMT 5.0% (0.2 g, volumetric titration, direct titration).

Dissolution Perform the test with 1 capsule of Doxycycline Hyclate Capsules at 75 revolutions per minute according to Method 2 under the Dissolution, using 900 mL of water as the dissolution medium, with the distance between the bottom edge of the stirring blade and the inside bottom of the flask being maintained at 4.5 ± 0.5 cm during the test. Take the dissolved solution after 30 minutes from the start of the test and filter. Discard the first 10 mL of the filtrate, pipet *V* mL of the subsequent

filtrate, add the dissolution medium to make exactly V' mL, and use this solution as the test solution. Separately, weigh accurately an appropriate amount of doxycycline RS, dissolve it in the dissolution medium to make it the same concentration as the test solution, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at the absorbance maximum wavelength of about 276 nm as directed under the Ultraviolet-visible Spectroscopy, using the dissolution medium as the control solution. Doxycycline Hyclate Capsules meet the requirement when the dissolution rate at 30 minutes is NLT 80% (Q).

Dissolution rate (%) with respect to the labeled amount of doxycycline ($C_{22}H_{24}N_2O_8$)

$$= C_S \times \frac{A_T}{A_S} \times \frac{V'}{V} \times \frac{1}{C} \times 90000$$

Cs: Concentration [mg (potency)/mL] of the standard solution

C: Labeled amount [mg (potency)] of doxycycline ($C_{22}H_{24}N_2O_8$) in 1 capsule

Uniformity of dosage units Meets the requirements.

Assay Perform the test as directed under the Assay under Doxycycline Hyclate Hydrate. In this case, weigh accurately the contents of NLT 20 Doxycycline Hyclate Capsules. Weigh accurately an appropriate amount of the combined contents of Doxycycline Hyclate Capsules, equivalent to about 100 mg (potency) according to the labeled potency of this drug, add 75 mL of 0.01 mol/L hydrochloric acid, sonicate for 5 minutes, shake for 15 minutes to dissolve, and add 0.01 mol/L hydrochloric acid to make exactly 100 mL. Filter this solution through a membrane filter with a pore size of NMT 0.5 μm and use the filtrate as the test solution. Separately, weigh accurately about 10 mg (potency) of doxycycline RS, add 6 mL of 0.01 mol/L hydrochloric acid, sonicate for 5 minutes to dissolve, make exactly 10 mL, and use this solution as the standard solution.

Packaging and storage Preserve in light-resistant, tight containers.

Doxycycline Hyclate Tablets
독시사이클린하이클레이트 정

Doxycycline Hyclate Tablets contain NLT 90.0% and NMT 120.0% of the labeled amount of doxycycline ($C_{22}H_{24}N_2O_8$: 444.44).

Method of preparation Prepare as directed under Tablets, with Doxycycline Hyclate Hydrate.

Identification The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

Water NMT 5.0% (0.2 g, volumetric titration, direct titration).

Dissolution Perform the test with 1 tablet of Doxycycline Hyclate Tablets at 75 revolutions per minute according to Method 2 under the Dissolution, using 900 mL of water as the dissolution medium, with the distance between the bottom edge of the stirring blade and the inside bottom of the flask being maintained at 4.5 ± 0.5 cm during the test. Take the dissolved solution after 90 minutes from the start of the test and filter. Discard the first 10 mL of the filtrate, pipet *V* mL of the subsequent filtrate, add the dissolution medium to make exactly V' mL, and use this solution as the test solution. Separately, weigh accurately an appropriate amount of doxycycline RS, dissolve it in the dissolution medium to make it the same concentration as the test solution, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at the absorbance maximum wavelength of about 276 nm as directed under the Ultraviolet-visible Spectroscopy, using the dissolution medium as the control solution. Doxycycline Hyclate Tablets meet the requirement when the dissolution rate at 90 minutes is NLT 85% (Q).

Dissolution rate (%) with respect to the labeled amount of doxycycline ($C_{22}H_{24}N_2O_8$)

$$= C_S \times \frac{A_T}{A_S} \times \frac{V'}{V} \times \frac{1}{C} \times 90000$$

Cs: Concentration [mg (potency)/mL] of the standard solution

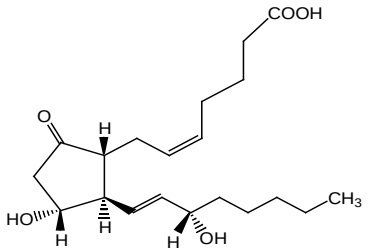
C: Labeled amount [mg (potency)] of doxycycline ($C_{22}H_{24}N_2O_8$) in 1 tablet

Uniformity of dosage units Meets the requirements.

Assay Perform the test as directed under the Assay under Doxycycline Hyclate Hydrate. Take NLT 20 Doxycycline Hyclate Tablets and powder them. Then, weigh accurately an appropriate amount of the powder, equivalent to about 100 mg (potency), according to the labeled potency of Doxycycline Hyclate Tablets, add 75 mL of 0.01 mol/L hydrochloric acid, sonicate for 5 minutes, shake for 15 minutes to dissolve, and add 0.01 mol/L hydrochloric acid to make exactly 100 mL. Filter this solution through a membrane filter with a pore size of NMT 0.5 μm and use the filtrate as the test solution. Separately, weigh accurately about 10 mg (potency) of doxycycline RS, add 6 mL of 0.01 mol/L hydrochloric acid, sonicate for 5 minutes to dissolve, make exactly 10 mL, and use this solution as the standard solution.

Packaging and storage Preserve in light-resistant, tight containers.

Dydrogesterone
디드로게스테론



$C_{21}H_{28}O_2$: 312.45

(8*S*,9*R*,10*S*,13*S*,14*S*,17*S*)-17-Acetyl-10,13-dimethyl-1,2,8,9,11,12,14,15,16,17-decahydrocyclopenta[a]phenanthren-3-one [*152-62-5*]

Dydrogesterone, when dried, contains NLT 98.0% and NMT 102.0% of dydrogesterone ($C_{21}H_{28}O_2$).

Description Dydrogesterone occurs as white or pale yellow crystals or a crystalline powder and is odorless.
It is freely soluble in chloroform, soluble in acetonitrile, sparingly soluble in methanol or in ethanol(95), slightly soluble in ether and practically insoluble in water.

Identification (1) To 5 mg of Dydrogesterone, add 5 mL of 4-methoxybenzaldehyde-acetic acid TS and 2 to 3 drops of sulfuric acid, and heat on a steam bath for 2 minutes; an orange color appears.

(2) Determine the absorption spectra of solutions of Dydrogesterone and dydrogesterone RS in methanol (1 in 200000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared spectra of Dydrogesterone and dydrogesterone RS, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Optical rotation $[\alpha]_D^{20}$: Between -47° and -50° (after drying 0.1 g, chloroform, 10 mL, 100 mm).

Melting point Between 167 and 171 ºC.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Dydrogesterone according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Related substances***—Dissolve 10 mg of Dydrogesterone in 200 mL of the mobile phase, and use this solution as the test solution. Pipet 1 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine each peak area of these solutions by the automatic integration method; the sum of the peak areas, other than the peak of dydrogesterone, obtained from the test solution, is not larger than the peak area of dydrogesterone obtained from the standard solution.

Operating conditions

Detector: An ultraviolet absorption spectrophotometer (wavelength: 280 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 μm in particle diameter).

Column temperature: A constant temperature of about 40 ℃.

Mobile phase: A mixture of water, ethanol(95) and acetonitrile (53 : 26 : 21).

Flow rate: Adjust the flow rate so that the retention time of dydrogesterone is about 12 minutes.

System suitability

Detection sensitivity: Adjust the detection sensitivity so that the peak height of dydrogesterone obtained from 10 μL of the standard solution is between 5 mm and 10 mm.

Selection of column: Dissolve 1 mg each of Dydrogesterone and progesterone in 20 mL of the mobile phase. Proceed with 10 μL of this solution under the above operating conditions. At this time, use a column from which dydrogesterone and progesterone are eluted in this order with the resolution between these peaks being NLT 8. In this case, use the wavelength of 265 nm for measurement.

Time span of measurement: About twice the retention time of dydrogesterone after the solvent peak.

Loss on drying NMT 0.5% (0.5 g, in vacuum, P_2O_5, 24 hours).

Ignition residue NMT 0.1% (1 g).

Assay Weigh accurately about 50 mg of Dydrogesterone, previously dried, and dissolve in methanol to make exactly 100 mL. Pipet 1 mL of this solution and add methanol to make exactly 100 mL. Determine the absorbance *A* of this solution at the absorbance maximum wavelength around 286 nm as directed under the Ultraviolet-visible Spectroscopy.

$$\text{Amount (mg) of dydrogesterone } (C_{21}H_{28}O_2) = \frac{A}{845} \times 100000$$

Packaging and storage Preserve in tight containers.

Dydrogesterone Tablets
디드로게스테론 정

Dydrogesterone Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of dydrogesterone ($C_{21}H_{28}O_2$: 312.45).

Method of preparation Prepare Dydrogesterone Tablets as directed under Tablets, with Dydrogesterone.

Identification (1) Take a portion of powdered Dydrogesterone Tablets, equivalent to 50 mg of dydrogesterone, add 50 mL of methanol, shake well to mix, and filter. Evaporate 5 mL of the filtrate to dryness on a steam bath. Perform the test as directed under the Identification (1) of Dydrogesterone with the residue.

(2) Take 1 mL of the filtrate and add methanol to make 200 mL. Determine the absorption spectrum of this solution as directed under the Ultraviolet-visible spectrophotometry; it exhibits a maximum at the wavelengths between 284 nm and 288 nm.

Dissolution Perform the test with 1 tablet of Dydrogesterone Tablets. Perform the test with 1 tablet of Dydrogesterone Tablets at 50 revolutions per minute according to Method 2 under the Dissolution, using 900 mL of water as the test solution. Take NLT 20 mL of the dissolved solution 30 minutes after starting the test, filter, and discard 10 mL of the first filtrate. Pipet *V* mL of the subsequent filtrate and add water to make *V′ mL* so that each mL contains about 50 μg of dydrogesterone according to the labeled amount. Use this solution as the test solution. Separately, dry dydrogesterone RS in a desiccator (in vacuum, phosphorus pentoxide) for 24 hours, weigh accurately 50 mg of dydrogesterone RS, dissolve in methanol to make exactly 100 mL. Pipet 1 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Measure the absorbances, A_T and A_S, of the test solution and the standard solution at the wavelength of 296 nm as directed under the Ultraviolet-visible Spectroscopy. Meets the requirements if the dissolution rate of Dydrogesterone Tablets in 30 minutes is NLT 80%.

$$\text{Dissolution rate (\%) of the labeled amount of dydrogesterone } (C_{21}H_{28}O_2) = W_S \times \frac{A_T}{A_S} \times \frac{1}{C} \times 9$$

W_S: Amount (mg) of dydrogesterone RS

C: Labeled amount (mg) of dydrogesterone ($C_{21}H_{28}O_2$) in 1 tablet

Uniformity of dosage units It meets the requirements when tested according to the following procedure. Powder 1 tablet of Dydrogesterone Tablets and add methanol to make exactly 100 mL. Shake well to mix until the tablet is fully disintegrated and filter through a membrane filter with a pore diameter of NMT 0.45 μm. Discard 20 mL of the first filtrate, pipet *V* mL of the subsequent filtrate, and add methanol to make exactly V′ mL so that each mL contains about 5 μg of dydrogesterone. Use this solution as the test solution. Perform the test as directed under the Assay below.

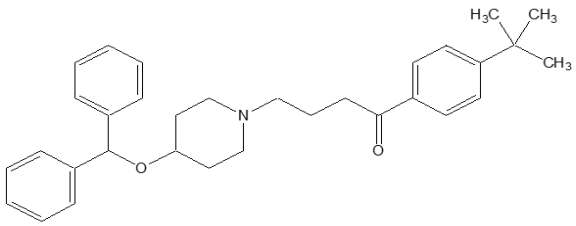
$$\text{Amount (mg) of dydrogesterone } (C_{21}H_{28}O_2) = \text{Amount (mg) of dydrogesterone RS} \times \frac{A_T}{A_S} \times \frac{V'}{V} \times \frac{1}{20}$$

Assay Weigh accurately the mass of NLT 20 Dydrogesterone Tablets and powder. Weigh accurately a portion of the powder, equivalent to about 10 mg of dydrogesterone ($C_{21}H_{28}O_2$), add 50 mL of methanol, shake well to mix, and add methanol to make exactly 100 mL. Filter this solution, discard the first 20 mL of the filtrate, take 5 mL of the subsequent filtrate, and add methanol to make exactly 100 mL. Use this solution as the test solution. Separately, dry dydrogesterone RS in a desiccator (in vacuum, phosphorus pentoxide) for 24 hours, weigh accurately 10 mg of dydrogesterone RS, and proceed in the same manner as in the preparation of the test solution. Use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at 286 nm as directed under the Ultraviolet-visible Spectroscopy.

$$\text{Amount (mg) of dydrogesterone } (C_{21}H_{28}O_2) = \text{Amount (mg) of dydrogesterone RS} \times \frac{A_T}{A_S}$$

Packaging and storage Preserve in tight containers.

Ebastine
에바스틴



Ebastine $C_{32}H_{39}NO_2$: 469.66

4-(4-Benzhydryloxypiperidin-1-yl)-1-(4-*tert*-butylphenyl)butan-1-one [*90729-43-4*]

Ebastine contains NLT 99.0% and NMT 101.0% of ebastine ($C_{32}H_{39}NO_2$), calculated on the anhydrous basis.

Description Ebastine occurs as white crystals or a crystalline powder.

It is very soluble in dichloromethane, slightly soluble in methanol, and practically insoluble in water.

Melting point—About 86 °C.

Identification Determine the infrared spectra of Ebastine and ebastine RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Purity (1) ***Sulfate***—Weigh 2.5 g of Ebastine and add 25 mL of dilute nitric acid and shake. Reflux with a reflux condenser for 10 minutes, cool and filter. Rinse the filter paper and the residue with a suitable amount of water, combine with the filtrate all together, dilute with water to make 50 mL, and use this solution as the test solution. Prepare the control solution with 0.53 mL of 0.005 mol/L sulfuric acid and 25 mL of dilute nitric acid to make 50 mL (NMT 0.01%).

(2) ***Related substances***—Keep the test solution and the standard solution of this test protected from light. Dissolve about 0.125 g of Ebastine in the mobile phase to make 50.0 mL, and use this solution as the test solution. Dissolve 5.0 mg of ebastine related substance III [4-(Diphenylmethoxy)piperidine] RS and 5.0 mg of ebastine related substance IV {1-[4-(1,1-Dimethylethyl) phenyl]-4-(4-hydroxypiperidine-1-yl)butan-1-one] RS in the mobile phase to make exactly 20 mL, pipet 1.0 mL of this solution, add the mobile phase to make exactly 100 mL and use this solution as the standard solution (1). Pipet 1.0 mL of the test solution, and add the mobile phase to make exactly 100 mL. Pipet 1.0 mL of this solution, add the mobile phase to make exactly 10 mL, and use this solution as the standard solution (2). Perform the test with 10 μL each of the test solution and the standard solution (2) as directed under the Liquid Chromatography according to the following conditions. Determine each peak area by the automatic integration method; any peak area of related substances I, II, III, IV, V, VI, and VII in the automatic integration method obtained with the test solution is NMT the area of the major peak with the standard solution (2) (0.1%), the peak area of the other related substances are NMT that of the major peak from the standard solution (2) (0.1%). The total area of all related substances is not greater than 4 times the area of the major peak area from the standard solution (2) (0.4%). Exclude any peak being NMT 0.5 times the area of the major peak with the standard solution (2).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 210 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25cm in length, packed with nitrile silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of phosphate buffer and acetonitrile (65 : 35). Adjust the percentage of acetonitrile so that the retention time of ebastine is about 110 minutes.

Flow rate: 1 mL/min

System suitability

System performance: Proceed with 10 μL of the test solution under the above operating conditions; the relative retention time of related substances I, II, III, IV, V, VI, and VII with reference to ebastine are 0.04, 0.05, 0.20, 0.22, 0.42, 0.57 and 1.14, respectively. Proceed with 10 μL of the standard solution (1) under the above operating conditions; the resolution between the peaks of related substance IV and related substance III is NLT 2.0.

Time span of measurement: About 1.4 times the retention time of ebastine.

Phosphate buffer—Adjust pH of 0.06 w/v% phosphoric acid with 4 w/v% sodium hydroxide to pH 5.0.

Water NMT 0.5% (0.5 g, volumetric titration, direct titration).

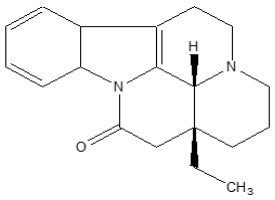
Residue on ignition 0.1% (1.0 g).

Assay Weigh accurately about 0.35 g of Ebastine, dissolve it in 50 mL of acetic acid(100) and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 46.97 mg of $C_{32}H_{39}NO_2$

Packaging and storage Preserve in light-resistant, well-closed containers.

(-)Eburnamonine
(-)에버나모닌



$C_{19}H_{22}N_2O$: 294.39

(-)-Eburnamonin-14(15*H*)-one, [*474-00-0*]

(-)Eburnamonine, when dried, contains NLT 99.0% and NMT 101.0% of (-)eburnamonine ($C_{19}H_{22}N_2O$: 294.39).

Description (-)Eburnamonine occurs as a white crystalline powder. It is practically insoluble or insoluble in water, soluble in ethanol, and very soluble in chloroform, but slightly soluble in ether. It dissolves in inorganic acid.

Melting point— Between 172 and 174 °C.

Identification (1) To a solution of (-)Eburnamonine in ether, add dehydrated ethanol solution containing phosphoric acid to form a white precipitate of eburnamonine phosphate. Filter this precipitate and recrystallize this

with ethanol and measure the melting point; the melting point is between 255 and 258 ℃.

(2) Pass a hydrogen chloride gas through the solution of (-)Eburnamonine in ether to form a white precipitate.

(3) Weigh about 25 mg each of (-)Eburnamonine and (-)eburnamonine RS, dissolve each in 5 mL of ethyl acetate, and use these solutions as the test solution and the standard solution, respectively. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL of each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography (previously sprayed with 0.1 mol/L sodium hydroxide solution and dried for 20 minutes at 105 ℃). Next, develop the plate with a mixture of acetone and methanol (1 : 1) as the developing solvent to a distance of about 15 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm) or spray sulfuric acid and heat it, the colors (blue) and R_f values of the spots obtained from the test solution and the standard solution are the same.

(4) Determine the absorption maxima at wavelengths of 299 to 301 nm, 292 to 294 nm, 263 nm, 239 to 241 nm, and 202 to 206 nm under a solution of (-)Eburnamonine in 0.01 mol/L hydrochloric acid (1 in 100000).

Optical rotation $[a]_D^{20}$: Between -88° and -104° (after drying, 1 g, chloroform, 100 mL).

Purity ***Heavy metals***—Weigh about 1.0 g of (-)Eburnamonine and perform the test according to Method 2. Prepare the control solution with 1.0 mL of lead standard solution (NMT 10 ppm).

Loss on drying NMT 0.5% (1.0 g, 100 ℃, constant mass).

Residue on ignition NMT 0.1% (1.0 g).

Assay Weigh accurately about 0.1 g of (-)Eburnamonine, previously dried, and put it in a 100-mL volumetric flask. Dissolve in 0.1 mol/L hydrochloric acid-ethanol solution to make 100 mL. Take 1.0 mL of this solution and dilute it with 0.1 mol/L hydrochloric acid-ethanol solution to make 100 mL. Perform the test according to the Ultraviolet-visible Spectroscopy and measure the absorbance *A* at the wavelength of 240 nm.

$$\text{Amount (mg) of (-)eburnamonine } (C_{19}H_{22}N_2O) = \frac{A}{725} \times 100000$$

Packaging and storage Preserve in tight containers.

Econazole Nitrate and Triamcinolone Acetonide Ointment
에코나졸질산염·트리암시놀론아세토니드 연고

Econazole Nitrate and Triamcinolone Acetonide Ointment contains NLT 90.0% and NMT 110.0% of the labeled amounts of econazole nitrate ($C_{18}H_{15}Cl_3N_2O \cdot HNO_3$: 444.70) and triamcinolone acetonide ($C_{24}H_{31}FO_6$: 434.49).

Method of preparation Prepare as directed under Ointments, with Econazole Nitrate and Triamcinolone Acetonide.

Identification Weigh an amount of Econazole Nitrate and Triamcinolone Acetonide Ointment, equivalent to 10 mg of econazole nitrate (1 mg of triamcinolone acetonide), dissolve in 10 mL of methanol, and use this solution as the test solution. Separately, use a 0.1% methanol solution of econazole nitrate and a 0.01% methanol solution of triamcinolone acetonide as the standard solutions. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 1 μL each of the test solution and the standard solution onto a thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of toluene, ethanol, ethyl acetate and 85% formic acid (50 : 20 : 20 : 5) as the developing solvent, and air-dry the plate. Examine the plate under ultraviolet light (principal wavelength: 254 nm) or spray evenly with platinic acid iodide-potassium iodide TS; the colors and R_f values of the spots obtained from the test solution and the standard solution are the same.

Assay (1) ***Econazole nitrate—***Weigh accurately an amount of Econazole Nitrate and Triamcinolone Acetonide Ointment equivalent to about 40 mg of econazole nitrate ($C_{18}H_{15}Cl_3N_2O \cdot HNO_3$) according to the labeled amount, add a mixture of methanol and water (40 : 60) to make 100 mL, filter, and use the filtrate as the test solution. Separately, weigh accurately about 40 mg of econazole nitrate RS, add a mixture of methanol and water (40 : 60) to make 100 mL, and use this solution as the econazole nitrate standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas of econazole nitrate, A_T and A_S, for each solution.

$$\text{Amount (mg) of econazole nitrate } (C_{18}H_{15}Cl_3N_2O \cdot HNO_3) = \text{Amount (mg) of econazole nitrate RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 225 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 10 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 μm in particle diameter).

Column temperature: A constant temperature of about 35 °C.

Mobile phase: Control the mixing ratio of mobile phase A and mobile phase B stepwise or via the gradient elution as follows.

Mobile phase A: Dissolve 0.77 g of ammonium acetate in water to make 1000 mL. Add 200 mL of methanol to 800 mL of this solution.

Mobile phase B: A mixture of acetonitrile and methanol (60 : 40).

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 ~ 25	60 → 10	40 → 90
25 ~ 27	10	90
27 ~ 27.1	10 → 60	90 → 40
27.1 ~ 30	60	40

Flow rate: 1.5 mL/min

System suitability

System performance: Proceed with 10 μL of the standard solution according to the above conditions; the symmetry factor is NMT 1.5.

System repeatability: Repeat the test 5 times with 10 μL each of the standard solution according to the above operating conditions; the relative standard deviation of the peak areas of Piroxicam is NMT 0.73%.

(2) ***Triamcinolone acetonide*—**Weigh accurately an amount of Econazole Nitrate and Triamcinolone Acetonide Ointment equivalent to about 5 mg of triamcinolone acetonide ($C_{24}H_{31}FO_6$) according to the labeled amount, add methanol to make 100 mL, filter, and use the filtrate as the test solution. Separately, weigh accurately about 50 mg of triamcinolone acetonide RS and add methanol to make 100 mL. Take 10.0 mL of this solution, add methanol to make 100 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions, and determine the peak areas of triamcinolone acetonide, A_T and A_S, for each solution.

$$\text{Amount (mg) of triamcinolone acetonide } (C_{24}H_{31}FO_6) = \text{Amount (mg) of triamcinolone acetonide RS} \times \frac{A_T}{A_S} \times \frac{1}{10}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.0 mm in internal diameter and 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 to 10 μm in particle diameter).

Mobile phase: A mixture of water, acetonitrile and acetic acid(100) (59 : 40 : 1).

Flow rate: 1.0 mL/min

Packaging and storage Preserve in tight containers.

Econazole Nitrate, Triamcinolone Acetonide and Gentamicin Sulfate Cream
에코나졸질산염·트리암시놀론아세토니드·겐타마이신황산염 크림

Econazole Nitrate, Triamcinolone Acetonide and Gentamicin Sulfate Cream contains NLT 90.0% and NMT 110.0% of the labeled amounts of econazole nitrate ($C_{18}H_{15}Cl_3N_2O \cdot HNO_3$: 444.70) and triamcinolone acetonide ($C_{24}H_{31}FO_6$: 434.50), and NMT 90.0% and NLT 120.0% of the labeled amount of gentamicin sulfate.

Method of preparation Prepare as directed under Creams, with Econazole Nitrate, Triamcinolone Acetonide and Gentamicin Sulfate.

Identification (1) ***Econazole nitrate and triamcinolone acetonide*—**Weigh an amount of Econazole Nitrate, Triamcinolone Acetonide and Gentamicin Sulfate Cream equivalent to 10 mg of econazole nitrate, dissolve in 10 mL of methanol, and use this solution as the test solution. Separately, use a 0.1% methanol solution of econazole nitrate RS and a 0.01% methanol solution of triamcinolone acetonide RS as the standard solutions. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solutions onto a thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of toluene, ethanol, ethyl acetate and 85% formic acid (55 : 20 : 20 : 5) as the developing solvent, and air-dry the plate. Spray evenly hexachloroplatinic (IV) acid-potassium iodide TS on the plate and examine under ultraviolet light; the R_f values and the colors of the spots obtained from the test solution and the standard solution are the same.

(2) ***Gentamicin sulfate***—(1) Dissolve 5 g of Econazole Nitrate, Triamcinolone Acetonide and Gentamicin Sulfate Cream in 10 mL of water, then add 2 mL of α-naphtholethanol solution (1 in 500). Gently superimpose the solution onto 1 mL of sulfuric acid; a purplish blue color develops at the boundary layer.

(3) Weigh an amount of Econazole Nitrate, Triamcinolone Acetonide and Gentamicin Sulfate Cream equivalent to 0.1 g of gentamicin sulfate, add 0.1 mol/L of phosphate buffer solution (pH 8.0) to make 100 mL, and use this solution as the test solution. Separately, weigh 10 mg of gentamicin sulfate RS, add 0.1 mol/L

phosphate buffer solution (pH 8.0) to make 10 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 50 μL each of the test solution and the standard solution onto a thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Develop with a mixture of chloroform, methanol and strong ammonia water (2 : 1 : 1) as the developing solvent, and air-dry the plate. Place the plate in an appropriate container containing between 2 g and 4 g of iodine crystals, close the lid, and let stand for 3 to 5 minutes; the spots obtained from the test solution and the standard solution have the same R_f value and color.

Assay (1) ***Econazole nitrate*—**Weigh accurately an amount of Econazole Nitrate, Triamcinolone Acetonide and Gentamicin Sulfate Cream equivalent to about 40 mg of econazole nitrate ($C_{18}H_{15}Cl_3N_2O \cdot HNO_3$) according to the labeled amount, add a mixture of methanol and water (40 : 60) to make 100 mL, filter, and use the filtrate as the test solution. Separately, weigh accurately about 40 mg of econazole nitrate RS, add a mixture of methanol and water (40 : 60) to make 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas of econazole nitrate from each solution, A_T and A_S, respectively.

Amount (mg) of econazole nitrate ($C_{18}H_{15}Cl_3N_2O \cdot HNO_3$)
= Amount (mg) of econazole nitrate RS $\times \frac{A_T}{A_S}$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 225 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 10 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 μm in particle diameter).

Column temperature: A constant temperature of about 35 °C.

Mobile phase: Control the mixing ratio of mobile phase A and mobile phase B stepwise or via the gradient elution as follows.

Mobile phase A: Dissolve 0.77 g of ammonium acetate in water to make 1000 mL. Add 200 mL of methanol to 800 mL of this solution.

Mobile phase B: A mixture of acetonitrile and methanol (60 : 40).

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 ~ 25	60 → 10	40 → 90
25 ~ 27	10	90
27 ~ 27.1	10 → 60	90 → 40
27.1 ~ 30	60	40

Flow rate: 1.5 mL/min

System suitability

System performance: Proceed with 10 μL of the standard solution according to the above conditions; the symmetry factor is NMT 1.5.

System repeatability: Repeat the test 5 times with 10 μL each of the standard solution according to the above operating conditions; the relative standard deviation of the peak areas of Piroxicam is NMT 0.73%.

(2) ***Triamcinolone acetonide*—**Weigh accurately an amount of Econazole Nitrate, Triamcinolone Acetonide and Gentamicin Sulfate Cream equivalent to about 5 mg of triamcinolone acetonide ($C_{24}H_{31}FO_6$), add methanol to make 100 mL, filter, and use the filtrate as the test solution. Separately, weigh accurately about 50 mg of triamcinolone acetonide RS and add methanol to make 100 mL. Take 10.0 mL of this solution, add methanol to make 100 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas of triamcinolone acetonide, A_T and A_S, in each solution.

Amount (mg) of triamcinolone acetonide ($C_{24}H_{31}FO_6$)
= Amount (mg) of triamcinolone acetonide RS $\times \frac{A_T}{A_S} \times \frac{1}{10}$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.0 mm in internal diameter and about 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 to 10 μm in particle diameter).

Mobile phase: A mixture of water, acetonitrile and acetic acid(100) (59 : 40 : 1).

Flow rate: 1.0 mL/min

(3) ***Gentamicin sulfate*—**(1) (A) Cylinder plate method ① Medium (a) Medium for seed and base layer

Peptone	6.0 g
Glucose	1.0 g
Yeast extract	3.0 g
Sodium chloride	10.0 g
Meat extract	1.5 g
Agar	13.0 ~ 20.0 g

Weigh the above ingredients, add purified water to make 1000 mL, and adjust the pH after sterilization of the solution so that it will be 7.8 to 8.0.

(b) Agar medium for transferring test organism: Use the medium in (A)→② (b) (ii) ⓑ under the Microbial Assays for Antibiotics.

② Test organism: Use *Staphylococcus epidermidis*

ATCC 12228 as the test organism.

③ Standard solution: Weigh an appropriate amount of gentamicin RS, dry for 3 hours at 110 ℃ under vacuum (NMT 0.67 kPa), then weigh accurately an amount equivalent to 5 mg (potency) and dissolve in 0.1 mol/L phosphate buffer solution (pH 8.0) to prepare a standard stock solution containing 1 mg (potency) per mL. Pipet an appropriate amount of this standard stock solution, dilute with the above buffer solution to contain 4.0 μg and 1.0 μg (potency) per mL, and use these solutions as the standard solutions.

④ Test solution: Weigh accurately an amount of Econazole Nitrate, Triamcinolone Acetonide and Gentamicin Sulfate Cream equivalent to about 25 mg (potency), dissolve in 0.1 mol/L phosphate buffer solution (pH 8.0) to prepare a solution containing 1 mg (potency) per mL; pipet an appropriate amount of this solution and dilute with the above buffer solution to contain 4.0 μg and 1.0 μg (potency) per mL, and use these solutions as the test solutions.

(B) Standard curve method ① Medium: Prepare according to (A) ① under the Microbial assays for antiobiotics.

② Test organism: Follow (A) ② under Microbial assays for antiobiotics.

③ Standard solution: Pipet an appropriate amount of the standard stock solution of (A) ③ under Microbial Assays for Antibiotics, dilute to contain 0.064 μg (potency), 0.080 μg (potency), 0.100 μg (potency), 0.125 μg (potency) and 0.156 μg (potency) per mL with 0.1 mol/L phosphate buffer solution (pH 8.0), and use these solutions as the standard solutions. Prepare a solution containing 0.100 μg (potency) per mL and use this as the standard intermediate diluent.

④ Test solution: Pipet an appropriate amount of the solution from (A) ④ under Microbial Assays for Antibiotics, and dilute to contain 0.10 μg (potency) per mL with 0.01 mol/L phosphate buffer solution (pH 8.0), and use this solution as the test solution.

(2) Content of gentamicin C1, etc. (liquid chromatography) Weigh an appropriate amount of Econazole Nitrate, Triamcinolone Acetonide and Gentamicin Sulfate Cream and gentamicin RS and dissolve in water to prepare solutions containing 0.65 mg per mL; take 10.0 mL of the solution, add 5 mL of isopropanol and 4 mL of *o*-phthaldehyde, shake to mix, add isopropanol to make 25 mL, warm for 15 minutes on a steam bath at 60 ℃, cool, and use as the test solution and the standard solution, respectively. Using the test solution and the standard solution, perform the test as directed under the Liquid Chromatography under the following conditions, and measure the peak areas of gentamicin A_T, and A_S for each solution (Gentamicin C_1: 25 to 50%, Gentamicin C_{1a}: 10 to 35%, Gentamicin C_2 and C_{2a}: 25 to 55%).

Respective content (%) of Gentamicin C_1, Gentamicin C_{1a}, Gentamicin C_{2a} and Gentamicin C_2

$$= \frac{A_T}{A_S} \times 100$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 330 nm).

Column: A stainless steel column about 5 mm in internal diameter and about 10 cm in length, packed with octadecylsilanized porous silica gel for liquid chromatography (5 to 10 μm in particle diameter).

Mobile phase: Add 250 mL of water and 50 mL of acetic acid(100) to 700 mL of methanol, shake to mix, and dissolve 5 mg of sodium 1-heptanesulfonate in this solution.

Flow rate: About 1.5 mL/min.

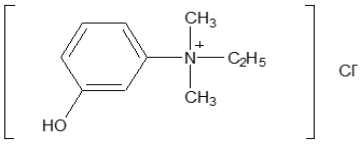
System suitability

System performance: K as determined from the Gentamicin C_1 peak is 2 to 7, the number of theoretical plates determined from the Gentamicin C_2 peak is NLT 1200, and the resolution R between the two peaks is NLT 1.25. Test according to the above conditions; Gentamicin C_1, Gentamicin C_{1a}, Gentamicin C_{2a} and Gentamicin C_2 are eluted in this order.

System repeatability: The relative standard deviation for repeatability is NMT 2.0.

Packaging and storage Preserve in tight containers.

Edrophonium Chloride
에드로포늄염화물



Edrophonium Chloride $C_{10}H_{16}ClNO$: 201.69
N-Ethyl-3-hydroxy-*N*,*N*-dimethylbenzenaminium chloride [*116-38-1*]

Edrophonium Chloride, when dried, contains NLT 98.0% and NMT 101.0% of edrophonium chloride ($C_{10}H_{16}ClN$).

Description Edrophonium Chloride occurs as white crystals or a crystalline powder and is odorless.
It is very soluble in water, freely soluble in ethanol(99.5) or acetic acid(100), and practically insoluble in acetic anhydride or ether.
It is hygroscopic.
It is gradually colored by light.

Identification (1) To 5 mL of an aqueous solution of Edrophonium Chloride (1 in 100), add one drop of

iron(III) chloride TS; the solution exhibits a pale purple color.

(2) Determine the absorption spectra of the solutions of Edrophonium Chloride and edrophonium chloride RS in 0.1 mol/L hydrochloric acid (1 in 20000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) An aqueous solution of Edrophonium Chloride (1 in 50) responds to the Qualitative Analysis for chloride.

Melting point Between 166 and 171 ℃ (with decomposition).

pH Dissolve 1.0 g of Edrophonium Chloride in 10 mL of water; the pH of this solution is between 3.5 and 5.0.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Edrophonium Chloride in 10 mL of water; the solution is clear and colorless.

(2) ***Heavy metals*—**Proceed with 1.0 g of Edrophonium Chloride according to Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Arsenic*—**Proceed with 1.0 g of Edrophonium Chloride according to Method 1 and perform the test (NMT 2 ppm).

(4) ***Related substances***—Dissolve about 0.50 g of Edrophonium Chloride in 10 mL of ethanol(95) and use this solution as the test solution. Pipet 1 mL of the test solution, and add ethanol(95) to make exactly 100 mL. Pipet 3 mL of this solution, add ethanol(95) to make exactly 10 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of methanol, chloroform and ammonia water(28) (16 : 4 : 1) to a distance of about 10 cm, and air-dry the plate. Observe the plate under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot obtained from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 0.2% (1 g, in vacuum, phosphorus pentoxide, 3 hours).

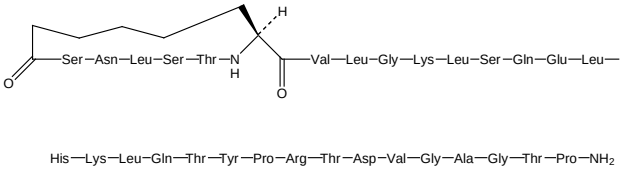
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.2 g of Edrophonium Chloride, previously dried, dissolve in 100 mL of a mixture of acetic anhydride and acetic acid(100) (7 : 3), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 20.169 mg of $C_{10}H_{16}ClNO$

Packaging and storage Preserve in light-resistant, tight containers.

Elcatonin
엘카토닌



Elcatonin $C_{148}H_{244}N_{42}O_{47}$: 3363.77
N-{[(3*S*,6*S*,9*S*,12*S*)-3-Amino-6-(2-amino-2-oxoethyl)-15-[(1*R*)-1-hydroxyethyl]-12-(hydroxymethyl)-9-isobutyl-4,7,10,13,16,24-hexaoxo-1-oxa-5,8,11,14,17-pentaazacyclotetracosan-18-yl]carbonyl}-L-valyl-L-le ucylglycyl-L-lysyl-L-leucyl-L-seryl-L-glutaminyl-L-α-glutamyl-L-leucyl-L-histidyl-L-lysyl-L-leucyl-L-glutaminyl-L-threonyl-L-tyrosyl-L-prolyl-L-arginyl-L-threonyl-L-α-aspartyl-L-valylglycyl-L-alanylglycyl-L-threonyl-L-prolinamide [*60731-46-6*]

Elcatonin contains NLT 5000 and not more 7000 of elcatonin units per mg of peptide, calculated on the anhydrous basis.

Description Elcatonin occurs as a white powder.
It is very soluble in water, freely soluble in ethanol(95), and practically insoluble in acetonitrile.
It is hygroscopic.
The pH of aqueous solution of Elcatonin (1 in 500) is between 4.5 and 7.0.

Identification Determine the absorption spectra of the solutions of 5 mg each of Elcatonin and elcatonin RS in 5 mL of water, respectively, as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

Constituent amino acids Put about 1 mg of Elcatonin into a test tube for hydrolysis, dissolve in phenolic acid TS, replace the air inside with nitrogen, seal the tube in vacuum, and heat at 110±2 °C for 24 hours. After cooling, open the tube, evaporate the hydrolysate to dryness in vacuum, dissolve the residue in about 1 mL of 0.02 mol/L hydrochloric acid TS, and use this solution as the test solution. Separately weigh exactly 1.33 mg of L-aspartic acid, 1.19 mg of L-threonine, 1.05 mg of L-serine, 1.47 mg of L-glutamic acid, 1.15 mg of L-proline, 0.75 mg of glycine, 0.89 mg of L-alanine, 1.17 mg of L-valine, 1.89 mg of L-2-aminosuberic acid, 1.31 mg of L-leucine, 1.81 mg of L-tyrosine, 1.83 mg of L-lysine hy-

drochloride, 2.10 mg of L-histidine hydrochloride monohydrate and 2.11 mg of L-arginine hydrochloride, dissolve them in 0.02 mol/L hydrochloric acid TS to make exactly 50 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions; 14 peaks of amino acids obtained from the test solution appear. Molar ratios of respective constituent amino acids to alanine are as follows: between 1.7 and 2.2 for aspartic acid, between 3.5 and 4.2 for threonine, between 2.4 to 3.0 for serine, between 2.7 and 3.2 for glutamic acid, between 1.7 and 2.2 for proline, between 2.7 and 3.2 for glycine, between 1.6 and 2.2 for valine, between 0.8 and 1.2 for 2-aminosuberic acid, between 4.5 and 5.2 for leucine, between 0.7 and 1.2 for tyrosine, between 1.7 and 2.2 for lysine, between 0.8 and 1.2 for histidine, and between 0.7 and 1.2 for arginine.

Operating conditions

Detector: Visible spectrophotometer (wavelengths: 440 nm and 570 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 8 cm in length, packed with strongly acidic ion exchange resin for liquid chromatography composed of a sulfonated styrene-divinylbenzene copolymer (3 μm in particle diameter).

Column temperature: Varied between 50 and 65 °C.

Chemical reaction vessel temperature: A constant temperature of about 130 °C.

Color developing time: About 1 minute.

Mobile phase: Buffer solutions A, B, C and D, with sodium ion concentrations of 0.10 mol/L, 0.135 mol/L, 1.26 mol/L and 0.20 mol/L, respectively; provided that the ion concentration is varied stepwise from 0.10 mol/L to 1.26 mol/L with the buffer solutions A, B, C and D.

Composition of buffer solutions (g)				
	A	B	C	D
Citric acid	8.85	7.72	6.10	-
Sodium citrate monohydrate	3.87	10.05	26.67	-
Sodium hydroxide dihydrate	-	-	2.50	8.00
Sodium chloride	3.54	1.87	54.35	-
Ethanol	60.0 mL	-	-	60.0 mL
Thiodiglycol	5.0 mL	5.0 mL	-	-
Purified water	A suitable amount	A suitable amount	A suitable amount	A suitable amount
Total volume	1000 mL	1000 mL	1000 mL	1000 mL

Reaction reagent: Mix 407 g of lithium acetate dihydrate, 245 mL of acetic acid(100) and 801 mL of 1-methoxy-2-propanol, add water to make 2000 mL, stir for about 20 minutes to mix while passing nitrogen, and use this solution as the solution A. Separately, add 77 g of ninhydrin and 0.134 g of sodium borohydride to 1957 mL of 1-methoxy-2-propanol, stir for 20 minutes to mix while passing nitrogen, and use this solution as the solution B. Mix the solution A and solution B before use.

Flow rate of mobile phase: Adjust so that the retention time of arginine is about 75 minutes.

Flow rate of reaction reagent: About 0.2 mL/min.

Selection of column: Proceed with 10 μL of the standard solution according to the above conditions; use a column from which aspartic acid, threonine, serine, glutamic acid, proline, glycine, alanine, valine, 2-aminosuberic acid, leucine, tyrosine, lysine, histidine and arginine are eluted in this order with complete separation of each peak.

Purity (1) ***Acetic acid***—Weigh accurately about 3 mg to 6 mg of Elcatonin quickly under conditions of 25±2 °C and 50±5% relative humidity, add exactly 1 mL of the internal standard solution to mix, and use this solution as the test solution. Separately, weigh accurately about 0.5 g of acetic acid(100), and add the internal standard solution to make exactly 100 mL. Pipet 5 mL of the resulting solution, add the internal standard solution to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the peak area ratios, Q_T and Q_S, of acetic acid to that of the internal standard; the amount of acetic acid is NMT 7.0%.

$$\text{Content (\%) of acetic acid } (CH_3COOH) = \frac{Q_T}{Q_S} \times \frac{W_{ST}}{W_{SA}} \times 50$$

W_{ST}: Amount (g) of acetic acid(100) taken
W_{SA}: Amount (mg) of sample taken

Internal standard solution—An aqueous solution of citric acid monohydrate (1 in 4000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 210 nm).

Column: A stainless steel column about 4.0 mm in internal diameter and 6 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: Dissolve 13.2 g of monobasic ammonium phosphate in 900 mL of water, adjust the pH to 2.5 with phosphoric acid, and add water to make 1000

mL.

Flow rate: Adjust the flow rate so that the retention time of acetic acid is about 4 minutes.

System suitability

System performance: Proceed with 20 μL of the standard solution according to the above conditions; acetic acid and citric acid are eluted in this order with the resolution being NLT 2.0.

(2) ***Related substances***—Dissolve 1.0 mg of Elcatonin in 1 mL of a mixture of trichloroacetic acid and acetonitrile (2 : 1), and use this solution as the test solution. Pipet 0.3 mL of the resulting solution, add a mixture of trichloroacetic acid and acetonitrile (2 : 1) to make 10 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine each peak area as directed in the automatic integration method; the sum of the peak areas other than elcatonin in the test solution is not greater than the peak area of elcatonin in the standard solution, and each peak area other than elcatonin in the test solution is not greater than one-third of the peak area of elcatonin in the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 225 nm).

Column: A stainless steel column about 4 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: A mixture of trifluoroacetic acid TS and acetonitrile (change the ratio from 85 : 15 to 55 : 45 in 30 minutes).

Flow rate: Adjust the flow rate so that the retention time of elcatonin is about 25 minutes.

System suitability

Detection sensitivity: Adjust the detection sensitivity so that the peak height of elcatonin obtained from 10 μL of the standard solution is between 50 mm and 200 mm.

System performance: Dissolve 2 mg of Elcatonin in 200 μL of trypsin TS for test of elcatonin. Warm this solution at 37 °C for 1 hour, and add one drop of acetic acid(100), and heat at 95 °C for 1 minute. To 10 μL of this solution, add 50 μL of the test solution, and mix it. Proceed with 10 μL of this solution according to the above operating conditions; the resolution between the peak of elcatonin and the peak which is eluted immediately before the peak of elcatonin is NLT 2.0, and the retention time of elcatonin is about 25 minutes.

Time span of measurement: A range in which the gradient elution appearing on the chromatogram is regularly changing after the solvent peak.

Water Weigh accurately about 1 to 3 mg of Elcatonin quickly and perform the test as directed under the coulometric titration under the Water; it is NMT 8.0%. It should be weighed under conditions of 25±2 °C and 50±5% relative humidity.

Nitrogen content Weigh accurately 15 to 20 mg of Elcatonin quickly under the conditions of 25±2 °C and 50±5% relative humidity, and perform the test as directed under the Nitrogen Determination; the amount of nitrogen (N: 14.01) is NLT 16.1% and NMT 18.7%, calculated on the anhydrous and residual acetic acid-free basis.

Assay (i) Animals: Select healthy male Sprague-Dawley rats each weighing between 90 g and 110 g. Keep the rats for NLT 3 days before use, providing an appropriate uniform diet and water.

(ii) Solution for elcatonin: Dissolve 2.72 g of sodium acetate trihydrate in water to make 200 mL, add 0.2 g of bovine serum albumin, and adjust the pH to 6.0 with acetic acid(100). Prepare before use.

(iii) Standard solution: Dissolve elcatonin RS in the solution for elcatonin to make two standard solutions: the high-dose standard solution, S_H, containing exactly 0.075 unit in each mL, and the low-dose standard solution, S_L, containing exactly 0.0375 unit in each mL.

(iv) Test solution: Weigh accurately 0.5 to 2.0 mg of Elcatonin quickly under conditions of 25±2 °C and 50±5% relative humidity, and dissolve in the solution for elcatonin to make two test solutions: the high-dose test solution, T_H, containing the units per mL equivalent to S_H and the low-dose test solution, T_L, containing the units per mL equivalent to S_L.

(v) Deproteinizing solution for elcatonin: Dissolve 160 g of trichloroacetic acid and 30.6 g of strontium chloride in water to make 3600 mL.

(vi) Procedure: Divide the animals into 4 equal groups of NLT 10 animals each. Withhold all food for 18 to 24 hours before the injections, and also withhold water during the assay until the final blood sample is taken. Handle the animals with care in order to avoid undue excitement.

Inject exactly 0.2 mL each of the standard solution and the test solution into the tail vein of each animal as indicated in the following regimen:

First Group	S_H	Third Group	T_H
Second Group	S_L	Fourth Group	T_L

At 1 hour after the injection, take a sufficient blood sample to perform the test from the carotid vein of each animal under ether anesthesia, centrifuge the blood samples to separate serum, and determine the serum calcium according to the following (G).

(vii) Serum calcium determination: Pipet 0.3 mL of the serum, add the deproteinizing solution for elcatonin to make exactly 3 mL, mix well, centrifuge, and use the clear supernatant as the test solution for calcium determination. Separately, pipet 1 mL of calcium standard solu-

tion for the Atomic Absorption Spectroscopy, and add a solution of sodium chloride (17 in 2000) to make exactly 50 mL. Use this solution as the standard solution for calcium determination. Determine the absorbances, A_T and A_S, of the test solution and standard solution as directed under the Atomic Absorption Spectroscopy according to the following conditions. Determine the absorbance, A_0, of a solution obtained in the same manner used for preparation of the standard solution, but with 1 mL of water.

Amount (mg) of calcium (Ca) in 100 mL of the serum

$$= 0.01\frac{A_T - A_0}{A_S - A_0} \times 10 \times 100$$

Gas: Air–acetylene
Lamp: Calcium hollow cathode lamp
Wavelength: 422.7 nm

(viii) Calculation: Amounts of calcium in 100 mL of the serum obtained with S_H, S_L, T_H and T_L in (G) are denoted by y_1, y_2, y_3 and y_4, respectively. Sum up y_1, y_2, y_3 and y_4 of each group to obtain Y_1, Y_2, Y_3 and Y_4, respectively.

Units per mg of peptide, calculated on the anhydrous and residual acetic acid-free basis.

= Anti log M × (units per mL of high-dose standard solution)$\times \frac{b}{a}$

$M = 0.3010 \times \frac{Y_a}{Y_b}$

$Y_a = -Y_1 - Y_2 + Y_3 + Y_4$

$Y_b = Y_1 - Y_2 + Y_3 - Y_4$

a: Amount (mg) of sample taken

$$\times \frac{100 - [Content\ (\%)\ of\ water + content\ (\%)\ of\ Acetic\ acid]}{100}$$

b: Total volume (mL) of the high-dose test solution prepared by dissolving the sample with solution for elcatonin

F' calculated by the following equation is smaller than F shown in the table against n with which s^2 is calculated. When calculate L (P = 0.95) according to the following equation, L is NMT 0.20. If F' exceeds F, or if L exceeds 0.20, repeat the test, increasing the number of animals or arranging the assay conditions so that F' is NMT F and L is NMT 0.20.

$$F' = \frac{(-Y_1 + Y_2 + Y_3 - Y_4)^2}{4fs^2}$$

f: Number of the animals of each group

$$s2 = \frac{\sum y^2 - \frac{Y}{f}}{n}$$

$\sum y^2$: The sum of squares of y_1, y_2, y_3 and y_4 in each group

$$Y = Y_1^2 + Y_2^2 + Y_3^2 + Y_4^2$$

$$n = 4(f\text{-}1)$$

$$L = 2\sqrt{(C-1)(CM^2 + 0.09062)}$$

$$C = \frac{Y_b^2}{Y_b^2 - 4fs^2t^2}$$

t^2: Value shown in the following table against n used to calculate s^2

n	$t^2 = F$	n	$t^2 = F$	n	$t^2 = F$
1	161.45	13	4.667	25	4.242

Packaging and storage Preserve in tight containers and store at below 8 °C.

Elcatonin Injection
엘카토닌 주사액

Elcatonin Injection is an aqueous injection and contains NLT 80.0% and NMT 125.0% of the labeled amount of elcatonin units.

Method of preparation Prepare as directed under Injections, with Elcatonin.

Description Elcatonin Injection occurs as a clear, colorless liquid.

Identification (1) Take 12 mL of Elcatonin Injection, evaporate to dryness on a steam bath, dissolve in 3 mL of water, and use this solution as the test solution. Add 1 mL of alkaline copper TS to the test solution, shake to mix, and allow to stand for 10 minutes. To this solution, add 0.2 mL of diluted Folin TS (1 in 2) and heat on a steam bath for 3 minutes; the solution exhibits a pale blue color.

(2) Perform the test with Elcatonin Injection as directed under Assay; the test group exhibits NLT 20% serum calcium reduction compared to the control group. The test animals are divided into 2 groups with 5 animals, respectively: the test group and control group. For the test group, Prepare the test solution by pipetting 0.5 mL of Elcatonin Injection and diluting in solution for elcatonin to obtain a solution having known a concentration of 0.1 elcatonin unit per mL. Use a solution for elcatonin vehicle as a control solution. Inject 0.2 mL of each of these solutions into the tail vein.

pH Between 5.0 and 6.5.

Sterility Meets the requirements.

Pyrogen Meets the requirements. The amount tested is 2.0 mL per kg of the body weight of a test animal.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Extractable volume of injections Meets the requirements.

Assay (1) ***Animals*—**Select healthy male Sprague-Dawley rats each weighing 90 to 110 g. Keep the rats for NLT 3 days before use, providing an appropriate uniform diet and water.

(2) ***Solution for elcatonin*—**Dissolve 2.72 g of sodium acetate trihydrate in water to make 200 mL, add 0.2 g of bovine serum albumin, and adjust the pH to 6.0 with acetic acid(100). Prepare before use.

(3) ***Standard solution*—**Dissolve elcatonin RS in the solution for elcatonin to prepare solutions containing exactly 0.075 units and 0.0375 units per mL, respectively. Use these solutions as the high-concentration standard solution S_H and the low-concentration standard solution S_L, respectively.

(4) ***Test solution*—**Pipet 0.5 mL of Elcatonin Injection, add the solution for elcatonin to obtain solutions having known concentration of units equivalent to the high-concentration standard solution S_H and the low-concentration standard solution S_L, and use these solutions as the high-concentration test solution T_H and the low-concentration test solution T_L, respectively.

(5) ***Procedure*—**Divide the test animals into 4 groups of NLT 10 animals each (the same number of animals). Withhold all food for 18 to 24 hours before the injections, and also withhold water during the assay until the final blood sample is taken. Handle the animals with care in order to avoid undue excitement.
Inject exactly 0.2 mL each of the standard solutions and the test solutions into the tail vein of each animal as indicated in the following regimen:

Group 1 S_H	Group 3 T_H
Group 2 S_L	Group 3 T_L

At 1 hour after the injection, take a sufficient blood sample to perform the test from the carotid artery and vein of each animal under ether anesthesia, centrifuge the blood samples to separate serum, and determine the serum calcium according to the following (G).

(6) ***Serum calcium assay*—**Pipet 0.5 mL of serum, add the deproteinizing solution for elcatonin to make exactly 5 mL, shake to mix well, centrifuge, and use the clear supernatant as the test solution for calcium assay. Separately, pipet 1.0 mL of calcium standard solution for atomic absorption spectrophotometry, and add sodium chloride solution (0.85 in 100) to make 10 mL. Pipet 5.0 mL of this solution, add deproteinizing solution for elcatonin to make exactly 50 mL, and use this solution as the standard solution for calcium assay. Separately, take 1.0 mL of water, proceed in the same manner as in preparation of standard solution for calcium assay, and use this solution as the blank test solution. Determine the absorbances, A_T and A_S, of the test solution, standard solution and the blank test solution as directed under the Atomic Absorption Spectroscopy according to the following conditions.

Gas: Air–acetylen
Lamp: Calcium hollow cathode lamp
Wavelength: 422.7 nm

$$\text{Amount (mg) of calcium (Ca) in 100 mL of serum} = 0.01 \times \frac{A_T - A_0}{A_S - A_0} \times 10 \times 100$$

Deproteinizing solution for elcatonin—Dissolve 160 g of trichloroacetic acid and 30.6 g of strontium chloride in water to make 3600 mL.

(7) ***Calculation*—**The amounts of calcium in 100 mL of serum obtained from S_H, S_L, T_H and T_L in the serum calcium Assay shall be y_1, y_2, y_3 and y_4, respectively. For each group, add y_1, y_2, y_3 and y_4 to make Y_1, Y_2, Y_3 and Y_4, respectively.

$$\text{Number of elcatonin units per mL of Elcatonin Injection} = \text{antilog } M \times [\text{Number of elcatonin units in 1 mL of the high-concentration standard solution}] \times \frac{b}{a}$$

$$M = 0.3010 \times \frac{Y_a}{Y_b}$$

$$Y_a = -Y_1 - Y_2 + Y_3 + Y_4$$

$$Y_b = Y_1 - Y_2 + Y_3 - Y_4$$

a: Amount (mL) of sample taken
b: Total amount (mL) when elcatonin vehicle is

added to the sample to prepare the high-concentration test solution

F′ calculated according to the following equation is less than the F in the table for n when S^2 is calculated. Also, when L (P = 0.95) is calculated according to the following equation, L is NMT 0.2. If F' exceeds F, or if L exceeds 0.2, repeat the test, increasing the number of animals or arranging the assay conditions so that F' is NMT F and L is NMT 0.20.

$$F' = \frac{(-Y_1 + Y_2 + Y_3 - Y_4)^2}{4fS^2}$$

f = Number of test animals in each group

$$S^2 = \frac{\sum Y^2 - Y/f}{n}$$

Σy^2 = The sum of the squares of y_1, y_2, y_3 and y_4 of each group

$$Y = Y_1^2 + Y_2^2 + Y_3^2 + Y_4^2$$

$$n = 4(f - 1)$$

$$L = 2\sqrt{(C-1)(CM^2 + 0.09062)}$$

$$C = \frac{Y_b^2}{Y_b^2 - 4fs^2t^2}$$

t^2: The table corresponding to n in the following table when s^2 is calculated.

n	$t^2 = F$	*n*	$t^2 = F$	*n*	$t^2 = F$
1	161.45	13	4.667	25	4.242

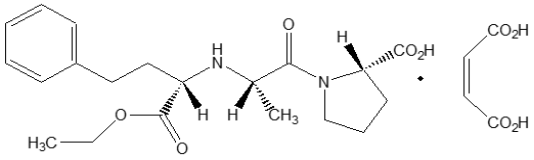
Packaging and storage Preserve in hermetic containers.

Enalapril Maleate
에날라프릴말레산염



$C_{20}H_{28}N_2O_5 \cdot C_4H_4O_4$: 492.52

(2*S*)-1-[(2*S*)-2-{[(2*S*)-1-Ethoxy-1-oxo-4-phenylbutan-2-yl]amino}propanoyl]pyrrolidine-2-carboxylic acid (*Z*)-but-2-enedioate [*76095-16-4*]

Enalapril Maleate contains NLT 98.0% and NMT 102.0% of enalapril maleate ($C_{20}H_{28}N_2O_5 \cdot C_4H_4O_4$), calculated on the dried basis.

Description Enalapril Maleate occurs as white crystals or a crystalline powder.
It is freely soluble in methanol, sparingly soluble in water or ethanol(99.5), and slightly soluble in acetonitrile.

Melting point—About 145 °C (with decomposition).

Identification (1) To 20 mg of Enalapril Maleate, add 1 mol/L hydrochloric acid TS, shake, add 5 mL of ether, and shake for 5 minutes. Take 3 mL of the upper layer, distill the ether on a steam bath, and add 5 mL of water to the residue while shaking. Add 1 drop of potassium permanganate TS; the red color of the solution disappears immediately.

(2) Determine the infrared spectra of Enalapril Maleate and enalapril maleate RS as directed in the paste method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) The retention times of the major peaks obtained from the test solution and the standard solution in the Assay are the same.

Optical rotation $[\alpha]_D^{25}$: Between -41.0° and -43.5° (0.1 g after drying, methanol, 10 mL, 100 mm).

Purity (1) ***Heavy metals***—Proceed with 2.0 g of Enalapril Maleate according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Related substances***—Weigh accurately about 30 mg of Enalapril Maleate, dissolve in a mixture of phosphate buffer solution, pH 2.5, and acetonitrile (95 : 5) to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 30 mg of enalapril maleate RS, dissolve in a mixture of phosphate buffer solution, pH 2.5 and acetonitrile (95 : 5) to make exactly 100 mL. Pipet accurately 1 mL of this solution, add a mixture of phosphate buffer solution, pH 2.5 and acetonitrile (95 : 5) to make exactly 100 mL, and use this solution as the standard solution Perform the test with 50

μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas of each solution by the automatic integration method, and calculate the content of each related substance; a peak among two peaks other than the major peak is NMT 1.0%, another peak is NMT 0.3%, and the total content of the related substances is NMT 2.0%.

$$\text{Content (\%) of each related substance} = 100 \times \left(\frac{C_S}{C_i} \times \frac{A_T}{A_S}\right)$$

C_S: Concentration (mg/mL) of the standard solution

C_i: Concentration (mg/mL) of Enalapril Maleate in the test solution

A_T: Peak area of each related substance in the test solution

A_S: Peak area of each related substance in the standard solution

Operating conditions

For the detector, column, column temperature, mobile phase and flow rate, proceed as directed in the operating conditions under the Assay.

Loss on drying NMT 1.0% (NMT 0.67 kPa, 60 ℃, 2 hours).

Residue on ignition NMT 0.2% (1 g).

Assay Weigh accurately about 30 mg of Enalapril Maleate, dissolve in a mixture of phosphate buffer solution, pH 2.5, and acetonitrile (95 : 5) to make exactly 100 mL, and use this solution as the test solution. Separately, dissolve about 30 mg, accurately weighed, of enalapril maleate RS in a mixture of phosphate buffer solution, pH 2.5, and acetonitrile (95 : 5) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 50 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the major peak areas, A_T and A_S, from each solution.

$$\text{Amount (mg) of enalapril maleate } (C_{20}H_{28}N_2O_5 \cdot C_4H_4O_4) = \text{Amount (mg) of enalapril maleate RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.1 mm in internal diameter and about 15 cm in length, packed with styrene-divinylbenzene copolymer for liquid chromatography (5 μm to 10 μm in particle diameter).

Column temperature: 70 °C

Flow rate: 1.5 mL/min

Mobile phase: Control the mixing ratio of mobile phase A and mobile phase B in stages or gradient elution as follows.

Mobile phase A: A mixture of phosphate buffer solution, pH 6.8 and acetonitrile (19 : 1).

Mobile phase B: A mixture of acetonitrile and phosphate buffer solution, pH 6.8 (33 : 17).

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0	95	5
0 - 20	95 → 40	5 → 60
20 - 25	40	60
25 - 26	40 → 95	60 → 5
26 - 30	95	5

System suitability

System performance: Mix 1 mL of enalapril diketopiperazine solution and 50 mL of the standard solution. Proceed with 50 μL of this solution according to the above operating conditions; enalapril and enalapril diketopiperazine are eluted in this order with the resolution being NLT 3.5.

System repeatability: Repeat the test 6 times with 50 μL each of the standard solution according to the operating conditions under the Assay; the relative standard deviation of the peak areas is NMT 1.0%.

pH 6.8 phosphate buffer solution—Dissolve 2.8 g of sodium dihydrogen phosphate dihydrate in about 900 mL of water. Adjust with 9 mol/L of sodium hydroxide TS to a pH of 6.8, dilute with water to make 1000 mL.

pH 2.5 phosphate buffer solution—Dissolve 2.8 g of sodium dihydrogen phosphate dihydrate in about 900 mL of water. Adjust with phosphoric acid to a pH of 2.5, dilute with water to make 1000 mL.

Enalapril diketopiperazine solution—Place about 20 mg of enalapril maleate RS in a 100-mL beaker to form a mound on the bottom of the beaker, and place the beaker on a hotplate stirrer. Heat up to a temperature not to cause pyrolysis for about 5 to 10 minutes until the solid is melted. Immediately allow to cool, add 50 ml of acetonitrile, and sonicate for a few minutes. The solution typically contains, in each mL, between 0.2 mg and 0.4 mg of enalapril diketopiperazine.

Packaging and storage Preserve in well-closed containers.

Enalapril Maleate Tablets
에날라프릴말레산염 정

Enalapril Maleate Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of enalapril maleate ($C_{20}H_{28}N_2O_5 \cdot C_4H_4O_4$: 492.52).

Method of preparation Prepare as directed under Tablets, with Enalapril Maleate.

Identification (1) Weigh an amount of previously powdered Enalapril Maleate Tablets equivalent to 50 mg of Enalapril Maleate according to the labeled amount, add 20 mL of methanol, and shake well. Centrifuge this solution, take the clear supernatant, and use this solution as the test solution. Separately, dissolve 25 mg of enalapril maleate RS in 10 mL of methanol, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 20 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of water, acetone, 1-butanol and acetic acid(100) (1 : 1 : 1 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm); the R_f values of the 2 spots obtained from the test solution and 2 spots obtained from the standard solution are the same.

(2) The retention times of the major peaks obtained from the test solution and the standard solution in the Assay are the same.

Purity ***Related substances***—Use the test solution and the standard solution prepared as directed under the Assay, the pH 2.2 phosphate buffer solution, and the enalapril diketopiperazine solution prepared as directed under the Assay of Enalapril Maleate. Take 1.0 mL of the standard solution, add phosphate buffer solution, pH 2.2, to make exactly 100 mL, and use this solution as the related substance standard solution. Perform the test with 50 μL each of the test solution, the standard solution, the related substance standard solution and the buffer solution as directed under the Liquid Chromatography according to the conditions of the Assay, determine the peak area of each solution by the automatic integration method, and calculate the content of related substances. Determine the peak areas of all peaks with peak areas NLT 0.1% of the enalapril peak area except for peaks appearing in the buffer solution in the chromatogram of the test solution.

$$\text{Content (\%) of anhydrous enalaprilate} = \frac{492.53}{348.39} \times \frac{CV}{N} \times \frac{A_T}{A_S} \times \frac{100}{L}$$

492.53: Molecular weight of enalapril maleate

348.39: Molecular weight of anhydrous enalaprilate

C: Concentration (μg/mL) of enalaprilate in the standard solution

V: Volume (mL) of the test solution

N: Number of tablets taken for the test

L: Labeled amount (mg) of enalapril maleate for tablets

A_T: Peak area of enalaprilate in the test solution

A_S: Peak area of enalaprilate in the standard solution

$$\text{Content (\%) of enalapril piperazine} = \frac{492.53}{358.44} \times \frac{C'V}{N} \times \frac{A_T}{1.25A_S} \times \frac{100}{L}$$

492.53: Molecular weight of enalapril maleate

358.44: Molecular weight of enalapril diketopiperazine

C': Concentration (mg/mL) of enalapril maleate RS in related substance standard solution

V: Volume (mL) of the test solution

N: Number of tablets taken for the test

1.25: Peak area of enalapril diketopiperazine to enalapril

L: Labeled amount (mg) of enalapril maleate for tablets

$$\text{Content (\%) of other related substances} = \frac{C'V}{N} \times \frac{A_T}{A_S} \times \frac{100}{L}$$

A_T: Peak area of other related substances

C', *V* and *N* are as above

The total amount of related substances, including enalaprilate and enalapril diketopiperazine, is NMT 5.0%.

Enalaprilate standard solution—Weigh accurately an appropriate amount of enalaprilate RS, and dissolve in water to make a solution containing 0.4 mg per mL.

Standard solution—Weigh accurately about 20 mg of enalapril maleate RS, add 0.5 mL of enalaprilate RS, add 50 mL of buffer solution, dissolve by mixing well, and add phosphate buffer solution, pH 2.2, to make exactly 100 mL.

Related substance standard solution—Pipet 1 mL of the standard solution accurately, and add phosphate buffer solution, pH 2.2, to make exactly 100 mL.

Dissolution Perform the test with 1 tablet of Enalapril Maleate Tablet at 50 revolutions per minute according to Method 2 under the Dissolution, using 900 mL of phosphate buffer solution, pH 6.8, as the dissolution medium. After 30 minutes from starting the dissolution test, take 20 mL of the dissolved solution, and filter through a membrane filter with a pore size NMT 0.8 μm. Discard the first 10 mL of the filtrate, and use the subsequent filtrate as the test solution. Separately, weigh accurately 10 mg of enalapril maleate RS, dissolve in phosphate buffer solution, pH 6.8, to make exactly 100 mL, and use this solution as the standard solution. Perform the test according to the operating conditions under the Assay of Enalapril Maleate.

It meets the requirements if the dissolution rate of Enalapril Maleate Tablets for 30 minutes is NLT 80%.

Uniformity of dosage units It meets the requirements of the Content Uniformity Test when the test is performed according to the following method. Take 1 tablet of Enalapril Maleate Tablet, add 50 mL of phosphate buffer solution, pH 2.2, sonicate for 15 minutes if necessary, shake for 30 minutes, add phosphate buffer solution, pH 2.2, to make exactly 100 mL, and use this solution as the test solution. Take a certain amount of this solution, and dilute exactly with the buffer solution to the concentration of 0.1 mg per mL. Separately, weigh accurately 10 mg of enalapril maleate RS, dissolve in phosphate buffer solution, pH 2.2, to make exactly 100 mL, and use this solution as the standard solution. Perform the test as directed under the Assay of Enalapril Maleate.

$$\text{Amount (mg) of enalapril maleate } (C_{20}H_{28}N_2O_5 \cdot C_4H_4O_4) = T \times \frac{C}{D} \times \frac{A_T}{A_S}$$

T: Labeled amount (mg) of enalapril maleate in 1 tablet
C: Concentration (mg/mL) of the standard solution
D: Concentration (mg/mL) of enalapril maleate in the test solution
A_T: Peak area of enalapril maleate in the test solution
A_S: Peak area of enalapril maleate in the standard solution

pH 2.2 phosphate buffer solution—Dissolve 1.38 g of sodium dihydrogen phosphate dihydrate in about 800 mL of water, add phosphoric acid to adjust the pH to 2.2, and add water to make 1000 mL.

Assay Weigh accurately the mass of NLT 20 tablets of Enalapril Maleate Tablets, and powder. Weigh accurately a portion of this powder, equivalent to about 20 mg of enalapril maleate ($C_{20}H_{28}N_2O_5 \cdot C_4H_4O_4$), add 50 mL of phosphate buffer solution, pH 2.2, from the Uniformity of dosage units, sonicate for 15 minutes, and shake for 30 minutes. Then, add phosphate buffer solution, pH 2.2, to make 100 mL, sonicate for 15 minutes, filter through a membrane filter, and use this solution as the test solution. Separately, weigh accurately about 20 mg of enalapril maleate RS, add 0.5 mL of enalaprilate RS, dissolve in 50 mL of phosphate buffer solution, pH 2.2, and sonicate if necessary. Then, add phosphate buffer solution, pH 2.2, to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 50 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions, and determine the peak areas, A_T and A_S, of each solution.

$$\text{Amount (mg) of enalapril maleate } (C_{20}H_{28}N_2O_5 \cdot C_4H_4O_4) = \text{Amount (mg) of enalapril maleate RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 215 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with hydroxy propylsilyl silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: 50 °C

Mobile phase: A mixture of phosphate buffer solution, pH 2.2, and acetonitrile (75 : 25).

Flow rate: 2 mL/min

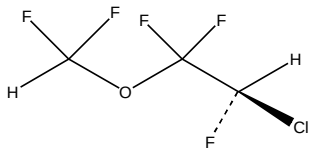
System suitability

System performance: Take 0.5 mL of enalapril diketopiperazine solution, and add the standard solution to make 25 mL. Proceed with 50 μL of this solution according to the above conditions; maleic acid, enalaprilate, enalapril and enalapril diketopiperazine are eluted in this order with the resolutions between maleic acid and enalaprilate, enalaprilate and enalapril, and enalapril and enalapril diketopiperazine being NLT 2.0, respectively.

System repeatability: Repeat the test 6 times with 50 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak areas of enalapril is NMT 2.0%.

Packaging and storage Preserve in well-closed containers.

Enflurane
엔플루란



and enantiomer

Enflurane $C_3H_2ClF_5O$: 184.49
2-Chloro-1-(difluoromethoxy)-1,1,2-trifluoroethane
[*13838-16-9*]

Description Enflurane occurs as a clear, colorless fluid.
It is slightly soluble in water.
It is miscible with ethanol(95) or ether.
It is a volatile, and not inflammable.
It shows no optical rotation.

Boiling point—Between 54 and 57°C.

Identification (1) Take 50 μL of Enflurane, and prepare the test solution as directed under the Oxygen Flask Combustion using 40 mL of water as the absorbent. The test solution responds to the Qualitative Analysis for chloride and fluoride.

(2) Determine the infrared spectra of Enflurane and enflurane RS as directed under the liquid film method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Refractive index n_D^{20}: Between 1.302 and 1.304.

Specific Gravity d_{20}^{20}: Between 1.520 and 1.540.

Purity (1) ***Acidity or alkalinity***—To 60 mL of Enflurane, add 60 mL of freshly boiled and cooled water, shake for 3 minutes to mix, take the water layer, and use this solution as the test solution. To 20 mL of the test solution, add 1 drop of bromocresol purple TS and 0.10 mL of 0.01 mol/L sodium hydroxide solution; a violet color develops. To 20 mL of the test solution, add 1 drop of bromocresol purple TS and 60 μL of 0.01 mol/L hydrochloric acid; a yellow color is produced.

(2) ***Chloride***—Weigh 20 g of Enflurane, add 20 mL of water, shake well to mix, and separate the water layer. Take 10 mL of the water layer, and add 6 mL of dilute nitric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid (NMT 0.001%).

(3) ***Related substances***—Perform the test with 5 μL of Enflurane as directed under the Gas Chromatography according to the following conditions. Introduce the sample, immediately determine each peak area other than the peak of air as directed in the automatic integration method, and calculate the amount of each peak by the percentage peak area method; the amount of the substances other than enflurane is NMT 0.10%.

Operating conditions

Detector: A thermal conductivity detector

Column: A stainless steel about 3 mm in inside diameter and about 3 m in length, packed with diatomaceous earth for gas chromatography, 180 to 250 μm in particle diameter, coated with diethylene glycol succinate ester for gas chromatography at the ratio of 20%.

Column temperature: A constant temperature of about 80 °C.

Carrier gas: Helium

Flow rate: Adjust the flow rate so that the retention time of enflurane is about 3 minutes.

System suitability

Test for required detectability: Take 1 mL of Enflurane, and add 2-propanol to make 100 mL. Take 2 mL of this solution, add 2-propanol to make 10 mL, and use this solution as the system suitability solution. Take 1.0 mL of this solution and add 2-propanol to make exactly 10 mL. Confirm that the peak area of enflurane obtained from 5 μL of this solution is equivalent to 7 to 13% of the peak area of enflurane from the system suitability solution.

System performance: Mix 5 mL of Enflurane with 5 mL of 2-propanol. Proceed with 5 μL of this solution according to the above operating conditions, enflurane and 2-propanol are eluted in this order with the resolution being NLT 2.0.

System repeatability: Repeat the test 6 times with 5 μL of the system suitability solution according to the above operating conditions; the relative standard deviation of the ratios of the peak area of enflurane is NMT 2.0%.

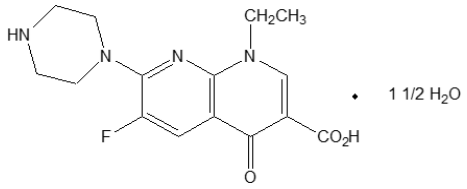
Time span of measurement: About 3 times the retention time of enflurane.

(4) ***Evaporation residue***—Pipet 65 mL of Enflurane, evaporate to dryness on a steam bath, and dry the residue at 105 ºC for 1 hour; the mass of the residue is NMT 1.0 mg.

Water NMT 0.1% (10 g, volumetric titration, direct titration).

Packaging and storage Preserve in tight containers and store at below 30 °C.

Enoxacin Hydrate
에녹사신수화물



Enoxacin $C_{15}H_{17}FN_4O_3 \cdot 1½H_2O$: 347.34
1-Ethyl-6-fluoro-4-oxo-7-(piperazin-1-yl)-1,4-dihydro-1,8-naphthyridine-3-carboxylic acid sesquihydrate
[*84294-96-2*]

Enoxacin Hydrate, when dried, contains NLT 98.5% and NMT 101.0% of enoxacin ($C_{15}H_{17}FN_4O_3$: 320.32).

Description Enoxacin Hydrate occurs as white to pale yellowish brown crystals or a crystalline powder.
It is freely soluble in acetic acid(100), slightly soluble in methanol, very slightly soluble in chloroform, and practically insoluble as water, ethanol(95) or ether.
It dissolves in dilute sodium hydroxide TS.
It is gradually colored by light.

Identification (1) Put 20 mg of Enoxacin Hydrate and 30 mg of sodium metal in a test tube, and heat gently with caution until glowing red. After cooling, add 0.5 mL of methanol and 5 mL of water, and heat to boiling. Add 2 mL of dilute acetic acid and filter; the filtrate responds to the Qualitative Analysis (2) for fluoride.

(2) Dissolve 50 mg each of Enoxacin Hydrate and enoxacin hydrate RS in dilute sodium hydroxide TS to make 100 mL. Pipet 1 mL each of these solutions and add water to make 100 mL. With these solutions, determine the absorption spectra as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared spectra of Enoxacin Hydrate and enoxacin hydrate RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of ab-

sorption at the same wavenumbers.

Melting point Between 225 and 229 ℃ (after drying).

Purity (1) ***Sulfate***—Dissolve 1.0 g of Enoxacin Hydrate in 50 mL of dilute sodium hydroxide TS, add 10 mL of dilute hydrochloric acid, shake to mix, and centrifuge. Filter the clear supernatant, take 30 mL of the filtrate, and add water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution by adding 0.50 mL of 0.005 mol/L sulfuric acid, 25 mL of dilute sodium hydroxide TS, 5 mL of dilute hydrochloric acid and water to make 50 mL (NMT 0.048%).

(2) ***Heavy metals***—Proceed with 1.0 g of Enoxacin Hydrate according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Arsenic***—Proceed with 1.0 g of Enoxacin Hydrate according to Method 3 and perform the test (NMT 2 ppm).

(4) ***Related substances***—Dissolve 50 mg of Enoxacin Hydrate in 25 mL of a mixture of methanol and chloroform (7 : 3), and use this solution as the test solution. Pipet 1 mL of this solution, add a mixture of methanol and chloroform (7 : 3) to make 200 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of 1-butanol, water and acetic acid(100) (3 : 1 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Observe the plate under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot obtained from the test solution are not more intense than the spots from the standard solution.

Loss on drying Between 7.0% and 9.0% (1 g, 105 ℃, 3 hours).

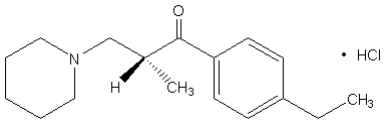
Residue on ignition NMT 0.1% (1 g, platinum crucible).

Assay Weigh accurately about 0.3 g of Enoxacin Hydrate, previously dried, dissolve in 30 mL of acetic acid(100), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 32.03 mg of $C_{15}H_{17}FN_4O_3$

Packaging and storage Preserve in light-resistant, tight containers.

Eperisone Hydrochloride
에페리손염산염



and enantiomer

$C_{17}H_{25}NO \cdot HCl$: 295.85

1-(4-Ethylphenyl)-2-methyl-3-(piperidin-1-yl) propan-1-one hydrochloride [*56839-43-1*]

Eperisone Hydrochloride contains NLT 98.5% and NMT 101.0% of eperisone hydrochloride ($C_{17}H_{25}NO \cdot HCl$).

Description Eperisone Hydrochloride occurs as a white crystalline powder.
It is freely soluble in water, methanol or acetic acid(100), and soluble in ethanol(99.5).

Melting point—About 167 ℃ (with decomposition)
A solution of Eperisone Hydrochloride in methanol (1 in 100) shows no optical rotation.

Identification (1) Determine the absorption spectra of solutions of Eperisone Hydrochloride and eperisone hydrochloride RS in methanol (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Eperisone Hydrochloride and eperisone hydrochloride RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) An aqueous solution of Eperisone Hydrochloride (1 in 50) responds to the Qualitative Analysis for chloride.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Eperisone Hydrochloride as directed under Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Piperidine hydrochloride***—Weigh 1.0 g of Eperisone Hydrochloride and dissolve in 20 mL of water, add 2.0 mL of diluted hydrochloric acid (1 in 2), 2.0 mL of copper(II) sulfate pentahydrate solution (1 in 20) and 1.5 mL of ammonia water(28), and use this solution as the test solution. Separately, to 2.0 mL of piperidine hydrochloride solution (1 in 1000), add 18 mL of water, 2.0 mL of diluted hydrochloric acid (1 in 2), 2.0 mL of copper(II) sulfate pentahydrate solution (1 in 20) and 1.5 mL of ammonia water(28), and use this solution as the standard solution. To each of the test solution and the standard solution, add 10 mL of a mixture of isopropyl ether and carbon disulfide (3 : 1), mix well for 30 seconds, allow them to stand for 2 minutes, and compare the color of two

supernatants; the color obtained from the test solution is not more intense than that obtained from the standard solution.

(3) ***Related substances***—Weigh 0.1 g of Eperisone Hydrochloride, dissolve it in 100 mL of the mobile phase, and use this solution as the test solution. Pipet 1 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine each peak area as directed in the automatic integration method; the total area of the peaks other than eperisone obtained from the test solution is not greater than 1/5 times the peak area of eperisone from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 30 °C.

Mobile phase: A mixture of methanol, 0.0375 mol/L sodium 1-decanesulfonate solution and perchloric acid (600 : 400 : 1).

Flow rate: Adjust so that the retention time of eperisone is about 17 minutes.

System suitability

Test for required detectability: Pipet 1 mL of the standard solution and add the mobile phase to make exactly 10 mL. Confirm that the peak area of eperisone obtained from 10 μL of this solution is equivalent to 7 to 13% of that from the standard solution.

System performance: Proceed with 10 μL of the standard solution according to the above operating conditions; the number of theoretical plates and symmetry factor of the peak of eperisone are NLT 4000 and NMT 2.0, respectively.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution according to the above operating conditions; the relative standard deviation of the peak area of eperisone is NMT 3.0%.

Time span of measurement: About 2 times the retention time of eperisone.

Sodium 1-decanesulfonate solution, 0.0375 mol/L—Dissolve 3.665 g of sodium 1-decanesulfonate in 400 mL of water.

Water NMT 0.2% (0.1 g, coulometric titration).

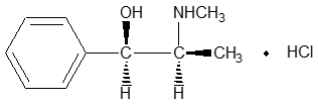
Residue on ignition NMT 0.2% (1 g).

Assay Weigh accurately about 0.6 g of Eperisone Hydrochloride, dissolve in 20 mL of acetic acid(100), add 80 mL of acetic anhydride, and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 29.59 mg of $C_{17}H_{25}NO{\cdot}HCl$

Packaging and storage Preserve in well-closed containers.

Ephedrine Hydrochloride
에페드린염산염



$C_{10}H_{15}NO{\cdot}HCl$: 201.69

(1*R*,2*S*)-2-(Methylamino)-1-phenylpropan-1-ol hydrochloride [*50-98-6*]

Ephedrine Hydrochloride, when dried, contains NLT 99.0% and NMT 101.0% of ephedrine hydrochloride ($C_{10}H_{15}NO{\cdot}HCl$).

Description Ephedrine Hydrochloride occurs as white crystals or a crystalline powder.
It is freely soluble in water, soluble in ethanol(95), slightly soluble in acetic acid(100), and practically insoluble in acetic anhydride or acetonitrile.

Identification (1) Determine the absorption spectra of aqueous solutions of Ephedrine Hydrochloride and ephedrine hydrochloride RS (1 in 2000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelength.

(2) Determine the infrared spectra of Ephedrine Hydrochloride and ephedrine hydrochloride RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) An aqueous solution of Ephedrine Hydrochloride (1 in 15) responds to the Qualitative Analysis for chloride.

Optical rotation $[\alpha]_D^{20}$: Between -33.0° and -36.0° (after drying, 1 g, water, 20 mL, 100 mm).

Melting point Between 218 and 222 ℃.

pH Dissolve 1.0 g of Ephedrine Hydrochloride in 20 mL of water; the pH of this solution is between 4.5 and 6.5.

Purity (1) ***Clarity and color of solution***—Dissolve 0.5 g of Ephedrine Hydrochloride in 10 mL of water; the solution is colorless and clear.

(2) ***Acidity and Alkalinity***—Weigh accurately 1.0 g

of Ephedrine Hydrochloride, dissolve in 20 mL of water, and add 1 drop of methyl red TS. Add 0.01 mol/L of sulfuric acid until the solution turns red if the solution exhibits a yellow color; the amount used of sulfuric acid is NMT 0.10 mL. Add 0.02 mol/L of sodium hydroxide solution until the solution turns yellow if the solution exhibits a pink color; the amount used of the sodium hydroxide solution is NMT 0.20 mL.

(3) ***Sulfate***—Dissolve 50 mg of Ephedrine Hydrochloride in 40 mL of water, add 1 mL of dilute hydrochloric acid and 1 mL of barium chloride TS and allow to stand for 10 minutes; the solution remains unchanged.

(4) ***Heavy metals***—Proceed with 1.0 g of Ephedrine Hydrochloride as directed under Method 2 and perform the test. Prepare the control solution with 1.0 mL of lead standard solution (10 ppm).

(5) ***Related substances***—Dissolve 50 mg of Ephedrine Hydrochloride in 50 mL of mobile phase and use this solution as the test solution. Pipet 1 mL of this solution, add the mobile phase to it make exactly 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak area obtained from each solution as directed in the automatic integration method; the sum of peak areas other than the major peak area from the test solution is not greater than the major peak area from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 210 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 45 ℃.

Mobile phase: A mixture of sodium lauryl sulfate solution (1 in 128), acetonitrile and phosphoric acid (640 : 360 : 1).

Flow rate: Adjust so that the retention time of ephedrine is about 14 minutes.

System suitability

Test for required detectability: Pipet 1 mL of the standard solution and add the mobile phase to make 20 mL. Confirm that the peak area of ephedrine obtained from 10 μL of this solution is equivalent to 4% to 6% of that of ephedrine from the standard solution.

System performance: Dissolve 1 mg of ephedrine hydrochloride RS and 4 mg of atropine sulfate in 100 mL of diluted methanol (1 in 2). Proceed with 10 μL of this solution according to the above operating conditions; ephedrine and atropine are eluted in this order with the resolution being NLT 1.5.

System repeatability: Repeat the test 6 times according to the above operating conditions with 10 μL each of the standard solution; the relative standard deviation of the peak areas of ephedrine is NMT 2.0%.

Time span of measurement: About 3 times the retention time of ephedrine after the solvent peak.

Loss on drying NMT 0.5% (1 g, 105 ℃, 3 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.4 g of Ephedrine Hydrochloride, previously dried, dissolve in 50 mL of a mixture of acetic anhydride and acetic acid(100) (7 : 3) by warming. After cooling, titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 20.169 mg of $C_{10}H_{15}NO \cdot HCl$

Packaging and storage Preserve in well-closed containers.

Ephedrine Hydrochloride Injection
에페드린염산염 주사액

Ephedrine Hydrochloride Injection is an aqueous injection and contains NLT 95.0% and NMT 105.0% of the labeled amount of ephedrine hydrochloride ($C_{10}H_{15}NO \cdot HCl$: 201.69).

Method of preparation Prepare as directed under Injections, with Ephedrine Hydrochloride.

Description Ephedrine Hydrochloride Injection occurs as a clear, colorless liquid.

pH—Between 4.5 and 6.5.

Identification Take an amount of Ephedrine Hydrochloride Injection equivalent to 509 mg of ephedrine hydrochloride according to the labeled amount, and add water to make 100 mL. Determine the absorption spectra of this solution as directed under Ultraviolet-visible Spectroscopy; it exhibits maxima between 249 nm and 253 nm, between 255 nm and 259 nm, and between 261 nm and 265 nm.

Sterility Meets the requirements.

Bacterial endotoxins Less than 7.5 EU per mg of ephedrine hydrochloride.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Extractable volume of injections Meets the requirements.

Assay Pipet an amount of Ephedrine Hydrochloride Injection equivalent to about 40 mg of ephedrine hydrochloride ($C_{10}H_{15}NO \cdot HCl$), add exactly 10 mL of the internal standard solution, then add water to make 200 mL, and use this solution as the test solution. Separately, weigh accurately about 40 mg of ephedrine hydrochloride RS, previously dried at 105 ℃ for 3 hours, dissolve in exactly 10 mL of the internal standard solution, then add water to make exactly 200 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak area ratios, Q_T and Q_S, of ephedrine to the peak area of the internal standard, respectively.

$$\text{Amount (mg) of ephedrine hydrochloride } (C_{10}H_{15}NO \cdot HCl) = \text{Amount (mg) of ephedrine hydrochloride RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—Etilefrine hydrochloride solution (1 in 500).

Operating conditions

For the detector, column, column temperature, mobile phase and flow rate, proceed as directed under the operating conditions under the Purity (5) of Ephedrine Hydrochloride.

System suitability

System performance: Proceed with 10 μL of the standard solution according to the above conditions; the internal standard and ephedrine are eluted in this order with the resolution being NLT 1.5.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution under the above operating conditions; the relative standard deviation of the peak area ratios of ephedrine to that of the internal standard is NMT 1.0%.

Packaging and storage Preserve in light-resistant, hermetic containers.

10% Ephedrine Hydrochloride Powder
에페드린염산염 10 배산

Ephedrine Hydrochloride

10% Ephedrine Hydrochloride

10% Ephedrine Hydrochloride Powder contains NLT 9.3% and NMT 10.7% of ephedrine hydrochloride ($C_{10}H_{15}NO \cdot HCl$: 201.69).

Method of preparation

Ephedrine hydrochloride	100 g
Starch, lactose hydrate or a mixture of these	A sufficient quantity
Total amount	1000 g

Prepare as directed under Powders, with the above.

Identification Take 0.5 g of 10% Ephedrine Hydrochloride Powder, add 100 mL of water, shake for 20 minutes and filter. Determine the absorption spectrum of the filtrate as directed under Ultraviolet-visible Spectrophotometry: it exhibits maxima between 249 nm and 253 nm, between 255 nm and 259 nm and between 261 nm and 265 nm. Determine the absorption spectrum of the filtrate as directed under the Ultraviolet-visible Spectroscopy; it exhibits maxima between 249 nm and 253 nm, between 255 nm and 259 nm, and between 261 nm and 265 nm.

Particle size distribution estimation by analytical sieving Meets the requirements.

Uniformity of dosage units (distribution) Meets the requirements.

Assay Weigh accurately about 0.4 g of 10% Ephedrine Hydrochloride Powder, add 150 mL of water and extract with the aid of ultrasonicator for 10 minutes with occasional shaking. Shake more for 10 minutes, add exactly 10 mL of the internal standard solution and water to make 200 mL, centrifuge and use the supernatant as the test solution. Separately, weigh accurately about 40 mg of Ephedrine Hydrochloride RS, previously dried at 105 ºC for 3 hours, put exactly to 10 mL of internal standard solution to dissolve, add water to make 200 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test and the standard solution as directed under Liquid Chromatography according to the following condition and calculate the ratios, QT and QS, of the peak area of ephedrine to that of the internal standard of each solution.

$$\text{Amount (mg) of ephedrine hydrochloride } (C_{10}H_{15}NO \cdot HCl) = \text{Amount (mg) of ephedrine hydrochloride RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—Etilefrine hydrochloride solution (1 in 500).

Operating conditions

Follow the operating conditions under the Purity (4) of Ephedrine Hydrochloride for the detector, column, column temperature, mobile phase and flow rate.

System suitability

System performance: Proceed with 10 μL of the standard solution according to the above conditions; the internal standard and ephedrine are eluted in this order with the resolution being NLT 1.5.

System repeatability: Repeat the test 6 times with 10 μL of the standard solution under the above operating conditions; the relative standard deviation of the peak area ratio of ephedrine to that of the internal standard is NMT 1.0%.

Packaging and storage Preserve in well-closed containers.

Ephedrine Hydrochloride Tablets
에페드린염산염 정

Ephedrine Hydrochloride Tablets contain NLT 93.0% and NMT 107.0% of the labeled amount of ephedrine hydrochloride ($C_{10}H_{15}NO \cdot HCl$: 201.69).

Method of preparation Prepare as directed under Tablets, with Ephedrine Hydrochloride.

Identification Weigh an amount of Ephedrine Hydrochloride Tablets, previously powdered, equivalent to 50 mg of ephedrine hydrochloride according to the labeled amount, add 100 mL of water, shake for 20 minutes to mix, and then filter. Determine the absorption spectrum of the filtrate as directed under the Ultraviolet-visible Spectroscopy; it exhibits maxima between 249 nm and 253 nm, between 255 nm and 259 nm, and between 261 nm and 265 nm.

Dissolution Perform the test with 1 tablet of Ephedrine Hydrochloride Tablets at 50 revolutions per minute according to Method 2 under the Dissolution, using 900 mL of water as the dissolution medium. Take 20 mL or more of the dissolved solution 30 minutes after starting the test, and filter through a membrane filter with a pore size of NMT 0.45 μm. Discard the first 10 mL of the filtrate, and use the subsequent filtrate as the test solution. Separately, weigh accurately about 28 mg of ephedrine hydrochloride RS, previously dried at 105 °C for 3 hours, and dissolve in water to make exactly 100 mL. Pipet 5 mL of this solution, add water to make exactly 50 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of ephedrine, respectively. The acceptable dissolution criterion is NLT 80% of Ephedrine Hydrochloride Tablets dissolved in 30 minutes.

Dissolution rate (%) of the labeled amount of ephedrine ($C_{10}H_{15}NO \cdot HCl$)
= Amount (mg) of the ephedrine RS taken

$$\times \frac{A_T}{A_S} \times \frac{1}{C} \times 90$$

C: Labeled amount (mg) of ephedrine ($C_{10}H_{15}NO \cdot HCl$) in 1 tablet.

Operating conditions

Ephedrine Hydrochloride: Perform the test according to the operating conditions under the Purity (5) Related substances.

System suitability

System performance: Proceed with 10 μL of the standard solution according to the above conditions; the number of theoretical plates and the symmetry factor of the peak of ephedrine are NLT 10000 and NMT 2.0, respectively.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solutions according to the above operating conditions; the relative standard deviation of the peak areas of ephedrine is NMT 2.0%.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 tablets of Ephedrine Hydrochloride Tablets, and powder. Weigh accurately an amount, equivalent to about 40 mg of ephedrine hydrochloride ($C_{10}H_{15}NO \cdot HCl$), add 150 mL of water, sonicate for 10 minutes while occasionally shaking to mix, and shake for 10 minutes to mix. Then, add exactly 10 mL of the internal standard solution, and then add water to make 200 mL. Centrifuge this solution, and use the clear supernatant as the test solution. Separately, weigh accurately about 40 mg of ephedrine hydrochloride RS, previously dried at 105 °C for 3 hours, dissolve exactly 10 mL of the internal standard solution, then add water to make 200 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak area ratios, Q_T and Q_S, of ephedrine to the peak area of the internal standard, respectively.

Amount (mg) of ephedrine hydrochloride ($C_{10}H_{15}NO \cdot HCl$)
= Amount (mg) of ephedrine hydrochloride RS $\times \frac{Q_T}{Q_S}$

Internal standard solution—Etilefrine hydrochloride solution (1 in 500).

Operating conditions

For the detector, column, column temperature, mobile phase and flow rate, proceed as directed under the operating conditions in the Purity (4) under Ephedrine Hydrochloride.

System suitability

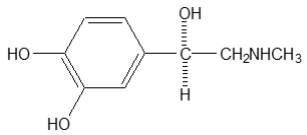
System performance: Proceed with 10 μL of the standard solution according to the above conditions; the internal standard and ephedrine are eluted in this order with the resolution being NLT 1.5.

System repeatability: Repeat the test 6 times with 10 μL of the standard solution under the above operating conditions; the relative standard deviation of the peak

area ratios of ephedrine to that of the internal standard is NMT 1.0%.

Packaging and storage Preserve in well-closed containers.

Epinephrine
에피네프린



Adrenaline
Epirenamine $C_9H_{13}NO_3$: 183.20
4-[(1*R*)-1-Hydroxy-2-(methylamino)ethyl]benzene-1,2-diol [*51-43-4*]

Epinephrine, when dried, contains NLT 98.0% and NMT 101.0% of epinephrine ($C_9H_{13}NO_3$).

Description Epinephrine occurs as a white to grayish white crystalline powder and is odorless.
It is freely soluble in acetic acid(100), very slightly soluble in water, and practically insoluble in methanol, ethanol(95) or ether.
It dissolves in dilute hydrochloric acid.
It is gradually changed to brown by air or light.

Identification (1) Dissolve 10 mg of Epinephrine in 10 mL of diluted ethanol (1 in 500) and use this solution as the test solution. To 1 mL of the test solution, add 4 mL of water and 1 drop of iron(III) chloride TS; the resulting solution exhibits dark green and then slowly turns red.

(2) Take 1 mL each of the test solution in (1) in test tubes A and B, respectively, add 10 mL of potassium hydrogen phthalate buffer solution (pH 3.5) to the test tube A and add 10 mL of phosphate buffer solution (pH 6.5) to the test tube B, add 1 mL of iodine TS to the test tubes A and B, respectively, allow them to stand for 5 minutes, then add 2 mL of sodium thiosulfate TS to each test tube; the test tube A exhibits red and the test tube B develops deep red color.

Optical rotation $[\alpha]_D^{20}$: Between -50.0° and -53.5° (1 g, after drying, 1 mol/L hydrochloric acid TS, 25 mL, 100 mm).

Purity (1) ***Clarity and color of solution***—Dissolve 0.1 g of Epinephrine in 10 mL of dilute hydrochloric acid; the solution is clear and the color is not more intense than that of the Color Matching Fluid A.

(2) ***Adrenalone***—Dissolve 50 mg of Epinephrine in 0.05 mol/L hydrochloric acid TS to make exactly 25 mL, and perform the test as directed under the Ultraviolet-visible Spectroscopy; the absorbance at a wavelength of 310 nm is NMT 0.40.

(3) ***Norepinephrine***—Weigh 10.0 mg of Epinephrine, dissolve in 2.0 mL of a solution of L-tartaric acid in methanol (1 in 200). Pipet 1 mL of this solution, and add 3.0 mL of pyridine. Add 1.0 mL of freshly prepared sodium naphthoquinone sulfonate TS, allow to stand for 30 minutes in the dark, and add 5.0 mL of pyridine containing 50 mg of L-ascorbic acid to the resulting solution; the color of the solution is not more intense than that of the control solution.

Control solution—Dissolve 2.0 mg of norepinephrine tartrate RS and 90 mg of epinephrine tartrate RS in methanol to make exactly 10 mL. Pipet 1 mL of this solution, and proceed in the same manner.

Loss on drying NMT 1.0% (2 g, in vacuum, silica gel, 18 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.3 g of Epinephrine, previously dried, dissolve in 50 mL of acetic acid(100), and titrate with 0.1 mol/L perchloric acid VS (indicator: 2 drops of methylrosaniline chloride TS). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 18.321 mg of $C_9H_{13}NO_3$

Packaging and storage Preserve in light-resistant, tight containers. Store at a cold place under nitrogen atmosphere.

Epinephrine Injection
에피네프린 주사액

Adrenaline Hydrochloride Injection
Epirenamine Hydrochloride Injection
Epinephrine Hydrochloride Injection

Epinephrine Injection is an aqueous solution for injection and contains NLT 0.085 w/v% and NMT 0.115 w/v% of epinephrine (C9H13NO3: 183.20).

Preparation Prepare as directed under Injections, with Epinephrine by dissolving in diluted hydrochloric acid (9 in 10000).

Description Epinephrine Injection occurs as a clear, colorless liquid.
It is gradually changed to pale red and then brown by air or light.

pH—Between 2.3 and 5.0.

Identification (1) Add 4 mL of water and 1 drop of iron(III) chloride TS to 1 mL of Epinephrine Injection; the solution turns dark green and slowly changes to red.

(2) Take 1 mL each of Epinephrine Injection in test tubes A and B and perform the test as directed under the Identification (2) under Epinephrine.

Sterility Meets the requirements.

Bacterial endotoxins Less than 357.0 EU per mg of epinephrine.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

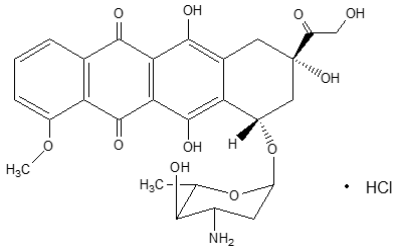
Extractable volume of injections Meets the requirements.

Assay Pipet 30 mL of Epinephrine Injection, transfer to a separatory funnel, add 25 mL of carbon tetrachloride, and shake vigorously to mix for 1 minute. Allow to stand, and discard the carbon tetrachloride layer. Repeat this procedure 3 times. Wash the stopper and inlet of the separatory funnel with a small amount of water, and introduce 0.2 mL of starch TS. While shaking, add iodine TS dropwise until the solution exhibits a persistent blue color, then immediately add sodium thiosulfate TS dropwise until the blue color disappears. Add 2.1 g of sodium bicarbonate to the liquid, preventing it from coming in contact with the inlet of the separatory funnel, and shake until most of the sodium bicarbonate dissolves. To this solution, immediately add 1.0 mL of acetic anhydride. Immediately stopper the separatory funnel loosely and allow to stand until the evolution of gas ceases. Shake vigorously, allow to stand for 5 minutes, extract six times with 25 mL volumes of chloroform. Filter each chloroform extract using cotton wool. Combine all chloroform extracts, evaporate on a steam bath to 3 mL with a current of air. Transfer this residue by means of small portions of chloroform to a tared beaker and heat again to evaporate to dryness. Dry the residue at 105 ºC for 30 minutes, cool in a desiccator (silica gel), weigh accurately the weight, W (mg), of the dried residue, and dissolve in chloroform to make exactly 5 mL. Determine the optical rotation, α_D, using a 100-mm cell as directed under the Optical Rotation.

$$\text{Amount (mg) of epinephrine } (C_9H_{13}NO_3) = 0.5923 \times W \times \left(0.5 + \frac{0.5 \times \alpha_D}{93}\right)$$

Packaging and storage Preserve in light-resistant, hermetic containers. Colored containers may be used for Epinephrine Injection.

Epirubicin Hydrochloride
에피루비신염산염



$C_{27}H_{29}NO_{11}$·HCl: 579.98

(8*R*,10*S*)-10-((2*S*,4*S*,5*R*,6*S*)-4-Amino-5-hydroxy-6-methyltetrahydro-2H-pyran-2-yl)-6,8,11-tri-hydroxy-8-(2-hydroxyacetyl)-1-methoxy-7,8,9,10-tetrahydrotetracene-5,12-dione hydrochloride [*56390-09-1*]

Epirubicin Hydrochloride is the hydrochloride of a derivative of daunorubicin.

Epirubicin Hydrochloride contains NLT 970 μg and NMT 1020 μg (potency) of epirubicin hydrochloride ($C_{27}H_{29}NO_{11}$ · HCl) per mg, calculated on the anhydrous and solvent-free basis.

Description Epirubicin Hydrochloride occurs as a pale yellowish red to brownish red powder.
It is soluble in water or methanol, slightly soluble in ethanol(95) and practically insoluble in acetonitrile.
It is hygroscopic.

Identification (1) Determine the absorption spectra of solutions of Epirubicin Hydrochloride and epirubicin hydrochloride RS in methanol (3 in 200000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Epirubicin Hydrochloride and epirubicin hydrochloride RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Optical rotation $[\alpha]_D^{20}$: Between +310° and +340° (10 mg calculated on the anhydrous and solvent-free basis, methanol, 20 mL, 100 mm).

pH Dissolve 10 mg of Epirubicin Hydrochloride in 2 mL of water; the pH of this solution is between 4.0 and 5.5.

Absorbance $E_{1cm}^{1\%}$ (495 nm): 200 to 230 (15 mg calculated on the anhydrous and solvent-free basis, methanol, 1000 mL).

Purity (1) ***Clarity and color of solution***—Dissolve 50 mg of Epirubicin Hydrochloride in 5 mL of water; the solution is clear and dark red.

(2) ***Heavy metals***—Proceed with 1.0 g of Epirubicin Hydrochloride as directed under Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Related substances***—Weigh accurately an amount equivalent to 50 mg (potency) of Epirubicin Hydrochloride, dissolve in the internal standard solution to make exactly 50 mL. Use this solution as the test solution. Take 10 μL of the test solution and perform the test as directed under the Liquid Chromatography according to the following conditions. Determine each peak area as directed in the automatic integration method and calculate the total peak area of substances other than epirubicin and 2-naphthalenesulfonic acid by the percentage peak area method; it is NMT 5.0%.

Internal standard solution—A solution of sodium 2-naphthalenesulfonate in a mixture of water, acetonitrile, methanol and phosphoric acid (540 : 290 : 170 : 1) (1 in 2000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 25 cm in length, packed with trimethylsilyl silica gel for liquid chromatography (6 μm in particle diameter).

Column temperature: A constant temperature of about 35 ℃.

Mobile phase: Dissolve 2 g of sodium lauryl sulfate in a mixture of water, acetonitrile, methanol and phosphoric acid (540 : 290 : 170 : 1) to make 1000 mL.

Flow rate: Adjust so that the retention time of epirubicin is about 9.5 minutes.

System suitability

Test for required detectability: Pipet 1 mL of the test solution, add the mobile phase to make exactly 100 mL, and use this solution as the system suitability solution (1). Pipet 1.0 mL of this solution and add the mobile phase to make exactly 10 mL. Confirm that the peak area of epirubicin obtained from 10 μL of this solution is equivalent to 7% to 13% of that obtained from 10 μL of the system suitability solution (1).

System performance: Weigh 50 mg (potency) of epirubicin hydrochloride RS and dissolve in the internal standard solution to make exactly 50 mL. Use this solution as the system suitability solution (2). Proceed with 10 μL of this solution according to the above conditions; the internal standard and epirubicin are eluted in this order with the resolution being NLT 20.

System repeatability: Repeat the test 5 times with 10 mL each of the system suitability solutions (2) according to the above conditions; the relative standard deviation of the ratios of the peak area of epirubicin to that of the internal standard is NMT 1.0%.

Time span of measurement: About 3 times the retention time of epirubicin after the solvent peak.

(4) ***Residual solvent***—Weigh accurately about 0.3 g of Epirubicin Hydrochloride, add exactly 0.6 mL of the internal standard solution, dissolve in dimethylacetamide to make 6 mL, and use it as the test solution. Separately, pipet 1 mL of methanol, add dimethylacetamide to make exactly 25 mL, and use this solution as the standard stock solution. Pipet 125 μL of acetone, 30 μL of ethanol(99.5), 32 μL of 1-propanol, and 17 μL of the standard stock solution each, add exactly 10 mL of the internal standard solution, then add dimethylacetamide to make 100 mL. Use this solution as the standard solution. Perform the test with 1 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the ratios, Q_{Ta} and Q_{Sa}, Q_{Tb} and Q_{Sb}, Q_{Tc} and Q_{Sc}, and Q_{Td} and Q_{Sd}, of peak areas of acetone, ethanol, 1-propanol and methanol to that of the internal standard, respectively. Calculate the amounts of acetone, ethanol, 1-propanol and methanol with the following equation: NMT 1.5%, NMT 0.5%, NMT 0.5% and NMT 0.1%, respectively.

$$\text{Content (\%) of acetone} = \frac{1}{W_T} \times \frac{Q_{Ta}}{Q_{Sa}} \times 593$$

$$\text{Content (\%) of ethanol} = \frac{1}{W_T} \times \frac{Q_{Tb}}{Q_{Sb}} \times 142$$

$$\text{Content (\%) of 1-propanol} = \frac{1}{W_T} \times \frac{Q_{Tc}}{Q_{Sc}} \times 154$$

$$\text{Content (\%) of methanol} = \frac{1}{W_T} \times \frac{Q_{Td}}{Q_{Sd}} \times 2.23$$

W_T: Amount (mg) of Epirubicin Hydrochloride taken

Internal standard solution—A solution of toluene in dimethylacetamide (1 in 100).

Operating conditions

Detector: A flame ionization detector

Column: A glass column about 0.25 mm in internal diameter and about 30 m in length, packed with 5% phenylmethyl silicone polymer for gas chromatography coated at 0.25 μm thick.

Column temperature: Maintain the temperature at 30 ℃ for the first 5 minutes, then raise the temperature at the rate of 2 ℃ per minute up to 40 ℃, and raise at the rate of 25 ℃ per minute up to 200 ℃ if necessary. Keep at 200 ℃ for 5 minutes.

Sample injection port temperature: A constant temperature of about 200 ℃.

Detector temperature: A constant temperature of about 200 ℃.

Carrier gas: Helium

Flow rate: About 1.0 mL per minute.

Split ratio: 1 : 100

System suitability

System performance: Proceed with 1 μL of the standard solution according to the above operation condi-

tions; acetone, methanol, ethanol, 1-propanol and the internal standard are eluted in this order. The resolution between the peaks of acetone and the internal standard is NLT 30.

System repeatability: Repeat the test 6 times with 1 μL each of the standard solutions according to the above conditions; the relative standard deviation of the peak areas of acetone, methanol, ethanol and 1-propanol is NMT 4.0% each.

Water NMT 8.0% (0.1 g, volumetric titration, direct titration).

Residue on ignition NMT 0.5% (0.1 g).

Sterility It meets the requirements when used in sterile preparations.

Bacterial endotoxins It is less than 1.1 EU per mg (potency) of epirubicin when used in the manufacturing of sterile preparations.

Histamine It meets the requirements when used in manufacturing of sterile preparations. Weigh an appropriate amount of Epirubicin Hydrochloride to prepare an aqueous solution containing 2.0 mg (potency) per mL and use the solution as the test solution. The amount of the test solution is 0.5 mL.

Assay Weigh accurately about 50 mg each of Epirubicin Hydrochloride and epirubicin hydrochloride RS, dissolve in the mobile phase to make exactly 50 mL each, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the ratios, Q_T and Q_S, of the peak area of epirubicin hydrochloride to that of the internal standard.

$$\text{Potency (μg) of epirubicin hydrochloride } (C_{27}H_{29}NO_{11}\cdot HCl) = \text{Potency (μg) of epirubicin hydrochloride RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of sodium 2-naphthalenesulfonate in a mixture of water, acetonitrile, methanol and phosphoric acid (540 : 290 : 170 : 1) (1 in 2000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 25 cm in length, packed with trimethylsilyl silica gel for liquid chromatography (6 μm in particle diameter).

Column temperature: A constant temperature of about 35 °C.

Mobile phase: Dissolve 2 g of sodium lauryl sulfate in a mixture of water, acetonitrile, methanol and phosphoric acid (540 : 290 : 170 : 1) to make 1000 mL.

Flow rate: Adjust so that the retention time of epirubicin hydrochloride is about 9.5 minutes.

System suitability

System performance: Proceed with 10 μL of the standard solution according to the above operating conditions; the internal standard and epirubicin are eluted in this order with the resolution being NLT 20.

System repeatability: Repeat the test 5 times with 10 μL each of the standard solutions according to the above operating conditions; the relative standard deviation of the ratios of the peak area of epirubicin to that of the internal standard is NMT 1.0%.

Packaging and storage Preserve in tight containers (0 to 5 °C).

Epirubicin Hydrochloride Injection
에피루비신염산염 주사액

Epirubicin Hydrochloride Injection contains NLT 90.0% and NMT 120.0% of the labeled amount of epirubicin hydrochloride ($C_{27}H_{29}NO_{11}\cdot HCl$: 579.98).

Method of preparation Prepare as directed under Injections, with Epirubicin Hydrochloride.

Identification The retention time ratios of the major peaks from the test solution and standard solution obtained under the Assay to the peaks of the internal standard are the same.

pH Between 2.5 and 3.5.

Sterility Meets the requirements.

Bacterial endotoxins Less than 1.1 EU per mg (potency) of epirubicin hydrochloride. Weigh an appropriate amount of Epirubicin Hydrochloride Injection, dissolve in water for endotoxin assay to obtain a solution having known concentration of 0.125 mg (potency) per mL, and use this solution as the test solution.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Extractable volume of injections Meets the requirements.

Assay Weigh accurately about 10 mg of Epirubicin Hydrochloride Injection according to the labeled potency, dissolve in 4.0 mL of internal standard solution, add the

mobile phase to make 10 mL, and use this solution as the test solution. Separately, weigh accurately about 10 mg (potency) of epirubicin hydrochloride RS, dissolve in exactly 4.0 mL of the internal standard solution, add the mobile phase to make exactly 10 mL, and use this solution as the standard solution. Perform the test with 5 μL each of the test solution and the standard solution as directed under the Liquid Chromatography, and calculate the ratios, QT and QS, of the peak area of epirubicin hydrochloride to that of the internal standard.

$$\text{Potency (μg) of epirubicin hydrochloride } (C_{27}H_{29}NO_{11}\cdot HCl) = \text{Potency (μg) of epirubicin hydrochloride RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—Weigh 1 g of sodium 2-naphthalenesulfonate and dissolve in a mixture of water and acetonitrile (69 : 31) to make 500 mL.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 μm in particle diameter).

Mobile phase: A mixture of water and acetonitrile (69 : 31), adjusted the pH to 2.0 with phosphoric acid.

Flow rate: Adjust the flow rate so that the retention time of epirubicin hydrochloride is about 10 minutes.

System suitability

System performance: Proceed with 5 μL of the standard solution according to the above conditions; the internal standard and epirubicin hydrochloride are eluted in this order with the resolution being NLT 8.0.

System repeatability: Repeat the test 6 times with 5 μL each of the standard solution under the above operating conditions; the relative standard deviation of the peak area ratio of epirubicin to that of the internal standard is NMT 1.0%.

Packaging and storage Preserve in hermetic containers.

Epirubicin Hydrochloride for Injection
주사용 에피루비신염산염

Epirubicin Hydrochloride for Injection is an injection to be dissolved before use and contains NLT 90.0% and NMT 120.0% of the labeled amount of epirubicin hydrochloride ($C_{27}H_{29}NO_{11}\cdot HCl$: 579.98).

Method of preparation Prepare as directed under Injections, with Epirubicin Hydrochloride.

Description Epirubicin Hydrochloride for Injection occurs as a red powder or a mass.

Identification The retention time ratios of the major peaks from the test solution and the standard solution obtained under the Assay to the peak of the internal standard are the same.

pH Dissolve Epirubicin Hydrochloride for Injection in water to make 2 mg (potency) per mL; the pH of the solution is between 4.5 and 6.0.

Sterility Meets the requirements.

Bacterial endotoxins Less than 1.1 EU per mg (potency) of epirubicin hydrochloride for injection. Weigh an appropriate amount of Epirubicin Hydrochloride for Injection to obtain a solution having known concentration of 0.125 mg (potency) per mL using water for endotoxin assay, and use this solution as the test solution.

Histamine Meets the requirements. Weigh an appropriate amount of Epirubicin Hydrochloride for Injection to obtain an aqueous solution having known concentration of 2.0 mg per mL, and use this solution as the test solution. The amount of test solution is 0.5 mL.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Uniformity of dosage units Meets the requirements.

Water NMT 4.0% (0.2 g, volumetric titration, direct titration).

Assay Weigh accurately about 10 mg (potency) of Epirubicin Hydrochloride for Injection according to the labeled potency, dissolve in the internal standard solution to make exactly 10 mL, and use this solution as the test solution. Separately, weigh accurately about 10 mg (potency) of epirubicin hydrochloride RS, dissolve in the internal standard solution to make exactly 10 mL, and use this solution as the standard solution. Perform the test with 5 μL each of the test solution and the standard solution as directed under the Liquid Chromatography, and determine the ratios, QT and QS, of the peak area of epirubicin hydrochloride to that of the internal standard in each solution.

$$\text{Potency (μg) of epirubicin hydrochloride } (C_{27}H_{29}NO_{11}\cdot HCl) = \text{Potency (μg) of epirubicin hydrochloride RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—Weigh 1 g of sodium 2-naphthalenesulfonate and dissolved in a mixture of water and acetonitrile (69 : 31) to make 500 mL.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 μm in particle diameter).

Mobile phase: A mixture of water and acetonitrile (69 : 31), adjusted the pH to 2.0 with phosphoric acid.

Flow rate: Adjust the flow rate so that the retention time of epirubicin hydrochloride is about 10 minutes.

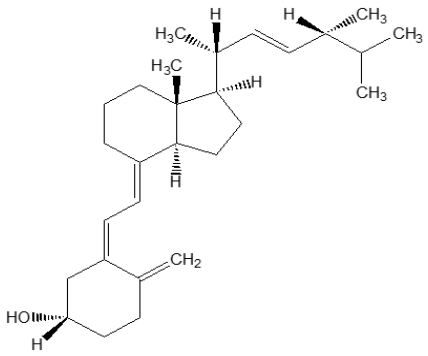
System suitability

System performance: Proceed with 5 μL of the standard solution according to the above conditions; the internal standard and epirubicin hydrochloride are eluted in this order with the resolution being NLT 8.0.

System repeatability: Repeat the test 6 times with 5 μL each of the standard solution under the above operating conditions; the relative standard deviation of the peak area ratio of epirubicin to that of the internal standard is NMT 1.0%.

Packaging and storage Preserve in hermetic containers.

Ergocalciferol
에르고칼시페롤



Vitamin D_2

Calciferol $C_{28}H_{44}O$: 396.65

(5*Z*,7*E*,22*E*)-(3*S*)-9,10-Seco-5,7,10(19),22-ergostatetraen-3-ol [*50-14-6*]

Ergocalciferol contains NLT 97.0% and NMT 103.0% of ergocalciferol ($C_{28}H_{44}O$).

Description Ergocalciferol occurs as white crystals. It is odorless or has a slightly characteristic odor.

It is freely soluble in ethanol(95), chloroform or ether, sparingly soluble in isooctane, and practically insoluble in water.

It is affected by air or light.

Melting point—Between 115 and 118 ℃ [Put Ergocalciferol into a capillary tube, and dry in a desiccator (in vacuum, NMT 2.67 kPa) for 3 hours, immediately seal the capillary tube and put the tube into a bath fluid, previously heated at a temperature 10 ℃ lower than the expected melting point, and measure the melting point with heating at a rate of 3°C per minute.]

Identification (1) Dissolve 0.5 mg of Ergocalciferol in 5 mL of chloroform, add 0.3 mL of acetic anhydride and 0.1 mL of sulfuric acid, and shake to mix; the resulting solution exhibits a red color, and rapidly changes through violet and blue to green.

(2) Determine the infrared spectra of Ergocalciferol and ergocalciferol RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Optical rotation $[\alpha]_D^{20}$: Between +102° and +107° (0.3 g, ethanol(95), 20 mL, 100 mm). Dissolve Ergocalciferol within 30 minutes after the container has been opened, and determine the rotation within 30 minutes after the solution has been prepared.

Absorbance $E_{1cm}^{1\%}$ (265 nm): Between 445 and 485 (10 mg, ethanol(95), 1000 mL).

Purity (1) ***Ergosterol***—Dissolve 10 mg of Ergocalciferol in 20 mL of diluted ethanol (9 in 10), add a solution of 20 mg of digitonin dissolved in 2.0 mL of ethanol (9 in 10), and allow to stand for 18 hours; no precipitate is formed.

(2) ***Reducing substances***—To 10 mL of a solution of Ergocalciferol in ethanol(99.5) (1 in 100), add 0.5 mL of a solution of blue tetrazolium in methanol (1 in 200) and 0.5 mL of a solution of tetramethylammonium hydroxide in ethanol(99.5) (1 in 10), and allow to stand for 5 minutes. After exactly 5 minutes, add 1 mL of acetic acid(100), and use this solution as the test solution. Proceed with 10 mg of ethanol(95.5) in the same manner, and use the resulting solution as the blank test solution. Dissolve an appropriate amount of hydroquinone in anhydrous alcohol to make a solution containing 0.2 μg per mL, proceed with this solution in the same manner, and use the resulting solution as the standard solution. Determine the absorption spectra of the test solution and the standard solution, using the blank test solution as the control solution, as directed under the Ultraviolet-visible Spectroscopy at the absorbance maximum wavelength around 525 nm; the absorbance of the test solution is not greater than that of the standard solution.

Assay Weigh accurately about 30 mg each of Ergocalciferol and ergocalciferol RS and dissolve them in isooctane, respectively, to make exactly 50 mL. Pipet 10 mL each of these solutions, add exactly 3 ml of the internal standard solution to each, add the mobile phase to make 50 mL, and use these solutions as the test solution and the standard solution. Perform the test with 10 μL to 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the ratios Q_T and Q_S,

of peak area of ergocalciferol to that of the internal standard from each solution. Perform the procedure quickly avoiding contact with air or other oxidizing agents as much as possible and using light-resistant containers.

$$\text{Amount (mg) of ergocalciferol } (C_{28}H_{44}O) = \text{Amount (mg) of ergocalciferol RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of dimethyl phthalate in isooctane (1 in 100).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and 10 cm to 30 cm in length, packed with silica gel for liquid chromatography (5 μm to 10 μm in particle diameter).

Column temperature: A constant temperature of about 20 °C.

Mobile phase: A mixture of hexane and *n*-amyl alcohol (997 : 3).

Flow rate: Adjust the flow rate so that the retention time of ergocalciferol is about 25 minutes.

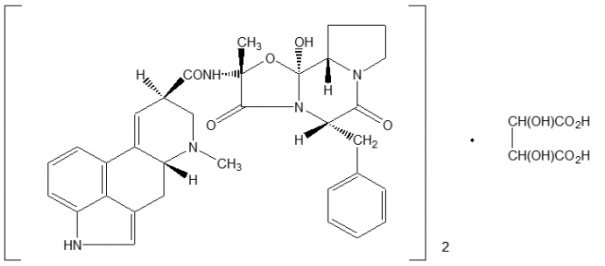
System suitability

System performance: Dissolve 15 mg of ergocalciferol RS in 25 mL of isooctane, transfer the resulting solution into a flask, heat in an oil bath under a reflux condenser for 2 hours, and then cool immediately to room temperature. Transfer the cooled solution to a quartz test tube and irradiate with a short-wavelength lamp (main wavelength: 254 nm) and a long-wavelength lamp (main wavelength: 365 nm) for 3 hours. To 10 mL of this solution, add the mobile phase to make 50 mL. Proceed with 10 μL of this solution according to the above operating conditions; the relative retention times of previtamin D_2, transvitamin D_2 and tachysterol$_2$ to that of ergocalciferol are about 0.5, about 0.6 and about 1.1, respectively, and the resolution between previtamin D_2 and transvitamin D_2 is NLT 0.7, and the resolution between ergocalciferol and tachysterol$_2$ is NLT 1.0.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution according to the above operating conditions; the relative standard deviation of the ratios of the peak area of ergocalciferol to that of the internal standard is NMT 1.0%.

Packaging and storage Preserve in light -resistant, hermetic containers under nitrogen atmosphere in a cold place.

Ergotamine Tartrate
에르고타민타르타르산염



$(C_{33}H_{35}N_5O_5)_2\ C_4H_6O_6$: 1313.41

(5'*S*)-5'-Benzyl-12'-hydroxy-2'-methylergotaman-3',6',18-trione hemitartrate [*379-79-3*]

Ergotamine Tartrate contains NLT 98.0% and NMT 101.0% of ergotamine tartrate [$(C_{33}H_{35}N_5O_5)_2 \cdot C_4H_6O_6$], calculated on the dried basis.

Description Ergotamine Tartrate occurs as a colorless crystal, or a white to pale yellowish white or grayish white crystalline powder.

It is slightly soluble in water or ethanol(95).

Melting point—About 180 °C (with decomposition).

Identification (1) Dissolve 1 mg of Ergotamine Tartrate in a mixture of acetic acid(100) and ethyl acetate (1 : 1), pipet 0.5 mL of this solution, shake to mix in cold water, add 0.5 mL of sulfuric acid, and allow to stand; the resulting solution exhibits a violet color. Add 0.1 mL of diluted iron(III) chloride TS (1 in 12) to the solution; the color of the solution turns blue to bluish purple.

(2) Dissolve 1 mg of Ergotamine Tartrate in 5 mL of L-tartaric acid (1 in 100). To 1 mL of this solution, add 2 mL of 4-dimethylaminobenzaldehyde-iron(III) chloride TS, and shake to mix; the resulting solution exhibits a blue color.

Optical rotation ***Ergotamine base*** $[\alpha]_D^{20}$: Between -155° and -165°. Dissolve 0.35 g of Ergotamine Tartrate in 25 mL of L-tartaric acid (1 in 100), add 0.5 g of sodium bicarbonate, shake gently and sufficiently to mix, and extract with four 10 mL portions of ethanol-free chloroform. Filter each chloroform extract through a small filter paper, moistened with ethanol-free chloroform, into a 50-mL volumetric flask, allow to stand on a steam bath at 20 ℃ for 10 minutes, and add 20 ℃ ethanol-free chloroform to make 50 mL. Determine the optical rotation of this solution in a 100 mm cell. Pipet 25 mL of this solution, and evaporate to dryness in vacuum at below 45 ℃. Dissolve the residue in 25 mL of acetic acid(100), and titrate with 0.05 mol/L perchloric acid VS (indicator: 1 drop of methylosaniline chloride TS). Perform a blank test in the same manner and make any necessary correction. Calculate the specific optical rotation of ergotamine base from the consumed volume of 0.05 mol/L perchloric acid and the optical rotation.

$$\text{Each mL of 0.05 mol/L perchloric acid VS} = 29.084 \text{ mg of } C_{33}H_{35}N_5O_5$$

Purity ***Related substances***—Perform this test using light-resistant containers. Weight 40 mg of Ergotamine Tartrate, add exactly 10 mL of a solution of L-tartaric acid in diluted methanol (1 in 2) (1 in 1000), dissolve by shaking well to mist, and use the resulting solution as the test solution. Pipet 1 mL of this solution, add a solution of L-tartaric acid in diluted ethanol (1 in 2) (1 in 1000) to make exactly 50 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of chloroform and methanol (9 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Spray evenly 4-dimethylaminobenzaldehyde TS on the plate; the spots other than the principal spot obtained from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 5.0% (0.1 g, in vacuum, 60 ℃, 4 hours).

Assay Weigh accurately about 0.2 g of Ergotamine Tartrate, dissolve in 15 mL of a mixture of acetic acid(100) and acetic anhydride (50 : 3), and titrate with 0.05 mol/L perchloric acid VS (indicator: 1 drop of methylrosaniline chloride TS). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.05 mol/L perchloric acid VS
= 32.836 mg of $(C_{33}H_{35}N_5O_5)_2 \cdot C_4H_6O_6$

Packaging and storage Preserve in light-resistant, tight containers. Fill the container almost full or replace the air in the empty part with nitrogen and store at below 5℃.

Ergotamine Tartrate Tablets
에르고타민타르타르산염 정

Ergotamine Tartrate Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of ergotamine tartrate [$(C_{33}H_{35}N_5O_5)_2 \cdot C_4H_6O_6$: 1313.41].

Method of preparation Prepare as directed under Tablets, with Ergotamine Tartrate.

Identification Weigh an amount of Ergotamine Tartrate Tablets, previously powdered, equivalent to 5 mg of ergotamine tartrate according to the labeled amount, add 10 mL of hexane, shake for a few minutes to mix, and allow to stand. Then, discard the hexane extracts, add 10 mL of ammonia water(28)-saturated chloroform to the residue, shake for a few minutes to mix, filter, and evaporate the filtrate to dryness on a steam bath. Dissolve the residue with 8 mL of a mixture of acetic acid(100) and ethyl acetate (1 : 1), take 1 mL of this solution, and slowly add 1 mL of sulfuric acid dropwise while shaking to mix in iced water; the resulting solution exhibits a violet color. To this solution, add 0.1 mL of diluted iron(III) chloride TS (1 in 2); the solution turns blue to bluish purple.

Disintegration It meets the requirements when it is a sublingual tablet. However, the time of the test is 5 minutes.

Dissolution This test is applicable when it is not a sublingual tablet. Perform the test with 1 tablet of Ergotamine Tartrate Tablets at 75 revolutions per minute according to Method 2 under the Dissolution, using 1000 mL of L-tartaric acid solution (1 in 100) as the dissolution medium. Take the dissolved solution 30 minutes after starting the dissolution test, filter, and use the filtrate as the test solution. Separately, weigh accurately an appropriate amount of ergotamine tartrate RS, add the dissolution medium to make the constant concentration, and use this solution as the standard solution. Perform the test with the test solution and the standard solution as directed under the Fluorescence Spectroscopy using the dissolution medium as a control solution, and determine the absorbances at an excitation wavelength of 327 nm and a fluorescence wavelength of 427 nm.

It meets the requirements when the dissolution rate of Ergotamine Tartrate Tablets for 30 minutes is NLT 75%.

Uniformity of dosage units It meets the requirements when the procedure for content uniformity is performed as directed under the Assay.

Assay Weigh accurately the mass of NLT 20 Ergotamine Tartrate Tablets, and powder. Weigh an amount equivalent to about 10 mg of ergotamine tartrate [$(C_{33}H_{35}N_5O_5)_2 \cdot C_4H_6O_6$], add 50.0 mL of the internal standard solution and 300 mL of a mixture of acetonitrile and water (55 : 45), sonicate for 10 minutes, and shake to mix. Then, add a mixture of acetonitrile and water (55 : 45) to make exactly 500 mL, mix, and filter. Discard the first filtrate, and use the subsequent filtrate as the test solution. Separately, weigh accurately about 10 mg ergotamine tartrate RS, previously dried at 60 ℃ in vacuum for 4 hours, and dissolve in a mixture of acetonitrile and water (55 in 45) to make exactly 50 mL. Pipet 5 mL of this solution, add 5.0 mL of the internal standard solution, add a mixture of acetonitrile and water (55 : 45) to make exactly 50 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the peak area ratios, Q_T and Q_S, of ergotamine to the peak area of the internal standard, respectively.

Amount (mg) of ergotamine tartrate
$[(C_{33}H_{35}N_5O_5)_2 \cdot C_4H_6O_6]$

= Amount (mg) of ergotamine tartrate RS× $\frac{Q_T}{Q_S}$

Internal standard solution—Dissolve about 40 mg of ergometrine maleate in a mixture of acetonitrile and water to make 250 mL.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 3.9 mm in internal diameter and about 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 to 10 μm in particle diameter).

Mobile phase: A mixture of acetonitrile and 0.01 mol/L potassium dihydrogen phosphate solution (55 : 45).

Flow rate: 1 mL/min

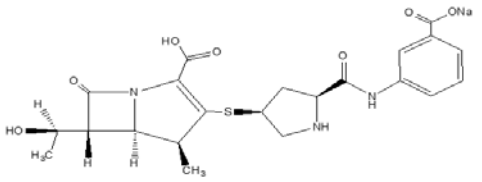
System suitability

System performance: Proceed with 20 μL of the standard solution according to the above conditions; the symmetry factor of ergotamine is NMT 2.0 with the resolution between the standard solution and the internal standard being NLT 3.0.

System repeatability: Repeat the test 6 times with 20 μL of the standard solution according to the above conditions; the relative standard deviation of the peak area ratio is NMT 2.0%.

Packaging and storage Preserve in light-resistant, well-closed containers.

Ertapenem Sodium
에르타페넴나트륨



Ertapenem Sodium $C_{22}H_{24}N_3NaO_7S$: 497.50
Sodium 3-({[(2*S*,4*S*)-4-({(4*R*,5*S*,6*S*)-2-carboxy-6-[(1*R*)-1-hydroxyethyl]-4-methyl-7-oxo-1-azabicyclo[3.2.0]hept-2-en-3-yl}sulfanyl)pyrrolidin-2-yl]carbonyl}amino)benzoate, [*153773-82-1*]

Ertapenem Sodium contains NLT 917 μg and NMT 970 μg (potency) of ertapenem ($C_{22}H_{25}N_3O_7S$: 475.52) per mg, calculated on the anhydrous and solvent-free basis.

Description Ertapenem Sodium occurs as a white to grayish white powder.
It is freely soluble in water, and practically insoluble in ethanol.
It is hygroscopic.

Identification (1) Determine the infrared spectra of Ertapenem Sodium and ertapenem sodium RS as directed in the paste method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) Dissolve 0.1 g (potency) of Ertapenem Sodium in 10 mL of water; the resulting solution responds to the Qualitative Analysis (1) for sodium salt.

Optical rotation $[\alpha]_{405nm}^{25}$: Between +216° and +238° (1.0 g, calculated on the anhydrous and solvent-free basis, water, 100 mL, 100 mm).

Purity (1) ***Related substances***—Just before starting this test, weigh accurately about 20 mg (potency) of Ertapenem Sodium, dissolve in water to make exactly 100 mL, and use this solution as the test solution. Perform the test with 10 μL of the test solution as directed under the Liquid Chromatography according to the following conditions, and determine the ratios of the peak area of each related substance to total area of the peaks excluding solvent peak from the test solution (ring-opened compound: NMT 1.4%,xazinone: NMT 0.2%, ProMABA: NMT 0.6%, total dimer: NMT 1.3%, other individual related substances: NMT 0.1%, total related substances: NMT 3.1%).

Contents (%) of individual related substances

$$= \frac{Peak\ areas\ of\ individual\ related\ substances\ in\ test\ solution}{\left[Sum\ of\ all\ peak\ areas\ other\ than\ solvent\ peak\ in\ test\ solution\right]}$$

Total content (%) of related substances
= Sum of contents (%) of all related substances

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 230 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with phenylated silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase

Mobile phase A: 15 mmol/L sodium phosphate TS (pH 8.0).

Mobile phase B: Acetonitrile

Mobile phase gradient elution conditions

Time (min)	Mobile phase A (%)	Mobile phase B (%)
0 - 3	98 → 95	2 → 5
3 - 25	95 → 85	5 → 15
25 - 35	85 → 75	15 → 25
35 - 45	75	25

Flow rate: 1.0 mL/min

The relative retention time of each related substance peak to the ertapenem peak is as follows.

Component	Relative Retention time	Component	Relative Retention time
Oxazinon peak I	0.27	Dimer VI	1.10
Oxazinon peak II	0.28	Dimer III	1.15
cis-Hydroxy proMABA	0.44	*trans*-Methanolysis product	1.18
Ring-opened compound	0.50	L-749345 Side-chain product	1.45
trans-Hydroxy proMABA	0.56	Dimer-H_2O(a)+dimer-H_2O(b)	1.55
ProMABA	0.65	Dimer V	1.65
Dimer I	0.85	PAB-L-749345	1.79
Dimer II	0.90	Disulfide	1.82
cis-Methanolysis product	0.97	Dimethylamide	2.04
Ertapenem	1.00	PAB side-chain	2.29

(2) ***Residual solvent***—Weigh accurately about 50 mg (potency) of Ertapenem Sodium, dissolve in water to make exactly 10 mL, and use this solution as the test solution. Pipet 1 mL each of methyl acetate, methanol, 2-propanol and 1-propanol, add water to make exactly 100 mL, and use this solution as the standard stock solution. Dilute this standard stock solution with water to prepare 0.01 vol% and 0.0001 vol% standard solutions, and use water as a blank test solution. Pipet accurately 1 mL each of the test solution, the standard solution and the blank test solution, transfer them to headspace vials, close with appropriate elastomeric closures, perform the test as directed under the Gas Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of the residual solvent from the test solution and the standard solution (methyl acetate: NMT 1.3%, methanol: NMT 0.3%, 2-propanol: NMT 0.5%, 1-propanol: NMT 0.1%).

$$\text{Content (\%) of residual solvent} = \frac{A_T}{A_S} \times \frac{d \times Volume\ (\%)\ of\ residual\ solvent\ in\ standard\ solution}{Amount\ (g)\ of\ sample\ taken} \times \text{Dilution factor of the test solution}$$

d: Density (g/mL) of residual solvent (methyl acetate: 0.93, methanol and 2-propanol: 0.79, 1-propanol: 0.80)

Operating conditions

Detector: A hydrogen flame ionization detector

Column: A stainless steel column about 0.32 mm in internal diameter and about 30 m in length, packed with porous dimethylpolysiloxane for gas chromatography (5 μm in particle diameter).

Column temperature: Maintain at 35 °C for 8 minutes, and then raise to 125 °C at a rate of 50 °C per minute.

Temperature of injection port: About 180 °C.

Temperature of detector: About 250 °C.

Carrier gas: Helium

Conditions of headspace

Temperature of injection port: 85 °C

Injection time of test solution: 0.1 minute

Temperature of needle: 125 °C

Temperature of conveying port: 135 °C

Circulation time of gas chromatograph: 20 minutes

Constant temperature retention time: 15 minutes

Pressurization time: 2.0 minutes

Sterility It meets the requirements when used in sterile preparations. However, it is excluded in cases where there is a terminal sterilization process in the manufacturing process of sterile preparations.

Water Between 15.5% and 19.0% (0.1 g, volumetric titration, direct titration).

Assay Weigh accurately bout 30 mg (potency) of Ertapenem Sodium and ertapenem sodium RS at places with the relative humidity of 50% to 60% and NMT 10%, respectively, dissolve in 10 mmol/L 3-(*N*-morpholine) propanesulfonic acid buffer solution, pH 7.0, and use these solutions as the test solution and the standard solution, respectively. Store the test solution and the standard solution at 4 °C and use within 18 hours. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas A_T and A_S, of ertapenem from each solution.

$$\text{Potency (μg) of ertapenem } (C_{22}H_{25}N_3O_7S) = \text{Potency (μg) of ertapenem sodium RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 307 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 10 cm in length, packed with octylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: Control the mixing ratio of mobile phase A and mobile phase B stepwise or via the gradient elution as follows.

Mobile phase A: 0.1% phosphoric acid

Mobile phase B: Acetonitrile.

Mobile phase gradient elution conditions

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 - 5	85	15
5 - 14	85 → 50	15 → 50
14 - 15	50 → 85	50 → 15
15 - 20	85	15

Flow rate: Adjust the flow rate so that the retention time of ertapenem is about 2.5 to 5.0 minutes.

Packaging and storage Preserve in tight containers.

Ertapenem Sodium for Injection
주사용 에르타페넴나트륨

Ertapenem Sodium for Injection is an injection, which is dissolved before use, and contains NLT 90.0% and NMT 120.0% of the labeled amount of ertapenem ($C_{22}H_{25}N_3O_7S$: 475.52).

Preparation Prepare as directed under Injections, with Ertapenem Sodium.

Description Ertapenem Sodium for Injection occurs as a white to grayish white powder.

Identification The retention times of the major peaks obtained from the test solution and standard solution in the Assay are the same.

pH Dissolve 1.0 g (potency) of Ertapenem Sodium for Injection in 0.9% sodium chloride injection to make 1 mL; the pH of this solution is 7.0 to 8.0.

Purity ***Related substances***—After performing the test as directed under the Assay, calculate as follows from the peak areas for each related substance (ring-opened NMT 10.0%; oxazinone NMT 1.2%; total dimers NMT 6.3%; NMT 0.2% each for other related substances; total related substances NMT 17.5%).

Content (%) of each related substance
= (A_D / A_S) × amount [mg (potency)] of ertapenem sodium RS / {labeled amount [mg (potency) / vial] of ertapenem sodium] × *RRF*} × 100

A_D: Peak area of related substance in test solution
A_S: Peak area of ertapenem in standard solution
RRF: Relative response factor of individual related substance peaks

Related substance	Relative response factor
Ring-opened	0.88
Oxazinone	0.98
Dimers I and II	0.66

Total dimers (%) = Sum of amounts (%) of all dimers (Dimers I, II, III, V, VI, Dimer IV + Dimer-H_2O).

Total related substances (%)
= Sum of amounts (%) of all related substances whose amount is NLT 0.1%.

Sterility Meets the requirements.

Bacterial endotoxins Ertapenem Sodium for Injection is NMT 0.35 EU per mg (potency) of ertapenem.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Uniformity of dosage units Meets the requirements.

Water In a location of relative humidity NMT 25%, without removing the elastomeric closure and metal ring, weigh accurately the entire mass of 1 vial of Ertapenem Sodium for Injection, and inject 20.0 mL of a mixture of methanol and dimethylformamide (1 : 1) into the vial through a syringe. Shake to mix for 4 to 8 minutes until the sample is completely dissolved, and use a syringe to place the dissolved test solution in 2 1.5 mL test tubes, immediately insert the stoppers, and centrifuge for 2 minutes at 14000 revolutions per minute. From the two test tubes, weigh the clean supernatant and place in vials for gas chromatography. Use these solutions as the test solutions. Evacuate the remaining solution from the vial of Ertapenem Sodium for Injection, wash with methanol and dry, measure the sum of the masses of the vial, elastomeric closure and metal ring, and subtract this sum from the total mass. Use the difference as the amount (mg) of sample. Separately, place 100 μL of water each in 100-mL and 200-mL volumetric flasks, previously dried for 2 hours at 100 ℃ and cooled to room temperature before use, and add a mixture of methanol and dimethylformamide (1 : 1) to the gauge line. Immediately plug with an elastomeric closure and seal, and mix well. Use these solutions as the standard solution (1) (1 mg/mL) and the standard solution (2) (0.5 mg/mL). Place a mixture of methanol and dimethylformamide (1 : 1) in a volumetric flask previously dried for 2 hours at 100 ℃ and cooled to room temperature before use, immediately plug with an elastomeric closure and seal, and use this solution as the blank test solution. Perform the test with 1 μL each of the test solution and the standard solution (1) (1 mg/mL) as directed under the Gas Chromatography according to the following conditions, and measure the water peak areas, A_T and A_S of the test solution and the standard solution (NMT 2.3%). Use a mixture of methanol and dimethylformamide (1 : 1) prepared by placing

500 mL of methanol and 500 mL of dimethylformamide in a 1000-mL container, mixing well, substituting with nitrogen and sealing.

$$\text{Water (\%) in Ertapenem Sodium for Injection} = (A_T / A_S) \times (0.1 / \text{amount of sample (mg)}) \times 1000 \times (20 / 100) \times 100$$

0.1: Amount (mL) of water in the standard solution (1)

1000: Specific gravity of water (mg/mL)

20: Dilution factor of the test solution

100: Dilution factor of the standard solution

Operating conditions

Detector: Thermal conductivity detector

Column: A gas pipe about 0.53 mm in internal diameter and about 25 m in length, packed with porous polystyrene-divinylbenzene copolymer for gas chromatography (20 μm in particle diameter).

Column temperature: Hold at 90 ℃ for 5 minutes, heat at a rate of 25 ℃ per minute to 250 ℃, and hold at 250 ℃ for 5 minutes. Re-equilibrate for 1 minute at 90 ℃ before the next injection.

Injection port temperature: 200 ℃

Detector temperature: 250 ℃

Carrier gas: Helium

Flow rate: Adjust the flow rate so that the retention time of water is between 1 and 2 minutes.

Assay Weigh accurately about 20 mg (potency) of Ertapenem Sodium for Injection and ertapenem sodium RS, dissolve in the diluent to contain exactly 0.2 mg (potency) per mL. Use these solutions as the test solution and the standard solution. Store the test solution and the standard solution at 5±3 ℃, and use within 24 hours. Pipet 10 μL each of the test solution and the standard solution, perform the test as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of ertapenem for each solution.

$$\text{Amount [mg (potency)] of ertapenem } (C_{22}H_{25}N_3O_7S) = \text{Amount [mg (potency)] of ertapenem sodium RS} \times (A_T / A_S)$$

Diluent—Mixture of 15 mmol/L 4-morpholine propane sulfonate (pH 7.5) and acetonitrile (9 : 1).

4-morpholine propane sulfonate (pH 7.5)—Dissolve 3.5 g of 4-morpholine propane sulfate in 1000 mL of water, and adjust pH to 7.5.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 230 nm).

Column: A stainless steel column 4.6 mm in internal diameter and 2.5 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: Control the mixing ratio of mobile phase A and mobile phase B stepwise or via the gradient elution as follows.

Mobile phase A: 0.1% phosphoric acid (pH 8.0)

Mobile phase B: Mixture of acetonitrile and 0.1% phosphoric acid (pH 8.0) (1 : 3).

Mobile phase gradient elution conditions

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 - 3	94	6
3 - 6	94 → 80	6 → 20
6 - 11	80 → 72	20 → 28
11 - 15	72	28
15 - 33	72 → 40	28 → 60
33 - 34	40 → 0	60 → 100
34 - 28	0	100

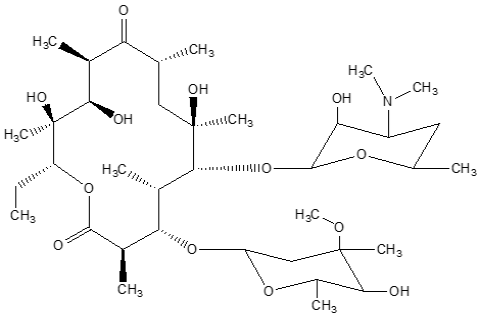
Flow rate: 1.0 mL/min

Relative retention time of each related substance

Component	Relative retention time
Oxazinone	0.25
Ring-opened	0.55
proMABA	0.64
Ertapenem	1.00
Dimers I + II	0.86, 0.91, 0.93
Dimer VI	1.2
Dimer III	1.3
Dimer IV + Dimer-H_2O	1.7
Dimer V	1.8

Packaging and storage Preserve in hermetic containers.

Erythromycin
에리트로마이신



Erythromycin $C_{37}H_{67}NO_{13}$: 733.93
(3*R*,4*S*,5*S*,6*R*,7*R*,9*R*,11*R*,12*R*,13*S*,14*R*)-6-[(2*S*,3*R*,4*S*,6*R*)-4-(Dimethylamino)-3-hydroxy-6-methyloxan-2-yl]oxy-14-ethyl-7,12,13-trihydroxy-4-[(2*R*,4*R*,5*S*,6*S*)-5-hydroxy-4-methoxy-4,6-dimethyloxan-2-yl]oxy-3,5,7,9,11,13-hexamethyl-oxacyclo-tetradecane-2,10-dione [*114-07-8*]

Erythromycin is a macrolide substance having antifungal activity produced by the growth of *Saccharopolyspora erythraea*.

Erythromycin contains NLT 930 μg and NMT 1020 μg (potency) of erythromycin ($C_{37}H_{67}NO_{13}$) per mg, calculated on the anhydrous basis.

Description Erythromycin occurs as a white to pale yellowish white powder.
It is very soluble in *N*,*N*-dimethylformamide, freely soluble in methanol or ethanol(95), and slightly soluble in water.

Identification (1) Determine the infrared spectra of Erythromycin and erythromycin RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) Dissolve 10 mg each of Erythromycin and erythromycin RS in 1 mL of methanol, and use these solutions as the test solution and the standard solution, respectively. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of methanol and ammonia water(28) (50 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Spray evenly 4-methoxybenzaldehyde-sulfuric acid TS on the plate, and heat at 100 ℃ for 15 minutes; the spots obtained from the test solution and the standard solution show a dark purple color and the R_f values are the same.

Optical rotation $[\alpha]_D^{20}$: Between -71° and -78° (1g, calculated on the anhydrous basis, ethanol(95), 50 mL, 100 mm).

pH Dissolve 0.1 g of Erythromycin in 150 mL of water; the pH of this solution is between 8.0 and 10.5.

Purity (1) ***Thiocyanate*—**Weigh accurately about 0.1 g of Erythromycin, transfer into a 50-mL brown volumetric flask, dissolve by adding 20 mL of methanol, add 1 mL of iron(III) chloride TS and methanol to make to 50 mL, and use this solution as the test solution. Separately, weigh accurately potassium thiocyanate, previously dried at 105 ℃ for 1 hour and cooled, transfer into two 50-mL volumetric flasks, and add methanol to make 50 mL. Take accurately 5.0 mL each of these solutions, add methanol to make 50 mL, then take exactly 5.0 mL each of the resulting solutions, transfer into 50-mL brown volumetric flasks, add exactly 1.0 mL of iron(III) chloride TS to each solution, add methanol to make 50 mL, and use these solutions as the standard solutions. Separately, transfer 1 mL of the iron(III) chloride TS into a 50-mL brown volumetric flask, dissolve in methanol to make 50 mL, and use this solution as the standard test solution. Use the test solution, the standard solutions and the standard test solution within 30 minutes after the preparation. Perform the test with the test and standard solutions as directed in the potassium bromide disk method under the Ultraviolet-visible Spectroscopy using the blank test solution as the control solution, determine the absorbance at 492 nm, and calculate the amount of thiocyanate by the following formula; it is NMT 0.3%.

$$\text{Content (\%) of thiocyanate} = \frac{58.08}{97.18} \times \frac{A_T}{W_T} \times 0.5 \times \left[\frac{W_1}{A_1} + \frac{W_2}{A_2}\right]$$

A_T: Absorbance of the test solution
W_T: Amount (mg) of sample taken
A_1, A_2: Absorbance of each standard solution
W_1, W_2: Amount (mg) of potassium thiocyanate taken from each standard solution
58.08: Molecular weight of thiocyanate
97.18: Molecular weight of potassium thiocyanate

System suitability**:** Determine the absorption spectrum of each standard solution, and calculate suitability factor (S) by the following formula; it is between 0.985 and 1.015.

$$S = \frac{A_1}{W_1} + \frac{W_2}{A_2}$$

A_1, A_2: Absorbance of each standard solution
W_1, W_2: Amount (mg) of potassium thiocyanate taken from each standard solution

(2) ***Heavy metals*—**Proceed with 1.0 g of Ceftazidime Hydrate according to Method 4 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Arsenic*—**Proceed with 1.0 g of Erythromycin

according to Method 5 and perform the test with hydrochloric acid instead of dilute hydrochloric acid (1 in 2) (NMT 2 ppm).

(4) **Related substances**—Dissolve 40 mg of Erythromycin in 2 mL of methanol, add a mixture of phosphate buffer solution, pH 7.0 and methanol (15 : 1) to make exactly 10 mL, and use this solution as the test solution. Separately, dissolve 16 mg of erythromycin RS in 2 mL of methanol, add a mixture of phosphate buffer solution, pH 7.0 and methanol (15 : 1) to make exactly 10 mL, and use this solution as the standard stock solution. Dissolve 5 mg each of erythromycin B and erythromycin C in 2 mL of methanol, add exactly 2 mL of the standard stock solution, add a mixture of phosphate buffer solution, pH 7.0 and methanol (15 : 1) to make exactly 25 mL, and use this solution as the standard solution. Take exactly each 100 μL of the test solution and the standard solution, perform the test as directed under the Liquid Chromatography according to the following conditions, and determine the peak area of each solution by the automatic integration method; the peak areas of erythromycin B and erythromycin C from the test solution are not greater than the peak areas of erythromycin B and erythromycin C in the standard solution. In addition, the peak areas other than erythromycin, erythromycin B and erythromycin C are not greater than the peak area of erythromycin from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 215 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm - 10 μm in particle diameter).

Column temperature: A constant temperature of about 70 °C.

Mobile phase: Dissolve 3.5 g of dibasic potassium phosphate in water to make 100 mL, adjust pH to 9.0 with diluted phosphoric acid (1 in 10). To 50 mL of this solution, add 190 mL of *t*-butyl alcohol, 30 mL of acetonitrile and water to make 1000 mL.

Flow rate: Adjust the flow rate so that the retention time of erythromycin is about 20 minutes.

System suitability

System performance: Dissolve 2 mg of N-demethylerythromycin in 10 mL of the standard solution. Proceed with 100 μL of this solution according to the above conditions; N-demethylerythromycin, erythromycin C, erythromycin and erythromycin B are eluted in this order with the resolution between N-demethylerythromycin and erythromycin C being NLT 0.8, and the resolution between N-demethylerythromycin and erythromycin being NLT 5.5.

System repeatability: Repeat the test 3 times with 100 μL each of the standard solutions according to the above operating conditions; the relative standard deviation of the peak area of erythromycin is NMT 3.0%.

Time span of measurement: About 4 times the retention time of erythromycin after the solvent peak.

Water NMT 10.0% (0.2 g, volumetric titration, direct titration).

Residue on ignition NMT 0.2% (1 g).

Sterility It meets the requirements when used in the manufacturing of sterile preparations. However, it is exempt from the requirements when there is a terminal sterilization process in the manufacturing process of sterile preparations.

Pyrogen It meets the requirements when used in the manufacturing of sterile preparations. Proceed with an appropriate amount of Erythromycin to prepare a solution containing 1.0 mg per mL, use 50 ml of this solution as the test solution. However, inject the test solution to a rabbit by 1.0 mL per kg of the rabbit weight.

Assay Weigh accurately about 50 mg (potency) each of Erythromycin and erythromycin RS, dissolve in 25 mL of methanol, add the mobile phase to make exactly 50 mL, and use these solutions as the test solution and the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions, and determine the peak areas, A_T and A_S of erythromycin.

$$\text{Potency (μg) of erythromycin } (C_{37}H_{67}NO_{13}) = \text{Potency (μg) of erythromycin RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 210 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 15 cm to 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm to 10 μm in particle diameter).

Mobile phase: A mixture of methanol and 0.067 mol/L potassium dihydrogen phosphate (3 : 2).

System suitability

System repeatability: Repeat the test 6 times with 20 μL each of the standard solutions according to the above operating conditions; the relative standard deviation of the peak area of erythromycin is NMT 2.0%.

Packaging and storage Preserve in well-closed containers.

Erythromycin Delayed-Release Capsules
에리트로마이신 장용캡슐

Erythromycin Delayed-Release Capsules contain NLT 90.0% and NMT 120.0% of the labeled amount of

erythromycin ($C_{37}H_{67}NO_{13}$: 733.93).

Method of preparation Prepare as directed under Capsules, with Erythromycin.

Identification Perform the test as directed under the Identification of Erythromycin Delayed-Release Tablets.

Water NMT 7.5% (0.1 g, volumetric titration, direct titration).

Dissolution Perform the test with 1 capsule of Erythromycin Delayed-Release Capsules at 50 revolutions per minute for 60 minutes according to Method 1 under the Dissolution, using 900 mL of 0.06 mol/L hydrochloric acid as the dissolution medium. Immediately wash the remaining contents and the basket with water to remove hydrochloric acid, and perform the test for 60 minutes under the conditions described in the above test method, using 900 mL of 0.2 mol/L phosphate buffer solution, pH 6.8, as the dissolution medium. Take 5 mL of the dissolved solution 60 minutes after starting the second dissolution test, and use the filtrate as the test solution.

Uniformity of dosage units Meets the requirements.

Assay Proceed as directed under the Assay under Erythromycin. Take NLT 20 capsules of Erythromycin Delayed-Release Capsules, weigh accurately the mass of the contents equivalent to about 50 mg (potency) according to the labeled potency, dissolve in 25 mL of methanol, add the mobile phase to make exactly 50 mL, and use this solution as the test solution.

Packaging and storage Preserve in tight containers.

Erythromycin Gel
에리트로마이신 겔

Erythromycin Gel contains NLT 90.0% and NMT 120.0% of the labeled amount of erythromycin ($C_{37}H_{67}NO_{13}$: 733.93).

Method of preparation Prepare as directed under Gels, with Erythromycin.

Identification Perform the test under the Identification (2) of Erythromycin Tropical Solution. However, weigh accurately an appropriate amount of Erythromycin Gel and erythromycin RS, and dissolve in methanol to make a solution containing 2.5 mg (potency) per mL; use this solution as the test solution and standard solution, respectively.

Assay Proceed as directed under the Assay of Erythromycin. However, weigh accurately an amount of Erythromycin Gel equivalent to about 50 mg (potency) according to the labeled potency, dissolve in 25 mL of methanol, and use the mobile phase to make exactly 50 mL; use this solution as the test solution.

Packaging and storage Preserve in tight containers.

Erythromycin Topical Solution
에리트로마이신 외용액

Erythromycin Topical Solution contains NLT 90.0% and NMT 120.0% of the labeled amount of erythromycin ($C_{37}H_{67}NO_{13}$: 733.93), when quantified as a topical solution.

Method of preparation Prepare as directed under the Liquids, with Erythromycin.

Identification (1) Take 1 mL of Erythromycin Topical Solution, add acetone to make 10 mL then add 2 mL of hydrochloric acid; the solution exhibits amber to a reddish purple color.

(2) Take 1 mL of Erythromycin Topical Solution, add 7 mL of methanol, and use this solution as the test solution. Separately, dissolve 26 mg (potency) of erythromycin RS in methanol to make 10 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Develop the plate with a mixture of methanol and chloroform (85 : 15) as the developing solvent, dry the plate at room temperature, spray evenly a mixture of ethanol(95), *p*-methoxybenzaldehyde and sulfuric acid (90 : 5 : 5), and heat at 100 ℃ for 10 minutes; the R_f values are the same when comparing the spots of the test solution and the standard solution.

Water (1) When using only ethanol as a solvent in the prescription: (1) NMT 8.0%, when 20 mg (potency) per mL, (2) NMT 5.0%, when 15 mg (potency) per mL.

(2) When using ethanol and acetone as a solvent in the prescription: NMT 2.0%.

(3) When using neither ethanol as a solvent nor stabilizer in the prescription: no criteria to apply.

However, use a mixture of pyridine and methanol for water determination (1 : 1), instead of methanol for water determination.

Assay Perform the test as directed under the Assay of Erythromycin. Weigh accurately an amount of Erythromycin Gel equivalent to about 50 mg (potency) according to the labeled potency, dissolve in 25 mL of methanol, and add the mobile phase to make exactly 50 mL. Use this solution as the test solution.

Packaging and storage Preserve in tight containers.

Erythromycin Enteric-Coated Tablets
에리트로마이신 장용정

Erythromycin Enteric-Coated Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of erythromycin ($C_{37}H_{67}NO_{13}$: 733.93). Erythromycin Enteric-Coated Tablets are delayed-release preparations.

Method of preparation Prepare as directed under Tablets, with Erythromycin.

Identification Perform the test as directed under the Identification (2) of Erythromycin. Weigh an amount of powdered Erythromycin Enteric-Coated Tablets, equivalent to 10 mg (potency) of erythromycin according to the labeled amount, add 1 mL of methanol, shake to mix, filter, and use this solution as the test solution.

Loss on drying NMT 10.0% (0.2 g, 0.67 kPa, 60 ℃, 3 hours).

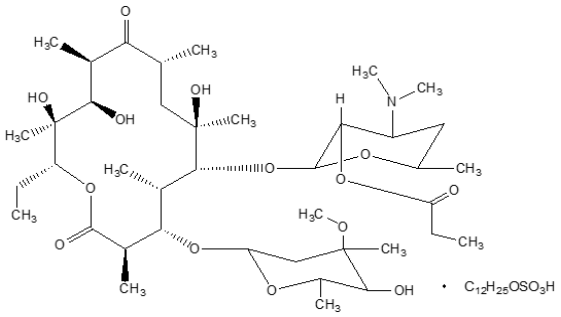
Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Perform the test as directed under the Assay of Erythromycin. Weigh accurately the mass of NLT 20 tablets of Erythromycin Enteric-Coated Tablets, powder, weigh accurately an amount of this powder, equivalent to about 50 mg (potency) of eythromycin according to the labeled potency, dissolve in 25 mL of methanol, add the mobile phase to make exactly 50 mL, and use this solution as the test solution.

Packaging and storage Preserve in tight containers.

Erythromycin Estolate
에리트로마이신에스톨산염



Erythromycin Estolate

$C_{40}H_{71}NO_{14}\cdot C_{12}H_{25}OSO_3H$: 1056.39

[(2*S*,3*R*,4*S*,6*R*)-4-(Dimethylamino)-2-[[(3*R*,4*S*,5*S*,6*R*,7*R*,9*R*,11*R*,12*R*,13*S*,14*R*)-14-ethyl-7,12,13-trihydroxy-4-[(2R,4R,5S,6S)-5-hydroxy-4-methoxy-4,6-dimethyloxan-2-yl]oxy-3,5,7,9,11,13-hexamethyl-2,10-dioxo-oxacyclotetradec-6-yl]oxy]-6-methyloxan-3-yl] propanoate dodecyl hydrogen sulfate [*3521-62-8*]

Erythromycin Estolate, when dried, contains NLT 600 μg (potency) of Erythromycin (C37H67NO13: 733.93) per mg, calculated on the anhydrous basis.

Description Erythromycin Estolate occurs as a white crystalline powder or a powder. It is odorless and has a bitter taste.
It is sparingly soluble in methanol or ethanol(95) and very slightly insoluble in water or benzene.

Identification Determine the infrared spectra of Erythromycin Estolate and erythromycin estolate RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both exhibit similar intensities of absorption at the same wavenumbers.

pH Dissolve 1.0 g of Erythromycin Estolate in 10 mL of water; the pH of this solution is between 4.5 and 7.0.

Purity ***Free erythromycin***—Dissolve 0.250g of this drug, weighed accurately, in 5.0 mL of the mobile phase and use this solution as the test solution. Separately, weigh accurately 75.0 mg of erythromycin RS and dissolve in the mobile phase to make exactly 50 mL. Take exactly 5.0 mL of this solution, add acetonitrile to make exactly 25 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions; the peak area obtained from the test solution is not larger than the major peak area obtained from the standard solution (NMT 6.0%).

Buffer solution—Dissolve 3.4 g of potassium dihydrogen phosphate and 2.75 mL of Triethylamine in water to make 1000 mL.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 195 nm).

Column: A stainless steel column 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 30 °C.

Mobile phase: Adjust the pH of a mixture of acetonitrile and buffer solution (35:65) to 3.0 by adding dilute phosphoric acid.

Flow rate: 1 mL/min

System suitability

System performance: Proceed with 25 μL of the standard solution and the test solution according to the above conditions; the retention time of the first major

peak in the test solution and erythromycin in the standard solution is about 5 minutes and about 10 minutes.

Time span of measurement: About twice the retention time of the erythromycin peak for the standard solution, and about 4.5 times the first peak retention time of erythromycin propionate for the test solution.

Water NMT 4.0% (0.2 g, 20 mL of methanol containing 10% imidazole, volumetric titration, direct titration).

Assay Proceed as directed under the Assay under Erythromycin. However, weigh accurately an appropriate amount of Erythromycin Estolate, dissolve in 25 mL of methanol, add 0.1 mol/L phosphate buffer solution (pH 8.0) to contain 1.0 mg (potency) per mL, and then warm this solution on a steam bath at 60 °C for 2 hours, or allow to stand at room temperature of 16 to 18 hours. Use this solution as the test solution.

Packaging and storage Preserve in tight containers.

Erythromycin Estolate Capsules
에리트로마이신에스톨산염 캡슐

Erythromycin Estolate Capsules contain NLT 90.0% and NMT 120.0% of the labeled amount of erythromycin ($C_{37}H_{67}NO_{13}$: 733.93).

Method of preparation Prepare as directed under Capsules, with Erythromycin Estolate.

Identification Weigh the appropriate amount of each Erythromycin Estolate Capsules and erythromycin estolate RS, dissolve in a small amount of methanol, add water to make a solution containing 500 μg (potency) per mL, respectively, and use these solutions as the test solution and the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of methanol and 2-propanol (85 : 15) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Apply iodine vapor on the thin-layer chromatographic plate or evenly spray 10% sulfuric acid solution; the R_f values of the spots obtained from the test solution and the standard solution are the same.

Loss on drying NMT 5.0% (0.1 g, in vacuum, 60 °C, 3 hours).

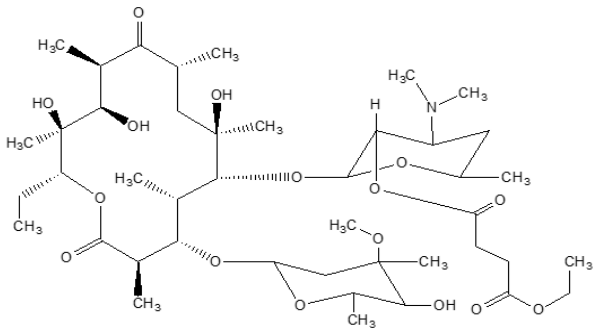
Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Proceed as directed under the Assay under Erythromycin. Take NLT 20 capsules of Erythromycin Estolate Capsules, weigh accurately the mass of the contents, and weigh accurately an amount equivalent to about 50 mg (potency) according to the labeled potency, dissolve in 25 mL of methanol, and dilute with 0.1 mol/L phosphate buffer solution, pH 8.0, to contain 1.0 mg (potency) per mL. Then warm this solution in a 60 °C water bath for 2 hours or allow it to stand at room temperature for 16 to 18 hours, and use this solution as the test solution.

Packaging and storage Preserve in tight containers.

Erythromycin Ethylsuccinate
에리트로마이신에틸숙시네이트



$C_{43}H_{75}NO_{16}$: 862.05

4-*O*-[(2*S*,3*R*,4*S*,6*R*)-4-(Dimethylamino)-2-[[(3*R*,4*S*,5*S*,6*R*,7*R*,9*R*,11*R*,12*R*,13*S*,14*R*)-14-ethyl-7,12,13-trihydroxy-4-[(2*R*,4*R*,5*S*,6*S*)-5-hydroxy-4-methoxy-4,6-dimethyloxan-2-yl]oxy-3,5,7,9,11,13-hexamethyl-2,10-dioxo-oxacyclotetradec-6-yl]oxy]-6-methyloxan-3-yl] 1-O-ethyl-butanedioate [*1264-62-6*]

Erythromycin Ethylsuccinate is a derivative of erythromycin.

Erythromycin Ethylsuccinate contains NLT 780 μg and NMT 900 μg (potency) of erythromycin ($C_{37}H_{67}NO_{13}$: 733.93) per mg, calculated on the anhydrous basis.

Description Erythromycin Ethylsuccinate occurs as a white powder.
It is freely soluble in methanol, soluble in ethanol(95) and practically insoluble in water.

Identification (1) Dissolve 3 mg of Erythromycin Ethylsuccinate in 2 mL of acetone and add 2 mL of hydrochloric acid; the solution exhibits an orange color and immediately changes into red to dark purple.

(2) Determine the infrared spectra of Erythromycin Ethylsuccinate and erythromycin ethylsuccinate RS, previously dried in a desiccator (in vacuum, silica gel) for 24 hours, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both exhibits similar intensities of absorption at the same wavenumbers.

pH The pH of a solution obtained by suspending 0.1 g of Erythromycin Ethylsuccinate in 10 mL of water is between 6.0 and 8.5.

Purity (1) ***Free erythromycin***—Weigh accurately 0.250 g of Erythromycin Ethylsuccinate, dissolve in the mobile phase to make exactly 50 mL, and use this solution as the test solution. Separately, weigh accurately about 75.0 mg of the erythromycin RS and dissolve in the mobile phase to make exactly 50 mL. Pipet 5.0 mL of this solution, add acetonitrile to make exactly 25 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions; the peak area obtained from the test solution is not larger than the area of the major peak obtained from the standard solution (NMT 6.0%).

Operating conditions

Proceed as directed under the operating conditions for free erythromycin under the Purity of Erythromycin Estolate.

System suitability

System performance: Proceed with 25 μL each of the standard solution and the test solution under the above conditions; the peak retention times of erythromycin in the standard solution and erythromycin ethylsuccinate in the test solution are about 8 min and about 24 min, respectively.

Time span of measurement: About 2 times the peak retention time of erythromycin for the standard solution, and about 2 times the peak retention time of erythromycin ethylsuccinate for the test solution.

(2) ***Related substances***—Weigh accurately about 0.115 g of Erythromycin Ethylsuccinate, put it into a 50-mL Erlenmeyer flask, dissolve in 25 mL of methanol, and add 20 mL of hydrolysis TS to mix. Allow to stand at room temperature for about 12 hours, add the hydrolysis TS to make exactly 50 mL, and use this solution as the test solution. Separately, weigh accurately about 50 mg of erythromycin, dissolve it in 12.5 mL of methanol, add hydrolysis TS to make exactly 25 mL, and use this solution as the standard solution (1). Separately, weigh accurately about 5 mg each of erythromycin B and erythromycin C, dissolve them in 25 mL of methanol, add 2.5 mL of standard solution (1), and then add hydrolysis solution to make exactly 50 mL. Use this solution as the standard solution (2). Perform the test with 200 μL each of the test solution and the standard solution (2) as directed under the Liquid Chromatography according to the following conditions and calculate the amount of individual related substances other than erythromycin A, erythromycin B, erythromycin C, erythromycin A enolether and erythromycin *N*-ethylsuccinate and the amount of erythromycin A enolether and erythromycin *N*-ethylsuccinate according to the following formula; each is NMT 3.0%. However, the relative retention time of erythromycin *N*-ethylsuccinate to the retention time of erythromycin A is about 1.3, and the peak areas of erythromycin A enolether and erythromycin *N*-ethylsuccinate are calculated by multiplying the area obtained by the automatic integration method by the sensitivity coefficients for erythromycin A of 0.09 and 0.14, respectively.

$$\text{Content (\%) related substances} = 50 \times \frac{C \times P}{W} \times \frac{A_T}{A_S}$$

C: Concentration (mg/mL) of erythromycin in the standard solution (2)

P: Content (%) of erythromycin A in erythromycin RS

W: Amount (mg) of sample taken

A_T: Peak areas of each related substance, other than erythromycin A, erythromycin B, erythromycin C, erythromycin A enol ether and erythromycin *N*-ethylsuccinate obtained from the test solution, and erythromycin A enol ether and erythromycin *N*-ethylsuccinate

AS: Peak area of erythromycin A obtained from the standard solution (2)

Hydrolysis TS—A solution prepared by dissolving 2 g of dibasic potassium phosphate in water to make 100 mL and adjust the pH to 8.0 with phosphoric acid.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 215 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with spherical styrene-divinylbenzene copolymer for liquid chromatography (5 μm to 10 μm in particle diameter).

Column temperature: A constant temperature of about 70 °C.

Mobile phase: Add 400 mL of water, 175 mL of *t*-butyl alcohol and 30 mL of acetonitrile to 50 mL of buffer solution, pH 8.0, and add water to make 1000 mL.

Flow rate: 2 mL/min

System suitability

System performance: Proceed with 200 μL of the system suitability solution (1) under the above conditions; *N*-demethylerythromycin, erythromycin C, erythromycin A and erythromycin B are eluted in this order with the resolution of *N*-demethylerythromycin and erythromycin C being NLT 0.8 and the resolution of *N*-demethylerythromycin and erythromycin A being NLT 5.5. Additionally, proceed with 100 μL of the system suitability solution (2) under the above conditions; the relative retention time of erythromycin A enol ether to the retention time of erythromycin A is about 4.3 to 4.7.

System repeatability: Repeat the test 5 times with 200 μL each of standard solution (1) under the above operating conditions; the relative standard deviation of the peak area of erythromycin is NMT 1.0%.

System suitability solution (1)—Dissolve about 2 mg of *N*-demethylerythromycin in 20 mL of the standard

solution (2).

System suitability solution (2)—Dissolve about 10 mg of erythromycin in 2 mL of methanol, then add 10 mL of buffer solution, pH 3.5, and allow to stand for 30 min. Keep refrigerated until use and discard after 8 hours after preparation.

Buffer solution, pH 8.0—A solution obtained by dissolving 2 g of dibasic potassium phosphate in water to make 100 mL and adjusting the pH to 8.0 with phosphoric acid.

Buffer solution, pH 3.5—A solution obtained by adjusting 20 mL of the buffer solution, pH 8.0 to pH 3.5 with phosphoric acid.

Water NMT 5.0% (0.5 g, volumetric titration, direct titration).

Residue on ignition NMT 1.0% (1 g).

Sterility It meets the requirements when used in the manufacturing of a sterile preparation. However, it is excluded in cases where there is a terminal sterilization process in the manufacturing of a sterile preparation.

Pyrogen It meets the requirements when used in a sterile preparation. However, weigh an appropriate amount of Erythromycin Ethylsuccinate to make an aqueous suspension containing 50 mg per mL, use this solution as the test solution, and inject 0.1 mL of the test solution into the lower extremity muscle. However, the test solution injected to a rabbit shall be 1.0 mL per kg of the rabbit weight.

Assay ***Cylindrical plate method*** (1) Medium Agar medium for seed and base layer: Use the medium in (A) (2) (a) ② ⓑ under the Microbial Assays for Antibiotics. However, adjust the pH to 7.8 to 8.0.

(2) Test organism: Use *Staphylococcus aureus* ATCC 6538 P as the test organism.

(3) Weigh accurately about 50 mg (potency) of Erythromycin Ethylsuccinate, dissolve in 50 mL of methanol, and add 0.1 mol/L phosphate buffer solution (pH 8.0) to make exactly 100 mL. Take exactly an appropriate amount of this solution, dilute with 0.1 mol/L phosphate buffer solution (pH 8.0) to contain 20.0 and 5.0 μg (potency) per mL, and use these solutions as the high concentration and low-concentration test solutions, respectively. Separately, weigh accurately about 50 mg (potency) of the erythromycin RS, dissolve in 50 mL of methanol, add again 0.1 mol/L phosphate buffer solution (pH 8.0) to make exactly 100 mL, and use this solution as the standard stock solution. Store the standard stock solution at below 5 °C and use it within 7 days. Take exactly an appropriate amount of this standard stock solution, dilute with 0.1 mol/L phosphate buffer solution (pH 8.0) to contain 20.0 and 5.0 μg (potency) per mL, and use these solutions as the high-concentration standard solution and the low-concentration standard solution, respectively. With these solutions, perform the test according to (A) (8) under the Microbial Assays for Antibiotics.

Packaging and storage Preserve in tight containers.

Erythromycin and Tretinoin Topical Gel
에리트로마이신·트레티노인 외용겔

Erythromycin and Tretinoin Topical Gel contains NLT 90.0% and NMT 120.0% of the labeled amount of erythromycin ($C_{37}H_{67}NO_{13}$: 733.93); NLT 90.0% and NMT 130.0% of the labeled amount of tretinoin ($C_{20}H_{28}O_2$: 300.44).

Method of preparation Prepare as directed under Gels, with Erythromycin and Tretinoin.

Identification (1) ***Erythromycin***—(i) Dissolve Erythromycin and Tretinoin Topical Gel and erythromycin RS in methanol to make a solution containing 2.5 mg (potency) per mL, and use this solution as the test solution and the standard solution, respectively. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography, develop the plate with a mixture of methanol and chloroform (85 : 15) as the developing solvent, and take it out to dry at room temperature. Spray evenly a mixture of ethanol, *p*-methoxybenzaldehyde and sulfuric acid (90 : 5 : 5), and warm at 100 °C for 10 minutes; when comparing the black-purple spots of the test solution and the standard solution, the R_f values of them are the same.

(ii) Dissolve Erythromycin and Tretinoin Topical Gel in methanol to make a solution containing 2.5 mg (potency) per mL. Take 1 mL of this solution, add acetone to make 10 mL, and add 2 mL of hydrochloric acid; the resulting solution turns from orange to reddish purple.

(2) ***Tretinoin***—The retention times of the major peaks obtained from the test solution and the standard solution under the Assay are the same.

Assay (1) ***Erythromycin***

(i) Microbial Assays for Antibiotics (i) Cylindrical plate method

⑴ Medium: Agar medium for seed and base layer Microbial Assays for Antibiotics: Use the medium in (i) ⑵ (a) ② ⓑ. However, adjust the pH to 7.8 to 8.0.

⑵ Test organism: Use *Staphylococcus aureus* ATCC 6538P as the test organism.

⑶ Common standard solution: Weigh accurately an amount equivalent to about 40 mg (potency) of erythro-

mycin RS, dissolve in 25 mL of methanol, add 0.1 mol/L phosphate buffer solution, pH 8.0, to make 100 mL, and shake well to mix. Use this solution as the common standard stock solution. Store the common standard stock solution at below 5 ℃ and use within 7 days. Pipet an appropriate amount of the common standard stock solution, dilute with the above buffer solution to contain 20.0 and 5.0 μg (potency) per mL, and use this solution as the common standard solution.

⑷ Test solution: Weigh accurately an amount of Erythromycin and Tretinoin Topical Gel, equivalent to about 40 mg (potency), dissolve in 25 mL of methanol, and add 0.1 mol/L phosphate buffer solution, pH 8.0, to make 100 mL. Take an appropriate amount of this solution, dissolve in the above buffer solution, and dilute it to contain 20.0 and 5.0 μg (potency) per mL. Use this solution as the test solution.

(ii) Standard curve method

⑴ Medium: Agar medium for seed and base layer Microbial Assays for Antibiotics Use the medium in (i) ⑵ (a) ② ⓑ.

⑵ Test organism: Use *Micrococcus luteus* ATCC 9341 as the test organism.

⑶ Common standard solution: Microbial Assays for Antibiotics Pipet an appropriate amount of the common standard solution in (i) ⑶, dilute it with 0.1 mol/L phosphate buffer solution, pH 8.0, to contain 0.64, 0.80, 1.00, 1.25 and 1.56 μg (potency) per mL, and use this solution as the common standard solution. Use the solution containing 1.0 μg (potency) per mL as the common standard intermediate diluent.

⑷ Test solution: Microbial Assays for Antibiotics Pipet an appropriate amount of the solution in (i) ⑷, dilute it with 0.1 mol/L phosphate buffer solution, pH 8.0 to contain 1.0 μg (potency) per mL, and use this solution as the test solution.

(iii) Weigh accurately about 40 mg (potency) each of Erythromycin and Tretinoin Topical Gel and erythromycin RS, dissolve in 25 mL of methanol, add the mobile phase to make 50 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas of erythromycin, A_T and A_S, in each solution.

$$\text{Potency (μg/mg) of Erythromycin and Tretinoin Topical Gel} = \frac{A_T}{A_S} \times \frac{\textit{Potency (mg) of erythromycin RS}}{\textit{Amount (mg) of}\ \text{Erythromycin and Tretinoin Topical Gel taken}} \times 1000$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 210 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 15 cm to 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 to 10 μm in particle diameter).

Mobile phase: A mixture of methanol and 0.067 mol/L potassium dihydrogen phosphate solution (3 : 2).

(2) ***Tretinoin***—Weigh accurately about 250 mg of tretinoin ($C_{20}H_{28}O_2$), dissolve in 50 mL tetrahydrofuran, and filter if necessary. Take 5 mL of this solution, add a mixture of tetrahydrofuran and phosphoric acid (1 in 100) (3 : 2) to make 25 mL, and use this solution as the test solution. Separately, proceed in the same manner as in the preparation of the test solution with about 250 mg of tretinoin RS, and use this solution as the standard solution. Perform the test with 5 mL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas of tretinoin from each solution, A_T and A_S, respectively.

$$\text{Amount (mg) of tretinoin } (C_{20}H_{28}O_2) = \text{Amount (mg) of tretinoin RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 365 nm).

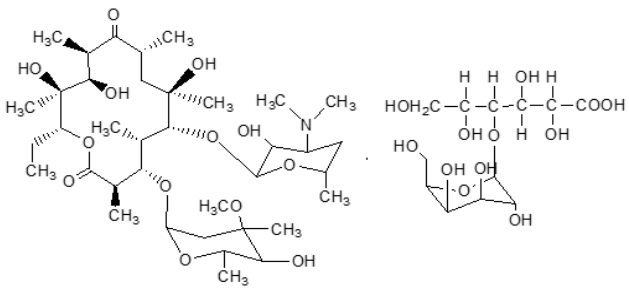
Column: A stainless steel column about 3.9 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (4 μm in particle diameter).

Mobile phase: A mixture of phosphate buffer solution, pH 3.0, and tetrahydrofuran (58 : 42).

Flow rate: 1.0 mL/min

Packaging and storage Preserve in tight containers.

Erythromycin Lactobionate
에리트로마이신락토비온산염



$C_{37}H_{67}NO_1 \cdot C_{12}H_{22}O_{12}$: 1092.22

(3*R*,4*S*,5*S*,6*R*,7*R*,9*R*,11*R*,12*R*,13*S*,14*R*)-6-[(2*S*,3*R*,4*S*,6*R*)-4-(Dimethylamino)-3-hydroxy-6-methyloxan-2-yl]oxy-

14-ethyl-7,12,13-trihydroxy-4-[(2*R*,4*R*,5*S*,6*S*)-5-hydroxy-4-methoxy-4,6-dimethyloxan-2-yl]oxy-3,5,7,9,11,13-hexamethyl-oxacyclo-tetradecane-2,10-dione(2*R*,3*R*,4*R*,5*R*)-2,3,5,6-tetrahydroxy-4-[(2*S*,3*R*,4*S*,5*R*,6*R*)-3,4,5-trihydroxy-6-(hydroxymethyl)oxan-2-yl]oxyhexanoate [*3847-29-8*]

Erythromycin Lactobionate is the lactobionate of erythromycin.

Erythromycin Lactobionate contains NLT 590 μg and NMT 700 μg (potency) of erythromycin ($C_{37}H_{67}NO_{13}$) per mg, calculated on the anhydrous basis.

Description Erythromycin Lactobionate occurs as a white powder.
It is freely soluble in water, methanol or ethanol(99.5) and slightly soluble in acetone.

Identification (1) To the 3 mg of Erythromycin Lactobionate, add 2 mL of acetone and 2 mL of hydrochloric acid; the resulting solution exhibits an orange color and immediately turns red to dark violet.

(2) To 0.3 g of Erythromycin Lactobionate, add 15 mL of ammonia TS and 15 mL of chloroform, shake to mix, and take the separated aqueous layer. Wash this solution with three 15 mL portions of chloroform, and evaporate to dryness on a steam bath. Dissolve the residue in 10 mL of a mixture of methanol and water (3 : 2), and use this solution as the test solution. Separately, dissolve 0.10 g of lactobionic acid in a mixture of methanol and water (3 : 2), and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of water, 1-butanol and acetic acid(100) (3 : 3 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Spray evenly dilute sulfuric acid on the plate, and heat at 105 ℃ for 20 minutes; the principal spot obtained from the test solution exhibits a dark brown color and has the same R_f value as the spot obtained from the standard solution.

pH Dissolve 0.5 g of Erythromycin Lactobionate in 10 mL of water; the pH of this solution is between 5.0 and 7.5.

Purity ***Heavy metals***—Proceed with 0.5 g of Erythromycin Lactobionate according to Method 2 and perform the test. Prepare the control solution with 2.5 mL of lead standard solution (NMT 50 ppm).

Water NMT 5.0% (0.5 g, volumetric titration, direct titration).

Residue on ignition NMT 2.0% (1 g). However, moisten the charred residue with 2 mL of nitric acid and 5 drops of sulfuric acid.

Sterility It meets the requirements when used in the manufacturing of sterile preparations. However, it is exempt from the requirements there is a terminal sterilization process in the manufacturing process of sterile preparations.

Bacterial endotoxins Less than 1.0 EU per mg (potency) of erythromycin when used in the manufacturing of sterile preparations.

Assay ***Cylinder-plate method*—**(1) Medium: Agar media for seed and base layer Use the medium in (A) (2) (a) ② ⓑ under the Microbial Assays for Antibiotics. However, adjust the pH to 7.8 to 8.0.

(2) Test organism: Use *Staphylococcus aureus* ATCC 6538P as the test organism.

(3) Weigh accurately about 50 mg (potency) of Erythromycin Lactobionate, dissolve in 50 mL of methanol, and add 0.1 mol/L phosphate buffer solution, pH 8.0 to make exactly 100 mL. Take exactly an appropriate amount of this solution, dilute with 0.1 mol/L phosphate buffer solution, pH 8.0 to make solutions containing 20.0 μg (potency) and 5.0 μg (potency) per mL, and use these solutions as the high concentration test solution and low concentration test solution, respectively. Separately, dissolve approximately 50 mg (potency) of erythromycin lactobionate RS in 50 mL of methanol, add 0.1 mol/L phosphate buffer solution, pH 8.0 to make exactly 100 mL, and use this solution as the standard stock solution. Store the standard stock solution at below 5 ℃ and use it within 7 days. Take exactly an appropriate amount of the standard stock solution, dilute with 0.1 mol/L phosphate buffer solution, pH 8.0 to make solutions containing 20.0 μg (potency) and 5.0 μg (potency) per mL, and use these solutions as the high concentration standard solution and the low concentration standard solution, respectively. With these solutions, perform the test according to (A)(8) under the Microbial Assays for Antibiotics.

Packaging and storage Preserve in tight containers.

Erythromycin Lactobionate and Colistin Sodium Methanesulfonate Ophthalmic Ointment

에리트로마이신락토비온산염·콜리스틴메탄설포네이트나트륨 안연고

Erythromycin Lactobionate and Colistin Sodium Methanesulfonate Ophthalmic Ointment contains NLT 90.0% and NMT 120.0% of the labeled amount of erythromycin ($C_{37}H_{67}NO_{13}$: 733.93) and colistin A ($C_{53}H_{100}N_{16}O_{13}$: 1169.47).

Method of preparation Prepare as directed under Ophthalmic Ointments, with Erythromycin Lactobionate and

Colistin Sodium Methanesulfonate.

Identification (1) ***Erythromycin lactobionate***—Put about 1 g of Erythromycin Lactobionate and Colistin Sodium Methanesulfonate Ophthalmic Ointment in a stoppered flask, and turn it into liquid by warming. Add 3 mL of warmed acetone, shake vigorously to mix, cool, and take the acetone layer. Add 2 mL of hydrochloric acid to the solution; the resulting solution turns from orange to red, and finally to reddish purple. Add 2 mL of chloroform again and shake; the chloroform layer exhibits a purple color.

(2) ***Colistin sodium methanesulfonate***—Put about 1 g of Erythromycin Lactobionate and Colistin Sodium Methanesulfonate Ophthalmic Ointment in a stoppered flask, and turn it into liquid by warming. Add 5 mL of water, shake vigorously to mix, cool, and take the water layer. Add 10% sodium hydroxide solution to this solution, and shake well. Add 5 drops of 1% copper sulfate solution, and shake well to mix; the resulting solution exhibits a reddish purple color.

Sterility Meets the requirements.

Foreign metallic matter Meets the requirements.

Water NMT 1.0% (1.0 g, volumetric titration, direct titration).

Assay (1) ***Erythromycin lactobionate*—Cylinder plate method** (i) Medium: Agar media for seed and base layer Microbial Assays for Antibiotics Use the medium in (i) (2) (a) ① ⓐ.

(ii) Test organism: Use *Bacillus subtilis* ATCC 6633 as the test organism.

(iii) Weigh accurately Erythromycin Lactobionate and Colistin Sodium Methanesulfonate Ophthalmic Ointment, equivalent to about 25 mg (potency) of erythromycin, according to the labeled potency, place it in a separatory funnel, add 50 mL of ether, shake until the mixture becomes homogeneous, and then add 25 mL of 0.1 mol/L phosphate buffer solution (pH 8.0). Extract three times, combine all extracts, dilute with 0.1 mol/L phosphate buffer solution, pH 8.0, and use these solutions as the high concentration test solution and the low concentration test solution, respectively. Separately, weigh accurately about 25 mg (potency) of erythromycin lactobionate RS, dissolve in 25 mL of methanol, add 0.1 mol/L phosphate buffer solution (pH 8.0) to make exactly 100 mL, and shake well to mix. Use this solution as the standard stock solution. Store the standard stock solution at a temperature NMT 5 ℃, and use it within 7 days. Pipet an appropriate amount of the standard stock solution, dilute with 0.1 mol/L phosphate buffer solution (pH 8.0) to contain 2.0 μg and 0.5 μg (potency) per mL, and use these solutions as the high concentration standard solution and the low concentration standard solution, respectively. With these solutions, perform the test according to (i) (8) under the Microbial Assays for Antibiotics.

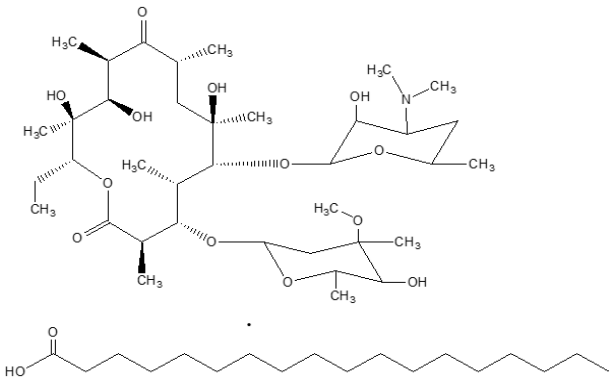
(2) ***Colistin sodium methanesulfonate*—Cylinder plate method** (i) Medium: Agar media for seed and base layer Microbial Assays for Antibiotics Use the medium in (ii) (2) (a) ① ⓐ.

(ii) Test organism: Use *Escherichia coli* NIHJ as the test organism.

(iii) Weigh accurately about 600000 units (potency) of Erythromycin Lactobionate and Colistin Sodium Methanesulfonate Ophthalmic Ointment according to the labeled potency of colistin to place in a separatory funnel, add 50 mL of ether, and shake until the mixture becomes homogeneous. Extract 3 times with 10 mL each of water, combine all extracts, and add 1% phosphate buffer solution (pH 6.0) to make exactly 60 mL. Pipet an appropriate amount of this solution, dilute with 1% phosphate buffer solution (pH 6.0), and use these solutions as the high concentration test solution and the low concentration test solution, respectivley. Separately, weigh accurately an appropriate amount of colistin sodium methanesulfonate RS and dissolve in water. Weigh accurately an appropriate amount of the erythromycin RS in this solution, add a small amount of methanol, and add water to make a solution containing 30000 units (potency) of colistin and 1 mg (potency) of erythromycin per mL. Pipet an appropriate amount of this solution, dilute with 1% phosphate buffer solution (pH 6.0) to contain 10000 and 2500 units (potency) per mL, and use these solutions as the high concentration standard solution and the low concentration standard solution, respectively. With these solutions, perform the test according (A) (8) under the Microbial Assays for Antibiotics.

Packaging and storage Preserve in tight containers.

Erythromycin Stearate
에리트로마이신스테아르산염



$C_{55}H_{103}NO_{15}$: 1018.40

(3*R*,4*S*,5*S*,6*R*,7*R*,9*R*,11*R*,12*R*,13*S*,14*R*)-6-[(2*S*,3*R*,4*S*,6*R*)-4-(Dimethylamino)-3-hydroxy-6-methyloxan-2-yl]oxy-14-ethyl-7,12,13-trihydroxy-4-[(2R,4R,5S,6S)-5-hydroxy-4-methoxy-4,6-dimethyloxan-2-yl]oxy-

3,5,7,9,11,13-hexamethyl-oxacyclo-tetradecane-2,10-dione octadecanoate [*643-22-1*]

Erythromycin Stearate is the stearate of erythromycin.

Erythromycin Stearate contains NLT 600 μg and NMT 720 μg (potency) of erythromycin ($C_{37}H_{67}NO_{13}$) per mg, calculated on the anhydrous basis.

Description Erythromycin Stearate occurs as a white powder.
It is freely soluble in ethanol(95) or acetone, soluble in methanol and practically insoluble in water.

Identification (1) Dissolve 3 mg of Erythromycin Stearate in 2 mL of acetone, and add 2 mL of hydrochloric acid; the resulting solution exhibits an orange color and immediately turns red to dark violet.

(2) Determine the infrared spectra of Erythromycin Stearate and erythromycin stearate RS, previously dried in a desiccator (in vacuum, silica gel) for 24 hours, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

pH Dissolve 0.1 g of Erythromycin Stearate in 10 mL of water; the pH of this solution is between 6.0 and 11.0.

Purity ***Related substances*—**Weigh accurately 0.165 g of Erythromycin Stearate, transfer into a 100-mL Erlenmeyer flask, dissolve in 15 mL of methanol, and add 15 mL of buffer solution, pH 8.0. After mixing, filter through a 0.2 μm filter, and use the filtrate as the test solution. Separately, weigh accurately 6 mg each of erythromycin RS, erythromycin B, erythromycin C and N-demethylerythromycin, and dissolve them in 15 mL of methanol, and add 15 mL of buffer solution, pH 8.0, and use this solution as the standard solution. Perform the test with 100 μL each of the test and standard solutions as directed under the Liquid Chromatography according to the following conditions, and determine the amount of individual related substances other than erythromycin A, erythromycin B, erythromycin C, erythromycin A enol ether and pseudoerythromycin A enol ether, and the amount of erythromycin A enol ether and pseudoerythromycin A enol ether by the following formula; NMT 3.0% However, the relative retention time of pseudoerythromycin A enol ether to erythromycin A is about 1.5, and the peak areas of ethyl erythromycin A enol ether and pseudoerythromycin A enol ether are calculated by multiplying the area obtained according to the automatic integration method by the correction factors for erythromycin A of 0.09 and 0.15, respectively.

$$\text{Content (\%) of related substances} = 30 \times \frac{C \times P}{W} \times \frac{A_T}{A_S}$$

C: Concentration (mg/mL) of erythromycin in the standard solution

P: Content (%) of erythromycin A in erythromycin RS

W: Weight (mg) of sample taken

A_T: Peak areas of individual related substances other than erythromycin A, erythromycin B, erythromycin C, erythromycin A enol ether, pseudoerythromycin A enol ether, and erythromycin A enol ether and pseudoerythromycin A enol ether obtained from the test solution

A_S: Peak area of erythromycin A obtained from standard solution

pH 8.0 buffer solution—A solution prepared by dissolving 2 g of dibasic potassium phosphate in water to make 100 mL and adjusting pH to 8.0 with phosphoric acid.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 215 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with spherical styrene-
divinylbenzene copolymer for liquid chromatography (5 μm to 10 μm in particle diameter).

Column temperature: A constant temperature of about 70 °C.

Mobile phase: Dissolve 3.5 g of dibasic potassium phosphate in water to make 100 mL, and adjust pH to 9.0 with dilute phosphoric acid (1 in 10). To 50 mL of this solution, add 400 mL of water, 175 mL of *t*-butyl alcohol, 30 mL of acetonitrile, and add water to make 1000 mL.

Flow rate: 2 mL/min

System suitability

System performance: Proceed with 100 μL of the standard solution according to the above conditions; N-demethylerythromycin, erythromycin C, erythromycin A and erythromycin B are eluted in this order with the resolution between N-demethylerythromycin and erythromycin C being NLT 0.8, and the resolution between N-demethylerythromycin and erythromycin A being NLT 5.5. Separately, weigh accurately 5 mg of erythromycin RS, dissolve in 1 mL of methanol, add 5 mL of pH 3.5 buffer solution, and allow to stand for 30 minutes, and use this solution as the system suitability solution (1). Proceed with 100 μL of this solution according to the above conditions; the relative retention time of erythromycin A enol ether to that of erythromycin A is between 4.3 and 4.7.

pH 3.5 buffer solution—A solution prepared by adjusting the pH of 20 mL of pH 8.0 buffer solution to pH 3.5 with phosphoric acid.

System repeatability: Weigh accurately about 40 mg of erythromycin stearate RS, transfer into a 100-mL Erlenmeyer flask, dissolve in 5 mL of methanol, add 5 mL of pH 8.0 buffer solution, and use this solution as the system suitability solution (2). Repeat the test 5 times with 100 μL each of this solution according to the above

conditions; the relative standard deviation of the peak area of Erythromycin is NMT 2.0%.

Water NMT 5.0% (0.5 g, volumetric titration, direct titration).

Residue on ignition NMT 2.0% (1 g).

Assay Perform the test as directed under the Assay of Erythromycin. However, weigh accurately about 50 mg (potency) of Erythromycin Stearate, dissolve in 25 mL of methanol, add the mobile phase to make exactly 50 mL, and use this solution as the test solution.

Packaging and storage Preserve in tight containers.

Erythromycin Stearate Tablets
에리트로마이신스테아르산염 정

Erythromycin Stearate Tablets contain NLT 90.0% and NMT 120.0% of the labeled amount of erythromycin ($C_{37}H_{67}NO_{13}$: 733.93).

Method of preparation Prepare as directed under Tablets, with Erythromycin Stearate.

Identification Weigh an amount of powdered Erythromycin Stearate Tablets, equivalent to about 100 mg (potency) of erythromycin stearate according to the labeled potency, add 50 mL of chloroform, shake well to mix, filtrate, and use the filtrate as the test solution. Separately, dissolve 10 mg of erythromycin RS in 5 mL of chloroform, and use this solution as the standard solution. Perform the test with these solutions as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of 1-butanol, acetic acid and water (3 : 1 : 1), and air-dry the plate. Apply iodine vapor or spray 10% sulfuric acid on the plate to examine the spots; the R_f values of the spots obtained from the test solution and the standard solution are the same.

Water NMT 5.0% (0.2 g, volumetric titration, direct titration).

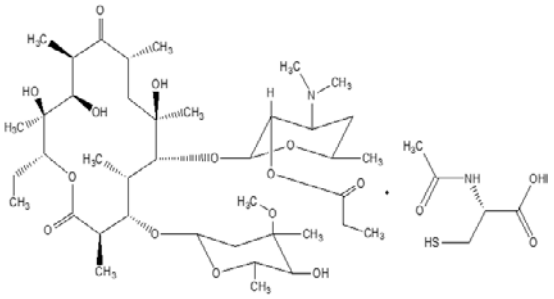
Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Proceed as directed under the Assay under Erythromycin. However, weigh accurately the mass of NLT 20 tablets of Erythromycin Stearate Tablets, powder, weigh accurately an amount of this powder, equivalent to about 50 mg (potency) of erythromycin stearate according to the labeled potency, dissolve in 25 mL of methanol, add the mobile phase to make exactly 50 mL, and use this solution as the test solution.

Packaging and storage Preserve in tight containers.

Erythromycin Stinoprate
에리트로마이신스티노프레이트



Erythromycin Stinoprate
$C_{40}H_{71}NO_{14}\cdot C_5H_9NO_3S$: 953.18
2'-Propanoate erythromycin *N*-acetyl-L-cysteine (1:1), [*84252-03-9*]

Erythromycin Stinoprate contains NLT 704 μg (potency) of erythromycin ($C_{37}H_{67}NO_{13}$: 733.93) per mg, calculated on the anhydrous basis, and contains NLT 16.3% and NMT 18.0% of acetylcysteine and NLT 78.7% and NMT 87.0% of erythromycin propionate per mg, calculated on the anhydrous basis.

Description Erythromycin Stinoprate occurs as a white, crystalline powder and has a characteristic odor.
It is soluble in methanol, acetone or chloroform and slightly soluble in water.

Identification (1) Dissolve 3 mg (potency) of Erythromycin Stinoprate in 2 mL of acetone, and add 2 mL of hydrochloric acid; the resulting solution exhibits an orange color and immediately turns red to dark purple.

(2) Determine the infrared spectra of Erythromycin Stinoprate and erythromycin stinoprate RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Optical rotation $[\alpha]_D^{20}$: Between -51° and -58° (1.0 g, calculated on the anhydrous basis, ethanol anhydrous, 50 mL, after 30 min, 100 mm).

pH Dissolve Erythromycin Stinoprate in water to make 1 mg (potency)/mL; the pH of the solution is between 4.0 and 5.0.

Purity (1) ***Heavy metals***—Perform the test with 1.0 g of Erythromycin Stinoprate according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Related substances***—(i) *N,N*-diacetylcystine: Weigh accurately about 0.2 g (potency) of Erythromycin Stinoprate, dissolve in methanol to make 100 mL, and use this solution as the test solution. Separately, weigh accurately about 10 mg of *N,N*-diacetylcystine RS, and add methanol to make exactly 100 mL. Pipet 1 mL and 6 mL of this solution, add methanol to make exactly 100 mL, and use these solutions as the detection limit solution and the standard solution. Within 30 minutes, perform the test with 20 μL each of the test and standard solutions as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas A_T and A_S of *N,N*-diacetylcystine from each solution (NMT 0.3%).

$$\text{Content (\%) of } N,N\text{-diacetylcystine} = \frac{A_T}{A_S} \times \frac{Amonut\ (mg)\ of\ N,N-diacetylcystine\ RS\ \times 6}{Amount\ (mg)\ of\ sample, calculated\ on\ the\ anhydrous\ basis}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 205 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: A mixture of water and acetonitrile (99 : 5), adjusted pH to 2.5 with phosphoric acid.

Flow rate: 2.0 mL/min

(ii) Erythromycin propionate enol ether and other related substances: Weigh accurately about 0.5 g of Erythromycin Stinoprate, dissolve in ethanol to make exactly 50 mL, and use this solution as the test solution. Separately, weigh accurately about 10 mg of erythromycin propionate enol ether RS, add methanol to make exactly 200 mL, and use this solution as the standard solution. Pipet 10 mL of this solution, add methanol to make exactly 100 mL, and use this solution as the detection limit solution. Perform the test with exactly 20 μL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions, determine the peak areas A_T and A_S, of erythromycin propionate enol ether from each solution, and calculate total peak area after the erythromycin propionate peak other than the erythromycin propionate enol ether peak, S_T (NMT 0.5% for each of erythromycin propionate enol ether and other related substances).

$$\text{Content (\%) of erythromycin propionate enol ether} = \left[\frac{Amount\ (mg)\ of\ erythromycin\ propionate\ enol\ ether\ RS}{Amount\ (mg)\ of\ sample, calculated\ on\ the\ anhydrous\ basis}\right] \times \frac{A_T}{A_S} \times 25$$

$$\text{Content (\%) of other related substances} = \left[\frac{Amount\ (mg)\ of\ erythromycin\ propionate\ enol\ ether\ RS}{Amount\ (mg)\ of\ sample, calculated\ on\ the\ anhydrous\ basis}\right] \times \frac{S_T}{A_S} \times 25$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 205 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: A mixture of water and acetonitrile (65 : 35), adjusted pH to 2.5 with phosphoric acid.

Flow rate: 2.0 mL/min

(iii) Free erythromycin: Weigh 0.1 g (potency) of Erythromycin Stinoprate, calculated on the anhydrous basis, dissolve in 10 mL of acetone, and use this solution as the test solution. Separately, weigh accurately 10.0 mg (potency) of erythromycin RS, dissolve in 20 mL of acetone, and use this solution as the standard solution. Perform the test with these solutions as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution to the thin-layer chromatographic plate made of silica gel for thin-layer chromatography (with fluorescence agent), and develop the plate with a mixture of chloroform, ethanol and 15% ammonium acetate (85 : 15 : 1) to a distance of about 10 cm. Spray evenly a mixture of methanol acetic anhydride sulfuric acid and anisaldehyde (92 : 5 : 2 : 1) on the plate, and dry at 105 ℃ for about 5 minutes. The spots of erythromycin obtained from the test solution are not more intense than the spots obtained from the standard solution (NMT 5.0%).

(iv) Acetylcysteine: Weigh accurately about 0.6 g of Erythromycin Stinoprate, calculated on the anhydrous basis, and dissolve in methanol to make exactly 100 mL. Pipet 10 mL of this solution, add methanol to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 50 mg of acetylcysteine RS, add methanol to make exactly 500 mL, and use this solution as the standard solution. Within 30 minutes, perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions, and determine the peak areas A_T and A_S, of acetylcysteine from each solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 205 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octa-

decylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: A mixture of water and acetonitrile (95 : 5), adjusted pH to 2.5 with phosphoric acid.

Flow rate: 2.0 mL/min

(v) Erythromycin propionate: Weigh accurately 0.24 g of Erythromycin Stinoprate, calculated on the anhydrous basis, dissolve in methanol to make exactly 50 mL, and use this solution as the test solution. Separately, weigh accurately about 0.2 g (potency) of erythromycin propionate RS, dissolve in methanol to make exactly 50 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions, and determine the peak areas A_T and A_S, of erythromycin stinoprate from each solution.

$$\text{Potency (μg) of erythromycin stinoprate} = \text{Potency (μg) of erythromycin stinoprate RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 214 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: A mixture of acetonitrile and phosphate buffer solution, pH 7.0 (53 : 47).

Flow rate: 2.0 mL/min

Water NMT 2.5% (0.4 g, volumetric titration, direct titration).

Residue on ignition NMT 0.5% (1 g).

Assay ***Cylinder-plate method***—(1) Medium: Agar media for seed and base layer Use the media in (A) (2) (a) ② ⓑ under the Microbial Assays for Antibiotics. However, adjust the pH to 7.8 to 8.0.

(2) Test organism: Use *Staphylococcus aureus* ATCC 6538P as the test organism.

(3) Weigh accurately about 0.1 g (potency) each of Erythromycin and erythromycin RS, dissolve in methanol to make 100 mL, and use these solutions as the test solution and the standard solution, respectively. Take exactly an appropriate amount each of these solutions, dilute with 0.1 mol/L phosphate buffer solution, pH 8.0, to make solutions containing 20.0 μg and 5.0 μg (potency) per mL, and use these solutions as the high concentration test solution and the low concentration test solution, respectively. Perform the test with these solutions according (A) (8) under the Microbial Assays for Antibiotics.

Packaging and storage Preserve in tight containers.

Erythromycin Stinoprate Tablets
에리트로마이신스티노프레이트 정

Erythromycin Stinoprate Tablets contain NLT 90.0% and NMT 120.0% of the labeled amount of erythromycin ($C_{37}H_{67}NO_{13}$: 733.93). Also, Erythromycin Stinoprate Tablets contain NLT 16.3% and NMT 18.0% of acetylcysteine and NLT 78.7% and NMT 87.0% of erythromycin propionate, calculated on the anhydrous basis.

Method of preparation Prepare as directed under Tablets, with Erythromycin Stinoprate.

Identification Dissolve 0.1 g (potency) each of Erythromycin Stinoprate Tablets and erythromycin stinoprate RS in 10 mL of acetone, and use these solutions as the test solution and the standard solution, respectively. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography, and develop the plate with a mixture of chloroform, ethanol and 15% ammonium acetate solution (85 : 15 : 1) as the developing solvent to a distance of about 10 cm. Spray evenly a mixture of methanol, acetic acid(100), sulfuric acid and anisaldehyde (92 : 5 : 2 : 1) on the plate, and heat at 105 ℃ for 5 minutes; the R_f values of spots obtained from the test solution and the standard solution are the same.

Purity (1) ***Related substances***—① *N,N*-diacetylcystine: Perform the test as directed under the Purity (2) ① under Erythromycin Stinoprate. However, weigh accurately about 0.25 g (potency) of Erythromycin Stinoprate Tablets according to the labeled potency, dissolve in methanol to make exactly 100 mL, and then filter. Pipet 3.0 mL of the filtrate, add methanol to make exactly 10.0 mL, and use this solution as the test solution (NMT 0.7% for erythromycin stinoprate).

$$\text{Content (\%) of } N,N\text{-diacetylcystine} = \text{Amount (mg) of } N,N\text{-diacetylcystine RS} \times \frac{A_T}{A_S} \times \frac{733.94}{963.20} \times \frac{6}{Potency\ (mg)\ in\ amount\ of\ \text{Erythromycin Stinoprate Tablets taken}}$$

733.94: Molecular weight of erythromycin
953.20: Molecular weight of erythromycin stinoprate

(2) ***Erythromycin propionate enol ether and other related substances***—Perform the test as directed under the Purity (2) 2) under Erythromycin Stinoprate. However, weigh accurately about 0.2 g (potency) of Erythromycin Stinoprate Tablets according to the labeled potency, add methanol to make exactly 50 mL, and use this solution as the test solution (NMT 1.0% of erythromycin propionate enol ether and NMT 0.5% of the total amount of other related substances relative to erythromycin stinoprate).

$$\text{Content (\%) of erythromycin propionate enol ether RS} = \text{Amount (mg) of erythromycin propionate enol ether} \times \frac{A_T}{A_S} \times \frac{733.94}{963.20} \times \frac{25}{Potency\ (mg)\ in\ amount\ of\ \text{Erythromycin Stinoprate Tablets taken}}$$

$$\text{Content (\%) of other related substances} = \text{Amount (mg) of erythromycin propionate enol ether RS} \times \frac{S_T}{A_S} \times \frac{733.94}{963.20} \times \frac{25}{Potency\ (mg)\ in\ amount\ of\ \text{Erythromycin Stinoprate Tablets taken}}$$

Dissolution Perform the test with 1 tablet of Erythromycin Stinoprate Tablets at 100 revolutions per minute for 45 minutes according to Method 1 under the Dissolution, using 900 mL of phosphate buffer solution, pH 6.9, as the dissolution medium. Take 20 mL of the dissolved solution 45 minutes after starting the dissolution test, and filter. Discard the first 10 mL of the filtrate, and use the subsequent filtrate as the test solution. Separately, weigh accurately about 55 mg (potency) of erythromycin propionate RS, dissolve in acetonitrile to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 100 µL each of the test solution and the standard solution as directed under the Assay (4) under Erythromycin Stinoprate It meets the requirements when the dissolution rate of Erythromycin Stinoprate Tablets for 45 minutes is NLT 75% of the labeled potency.

$$\text{Dissolution rate (\%)} = \text{Potency (mg) of erythromycin propionate RS} \times \frac{A_T}{A_S} \times \frac{900}{Labled\ potency\ (mg)\ in\ 1\ tablent}$$

Uniformity of dosage units Meets the requirements.

Loss on drying NMT 5.0% (1.0 g, phosphorus pentoxide, 0.7 kPa, 50 °C, 4 hours).

Assay ***Cylinder plate method***—Perform the test as directed under the Assay under Erythromycin Stinoprate. However, weigh accurately the mass of NLT 20 Erythromycin Stinoprate Tablets, and then powder. Weigh accurately an amount equivalent to about 0.1 g (potency), and dissolve in methanol to make exactly 100 mL. Filter this solution, pipet an appropriate amount of the filtrate, dilute with 0.1 mol/L phosphate buffer solution (pH 8.0), and use this solution as the test solution.

Acetylcysteine—Perform the test as directed under the Acetylcysteine under Erythromycin Stinoprate. However, weigh accurately an amount of Erythromycin Stinoprate Tablets, equivalent to about 0.25 g (potency) according to the labeled potency, add acetonitrile, shake enough to mix, and then add another acetonitrile to make exactly 100 mL. Filter this solution, pipet 20 mL of the filtrate, add purified water to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 55 mg of acetylcysteine RS, and dissolve it in acetonitrile to make exactly 100 mL. Pipet 20 mL of this solution, add purified water to make exactly 100 mL, and use this solution as the standard solution.

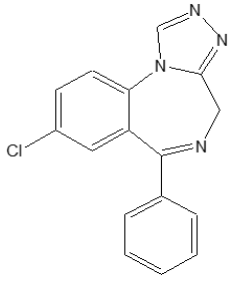
$$\text{Content (\%) of acetylcysteine} = \text{Amount (mg) of acetylcysteine RS} \times \frac{A_T}{A_S} \times \frac{733.94}{963.20} \times \frac{100}{Potency\ (mg)\ in\ amount\ of\ \text{Erythromycin Stinoprate Tablets taken}}$$

Erythromycin propionate—Perform the test as directed under the Erythromycin propionate under Erythromycin Stinoprate. However, weigh accurately an amount of Erythromycin Stinoprate Tablets, equivalent to about 0.185 g (potency) according to the labeled potency, dissolve in methanol to make 50 mL, and use this solution as the test solution.

$$\text{Content (\%) of erythromycin propionate} = \text{Amount (mg) of erythromycin propionate RS} \times \frac{A_T}{A_S} \times \frac{733.94}{963.20} \times \frac{100}{Potency\ (mg)\ in\ amount\ of\ \text{Erythromycin Stinoprate Tablets taken}}$$

Packaging and storage Preserve in tight containers.

Estazolam
에스타졸람



Estazolam $C_{16}H_{11}ClN_4$: 294.74
8-Chloro-6-phenyl-4*H*-`1,2,4-triazolo[4,3-a]-1,4-benzodiazepine [*29975-16-4*]

Estazolam, when dried, contains NLT 98.5% and NMT 101.0% of estazolam ($C_{16}H_{11}ClN_4$).

Description Estazolam occurs as a white to pale yellowish white crystals or crystalline powder. It is odorless and has a bitter taste.
It is soluble in methanol and in acetic anhydride, sparingly soluble in ethanol(95), and practically insoluble in water and in ether.

Identification (1) Dissolve about 10 mg of Estazolam in 3 mL of sulfuric acid and examine the solution under ultraviolet light (wavelength of 365 nm); the resulting solution exhibits a yellowish green fluorescent color.

(2) Determine the absorption spectra of the solutions of Estazolam and estazolam RS in 1 mol/L hydrochloric acid (1 in 100000) as directed under Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Perform the test with Lorazepam as directed under the Flame Coloration (2); it exhibits a green color.

Melting point Between 229 and 233 ºC.

Purity (1) ***Clarity and color of solution***—Dissolve about 0.1 g of Estazolam in 10 mL of ethanol(95); the resulting solution is colorless and clear.

(2) ***Chloride***—Dissolve 1.0 g of Estazolam in 10 mL of ethanol(95) by heating, add 40 mL of water, cool with shaking in iced water, allow to stand until it reaches room temperature, and filter. To 30 mL of the filtrate, add 6 mL of dilute nitric acid and water to make 50 mL. Using this solution as the test solution, perform the test. Prepare the control solution with 0.25 mL of 0.01 mol/L hydrochloric acid and 6 mL of ethanol (NMT 0.015%).

(3) ***Heavy metals*—**Proceed with 1.0 g of Estazolam according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(4) ***Arsenic*—**Prepare the test solution with 1.0 g of Estazolam according to Method 3 and perform the test (NMT 2 ppm).

(5) ***Related substances*—**Dissolve 0.2 g of Estazolam in 10 mL of methanol and use this solution as the test solution. Pipet 1 mL of this solution, add methanol to make exactly 200 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on a plate made of silica gel with fluorescent indicator for thin-layer chromatography, develop the plate with a mixture of hexane, chloroform and methanol (5 : 3 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot obtained from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 1.0% (1 g, 105 ℃, 4 hours).

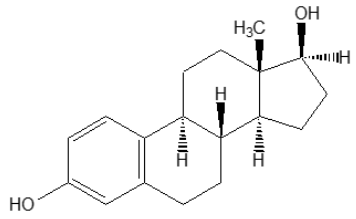
Residue on ignition NMT 0.1% (2 g).

Assay Weigh accurately about 0.25 g of Estazolam, previously dried, dissolve in 100 mL of acetic anhydride, and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). The endpoint of the titration is when the solution changes to the equivalence point 2. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 14.737 mg of $C_{16}H_{11}ClN_4$

Packaging and storage Preserve in well-closed containers.

Estradiol
에스트라디올



Estradiol $C_{18}H_{24}O_2$: 272.38
(17β)-Eestra-1,3,5(10)-triene-3,17-diol [*50-28-2*]

Estradiol, when dried, contains NLT 97.0% and NMT 103.0% of Estradiol ($C_{18}H_{24}O_2$).

Description Estradiol occurs as white crystals or a crystalline powder and is odorless.
It is freely soluble in 1,4-dioxane, soluble in acetone, sparingly soluble in ethanol(95), slightly soluble in sesame oil and practically insoluble in water.

Identification (1) Determine the absorption spectra of solutions of Estradiol and estradiol RS, respectively, in ethanol(95) (1 in 20000) as directed under Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths. The difference of absorption maxima in each absorption spectra is NLT 3.0% at about 280 nm.

(2) Determine the infrared spectra of Estradiol and estradiol RS as directed in the paste method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Optical rotation $[\alpha]_D^{20}$: Between +76.0° and +83.0° (0.250 g, calculated on the anhydrous basis, ethanol(95),

25 mL, 100 mm).

Melting point Between 173 and 179 ºC.

Purity ***Related substances***—Weigh about 70 mg of Estradiol, add a mixture of n-butyl chloride and methanol (5 : 1), shake vigorously, add a mixture of n-butyl chloride and methanol (5 : 1) to make 10 mL, and use this solution as the test solution. Perform the test with 10 μL of the test solution as directed under the Liquid Chromatography according to the following conditions. Determine each peak area by the automatic integration method and calculate the peak area, A_i of each related substance and the total area of all peaks AS by the percentage peak area method; the amount of each related substance is NMT 0.5%, and the total amount of related substances is NMT 1.0%.

$$\text{Content (\%) of each related substance} = 100\times \frac{A_i}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 280 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with porous silanized silica gel for liquid chromatography (3 μm to 10 μm in particle diameter).

Mobile phase: A mixture of isooctane, n-butyl chloride, and methanol (45 : 4 : 1).

Flow rate: 2 mL/min

System suitability

System performance: Proceed with 10 μL of the test solution under the above operating conditions; the resolution between the peaks of estradiol and each related substance is NLT 1.0, and the number of theoretical plates and symmetry factor are NLT 800 and NMT 1.5, respectively.

System repeatability: Repeat the test 5 times according to the above conditions with 10 μL each of the test solution; the relative standard deviation of the peak area of estradiol is NMT 2.0%.

Water NMT 3.5% (0.5 g, volumetric titration, direct titration).

Assay Weigh accurately about 0.1 g of Estradiol, previously dried, and dissolve in methanol to make exactly 250 mL. Pipet 10 mL of this solution, add 5.0 mL of the internal standard solution and 100 mL of methanol and water to make exactly 200 mL and use this solution as the test solution. Separately, weigh accurately a sufficient amount each of estradiol RS (previously determined water contents) and estrone RS and dissolve separately in methanol to contain about 400 μg of estradiol and 240 μg of estrone per mL. Pipet 10 mL each of these solutions, add 5.0 mL of the internal standard solution, 100 mL of methanol and add water to make exactly 200 mL and use these solutions as the standard solutions. Perform the test with 25 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the peak area ratios, Q_T and Q_S, of estradiol to internal standard, respectively.

$$\text{Amount (mg) of estradiol } (C_{18}H_{24}O_2) = 5\times C \times \frac{Q_T}{Q_S}$$

C: Final concentration of Estradiol in the standard solution (μg/mL)

Internal standard solution—A solution of ethylparabene in methanol (0.6 in 1000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 205 nm).

Column: A stainless steel column about 3.9 mm in internal diameter and 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (about 5 μm to 10 μm in particle diameter).

Mobile phase: A mixture of acetonitrile and water (55 : 45).

Flow rate: 1 mL/min

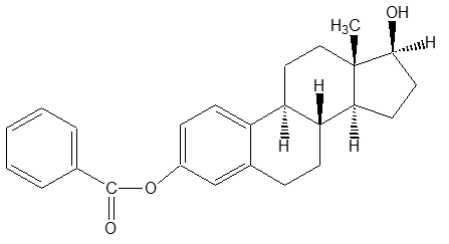
System suitability

System performance: Proceed with 25 μL of the standard solution under the above conditions; the internal standard, estradiol, and estrone are eluted in this order with the resolution being NLT 2.0.

System repeatability: Repeat the test 6 times with 25 μL of the standard solution according to the above conditions; the relative standard deviation of the peak area ratio is NMT 2.0%.

Packaging and storage Preserve in light-resistant, tight containers.

Estradiol Benzoate
에스트라디올벤조에이트



$C_{25}H_{28}O_3$: 376.49

(17β)-3-Hydroxyestra-1,3,5(10)-trien-3-yl benzoate [*50-50-0*]

Estradiol Benzoate, when dried, contains NLT 97.0% and NMT 101.0% of estradiol benzoate

($C_{25}H_{28}O_3$).

Description Estradiol Benzoate occurs as a white crystalline powder and is odorless.
It is sparingly in acetone, slightly soluble in methanol, ethanol(95) and ethanol(95), and practically insoluble in water.

Identification (1) Add 2 mL of sulfuric acid to 2 mg of Estradiol Benzoate; the resulting solution exhibits a yellowish green color with blue fluorescence. Carefully add 2 mL of water; the color of the solution changes to light orange.

(2) Determine the infrared spectra of Estradiol Benzoate and estradiol benzoate RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Optical rotation $[\alpha]_D^{20}$: Between +54° and +58° (after drying, 0.1 g, acetone, 10 mL, 100 mm).

Melting point Between 191 and 198 ºC.

Purity (1) ***3,17α-Estradiol***—Dissolve 5.0 mg each of Estradiol Benzoate and estradiol benzoate RS in acetone to make exactly 100 mL, and use these solutions as the test solution and the standard solution, respectively. Put exactly 2 mL each of the test solution and standard solution in separate glass-stoppered test tube, add boiling stones, evaporate the acetone by heating on a steam bath, and dry the residue in a desiccator (in vacuum, phosphorus (V) oxide) for 1 hour. Add 1.0 mL of dilute iron-phenol TS to each test tube. Stopper the test tubes loosely, heat for 30 seconds on a steam bath, shake on a steam bath for several seconds, and heat for 2 minutes again. After cooling the solutions in ice again for 2 minutes, add 4.0 mL of diluted sulfuric acid (7 in 20) and mix well; the solution obtained from the test solution has no more intense than that from the standard solution.

(2) ***Related substances***—Dissolve 40 mg of Estradiol Benzoate in 2 mL of acetone, and use this solution as the test solution. Pipet 1 mL of this solution, add acetone to make exactly 100 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of chloroform and diethylamine (19 : 1) as the developing solvent to a distance of about 15 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot obtained from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 0.5% (0.5 g, in vacuum, phosphorus (V) pentoxide, 4 hours).

Residue on ignition NMT 0.2% (0.1 g).

Assay Weigh accurately about 10 mg each of Estradiol Benzoate and estradiol benzoate RS, previously dried, dissolve separately in methanol to make exactly 20 mL. Pipet 5 mL each of these solutions, add exactly 5 mL of the internal standard solution, then add methanol to make 20 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 5 μL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the ratios, Q_T and Q_S, of the peak area of estradiol benzoate to that of the internal standard for the test solution and the standard solution, respectively.

$$\text{Amount (mg) of estradiol benzoate } (C_{25}H_{28}O_3) = \text{Amount (mg) of estradiol benzoate RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of progesterone in methanol (13 in 80000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 230 nm).

Column: A stainless steel column 4 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 35 °C.

Mobile phase: A mixture of acetonitrile and water (7 : 3).

Flow rate: Adjust the flow rate so that the retention time of estradiol benzoate is about 10 minutes.

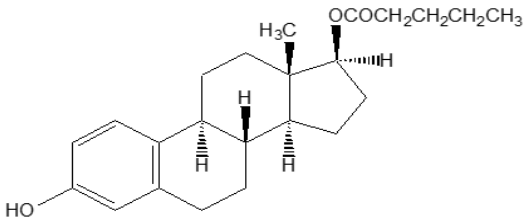
System suitability

System performance: Proceed with 5 μL of the standard solution according to the above conditions; the internal standard and estradiol benzoate are eluted in this order with the resolution being NLT 9.

System repeatability: Repeat the test 6 times with 5 μL each of the standard solution as directed in the above conditions; the relative standard deviation of the peak area ratios of estradiol benzoate to the peak area of the internal standard is NMT 1.0%.

Packaging and storage Preserve in light-resistant, tight containers.

Estradiol Valerate
에스트라디올발레레이트



$C_{23}H_{32}O_3$: 356.50
(17β)-3-Hydroxyestra-1,3,5(10)-trien-17-yl pentanoate
[*979-32-8*]

Estradiol Valerate contains NLT 98.0% and NMT 102.0% of Estradiol Valerate ($C_{23}H_{32}O_3$).

Description Estradiol Valerate occurs as a white crystalline powder, is odorless or has a slightly oily odor.
It is soluble in castor oil, methanol, benzylbenzoate or 1,4-dioxane, sparingly soluble in sesame oil or peanut oil, and practically insoluble in water.

Identification Determine the infrared spectra of Estradiol Valerate and estradiol valerate RS, prepared by adding chloroform and potassium bromide to Estradiol Valerate or estradiol valerate RS, then grinding and drying at 105 ºC, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibits similar intensities of absorption at the same wavenumbers.

Optical rotation $[\alpha]_D^{20}$: Between +41° and +47° (0.5 g, calculated on the anhydrous basis, methanol, 20 mL, 100 mm).

Melting point Between 143 and 150 ℃ (Method 1).

Purity (1) ***Estradiol***—Dissolve 50 mg of Estradiol Valerate in 10 mL of acetone and use this solution as the test solution. Separately, dissolve 5 mg of estradiol valerate RS in 100 mL of acetone and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on a plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of cyclohexane and ethyl acetate (7 : 3) as the developing solvent to a distance of about 15 cm and dry the plate at 90 ºC for 30 minutes. Spray evenly a solution of sulfuric acid in methanol (3 in 10) on the plate and heat at 90 ºC for 30 minutes; spots other than the principal spot from the test solution or the spot corresponding to estradiol are not more intense or not greater than the spots from the standard solution (NMT 1.0%).

(2) ***Free acid***—Neutralize 25 mL of ethanol(95) in an Erlenmeyer flask with 0.01 mol/L sodium hydroxide VS to a pale blue color, using bromothymol blue TS. Weigh accurately about 0.50 g of Estradiol Valerate and dissolve in the neutralized ethanol. Titrate with 0.01 mol/L sodium hydroxide VS to a pale blue color. (NMT 0.5% of valeric acid)

Each mL of 0.01 mol/L sodium hydroxide VS
= 1.021 mg of $C_5H_{10}O_2$

(3) ***Related substances***—Dissolve 0.1 g of Estradiol Valerate in 10 mL of acetone and use this solution as the test solution. Separately, weigh 10 mg of estradiol valerate RS and add acetone to make 10 mL. Pipet 0.1 mL, 0.5 mL, 1 mL and 2 mL of this solution and add acetone to each to make exactly 10 mL and use these solutions as the standard solutions (1),(2), (3) and (4). With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 20 μL each of the test solution and the standard solutions (1), (2), (3) and (4) on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of cyclohexane and ether (4 : 1) as the developing solvent to a distance of about 15 cm and air-dry the plate. Spray evenly sulfuric acid in ethanol(95) (1 in 10) on the plate, heat the plate until burn and cool. Examine under ultraviolet light (main wavelength: 254 nm and 366 nm). Compare the intensities of any spot other than the principal spot from the test solution with those from the standard solution; the relative intensity is NMT 2.0%.

Water NMT 0.1% (5 g, direct titration).

Assay Weigh accurately about 25 mg of Estradiol Valerate and estradiol valerate RS, dissolve each in the internal standard solution to make exactly 25 mL and use these solutions as the test solution and the standard solution, respectively. Perform the test with 10 μL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the ratio of the peak area of Estradiol Valerate to that of the internal standard, Q_T and Q_S.

$$\text{Amount (mg) estradiol valerate } (C_{23}H_{32}O_3) = \text{Amount (mg) of estradiol valerate RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—Testosterone benzoate solution in tetrahydrofuran (2 in 1000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 280 nm).

Column: A stainless steel column about 4 mm in internal diameter and 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (about 5 μm to 10 μm in particle diameter).

Mobile phase: Dissolve 0.8 g of ammonium nitrate in 300 mL of water, add 700 mL of acetonitrile and mix.

Flow rate: 2 mL/min

System suitability

System performance: Proceed with 10 μL of the standard solution under the above operating conditions; estradiol valerate and the internal standard are eluted in this order with the resolution being NLT 3.

System repeatability: Repeat the test 6 times with 10 μL of the standard solution according to the above conditions; the relative standard deviation of the peak area ratio is NMT 1.5%.

Packaging and storage Preserve in light-resistant, tight containers.

Estradiol Valerate Injection
에스트라디올발레레이트 주사액

Estradiol Valerate Injection is an oily preparation for injection, and contains NLT 90.0% and NMT 115.0% of the labeled amount of estradiol valerate ($C_{23}H_{32}O_3$: 356.50).

Method of preparation Prepare as directed under Injections, with Estradiol Valerate.

Description Estradiol Valerate Injection occurs as a pale yellow distillate.

Identification Add 0.5 mL of Estradiol Valerate Injection in a separatory funnel with 10 mL of hexane and 10 mL of 80% methanol, shake for 2 minutes to mix, and allow to stand to separate the layers. To 1 mL of the bottom layer solution, add 1 mL of Folin TS (dilute by adding 2 mL of water to 1 mL of stock solution when using) and 3 mL of sodium carbonate solution (1 in 5); the resulting solution exhibits a blue color.

Purity ***Estradiol*—**Pipet an appropriate amount of Estradiol Valerate Injection according to the labeled amount, and add acetone to obtain a solution containing 30%. To 1.0 mL of this solution, add the oil used in the injection to make exactly 10 mL, and use this solution as the estradiol solution. Perform the test with this solution and estradiol valerate injection as directed under the Thin Layer Chromatography. Spot 5 μL each of these solutions on the plate made of silica gel for thin-layer chromatography. Proceed as directed under Estradiol of Estradiol Valerate (NMT 3.0%).

Sterility Meets the requirements.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Extractable volume of injections Meets the requirements.

Assay Pipet an amount of Estradiol Valerate Injection equivalent to about 20 mg of estradiol valerate ($C_{23}H_{32}O_3$) according to the labeled amount, wash the pipet with tetrahydrofuran, add 5.0 mL of the internal standard solution, and then add tetrahydrofuran to make exactly 25 mL. Use this solution as the test solution. Separately, weigh accurately about 20 mg of estradiol valerate RS, add 5.0 mL of the internal standard solution, add tetrahydrofuran to make exactly 25 mL, and use this solution as the standard solution. Perform the test as directed in the Assay of Estradiol Valerate.

$$\text{Amount (mg) estradiol valerate } (C_{23}H_{32}O_3) = \text{Amount (mg) of estradiol valerate RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—Solution of testosterone benzoate in tetrahydrofuran (8 in 1000).

Packaging and storage Preserve in light-resistant, hermetic containers.

Estradiol Valerate Tablets
에스트라디올발레레이트 정

Estradiol Valerate Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of estradiol valerate ($C_{23}H_{32}O_3$: 356.50).

Method of preparation Prepare as directed under Tablets, with Estradiol Valerate.

Identification Weigh an amount of Estradiol Valerate Tablets, equivalent to 10 mg of estradiol valerate, according to the labeled amount, dissolve in 25 mL of 80% methanol, and filter. Use the filtrate as the test solution. Separately, weigh 10 mg of estradiol valerate RS, add 80% methanol to make 25 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of hexane and ethyl acetate (8 : 2) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Spray evenly the coloring agent (dissolve 20 g of toluenesulfonic acid in ethanol to make 100 mL), and then examine the plate under ultraviolet light (main wavelength: 254 nm); the R_f values and the colors of the spots obtained from the test solution and the standard solution are the same.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 tablets of Estradiol Valerate Tablets and powder. Weigh accurately an amount equivalent to about 2 mg of estradiol valerate,

add 1 mL of 0.1 mol/L hydrochloric acid, shake to mix, and warm on a steam bath at 50 ℃ for 10 minutes. Then, add 4.0 mL of internal standard solution, warm for 20 minutes, filter, and use the filtrate as the test solution. Separately, weigh accurately about 0.1 g of estradiol valerate RS and add the internal standard solution to make 200 mL. Take 20.0 mL of this solution, add 5.0 mL of 0.1 mol/L hydrochloric acid, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions; determine the peak area ratios, Q_T and Q_S, of estradiol to the peak area of the internal standard, respectively.

$$\text{Amount (mg) of estradiol valerate } (C_{23}H_{32}O_3) = \text{Amount (mg) of estradiol valerate RS} \times \frac{Q_T}{Q_S} \times \frac{1}{50}$$

Internal standard solution—A solution of diflucortolone valerate in methanol (5 in 10000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 280 nm).

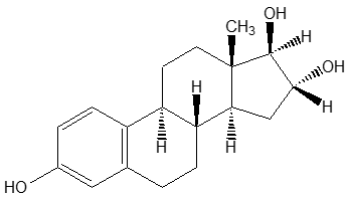
Column: A stainless steel column about 4.0 mm in internal diameter and about 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 to 10 μm in particle diameter).

Mobile phase: A mixture of methanol and water (725: 275).

Flow rate: 2.0 mL/min

Packaging and storage Preserve in well-closed containers.

Estriol
에스트리올



Estriol $C_{18}H_{24}O_3$: 288.38

(16α,17β)-Estra-1,3,5(10)-triene-3,16,17-triol [*50-27-1*]

Estriol, when dried, contains NLT 97.0% and NMT 102.0% of estriol ($C_{18}H_{24}O_3$).

Description Estriol occurs as a white crystalline powder and is odorless.

It is sparingly soluble in methanol, slightly soluble in ethanol(95) or 1,4-Dioxane and practically insoluble in water or ether.

Identification (1) Dissolve 10 mg of Estriol in 100 mL of ethanol(95) by warming, and use this solution as the test solution. Evaporate 1 mL of this solution on a steam bath to dryness, add 5 mL of a solution of sodium p-phenolsulfonate in phosphoric acid (1 in 50), heat at 150 ℃ for 10 minutes, and cool; the resulting solution exhibits a purple color.

(2) Dissolve 10 mg of Estriol and estriol RS in 100 mL of ethanol(95) by warming, determine the absorption spectra as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared spectra of Estriol and estriol RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Optical rotation $[\alpha]_D^{20}$: Between +60° and +65° (after drying, 80 mg, ethanol(99.5), 10 mL, 100 mm).

Melting point Between 281 and 286 ºC.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Estriol according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Related substances***—Dissolve about 40 mg of Estriol in 10 mL of ethanol(95) by warming and use this solution as the test solution. Pipet 1 mL of this solution, add ethanol(95) to make 100 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on a plate made of silica gel for thin-layer chromatography. Develop the plate with a mixture of chloroform, methanol, acetone, and acetic acid(100) (18 : 1 : 1 : 1) as the developing solvent to a distance of about 15 cm, and air-dry the plate. Spray evenly diluted sulfuric acid (1 in 2) on the plate and heat at 105 ℃ for 15 minutes; the spots other than the principal spot from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 0.5% (0.5 g, 105 ℃, 3 hours).

Residue on ignition NMT 0.1% (0.5 g).

Assay Weigh accurately the average about 25 mg each of Estriol and estriol RS, previously dried, dissolve separately in methanol to make exactly 50 mL. Pipet 10 mL each of these solutions, add exactly 5 ml of the internal standard solution, add methanol to make 100 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 10 μL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the ratio of the peak area of Estriol to that of the internal standard, Q_T and Q_S.

$$\text{Amount (mg) of estriol } (C_{18}H_{24}O_3) = \text{Amount (mg) of estriol RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of methyl benzoate in methanol (1 in 1000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 280 nm).

Column: A stainless steel column about 4 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: A mixture of water and methanol (51:49).

Flow rate: Adjust the flow rate so that the retention time of Estriol is about 10 minutes.

System suitability

System performance: Proceed with 10 μL of the standard solution under the above operating conditions; estriol and the internal standard are eluted in this order with the resolution being NLT 8.

System repeatability: Repeat the test 6 times with 10 μL of the standard solution under the above operating conditions; the relative standard deviation of the peak area ratios of estriol to that of the internal standard is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Estriol Tablets
에스트리올 정

Estriol Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of estriol ($C_{18}H_{24}O_3$: 288.38).

Method of preparation Prepare as directed under Tablets, with Estriol.

Identification Weigh an amount of Estriol Tablets, previously powdered, equivalent to 2 mg of estriol according to the labeled amount, add 20 mL of ethanol(95), shake to mix for 10 minutes, and centrifuge. Use the clear supernatant as the test solution. Perform the Identification (1) and (2) of Estriol with the test solution.

Dissolution Perform the test with 1 tablet of Estriol Tablets at 50 revolutions per minute according to Method 2 under the Dissolution, using 900 mL of water as the dissolution medium. Take NLT 20 mL of the dissolved solution 30 minutes after starting the test, and filter through a membrane filter with a pore size of NMT 0.8 μm. Discard the first 10 mL of the filtrate, pipet V mL of the subsequent filtrate, add water to make exactly V' mL of solution containing about 0.1 μg of estriol ($C_{18}H_{24}O_3$) per mL according to the labeled amount, and use this solution as the test solution. Separately, weigh accurately about 10 mg of estriol RS, previously dried at 105 ℃ for 3 hours, and dissolve in methanol to make exactly 100 mL. Pipet 5 mL of this solution and add water to make 100 mL. Pipet 2 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 100 μL each of the test solution and the standard solution according to the operating conditions under the Assay of Estriol, and measure the peak areas, A_T and A_S, of estriol, respectively.

It meets the requirements when the dissolution rate of Estriol Tablets in 30 minutes is NLT 80%.

$$\text{Dissolution rate (\%) of the labeled amount of estriol } (C_{18}H_{24}O_3) = W_S \times \frac{A_T}{A_S} \times \frac{V'}{V} \times \frac{1}{C} \times \frac{9}{10}$$

W_S: Amount (mg) of estriol RS

C: Labeled amount (mg) of estriol ($C_{18}H_{24}O_3$) in 1 tablet

Uniformity of dosage units It meets the requirements when the Content uniformity test is performed according to the following procedure. Take 1 tablet of Estriol Tablets, add exactly 5 mL of water, sonicate to disperse, and add exactly 15 mL of methanol. Shake to mix for 15 minutes. Centrifuge this solution for 10 minutes, pipet a certain amount of the clear supernatant, and add methanol to obtain a solution having known concentration of about 5 μg of estriol ($C_{18}H_{24}O_3$) per mL. Pipet 5 mL of this solution, add exactly 1 mL of the internal standard solution, and use this solution as the test solution. Perform the test solution with 20 μL of the test solution under the Assay of Estriol as follow. However, prepare the internal standard solution with a solution of methyl benzoate in methanol (1 in 40000). Measure the average value from the peak area ratios of individual 10 tablets of Estriol Tablets; it meets the requirements when the deviation (%) between the value and the individual peak area ratio is within 15%. Also, perform the test with another 20 tablets of Estriol Tablets when there is 1 tablet with a deviation (%) of more than 15% and less than 25%. Calculate the deviation (%) between the average value of total 30 tablets from the two tests and each peak area ratio; it meets the requirements when there is NMT 1 tablet with a deviation of more than 15% and less than 25%, and there are no tablets with a deviation of more than 25%.

Assay Weigh accurately NLT 20 tablets of Estriol Tablets, and powder. Weigh accurately an amount equivalent to about 1 mg of estriol ($C_{18}H_{24}O_3$), add exactly 5 mL of water, sonicate to disperse, and add 25 mL of methanol. Shake to mix for 10 minutes, centrifuge, and take the clear supernatant. Add 25 mL of methanol, repeat the

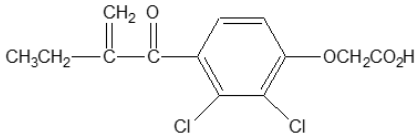
procedure 2 times in the same manner, combine the clear supernatant, and add 5.0 mL of the internal standard solution, and add methanol to make exactly 100 mL. Use this solution as the test solution. Separately, weigh accurately about 25 mg of estriol RS, previously dried at 105 ℃ for 3 hours, and dissolve in methanol to make exactly 100 mL. Pipet 4 mL of this solution, add 5.0 mL of the internal standard solution, add methanol to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL each of the test solution and the standard solution under the Assay of Estriol.

$$\text{Amount (mg) of estriol } (C_{18}H_{24}O_3) = \text{Amount (mg) of estriol RS} \times \frac{Q_T}{Q_S} \times \frac{1}{25}$$

Internal standard solution—A solution of methyl benzoate in methanol (1 in 5000).

Packaging and storage Preserve in tight containers.

Etacrynic Acid
에타크린산



Etacrynic Acid $C_{13}H_{12}Cl_2O_4$: 303.14
[2,3-Dichloro-4-(2-methylenebutanoyl)phenoxy]acetic acid [*58-54-8*]

Etacrynic Acid, when dried, contains NLT 98.0 and NMT 101.0% of etacrynic acid ($C_{13}H_{12}Cl_2O_4$).

Description Etacrynic Acid occurs as a white, crystalline powder. It is odorless and has a slightly bitter taste.
It is very soluble in methanol, freely soluble in ethanol(95), acetic acid(100) and ether, and very slightly soluble in water.

Identification (1) Dissolve 0.2 g of Etacrynic Acid in 10 mL of acetic acid(100), and to 5 mL of this solution, add 0.1 mL of bromine TS; the color of the test solution disappears. To the remaining 5 mL of the solution, add 0.1 mL of potassium permanganate TS; the color of the test solution immediately changes to light orange.

(2) Add 1 mL of sodium hydroxide TS to 0.01 g of Etacrynic Acid, and heat on a steam bath for 3 minutes. After cooling, add 1 mL of chromotropic acid TS, and heat on a steam bath for 10 minutes; the solution exhibits an intense purple color.

(3) Determine the absorption spectra of solutions of Etacrynic Acid and etacrynic acid RS in methanol (1 in 20000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(4) Perform the test with Etacrynic Acid as directed under the Flame Coloration (2); it exhibits a green color.

Melting point Between 121 and 125 ºC.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Etacrynic Acid in 10 mL of methanol; the solution is clear and colorless.

(2) ***Heavy metals***—Proceed with 1.0 g of Etacrynic Acid according to Method 4 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Arsenic***—Proceed with 1.0 g of Etacrynic Acid according to Method 3 and perform the test. Add 10 mL of a solution of magnesium nitrate hexahydrate in ethanol(95) (1 in 50), then add 1.5 mL of hydrogen peroxide(30), and fire to burn (NMT 2 ppm).

(4) ***Related substances***—Dissolve about 0.20 g of Etacrynic Acid in 10 mL of ethanol(95) and use this solution as the test solution. Pipet 3 mL of this solution, add ethanol(95) to make exactly 200 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of chloroform, ethyl acetate, and acetic acid(100) (6 : 5 : 2) as the developing solvent to a distance of about 15 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 0.25% (1 g, in vacuum, 60 ℃, 2 hours).

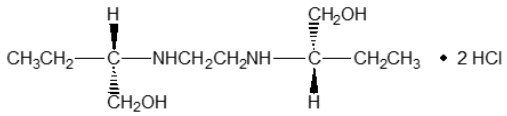
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.1 g of Etacrynic Acid, previously dried, put in an iodine bottle, dissolve in 20 mL of acetic acid(100), and add exactly 20 mL of 0.05 mol/L bromine. To this solution, add 3 mL of hydrochloric acid, stopper tightly at once, shake, and allow to stand in a dark place for 60 minutes. Then, carefully add 50 mL of water and 15 mL of potassium iodide TS, stopper tightly immediately, shake well, and titrate the liberated iodine with 0.1 mol/L sodium thiosulfate VS (indicator: 1 mL of starch TS). Perform a blank test in the same manner and make any necessary correction.

$$\text{Each mL of 0.05 mol/L bromine VS} = 15.157 \text{ mg of } C_{13}H_{12}Cl_2O_4$$

Packaging and storage Preserve in well-closed containers.

Ethambutol Hydrochloride
에탐부톨염산염



$C_{10}H_{24}N_2O_2 \cdot 2HCl$: 277.23

(2*S*,2'*S*)-2,2'-(Ethane-1,2-diyldiimino)dibutan-1-ol dihydrochloride [*1070-11-7*]

Ethambutol Hydrochloride, when dried, contains NLT 98.5% and NMT 101.0% of ethambutol hydrochloride ($C_{10}H_{24}N_2O_2 \cdot 2HCl$).

Description Ethambutol Hydrochloride occurs as white crystals or a crystalline powder, is odorless and has a bitter taste.
It is very soluble in water, soluble in methanol and in ethanol(95), and practically insoluble in ether.
The pH of a solution of Ethambutol Hydrochloride (1 in 20) in 20 mL of water is between 3.4 and 4.0.

Identification (1) Determine the infrared spectra of Ethambutol Hydrochloride and ethambutol hydrochloride RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) An aqueous solution of Ethambutol Hydrochloride (1 in 30) responds to the Qualitative Analysis for chloride.

Optical rotation $[\alpha]_D^{20}$: Between +5.5 and +6.1° (after drying, 5.0 g, water, 50 mL, 200 mm).

Melting point Between 200 ºC and 204 ºC.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Ethambutol Hydrochloride in 10 mL of water; the solution is clear and colorless.

(2) ***Heavy metals***—Proceed with 2.0 g of Ethambutol Hydrochloride according to Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Arsenic***—Prepare the test solution with 1.0 g of Ethambutol Hydrochloride, according to Method 1 and perform the test (NMT 2 ppm).

(4) ***Related substances***—Dissolve 0.10 g of Ethambutol Hydrochloride in 10 mL of methanol and use this solution as the test solution. Separately, dissolve 2 mg of ethambutol hydrochloride RS in 10 mL of methanol, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 20 μL each of the test solution and the standard solution on a plate made of silica gel for thin-layer chromatography. Develop the plate with a mixture of methanol and ammonia water(28) (18 : 1) as the developing solvent to a distance of about 15 cm, and air-dry the plate. Spray evenly iodine chloroform solution TS for spray on the plate; the spots other than the principal spots from the test solution are not more intense than the spots from the standard solution (2.0%).

(5) ***2-Aminobutanol***—Weigh accurately about 50 mg of Ethambutol Hydrochloride, dissolve in water to make exactly 100 mL and use this solution as the test solution. Separately, dissolve adequate amount of 2-aminobutanol RS, weighed accurately, in water and dilute sequentially to make a solution containing 5 μg per mL and use this solution as the standard solution. Transfer 10 mL of the test solution into a 100-mL Erlenmeyer flask with glass stopper and add 10 mL of water and 20 mL of boric acid buffer solution. Separately, mix 10.0 mL of the test solution, 10.0 mL of the standard solution, and 20 mL of boric acid buffer solution in a 100-mL Erlenmeyer flask. While the contents in two flasks are mixed on shaker, quickly add 10 mL of fluorescamine solution and stopper them and mix briefly. Perform the test after exactly 1 minute with these solutions as directed under the Fluorescence Spectroscopy. Determine the fluorescence intensity at 385 nm of excitation wavelength and 485 nm of emission wavelength: the fluorescence intensity obtained from the test solution is NMT that of the difference between two solutions (NMT 1.0%).

Boric acid buffer solution—Weigh about 1.24 g of boric acid, dissolve in 90 mL of water, adjust with 5 mol/L sodium hydroxide to pH 9.0, and dilute with water to exactly 100 mL and mix.

Fluorescamine solution—Transfer 5 mg of fluorescamine into a cylinder with stopper and scale line, and dissolve in 50 mL of acetone.

Loss on drying NMT 0.5% (1 g, 105 ℃, 3 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.2 g of Ethambutol Hydrochloride, previously dried, dissolve in 50 mL of water, add 1 mL of 0.1 mol/L hydrochloric acid TS and titrate with 0.1 mol/L sodium hydroxide TS from the first equivalence point to the second equivalence point (potentiometric titration under the Titrimetry).

Each mL of 0.1 mol/L sodium hydroxide VS
= 27.723 mg of $C_{10}H_{24}N_2O_2 \cdot 2HCl$

Packaging and storage Preserve in tight containers.

Ethambutol Hydrochloride Tablets
에탐부톨염산염 정

Ethambutol Hydrochloride Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of eth-

ambutol hydrochloride ($C_{10}H_{24}N_2O_2 \cdot 2HCl$: 277.23).

Method of preparation Prepare as directed under Tablets, with Ethambutol Hydrochloride.

Identification (1) Weigh an amount of Ethambutol Hydrochloride Tablets, previously powdered, equivalent to 0.1 g of ethambutol hydrochloride, according to the labeled amount, add 3 mL of methanol, transfer into a glass mortar, and stir to mix. Again, add 5 mL of methanol make a suspension, and filter through a filter paper, previously moistened with methanol. Transfer the filtrate to a beaker containing 100 mL of acetone, stir to mix, allow to stand for 15 minutes, and extract crystals. Discard the clear supernatant by inclining the container, and air-dry the crystals until there is no methanol odor. Determine the infrared spectra of these crystals and ethambutol hydrochloride RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit maxima at the same wavenumber.

(2) An aqueous solution of the crystals (1 in 10), obtained from (1), responds to the Qualitative Analysis for chloride.

Purity ***2-Aminobutanol***—Take an appropriate number of tablets, equivalent to 400 mg of ethambutol hydrochloride, transfer in a beaker, add acetone until the tablets are submerged, and allow to stand for 15 minutes. Discard the acetone, then dry, powder the tablet with the coating removed, and add methanol, shake to mix, make exactly 100 mL, and filter. Pipet 25 mL of the filtrate, and dilute with water to make exactly 200 mL. Allow to stand for 15 minutes, filter through a dried filter paper, discard the first turbid filtrate, and use the subsequent filtrate as the test solution. Proceed with this solution under the Purity (5) of Ethambutol Hydrochloride.

Dissolution Perform the test with 1 tablet of Ethambutol Hydrochloride Tablets at 100 revolutions per minute according to Method 1 under the Dissolution, using 900 mL of water as the dissolution medium. Take the dissolved solution 45 minutes after starting the test, filter, and use the filtrate as the test solution. Separately, weigh an appropriate amount of ethambutol hydrochloride RS, previously dried at 105 ℃ for 2 hours, dissolve in water to make a solution containing 0.1 mg per mL, and use this solution as the standard solution. Transfer 1 mL each of the test solution, the standard solution and water to 3 glass-stoppered centrifuge tubes, add 5.0 mL of bromocresol green solution and 10.0 mL of chloroform, respectively, close with the stoppers, and shake vigorously to mix. Allow to stand until the chloroform layer separates, discard the supernatant water layer, and filter the chloroform layer through cotton. Perform the test with these solutions as directed under the Ultraviolet-visible Spectroscopy, and measure the absorbance at the absorbance maximum wavelength at about 415 nm.

The acceptable dissolution criterion of Ethambutol Hydrochloride Tablets is NLT 75% (Q) dissolved in 45 minutes.

Phosphate buffer solution—Dissolve 38.0 g of sodium dihydrogen phosphate dihydrate and 2.0 g of anhydrous sodium dihydrogen phosphate in water to make 1000 mL.

Bromocresol green solution—Weigh 0.2 g of bromocresol green, dissolve in 30 mL of water and 6.5 mL of 0.1 mol/L sodium hydroxide, add phosphate buffer solution to make 500 mL, and mix. Then, add 0.1 mol/L hydrochloric acid to adjust the pH to 4.6 ± 0.1.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately NLT 20 tablets of Ethambutol Hydrochloride Tablets, and powder. Weigh accurately about 30 mg of ethambutol hydrochloride ($C_{10}H_{24}N_2O_2 \cdot 2HCl$), dissolve in water by shaking to mix, then add water to make exactly 100 mL, and filter. Discard the first 10 mL of the filtrate, and use the subsequent filtrate as the test solution. Separately, weigh accurately about 30 mg of ethambutol hydrochloride RS, dissolve in water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 50 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and measure the peak areas, A_T and A_S, of ethambutol hydrochloride in each solution.

$$\text{Amount (mg) of ethambutol hydrochloride } (C_{10}H_{24}N_2O_2 \cdot 2HCl) = \text{Amount (mg) of ethambutol hydrochloride RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 200 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with nitrile silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of a solution, obtained by mixing 1.0 mL of triethylamine and 1000 mL of water to adjust the pH to 7.0 with phosphoric acid, and acetonitrile (1 : 1).

Flow rate: 1.0 mL/min

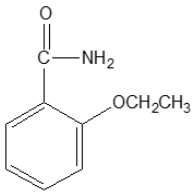
System suitability

System performance: Proceed with 50 μL of the standard solution according to the conditions above; the symmetry factor is NMT 2.0.

System repeatability: Repeat the test 6 times with 50 μL each of the standard solution according to the conditions above; the relative standard deviation of the peak areas of ethambutol hydrochloride is NMT 2.0%.

Packaging and storage Preserve in well-closed containers.

Ethenzamide
에텐자미드



2-Ethoxybenzamide $C_9H_{11}NO_2$: 165.19
2-Ethoxybenzamide [*938-73-8*]

Ethenzamide, when dried, contains NLT 98.0% and NMT 101% of ethenzamide ($C_9H_{11}NO_2$).

Description Ethenzamide occurs as white crystals or a crystalline powder.
It is soluble in methanol, ethanol(95) or acetone and practically insoluble in water.
It begins to sublime slightly at about 105 ℃.

Identification (1) Take 0.5 g of Ethenzamide, add 5 mL of sodium hydroxide TS and heat the mixture gently; the gas produced turns moistened red litmus paper to blue.

(2) Take 0.2 g of Ethenzamide, add 10 mL of hydrobromic acid and boil the mixture gently for 1 hour under a reflux condenser. Cool in ice-water, filter and collect the separated crystalline precipitate, wash 3 times with 5 mL each of ice-water and dry in a desiccator (in vacuum, silica gel) for 2 hours; the precipitate melts between 158 ºC and 161 ºC.

(3) Determine the absorption spectra of solutions of Ethenzamide and ethenzamide RS in methanol (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(4) Determine the infrared spectra of Ethenzamide and ethenzamide RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Melting point Between 131 and 134 ℃.

Purity (1) ***Chloride***—Dissolve 0.5 g of Ethenzamide in 30 mL of acetone, add 6 mL of dilute nitric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 0.7 mL of 0.01 mol/L hydrochloric acid, 30 mL of acetone, 6 mL of dilute nitric acid and water to make 50 mL (NMT 0.050%).

(2) ***Sulfate***—Dissolve 0.5 g of Ethenzamide in 30 mL of acetone and add 1 mL of dilute hydrochloric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 0.50 mL of 0.005 mol/L sulfuric acid, add 30 mL of acetone, 1 mL of dilute hydrochloric acid and water to 50 mL (NMT 0.048%).

(3) ***Heavy metals***—Proceed with 2.0 g of Ethenzamide according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(4) ***Arsenic***—Take 0.40 g of Ethenzamide, add 0.3 g of potassium nitrate and 0.5 g of anhydrous sodium carbonate, mix thoroughly, ignite the mixture gradually. After cooling, dissolve the residue in 10 mL of dilute sulfuric acid and heat the solution until white fumes are produced. After cooling, add water carefully to make 5 mL. Use this solution as the test solution (NMT 5 ppm).

(5) ***Salicylamide***—Dissolve 0.20 g of Ethenzamide in 15 mL of dilute ethanol (2 in 3) and add 2 to 3 drops of dilute iron(III) chloride TS; the resulting solution does not exhibit a purple color.

Loss on drying NMT 1.0% (1 g, silica gel, 3 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 20 mg each of Ethenzamide and ethenzamide RS, previously dried, and dissolve each in 70 mL of ethanol(95) by warming. After cooling, add ethanol(95) to make exactly 100 mL. Pipet 5.0 mL each of these solutions, add ethanol(95) to make exactly 50 mL and use these solutions as the test solution and the standard solution, respectively. Determine the absorbances, A_T and A_S of the test solution and the standard solution, respectively, at 290 nm as directed under the Ultraviolet-visible Spectroscopy, using ethanol(95) as the blank.

$$\text{Amount (mg) of ethenzamide } (C_9H_{11}NO_2) = \text{Amount (mg) of ethenzamide RS} \times \frac{A_T}{A_S}$$

Packaging and storage Preserve in well-closed containers.

Anesthetic Ether
마취용 에테르

$CH_3CH_2OCH_2CH_3$

$C_4H_{10}O$: 74.12
Ethoxyethane [*60-29-7*]

Anesthetic Ether contains NLT 96.0% and NMT 98.0% (by specific gravity) of ether ($C_4H_{10}O$).

Anesthetic Ether contains small quantities of ethanol(95) and water, and suitable stabilizers may be added.

Anesthetic Ether is not to be used for anesthesia if it has been removed from the original container for more than 24 hours.

Description Anesthetic Ether occurs as a colorless, clear, mobile liquid, and has a characteristic odor.

It is miscible with ethanol(95).
It is soluble in water.
It is highly volatile and flammable.
It is slowly oxidized by the action of air and light, producing peroxides.
The vapor of Anesthetic Ether, when mixed with air and ignited, may explode violently.

Boiling point—Between 35 and 37 ℃.

Specific gravity d_{20}^{20}: Between 0.718 and 0.721.

Purity (1) ***Characteristic odor***—Put 10 mL of Anesthetic Ether in an evaporating dish and allow it to evaporate spontaneously to a volume of 1 mL; no characteristic odor is perceptible. Pour the remaining solution onto a piece of clean, odorless filter paper to evaporate ether; no characteristic odor is perceptible.

(2) ***Acid***—Put 10 mL of diluted ethanol(4 in 5) and 0.5 mL of phenolphthalein TS in a glass-stoppered flask and add 0.02 mol/L sodium hydroxide VS dropwise to produce a red color which persists for 30 seconds after mixing by shaking. To this solution, add 25 mL of Anesthetic Ether, stopper the flask, shake gently, and add 0.40 mL of 0.02 mol/L sodium hydroxide VS while mixing by shaking; a red color develops.

(3) ***Aldehyde***—To 100 mL of water in a glass-stoppered flask, add 10 mL of Anesthetic Ether and 1 mL of a solution of sodium bisulfite (1 in 1000), stopper tightly, shake vigorously for 10 seconds, and allow the mixture to stand in a cool place for 30 minutes, protected from light. Then, add 2 mL of starch TS and add 0.01 mol/L iodine VS dropwise until a pale blue color appears. To this solution, add about 2 g of sodium bicarbonate, shake to mix until the blue color disappears, and add 1 mL of diluted 0.01 mol/L iodine VS (9 in 40); the solution turns blue. Keep the temperature of the solution below 18 ºC during the procedure.

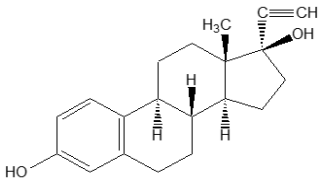
(4) ***Peroxide***—Put 10 mL of Anesthetic Ether in a Nessler tube, add 1 mL of a freshly prepared solution of potassium iodide (1 in 10), allow to stand for 1 hour while shaking occasionally and protecting from light, then add 1 mL of starch TS, and shake well to mix; no color is produced in the aqueous layer and in the ether layer.

(5) ***Residue on evaporation***—Evaporate 50 mL of Anesthetic Ether and dry the residue at 105 ºC for 1 hour; the weight of the residue is NMT 1.0 mg.

Water NMT 0.2% (0.1 g, volumetric titration, direct titration).

Packaging and storage Preserve in light-resistant, tight containers at a temperature not exceeding 25 ºC, without filling up and protected from fire.

Ethinylestradiol
에티닐에스트라디올



$C_{20}H_{24}O_2$: 296.40
19-Nor-17α-pregna-1,3,5(10)-trien-20-yne-3,17-diol [*57-63-6*]

Ethinylestradiol, when dried, contains NLT 98.0% and NMT 101.0% of ethinylestradiol ($C_{20}H_{24}O_2$).

Description Ethinylestradiol occurs as white or pale yellow crystals or a crystalline powder and is odorless.
It is freely soluble in pyridine and tetrahydrofuran, soluble in ethanol(95) and ether, and practically insoluble in water.
It dissolves in sodium hydroxide TS.

Identification (1) Dissolve 2 mg of Ethinylestradiol in 1 mL of a mixture of sulfuric acid and ethanol(95) (1 : 1); the solution exhibits a purplish red color with yellowish green fluorescence. Carefully add 2 mL of water to this solution; the color of the solution changes to reddish purple.

(2) Transfer 20 mg of Ethinylestradiol to a glass stoppered test tube, dissolve in 10 mL of a solution of potassium hydroxide (1 in 20), add 0.1 g of benzoyl chloride, and shake. Collect the resulting precipitate by filtering. Recrystallize from methanol, and dry in a desiccator (in vacuum, phosphorus (V) pentoxide); the precipitate melts between 200 and 202 ℃.

Optical rotation $[\alpha]_D^{20}$: Between -26° and -31° (after drying, 0.1 g, pyridine, 25 mL, 100 mm).

Melting point Between 180 and 186 ℃ or 142 and 146 ℃.

Purity ***Estrone***—Dissolve 5 mg of Ethinylestradiol in 0.5 mL of ethanol(95), and add 50 mg of m-dinitrobenzene. Add 0.5 mL of freshly prepared dilute potassium hydroxide-ethanol TS, allow to stand in a dark place for 1 hour, and add 10 mL of ethanol(95); the color of the solution is no more intense than that of the following control solution.

Control solution—Proceed in the same manner in the preparation of the test solution, omitting Ethinylestradiol.

Loss on drying NMT 0.5% (0.5 g, in vacuum, phosphorus pentoxide, 4 hours).

Residue on ignition NMT 0.1% (0.5 g).

Assay Weigh accurately about 0.2 g of Ethinylestradiol, previously dried, dissolve in 40 mL of tetrahydrofuran, add 10 mL of a solution of silver nitrate (1 in 20) and titrate with 0.1 mol/L sodium hydroxide VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS
= 29.640 mg of $C_{20}H_{24}O_2$

Packaging and storage Preserve in light-resistant, tight containers.

Ethinylestradiol Tablets
에티닐에스트라디올 정

Ethinylestradiol Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of ethinylestradiol ($C_{20}H_{24}O_2$: 296.40).

Method of preparation Prepare as directed under Tablets, with Ethinylestradiol.

Identification (1) Evaporate 5 mL of the test solution from the Assay to dryness, and dissolve the residue in 2 mL of a mixture of sulfuric acid and ethanol (2 : 1); the resulting solution exhibits a pale red color and a yellow fluorescence. Add carefully 4 mL of water to this solution; the color of the solution changes to purple.

(2) Evaporate 10 mL of the test solution from the Assay to dryness, add 0.2 mL of acetic acid(31) and 2 mL of phosphoric acid to the residue, and heat on a steam bath for 5 minutes; the resulting solution exhibits a red color and a yellowish green fluorescence.

Disintegration Meets the requirements.

Uniformity of dosage units It meets the requirements when the procedure for content uniformity is performed according to the following procedure.

Transfer 1 tablet of Ethinylestradiol Tablets into a separatory funnel, add 10 mL of Solution 2 from the Disintegration, and shake to mix until disintegration. Add 10 mL of dilute sulfuric acid and 20 mL of chloroform, shake vigorously for 5 minutes to mix, and filter the chloroform layer through a filter paper containing 5 g of anhydrous sodium sulfate into an Erlenmeyer flask. Extract the water layer twice with 20 mL each of chloroform, proceed in the same manner, and combine with the previous filtrate. Evaporate gently on a steam bath while passing through nitrogen, add exactly 100 mL of methanol to the residue, dissolve, and centrifuge, if necessary. Pipet χ mL of the supernatant clear liquid, add methanol to obtain exactly V mL of a solution containing about 0.04 μg of ethinylestradiol ($C_{20}H_{24}O_2$) per mL, and use this solution as the test solution. Separately, weigh accurately about 10 mg of ethinylestradiol RS, previously dried in a desiccator (in vacuum, phosphorus pentoxide) for 4 hours, dissolve in methanol to obtain a solution containing about 0.04 μg of ethinylestradiol ($C_{20}H_{24}O_2$) per mL, and use this solution as the standard solution. To the glass-stoppered test tubes T, S and B, put exactly 4 mL of sulfuric acid-methanol TS, respectively, cool with ice, add exactly 1 mL each of the test solution, the standard solution and methanol, and shake immediately. Allow to stand on a steam bath at 30 ℃ for 40 minutes, and then allow to stand on a steam bath at 20 ℃ for 5 minutes. Perform the test with these solutions as directed under the Fluorescence Spectroscopy. Determine the fluorescence intensity, F_T, F_S, and F_B at an excitation wavelength of 460 mm and a fluorescence wavelength of 493 mm.

$$\text{Amount (mg) ethinylestradiol } (C_{20}H_{24}O_2) = \text{Amount (mg) of ethinylestradiol RS} \times \frac{F_T - F_B}{F_S - F_B} \times \frac{V}{2500} \times \frac{1}{x}$$

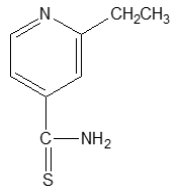
Assay Weigh accurately the mass of NLT 20 tablets of Ethinylestradiol Tablets, and powder. Weigh accurately an amount equivalent to about 0.5 mg of ethinylestradiol ($C_{20}H_{24}O_2$), transfer into a 50-mL beaker, add 2 mL of water, and shake well to mix. Then add 3 mL of chloroform and shake well to mix. Add 4 g of diatomaceous earth for chromatography, mix well until the contents do not adhere to the wall, and use this as the sample. Add 5 g of diatomaceous earth for chromatography, previously weighed, to a 200-mL beaker, put 4 mL of 1 mol/L hydrochloric acid TS to mix thoroughly. Prepare a column for chromatography about 25 mm in internal diameter and about 30 cm in length with a glass wool at the bottom and 5 g of anhydrous sodium sulfate on top. Put the well-mixed solution to the column by pressing appropriately with a glass rod to fill the column homogeneously until the layer reaches 60 to 80 mm. Use this as the chromatographic column. Add the sample, using a funnel, and pack appropriately and tightly. Add 0.5 g of diatomaceous earth for chromatography to the sample sticking to the beaker, mix well, and transfer to the column. Again, wash the sample sticking to the beaker and the glass rod with glass wool, transfer to the column along with the glass wool, and press gently with a glass rod to make the height of the column to 110 - 130 mm. Next, take 70 mL of chloroform, and wash the inner wall of the column for chromatography. Collect the eluate at a rate of NMT 0.8 mL per minute for 1 minute. After the elution is complete, wash the bottom of the column with a small amount of chloroform, combine the washings with the eluate, add chloroform to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 10 mg of ethinylestradiol RS, previously dried in a desiccator (in vacuum, phosphorus pentoxide) for 4 hours, and dissolve in chloroform to make exactly 100 mL. Pipet 5 mL of this solution, add chloroform to make 100 mL, and use this solution as the standard solu-

tion. Pipet 6 mL each of the test solution, the standard solution and chloroform, transfer into a separatory funnel, and add 20 mL of isooctane. Then, add 10 mL of a mixture of sulfuric acid and methanol (7 : 3), shake vigorously for 5 minutes, allow to stand in the dark for 15 minutes, and centrifuge. Perform the test with the obtained coloring solution as directed under the Ultraviolet-visible Spectroscopy using a solution, proceeded with 6 mL of chloroform in the same manner, as the control solution. Determine the absorbances of each solution, A_T and A_S, obtained from the test solution and the standard solution, at a wavelength of 540 nm.

$$\text{Amount (mg) ethinylestradiol } (C_{20}H_{24}O_2) = \text{Amount (mg) of ethinylestradiol RS} \times \frac{A_T}{A_S} \times \frac{1}{20}$$

Packaging and storage Preserve in tight containers.

Ethionamide
에티온아미드



$C_8H_{10}N_2S$: 166.24

2-Ethylpyridine-4-carbothioamide [*536-33-4*]

Ethionamide, when dried, contains NLT 98.5% and NMT 101.0% of ethionamide ($C_8H_{10}N_2S$).

Description Ethionamide occurs as yellow crystals or a crystalline powder and has a characteristic odor and taste. It is soluble in methanol and in acetic acid(100), sparingly soluble in ethanol(95), slightly soluble in ether, and practically insoluble in water.

Identification (1) Determine the absorption spectra of Ethionamide and ethionamide RS in methanol (3 in 160000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Ethionamide and ethionamide RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Melting point Between 161 ºC and 165 ºC.

Purity (1) ***Acidity***—Dissolve 3.0 g of Ethionamide in 30 mL of methanol by warming, add 90 mL of water, allow to stand in iced water for 1 hour, and filter. To 80 mL of the filtrate, add 0.8 mL of cresol red TS and 0.20 mL of 0.1 mol/L sodium hydroxide VS; the resulting solution exhibits a red color.

(2) ***Heavy metals*—**Proceed with 1.0 g of Ethionamide according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Arsenic***—Proceed with 1.0 g of Ethionamide according to Method 3 and perform the test. Add 10 mL of a solution of magnesium nitrate hexahydrate in ethanol(95) (1 in 50), then add 1.5 mL of hydrogen peroxide(30), and fire to burn (NMT 2 ppm).

(4) ***Selenium***—Weigh about 0.2 g of Ethionamide and combust as directed under the Oxygen Flask Combustion with 25 mL of diluted nitric acid (1 in 30) as an absorbent. Use a combustion flask with a volume of 1000 mL, combust, wash the stopper and the inner wall of the flask with 10 mL of water, and use 20 mL of water to move the solution in the combustion flask into a 150-mL beaker. Heat lightly until it boils, boil for 10 minutes, allow it to cool down to room temperature, and use this solution as the test solution. Separately, pipet 6.0 mL of standard selenium stock solution, add 25 mL of diluted nitric acid (1 in 30) and 25 mL of water, and use this solution as the standard solution. Add diluted ammonia water(28) (1 in 2) to each of the test and standard solutions, adjust the pH to 2.0, add water to dilute to 60 mL, and add 10 mL of water to move to a separatory funnel. Then, wash the separatory funnel with 10 mL of water. Add 0.2 g of hydroxylamine hydrochloride, dissolve by mixing, add 5.0 mL of 2,3-diaminonaphthalene TS, and close the stopper. Mix by stirring and allow to stand at room temperature for 100 minutes. Add 5.0 mL of cyclohexane, shake well, and allow to stand. If the layer is separated, remove the water layer, centrifuge cyclohexane extract, remove water, and take the cyclohexane layer. With these solutions and a control solution prepared with water added to 25 mL of diluted nitric acid (1 in 30) in the same way, perform the test as directed under the Ultraviolet-visible Spectroscopy. Determine the absorption at the absorption maximum wavelength around 380 nm; the absorption of the solution from the test solution is not greater than the absorption from the standard solution (NMT 30 ppm).

(5) ***Related substances*—**Perform the test without exposure to daylight using light-resistant vessels. Dissolve 0.20 g of Ethionamide in 10 mL of methanol, and use this solution as the test solution. Pipet 0.5 mL of this solution, add acetone to make exactly 100 mL, and use this solution as the standard solution (1). Pipet 0.2 mL of the test solution, add acetone to make exactly 100 mL, and use this solution as the standard solution (2). With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 µL each of the test solution, the standard solution (1) and (2) on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, hexane, and methanol (6 : 2 : 1) to a distance of about 15 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm);

the spots other than the principal spot from the test solution are not more intense than the spots from the standard solution (1). The number of the spots other than the principal spot from the test solution which is more intense than the spot from the standard solution (2) is NMT one.

Loss on drying NMT 0.5% (1 g, 105 ℃, 3 hours).

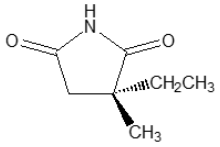
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.3 g of Ethionamide, previously dried, dissolve in 50 mL of acetic acid(100), and titrate with 0.1 mol/L perchloric acid VS (indicator: 2 mL of p-naphtholbenzein TS). The endpoint of titration is when the color of the solution changes from orange-red to dark orange-brown. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 16.624 mg of $C_8H_{10}N_2O$

Packaging and storage Preserve in light-resistant, well-closed containers.

Ethosuximid
에토숙시미드



and enantiomer

$C_7H_{11}NO_2$: 141.17
3-Ethyl-3-methylpyrrolidine-2,5-dione [*77-67-8*]

Ethosuximid contains NLT 98.5% and NMT 101.0% of Ethosuximid ($C_7H_{11}NO_2$), calculated on the anhydrous basis.

Description Ethosuximid occurs as a white, paraffin-like solid or a powder. It is odorless or has a slight, characteristic odor.
It is very soluble in methanol, ethanol(95), ether and *N*,*N*-dimethylformamide, and freely soluble in water.

Melting point—About 48 °C.

Identification (1) Add 10 mL of sodium hydroxide TS to about 0.2 g of Ethosuximid, and boil; the gas produced turns a moistened red litmus paper blue

(2) Dissolve 50 mg of Ethosuximide in 1 mL of ethanol(95), add 3 drops of a solution of cupric acetate (1 in 100), warm slightly, and add 1 to 2 drops of sodium hydroxide TS; the resulting solution exhibits a purple color.

(3) Determine the absorption spectra of ethanol(95) solutions of Ethosuximide and ethosuximide RS (1 in 2000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Ethosuximide in 10 mL of water; the solution is clear and colorless.

(2) ***Chloride***—Perform the test with about 1.0 g of Ethosuximide. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid (NMT 0.011%).

(3) ***Heavy metals—***Proceed with about 1.0 g of Ethosuximide according to Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(4) ***Arsenic***—Prepare the test solution with about 1.0 g of Ethosuximide according to Method 1 and perform the test (NMT 2 ppm).

(5) ***Acid anhydride***—Dissolve about 0.50 g of Ethosuximide in 1 mL of ethanol(95), add 1 mL of hydroxylamine hydrochloride-iron(III) chloride TS, and allow to stand for 5 minutes. Add 3 mL of water and mix. Allow to stand for 5 minutes; the red to reddish purple color of this solution is not more intense than that of the following control solution.

Control solution—Dissolve 70 mg of succinic anhydride in ethanol(95) to make exactly 100 mL. To 1.0 mL of this solution, add 1 mL of hydroxylamine hydrochloride-iron(III) chloride TS and proceed in the same manner.

(6) ***Cyanide***—Dissolve 1.0 g of Ethosuximide in 10 mL of ethanol(95), and add 3 drops of iron(II) sulfate TS, 1 mL of sodium hydroxide TS and 2 to 3 drops of iron(III) chloride TS. Warm gently, and acidify with dilute sulfuric acid; no blue precipitates are formed and a blue color is not exhibited within 15 minutes.

(7) ***Related substances***—Weigh accurately 1.0 g of Ethosuximide, dissolve in the mobile phase to make 10 mL, and use this solution as the test solution. Separately, weigh accurately 10.0 mg each of ethosuximide RS and 2-ethyl-2-methylsuccinic acid, add the mobile phase to make 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions; the amount of 2-ethyl-2-methylsuccinic acid by equation (1) is NMT 0.1%. Calculate the amount of each related substance by equation (2): NMT 0.1%, and the total amount of related substances is NMT 0.5%.

Content (%) of 2-ethyl-2-methylsuccinic acid
$$= \frac{C}{W} \times \frac{A_T}{A_S} (1)$$

C: Concentration (mg/mL) of 2-ethyl-2-methylsuccinic acid in the standard solution
W: Amount of Ethosuximide taken (g)
A_T: Peak area of 2-ethyl-2-methylsuccinic acid ob-

tained from the test solution

A_S: Peak area of 2-ethyl-2-methylsuccinic acid obtained from the standard solution

$$\text{Content (\%) of related substances} = \frac{C}{W} \times \frac{A_i}{A_S} \quad (2)$$

C: Concentration of Ethosuximide in the standard solution (mg/mL)

W: Amount of Ethosuximide taken (g)

A_i: Peak area of each related substance obtained from the test solution

A_S: Peak area of Ethosuximide obtained from the standard solution

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

Column: A stainless steel column about 3.9 mm in internal diameter and about 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography.

Mobile phase: A mixture of pH 3.0 phosphate buffer solution and acetonitrile (9 : 1).

Flow rate: 1 mL/min

System suitability

System performance: Weigh accurately a suitable amount each of 2-ethyl-2-methylsuccinic acid and ethosuximide RS, dissolve in the mobile phase to obtain a solution containing 2 mg of 2-ethyl-2-methylsuccinic acid and 10 mg of ethosuximide per mL, and use this solution as the system suitability solution. Proceed with 10 μL of this solution under the above operating conditions; the resolution between the peaks of 2-ethyl-2-methylsuccinic acid and ethosuximide is NLT 6.6, the number of theoretical plates is NLT 2900, and the symmetry factor of the peak of ethosuximide is NMT 2.0.

System repeatability: Repeat the test 6 times with 10 μL each of the system suitability solution under the above operating conditions; the relative standard deviation of the peak areas of ethosuximide and 2-ethyl-2-methylsuccinic acid is NMT 0.4%, respectively.

Phosphate buffer solution, pH 3.0—To 4.1 mL of phosphoric acid add water to make 1000 mL. To this solution, add sodium hydroxide TS to adjust the pH to 3.0.

Water NMT 0.5% (2 g, volumetric titration, direct titration).

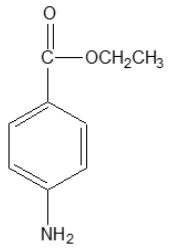
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.2 g of Ethosuximide, previously dried, dissolve in 20 mL of *N,N*-Dimethylformamide, and titrate with 0.1 mol/L tetramethylammonium hydroxide VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L tetramethylammonium hydroxide VS
= 14.117 mg of $C_7H_{11}NO_2$

Packaging and storage Preserve in tight containers.

Ethyl Aminobenzoate
아미노벤조산에틸



Benzocaine
Anestesine $C_9H_{11}NO_2$:165.19
Ethyl 4-aminobenzoate [*94-09-7*]

Ethyl Aminobenzoate, when dried, contains NLT 99.0% and NMT 101.0% of ethyl aminobenzoate ($C_9H_{11}NO_2$).

Description Ethyl Aminobenzoate occurs as white crystals or a crystalline powder. It is odorless and has a slightly bitter taste, numbing the tongue.
It is freely soluble in ethanol(95) or in ether and very slightly soluble in water.
It dissolves in dilute hydrochloric acid.

Identification (1) Dissolve 10 mg of Ethyl Aminobenzoate in 1 mL of dilute hydrochloric acid and 4 mL of water; the resulting solution responds to the Qualitative Analysis for primary aromatic amines.

(2) Dissolve 0.1 g of Ethyl Aminobenzoate in 5 mL of water with the aid of dilute hydrochloric acid added dropwise and add iodine TS dropwise; a brown precipitate is formed.

(3) Warm 50 mg of Ethyl Aminobenzoate with 2 drops of acetic acid(31) and 5 drops of sulfuric acid; the characteristic odor of ethyl acetate comes out.

Melting point Between 89 and 91 ℃.

Purity (1) ***Acid***—Dissolve about 1.0 g of Ethyl Aminobenzoate in 10 mL of neutralized ethanol and add 10 mL of water, 2 drops of phenolphthalein TS and 0.50 mL of 0.01 mol/L sodium hydroxide solution; the resulting solution exhibits a red color.

(2) ***Chloride***—Dissolve 0.20 g of Ethyl Aminobenzoate in ethanol(95) and add 2 to 3 drops each of dilute nitric acid and silver nitrate TS; there is no immediate change in the solution.

(3) ***Heavy metals***—Dissolve 2.0 g of Ethyl Aminobenzoate in 20 mL of ethanol(95) and add 2 mL of dilute

acetic acid and ethanol(95) to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution as follows: to 2.0 mL of lead standard solution, add 2 mL of dilute acetic acid and ethanol(95) to make 50 mL (NMT 10 ppm).

(4) ***Readily carbonizable substances***—Perform the test with 0.5 g of Ethyl Aminobenzoate. The color of this solution is not more intense than that of the matching fluid A.

Loss on drying NMT 1.0% (1 g, silica gel, 3 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weight accurately about 0.25 g of Ethyl Aminobenzoate, previously dried, dissolved in 10 mL of hydrochloric acid and 70 mL of water, add 10 mL of a solution of potassium bromide (3 in 10), and cool down to a temperature below 15 ºC. Then, titrate with 0.1 mol/L sodium nitrite VS. (potentiometric titration or amperometric titration under the Titrimetry).

Each mL of 0.1 mol/L sodium nitrite VS
= 16.519 mg of $C_9H_{11}NO_2$

Packaging and storage Preserve in well-closed containers.

Ethyl Linoleate
리놀레산에틸

Ethyl Linoleate $C_{20}H_{36}O_2$: 308.50
Ethyl (9*Z*,12*Z*)-9,12-octadecadienoic acid ester, [*544-35-4*]

Ethyl Linoleate contains NLT 88.0% and NMT 101.0% of ethyl linoleate ($C_{20}H_{36}O_2$: 308.50).

Description Ethyl Linoleate occurs as a colorless to pale yellow and clear liquid. It has a slightly characteristic odor.
It is soluble in methanol, ethanol, ether, chloroform or petroleum ether.

Identification To about 4 g of Ethyl Linoleate, add 20 mL of potassium hydroxide-ethanol TS, and heat on a steam bath with a reflux condenser attached for 30 minutes. After cooling, add dilute hydrochloric acid to make the solution acidic. Transfer it to a separatory funnel, take the separated oil layer, wash with 2 mL of water, and add 10 mL of ligroin for mixing. To this solution, add 3 g of anhydrous sodium sulfate, allow the solution to stand for 10 minutes, and filter. Well shake and maintain the filtrate at between 10 and 15 ℃, add 1 mL of bromine, and allow it to stand for 30 minutes with occasional shaking. Take the produced precipitate, wash with 3 mL of ligroin 3 times for recrystallization, dry in a desiccator, and determine the melting point of the dried material. The melting point is between 113 and 117 ℃.

Specific gravity d_{20}^{20}: Between 0.875 and 0.885.

Refractive index $[\alpha]_D^{20}$: Between 1.455 and 1.465.

Saponification value Between 180 and 185.

Acid value NMT 15.

Iodine value Between 150 and 163 (when the test is performed with 0.15 g of Ethyl Linoleate).

Purity (1) ***Chloride***—To 1.0 g of Ethyl Linoleate, add Ethanol to make 50 mL, and add 1 mL of silver nitrate-ethanol solution (1 in 50). The turbidity of the solution is not greater than the following control solution. Control solution: To 0.40 mL of 0.01 mol/L Hydrochloric Acid, add Ethanol to make 50 mL and add 1 mL of silver nitrate-ethanol solution (1 in 50).

(2) ***Heavy metals***—Dissolve 1.0 g of Ethyl Linoleate in ethanol, add 2 mL of dilute acetic acid and ethanol to make 50 mL. Use this solution as the test solution and perform the test with this solution. Prepare the control solution by adding 2 mL of dilute acetic acid and 2.0 mL of lead standard solution as well as ethanol to make 50 mL (NMT 20 ppm).

(3) ***Arsenic***—To 1.0 g of Ethyl Linoleate, add 10 mL of diluted hydrochloric acid (1 in 2) and 20 mL of ether, shake vigorously for 3 minutes to mix, allow to stand, and perform the test with this solution (NMT 2 ppm).

(4) ***Peroxide***—Put 10.0 mL of chloroform in a 250 mL stoppered flask and replace the air in the flask with dry carbon dioxide. Weigh accurately 1 g of Ethyl Linoleate and put it in a glass cup. Put the glass cup in the flask and slowly shake to mix and dissolve. To this, add 15.0 mL of acetic acid(100) and 1.0 mL of saturated potassium iodide solution, stopper the flask, shake well for 1 minute to mix, and allow to stand in the dark for 5 minutes. Add 75 mL of water, stopper the flask, shake vigorously to mix, and allow to stand in the dark for 5 minutes. Then, add 75 mL of water, stopper the flask, shake vigorously to mix, and titrate with 0.01 mol/L sodium thiosulfate VS (indicator: starch TS). Perform a blank test in the same manner and make any necessary correction.

$$\text{Peroxide value} = \frac{(A - B)}{\text{Amount (g) of sample}} \times 10$$

A: Consumed amount (mL) of 0.01 mol/L sodium thiosulfate VS used for the sample

B: Consumed amount (mL) of 0.01 mol/L sodium thiosulfate VS used for the blank test

The peroxide value is NMT 20.

Residue on ignition NMT 0.1% (1 g). Put 1 g of Ethyl Linoleate in a crucible, previously weighed accurately its mass, and weigh accurately the mass. Heat with weak flame to boil, stop heating once boiling starts, and directly fire to burn. After cooling, wet the residue with 1 or 2 drops of sulfuric acid, carefully ignite to a constant mass, and weigh the mass of the residue.

Assay Weigh accurately about 60 mg of Ethyl Linoleate and put it in a glass cup. Heat potassium hydroxide-glycerin solution at 100 ℃ and put 10 mL each of this solution to 3 stoppered test tubes (A, B and C). Place a thermometer in the stoppered test tube C. Put the 3 stoppered test tubes in a 180 ± 3 ℃ oil bath and heat until the thermometer in the stoppered test tube C indicates 180 ℃. Then, blow nitrogen gas into the stoppered test tubes A and B. Take the stoppered test tubes from the oil bath. Place the glass cup containing the sample in the stoppered tube A, place an empty glass cup in the stoppered test tube B, shake vigorously the 3 stoppered test tubes for 2 minutes, and place the 3 stoppered test tubes in the oil bath. When the temperature of the stoppered test tube reaches 175 ℃, heat for exactly 45 minutes. For at least 30 minutes of this period, take care to maintain 180 ℃. Take out the stoppered test tubes A and B from the oil bath and cool them down to 60 ℃. Wash them with hot methanol, place each in a 100-mL volumetric flask, cool, and add methanol to make 100.0 mL each. To 10.0 mL each of the solutions, add methanol to make 100.0 mL each, and use each of the resulting solutions as the solution A and solution B, respectively. Perform the test with the solution A, using the solution B for comparison, as directed under the Ultraviolet-visible Spectroscopy and determine the absorbance at the wavelength 268 nm, A_{268}. Additionally, to 10.0 mL each of the solutions A and B, add methanol to make 100 mL each, and use these solutions as the solution A' and solution B', respectively. Perform the test with the solution A', using the solution B' for comparison, as directed under the Ultraviolet-visible Spectroscopy and determine the absorbance at the wavelength 233 nm, A_{233}.

$$\text{Content (\%) of linoleic acid } (C_{18}O_{32}O_2) = \frac{A}{93.7} \times 100$$

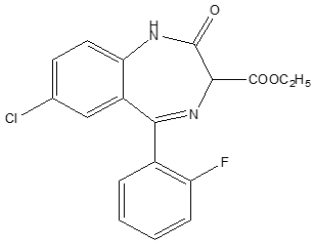
$$A = A_{233} \times \frac{10}{W} - 1206 \times A_{268} \times \frac{1}{W}$$

$$\text{Amount (mg) of ethyl linoleate } (C_{20}H_{36}O_2) = \text{Amount (mg) of linoleic acid} \times 1.100$$

Potassium hydroxide-glycerin TS—Add glycerin to 17.5 g of potassium hydroxide and warm to dissolve to make 100 mL.

Packaging and storage Preserve in light-resistant, tight containers.

Ethyl Loflazepate
에틸로플라제페이트



Ethyl Loflazepate $C_{18}H_{14}ClFN_2O_3$: 360.77
Ethyl 7-chloro-5-(2-fluorophenyl)-2,3 -dihydro-2-oxo-1*H*-1,4-benzodiazepine-3-carboxylic acid ester, [*29177-84-2*]

Ethyl Loflazepate contains NLT 98.0% and NMT 102.0% of ethyl loflazepate ($C_{18}H_{14}ClFN_2O_3$: 360.77).

Description Ethyl Loflazepate is white to pale yellow powder.
It is freely soluble in chloroform, soluble in acetonitrile, slightly soluble in ethanol(95) and practically insoluble in water.

Identification (1) Weigh 20 mg of Ethyl Loflazepate, dissolve in dichloromethane to make 4 mL, and use this solution as the test solution. Weigh 20 mg of ethyl loflazepate RS, dissolve in dichloromethane to make 4 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of chloroform, diisopropyl ether and ethanol(95) (14 : 5 : 1) as the developing solvent, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the R_f value and the color of the spots obtained from the test solution and the standard solution are the same.

(2) Determine the infrared spectra of Ethyl Loflazepate and ethyl loflazepate RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) Determine the absorption spectra with a solution of Ethyl Loflazepate in ethanol(95) (1 in 100000); it exhibits maxima at wavelengths of about 231 nm and 318 nm.

Purity (1) ***Clarity and color of solution***—Dissolve 0.5 g of Ethyl Loflazepate in chloroform to make 10 mL; the solution is clear.

(2) ***Heavy metals***—Proceed with 4.0 g of Ethyl

Loflazepate as directed under Method 4 and perform the test. Prepare the control solution with 4.0 mL of lead standard solution (NMT 40 ppm).

(3) ***Related substances***—Dissolve 20 mg of Ethyl Loflazepate in dichloromethane to make exactly 4 mL, and use this solution as the test solution. Separately, weigh accurately 20 mg of ethyl loflazepate RS, dissolve in dichloromethane to make exactly 4 mL, and use this solution as the standard solution I. Pipet 1 mL of the standard solution I, add dichloromethane to make exactly 200 mL, and use this solution as the standard solution II. Pipet 2 mL of the standard solution II, dilute with the same solvent to make exactly 5 mL, and use this solution as the standard solution III. Pipet 2 mL of the standard solution III, dilute with the same solvent to make exactly 10 mL, and use this solution as the standard solution IV. Spot 10 μL each of the test solution and the standard solutions on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of chloroform, diisopropyl ether and ethanol(95) (14 : 5 : 1) as the developing solvent, air-dry the plate, and examine it under ultraviolet light (main wavelength: 254 nm); The spots other than the principal spot obtained from the test solution are not more intense nor greater than the spots obtained from the standard solution II.

Residue on ignition NMT 0.2% (1 g).

Assay Weigh accurately about 0.2 g of Ethyl Loflazepate, dissolve in 40 mL of a mixture of acetic anhydride and acetic acid(100) (3 : 1), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 36.08 mg of $C_{18}H_{14}ClFN_2O_3$

Packaging and storage Preserve in tight containers.

Ethyl Loplazepate Tablets
에틸로플라제페이트 정

Ethyl Loplazepate Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of ethyl loflazepate ($C_{18}H_{14}ClFN_2O_3$: 360.77).

Method of preparation Prepare as directed under Tablets, with Ethyl Loflazepate.

Identification Weigh an amount of Ethyl Loplazepate Tablets, equivalent to about 4 mg of ethyl loflazepate. Add 5 mL of acetonitrile, shake to mix, then filter, and use the filtrate as the test solution. Separately, dissolve 20 mg of ethyl loflazepate RS in 25 mL of acetonitrile, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of chloroform, diisopropyl ether and ethanol(95) (14 : 5 : 1) as the developing solvent to a distance of about 12 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the colors and R_f values of the spots obtained from the test solution and the standard solution are the same.

Disintegration Meets the requirements.

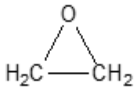
Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 tablets of Ethyl Loplazepate Tablets, and powder. Weigh accurately an amount, equivalent to about 8 mg of ethyl loflazepate ($C_{18}H_{14}ClFN_2O_3$), and add ethanol(95) to make exactly 100 mL. Filter this solution, discard the first 20 mL of the filtrate, pipet 10 mL of the subsequent filtrate, add ethanol(95) to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 20 mg of ethyl loflazepate RS, and dissolve in ethanol(95) to make exactly 100 mL. Pipet 4 mL of this solution, add ethanol(95) to make exactly 100 mL, and use this solution as the standard solution. Perform the test of the test solution and the standard solution as directed under the Ultraviolet-visible Spectroscopy using ethanol(95) as a control solution, and determine the absorbances, A_T and A_S, at a wavelength of 231 nm.

Amount (mg) of ethyl loflazepate ($C_{18}H_{14}ClFN_2O_3$)
= Amount (mg) of ethyl loflazepate RS × (A_T / A_S) × 0.4

Packaging and storage Preserve in tight containers.

Ethylene Oxide
산화에틸렌



Ethylene Oxide C_2H_4O : 44.05
Ethylene Oxide, [*75-21-8*]

Ethylene Oxide contains NLT 99.0% and NMT 101.0% of ethylene oxide (C_2H_4O).

Description Ethylene Oxide occurs as a colorless and clear liquid at 0 to 5 ℃.
It has a weak ether odor when vaporized.
It is very soluble in water, ethanol(95), acetone or ether at 0 to 5 ℃.

Identification To 1 mL of Ethylene Oxide, previously

cooled to 0 to 5 ℃, add 1 mL of water, 2 drops of phenolphthalein TS and 4 mL of sodium chloride solution (1 in 5), and allow to stand for 5 minutes; the solution exhibits a reddish purple color.

Purity (1) ***Aldehyde*—**In a 250-mL Erlenmeyer flask, add about 100 mL of water and cool to 0 to 5 ℃ in iced water. To this, add 10 mL of 0.2 mol/L sodium bisulfite and allow to stand for 30 minutes in iced water. Titrate with 0.05 mol/L iodine VS, previously cooled to 0 to 5 ℃ (indicator: 2 mL of starch TS). However, the endpoint of titration is when the blue color persists for 1 minute. Perform a blank test in the same manner and make any necessary correction (NMT 0.03% of acetaldehyde).

$$\text{Content (\%) of aldehyde} = \frac{(B - A) \times 0.0022}{10 \times G} \times 100$$

A: Consumed amount (mL) of 0.05 mol/L iodine VS
B: Amount (mL) of 0.05 mol/L iodine VS consumed for the blank test
G: Specific gravity of ethylene oxide at 0 to 5 ℃

(2) ***Chloride*—**Perform the test with 4.0 mL of Ethylene Oxide, previously cooled to 0 to 5 ℃, as directed under the Chloride. Prepare the control solution with 1.0 mL of 0.01 mol/L hydrochloric acid VS (NMT 0.01%).

Water NMT 0.05% (20.0 mL of Ethylene Oxide previously cooled to 0 to 5 ℃, volumetric titration, direct titration).
The above test should be performed at 0 to 5 ℃.

Acidity Evaporate 68.0 mL of Ethylene Oxide, previously cooled to 0 to 5 ℃, to the volume of about 50 mL in a fume chamber to eliminate carbon dioxide. Titrate with 0.1 mol/L sodium hydroxide VS (indicator: 3 to 4 drops of phenolphthalein TS) (NMT 0.005% as acetic acid).

Residue on evaporation Evaporate 20 mL of Ethylene Oxide, previously cooled to 0 to 5 ℃, in a crucible, previously measured in the mass, in a fume chamber and dry at 105 ± 2 ℃ for 1 hour. Place in a desiccator, allow to stand for 30 minutes, cool to the room temperature, and measure the mass (NMT 0.03%).

$$\text{Residue (\%) on evaporation} = \frac{A - B - C}{20 \times G} \times 100$$

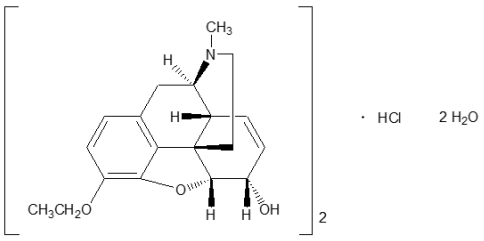
A: Mass (g) of the crucible measured after placing the sample in it and heating
B: Mass (g) of the crucible
C: Mean mass (g) of the blank test mass difference
G: Specific gravity of ethylene oxide at 0 to 5 ℃

Assay Connect and fix Ethylene Oxide to a connector, attach the needle valve for flow rate control, and allow to stand for NLT 30 minutes. Slowly open the needle valve for flow rate control, exhaust the Ethylene Oxide into a container containing water, and control bubbles so that 3 to 4 bubbles appear per second. Introduce the gas to the gas collector for 2 minutes, inject the conversion valve for 2 seconds, and perform the test as directed under the Gas Chromatography according to the following conditions.

Operating conditions
Detector: A thermal conductivity detector (TCD)
Column: A column about 4 mm in internal diameter and about 3 m in length, packed with 80- to 100-mesh divinylbenzene-ethylene glycol-dimethylacrylate copolymer for gas chromatography.
Column temperature: 120 ℃
Detector temperature: 225 ℃
Carrier gas: Helium
Flow rate: Between 40 mL/min and 50 mL/min.

Packaging and storage Preserve in tight containers.

Ethylmorphine Hydrochloride Hydrate
에틸모르핀염산염수화물



Ethylmorphine Hydrochloride
$C_{19}H_{23}NO_3 \cdot HCl \cdot 2H_2O$: 385.88
(4*R*,4a*R*,7*S*,7a*R*,12b*S*)-9-Ethoxy-3-methyl-2,4,4a,7,7a,13-hexahydro-1*H*-4,12-methanobenzofuro[3,2-e]isoquinoline-7-ol hydrochloride dihydrate [*6746-59-4*]

Ethylmorphine Hydrochloride Hydrate contains NLT 98.0% and NMT 101.0% of ethylmorphine hydrochloride ($C_{19}H_{23}NO_3 \cdot HCl$: 349.85), calculated on the anhydrous basis.

Description Ethylmorphine Hydrochloride Hydrate occurs as white to pale yellow crystals or a crystalline powder.
It is very soluble in methanol or acetic acid(100), freely soluble in water, soluble in ethanol(95), sparingly soluble in acetic anhydride and practically insoluble in ether.
It is affected by light.

Melting point—About 123 ℃ (with decomposition).

Identification (1) Determine the absorption spectra of aqueous solutions of Ethylmorphine Hydrochloride Hydrate and ethylmorphine hydrochloride RS (1 in 10000) as directed under the Ultraviolet-visible Spectroscopy;

both spectra exhibit similar intensities of absorption at the same wavelength.

(2) Determine the infrared spectra of Ethylmorphine Hydrochloride Hydrate and ethylmorphine hydrochloride RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) An aqueous solution of Ethylmorphine Hydrochloride Hydrate (1 in 50) responds to the Qualitative Analysis (2) for chloride.

Optical rotation $[\alpha]_D^{20}$: Between -103° and -106° (0.4 g calculated on the anhydrous basis, water, 20 mL, 100 mm).

pH Dissolve 0.10 g of Ethylmorphine Hydrochloride Hydrate in 10 mL of water; the pH of this solution is between 4.0 and 6.0.

Purity ***Related substances***—Dissolve 0.20 g of Ethylmorphine Hydrochloride Hydrate in 10 mL of diluted ethanol (1 in 2) and use this solution as the test solution. Pipet 0.5 mL of this solution, add diluted ethanol (1 in 2) to make exactly 100 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of ethanol(99.5), toluene, acetone and ammonia water(28) (14 : 14 : 7 : 1) as a developing solvent to a distance of about 10 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot from the test solution are not more intense than the spots from the standard solution.

Water Between 8.0% and 10.0% (0.25 g, volumetric titration, direct titration).

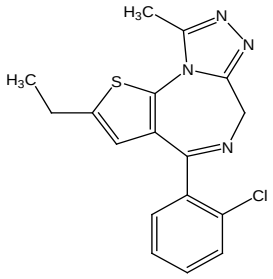
Residue on ignition NMT 0.1% (0.5 g).

Assay Weigh accurately about 0.5 g of Ethylmorphine Hydrochloride Hydrate, dissolve in 50 mL of a mixture of acetic anhydride and acetic acid(100) (7 : 3), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 34.985 mg of $C_{19}H_{23}NO_3 \cdot HCl$

Packaging and storage Preserve in light-resistant, tight containers.

Etizolam
에티졸람



Etizolam $C_{17}H_{15}ClN_4S$: 342.85
7-(2-Chlorophenyl)-4-ethyl-13-methyl-3-thia-1,8,11,12-tetraazatricyclo[8.3.0.02,6}]trideca-2(6),4,7,10,12-pentaene [*40054-69-1*]

Etizolam contains NLT 98.5% and NMT 101.0% of etizolam ($C_{17}H_{15}ClN_4S$).

Description Etizolam occurs as a white to pale yellowish white crystalline powder.
It is soluble in ethanol(99.5), sparingly soluble in acetonitrile or acetic anhydride, and practically insoluble in water.

Identification (1) Determine the absorption spectra of the solutions of Etizolam and etizolam RS in ethanol(99.5) (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Etizolam and etizolam RS as directed in potassium bromide disk method under the Mid-infrared Absorption Spectrophotometry; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Melting point Between 146 and 149 ℃.

Purity (1) ***Heavy metals*** Proceed with 2.0 g of Etizolam according to Method 2 and perform the test Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Related substances*** Dissolve 20 mg of Etizolam in 50 mL of acetonitrile, and use this solution as the test solution. Take exactly 1.0 mL of this solution and add acetonitrile to make exactly 20 mL. Pipet 1 mL of this solution, add acetonitrile to make exactly 50 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak area of each solution as directed in the automatic integration method; each peak area other than that of etizolam from the test solution is not greater than the peak area of etizolam from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 240 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 35 °C.

Mobile phase: Dissolve 1.36 g of potassium dihydrogen phosphate in water to make 1000 mL, and add diluted phosphoric acid (1 in 10) to adjust the pH to 3.5. To 550 mL of this solution, add 450 mL of acetonitrile.

Flow rate: Adjust the flow rate so that the retention time of etizolam is about 6 minutes.

System suitability

Test for required detectability: Pipet 2 mL of the standard solution and add acetonitrile to make exactly 20 mL. Confirm that the peak area of etizolam obtained from 10 μL of this solution is equivalent to 8 to 12% of the peak area of etizolam from the standard solution.

System performance: Dissolve 0.02 g each of Epizolam and ethylparaben in the mobile phase to make 50 mL. To 1 mL of this solution, add the mobile phase to make 50 mL. Proceed with 10 μL of this solution according to the above conditions; ethylparaben and etizolam are eluted in this order with the resolution being NLT 3.0.

System repeatability: Repeat the test 6 times with 10 μL of the standard solution according to the above conditions; the relative standard deviation of the peak area of etizolam is NMT 2.0%.

Time span of measurement: About 5 times the retention time of etizolam after the solvent peak.

Loss on drying NMT 0.5% (1 g, 105 °C, 3 hours).

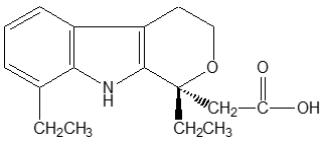
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.3 g of Etizolam, previously dried, dissolve in 70 mL of a mixture of acetic anhydride and acetic acid(100) (7 : 3), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). The endpoint of the titration is the second inflection point. Perform a blank test in the same way and make a necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 17.14 mg of $C_{17}H_{15}ClN_4S$

Packaging and storage Preserve in light-resistant, tight containers.

Etodolac
에토돌락



and enantiomer

Etodolac $C_{17}H_{21}NO_3$: 287.35
2-(1,8-Diethyl-4,9-dihydro-3H-pyrano[3,4-b]indol-1-yl)acetic acid [*41340-25-4*]

Etodolac contains NLT 98.0% and NMT 102.0% of etodolac ($C_{17}H_{21}NO_3$), calculated on the anhydrous basis.

Description Etodolac occurs as white to pale yellow crystals or a crystalline powder.
It is freely soluble in methanol or ethanol(99.5) and practically insoluble in water.
A solution of Etodolac in methanol (1 in 50) shows no optical rotation.

Melting point—About 147 °C (with decomposition).

Identification (1) Determine the absorption spectra of solutions of Etodolac and etodolac RS in ethanol(99.5) (1 in 200000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Etodolac and etodolac RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Purity (1) ***Chloride***—Dissolve about 0.5 g of Etodolac in 30 mL of methanol, add water to make 50 mL, and use this solution as the test solution. Prepare the control solution by adding 30 mL of methanol and water to 0.42 mL of 0.01 mol/L hydrochloric acid to make 50 mL (NMT 0.03%).

(2) ***Heavy metals***—Proceed with 1.0 g of Etodolac according to Method 2 and perform the test. Prepare the control solution with 1.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Methanol and ethanol***—Dissolve about 0.5 g of Etodolac, weighed accurately, in 5.0 mL of the internal standard solution, and use this solution as the test solution. Separately, pipet 5 mL each of methanol and ethanol(95), add *N*,*N*-dimethylformamide to make exactly 200 mL. Pipet 5.0 mL of this solution, add *N*,*N*-dimethylformamide to make exactly 100 mL, and use this solution as the standard stock solution. Pipet 10.0 mL of the standard stock solution, add 5.0 mL of the internal standard, dilute with *N*,*N*-dimethylformamide to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 1 μL each of the test solution and the standard solution as directed under the Gas Chromatography according to the following conditions, and calculate the ratios, Q_T and Q_S, of the peak areas of methanol and ethanol in Etodolac to that of the internal standard for the test solution and the standard solution,

respectively. The contents of methanol and ethanol is NMT 0.1%, respectively.

$$\text{Content (\%) of methanol or ethanol} = 500 \times \frac{C}{W} \times \frac{Q_T}{Q_S}$$

C: Concentration (mg/mL) of ethanol or methanol in the standard solution

W: Weight (mg) of Etodolac in the test solution

Internal standard solution—Dissolve a suitable quantity of 2-propanol in *N*,*N*-dimethylformamide to make a solution with a concentration of 2.5 μL/mL. Pipet 5.0 mL of this solution, and dilute this solution with *N*,*N*-dimethylformamide to make exactly 100 mL.

Operating conditions

Detector: A hydrogen flame ionization detector

Column: A fused silica capillary column 0.32 mm in internal diameter and 25 m in length, coated with a 5 μm film of 1% vinyl–5% phenylmethylpolysiloxane for gas chromatography.

Carrier gas: Helium

Flow rate: 50 mL/min

Sample injection port temperature: 200 ℃

Detector temperature: 300 ℃.

Column temperature: Maintain the temperature of 45 ℃ for 5 minutes, then raise to 280 ℃ at the rate of 30 ℃ per minute, and maintain at 280 ℃ for 27 minutes.

System suitability

System performance: Proceed with 1 μL of the standard solution under the above operating conditions; methanol, ethanol, and 2-propanol are eluted in this order with the resolution between their peaks being NLT 1.0.

(4) ***Related substances***—Dissolve 25 mg of Etodolac, weighted accurately, in acetonitrile to make exactly 250 mL, and use this solution as the test solution. Perform the test with 20 μL of the test solution as directed under the Liquid Chromatography according to the following conditions. Each peak area of any peak other than the major peak from the test solution is NMT 0.5% to the total area of all peaks, and the total area is NMT 2.0%.

$$\text{Content (\%) of related substances} = 100 \times \frac{A_T}{A_S}$$

A_T: Each peak area of the peaks other than the principle peak

A_S: Total area of all peaks

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 214 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 to 10 μm in particle diameter).

Mobile phase: Control the mixing ratio of mobile phase A and mobile phase B in stages or gradient elution as follows. For the first 5 minutes, use mixture of 60% solution A and 40% solution B as the mobile phase. For the next 30 minutes, change the mixture ratio as linear gradient to finally make mixture of 20% solution A and 80% solution B. Adjust mobile phase to 40% of solution B before injection of the test solution and the standard solution, and keep re-equilibrium.

Mobile phase A: Mix 0.6 mL of phosphoric acid with 100 mL of water.

Mobile phase B: Mix 0.6 mL of phosphoric acid with 100 mL of acetonitrile.

Flow rate: 1 mL/min

System suitability

System performance: Dissolve suitable amount each of etodolac related substance I RS and etodolac RS in acetonitrile to make solutions containing 10 μg of etodolac related substance I RS and 0.2 mg of etodolac RS per mL, respectively. Proceed with 20 μL of this solution as directed under the above operating conditions; etodolac related substance I and etodolac are eluted in this order with the resolution between their peaks being NLT 3.0.

System repeatability: Repeat the test 6 times with 20 μL each of the solution according to the above conditions; the relative standard deviation of the ratio of the peak area is NMT 3%.

Water NMT 0.5% (2 g, volumetric titration, direct titration).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.23 g of Etodolac, dissolve in 60 mL of methanol, and titrate with 0.1 mol/L tetrabutylammonium hydroxide VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 1 mol/L tetrabutylammonium hydroxide VS = 28.735 mg of $C_{17}H_{21}NO_3$

Packaging and storage Preserve in tight containers.

Etodolac Tablets
에토돌락 정

Etodolac Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of etodolac ($C_{17}H_{21}NO_3$: 287.36).

Method of preparation Prepare as directed under Tablets, with Etodolac.

Identification The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

Dissolution Perform the test with 1 tablet of Etodolac Tablets at 100 revolutions per minute according to Method 1 under the Dissolution, using 1000 mL of pH 6.8 phosphate buffer solution as the dissolution medium. Take 20 mL of the dissolved solution 30 minutes after starting the test, and filter through a membrane filter with a pore size of NMT 0.8 μm. Discard the first 10 mL of the filtrate and use the subsequent filtrate as the test solution. Separately, weigh accurately about 25 mg of etodolac RS, dissolve in the dissolution medium to make exactly 100 mL, pipet 5 mL of this solution, and add the dissolution medium to make exactly 50 mL. Use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution as directed under the Ultraviolet-visible Spectroscopy at the absorbance maximum wavelength of about 274 nm, using the dissolution medium as a control solution.
The acceptable dissolution criterion is NLT 80% of Etodolac Tablets dissolved in 30 minutes.

Dissolution rate (%) of the labeled amount of etodolac ($C_{17}H_{21}NO_3$)

$$= W_S \times \frac{A_T}{A_S} \times \frac{100}{C}$$

W_S: Amount (mg) of etodolac RS
C: Labeled amount (mg) of etodolac ($C_{17}H_{21}NO_3$) in 1 tablet

Uniformity of dosage units It meets the requirements when the Content uniformity test is performed according to the following procedure. Take 1 tablet of Etodolac Tablets, add 10 mL of phosphate buffer solution, and shake to mix until disintegration. Then, add phosphate buffer solution to make exactly 100 mL, and centrifuge. Take χ mL of the clear supernatant, add phosphate buffer solution to obtain V mL of a solution having known concentration of about 25 μg of etodolac ($C_{17}H_{21}NO_3$) per mL, and use this solution as the test solution. Separately, weigh accurately about 25 mg of the etodolac RS, and dissolve in phosphate buffer solution to make exactly 100 mL. Pipet 10 mL of this solution, add phosphate buffer solution to make 100 mL, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution as directed under the Ultraviolet-visible Spectroscopy at the absorbance maximum wavelength at about 274 nm.

Amount (mg) of etodolac ($C_{17}H_{21}NO_3$)

$$= \text{Amount (mg) of etodolac RS} \times \frac{A_T}{A_S} \times \frac{V}{10} \times \frac{1}{x}$$

Assay Weigh accurately the mass of NLT 20 tablets of Etodolac Tablets, and powder. Weigh accurately an amount, equivalent to about 0.1 g of etodolac ($C_{17}H_{21}NO_3$), add 30 mL of the mobile phase, shake to mix for 15 minutes, and sonicate for 5 minutes to mix. After cooling, add 50 mL of the mobile phase to make exactly 50 mL. Allow to stand for 10 minutes, then take 10.0 mL of this solution, add the mobile phase to make exactly 100 mL, and filter. Use the filtrate as the test solution. Separately, weigh accurately about 20 mg of etodolac RS, dissolve in the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of etodolac in each solution.

Amount (mg) of etodolac ($C_{17}H_{21}NO_3$)

$$= \text{Amount (mg) of etodolac RS} \times \frac{A_T}{A_S} \times 5$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 274 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 μm to 10 μm in particle diameter).

Mobile phase: A mixture of acetonitrile, water, and phosphoric acid (500 : 500 : 0.25).

Flow rate: 1.5 mL/min

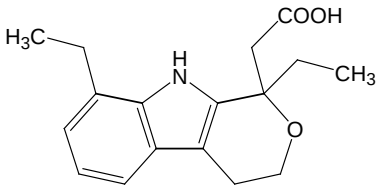
System suitability

System performance: Dissolve an appropriate amount of etodolac related substance I RS and etodolac RS in acetonitrile to make a solution containing 10 μg of etodolac related substance I RS and 0.2 mg of etodolac RS per mL. Proceed with 20 μL of this solution as directed under the above conditions; etodolac related substance I and etodolac are eluted in this order with the resolution being NLT 3.0.

System repeatability: Repeat the test 6 times with 20 μL each of the solution according to the above conditions; the relative standard deviation of the peak area is NMT 3%.

Packaging and storage Preserve in tight containers.

Etodolac Micronized
미분화에토돌락



Etodolac Micronized $C_{17}H_{21}NO_3$: 287.36
(1*S*)-1,8-Diethyl-1,3,4,9-tetrahydropyrano[3,4-b]indole-1-acetic acid, [*87249-11-4*]

Etodolac Micronized contains NLT 97.0% and NMT 101.0% of etodolac ($C_{17}H_{21}NO_3$), calculated on the anhydrous basis.

Description Etodolac Micronized occurs as a white fine crystalline powder.
It is very soluble in polyethylene glycol 400, freely soluble in ethanol, methanol or chloroform and practically insoluble in water.

Melting point—Between 145 and 148 ℃.

Identification (1) Perform the test with Etodolac Micronized as directed in article (2) of the Purity; the spots obtained from the test solution and the standard solution show the same R_f value and color.

(2) Determine the infrared spectra of Etodolac Micronized and etodolac RS as directed in the paste method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Etodolac Micronized as directed under Method 2 and perform the test. Prepare the control solution with 1.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Related substances***—Weigh accurately about 0.1 g of Etodolac Micronized, add acetone to make 100 mL, and use this solution as the test solution. Separately, weigh accurately 0.10 g of etodolac RS, dissolve in acetone to make 100 mL, and use this solution as the standard solution. To 25.0 mL of the standard solution, add acetone to make 100 mL, and use this solution as the diluted standard solution. Perform the test with the test solution, the standard solution and the diluted standard solution as directed under the Thin Layer Chromatography. Immerse a plate made of silica gel for thin-layer chromatography (with florescent agent) in a solution prepared by dissolving 0.5 g of ascorbic acid in a mixture of water and ethanol (1 in 5) to make 100 mL, and air-dry the plate. Apply 25 μL each of the test solution and the standard solution and 2 μL of the diluted standard solution on the plate. Develop the plate with a mixture of toluene, acetic acid and ethanol (70 : 50 : 30) as the developing solvent to a distance of 16 cm to 18 cm, and air-dry the plate for 30 minutes. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot from the test solution are not greater or more intense than the spot from the diluted standard solution.

Water NMT 0.5%.

Residue on ignition NMT 0.1% (1.0 g).

Particle size Place a small amount of Etodolac Micronized on a microscope slide, add 1 to 2 drops of mineral oil, mix well, and disperse. Then, cover it with a coverslip and measure the particle size with a microscope with a magnification of 40 to 400 times. Measure the size of all particles in the micrometer range of particle size measurement, and repeat the test more than three times; the average particle size should be NMT 8 μm, and the percentage of the number of particles NMT 20 μm should be NLT 95%.

Assay Weigh accurately about 0.1 g of Etodolac Micronized and dissolve in methanol to make 100.0 mL. Pipet 1.0 mL of this solution and add methanol to make 50.0 mL. Use this solution as the test solution. Separately, weigh accurately 0.1 g of etodolac RS and proceed in the same manner as in the preparation of the test solution. Use the resulting solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution according to the following conditions as directed under the Liquid Chromatography, and determine the peak areas, A_T and A_S, of etodolac in each solution.

$$\text{Amount (mg) of etodolac } (C_{17}H_{21}NO_3) = \text{Amount (mg) of etodolac RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 225 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm to 10 μm in particle diameter).

Mobile phase: A mixture of buffer solution, methanol and acetonitrile (68 : 19 : 13).

Flow rate: 1.0 mL/min

Buffer solution—To 0.5 mol/L potassium dihydrogen phosphate, add 200 mL of water to make 1000 mL.

Packaging and storage Preserve in tight containers.

Etodolac Micronized Capsules
미분화에토돌락 캡슐

Etodolac Micronized Capsules contain NLT 90.0% and NMT 110.0% the labeled amount of etodolac ($C_{10}H_{21}NO_3$: 287.36).

Method of preparation Prepare as directed under Capsules, with Etodolac Micronized.

Identification The retention times of the major peaks

from the test solution and standard solution obtained under the Assay are the same.

Dissolution Perform the test with 1 capsule of Etodolac Micronized Capsules at 100 revolutions per minute according to Method 1, using 900 mL of phosphate buffer solution (pH 7.5) as the dissolution medium. Take the dissolved solution 45 minutes after the start of the dissolution, filter, take 4.0 mL of the filtrate, and add phosphate buffer solution (pH 7.5) to make 25.0 mL. Use this solution as the test solution. Separately, weigh accurately about 0.1 g of etodolac RS, dissolve in phosphate buffer solution (pH 7.5), make the same concentration as the test solution, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, at 278 nm as directed under the Ultraviolet-visible Spectroscopy, using phosphate buffer solution (pH 7.5) as the control solution. It meets the requirements if the dissolution rate in 45 minutes is NLT 75%.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the contents of NLT 20 capsules of Etodolac Micronized Capsules and powder. Weigh an amount equivalent to about 50 mg of etodolac ($C_{17}H_{21}NO_3$), add 0.1 mol/L sodium hydroxide to make 100 mL, sonicate for 30 minutes, and centrifuge. Take 1.0 mL of the clear supernatant, add the mobile phase to make 50.0 mL, and use this solution as the test solution. Separately, weigh accurately about 50 mg of etodolac RS, add 0.1 mol/L sodium hydroxide to make 100.0 mL. Take an appropriate amount of this solution to obtain a solution having known concentration of 10 μg per mL, and use this solution as the standard solution. Perform the test with 50 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak area of etodolac, A_T and A_S, respectively.

$$\text{Amount (mg) of etodolac } (C_{17}H_{21}NO_3) = \text{Amount (mg) of etodolac RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 225 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 to 10 μm in particle diameter).

Mobile phase: A mixture of phosphate buffer (pH 4.75) and acetonitrile buffer (55 : 45).

Flow rate: 1.0 mL/min

Packaging and storage Preserve in tight containers.

Etodolac Micronized Tablets
미분화에토돌락 정

Etodolac Micronized Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of etodolac ($C_{17}H_{21}NO_3$: 287.36).

Method of preparation Prepare as directed under Tablets, with Etodolac Micronized.

Identification The major peaks obtained from the test solution and the standard solution under the Assay are the same in the retention time.

Dissolution Perform the test with 1 tablet of Etodolac Micronized Tablets at 100 revolutions per minute according to Method 1 under the Dissolution, using 900 mL of phosphate buffer solution, pH 7.5, as the dissolution medium. Take the dissolved solution 45 minutes after starting of the dissolution test, filter, take 4.0 mL of the filtrate, add phosphate buffer solution, pH 7.5, to make 25.0 mL, and use this solution as the test solution. Separately, weigh accurately about 0.1 g of etodolac RS, dissolve in phosphate buffer solution, pH 7.5, to make it the same concentration as the test solution, and this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution at a wavelength of 278 nm as directed under the Ultraviolet-visible Spectroscopy, using phosphate buffer solution, pH 7.5, as the control solution. Meets the requirements if the dissolution rate of Etodolac Micronized Tablets for 45 minutes is NLT 75%.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately NLT 20 tablets of Etodolac Micronized Tablets, and powder. Weigh accurately a portion of this powder, equivalent to about 50 mg of etodolac ($C_{17}H_{21}NO_3$), add 0.1 mol/L sodium hydroxide solution to make 100.0 mL, sonicate for 30 minutes, and centrifuge. Take 1.0 mL of the clear supernatant, add the mobile phase to make 50.0 mL, and use this solution as the test solution. Separately, weigh accurately about 50 mg of etodolac RS, and dissolve in 0.1 mol/L hydrochloric acid to make 100.0 mL. Take an appropriate amount of this solution, prepare a solution containing 10 μg per mL, and use this solution as the standard solution. Perform the test with 50 μL each of the test solution and the standard solution according to the following conditions as directed under the Liquid Chromatography, and determine the peak areas, A_T and A_S, of etodolac for each solution.

$$\text{Amount (mg) of etodolac } (C_{17}H_{21}NO_3) = \text{Amount (mg) of etodolac RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 225 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm to 10 μm in particle diameter).

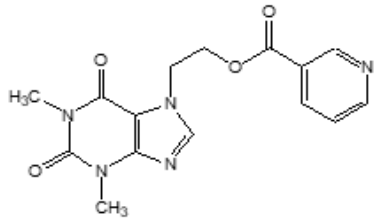
Mobile phase: A mixture of phosphate buffer solution, pH 4.75, and acetonitrile (55 : 45).

Flow rate: 1.0 mL/min

Phosphate buffer solution, pH 4.75—Add water to 100 mL of 0.5 mol/L potassium dihydrogen phosphate solution to make 1000 mL, and adjust the pH to 4.75 with potassium hydroxide solution.

Packaging and storage Preserve in tight containers.

Etofylline Nicotinate
에토필린니코티네이트



Etofylline Nicotinate $C_{15}H_{15}N_5O_4$: 329.31

2-(1,2,3,6-Tetrahydro-1,3-dimethyl-2,6-dioxo-7*H*-purin-7-yl)ethyl 3-pyridinecarboxylic acid ester, [*13425-39-3*]

Etofylline Nicotinate, when dried, contains NLT 99.0% and NMT 101.0% of etofylline nicotinate ($C_{15}H_{15}N_5O_4$).

Description Etofylline Nicotinate occurs as a white crystalline powder, is odorless and has a bitter taste.

Identification (1) Add 10 drops of 3% hydrogen peroxide and 3 drops of hydrochloric acid to 10 mg of Etofylline Nicotinate, mix well, and evaporate to dryness. Add a few drops of 10% ammonia water to the residue on evaporation; it exhibits dark red color.

(2) Determine the absorption spectrum as directed under the Ultraviolet-visible Spectroscopy with a solution of Etofylline Nicotinate in hydrochloric acid (1 in 10000); it exhibits a maximum at about 268 nm.

Melting point Between 151 and 152 ℃.

Purity (1) ***Clarity and color of solution***—Weigh 2.0 g of Etofylline Nicotinate in 10 mL of chloroform; the resulting solution is clear and colorless.

(2) ***Heavy metals***—Proceed with 1.0 g of Etofylline Nicotinate as directed under Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

Loss on drying 0.5% (1 g, 105 ℃, 2 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.2 g of Etofylline Nicotinate, previously dried, dissolve in 50 mL of acetic acid(100) for non-aqueous titration, and titrate with 0.1 mol/L perchloric acid VS as directed in the potentiometric titration under the Titrimetry. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 16.47 mg of $C_{15}H_{15}N_5O_4$

Packaging and storage Preserve in tight containers.

Etofylline Nicotinate Injection
에토필린니코티네이트 주사액

Etofylline Nicotinate Injection is an aqueous injection and contains NLT 95.0% and NMT 105.0% of etofylline nicotinate ($C_{15}H_{15}N_5O_4$: 329.31).

Method of preparation Prepare as directed under Injections, with Etofylline Nicotinate.

Identification (1) To an amount of Etofylline Nicotinate Injection equivalent to 10 mg of etofylline nicotinate, add 10 drops of 3% hydrogen peroxide and 3 drops of hydrochloric acid, shake to mix, evaporate in an evaporating dish until a reddish brown residue forms, and add a few drops of 10% ammonia water; the solution exhibits a dark red color.

(2) Take an amount of Etofylline Nicotinate Injection equivalent to 25 mg of etofylline nicotinate according to the labeled amount, extract in 100 mL of chloroform, and add chloroform to 10 mL of the extract to make 100.0 mL. Use this solution as the test solution. Separately, dissolve 10 mg of etofylline nicotinate RS in 100 mL of chloroform and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on a thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of chloroform and methanol (9 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Spray evenly a phosphomolybdic acid ethanol solution on the plate, dry at 120 ℃ and apply iodine vapor to the plate; the R_f values and colors of spots obtained from the test solution and the standard solution are the same.

(3) Take an amount of Etofylline Nicotinate Injection, equivalent to 10 mg of etofylline nicotinate, add 0.05 mol/L hydrochloric acid to make exactly 100 mL, and filter. Take 10 mL of the filtrate, add 0.05 mol/L hy-

drochloric acid to make 100.0 mL, and measure the absorbance spectrum as directed under Ultraviolet-visible Spectroscopy; it exhibits a maximum around 268 nm.

Sterility Meets the requirements.

Bacterial endotoxins Less than 3 EU per mg of etofylline nicotinate.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

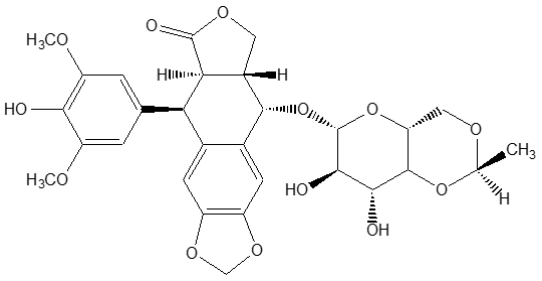
Extractable volume of injections Meets the requirements.

Assay Take an amount of Etofylline Nicotinate Injection equivalent to 0.1 g of etofylline nicotinate ($C_{15}H_{15}N_5O_4$) according to the labeled amount, place in a 125 mL separatory funnel, then extract 3 times with 30 mL of chloroform each time. Combine the chloroform extract and filter with cotton wool to make 100 mL. Pipet 3 mL of this solution and evaporate the chloroform to dryness completely on a steam bath. Add 0.05 mol/L hydrochloric acid to the residue and shake to dissolve to make exactly 500 mL, and use this solution as the test solution. Separately, weigh accurately about 0.1 g of etofylline nicotinate RS, previously dried at 105 °C for 2 hours, and dissolve in 0.05 mol/L hydrochloric acid TS to make exactly 100 mL. Pipet 3 mL of this solution, add 0.05 mol/L hydrochloric acid TS to make exactly 500 mL, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution at the wavelength of 268 nm as directed under the Ultraviolet-visible Spectroscopy, using 0.05 mol/L hydrochloric acid as a control solution.

Amount (mg) of etofylline nicotinate ($C_{15}H_{15}N_5O_4$)
= Amount (mg) of etofylline nicotinate RS × (A_T / A_S)

Packaging and storage Preserve in hermetic containers.

Etoposide
에토포시드



Etoposide $C_{29}H_{32}O_{13}$: 588.56
(5*S*,5a*R*,8a*R*,9*R*)-5-[[(2*R*,4a*R*,6*R*,7*R*,8*R*,8a*S*)-7,8-Dihydroxy-2-methyl-4,4a,6,7,8,8a-hexahydropyrano[3,2-d][1,3]dioxin-6-yl]oxy]-9-(4-hydroxy-3,5-dimethoxyphenyl)-5a,6,8a,9-tetrahydro-5H-[2]benzofuro[6,5-f][1,3]benzodioxol-8-one [*33419-42-0*]

Etoposide contains NLT 98.0% and NMT 102.0% of etoposide ($C_{29}H_{32}O_{13}$), calculated on the anhydrous basis.

Description Etoposide occurs as white crystals or a crystalline powder.
It is sparingly soluble in methanol, slightly soluble in ethanol(99.5), and very slightly in water.

Melting point—About 260 °C.

Identification (1) Determine the absorption spectra of Etoposide and etoposide RS in methanol (1 in 10000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Etoposide and etoposide RS as directed in the paste method under Infrared Spectrophotometry: both spectra exhibit similar intensities of absorption at the same wavenumbers.

Optical rotation $[\alpha]_D^{20}$: Between -100° and -105° (0.1 g, calculated on the anhydrous basis, methanol, 20 mL, 100 mm).

Purity (1) ***Heavy metals***—Proceed about 2.0 g of Etoposide according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Related substances***—Dissolve 50 mg of Etoposide in 10 mL of methanol, add the mobile phase to make 50 mL, and use this solution as the test solution. Pipet 2 mL of this solution, add the mobile phase to it make exactly 200 mL, and use this solution as the standard solution. Perform the test with 50 μL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions. Determine each peak area by the automatic integration method: the area of any peak other than etoposide obtained with the test solution is not greater than 1/5 times the peak area of etoposide obtained with the standard solution. The total area of all peaks other than the peak of etoposide obtained with the test solution is not greater than 1/2 times the peak area of etoposide obtained with the standard solution.

Operating conditions

For the detector, column, column temperature, mobile phase and flow rate, proceed as directed in the operating conditions under the Assay.

System suitability

System performance: Proceed as directed under the system suitability under the Assay.

Test for required detectability: Weigh accurately 1

mL of the standard solution and add the mobile phase to make exactly 10 mL. Confirm that the peak area of Etoposide obtained from 50 μL of this solution is within the range between 7% and 13% of the peak area of Etoposide in the standard solution.

System repeatability: Repeat the test 6 times with 50 μL of the standard solution according to the above operating conditions; the relative standard deviation of the peak area for Etoposide is NMT 2.0%.

Time span of measurement: About 3 times the retention time of etoposide after the solvent peak.

Water NMT 4.0% (0.5 g, volumetric titration, direct titration).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 25 mg each of Etoposide and etoposide RS (previously determined the water), dissolve separately in and dilute with methanol to make exactly 25 mL each. Pipet 10 mL each of these solutions, add exactly 5 mL of the internal standard solution and the mobile phase to make exactly 50 mL and use these solutions as the test solution and standard solution, respectively. Perform the test with 50 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and measure the ratio of the peak area of etoposide to that of the internal standard, Q_T and Q_S.

$$\text{Amount (mg) of Etoposide } (C_{29}H_{32}O_{13}) = \text{Amount (mg) of etoposide RS, as calculated on the anhydrous basis} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of 2,6-dichlorophenol in methanol (3 in 2500).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 290 nm).

Column: A stainless steel column about 3.9 mm in internal diameter and about 30 cm in length, packed with phenylsilyl silica gel for liquid chromatography (10 μm in particle diameter).

Column temperature: A constant temperature of about 35 °C.

Mobile phase: Dissolve 6.44 g of sodium sulfate decahydrate in diluted acetic acid(100) (1 in 100) to make 1000 mL, and add 250 mL of acetonitrile.

Flow rate: Adjust the flow rate so that the retention time of etoposide is about 20 minutes.

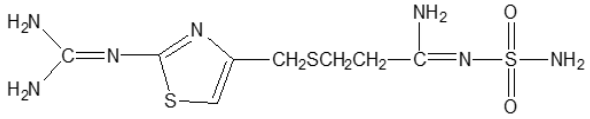
System suitability

System performance: Dissolve 10 mg of Etoposide in 2 mL of methanol, add 8 mL of the mobile phase, and mix well. Add 0.1 mL of diluted acetic acid(100) (1 in 25) and 0.1 mL of phenolphthalein TS, and add sodium hydroxide TS until the color of the solution changes to faintly red. After allowing to stand for 15 minutes, add 0.1 mL of diluted acetic acid(100)(1 in 25). Proceed with 10 μL of this solution under the above operating conditions; the resolution between the peak having the relative retention time of about 1.3 with respect to etoposide is NLT 3.0.

System repeatability: Repeat the test 6 times with 50 μL of the standard solution according to the above operating conditions; the relative standard deviation of the peak area for Etoposide is NMT 1.0%.

Packaging and storage Preserve in light-resistant, tight containers.

Famotidine
파모티딘



Famotidine $C_8H_{15}N_7O_2S_3$: 337.45
3-[({2-[(Diaminomethylidene)amino]-1,3-thiazol-4-yl}methyl)sulfanyl]-*N'*-sulfamoylpropanimidamide
[*76824-35-6*]

Famotidine, when dried, contains NLT 98.5% and NMT 101.0% of famotidine ($C_8H_{15}N_7O_2S_3$).

Description Famotidine occurs as white to yellowish white crystals.
It is freely soluble in acetic acid(100), slightly soluble in ethanol(95), very slightly soluble in water.
It dissolves in 0.5 mol/L hydrochloric acid TS.
It is gradually colored by light.

Melting point—About 164 °C (with decomposition).

Identification (1) Determine the absorption spectra of solutions of Famotidine and famotidine RS in 0.05 mol/L potassium dihydrogen phosphate TS (1 in 50000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Famotidine and famotidine RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Purity (1) ***Clarity and color of solution***—Dissolve 0.5 g of Famotidine in 10 mL of 0.5 mol/L hydrochloric acid TS; the solution is clear and colorless to pale yellow.

(2) ***Heavy metals***—Proceed with 2.0 g of Famotidine according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Related substances***—Dissolve 0.20 g of Famotidine in 10 mL of acetic acid(100), and use this solu-

tion as the test solution. Pipet 1 mL of this solution, and add acetic acid(100) to make exactly 100 mL. Pipet 1 mL, 2 mL and 3 mL of this solution, and add acetic acid(100) to make exactly 100 mL each, and use these solutions as the standard solutions (1), (2) and (3). With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution, the standard solution (1), the standard solution (2), the standard solution (3) on the plate made of silica gel for thin-layer chromatography (5 μm to 7 μm in particle diameter, with fluorescent indicator). Then, dry with the aid of a current of nitrogen. Next, develop the plate using a mixture of ethyl acetate, methanol, toluene and ammonia water(28) (40 : 25 : 20 : 2) as the developing solvent to a distance of about 8 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot and the spot of the starting point obtained from the test solution are not more intense than the spots from the standard solution (3). The total intensity of the spots other than the principal spot and the spot of the starting point obtained from the test solution are NMT 0.5%, as compared to intensities of the spots obtained from the standard solutions (1) and (2).

Loss on drying NMT 0.5% (1 g, in vacuum, phosphorus pentoxide, 80 ℃, 4 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.3 g of Famotidine, previously dried, dissolve in 50 mL of acetic acid(100), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of perchloric acid VS
= 16.873 mg of $C_8H_{15}N_7O_2S_3$

Packaging and storage Preserve in light-resistant, tight containers.

Famotidine for Injection
주사용 파모티딘

Famotidine for injection is a preparation for injection, which is dissolved before use. Famotidine for injection contains NLT 94.0% and NLT 106.0% of the labeled amount of famotidine ($C_8H_{15}N_7O_2S_3$: 337.45).

Method of preparation Prepare as directed under Injections, with Famotidine.

Description Famotidine for injection occurs as a porous mass or a powder.

Identification Weigh an amount of Famotidine for injection, equivalent to 10 mg of famotidine according to the labeled amount, dissolve in 50 mL of 0.05 mol/L potassium dihydrogen phosphate TS, then to 5 mL of the resulting solution, add 0.05 mol/L potassium dihydrogen phosphate TS to make 50 mL. Determine the absorption spectra of this solution as directed under Ultraviolet-visible Spectroscopy; it exhibits a maximum absorption between 263 nm and 267 nm.

pH Dissolve an amount of Famotidine for injection equivalent to 20 mg (potency) of famotidine, and dissolve in 1 mL of water; the pH of this solution is between 4.9 and 5.5.

Purity (1) ***Clarity and color of solution***—Weigh an amount of Famotidine for injection equivalent to about 20 mg of famotidine according to the labeled amount, and dissolved in 1 mL of water; the solution is clear and colorless.

(2) ***Related substances***—Take a number of Famotidine for injection, equivalent to about 0.1 g of famotidine (C8H15N7O2S3), dissolve each content in water, wash the inside of the container with water, combine the solutions of the contents with the washings, add water to the combined solution to make exactly 100 mL, and use this solution as the test solution. Pipet 1 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 5 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine each peak area of these solutions by the automatic integration method: the total area of the peaks other than the major peak from the test solution is not larger than the major peak from the standard solution.

Operating conditions

For the detector, column, column temperature, mobile phase, flow rate and system performance, proceed as directed in the operating conditions under the Assay.

Detection sensitivity: Adjust the detection sensitivity so that the peak height of famotidine obtained from 5 μL of the standard solution is between 5 mm and 10 mm.

System suitability

System performance: Proceed as directed under the system suitability under the Assay.

Test for required detectability: Pipet 2 mL of the standard solution, and add water to make exactly 20 mL. Confirm that the peak area of famotidine obtained from 5 μL of this solution is 8% to 12% of the peak area of famotidine obtained from the standard solution.

System repeatability: Repeat the test 6 times with 5 μL each of the standard solution according to the above operating conditions; the relative standard deviation of the peak area of famotidine is NMT 2.0%.

Time span of measurement: About 2 times the retention time of famotidine after the solvent peak.

Water NMT 1.5% (0.1 g, coulometric titration).

Sterility Meets the requirements.

Bacterial endotoxins Less than 15 EU per mg of Famotidine for Injection.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Take a number of Famotidine for injection equivalent to about 0.1 g of famotidine ($C_8H_{15}N_7O_2S_3$), dissolve the contents in water, wash each container with water, add the washings to the initial fluid, and add water to make exactly 100 mL. Pipet 5 mL of this solution, add 5.0 mL of the internal standard solution, add the mobile phase to make exactly 50 mL, and use this solution as the test solution. Separately, weigh accurately about 50 mg of famotidine RS (previously dried at 80 ℃ for 4 hours in a phosphorus pentoxide desiccator) and dissolve in the mobile phase to make exactly 50 mL. Pipet 5 mL of this solution, add 5.0 mL of the internal standard solution, add the mobile phase to make exactly 50 mL, and use this solution as the standard solution. Perform the test with 5 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the peak area ratios, Q_T and Q_S, of famotidine to the internal standard, respectively.

$$\text{Amount (mg) of famotidine } (C_8H_{15}N_7O_2S_3) = \text{Amount (mg) of famotidine RS} \times \frac{Q_T}{Q_S} \times 2$$

Internal standard solution—To 5 mL of a solution of methyl *p*-hydroxybenzoate in methanol (1 in 500), add water to make 50 mL.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: Dissolve 2 g of sodium 1-heptanesulfonate in 900 mL of water, add acetic acid(100) to adjust the pH to 3.0, and add water to make 1000 mL. To this solution, add 240 mL of acetonitrile and 40 mL of methanol.

Flow rate: Adjust the flow rate so that the retention time of famotidine is about 6 minutes.

System suitability

System performance: Proceed with 5 μL of the standard solution according to the above conditions; famotidine and the internal standard are eluted in this order with the resolution being NLT 11.

System repeatability: Repeat the test 6 times with 5 μL each of the standard solution according to the above conditions; the relative standard deviation of ratios of the peak area of famotidine to that of the internal standard is NMT 1.0%.

Packaging and storage Preserve in hermetic containers.

Famotidine Tablets
파모티딘 정

Famotidine Tablets contain NLT 94.0% and NMT 106.0% of the labeled amount of famotidine ($C_8H_{15}N_7O_2S_3$: 337.45).

Method of preparation Prepare as directed under Tablets, with Famotidine.

Identification Weigh an amount of Famotidine Tablets, previously powdered, equivalent to 10 mg of famotidine according to the labeled amount, add 50 mL of 0.05 mol/L potassium dihydrogen phosphate TS, shake well to mix, and then centrifuge. To 5 mL of the clear supernatant, add 0.05 mol/L potassium dihydrogen phosphate TS to make 50 mL, and determine the absorption spectrum of the solution as directed under Ultraviolet-visible Spectroscopy; it exhibits a maximum absorption between 263 nm and 267 nm.

Purity ***Related substances***—Take NLT 10 Famotidine Tablets, add 200 mL of diluent, and disintegrate by shaking well to mix. To this solution, add 200 mL of methanol, mix at 300 revolutions per minute for 1 hour, add diluent to make exactly 1000 mL, and then filter. Pipet an amount of this solution equivalent to 10 mg of famotidine, add diluent to make 100 mL, and use this solution as the test solution. Separately, weigh accurately 10 mg of famotidine RS, add 20 mL of methanol, sonicate for 5 minutes, and then add diluent to make exactly 100 mL. Use this solution as the standard solution. Perform the test with 50 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak area of each solution by the automatic integration method, and calculate the amount of each related substance in the test solution; the famotidine related substance I {3-[2-(diaminomethyleneamino)-1,3-thiazol-4-yl methylsulfonyl]phenyl}-*N*-sulfamoyl-propanamide} is NMT 1.0%, and famotidine related substance II {3-[2-(diaminomethyleneamino)-1,3-thiazol-4-yl methylthio]propanoic acid}, famotidine related substance III {3-[2-(diaminomethyleneamino)-1,3-thiazol-4-yl methylthio]-*N*-sulfamoyl-propanamide}, and famotidine related

substances IV {3-[2-(diaminomethyleneamino)-1,3-thiazol-4-yl methylthio]-propanamide} are NMT 0.5%, and the total amount of related substances is NMT 1.5%. However, the peak area of famotidine related substance IV is obtained by dividing the area determined with the automatic integration method by the correction factor 1.3.

$$\text{Content (\%) of related substances} = 100 \times \frac{C_S}{C \times N} \times \frac{A_i}{A_S}$$

C_S: Concentration (mg/mL) of famotidine in the standard solution

C: Labeled amount (g) of famotidine in 1 tablet

N: Number of tablets used in the preparation of the test solution

A_T: Peak area of each related substance in the test solution

A_S: Peak area of famotidine in the standard solution

Diluent—Dissolve 6.8 g of potassium dihydrogen phosphate in 750 mL of water, adjust pH with 1 mol/L potassium hydroxide to 6.0, and add water to make 1000 mL.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 275 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 ℃.

Mobile phase: A mixture of buffer solution and acetonitrile (93 : 7).

Flow rate: About 1.4 mL/min

System suitability

Test for required detectability: To 10 mg of famotidine, add 1 mL of 0.1 mol/L hydrochloric acid, heat at 80 ℃ for 30 minutes, and then cool to room temperature. Then, add 2 mL of 0.1 mol/L sodium hydroxide TS, heat at 80 ℃ for 30 minutes, then cool to room temperature, and then neutralize with 1 mL of 0.1 mol/L hydrochloric acid. Add diluent to make 50 mL. Pipet 10 mL of this solution, transfer into a solution of 5 mg of famotidine dissolved in 8 mL of methanol, then add diluent to make 50 mL. Take 25 mL of this solution, add diluent to make 50 mL, and use this solution as the system suitability stock solution. Take 1 to 1.5 mL of this solution, add 1 drop of hydrogen peroxide TS, and use this solution as the system suitability solution. Proceed with 50 μL of this solution according to the above conditions; the relative retention time of famotidine related substances I, II, III, and IV to the retention time of the famotidine peak are 0.4, 0.7, 0.8, and 1.2, respectively.

System performance: Proceed with 50 μL of the system suitability solution according to the above conditions; the resolutions between famotidine related substance III and famotidine, and between famotidine and famotidine related substance IV, are NLT 1.3, respectively, and the mass distribution ratio of the famotidine peak is NLT 2.0.

System repeatability: Repeat the test 6 times with 50 μL each of the standard solution according to the above conditions; the relative standard deviation is NMT 2.0%.

Buffer solution—Dissolve 13.6 g of sodium acetate trihydrate in 750 mL of water, add 1 mL of triethylamine, adjust the pH to 6.0 with acetic acid(100), and then add water to make 1000 mL.

Dissolution Perform the test with 1 tablet of Famotidine Tablets at 50 revolutions per minute according to Method 2, using 900 mL of pH 4.5 0.1 mol/L phosphate buffer solution as the dissolution medium. Take 20 mL of the dissolved solution 30 minutes after starting the test, and filter through a membrane filter with a pore size of NMT 0.8 μm. Discard the first 10 mL of the filtrate and use the subsequent filtrate as the test solution. Separately, weigh accurately 20 mg of Famotidine RS, add buffer solution to make exactly 100 mL. Pipet 5.0 mL of this solution, add the buffer solution to make exactly 50 mL, and use this solution as the standard solution. Determine the absorbances, AT and AS, of the test solution and the standard solution at the absorbance maximum wavelength near 265 nm as directed under Ultraviolet-visible Spectrophotometry.

It meets the requirements if the dissolution rate of Famotidine Tablets in 30 minutes is NLT 75%.

$$\text{Dissolution rate (\%) of the labeled amount of famotidine } (C_8H_{15}N_7O_2S_3) = \text{Amount (mg) of famotidine RS} \times \frac{Q_T}{Q_S} \times \frac{90}{C}$$

C: Labeled amount (mg) of famotidine ($C_8H_{15}N_7O_2S_3$) in 1 tablet

Uniformity of dosage units It meets the requirements when the procedure for content uniformity is performed according to the following method.

Take 1 tablet of Famotidine Tablets, add 2 mL of water, shake to disintegrate. Add methanol, shake well to mix, then add methanol to make exactly V mL of a solution containing about 0.2 mg of famotidine ($C_8H_{15}N_7O_2S_3$) per mL, and centrifuge. Pipet 10 mL of the clear supernatant, add 2.0 mL of the internal standard solution, add the mobile phase to make exactly 20 mL, and use this solution as the test solution. Separately, weigh accurately about 0.1 g of famotidine RS, previously dried in a phosphorus pentoxide desiccator in vacuum at 50 ℃ for 4 hours, and dissolve in methanol to make exactly 100 mL. Pipet 10 mL of this solution, add 2.0 mL of the internal standard solution, add the mobile phase to make exactly 20 mL, and use this solution as the standard solution. Perform the test with 5 μL each of the test solution and the standard

solution as directed under Liquid Chromatography according to the operating conditions described in the Assay and calculate the ratios, QT and QS, of the peak area of famotidine to that of the internal standard.

$$\text{Amount (mg) of famotidine } (C_8H_{15}N_7O_2S_3) = \text{Amount (mg) of famotidine RS} \times \frac{Q_T}{Q_S} \times \frac{V}{500}$$

Internal standard solution—To 5 mL of a solution of methyl *p*-hydroxybenzoate in methanol (1 in 500), add water to make 50 mL.

Assay Take a certain number of Famotidine Tablets equivalent to 0.2 g of famotidine ($C_8H_{15}N_7O_2S_3$), add 50 mL of water, and disintegrate by shaking well to mix. Next, add 100 mL of methanol, shake well to mix, then add methanol to make exactly 200 mL, and centrifuge. Pipet 5 mL of the clear supernatant, add exactly 5 mL of the internal standard solution, add the mobile phase to make exactly 50 mL, and use this solution as the test solution. Separately, weigh accurately about 0.1 g of famotidine RS, previously dried in a phosphorus pentoxide desiccator in vacuum at 80 ℃ for 4 hours, and dissolve in methanol to make exactly 100 mL. Pipet 5 mL of this solution, add exactly 5 mL of the internal standard solution, add the mobile phase to make exactly 50 mL, and use this solution as the standard solution. Perform the test with 5 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the peak area ratios, Q_T and Q_S, of famotidine to the peak area of the internal standard, respectively.

$$\text{Amount (mg) of famotidine } (C_8H_{15}N_7O_2S_3) = \text{Amount (mg) of famotidine RS} \times \frac{Q_T}{Q_S} \times 2$$

Internal standard solution—To 5 mL of a solution of methyl *p*-hydroxybenzoate in methanol (1 in 500), add water to make 50 mL.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 ℃.

Mobile phase: Dissolve 2 g of sodium 1-heptanesulfonate in 900 mL of water, add acetic acid(100) to adjust the pH to 3.0, and add water to make 1000 mL. To this solution, add 240 mL of acetonitrile and 40 mL of methanol.

Flow rate: Adjust the flow rate so that the retention time of famotidine is about 6 minutes.

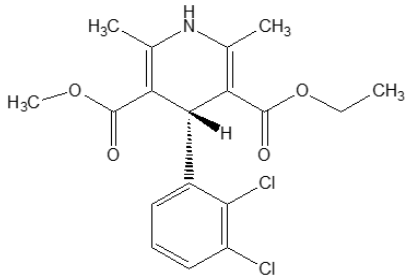
System suitability

System performance: Proceed with 5 μL of the standard solution according to the above conditions; famotidine and the internal standard are eluted in this order with the resolution being NLT 11.

System repeatability: Repeat the test 6 times with 5 μL of the standard solution under the above operating conditions; the relative standard deviation of the peak area of famotidine is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Felodipine
펠로디핀



and enantiomer

Felodipine $C_{18}H_{19}Cl_2NO_4$: 384.25

3-Ethyl 5-methyl 4-(2,3-dichlorophenyl)-2,6-dimethyl-1,4-dihydropyridine-3,5-dicarboxylate [*72509-76-3*]

Felodipine contains NLT 98.0% and NMT 101.0% of felodipine ($C_{18}H_{19}Cl_2NO_4$), calculated on the dried basis.

Description Felodipine occurs as a pale yellow to yellow crystalline powder.

It is freely soluble in acetone or ethanol(95), slightly soluble in heptane, and practically insoluble in water.

Identification (1) Determine the infrared spectra of Felodipine and felodipine RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Felodipine in methanol to make 50 mL, perform the test with this solution as directed under the Ultraviolet-visible Spectroscopy using methanol as a control solution, and determine the absorbance at the wavelength of 440 nm with a layer length of 5 cm; it is NMT 0.2.

(2) ***Heavy metals***—Proceed with 1.0 g of Felodipine according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Related substances***—With 40 μL of the test solution prepared according to the Assay, perform the test

as directed under the Liquid Chromatography according to the following conditions, and determine the peak area from the test solution; each peak area other than the major peak from the test solution is NMT 1.0%, and the sum of peak areas of these peaks is NMT 1.5% relative to the major peak area.

$$\text{Content (\%) of related substances} = 100 \times \frac{A_\text{i}}{A_\text{S}}$$

A_T: Each peak area other than the major peak
A_S: Total area of all peaks

Operating conditions

Proceed as directed under the operating conditions under the Assay.

Time span of measurement: NLT 2 times the retention time of felodipine.

Loss on drying NMT 0.5% (1 g, 105 ℃, 3 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 30 mg each of Felodipine and felodipine RS, dissolve each in the mobile phase to make exactly 100 mL, and use these solutions as the test solution and the standard solution, respectively. Prepare the test solution and the standard solution before use. Perform the test with 40 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions and determine the peak areas, A_T and A_S, of felodipine in each solution.

$$\text{Amount (mg) of felodipine } (C_{18}H_{19}ClNO_4) = \text{Amount (mg) of felodipine RS} \times \frac{A_\text{T}}{A_\text{S}}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of phosphate buffer solution, acetonitrile and methanol (2 : 2 : 1).

Flow rate: 1 mL/min

System suitability

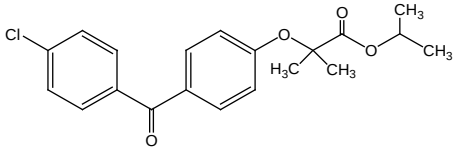
System performance: Dissolve 0.15 g of felodipine in a mixture of 25 mL of t-butyl alcohol and 25 mL of 1 mol/L perchloric acid, add 10 mL of 0.1 mol/L cerium ferric sulfate TS, allow to stand for 15 minutes, and add 3.5 mL of 10 mol/L sodium hydroxide TS. Neutralize with 2 mol/L sodium hydroxide TS. Transfer this mixture into a separatory funnel, add 25 mL of dichloromethane, shake, and take the lower layer. Evaporate the lower layer to dryness on a steam bath with the aid of a current of nitrogen. Dissolve 10 mg of the residue (felodipine oxide) and 5 mg of felodipine RS in the mobile phase to make 100 mL. Take 1.0 mL of this solution, and add the mobile phase to make 100 mL. Proceed with 20 μL of this solution according to the above conditions; felodipine oxide and felodipine are eluted in this order with the resolution not being less than 2.5. Proceed with 40 μL of the standard solution according to the above conditions; the symmetry factor of the felodipine peak is NMT 1.5.

Detection sensitivity: Adjust the detection sensitivity so that the height of the two peaks obtained from the solution in the system performance is NLT 20% of the full scale.

Phosphate buffer solution—Dissolve 6.9 g of sodium dihydrogen phosphate dihydrate in 400 mL of water, add 8 mL of 1 mol/L phosphoric acid, and add water to make 1000 mL.

Packaging and storage Preserve in light-resistant, tight containers.

Fenofibrate
페노피브레이트



Fenofibrate $C_{20}H_{21}ClO_4$: 360.83
Propan-2-yl 2-{4-[(4-chlorophenyl)carbonyl] phenoxy}-2-methylpropanoate [*49562-28-9*]

Fenofibrate contains NLT 98.5% and NMT 101.0% of fenofibrate ($C_{20}H_{21}ClO_4$), calculated on the dried basis.

Description Fenofibrate occurs as a white crystalline powder.
It is very soluble in dichloromethane, slightly soluble in ethanol(95), and practically insoluble in water.

Identification Determine the infrared spectra of Fenofibrate and fenofibrate RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Melting point Between 79 and 82 ℃.

Purity (1) ***Clarity and color of solution*—**Dissolve 0.50 g of Fenofibrate in acetone to make exactly 10 mL; the resulting solution is clear.

(2) ***Acid*—**Dissolve 1.0 g of Fenofibrate in 50 mL of ethanol previously neutralized with 0.2 mL of phenolphthalein TS. To this solution, add dropwise 0.1 mol/L sodium hydroxide solution until the resulting solution

exhibits a pink color; the consumed amount is NMT 0.2 mL.

(3) ***Chloride*—**To 5.0 g of Fenofibrate, add 25 mL of water, heat at 50 °C for 10 minutes, cool, and filter. To 5 mL of the filtrate, add 6 mL of dilute nitric acid and water to make 50 mL, and perform the test. Prepare the control solution by adding 6 mL of dilute nitric acid, 0.30 mL of 0.01 mol/L hydrochloric acid, and water to make 50 mL (NMT 0.01%).

(4) ***Sulfate*—**To 5.0 g of Fenofibrate, add 25 mL of water, heat at 50 °C for 10 minutes, cool, and filter. To 10 mL of the filtrate, add 1 mL of dilute hydrochloric acid and water to make 50 mL. Prepare the control solution by adding 1 mL of dilute hydrochloric acid, 0.42 mL of 0.005 mol/L sulfuric acid, and water to make 50 mL (NMT 0.01%).

(5) ***Heavy metals***—Proceed with 1.0 g of Fenofibrate and perform the test as directed under Method 2. Prepare the control solution with 2.0 mL of the lead standard solution (NMT 20 ppm).

(6) ***Related substances*—**Dissolve about 100 mg of Fenofibrate in the mobile phase to make exactly 100 mL, and use this solution as the test solution. Pipet 1 mL of this solution, and add the mobile phase to make exactly 100 mL. Pipet 1 mL of this solution, add the mobile phase to make exactly 10 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine each peak area of each solution according to the automatic integration method and determine the amount of each related substance; fenofibrate related substance I with the relative retention time of 0.3 for fenofibrate obtained from the test solution and fenofibrate related substance II with the relative retention time of 0.4 are NMT 0.1%, and fenofibrate related substance III with the relative retention time of 1.3 is NMT 0.1%. Any other individual unidentified related substances are NMT 0.1%, and the total related substances are NMT 0.5%. However, exclude any peaks smaller than 0.05%.

$$\text{Content (\%) of related substances} = \frac{A_T}{A_S} \times rf \times \frac{1}{10}$$

A_T: Peak area of each related substance obtained from the test solution

A_S: Peak area of fenofibrate obtained from the standard solution

rf: The correction factor for each related substance for fenofibrate peak

Fenofibrate related substance I: 0.78
Fenofibrate related substance II: 1.02
Fenofibrate related substance III: 1.27
Other related substances: 1.00

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 286 nm).

Column: A stainless steel column about 4.0 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of acetonitrile and water (7 : 3) (adjust the pH with phosphoric acid).

Flow rate: 1.0 mL/min

System suitability

Test for required detectability: Pipet 5 mL of the standard solution, and add the mobile phase to make exactly 10 mL. Proceed with 20 μL of this solution according to the above conditions; confirm that the signal-to-noise ratio of the torsemide peak is NLT 10.

System performance: Proceed with 20 μL of the standard solution according to the above conditions; the symmetry factor of the fenofibrate peak is between 0.8 and 2.0.

System repeatability: Repeat the test 6 times with 20 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area of fenofibrate is NMT 10.0%.

Loss on drying NMT 0.5% (0.5 g, 60 °C, in vacuum, constant mass).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 25 mg each of Fenofibrate and fenofibrate RS, dissolve in the mobile phase to make exactly 25 mL, and use these solutions as the test solution and the standard solution (1), respectively. Also, weigh 10.0 mg of fenofibrate RS, 10.0 mg of fenofibrate related substance I RS, 10.0 mg of fenofibrate related substance II RS, and 20.0 mg of fenofibrate related substance III RS, and dissolve in the mobile phase to make exactly 100 mL. To 1.0 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution (2). Perform the test with 5 μL each of the test solution and the standard solution (1) as directed under the Liquid Chromatography according to the operating conditions for testing related substances, and determine the peak areas, A_T and A_S, of fenofibrate in each solution.

$$\text{Amount (mg) of fenofibrate } (C_{20}H_{21}ClO_4) = \text{Amount (mg) of fenofibrate RS} \times \frac{A_T}{A_S}$$

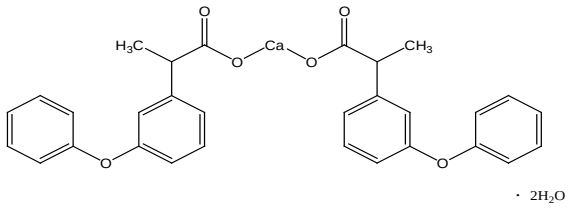
System suitability

Detection sensitivity: Adjust the sensitivity so that the peak heights obtained by performing the test with 5 μL of standard solution (2) according to the above conditions are NLT 50% of the full scale of the data collection device.

System repeatability: Repeat the test 6 times with 5 μL each of the standard solution (1) according to the above conditions; the relative standard deviation of the peak area of fenofibrate is NMT 1.0%.

Packaging and storage Preserve in light-resistant, well-closed containers.

Fenoprofen Calcium Dihydrate
페노프로펜칼슘수화물



Fenoprofen Calcium $C_{30}H_{26}CaO_6 \cdot 2H_2O$: 558.63
Calcium 2-(3-phenoxyphenyl)propanoate dihydrate [*152864-45-4*]

Fenoprofen Calcium Dihydrate contains NLT 97.0% and NMT 103.0% of fenoprofen calcium ($C_{30}H_{26}CaO_6$: 522.60), calculated on the anhydrous basis.

Description Fenoprofen Calcium Dihydrate occurs as a white crystalline powder.
It is slightly soluble in n-hexanol, methanol, or water, and practically insoluble in chloroform.

Identification (1) Mix 1 g of Fenoprofen Calcium Dihydrate with 50 mL of acetic acid(31), heat, filter, and add 2mL of ammonium oxalate TS to the filtrate; a white precipitate develops, and dissolve the precipitate in 3 mol/L hydrochloric acid TS.

(2) Determine the infrared spectra of Fenoprofen Calcium Dihydrate and fenoprofen calcium dihydrate RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Purity (1) ***Calcium***—Weigh accurately about 0.75 g of Fenoprofen Calcium Dihydrate, add ethanol(95), and dissolve by heating if necessary. Add ethanol(95) to make exactly 50 mL, and use this solution as the test solution. Put 70 mL of water, 2 mL of sodium hydroxide solution (1 in 10) and 0.3 g of hydroxynaphthol in a 150-mL beaker to mix, add about 1 mL of the test solution, and titrate with 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS until the resulting solution exhibits a blue color. To this solution, add 10.0 mL of the test solution, and titrate with 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS until the resulting solution exhibits a blue color (between 7.3% and 8.0%, calculated on the anhydrous basis).

Each mL of 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS
= 2.004 mg of Ca

(2) ***Heavy metals***—Proceed with 2.0 g of Fenoprofen Calcium Dihydrate according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Related substances***—Weigh accurately about 0.2 g of Fenoprofen Calcium Dihydrate, dissolve in a mixture of water and acetonitrile (1 : 1) to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 20 mg of fenoprofen calcium dihydrate RS and dissolve in a mixture of water and acetonitrile (1 : 1) to make exactly 100 mL. To 5.0 mL of this solution, add a mixture of water and acetonitrile (1 : 1) to make exactly 50 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, determine each peak area from each solution by the automatic integration method, and calculate the amount of each related substance; the amount of each related substance is NMT amount 0.5%, and the total amount of related substances is NMT 2.0%.

$$\text{Content (\%) of related substances} = 10000 \times \frac{C}{W} \times \frac{A_i}{A_S}$$

C: Concentration (mg/mL) of fenoprofen calcium in the standard solution

W: Amount (mg) of Fenoprofen Calcium Dihydrate taken from the test solution

A_i: Peak area of each related substance obtained from the test solution

A_S: Peak area of fenoprofen obtained from the standard solution

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 270 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: Control the mixing ratio of mobile phase A and mobile phase B stepwise or via the gradient elution as follows.

Mobile phase A: A mixture of water and acetic acid(31) (98 : 2).

Mobile phase B: A mixture of acetonitrile and acetic acid(31) (98 : 2).

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0	70	30
0 - 3	70	30
3 - 41	70 → 10	30 → 90
41 - 42	10	90
42 - 43	10 → 70	90 → 30

43 - 55	70	30

Flow rate: 1.5 mL/min

System suitability

System performance: Dissolve 2 mg of 3-phenoxybenzoic acid and 2 mg of fenoprofen calcium dihydrate RS in a mixture of water and acetonitrile (1 : 1) to make 100 mL. Proceed with 20 μL of this solution according to the above conditions; the relative retention times of 3-phenoxybenzoic acid peak and fenoprofen peak are 0.89 and 1.0, respectively, the resolution between these peaks is NLT 9.0, and the symmetry factor of the fenoprofen peak is NMT 2.0. Proceed with 20 μL of the standard solution according to the above conditions; the symmetry factor of the fenoprofen peak is NMT 2.0.

System repeatability: Repeat the test 5 times with 20 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area of temazepam is NMT 2.0%.

Water Between 5.0% and 8.0% (1 g, volumetric titration, direct titration).

Assay Weigh accurately about 70 mg each of Fenoprofen Calcium Dihydrate and fenoprofen calcium dihydrate RS, add 0.5 mL of 0.5 mol/L hydrochloric acid TS and 2 mL of acetone, dissolve in a mixture of methanol and water (7 : 3) to make exactly 100 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the peak areas, A_T and A_S, of fenoprofen in each solution.

$$\text{Amount (mg) of fenoprofen calcium } [(C_{15}H_{13}O_3)_2Ca] = 100 \times C \times \frac{A_T}{A_S}$$

C: Amount (mg) of fenoprofen calcium in fenoprofen calcium dihydrate RS, calculated on the anhydrous basis

Operating conditions

Detector: An ultraviolet absorption photometer (272 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of acetonitrile, water, and phosphoric acid (50 : 49.6 : 0.4).

Flow rate: 2 mL/min

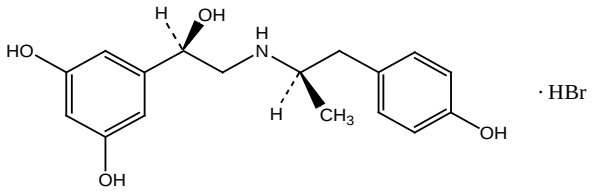
System suitability

System performance: Dissolve 5 mg of fenoprofen calcium dihydrate RS and 5 mg of gemfibrozil in a mixture of methanol and water (7 : 3) to make 5 mL. Proceed with 20 μL of this solution according to the above conditions; the relative retention times of fenoprofen peak and gemfibrozil peak are about 0.5 and 1.0, respectively, and the resolution between these peaks is NLT 8. Also, proceed with 20 μL of the standard solution according to the above conditions; the number of theoretical plate obtained from the fenoprofen peak is NLT 3000.

System repeatability: Repeat the test 5 times with 20 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area of fenoprofen is NMT 2.0%.

Packaging and storage Preserve in tight containers.

Fenoterol Hydrobromide
페노테롤브롬화수소산염



and enantiomer

$C_{17}H_{21}NO_4 \cdot HBr$: 384.27

5-[1-Hydroxy-2-[1-(4-hydroxyphenyl)propan-2-ylamino]ethyl]benzene-1,3-diolhydrobromide [*1944-12-3*]

Fenoterol Hydrobromide contains NLT 99.0% and NMT 101.0% of fenoterol hydrobromide ($C_{17}H_{21}NO_4 \cdot HBr$), calculated on the dried basis.

Description Fenoterol Hydrobromide occurs as a white crystalline powder.
It is soluble in water or ethanol(95).

Identification (1) Determine the infrared spectra of Fenoterol Hydrobromide and fenoterol hydrobromide RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) An aqueous solution of Fenoterol Hydrobromide (1 in 100) responds to the Qualitative Analysis (1) for bromide.

pH Dissolve 2.0 g of Fenoterol Hydrobromide in water to make exactly 50 mL; the pH of this solution is between 4.2 and 5.2.

Purity (1) ***Clarity and color of solution***—Dissolve 2.0 g of Fenoterol Hydrobromide in water to make exactly 50 mL; the resulting solution is clear and colorless.

(2) ***Iron***—Proceed with 1.0 g of Fenoterol Hydrobromide according to Method 3 and perform the test as directed under Method A. Prepare the control solution

with 0.5 mL of iron standard solution (NMT 5 ppm).

(3) ***Phenone***—Dissolve 2.0 g of Fenoterol Hydrobromide in water to make 50 mL. Determine the absorbance of this solution at the wavelength of 330 nm as directed under the Ultraviolet-visible Spectroscopy; it is NMT 0.42 (NMT 0.2%).

(4) ***Isomer***—Dissolve 25.0 mg each of Fenoterol Hydrobromide and fenoterol hydrobromide RS in water to make exactly 10 mL, and use these solutions as the test solution and the standard solution, respectively. Prepare the test solution and the standard solution before use. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Calculate the amount of isomer by determining the heights, (H_T) and (H_S), of the peak eluting immediately after the major peak obtained from the test solution; it is NMT 4.0%.

$$\text{Content (\%) of isomer} = \text{Content (\%) of isomer indicated on the reference standards} \times \frac{H_T}{H_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 280 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm to 10 μm in particle diameter).

Mobile phase: To 10 mL of 0.9 w/v% potassium dihydrogen phosphate, add 690 mL of 2.4 w/v% dibasic sodium phosphate 12-hydrate solution, mix, and add phosphoric acid to adjust the pH to 8.5. Add 300 mL of methanol, and mix.

Flow rate: 1.0 mL/minute. Adjust the retention time of the major peak to be NMT 20 minutes.

System suitability

System performance: Proceed with 20 μL of the standard solution under the above conditions; adjust the sensitivity so that the peak height of the isomer eluting immediately after the major peak is NLT 10% of the full scale. The height of the valley between the major peak and the isomer peak obtained from the standard solution is NMT 4% of the full scale.

Loss on drying NMT 0.5% (1 g, 105 ℃, constant mass).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.6 g of Fenoterol Hydrobromide, dissolve in 50 mL of water, add 5 mL of dilute nitric acid and 25.0 mL of 0.1 mol/L silver nitrate solution, and titrate with 0.1 mol/L ammonium thiocyanate VS while shaking to mix until the resulting solution exhibits an orange color (indicator: 2 mL of ammonium iron(III) sulfate TS). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L silver nitrate VS
= 38.43 mg of $C_{17}H_{21}NO_4$

Packaging and storage Preserve in light-resistant, well-closed containers.

Fenoterol Hydrobromide Tablets
페노테롤브롬화수소산염 정

Fenoterol Hydrobromide Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of fenoterol hydrobromide ($C_{17}H_{21}NO_4 \cdot HBr$: 384.27).

Method of preparation Prepare as directed under Tablets, with Fenoterol Hydrobromide.

Identification Weigh an amount of Fenoterol Hydrobromide Tablets, equivalent to about 50 mg of fenoterol hydrobromide according to the labeled amount, extract with 5 mL of water, then filter, and use this solution as the test solution. Weigh 50 mg of fenoterol hydrobromide RS, add water to make 5 mL, and use this solution as the standard solution. Perform the test with the test solution and the standard solution as directed under the Thin Layer Chromatography. Spot the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of 2-butanol, formic acid and water (75 : 15 : 10), and air-dry the plate. Spray evenly a diazobenzenesulfonic acid TS on the plate, and heat at 105 ℃ for 10 minutes; the R_f values and colors of the spots from the test solution and the standard solution are the same.

Dissolution Perform the test with 1 tablet of Fenoterol Hydrobromide Tablets at 50 revolutions per minute according to Method 2, using 900 mL of water as the dissolution medium. Take the medium 15 minutes after starting the test, and filter. Discard the first 10 mL of the filtrate, pipet V mL of the subsequent filtrate, add water to make V' mL of a solution containing about 2 μg of fenoterol hydrobromide ($C_{17}H_{21}NO_4 \cdot HBr$) per mL according to the labeled amount, and use this solution as the test solution. Separately, weigh accurately about 20 mg of fenoterol hydrobromide RS, and dissolve in water to make 100 mL. Pipet 1 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 100 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of fenoterol hydrobromide in each solution. The dissolution rate in 15 minutes is NLT 80%.

Dissolution rate (%) of the labeled amount of fenoterol hydrobromide ($C_{17}H_{21}NO_4$)

$$= W_S \times \frac{V'}{V} \times \frac{A_T}{A_S} \times \frac{1}{C} \times 9$$

W_S: Amount (mg) of fenoterol hydrobromide RS
C: Labeled amount (mg) of fenoterol hydrobromide ($C_{17}H_{21}NO_4$) in 1 tablet

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 276 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 ℃.

Mobile phase: A mixture of pH 3.2 buffer solution and acetonitrile (100 : 27).

Flow rate: 1.0 mL/min

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 Fenoterol Hydrobromide Tablets, and powder. Weigh accurately an amount equivalent to about 2.5 mg of fenoterol hydrobromide ($C_{17}H_{21}NO_4$·HBr), add water to make exactly 100 mL, then filter, and use the filtrate as the test solution. Separately, weigh accurately about 25 mg of fenoterol hydrobromide RS, and add water to make exactly 100 mL. Pipet 10 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography, and determine the peak areas, A_T and A_S, of fenoterol hydrobromide in each solution.

Amount (mg) of fenoterol hydrobromide ($C_{17}H_{21}NO_4$·HBr)
$= \text{Amount (mg) of fenoterol hydrobromide RS} \times \frac{A_T}{A_S} \times \frac{1}{10}$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 276 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 ℃.

Mobile phase: A mixture of pH 3.2 buffer solution and acetonitrile (100 : 27).

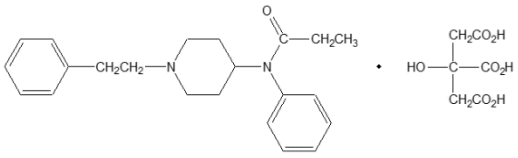
Flow rate: 1.0 mL/min

System suitability

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak areas of fenoterol hydrobromide is NMT 1.0%.

Packaging and storage Preserve in well-closed containers.

Fentanyl Citrate
펜타닐시트르산염



$C_{22}H_{28}N_2O \cdot C_6H_8O_7$: 528.59
2-Hydroxypropane-1,2,3-tricarboxylic acid ; *N*-phenyl-*N*-[1-(2-phenylethyl)piperidin-4-yl]propanamide [*990-73-8*]

Fentanyl Citrate contains NLT 98.0% and NMT 101.0% of fentanyl citrate ($C_{22}H_{28}N_2O \cdot C_6H_8O_7$), calculated on the dried basis.

Description Fentanyl Citrate occurs as white crystals or a crystalline powder.
It is freely soluble in methanol or acetic acid(100), sparingly soluble in water or ethanol(95), and very slightly soluble in ether.

Identification (1) Dissolve 50 mg each of Fentanyl Citrate and fentanyl citrate RS in 10 mL of 0.1 mol/L hydrochloric acid TS and ethanol(95) to make 100 mL. Determine the absorption spectra of these solutions as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Fentanyl Citrate and fentanyl citrate RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) An aqueous solution of Fentanyl Citrate (1 in 100) responds to the Qualitative Analysis (1) for citrate.

Melting point Between 150 and 154 ℃.

pH Dissolve 0.10 g of Fentanyl Citrate in 10 mL of water; the pH of this solution is between 3.0 and 5.0.

Purity (1) ***Heavy metals***—Proceed with 0.5 g of Fentanyl Citrate according to Method 2 and perform the test. Prepare the control solution with 1.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Related substances***—Dissolve 0.10 g of Fentanyl Citrate in 5 mL of methanol, and use this solution as the test solution. Pipet 1 mL of this solution, add methanol to make exactly 100 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel

for thin-layer chromatography. Next, develop the plate with a mixture of 1-butanol, water and acetic acid(31) (3 : 1 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Spray evenly Dragendorff's TS for spraying on the plate; the spots other than the principal spot obtained from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 0.5% (0.2 g, in vacuum, silica gel, 60 ℃, 2 hours).

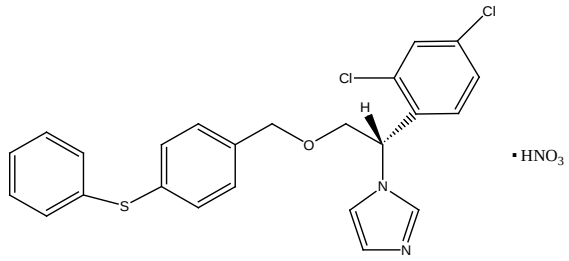
Residue on ignition NMT 0.2% (0.5 g).

Assay Weigh accurately about 75 mg of Fentanyl Citrate, dissolve in 50 mL of acetic acid(100), and titrate with 0.02 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.02 mol/L perchloric acid VS
= 10.572 mg of $C_{22}H_{28}N_2O \cdot C_6H_8O_7$

Packaging and storage Preserve in light-resistant, tight containers.

Fenticonazole Nitrate
펜티코나졸질산염



and enantiomer

$C_{24}H_{20}Cl_2N_2OS \cdot HNO_3$: 518.41
1-{2-(2,4-Dichlorophenyl)-2-[4-(phenylthio) benzyloxy]ethyl}-1*H*-imidazole nitrate [*73151-29-8*]

Fenticonazole Nitrate contains NLT 99.0% and NMT 101.0% of fenticonazole nitrate ($C_{24}H_{20}Cl_2N_2OS \cdot HNO_3$), calculated on the dried basis.

Description Fenticonazole Nitrate occurs as a white crystalline powder.
It is freely soluble in methanol or *N*,*N*-dimethylformamide, sparingly soluble in ethanol(95), and practically insoluble in water.

Identification (1) Determine the absorption spectra of solutions of Fenticonazole Nitrate and fenticonazole nitrate RS in ethanol(95) (1 in 50000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Fenticonazole Nitrate and fenticonazole nitrate RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) Weigh an amount of Fenticonazole Nitrate, equivalent to 1 mg of nitrate ions, add a mixture of 0.1 mL of nitrobenzene and 0.2 mL of sulfuric acid, allow to stand for 5 minutes, and cool with iced water. Add gently 5 mL of water while stirring, add 5 mL of 10 mol/L sodium hydroxide TS and 5 mL of acetone, shake to mix, and allow to stand; the upper layer exhibits an intense purple color.

Optical rotation $[\alpha]_D^{20}$: Between -0.10° and + 0.10° (0.1 g, methanol, 10 mL, 100 mm).

Melting point Between 134 and 137 ℃.

Purity (1) ***Toluene***—Weigh exactly 0.2 g of Fenticonazole Nitrate, transfer into a 10 mL vial, disperse with exactly 5 mL of water, and use this solution as the test solution. Separately, mix 4.0 mg of toluene with water to make 1000 mL. Transfer 5 mL of this solution into a 10 mL vial, and use this solution as the standard solution. Perform the test with the test solution and the standard solution as directed under the Gas Chromatography according to the following conditions. Use a headspace sample injection apparatus. Determine the amount of toluene according to the standard addition method; it is NMT 100 ppm.

Operating conditions
Detector: A flame ionization detector
Column: A tube about 0.32 mm in internal diameter and about 25 m in length, coated with poly(cyanopropyl)(7)phenyl(7)methyl(86)siloxane for gas chromatography with a thickness of 1.2 μm.
Headspace conditions: Equilibrium temperature of 90 ℃, equilibrium time of 1 hour.
Column temperature: 80 ℃
Injection port temperature: 180 ℃
Detector temperature: 220 ℃
Carrier gas: Helium
Split ratio: About 1 : 25.
Column head pressure: 40 kPa
Injection volume: Maintain each liquid at 90 ℃ for 1 hour, and inject 1 mL in the form of vapor into the column.

(2) ***Related substances***—Weigh accurately 25.0 mg of Fenticonazole Nitrate, add the mobile phase to make exactly 25 mL, and use this solution as the test solution. To 1.0 mL of the test solution, add the mobile phase to make exactly 200 mL, and use this solution as the standard solution (1). To 10.0 mL of the standard solution (1), add the mobile phase to make exactly 25 mL, and use this solution as the standard solution (2). Pipet 1.0 mL of the

standard solution (1), add the mobile phase to make exactly 10 mL, and use this solution as the standard solution (3). To 5.0 mL of the test solution, add 5 mg of fenticonazole related substance I RS {(*RS*)-1-[2-(2,4-dichlorophenyl)-2-hydroxyethyl]-3-[4-(phenylsulfanyl)benzyl]imidazolium nitrate}, and dissolve in the mobile phase to make exactly 100 mL. To 2.0 mL of this solution, add 2.0 mL of the mobile phase to make exactly 10 mL, and use this solution as the standard solution (4). Perform the test with 10 μL each of the test solution and the standard solution (1) as directed under the Liquid Chromatography according to the following operating conditions, and determine the areas of each peak according to the automatic integration method; the peak area other than the major peak and nitric acid ion peak (corresponding to the void volume of column) obtained from test solution is NMT the major peak area obtained from the standard solution (2) (0.2%), and the total area of these peaks is NMT the major peak area obtained from standard solution (1) (0.5%). However, exclude any peak having an area smaller than the major peak area obtained from the standard solution (3).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 229 nm).

Column: A stainless steel column, about 4 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 - 10 μm in particle diameter).

Mobile phase: A mixture of acetonitrile and phosphate buffer solution (70 : 30).

Flow rate: 1.0 mL/min

System suitability

Inject 10 μL of the standard solution (2), and adjust the sensitivity so that the peak height of fenticonazole is at least 10% of the full scale of the data collection device. Inject 10 μL each of the standard solution (3) and the standard solution (4) separately. In the chromatogram obtained from the standard solution (4), the resolution between fenticonazole related substance I and fenticonazole is NLT 2, and in the chromatogram obtained from the standard solution (3), a signal-to-noise ratio is NLT 5.

Phosphate buffer solution—Dissolve 3.4 g of potassium dihydrogen phosphate in 900 mL of water, adjust pH with phosphoric acid to 3.0, and add water to make 1000 mL.

Loss on drying NMT 0.5% (1 g, in vacuum, 60 ℃, constant mass).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.45 g of Fenticonazole Nitrate, dissolve with 50 mL of a mixture of 2-butanone and acetic acid(100) (1 : 1), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 1 mol/L perchloric acid VS
= 51.84 mg of $C_{24}H_{20}Cl_2N_2OS \cdot HNO_3$

Packaging and storage Preserve in light-resistant, well-closed containers.

Ferric Hydroxide Polymaltose Complex
폴리말토오스수산화제이철착염

Ferric Hydroxide Polymaltose Complex contains NLT 24.0% and NMT 32.0% of iron (Fe: 55.85).

Description Ferric Hydroxide Polymaltose Complex occurs as a brown amorphous powder and is odorless.
It is soluble in water and insoluble in organic solvents.

Identification (1) ***Ionized iron***—Weigh an amount of Ferric Hydroxide Polymaltose Complex, equivalent to 5 g of iron according to the labeled amount, add 80 mL of water, dissolve at 70 ℃ for 1 hour while shaking, add water to make 100 mL, and filter the solution. Use the filtrate as the test solution. To the solution of 1 mL of the test solution in 4 mL of water, add 1 mL of 2 mol/L ammonia TS, and mix; a brown precipitate does not form.

(2) ***Iron***—Mix with 1 mL of the test solution of (1), 20 mL of water and 5 mL of hydrochloric acid, and heat on a steam bath for 5 minutes. After cooling, neutralize with excess 25% ammonia water, and filter. Wash the produced ferric hydroxide precipitate with water, dissolve the precipitate in a small amount of 2 mol/L hydrochloric acid, and add water to make 20 mL. To this solution, add 1 mL of hydroxylamine hydrochloride TS, allow to stand for 30 minutes, and add *o*-phenanthroline ethanol solution (1 in 50); the resulting solution exhibits an dark red color.

(3) ***Polymaltose***—To 1 mL of the test solution of (1), add 4 mL of water and 0.5 mL of hydrochloric acid, heat on a steam bath for 5 minutes, cool rapidly, add 2 mL of 25% ammonia water and 5 mL of freshly prepared hydrogen sulfide TS, and mix. Remove excess hydrogen sulfide by boiling, cool, and filter. To 5 mL of the filtrate, add 1 mL of hydrochloric acid, heat on a steam bath for 15 minutes, and cool immediately. Add 4 mL of 20% sodium hydroxide solution and 5 mL of Fehling's TS, mix, boil for 1 minute, and cool immediately; a red Cu_2O precipitate forms.

pH Weigh an amount of Ferric Hydroxide Polymaltose Complex, equivalent to 5 g of iron according to the labeled amount, add 80 mL of water, dissolve at 70 ℃ for 1 hour while shaking, and add water to make 100 mL; the pH of the filtrate is between 5.5 and 7.5.

Purity (1) ***Polymaltose***—Between 25.0% and 50.0% Weigh an amount of Ferric Hydroxide Polymaltose Complex, equivalent to 5 g of iron, add 80 mL of water,

dissolve at 70 ℃ for 1 hour while shaking, add water at 20 ℃ to make 100 mL, and filter. To 2.0 mL of this solution, add water to make 100 mL. To 20 mL of this solution, add water to make 100 mL, and use this solution as the test solution. Separately, transfer 0.10 g of the anhydrous glucose into a 100-mL volumetric flask, and add water to make 100 mL. Take 20 mL of this solution, add water to make 100 mL, and use it as the standard solution. Prepare 6 stoppered test tubes, separately add 1 mL of water for 2 test tubes, 1 mL of the test solution for 2 test tubes, and 1 mL of the standard solution for 2 test tubes. Add 10 mg of anthrone solution to each tube, mix well, and close the stopper. After warming on a steam bath for exactly 10 minutes, take it out, and cool. Next, shake for 5 minutes to mix, perform the test as directed under the Ultraviolet-visible Spectroscopy using water as the control solution, and determine the absorbances, A_T and A_S, at the absorbance maximum wavelength of between 600 nm and 605 nm from the test solution and the standard solution.

$$\text{Amount (mg) of polymaltose} = \frac{A_T \times 100\ (mg) \times 162}{A_S \times 180}$$

(2) ***Sodium chloride***—NMT 6.0%. Transfer 10.0 mL of the test solution of (1) into a 100-mL beaker, add 60 mL of water and 0.2 mL of nitric acid, shake well, and titrate with 0.1 mol/L silver nitrate VS using the potentiometric titration. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L silver nitrate VS
= 5.850 mg of NaC1

Loss on drying NMT 5.0% (1 g, in vacuum, 20 ℃, phosphorus pentoxide, 2 hours).

Assay After mixing 10 g of Ferric Hydroxide Polymaltose Complex well, weigh accurately 0.3 g of the mixed drug, transfer into a 200-mL beaker, add 10 mL of hydrochloric acid, and heat on a steam bath for 1 to 2 minutes while shaking to mix. After the solution is completely dissolved, take it out, and allow to stand for 5 minutes. Add 100 mL of water and 10 mL of acetic acid(100), and adjust the pH to between 2.2 and 2.5 with 30% sodium hydroxide solution. Add 2.5 mL of 2% pyrocatechol sodium salt solution as the indicator, titrate with freshly prepared 0.1 mol/L ethylenediaminetetraacetic acid disodium salt VS at between 40 and 50 ℃ until the green color of the solution turns yellow. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L ethylenediaminetetraacetic acid disodium salt VS
= 5.585 mg of Fe

Packaging and storage Preserve in tight containers.

Ferric Hydroxide Polymaltose Complex Solution
폴리말토오스수산화제이철착염 액

Ferric Hydroxide Polymaltose Complex Solution contains NLT 95.0% and NMT 105.0% of the labeled amount of iron (Fe: 55.85) in the ferric hydroxide polymaltose complex.

Method of preparation Prepare as directed under Liquids, with Ferric Hydroxide Polymaltose Complex.

Identification Take 0.25 mL of Ferric Hydroxide Polymaltose Complex Solution, add 1 mL of 4 mol/L sulfuric acid, and heat until it becomes transparent yellow. Add 0.1 mol/L potassium ferrocyanide TS; the resulting solution exhibits a blue color.

pH Between 5.0 and 7.0.

Purity To 0.25 mL of Ferric Hydroxide Polymaltose Complex Solution, add 4 mL of water and 1 mL of 2 mol/L ammonia TS, and shake to mix; a brown precipitate ($Fe(OH)_3$) does not form.

Assay Take 5.0 mL of Ferric Hydroxide Polymaltose Complex Solution, add 10 mL of hydrochloric acid, shake well to mix, and heat until the solution becomes yellow. Add 100 mL of water and 10 mL of acetic acid(100), and adjust the pH to between 2.2 and 2.5 with 30% sodium hydroxide solution. Add 0.2 mL of hydrogen peroxide, immediately add 2.5 mL of 2% pyrocatechol sodium salt solution, and titrate with 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS while maintaining the temperature at 40 to 50 ℃. The endpoint of the titration is when the color of this solution changes from green to yellow. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.05 mol/L ethylenediaminetetraacetic acid disodium salt VS
= 2.7925 mg of Fe

Packaging and storage Preserve in tight containers.

Ferric Hydroxide Polymaltose Complex and Folic Acid Tablets
폴리말토오스수산화제이철착염·폴산 정

Ferric Hydroxide Polymaltose Complex and Folic Acid Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of iron (Fe: 55.85) and NLT 90.0% and NMT 150.0% of folic acid ($C_{19}H_{19}N_7O_6$: 441.40).

Method of preparation Prepare as directed under Tablets, with Ferric Hydroxide Polymaltose Complex and Folic Acid.

Identification (1) ***Ferric hydroxide polymaltose complex*—**Perform the test with Ferric Hydroxide Polymaltose Complex and Folic Acid Tablets as directed under the Analysis for Minerals.

(2) ***Folic acid*—**Perform the test with Ferric Hydroxide Polymaltose Complex and Folic Acid Tablets as directed under the Analysis for Vitamins.

Disintegration Meets the requirements.

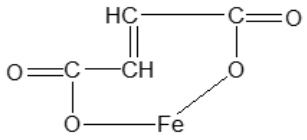
Uniformity of dosage units Meets the requirements.

Assay (1) ***Ferric hydroxide polymaltose complex*—**Weigh accurately the mass of NLT 20 Ferric Hydroxide Polymaltose Complex and Folic Acid Tablets, then powder, and perform the test as directed under the Analysis for Minerals.

(2) ***Folic acid*—**Weigh accurately the mass of NLT 20 Ferric Hydroxide Polymaltose Complex and Folic Acid Tablets, and perform the test as directed under the Analysis for Vitamins.

Packaging and storage Preserve in tight containers.

Ferrous Fumarate
푸마르산철



Ferrous fumarate $C_4H_2FeO_4$: 169.90
Iron(II) (*E*)-but-2-enedioate [*141-01-5*]

Ferrous fumarate, when dried, contains NLT 97.0% and NMT 101.0% of ferrous fumarate ($C_4H_2FeO_4$).

Description Ferrous fumarate occurs as an orange to reddish brown powder and is odorless.
It is slightly soluble in water and very slightly soluble in ethanol(95).
The solubility of Ferrous Fumarate in dilute hydrochloric acid is decreased by separation of fumarate.

Identification (1) Add 25 mL of diluted hydrochloric acid (1 in 2) to 1.5 g of Ferrous fumarate, add water to make 50 mL, and heat until the solution completely dissolves. After cooling, filter using a glass filter, wash the precipitate with diluted hydrochloric acid (3 in 100), and dry at 105 ℃. Determine the infrared spectra of this precipitate and fumarate RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wave numbers.

(2) The filtrate obtained in (1) responds to the Qualitative Analysis for ferrous salt.

Purity (1) ***Sulfate*—**Put 1.0 g of Ferrous Fumarate in a 250-mL beaker, add 100 mL of water, and heat on a steam bath while adding hydrochloric acid dropwise until the solution completely dissolves (about 2 mL of hydrochloric acid is consumed). Filter, if necessary, and add water to the filtrate to make 100 mL. Heat this solution to boiling, add 10 mL of barium chloride TS, heat for 2 hours on a steam bath, put a lid, and allow to stand for 16 hours. If crystals of ferrous fumarate form, dissolve by heating the solution on a steam bath. Filter the solution with filter paper for assay, add ammonium sulfide TS to the filtrate, and wash with warm water until the black precipitate is no longer produced. Transfer the residue into a crucible, previously weighed along with the filter paper, carbonize the filter paper without burning, and ignite the crucible and its contents at 600 ℃ to a constant mass. 1 mg of the residue corresponds to 0.412 mg of sulfate (SO_4) (NMT 0.2%).

(2) ***Arsenic***—Put 2.0 g of Ferrous Fumarate in a beaker and add 10 mL of water and 10 mL of sulfuric acid. Heat the fumaric acid and precipitate completely, cool, add 20 mL of water, and filter in a 50-mL volumetric flask. Wash the precipitate with water, combine the washings in a volumetric flask, and add water to the gauge line to mix. Use 25.0 mL of this solution as the test solution and perform the test. Prepare the control solution with 3.0 mL of arsenic standard solution (NMT 3 ppm).

(3) ***Ferric ion*—**Weigh accurately about 2.0 g of Ferrous Fumarate, put in a 250-mL Erlenmeyer flask with a stopper, add 25 mL of water and 4 mL of hydrochloric acid, and heat on a hot plate until it completely dissolves. Stopper and cool to room temperature. Add 3 g of potassium iodide, stopper, shake to mix, and allow to stand for 5 minutes in the dark. Remove the stopper, add 75 mL of water, then titrate with 0.1 mol/L sodium thiosulfate solution (indicator : 3 mL of starch TS). NMT 7.16 of 0.1 mol/L sodium thiosulfate is consumed (NMT 2.0%).

(4) ***Mercury*—**Proceed with the following procedure using a light-resistant container. Weigh accurately about 1 g of Ferrous Fumarate, add 30 mL of diluted nitric acid (1 in 10), and dissolve while heating on a steam bath. Cool quickly in an ice bath and filter using a filter washed with pre-diluted nitric acid (1 in 10) and water. To the filtrate, add 20 mL of sodium citrate solution (1 in 4) and 1 mL of hydroxylamine hydrochloride TS, and use this solution as the test solution. Separately, prepare the control solution with 3.0 mL of mercury standard solution, 30 mL of diluted nitric acid (1 in 4), 5 mL of sodium citrate solution (1 in 4) and 1 mL of hydroxylamine hydrochloride. Add ammonia TS to the control solution to adjust the pH to 1.8, and adjust the pH of the test solution to 1.8 with sulfuric acid, and transfer each to a separatory funnel. Perform the test with the test solution and the control solution as directed below. Extract 2 times using

5 mL of dithizone solution for extraction and then 5 mL of chloroform, and transfer the chloroform extract to another separatory funnel. To the extract, add 10 mL of diluted hydrochloric acid (1 in 2), shake to mix, allow to stand, and then discard the chloroform layer. Wash the acid-extract with 3 mL of chloroform and discard the washings. Add 0.1 mL of ethylenediaminetetraacetic acid disodium salt solution (1 in 50) and 2 mL of 6 mol/L acetic acid, mix, and slowly add 5 mL of ammonia TS. Close the lid of the separatory funnel, cool it under running cold water, open the lid, and transfer the contents into a beaker. Adjust the pH of the test solution and the control solution to 1.8 in the same way as the above, and transfer them to separatory funnels again. Add 5.0 mL of diluted dithizone solution for extraction, shake vigorously to mix, and allow to stand. Compare the color of the chloroform layers of the test solution and the control solution using a diluted dithizone solution for extraction as a control solution; the color obtained from the test solution is not more intense than that from the control solution (NMT 3 ppm).

Mercury standard stock solution—Transfer 135.4 mg of mercury(II) chloride to a 100-mL volumetric flask, dissolve in 0.5 mol/L sulfuric acid TS, fill to the gauge line, and mix. This solution contains 0.1 g of mercury (Hg) in 100 mL.

Mercury standard solution—Take 1.0 mL of the mercury standard stock solution immediately before use, put in a 1000-mL volumetric flask, add 0.5 mol/L sulfuric acid TS, fill up to the gauge line, and mix. 1 mL of this solution contains 1 μg of mercury (Hg).

Diluted dithizone solution for extraction—Dilute 5 mL of dithizone solution for extraction with 25 mL of chloroform before use.

(5) ***Lead***—Put 1.0 g of Ferrous Fumarate in a 50-mL beaker, add 6 mL of nitric acid and 10 mL of perchloric acid, cover with a watch glass, and heat to evaporate until completely dry. Cool, then dissolve the residue by adding 10 mL of 9 mol/L hydrochloric acid, and then use about 10 mL of water to transfer to a 50-mL volumetric flask. Add 20 mL of ascorbic acid-sodium iodide TS and 5.0 mL of trioctylphosphine oxide solution, shake for 30 seconds to mix, and allow to stand to separate. Then, add water so that the organic solvent layer reaches the neck portion of the flask, shake to mix again, and allow to stand to separate. Use the organic solvent layer as the test solution. Separately, take 5mL of lead standard solution, and add water to make exactly 100 mL. Pipet 2 mL of this solution and put in a 50-mL beaker. To this beaker and a beaker for blank test, add 6 mL of nitric acid and 10 mL of perchloric acid, and heat to evaporate to dryness. Cool, dissolve the residue in 10 mL of 9 mol/L hydrochloric acid, and use about 10 mL of water to transfer to 50-mL flasks, respectively. To each flask, add 20 mL of ascorbic acid-sodium iodide TS and 5.0 mL of trioctylphosphine oxide solution, shake for 30 seconds to mix, and allow to stand to separate. Then add water so that the organic solvent layer reaches the neck portion of the flask, shake to mix again, allow to stand to separate. Use the organic solvent layers as the standard solution(2.0 μg/mL) and the blank test solution, respectively. Perform the test with the test solution and the standard solution as directed under Atomic Absorption Spectroscopy according to the following conditions; the absorbance of the test solution is not greater than that of the standard solution (NMT 0.001%). Use 4-methyl-2-pentanone to adjust absorbance to 0; the absorbance of the blank test solution is NMT 20% of the difference between the absorbance of the standard solution and the absorbance of the blank test solution.

Gas: Air–acetylene
Lamp: Lead hollow-cathode lamp
Wavelength: 283.3 nm

Trioctylphosphine oxdie solution—Dissolve 5.0 g of trioctylphosphine oxide in 4-methyl-2-pentanone to make 100 mL.

(6) ***Cadmium***—Weigh 2.0 g of Ferrous Fumarate and dissolve in 10 mL of hydrochloric acid and 80 mL of water, and heat gently as needed. After cooling, filter as needed, add water to make 100 mL, and use this solution as the test solution. Separately, pipet 2.0 mL of cadmium standard solution, add hydrochloric acid to make exactly 10 mL, and use this solution as the standard solution. Perform the test with the test solution and the standard solutions as directed under Atomic Absorption Spectroscopy according to the following conditions; the absorbance of the test solution is NMT that of the standard solution (NMT 10 ppm).

Gas: Air–acetylene
Lamp: Cadmium hollow-cathode lamp
Wavelength: 228.8 nm

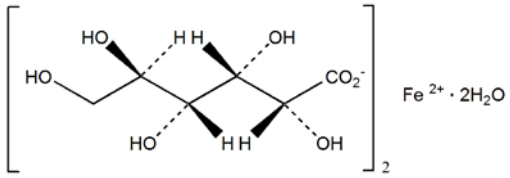
Loss on drying NMT 1.5% (1 g, 105 ℃, 16 hours).

Assay Weigh accurately about 0.15 g of Ferrous Fumarate, previously dried, add 7.5 mL of dilute sulfuric acid, dissolve by heating and cool, then add 25 mL of water, and immediately titrate with 0.1 mol/L cerium sulfate VS (indicator : 0.1 mL of ferroin TS). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L cerium sulfate VS
= 16.990 mg of $C_4H_2FeO_4$

Packaging and storage Preserve in well-closed containers.

Ferrous Gluconate Hydrate
글루콘산제일철수화물



Ferrous Gluconate $C_{12}H_{22}FeO_{14}\cdot 2H_2O$: 482.17
Iron(2+);(2*R*,3*S*,4*R*,5*R*)-2,3,4,5,6-pentahydroxyhexanoate; dihydrate [*6047-12-7*]

Ferrous Gluconate Hydrate contains NLT 97.0% and NMT 102.0% of ferrous gluconate ($C_{12}H_{22}FeO_{14}$: 446.14), calculated on the dried basis.

Description Ferrous Gluconate Hydrate occurs as a yellowish gray or light yellowish green fine powder or granule with a faint odor of burning sugar.
1.0 g of Ferrous Gluconate Hydrate dissolves in 10 mL of warm water and is practically insoluble in ethanol(95).
Its aqueous solution (1 in 20) is acidic.

Identification (1) Weigh 10 mg of Ferrous Gluconate Hydrate and dissolve in 10 mL of water to use it as the test solution. If necessary, warm it in a 60 °C water bath. Separately, dissolve 10 mg of ferrous gluconate hydrate RS in 10 mL of water and use this solution as the standard solution. Perform the test with these solutions as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on a thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of ethanol(95), water. ammonia water(28) and ethyl acetate (50 : 30 : 10 : 10) as a developing solvent to a distance of about 15 cm, dry the plate at 110 ℃ for 20 minutes, and cool it. Dissolve 2.5 g of ammonium heptamolybdate tetrahydrate in 50 mL of 1 mol/L sulfuric acid, add 1.0 g of cerium sulfate, shake to dissolve, and add 1 mol/L sulfuric acid to make 100 mL. Spray this solution evenly on the plate and heat at 110 ° C for 10 minutes; the color and R_f values of the spots obtained from the test and standard solutions are the same.

(2) Add potassium hexacyanoferrate(III) TS to the aqueous solution of Ferrous Gluconate Hydrate (1 in 200); a dark blue precipitate is formed.

Purity (1) ***Chloride***—Proceed with 1.0 g of Ferrous Gluconate Hydrate and perform the test. Prepare the control solution with 1.0 mL of 0.02 mol/L hydrochloric acid (NMT 0.07%).

(2) ***Sulfate***—Proceed with 1.0 g of Ferrous Gluconate Hydrate and perform the test. Prepare the control solution with 1.0 mL of 0.01 mol/L sulfuric acid (NMT 0.1%).

(3) ***Oxalic acid***—Dissolve 1.0 g of Ferrous Gluconate Hydrate in 10 mL of water, add 2 mL of hydrochloric acid, extract each with 50 mL and 20 mL of ether, and combine all the extracts. To the combined extracts, add 10 mL of water and evaporate ether on a steam bath. Add 1 drop of 6 mol/L acetic acid and 1 mL of calcium acetate hydrate solution (1 in 20); the solution does not become turbid within 5 minutes.

(4) ***Lead***—Weigh 1.0 g of Ferrous Gluconate Hydrate, put it in 50-mL volumetric flask, add 10 mL of 9 mol/L hydrochloric acid, about 10 mL of water, 20 mL of ascorbic acid-sodium iodide TS, and 5 mL of 4-methyl-2-pentanone solution of trioctylphosphine oxide (5 in 100), shake for 30 seconds, and allow to stand until the layers separate. Next, add water to the neck of the volumetric flask, shake it again, and allow it to stand. Take the organic solvent layer and use it as the test solution. Separately, put exactly 5.0 mL of lead nitrate standard stock solution into a volumetric flask, dilute with water to make 100 mL, transfer exactly 2.0 mL of this solution into a volumetric flask, and then prepare the standard solution in the same way as the test solution. Perform the test with the test solution and the standard solution as directed under the Atomic Absorption Spectroscopy according to the following conditions; the absorbance of the test solution is less than that of the standard solution (NMT 0.001%).

Gas: Air–acetylene
Lamp: Lead hollow-cathode lamp
Wavelength: 283.8 nm

(5) ***Mercury***—Proceed with the following procedure using a light-resistant container. Weigh accurately about 1 g of Ferrous Gluconate Hydrate, add 30 mL of diluted nitric acid (1 in 10), and dissolve while heating on a steam bath. Cool quickly in an ice bath and filter using a filter washed with pre-diluted nitric acid (1 in 10) and water. To the filtrate, add 20 mL of sodium citrate solution (1 in 4) and 1 mL of hydroxylamine hydrochloride TS and use this solution as the test solution. Separately, prepare the control solution with 3.0 mL of mercury standard solution, 30 mL of diluted nitric acid (1 in 4), 5 mL of sodium citrate solution (1 in 4) and 1 mL of hydroxylamine hydrochloride. Put the test solution and the control solution each into a separatory funnel, adjust the pH to 1.8 using sulfuric acid, extract twice with 5 mL of dithizone solution for extraction and then with 5 mL of chloroform, and transfer the chloroform extract to another separatory funnel. To the extract, add 10 mL of diluted hydrochloric acid (1 in 2), shake to mix, allow to stand, and then discard the chloroform layer. Wash the acid-extract with 3 mL of chloroform and discard the solution used for washing. Add 0.1 mL of ethylenediaminetetraacetic acid disodium salt solution (1 in 50) and 2 mL of 6 mol/L acetic acid, mix, and slowly add 5 mL of ammonia TS. Close the lid of the separatory funnel, cool it under running cold water, open the lid, and transfer the contents into a beaker. Adjust the pH of the test solution and the control solution to 1.8 in the same way as the above, and transfer them to separatory funnels again. Add 5.0 mL of diluted dithizone solution for extraction, shake

vigorously, and allow to stand. Compare the color of the chloroform layers of the test solution and the control solution using a diluted dithizone solution for extraction as a control solution; the color obtained from the test solution is not more intense than that from the control solution (NMT 3 ppm).

Mercury standard stock solution—Transfer 135.4 mg of mercury(II) chloride into a 100-mL volumetric flask, dissolve in 0.5 mol/L sulfuric acid TS, fill up to the gauge line, and mix. This solution contains 0.1 g of mercury (Hg) in 100 mL.

Mercury standard solution—Before use, take 1.0 mL of the mercury standard stock solution, put it in a 1000-mL volumetric flask, add 0.5 mol/L sulfuric acid TS, fill up to the gauge line, and mix. 1 mL of this solution contains 1 μg of mercury (Hg).

Before using diluted dithizone solution for extraction, dilute 5 mL of dithizone solution for extraction with 25 mL of chloroform.

(6) ***Ferric ion***—Weigh accurately about 5 g of Ferrous Gluconate Hydrate and dissolve it in a mixture of 100 mL of water and 10 mL of hydrochloric acid, and add 3.0 g of potassium iodide. Shake well to mix and allow to stand in the dark place for 5 minutes. Then, titrate any free iodine with 0.1 mol/L sodium thiosulfate VS (indicator: 3 mL of starch TS). Perform a blank test in the same manner and make any necessary correction (NMT 2.0%).

Each mL of 0.1 mol/L sodium thiosulfate VS
= 5.585 mg of Fe^{+3}

(7) ***Arsenic***—Weigh 1.0 g of Ferrous Gluconate Hydrate, put it in 100 mL round bottom flask, add 40 mL of 4.5 mol/L sulfuric acid and 2 mL of potassium bromide solution (3 in 10), and connect it to a distillation device equipped with an ice water cooler. Heat the test sample to dissolve and start distillation. Perform the test using 25 mL of the distillate as the test solution (NMT 3 ppm).

(8) ***Reducing sugars***—Weigh 0.5 g of Ferrous Gluconate Hydrate, dissolve it in 10 mL of water, slightly warm it up, and add 1 mL of ammonia TS to make it alkaline. Precipitate iron through hydrogen sulfide in this solution, allow to stand for 30 minutes, filter, and wash the precipitate twice with 5 mL of water. Then, combine the filtrate and the solution used for washing, make the combined solution acidic with hydrochloric acid, and add another 2 mL of dilute hydrochloric acid. Boil this solution until the steam does not turn the lead acetate paper black, and if necessary, boil further to concentrate to about 10 mL. After cooling, add 5 mL of sodium carbonate TS and 20 mL of water, filter, wash the residue with water, combine the filtrate and the solution used for washing, add water to make the combined solution to exactly 100 mL. To 5mL of this solution, add 2 mL of Ferring's TS, and boil for 1 minute; a red precipitate is not formed within 1 minute.

Loss on drying Between 6.5% and 10.0% (1 g, 105 ℃, 16 hours).

Assay Weigh accurately about 1.5 g of Ferrous Gluconate Hydrate, put it in a 300-mL Erlenmeyer flask, and dissolve in a mixture of 75 mL of water and 15 mL of dilute sulfuric acid. Add 0.25 g of zinc powder, stopper the flask with a Bunsen valve, and allow to stand at room temperature for 20 minutes or until the solution becomes colorless. Filter the solution through a filtering crucible (Gooch crucible) containing an asbestos mat coated with a thin layer of zinc dust, and wash the crucible and the contents with 10 mL of dilute sulfuric acid and then with 10 mL of water. To the filtrate, add 1,10-phenanthroline monohydrate TS, and immediately titrate the filtrate with 0.1 mol/L cerium sulfate VS in a suction flask. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L cerium sulfate solution
= 44.61 mg of $C_{12}H_{22}FeO_{14}$

Packaging and storage Preserve in tight containers.

Ferrous Gluconate Tablets
글루콘산제일철 정

Ferrous Gluconate Tablets contains NLT 93.0% and NMT 107.0% of the labeled amount of ferrous gluconate hydrate ($C_{12}H_{22}FeO_{14}\cdot 2H_2O$: 482.17).

Method of preparation Prepare Ferrous Gluconate Tablets as directed under Tablets, with Ferrous Gluconate Hydrate.

Identification Powder Ferrous Gluconate Tablets, weigh an appropriate amount of the powder, equivalent to 1 g of ferrous gluconate hydrate, according to the labeled amount, dissolve in 100 mL of water, and filter. Take an appropriate amount of the filtrate, add water, dilute it to the corresponding concentration, and perform the test as directed under the Identification for Ferrous Gluconate Hydrate.

Dissolution Perform the test with 1 tablet of Ferrous Gluconate Tablets at 150 revolutions per minute according to Method 1 under the dissolution using 900 mL of dissolution medium 1. Take the dissolved solution 80 minutes after the start of the dissolution, filter it, and use the filtrate as the test solution. If necessary, dilute the test solution to a suitable concentration using the dissolution medium. Separately, weigh accurately an appropriate amount of ferrous gluconate hydrate RS, dissolve in the

dissolution medium, and prepare the standard solution containing the same concentration of iron as the test solution. Determine the absorbances of the test solution and the standard solution according to the following conditions, as directed under the Atomic Absorption Spectroscopy, and calculate the content of iron using the calibration curve obtained from the absorbance of the standard solution.

Gas: Air–acetylene
Lamp: Iron hollow-cathode lamp
Wavelength: 248.3 nm

It meets the requirements when the dissolution rate of Ferrous Gluconate Tablets in 80 minutes is NLT 80%.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately NLT 20 tablet of Ferrous Gluconate Tablets and powder them. Weigh accurately an appropriate amount of the powder equivalent to about 1.5 g of ferrous gluconate hydrate ($C_{12}H_{22}FeO_{14}\cdot 2H_2O$), put in a 300-mL Erlenmeyer flask, dissolve in a mixture of 75 mL of water and 15 mL of dilute sulfuric acid, and hereinafter proceed as directed under the Assay of Ferrous Gluconate Hydrate.

Each mL of 0.1 mol/L cerium sulfate VS
= 48.22 mg of $C_{12}H_{22}FeO_{14}\cdot 2H_2O$

Packaging and storage Preserve in tight containers.

Ferrous Sulfate Hydrate
황산철수화물

Ferrous Sulfate $FeSO_4\cdot 7H_2O$: 278.02
Iron(2+) sulfate heptahydrate [*7782-63-0*]

Ferrous Sulfate Hydrate contains NLT 98.0% and NMT 104.0% of ferrous sulfate hydrate ($FeSO_4\cdot 7H_2O$).

Description Ferrous Sulfate Hydrate occurs as pale green crystals or a crystalline powder. It is odorless and astringent.
It is freely soluble in water and practically insoluble in ether.
It easily effloresces in dry air, and its crystal surface changes to yellowish brown in the humid air.

Identification An aqueous solution of Ferrous Sulfate Hydrate (1 in 10) responds to the Qualitative Analysis for ferrous salt and sulfate.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Ferrous Sulfate Hydrate in 20 mL of water and 1 mL of dilute sulfuric acid; the resulting solution is clear.

(2) ***Acid***—To 5.0 g of powdered Ferrous Sulfate Hydrate, add 50 mL of ethanol(95), shake for 2 minutes, and filter. To 25 mL of the filtrate, add 50 mL of water, 3 drops of bromothymol blue TS, and 0.5 mL of dilute sodium hydroxide TS; the resulting solution exhibits a blue color.

(3) ***Mercury***—Perform the test using a light-resistant container. Weigh accurately about 1 g of Ferrous Sulfate Hydrate, add 30 mL of diluted nitric acid (1 in 10), and dissolve while heating on a steam bath. Cool quickly in an ice bath and filter using a filter washed with pre-diluted nitric acid (1 in 10) and water. To the filtrate, add 20 mL of sodium citrate solution (1 in 4) and 1 mL of hydroxylamine hydrochloride TS, and use this solution as the test solution. Separately, prepare the control solution with 3.0 mL of mercury standard solution, 30 mL of diluted nitric acid (1 in 4), 5 mL of sodium citrate solution (1 in 4), and 1 mL of hydroxylamine hydrochloride. To the control solution, add ammonia TS to adjust the pH to 1.8. To the test solution, add sulfuric acid to adjust the pH to 1.8. Transfer each solution into two separation funnels. Perform the test with the test solution and the control solution as follows. Extract 2 times each with 5 mL of extracting dithizone solution and 5 mL of chloroform, transfer chloroform extract into another separation funnel. To the extract, add 10 mL of diluted hydrochloric acid (1 in 2), shake to mix, allow to stand, and then discard the chloroform layer. Wash the acid extract with 3 mL of chloroform and discard the solution used for washing. Add 0.1 mL of ethylenediaminetetraacetic acid disodium salt solution (1 in 50) and 2 mL of 6 mol/L acetic acid, mix, and slowly add 5 mL of ammonia TS. Close the lid of the separatory funnel, cool it under running cold water, open the lid, and transfer the contents into a beaker. Adjust the pH of the test solution and the control solution to 1.8 in the same way as the above, and transfer them to separatory funnels again. Add 5.0 mL of diluted dithizone solution for extraction, shake vigorously, and allow to stand. Compare the color of the chloroform layers of the test solution and the control solution using a diluted dithizone solution for extraction as a control solution; the color obtained from the test solution is not more intense than that from the control solution (NMT 3 ppm).

Mercury standard stock solution—Transfer 135.4 mg of mercury(II) chloride into a 100-mL volumetric flask, dissolve in 0.5 mol/L sulfuric acid TS, fill up to the gauge line, and mix. This solution contains 0.1 g of mercury (Hg) in 100 mL.

Mercury standard solution—Before use, take 1.0 mL of the mercury standard stock solution, transfer into a 1000-mL volumetric flask, add 0.5 mol/L sulfuric acid TS, fill up to the gauge line, and mix. 1 mL of this solution contains 1 μg of mercury (Hg).

Diluted dithizone solution for extraction—Before use, dilute 5 mL of dithizone solution for extraction with 25 mL of chloroform.

(4) ***Lead***—Transfer about 1.0 g of Ferrous Sulfate

Hydrate into a 50-mL volumetric flask, add 10 mL of 9 mol/L hydrochloric acid, about 10 mL of water, 20 mL of ascorbic acid-sodium iodide TS, and 5 mL of a solution of 4-methyl-2-pentanone solution in trioctylphosphine oxide (5 in 100), shake for 30 seconds, and allow to stand until the layers separate. Next, add water to the neck of the volumetric flask, shake it again, and allow to stand. Take the organic solvent layer and use this solution as the test solution. Separately, transfer exactly 5.0 mL of lead nitrate standard stock solution into a volumetric flask, dilute with water to make 100 mL, transfer exactly 2.0 mL of this solution into a volumetric flask, and proceed in the same manner as the test solution. Use this solution as the standard solution. Determine the absorbances of the test solution and the standard solution according to the following conditions, as directed under Ultraviolet-visible Spectrophotometry; the absorbance of the solution obtained from the test solution is not greater than that from the standard solution.

Gas: Air–acetylene
Lamp: Lead hollow-cathode lamp
Wavelength: 283.8 nm

(5) ***Arsenic***—Prepare the test solution with 1.0 g of Ferrous Sulfate Hydrate, according to Method 1, and perform the test (NMT 2 ppm).

Assay Weigh accurately about 0.7 g of Ferrous Sulfate Hydrate, add 20 mL of water, 20 mL of dilute sulfuric acid TS, and 2 mL of phosphoric acid, and titrate immediately with 0.02 mol/L potassium permanganate VS.

Each mL of 0.02 mol/L potassium permanganate VS
= 27.80 mg of $FeSO_4 \cdot 7H_2O$

Packaging and storage Preserve in tight containers.

Dried Ferrous Sulfate, Folic Acid, Cyanocobalamin and DL-Serine Capsules
건조황산제일철·폴산·시아노코발라민·DL-세린 캡슐

Dried Ferrous Sulfate, Folic Acid, Cyanocobalamin and DL-Serine Capsules contain ferrous sulfate ($FeSO_4$: 151.90) equivalent to NLT 90.0% and NMT 110.0% of the labeled amount, folic acid ($C_{19}H_{19}N_7O_6$: 441.40) and cyanocobalamin ($C_{63}N_{88}Co_{14}O_{14}P$: 1355.37) equivalent to NLT 90.0% and NMT 150.0% of the labeled amount, and DL-serine ($C_3H_7NO_3$: 105.10) NLT 90.0% and NMT 130.0% of the labeled amount.

Method of preparation Prepare as directed under Capsules, with Dried Ferrous Sulfate, Folic Acid, Cyanocobalamin and DL-Serine.

Identification (1) ***Ferrous sulfate***—Weigh an amount of the contents of Dried Ferrous Sulfate, Folic Acid, Cyanocobalamin and DL-Serine Capsules, equivalent to 0.25 g of ferrous sulfate according to the labeled amount, add water and hydrochloric acid to acidify, and add water again to make 50 mL; the solution responds to the Qualitative Analysis for ferrous salt and sulfate.

(2) ***Folic acid***—Perform the test with the contents of 5 capsules of Dried Ferrous Sulfate, Folic Acid, Cyanocobalamin and DL-Serine Capsules as directed under the Analysis for Vitamins.

(3) ***Cyanocobalamin***—Perform the test with the contents of 5 capsules of Dried Ferrous Sulfate, Folic Acid, Cyanocobalamin and DL-Serine Capsules as directed under the Analysis for Vitamins.

(4) ***DL-serine***—Add the contents of 5 capsules of Dried Ferrous Sulfate, Folic Acid, Cyanocobalamin and DL-Serine Capsules to a G4 glass filter, and wash several times with petroleum ether until the fat of the residue is completely removed. Carefully dry the residue at 65 ℃, dissolve in 50 mL of water, and use this solution as the test solution. Separately, dissolve 0.13 g of DL-serine RS in 100 mL of water, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on a plate made of silica gel with fluorescence indicator for thin-layer chromatography. Next, develop the plate with a mixture of methanol and water (70 : 30) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Spray ninhydrin-ethanol solution evenly on the plate, and heat at 100 ℃ for 10 minutes; the R_f values of the spots obtained from the test and standard solutions are the same.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay (1) ***Ferrous sulfate***—Weigh accurately the mass of the contents of NLT 20 capsules of Dried Ferrous Sulfate, Folic Acid, Cyanocobalamin and DL-Serine Capsules. Weigh accurately about 0.4 g of ferrous sulfate ($FeSO_4$), dissolve in a mixture of 20 mL of dilute sulfuric acid and 80 mL of freshly boiled and cooled water, and filter. Wash the beaker and the residue on the filter paper with a small amount of the mixture of 20 mL of dilute sulfuric acid and 80 mL of freshly boiled and cooled water, combine the washings with the filtrate, and immediately titrate with 0.1 mol/L cerium sulfate VS (indicator: *o*-Phenanthroline TS). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L cerium sulfate VS
= 15.190 mg of $FeSO_4$

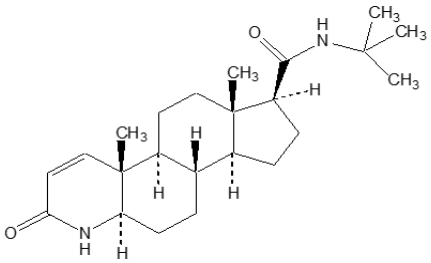
(2) ***Folic acid and cyanocobalamin***—Weigh accurately the mass of the contents of NLT 20 tablets of Dried Ferrous Sulfate, Folic Acid, Cyanocobalamin and DL-

Serine Capsules and perform the test as directed under the Analysis for Vitamins.

(3) ***DL-serine*—**Weigh accurately the mass of the contents of NLT 20 tablets of Dried Ferrous Sulfate, Folic Acid, Cyanocobalamin and DL-Serine Capsules and perform the test as directed under the Identification and Assay for Amino Acids.

Packaging and storage Preserve in well-closed containers.

Finasteride
피나스테리드



Finasteride $C_{23}H_{36}N_2O_2$: 372.54
(1*S*,3a*S*,3b*S*,5a*R*,9a*R*,9b*S*,11a*S*)-*N*-*tert*-Butyl-9a, 11a-dimethyl-7-oxo-1,2,3,3a,3b,4,5,5a,6,9b,10,11-dodecahydroindeno[5,4-f]quinoline-1-carboxamide
[*98319-26-7*]

Finasteride contains NLT 98.5% and NMT 101.0% of finasteride ($C_{23}H_{36}N_2O_2$: 372.55), calculated on the anhydrous basis.

Description Finasteride occurs as a white or grayish white crystalline solid.
It is freely soluble in ethanol(95) or chloroform, and very slightly soluble in water.

Melting point—About 257 °C.

Identification (1) Determine the infrared spectra of Finasteride and finasteride RS, as directed in the paste method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

Optical rotation $[\alpha]_{405\text{nm}}^{25}$: Between -56.0° and -60.0° (0.1 g calculated on the anhydrous basis, methanol, 10 mL, 100 mm).

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Finasteride according to Method 2 and perform the test. Prepare the control solution with 1.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Related substances*—**Weigh accurately 0.1 g of Finasteride, dissolve in a mixture of acetonitrile and water (1 : 1) to make exactly 100 mL, and use this solution as the test solution. Perform the test with 15 μL of the test solution as directed under the Liquid Chromatography according to the following conditions, determine the peak areas according to the automatic integration method, and calculate the amount of each related substance; it is NMT 0.5%, and total amount of all related substances is NMT 1.0%.

$$\text{Content (\%) of each related substance} = 100 \times \frac{A_\text{i}}{A_\text{S}}$$

A_i: Peak area of each related substance
A_S: Total area of peaks obtained from the test solution

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 210 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (4 μm in particle diameter).

Mobile phase: A mixture of water, tetrahydrofuran and acetonitrile (8 : 1 : 1).

Column temperature: A constant temperature of about 60 °C.

Flow rate: About 1.5 mL/min.

System suitability

System performance: Weight 10 mg of finasteride TS, dissolve in a mixture of water and acetonitrile (1 : 1) to make 10 mL. Proceed with 15 μL of this solution according to the above conditions; the number of theoretical plates and the symmetry factor of the peak of finasteride are NLT 10000 plates and NMT 1.3, respectively.

Water NMT 0.3% (1 g, volumetric titration, direct titration).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 20 mg each of Finasteride and finasteride RS, dissolve in a mixture of water and acetonitrile (1 in 1) to make exactly 100 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas of finasteride, A_T and A_S, from each solution.

$$\text{Amount (mg) of finasteride } (C_{23}H_{36}N_2O_2) = \text{Amount (mg) of finasteride RS} \times \frac{A_\text{T}}{A_\text{S}}$$

Operating conditions

Detector: An ultraviolet absorption photometer

(wavelength: 215 nm).

Column: A stainless steel column about 3.0 mm in internal diameter and 30 cm in length, packed with octylsilyl silica gel for liquid chromatography (3 μm in particle diameter).

Mobile phase: A mixture of water and tetrahydrofuran (4 : 1).

Flow rate: About 3 mL/min.

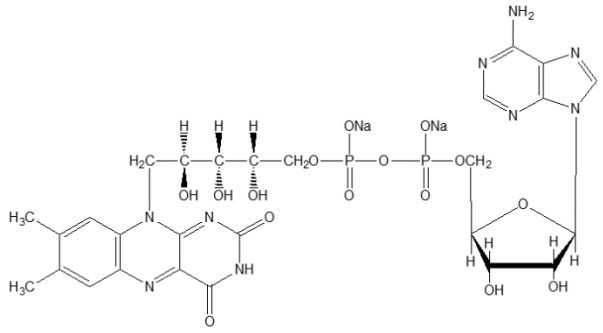
System suitability

System performance: Proceed with 10 μL of the standard solution according to the above conditions; the number of theoretical plates and the symmetry factor of the peak of finasteride are NLT 1800 plates and NMT 1.3, respectively.

System repeatability: Repeat the test 5 times with 10 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Flavin Adenine Dinucleotide Sodium
플라빈아데닌디뉴클레오티드나트륨



Flavin Adenine Dinucleotide Sodium

$C_{27}H_{31}N_9Na_2O_{15}P_2$: 829.51

Disodium adenosine 5'-(3-{D-ribo-5-[7,8-dimethyl-2,4-dioxo-3,4-dihydrobenzo[g]pteridin-10(2*H*)-yl]-2,3,4-trihydroxypentyl} dihydrogen diphosphate) [*84366-81-4*]

Flavin Adenine Dinucleotide Sodium contains NLT 93.0% and NMT 101.% of flavin adenine dinucleotide sodium ($C_{27}H_{31}N_9Na_2O_{15}P_2$), calculated on the anhydrous basis.

Description Flavin Adenine Dinucleotide Sodium occurs as an orange yellow to pale yellowish brown powder. It is odorless or has a slightly characteristic odor and has a slightly bitter taste.

It is freely soluble in water and practically insoluble in methanol, ethanol(95), ethylene glycol or ether.

It is hygroscopic.

It is decomposed by light.

Identification (1) An aqueous solution of Flavin Adenine Dinucleotide Sodium (1 in 100000) is pale yellowish green and has an intense yellowish green fluorescence. To 5 mL of the solution, add 20mg of sodium hydrosulfite; the color and fluorescence of the solution disappear, but reappear slowly upon shaking the mixture in air. This fluorescence disappears upon the addition of dilute hydrochloric acid or sodium hydroxide TS dropwise.

(2) Determine the infrared absorption spectrum of Flavin Adenine Dinucleotide Sodium and flavin adenine dinucleotide sodium RS as directed in the potassium bromide disk method under Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Take 0.1g of Flavin Adenine Dinucleotide Sodium, add 10 mL of nitric acid, evaporate on a steam bath to dryness, and ignite. Boil the residue with 10 mL of diluted nitric acid (1 in 50) for 5 minutes. Cool, then neutralize with ammonia TS and filter as needed; the solution responds to the Qualitative Analysis for sodium salt and Qualitative Analysis (1) and (3) for phosphate.

Optical rotation $[\alpha]_D^{20}$: Between -21.0° and -25.5° (0.3g calculated on the anhydrous basis, water, 20 mL, 100 mm).

pH Dissolve 1.0 g of Flavin Adenine Dinucleotide Sodium in 100 mL of water; the pH of the solution is between 5.5 and 6.5.

Purity (1) ***Clarity and color of solution*—**Dissolve 0.20 g of Flavin Adenine Dinucleotide Sodium in 10 mL of water; the resulting solution is clear and yellow.

(2) ***Free phosphoric acid***—Weigh accurately about 20 mg of Flavin Adenine Dinucleotide Sodium, dissolve in 10 mL of water, and use this solution as the test solution. Separately, pipet 2 mL of phosphoric acid RS, add 10 mL of water, and use this solution as the standard solution. Add 2 mL of diluted perchloric acid (100 in 117) to each of the test solution and the standard solution, add 1 mL of ammonium molybdate TS and 2 mL of 2,4-diaminophenol hydrochloride TS, shake to mix, add water to make exactly 25 mL, and allow to stand for 30 minutes at 20 ± 1 ℃. With these solutions and the control solution prepared with 2 mL of water in the same way, perform the test according to Ultraviolet-visible Spectroscopy. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at wavelength 730 nm; the amount of free phosphoric acid is NMT 0.25%.

$$\text{Content (\%) of free phosphoric acid } (H_3PO_4) = \frac{A_T}{A_S} \times \frac{1}{W} \times 5.16$$

W: Amount (mg) of Riboflavin Sodium Phosphate calculated on the anhydrous basis

(3) ***Heavy metals***—Weigh 1.0 g of Flavin Adenine Dinucleotide Sodium according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead

standard solution (NMT 20 ppm).

(4) ***Arsenic***—Proceed with 2.0g of Flavin Adenine Dinucleotide Sodium according to Method 3 and perform the test (NMT 1 ppm).

(5) ***Related substances*—**Dissolve about 0.10 g of Flavin Adenine Dinucleotide Sodium in 200 mL of the mobile phase and use this solution as the test solution. Perform the test with 20 μL of the test solution as directed under the Liquid Chromatography according to the following conditions. Measure the peak area A of flavin adenine dinucleotide sodium and the total area S of the other peaks; S/(A + S) is NMT 0.10.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 260 nm).

Follow the operating conditions under Assay 1) Procedure (B) for the column, column temperature, mobile phase, flow rate and time span of measurement.

System suitability

Test system performance as directed in System suitability under Assay 1) Procedure B).

Test for required detectability: Pipet 2 mL of the test solution, add the mobile phase to make exactly 20 mL, and use this solution as the system suitability solution. Confirm that the peak area of flavin adenine dinucleotide sodium obtained from 20 μL of this solution is equivalent to between 8% and 12% of the peak area of flavin adenine dinucleotide sodium obtained from the standard solution.

System repeatability: Repeat the test 6 times with 20 μL each of the system suitability solution according to the above conditions; the relative standard deviation of the peak areas of flavin adenine dinucleotide sodium is NMT 1.0%.

Water Put 50 mL of a mixture of methanol for water determination and ethylene glycol for water determination (1:1) in a dry flask for titration and titrate with a test solution for water determination to the endpoint. Weigh accurately about 0.1 g of Flavin Adenine Dinucleotide Sodium, quickly transfer into the titration flask, add a certain amount of the excess test solution for water determination, stir to mix for 10 minutes, and perform the test; the water content is NMT 10.0%.

Assay (1) ***Procedure***—(i) Total amount of flavin: Perform the procedure using light-resistant containers. Separately, weigh accurately about 0.1 g of Flavin Adenine Dinucleotide Sodium and dissolve in water to make exactly 200 mL. Pipet 5 mL of this solution, add 5 mL of zinc chloride TS, heat for 30 minutes on a steam bath, and cool. Then add water to make exactly 100 mL, and use this solution as the standard solution. Separately, weigh accurately about 50 mg of riboflavin RS (previously dried at 105 ℃ for 2 hours), dissolve in 200 mL of diluted acetic acid(100) (1 in 100) by warming, cool, and add water to make exactly 500 mL. Pipet 10 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. With the test solution and the standard solution, perform the test as directed under the Ultraviolet-visible Spectroscopy using water as the control solution, and determine the absorbances, A_T and A_S, at the wavelength of 450 nm.

$$\text{Total amount (mg) of flavin} = \text{Amount (mg) of riboflavin RS} \times \frac{A_T}{A_S} \times \frac{4}{5}$$

(ii) Peak area ratio of flavin adenine nucleotide: Weigh accurately about 0.1 g of Flavin Adenine Dinucleotide Sodium, dissolve in water to make exactly 200 mL, and use this solution as the test solution. Perform the test with 5 μL of the test solution as directed under the Liquid Chromatography according to the following conditions. Measure the respective peak areas using the automatic integration method, and determine the peak area *A* of flavin adenine dinucleotide sodium and the sum of the other peak areas S.

$$\text{Peak area ratio of flavin adenine dinucleotide sodium} = \frac{1.08A}{1.08A + S}$$

Operating conditions

Detector: A visible absorption photometer (wavelength: 450 nm).

Column: A stainless steel column about 4 mm in internal diameter and 15 cm to 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm to 10 μm in particle diameter).

Column temperature: A constant temperature of about 35 °C.

Mobile phase: A mixture of potassium dihydrogen phosphate solution (17 in 500) and methanol (4 : 1).

Flow rate: Adjust the flow rate so that the retention time of flavin adenine dinucleotide sodium is about 10 minutes.

System suitability

Test for required detectability: Pipet 2 mL of the test solution, add water to make exactly 20 mL, and use this solution as the system suitability solution. Weigh accurately 2 mL of this solution and make 20 mL. Confirm that the peak area of flavin adenine dinucleotide sodium obtained from 5 μL of this solution is equivalent to between 8% and 12% of the peak area of flavin adenine dinucleotide sodium obtained from the standard solution.

System performance: Dissolve 20 mg each of Flavin Adenine Dinucleotide Sodium and sodium riboflavinphosphate in 100 mL of water. Proceed with 5 μL of this solution according to the above conditions; flavin adenine dinucleotide sodium and riboflavin phosphate are eluted in this order with the resolution being NLT 2.0.

System repeatability: Repeat the test 6 times with 5 μL each of the system suitability solution according to the above conditions; the relative standard deviation of the peak areas of flavin adenine dinucleotide sodium is

NMT 1.0%.

Time span of measurement: About 4.5 times the retention time of flavin adenine dinucleotide sodium.

(2) ***Calculation formula***

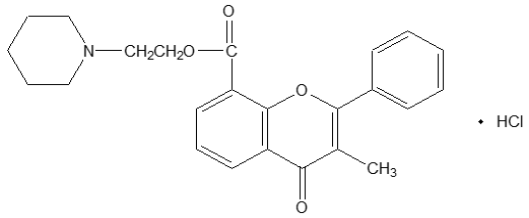
Amount (mg) of flavin adenine dinucleotide sodium ($C_{27}H_{31}N_9Na_2O_{15}P_2$)
$= f_T \times f_R \times 2.2040$

f_T: Total amount (mg) of flavin in Flavin Adenine Dinucleotide Sodium obtained from the Procedure (i)

f_R: Peak area ratio of flavin adenine nucleotide in Flavin Adenine Dinucleotide Sodium obtained from the Procedure (ii)

Packaging and storage Preserve in light-resistant, tight containers.

Flavoxate Hydrochloride
플라복세이트염산염



$C_{24}H_{25}NO_4 \cdot HCl$: 427.92

2-(1-Piperidyl)ethyl 3-methyl-4-oxo-2-phenyl-chromene-8-carboxylate hydrochloride [*3717-88-2*]

Flavoxate Hydrochloride, when dried, contains NLT 99.0% and NMT 101.0% of propranolol hydrochloride ($C_{24}H_{25}NO_4 \cdot HCl$).

Description Flavoxate Hydrochloride occurs as white crystals or a crystalline powder.
It is sparingly soluble in acetic acid(100) or chloroform, slightly soluble in water or ethanol(95), and practically insoluble in acetonitrile or ether.

Identification (1) Determine the absorption spectra of the solutions of Flavoxate Hydrochloride and flavoxate hydrochloride RS in 0.01 mol/L hydrochloric acid TS (1 in 50000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Flavoxate Hydrochloride and flavoxate hydrochloride RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy, respectively; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) An aqueous solution of Flavoxate Hydrochloride (1 in 100) responds to the Qualitative Analysis for chloride.

Purity (1) ***Heavy metals***—Proceed with 2.0 g of Flavoxate Hydrochloride according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Arsenic***—Proceed with 2.0 g of Flavoxate Hydrochloride according to Method 4, and perform the test (NMT 1 ppm).

(3) ***Related substances***—Dissolve 80 mg of Flavoxate Hydrochloride in 10 mL of chloroform and use this solution as the test solution. Pipet 1 mL of this solution and add chloroform to make exactly 20 mL. Pipet 1 mL of this solution, add chloroform to make exactly 20 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on a plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of 1-butanol, water and acetic acid(100) (3 : 1 : 1) as the developing solvent to a distance of about 12 cm and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot from the test solution are not more intense than those from the standard solution.

Loss on drying NMT 1.0% (1 g, in vacuum, silica gel, 2 hours).

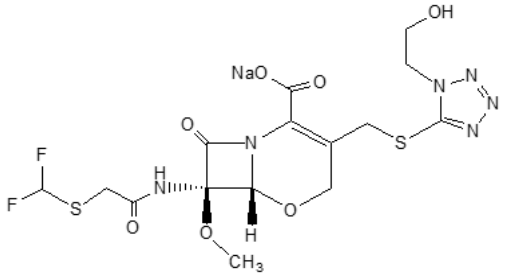
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.6 g of Flavoxate Hydrochloride, previously dried, add 10 mL of acetic acid(100) and 40 mL of acetonitrile, and dissolve. Add 50 mL of acetic anhydride and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 42.79 mg of $C_{24}H_{25}NO_4 \cdot HCl$

Packaging and storage Preserve in tight containers.

Flomoxef Sodium
플로목세프나트륨



Flomoxef Sodium $C_{15}H_{17}F_2N_6NaO_7S_2$: 518.45
Sodium (6*R*,7*R*)-7-[[2-(difluoromethylsulfanyl)acetyl]amino]-3-[[1-(2-hydroxyethyl)tetrazol-5-yl]sulfanylmethyl]-7-methoxy-8-oxo-5-oxa-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylate
[*92823-03-5*]

Flomoxef Sodium contains NLT 870 μg (potency) and NMT 985 μg (potency) of flomoxef ($C_{15}H_{18}F_2N_6O_7S_2$: 496.47) per mg, calculated on the anhydrous basis.

Description Flomoxef Sodium occurs as a white to pale yellowish white crystalline powder.
It is very soluble in water, freely soluble in methanol, and sparingly soluble in ethanol(99.5).

Identification (1) Weigh about 0.01 g of Flomoxef Sodium and decompose as directed under the Oxygen Flask Combustion, using a mixture of 0.5 mL of 0.01 mol/L sodium hydroxide TS and 20 mL of water as the absorbent. To 2 mL of this test solution, add 1.5 mL of a mixture of alizarin complexone TS, acetic acid, potassium acetate buffer solution (pH 4.3) and cerium(III) nitrate TS (1 : 1 : 1); the solution exhibits a bluish purple color.

(2) Determine the absorption spectra of each aqueous solution of Flomoxef Sodium and flomoxef sodium RS (3 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared spectra of Flomoxef Sodium and flomoxef sodium RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(4) Determine the ^1H spectrum of a solution of Flomoxef Sodium in deuterium oxide for nuclear magnetic resonance spectroscopy (1 in 10) as directed under the Nuclear Magnetic Resonance Spectroscopy, using sodium 3-trimethylsilylpropanesulfonate as the internal reference compound; the acquired spectrum exhibits a singlet A at around δ 3.5 ppm, a singlet or sharp multiplet B at around δ 3.7 ppm and a singlet C at around δ 5.2 ppm. The ratio of the integrated intensity of these signals, A : B : C, is about 3 : 2 : 1.

(5) Flomoxef Sodium responds to the Qualitative Analysis (1) for sodium salt.

Optical rotation $[\alpha]_D^{20}$: Between -8° and -13° (1 g calculated on the anhydrous basis, a mixture of water and ethanol(99.5) (4 : 1), 50 mL, 100 mm).

pH Dissolve 0.5 g (potency) of Flomoxef Sodium in 5 mL of water; the pH of the solution is between 4.0 and 5.5.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Flomoxef Sodium in 10 mL of water; the resulting solution is colorless to pale yellow and clear.

(2) ***Heavy metals***—Place about 1.0 g of Flomoxef Sodium in a quartz crucible, proceed according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Arsenic***—To 1.0 g of Flomoxef Sodium, add 5 mL of sulfuric acid and 5 mL of nitric acid and heat carefully. Continue heating, adding 2 mL of nitric acid occasionally until the solution is colorless to pale yellow. After cooling, add 10 mL of ammonium oxalate TS and concentrate the solution from 2 mL to 3 mL by heating until white fumes evolve. After cooling, add water to make 10 mL and perform the test using this solution as the test solution; the color of the solution is not more intense than the reference color.

Reference color: Proceed to prepare a solution in the same manner as the test solution without Flomoxef Sodium, transfer 10 mL of this solution to the bottle of the generator apparatus, add exactly 2 mL of arsenic standard solution, and proceed in the same manner as the test solution (NMT 2 ppm).

(4) ***1-(2-hydroxyethyl)-1H-tetrazol-5-thiol***—Use the test solution prepared under the Assay as the test solution. Separately, weigh accurately about 20 mg of 1-(2-hydroxyethyl)-1*H*-tetrazol-5-thiol and dissolve in water to make exactly 100 mL. Pipet 5 mL of this solution, add exactly 25 mL of the internal standard solution and water to make 50 mL and use this solution as the standard solution. Perform the test with each 5 μL of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions and calculate the ratios, Q_T and Q_S, of the peak area of 1-(2-hydroxyethyl)-1*H*-tetrazol-5-thiol to that of the internal standard. The amount of 1-(2-hydroxyethyl)-1*H*-tetrazol-5-thiol is NMT 1.0% of Flomoxef Sodium, calculated on the anhydrous basis.

$$\text{Amount (mg) of 1-(2-hydroxyethyl)-1}H\text{-tetrazol-5-thiol } (C_3H_6N_4OS) = \text{Potency (mg) of 1-(2-hydroxyethyl)-1}H\text{-tetrazol-5-thiol} \times \frac{Q_T}{Q_S} \times \frac{1}{10}$$

Internal standard solution—*m*-cresol solution (3 in 1000).

Operating conditions

Proceed as directed under the operating conditions under the Assay.

System suitability Proceed as directed under the system suitability under the Assay.

Water NMT 1.5% (0.5 g, volumetric titration, direct titration).

Sterility It meets the requirements when used in sterile

preparations (excluding in case of a manufacturing process of a sterile preparation with a terminal sterilization process). Use a diluent containing 0.1% polysorbate 80 as the rinsing fluid.
Bacterial endotoxins Less than 0.025 EU/mg (potency) of flomoxef, when used in a sterile preparation.

Assay Weigh accurately each 50 mg (potency) of Flomoxef Sodium and flomoxef sodium RS, dissolve in the internal standard solution to make exactly 100 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 5 μL of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions and calculate the ratios, Q_T and Q_S, of the peak area of flomoxef to that of the internal standard for the test solution and the standard solution, respectively.

$$\text{Amount [μg (potency)] of flomoxef } (C_{15}H_{18}F_2N_6O_7S_2) = \text{Potency (μg) of flomoxef trimethylammonium RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—*m*-cresol solution (3 in 1000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength 246 nm).

Column: A stainless steel column, about 4 mm in internal diameter and 20 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm to 10 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: Dissolve 6.94 g of potassium dihydrogen phosphate, 3.22 g of disodium hydrogen phosphate dodecahydrate and 1.60 g of tetra-n-butylammonium bromide in water to make 1000 mL. Add 250 mL of methanol to 750 mL of this solution.

Flow rate: Adjust the flow rate so that the retention time of flomoxef is about 9 minutes.

System suitability

System performance: Perform the test with 5 μL of the standard solution according to the above operating conditions; flomoxef and the internal standard are eluted in this order, and the peak resolution is NLT 10.

System repeatability: Repeat the test 3 times with 5 μL of the standard solution under the above operating conditions; the relative standard deviation of the ratio of the peak area of flomoxef to that of the internal standard is NMT 1.0%.

Packaging and storage Preserve in light-resistant, tight containers (at below 5 °C).

Flomoxef Sodium for Injection
주사용 플로목세프나트륨

Flomoxef Sodium for Injection is an injection to be dissolved before use and contains NLT 90.0% and NLT 110.0% of the labeled amount of flomoxef ($C_{15}H_{18}F_2N_6O_7S_2$: 496.47).

Method of preparation Prepare as directed under Injections, with Flomoxef Sodium.

Description Flomoxef Sodium for Injection occurs as a hard, white to pale yellowish white mass or a powder.

Identification Perform the test with Flomoxef Sodium for Injection as directed under the Identification (3) under Flomoxef Sodium.

pH Dissolve an amount of Flomoxef Sodium for Injection, equivalent to 0.5 g (potency) of flomoxef sodium, in 5 mL of water; the pH of this solution is between 4.0 and 5.5.

Purity (1) ***Clarity and color of solution***—Dissolve an amount of Flomoxef Sodium for Injection equivalent to 1.0 g (potency) of flomoxef sodium according to the labeled amount, in 10 mL of water; the solution is clear and colorless to pale yellow.

(2) ***1-(2-hydroxyethyl)-1H-tetrazole-5-thiol***—Use the test solution obtained in Assay as the test solution. Separately, weigh accurately about 20 mg of 1-(2-hydroxyethyl)-1*H*-tetrazol-5-thiol and dissolve in water to make exactly 100 mL. Pipet 5 mL of this solution, add exactly 25 mL of the internal standard solution and water to make 50 mL, and use this solution as the standard solution. Perform the test with 5 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak area ratio, Q_T and Q_S, of 1-2(hydroxyethyl)-1*H*-tetrazole-5-thiol to the peak area of the internal standard. The amount of 1-(2-hydroxyethyl)-1*H*-tetrazole-5-thiol is NMT 10 mg per g (potency) of Flomoxef Sodium for Injection.

$$\text{Amount (mg) of 1-2(2-hydroxyethyl)-1}H\text{-tetrazole-5-thiol } (C_3H_6N_4OS) = \text{Potency (mg) of 1-(2-hydroxyethyl)-1}H\text{-tetrazol-5-thiol} \times \frac{Q_T}{Q_S} \times \frac{1}{10}$$

Internal standard solution—m-Cresol solution (3 in 1000).

Operating conditions

Perform the test according to the operating conditions as directed under the Assay under Flomoxef Sodium.

System suitability

Test for required detectability: Pipet 1 mL of the standard solution, and add water to make exactly 20 mL. Confirm that the peak area of 1-methyl-1*H*-tetrazole-5-thiol obtained from 5 μL of this solution is 3.5% to 6.5% of the peak area of 1-methyl-1*H*-tetrazole-5-thiol obtained from 5 μL of the standard solution.

System performance: Proceed with 5 μL of the standard solution according to the above conditions; 1-(2-hydroxyethyl)-1*H*-tetrazol-5-thiol and the internal standard are eluted in this order with the resolution being NLT 20.

System repeatability: Repeat the test 3 times with 5 μL each of the standard solution (1) according to the above conditions; the relative standard deviation of the peak area of 1-methyl-1*H*-tetrazole-5-thiol is NMT 1.0%.

Water NMT 1.5% (0.5 g, volumetric titration, direct titration).

Sterility Meets the requirements.

Bacterial endotoxins Less than 0.025 EU per mg (potency) of flomoxef.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Uniformity of dosage units Meets the requirements.

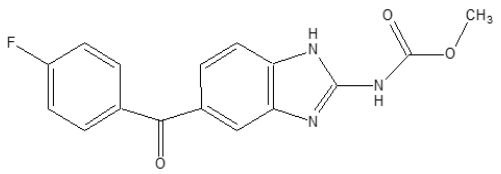
Assay Take NLT 10 units of Flomoxef Sodium for Injection, weigh accurately the mass of the contents, and determine the average weight of the contents. Thinly spread about 1 g of the contents on a petri dish, and allow it to stand in a humidistat with a saturated solution of magnesium bromide, protected from light, to bring the water to equilibrium. Measure the water content of 0.1 g of the content as directed under Water. Weigh accurately an amount of Flomoxef Sodium for Injection, equivalent to about 50 mg (potency) of flomoxef sodium, dissolve in exactly 50 mL of the internal standard solution, and add water to make 100 mL. Use this solution as the test solution. Separately, weigh accurately about 50 mg (potency) of flomoxef triethylammonium RS, dissolve in exactly 50 mL of the internal standard solution, add water to make 100 mL, and use this solution as the standard solution. Perform the test as directed under the Assay of Flomoxef Sodium.

$$\text{Potency (μg) of flomoxef } (C_{15}H_{18}F_2N_6O_7S_2) = \text{Potency (μg) of flomoxef triethylammonium RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—*m*-cresol solution (3 in 1000).

Packaging and storage Preserve in hermetic containers. Plastic containers for aqueous injections may be used.

Flubendazole
플루벤다졸



Flubendazole $C_{16}H_{12}FN_3O_3$: 313.28
Methyl *N*-[6-(4-fluorobenzoyl)-1*H*-benzimidazol-2-yl]carbamate [*31430-15-6*]

Flubendazole contains NLT 99.0% and NMT 101.0% of flubendazole ($C_{16}H_{12}FN_3O_3$), calculated on the dried basis.

Description Flubendazole occurs as a white powder.
It is practically insoluble in water, dichloromethane or ethanol(95).
It shows crystalline polymorphism.

Identification Determine the infrared spectra of Flubendazole and flubendazole RS as directed in the potassium bromide disk method under Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Purity ***Related substances***—Dissolve 0.10 g of Flubendazole in *N*,*N*-dimethylformamide to make exactly 100 mL, and use this solution as the test solution. To 1.0 mL of the test solution, add *N*,*N*-dimethylformamide to make exactly 100 mL. To 5.0 mL of this solution, add *N*,*N*-dimethylformamide to make exactly 20 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. The area of peaks of the related substances, each of which the relative retention time to flubendazole is between 1.2 and 1.3, is not greater than the major peak area from the standard solution (0.25%), and the total area of peaks other than the major peak from the test solution is not greater than 6 times the major peak area from the standard solution (1.5%). However, exclude any peak having an area smaller than 0.2 times the major peak area obtained from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 250 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 10 cm in length, packed with base-deactivated octadecylsilanized silica gel for liquid chromatography (3 μm in particle diameter).

Column temperature: A constant temperature of about 40 ℃.

Mobile phase: Control the mixing ratio of mobile phase A and mobile phase B stepwise or via the gradient elution as follows.

Mobile phase A: Dissolve 7.5 g of ammonium acetate in water to make 1000 mL.

Mobile phase B: Acetonitrile

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 - 15	90 → 75	10 → 25
15 - 30	75 → 45	25 → 55
30 - 32	45 → 10	55 → 90
32 - 37	10	90
37 - 38	10 → 90	90 → 10
38 - 42	90	10

Flow rate: 1.2 mL/min

Loss on drying NMT 0.5% (1 g, 105 ℃, 4 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.25 g of Flubendazole, dissolve in 3 mL of formic acid, add 50 mL of a mixture of 2-butanone and acetic acid(100) (7 : 1), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid
= 31.330 mg of $C_{16}H_{12}FN_3O_3$

Packaging and storage Preserve in light-resistant, well-closed containers.

Flubendazole Suspension
플루벤다졸 현탁액

Flubendazole Suspension contains NLT 90.0% and NMT 105.0% of the labeled amount of flubendazole ($C_{16}H_{12}FN_3O_3$: 313.28).

Method of preparation Prepare as directed under Suspensions, with Flubendazole.

Identification (1) Shake Flubendazole Suspension well to mix, take an amount of Flubendazole Suspension, equivalent to 25 mg of flubendazole. Add it to 10 mL of formic acid, shake well to mix, and add isopropanol to make 25 mL. Filter and use the filtrate as the test solution. Separately, weigh 25 mg of flubendazole RS, dissolve in 10 mL of formic acid, add isopropanol to make 25 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescence indicator for thin-layer chromatography. Develop the plate with a mixture of chloroform, methanol and ammonia water(28) (45 : 4 : 1) as the developing solvent to a distance of about 15 cm, and air-dry the plate. Expose the plate under ultraviolet light (main wavelength: 254 nm) or spray Dragendorff's TS onto the plate; the R_f values and colors of the spots from the test solution and the standard solution are the same.

(2) Determine the absorption spectra of the test solution and the standard solution as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelength.

pH Between 4.5 and 6.5.

Assay Shake Flubendazole Suspension well to mix, and pipet an amount of Flubendazole Suspension, equivalent to 50 mg of flubendazole ($C_{16}H_{12}FN_3O_3$). Add it to 10 mL of formic acid, shake well to mix, add isopropanol to make exactly 100 mL, and filter. Discard the first 10 mL of the filtrate, pipet 10 mL of the subsequent filtrate, add isopropanol to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 50 mg of flubendazole RS, dissolve in 10 mL of formic acid, and add isopropanol to make exactly 100 mL. Pipet 2 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution at the wavelength of 310 nm as directed under the Ultraviolet-visible Spectroscopy, using isopropanol as a control solution.

Amount (mg) of flubendazole ($C_{16}H_{12}FN_3O_3$)
= Amount (mg) of flubendazole RS × (A_T / A_S)

Packaging and storage Preserve in tight containers.

Flubendazole Tablets
플루벤다졸 정

Flubendazole Tablets contain NMT 95.0% and NLT 105.0% of the labeled amount of flubendazole ($C_{16}H_{12}FN_3O_3$: 313.28).

Method of preparation Prepare as directed under Tablets, with Flubendazole.

Identification (1) Weigh an amount of Flubendazole Tablets, equivalent to 20 mg of flubendazole according to the labeled amount, dissolve with 2 mL of formic acid, and add chloroform to make 25 mL. Filter this solution, and use the filtrate as the test solution. Separately, weigh 20 mg of flubendazole RS, dissolve with 2 mL of formic

acid, add chloroform to make 25 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate in a mixture of chloroform, methanol and formic acid (18 : 1 : 1) to a distance of about 15 cm and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots from the test solution and the standard solution are the same in R_f value.

(2) Perform the test as directed under the Assay; the test solution shows the maximum absorbance at the same wavelength as the standard solution.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 tablets of Flubendazole Tablets, and powder them. Weigh accurately an amount of the powder equivalent to about 0.1 g of flubendazole ($C_{16}H_{12}FN_3O_3$), add 10 mL of formic acid, dissolve by warming on a steam bath for 15 minutes, and add isopropanol to make exactly 100 mL. Filter this solution, take exactly 1 mL of the filtrate, add isopropanol to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 0.1 g of flubendazole RS, proceed in the same manner with the test solution, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution at the wavelength of 311 nm as directed under the Ultraviolet-visible Spectroscopy, using 10% formic acid-isopropanol as a control solution.

Amount (mg) of flubendazole ($C_{16}H_{12}FN_3O_3$)
= Amount (mg) of flubendazole RS × (A_T / A_S)

Packaging and storage Preserve in well-closed containers.

Fluconazole Capsules
플루코나졸 캡슐

Fluconazole Capsules contain NLT 95.0% and NMT 105.0% of the labeled amount of fluconazole ($C_{13}H_{12}F_2N_6$: 306.27).

Method of preparation Prepare as directed under Capsules, with Fluconazole.

Identification Weigh an amount of contents equivalent to about 50 mg of fluconazole according to the labeled amount of Fluconazole Capsules, dissolve in 5 mL of methanol, centrifuge, and use the clear supernatant as the test solution. Separately, dissolve about 50 mg of fluconazole RS in 5 mL of methanol and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescence indicator for thin-layer chromatography. Develop the plate with a mixture of dichloromethane, methanol and ammonia (80 : 20 : 1) as the developing solvent, and air-dry the plate. Next, develop the plate with a mixture of ethyl acetate, isopropanol and ammonia (72 : 28 : 1) as the developing solvent, and air-dry the plate. Spray evenly hexachloroplatinic(IV) acid-potassium iodide TS on the plate and examine the plate under ultraviolet light (main wavelength: 254 nm); the R_f values of the spots obtained from the test solution and the standard solution are the same.

Uniformity of dosage units Meets the requirements.

Dissolution Perform the test with 1 capsule of Fluconazole Capsules at 100 revolutions per minute according to Method 2 under the Dissolution, using 500 mL of 0.1 mol/L hydrochloric acid with a sinker. Take 20 mL of the dissolved solution after 30 minutes from starting the test and filter. Discard the first 1 mL of the filtrate and use the subsequent filtrate as the test solution. Separately, weigh accurately about 40 mg of fluconazole RS, transfer to a 250-mL volumetric flask, add 0.1 mol/L hydrochloric acid to make 250 mL, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at the wavelength of 261 nm as directed under the Ultraviolet-visible Spectroscopy. Meets the requirements if the dissolution rate of Fluconazole Capsules in 30 minutes is NLT 80%.

Dissolution rate (%) with respect to the labeled amount of fluconazole ($C_{13}H_{12}F_2N_6$)

$$= W_S \times \frac{A_T}{A_S} \times \frac{1}{C} \times 200$$

W_S: Amount (mg) of fluconazole RS
C: Labeled amount (mg) of fluconazole ($C_{13}H_{12}F_2N_6$) in 1 capsule

Assay Weigh accurately the mass of NLT 20 capsules of Fluconazole Capsules. Weigh accurately an amount equivalent to about 50 mg of fluconazole ($C_{13}H_{12}F_2N_6$) and add the mobile phase to make 100 mL. Take 10.0 mL of the filtrate, add the mobile phase to make 100 mL, and use this solution as the test solution. Separately, weigh accurately about 50 mg of fluconazole RS and dissolve in the mobile phase to make 100 mL. To 10.0 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 50 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of fluconazole in each solution.

Amount (mg) of fluconazole ($C_{13}H_{12}F_2N_6$)
= Amount (mg) of fluconazole RS × $\frac{A_T}{A_S}$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 210 nm).

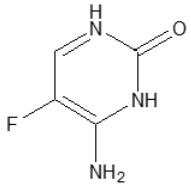
Column: A stainless-steel column about 4 mm in internal diameter and about 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of water and methanol (75 : 25).

Flow rate: 2 mL/min

Packaging and storage Preserve in well-closed containers.

Flucytosine
플루시토신



Flucytosine $C_4H_4FN_3O$: 129.09
6-Amino-5-fluoropyrimidin-2(1*H*)-one [*2022-85-7*]

Flucytosine, when dried, contains NLT 98.5% and NMT 101.0% of flucytosine ($C_4H_4FN_3O$). It also contains NLT 14.0% and NMT 15.5% of fluorine (F: 19.00).

Description Flucytosine occurs as a white or almost white, crystalline powder and is odorless.
It is sparingly soluble in water, slightly soluble in methanol, acetic acid(100), acetic anhydride or ethanol(95), and practically insoluble in ether.
It dissolves in 0.1 mol/L hydrochloric acid TS.
Dissolve 1.0 g of Flucytosine in 100 mL of water; the pH of the solution is between 5.5 and 7.5.
It is slightly hygroscopic.

Melting point—About 295 °C (with decomposition).

Identification (1) To 5 mL of aqueous solution of Flucytosine (1 in 500), add 0.2 mL of bromine TS; a yellowish brown color of the test solution immediately disappears. Further add 2 mL of barium hydroxide TS; a violet precipitate is formed.

(2) Weigh about 0.1 g of Flucytosine as directed under the Oxygen Flask Combustion, using a mixture of 0.5 mL of 0.01 mol/L sodium hydroxide TS and 20 mL of water as the absorbent; the resulting test solution responds to the Qualitative Analysis (2) for fluoride.

(3) Determine the absorption spectra of solutions of Flucytosine and flucytosine RS in 0.1 mol/L hydrochloric acid TS (1 in 125000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Flucytosine in 100 mL of water; the solution is clear and colorless.

(2) ***Chloride***—To 1.0 g of Flucytosine, add 80 mL of water, and dissolve by heating on a steam bath. After cooling, take 40 mL of this solution, add 6 mL of dilute nitric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 0.20 mL of 0.01 mol/L hydrochloric acid (NMT 0.014%).

(3) ***Fluoride***—Weigh about 0.10 g of Flucytosine and dissolve in 10.0 mL of 0.1 mol/L diluted sodium hydroxide TS (1 in 20). To 5.0 mL of this solution, add 10 mL of a mixture of alizarin complexone TS, acetic acid-potassium acetate buffer solution (pH 4.3) and cerium(III) nitrate TS (1 : 1 : 1), add water again to make exactly 20 mL, allow to stand for 1 hour, and use this solution as the test solution. Separately, add 5.0 mL of 0.01 mol/L diluted sodium hydroxide TS (1 in 20) to 4.0 mL of standard fluorine solution, add 10 mL of a mixture of alizarin complexone TS, acetic acid-potassium acetate buffer solution (pH 4.3) and cerium(III) nitrate TS (1 : 1 : 1), and proceed in the same manner as the test solution. Use this solution as the standard solution. Perform the test with these solutions as directed under the Ultraviolet-visible Spectroscopy using a solution obtained by proceeding with 5.0 mL of 0.01 mol/L diluted sodium hydroxide TS (1 in 20) in the same manner as the blank; the absorbance of the test solution at 600 nm is not greater than that of the standard solution (NMT 0.048%).

(4) ***Heavy metals***—Weigh about 1.0 g of Flucytosine according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(5) ***Arsenic***—Weigh about 1.0 g of Flucytosine according to Method 2 and perform the test (NMT 2 ppm).

(6) ***Related substances***—Dissolve 50.0 mg of Flucytosine in 5 mL of methanol solution (1 in 2) and use this solution as the test solution. Pipet 1 mL of this solution and add methanol solution (1 in 2) to make exactly 25 mL. Pipet 1 mL of this solution and add methanol solution (1 in 2) to make exactly 20 mL. Use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 20 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, methanol and water (5 : 3 : 2) as the developing solvent to a distance of about 12 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); spots other than the principal spot obtained from the test solution is not more intense than the spots obtained from the standard solution.

Loss on drying NMT 1.0% (1 g, 105 ℃, 4 hours).

Residue on ignition NMT 0.1% (1 g).

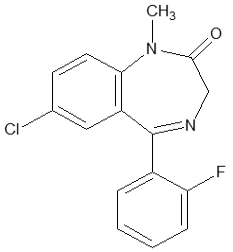
Assay (1) ***Flucytosine***—Weigh accurately about 0.2 g of Flucytosine, previously dried, dissolve in 40 mL of acetic acid(100) and 100 mL of acetic anhydride, and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid
= 12.909 mg of $C_4H_4FN_3O$

(2) ***Fluorine***—Weigh accurately about 10 mg of Flucytosine, previously dried, and perform the test as directed under the Assay of fluorine under the Oxygen Flask Combustion, using a mixture of 0.5 mL of 0.01 mol/L sodium hydroxide TS and 20 mL of water as the absorbent.

Packaging and storage Preserve in light-resistant, tight containers.

Fludiazepam
플루디아제팜



Fludiazepam $C_{16}H_{12}ClN_2O$: 302.73
7-Chloro-5-(2-fluorophenyl)-1-methyl-1*H*-benzo[e][1,4]diazepin-2(3H)-one [*3900-31-0*]

Fludiazepam, when dried, contains NLT 99.0% and NMT 101.0% of fludiazepam ($C_{16}H_{12}ClN_2O$).

Description Fludiazepam occurs as white to pale yellow crystals or crystalline powder.
It is very soluble in chloroform, freely soluble in methanol, ethanol, acetic acid(100) or ether, and practically insoluble in water.

Identification (1) Proceed with 10 mg of Fludiazepam as directed under the Oxygen Flask Combustion, using a mixture of 0.5 mL of 0.01 mol/L sodium hydroxide TS and 20 mL of water as the absorbent; the resulting test solution responds to the Qualitative Analysis (2) for fluoride.

(2) Determine the absorption spectra of solutions of Fludiazepam and fludiazepam RS in methanol (1 in 200000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths. Further, determine the absorption spectra of solutions of Fludiazepam and fludiazepam RS in methanol (1 in 20000); both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared spectra of Fludiazepam and fludiazepam RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(4) Perform the test with Fludiazepam as directed under the Flame Coloration (2); it exhibits a green color.

Melting point Between 91 and 94 ℃.

Purity (1) ***Chloride***—Dissolve 1.0 g of Fludiazepam in 50 mL of ether, add 50 mL of water, shake to mix, and collect the water layer. Wash the water layer twice each time with 20 mL of ether and filter the water layer. To 20 mL of the filtrate, add 6 mL of dilute nitric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 0.40 mL of 0.01 mol/L hydrochloric acid TS (NMT 0.036%).

(2) ***Heavy metals***—Proceed with 2.0 g of Fludiazepam according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Related substances***—Dissolve 0.10 g of Fludiazepam in 20 mL of chloroform and use this solution as the test solution. Pipet 1 mL of this solution and add chloroform to make exactly 50 mL. Pipet 2 mL of this solution, add chloroform to make exactly 20 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 20 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of chloroform and ethyl acetate (10 : 7) as the developing solvent to a distance of about 12 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 0.3% (1 g, in vacuum, 60 ℃, 3 hours).

Residue on ignition NMT 0.1% (1 g, platinum crucible).

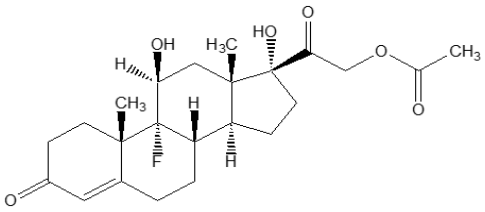
Assay Weigh accurately about 0.5 g of Fludiazepam, previously dried, dissolve in 50 mL of acetic acid(100), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid

= 30.273 mg of $C_{16}H_{12}ClN_2O$

Packaging and storage Preserve in tight containers.

Fludrocortisone Acetate
플루드로코르티손아세테이트



Fludrocortisone Acetate $C_{23}H_{31}FO_6$: 422.49
2-((8*S*,9*R*,10*S*,11*S*,13*S*,14*S*,17*R*)-9-fluoro-11,17-dihydroxy-10,13-dimethyl-3-oxo-2,3,6,7,8,9,10,11,12,13,14,15,16,17-tetradecahydro-1*H*-cyclopenta[a]phenanthren-17-yl)-2-oxoethyl acetate [*514-36-3*]

Fludrocortisone Acetate contains NLT 97.0% and NMT 103.0% of fludrocortisone acetate ($C_{23}H_{31}FO_6$), calculated on the dried basis.

Description Fludrocortisone Acetate occurs as white to pale yellow crystals or a crystalline powder, which has no odor or slight odor.
It is hygroscopic.
It is sparingly soluble in ethanol(95) or chloroform, slightly soluble in ether, and practically insoluble in water.

Identification Determine the infrared spectra of Fludrocortisone Acetate and fludrocortisone acetate RS as directed in the paste method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Optical rotation $[\alpha]_D^{20}$: Between +131° and +138° (after drying, 0.1 g, acetone, 20 mL, 100 mm).

Purity (1) ***Heavy metals***—Proceed with 0.5 g of Fludrocortisone Acetate according to Method 2 and perform the test. Prepare the control solution with 1.5 mL of lead standard solution (NMT 30 ppm).

(2) ***Related substances***—Weigh accurately about 20 mg of Fludrocortisone Acetate, dissolve exactly in 10 mL of the mobile phase, and use this solution as the test solution. Pipet 1 mL of this solution, add the mobile phase to it make exactly 50 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak area of each solution according to the automatic integration method; the total area of peaks other than fludrocortisone acetate from the test solution is not greater than 1/4 the peak area of fludrocortisone acetate from the standard solution. The total area of the peaks other than fludrocortisone acetate from the test solution is not greater than 1/ 2 the peak area of fludrocortisone acetate from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6mm in internal diameter and 20 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 ℃.

Mobile phase: A mixture of water and tetrahydrofuran (13 : 7).

Flow rate: Adjust the flow rate so that the retention time of fludrocortisone acetate is about 10 minutes.

System suitability

Test for required detectability: Pipet 5 mL of the standard solution, and add the mobile phase to make exactly 100 mL. Confirm that the peak area of fludrocortisone acetate obtained from 20 μL of this solution is equivalent to 4.0% to 6.0% of the peak area of fludrocortisone acetate obtained from the standard solution.

System performance: Dissolve 2 mg each of Fludrocortisone Acetate and hydrocortisone acetate in the mobile phase to make 50 mL. Proceed with 10 μL of this solution according to the above conditions; hydrocortisone acetate and fludrocortisone acetate are eluted in this order with the resolution being NLT 1.5.

System repeatability: Repeat the test 6 times with 20 μL of the standard solution according to the above conditions; the relative standard deviation of the peak area of fludrocortisone acetate is NMT 2.0%.

Time span of measurement: About 2 times the retention time of fludrocortisone beginning after the solvent peak

Loss on drying NMT 1.0% (1 g, 100 °C, in vacuum, 2 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 25 mg each of Fludrocortisone Acetate and fludrocortisone acetate RS, previously dried in vacuum for 2 hours at 100 ℃, dissolve in chloroform to make exactly 250 mL, pipet 10 mL of the resulting solutions, and add chloroform to make exactly 50 mL. Use these solutions as the test solution and the standard solution. Pipet 10 mL each of the test solution and the standard solution, put them in the 25 mL volumetric flasks, respectively, add 1.0 mL of a solution obtained by dissolving 50 mg of blue tetrazolium in 10 mL of methanol, and shake to mix. Mix with 1.0 mL of a mixture of tetramethylammonium hydroxide TS and methanol (1 : 4), allow to stand for 10 minutes, then add a solution of hydrochloric acid in methanol (1 in 100) to

make exactly 25 mL. With these solutions, perform the test as directed under the Ultraviolet-visible Spectroscopy and determine the absorbances, A_T and A_S, at the absorbance maximum wavelength of around 525 nm, using a solution prepared with 10 mL of chloroform in the same manner as the control solution.

Amount (mg) of Fludrocortisone Acetate ($C_{23}H_{31}FO_6$)
= Amount (mg) of fludrocortisone acetate RS$\times \frac{A_T}{A_S}$

Packaging and storage Preserve in light-resistant, well-closed containers.

Flufenamic Acid Capsules
플루페남산 캡슐

Flufenamic Acid Capsules contain NLT 95.0% and NMT 105.0% of the labeled amount of flufenamic acid ($C_{14}H_{10}F_3NO_2$: 281.23).

Method of preparation Prepare as directed under Capsules, with Flufenamic Acid.

Identification Weigh a portion of Flufenamic Acid Capsules, equivalent to 0.3 g of flufenamic acid, extract twice with 30 mL each of ether, combine the ether extracts, and wash with 10 mL of water. Evaporate the ether extracts on a steam bath to dryness, dry the residue at 105 ℃, and perform the following test.

(1) Dissolve 20 mg of the residue in 15 mL of chloroform, and examine under ultraviolet light; it exhibits strong bluish white fluorescence.

(2) Transfer 0.5 mL of chromic acid-sulfuric acid TS to a small test tube, heat on a steam bath for 5 minutes; the side of the test tube is moistened transparently without stickiness. Add 1 to 2 mg of the residue, heat on a steam bath for 5 minutes; the side of the test tube is not moistened and the solution does not flow easily.

(3) With a solution prepared by dissolving 5.0 mg of the residue in 500 mL of a solution of hydrochloric acid in methanol (3.7 in 1000), determine the absorption spectrum as directed under the Ultraviolet-visible Spectroscopy; it exhibits a maximum at wavelengths around 287 nm and 344 nm.

Purity ***Related substances*—**Use a solution of the residue in 5% ethanol obtained from the Identification as the test solution, and prepare 0.01% ethanol solution and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography, develop the plate with a mixture of toluene, tetrahydrofuran and acetic acid(100) (90 : 25 : 1) as the developing solvent to a distance of about 15 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot obtained from the test solution are not more intense than the spot from the standard solution.

Disintegration Meets the requirements.

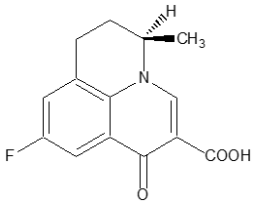
Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of the contents of NLT 20 capsules of Flufenamic Acid Capsules. Weigh accurately about 0.6 g of flufenamic acid ($C_{14}H_{10}F_3NO_2$), dissolve in 100 mL of ethanol(99.5), previously neutralized with a solution of chromium trioxide in saturated sulfuric acid solution, and titrate with 0.1 mol/L sodium hydroxide VS (indicator: phenol red TS). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS
= 28.12 mg of $C_{14}H_{10}F_3NO_2$

Packaging and storage Preserve in tight containers.

Flumequine
플루메퀸



and enantiomer

Flumequine $C_{14}H_{12}FNO_3$: 261.25
(*RS*)-9-Fluoro-5-methyl-1-oxo-1,5,6,7-tetrahydropyrido[3,2,1-ij]quinoline-2-carboxylic acid [*42835-25-6*]

Flumequine contains NLT 99.0% and NMT 101.0% of flumequine ($C_{14}H_{12}FNO_3$), calculated on the dried basis.

Description Flumequine occurs as a white fine crystalline powder.
It is sparingly soluble in dichloromethane, very slightly soluble in methanol and practically insoluble in water.
It soluble in dilute sodium hydroxide TS.

Identification (1) Mix 5 mg of Flumequine with 45 mg of magnesium oxide, and incinerate for about 5 minutes until a white residue is obtained. After cooling, add 1 mL of water and 2 drops of phenolphthalein TS to make it colorless, add about 2 mL of dilute hydrochloric acid, filter, and use this solution as the test solution. Mix the

test solution with 0.1 mL of alizarin S TS and 0.1 mL of zirconium nitrate solution, allow to stand for 5 minutes, and compare with the blank test solution proceeded in the same manner as the test solution; the test solution turns red to yellow while the blank test solution remains red.

(2) Determine the infrared spectra of Flumequine and flumequine RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) Dissolve 5 mg of Flumequine in dichloromethane to make 10 mL, and use this solution as the test solution. Separately, dissolve 5 mg of flumequine RS in dichloromethane to make 10 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography (with fluorescence agent). Develop the plate with a mixture of ethanol(95), water and 9 mol/L ammonia water (90 : 10 : 10) as the developing solvent to a distance of about 15 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254nm); the R_f values of the principal spots obtained from the test solution and the standard solution are the same.

Zirconium nitrate solution—Dissolve 0.1 mg of zirconium nitrate in a mixture of 60 mL of hydrochloric acid and 40 mL of water.

9 mol/L ammonia water—Add water to 67 g of 13.5 mol/L ammonia water to make 100 mL.

Optical rotation $[\alpha]_D^{20}$: Between -0.10° and +0.10° (5.0 g, 0.5 mol/L sodium hydroxide TS, 50 mL, 100 mm).

Purity (1) ***Clarity and color of solution***—Dissolve 5.0 g of Flumequine in 0.5 mol/L sodium hydroxide TS to make 50 mL; the solution is clear.

(2) ***Heavy metals***—Proceed with 2.0 g of Flumequine according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Related substances***—Dissolve 35.0 mg of Flumequine in *N*,*N*-dimethylformamide to make exactly 100 mL, and use this solution as the test solution. Separately, dissolve 5.0 mg of flumequine RS and 5.0 mg of flumequine related substance I RS [(*RS*)-9-fluoro-5-methyl-1-oxo-6,7-dihydro-*1H*,*5H*-benzo[i.j]qunolizine-2-carboxylate (flumequine ethyl ester)] in *N*,*N*-dimethylformamide to make exactly 100 mL. Use this solution as the standard solution (1). To 1.0 mL of the test solution, add *N*,*N*-dimethylformamide to make exactly 200 mL, and use this solution as the standard solution (2). Perform the test with 10 μL each of the blank test solution (dimethylformamide), the test solution, the standard solution (1) and the standard solution (2) as directed under the Liquid Chromatography according to the following conditions. The area of peaks other than the major peak obtained from the test solution is not greater than the major peak area from the standard solution (2) (0.5%) and the total area of peaks other than the major peak obtained from the test solution is not more than twice the major peak area from the standard solution (2) (1.0%). However, exclude the peaks obtained from *N*,*N*-dimethylformamide and any peak with an area less than 0.1 times the major peak area from the standard solution (2).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 250 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of potassium dihydrogen phosphate buffer solution and methanol (51 : 49).

Flow rate: 0.8 mL/min

System suitability

System performance: Proceed with the standard solution (1) according to the above conditions; the retention times of flumequine related substance I and flumequine are about 11 minutes and 13 minutes, respectively, with the resolution between the peaks of flumequine and flumequine related substance I being NLT 2.0.

Potassium dihydrogen phosphate buffer solution—Dissolve 1.36 g of potassium dihydrogen phosphate in water to make 1000 mL.

Loss on drying NMT 0.5% (1 g, 105 ℃, 3 hours).

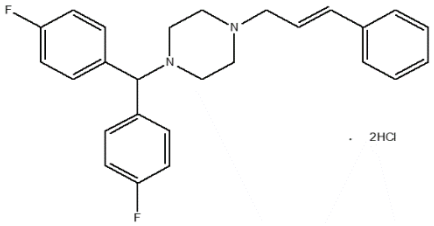
Residue on ignition NMT 0.1% (0.5 g, platinum crucible).

Assay Weigh accurately about 0.5 g of Flumequine, dissolve in 50 mL of *N*,*N*-dimethylformamide, and titrate with 0.1 mol/L tetramethylammonium hydroxide VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L tetrabutylammonium hydroxide
= 26.126 mg of $C_{14}H_{12}FNO_3$

Packaging and storage Preserve in well-closed containers.

Flunarizine Dihydrochloride
플루나리진염산염



Flunarizine Dihydrochloride

$C_{26}H_{26}F_2N_2 \cdot 2HCl$: 477.42

1-[Bis(4-fluorophenyl)methyl]-4-[(2*E*)-3-phenylprop-2-enyl]piperazine dihydrochloride, *[30484-77-6*]

Flunarizine Dihydrochloride, when dried, contains NLT 98.5% and NMT 101.0% of flunarizine dihydrochloride ($C_{26}H_{26}F_2N_2 \cdot 2HCl$) and NLT 7.2% and NMT 8.8% of fluorine (F: 19.00).

Description Flunarizine Dihydrochloride occurs as a white to pale yellowish white powder.
It is soluble in ethanol(95), sparingly soluble in methanol, acetic acid(100) or chloroform, slightly soluble in water or acetic anhydride, and practically insoluble in ether.

Melting point—About 209 °C.

Identification (1) Weigh 15 mg of Flunarizine Dihydrochloride, and prepare the test solution as directed under the Oxygen Flask Combustion using 20 mL of water as the absorbent. The resulting test solution responds to the Qualitative Analysis for fluoride.

(2) Dissolve 10 mg of Flunarizine Dihydrochloride in 10 mL of water, add dilute nitric acid, shake to mix, allow to stand for 5 minutes, and filter. The filtrate responds to the Qualitative Analysis for chloride.

(3) Dissolve 3 mg of Flunarizine Dihydrochloride in 3 mL of citric acid-acetic acid TS, and heat for 10 minutes on a steam bath; the resulting solutions exhibits a reddish purple color.

(4) Determine the absorption spectrum as directed under the Ultraviolet-visible Spectroscopy using a solution of Flunarizine Dihydrochloride in methanol (1 in 100000); it exhibits a maximum between 252 nm and 256 nm.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Flunarizine Dihydrochloride according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Related substances***—Weigh 0.4 g of Flunarizine Dihydrochloride, dissolve in methanol to make exactly 10 mL, and use this solution as the test solution. Pipet 1 mL of this solution and add methanol to make exactly 50 mL. Pipet 5 mL of this resulting solution, add methanol to make exactly 50 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on a thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of tetrahydrofuran, water, methanol and ammonia water(28) (40 : 30 : 30 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot obtained from the test solution are not more intense than the spot from the standard solution.

Loss on drying NMT 0.5% (1 g, in vacuum, phosphorus pentoxide, 60 °C, 3 hours).

Residue on ignition NMT 0.1% (1 g, platinum crucible).

Assay (1) ***Flunarizine dihydrochloride***—Weigh accurately about 0.25 g of Flunarizine Dihydrochloride, previously dried, dissolve in 20 mL of acetic acid(100) and 50 mL of acetic anhydride, and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 1 mol/L perchloric acid VS
= 23.87 mg of $C_{26}H_{26}F_2N_2 \cdot 2HCl$

(2) ***Fluorine***—Weigh accurately about 4 mg of Flunarizine Dihydrochloride, previously dried, and perform the test as directed under the assay of fluorine under the Oxygen Flask Combustion, using 15 mL of water as the absorbent.

Packaging and storage Preserve in light-resistant, tight containers.

Flunarizine Dihydrochloride Capsules
플루나리진염산염 캡슐

Flunarizine Dihydrochloride Capsules contain NLT 90.0% and NMT 110.0% of the labeled amount of flunarizine dihydrochloride ($C_{26}H_{26}F_2N_2 \cdot 2HCl$: 477.42).

Method of preparation Prepare as directed under Capsules, with Flunarizine Dihydrochloride.

Identification (1) Weigh an amount of Flunarizine Dihydrochloride Capsules, equivalent to 10 mg of flunarizine dihydrochloride RS, according to the labeled amount. Dissolve in 10 mL of methanol, filter, and use the filtrate as the test solution. Separately, weigh 10 mg of flunarizine dihydrochloride RS, dissolve in 10 mL of methanol, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on a thin-layer chromatographic plate made of silica gel for thin-layer chromatography (with a fluorescent indicator). Next, develop the plate with a mixture of *n*-heptane, methanol, ethyl acetate and acetic acid(100) (7 : 1.5 : 1.5 : 0.1) (as the developing solvent) to a distance of about 15 cm, and air-dry the

plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots from the test solution exhibits R_f values and color corresponding to that of the test solution.

(2) Determine the absorption spectra of the test solution and the standard solution from the Assay as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit the same maximum absorption at the same wavelength.

Dissolution Take 1 capsule of Flunarizine Dihydrochloride Capsules and perform the test at 100 revolutions per minute according to Method 2 under the Dissolution, using 600 mL of the first fluid for the Disintegration as the dissolution medium. Take the dissolved solution 45 minutes after staring the test, filter, and use the filtrate as the test solution. Separately, weigh accurately about 25 mg of flunarizine dihydrochloride RS and dissolve in methanol to make exactly 50 mL. Pipet 1 mL of this solution, add the dissolution medium to make exactly 50 mL, and use this solution as the standard solution. With the test solution and the standard solution, perform the test as directed under the Ultraviolet-visible Spectroscopy using the dissolution medium as a control solution, and determine the absorbances, A_T and A_S, at 252 nm. Meets the requirements if the dissolution rate of Flunarizine Dihydrochloride Capsules in 45 minutes is NLT 70%.

Dissolution rate (%) of flunarizine dihydrochloride ($C_{26}H_{26}F_2N_2 \cdot 2HCl$)
= Amount (mg) of flunarizine dihydrochloride RS
$\times (A_T / A_S) \times (1 / C) \times 24$

C: Labeled amount (mg) of flunarizine dihydrochloride in 1 capsule

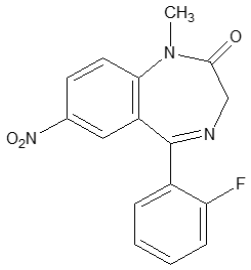
Uniformity of dosage units It meets the requirements when the Content uniformity test is performed according to the following procedure. Perform the test with 1 capsule of Flunarizine Dihydrochloride Capsules as directed under the Assay.

Assay Weigh accurately the mass of the contents of NLT 20 capsules of Flunarizine Dihydrochloride Capsules. Weigh accurately about 10 mg of flunarizine dihydrochloride ($C_{26}H_{26}F_2N_2 \cdot 2HCl$), add 10 mL of 0.1 mol/L hydrochloric acid TS and 40 mL of isopropanol, and dissolve by warming on a steam bath. After cooling, add isopropanol to make exactly 100 mL, and filter through a filter paper. Pipet 10 mL of this solution, add 10 mL of the 0.1 mol/L hydrochloric acid TS, add isopropanol to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 20 mg of flunarizine dihydrochloride RS, add 20 mL of 0.1 mol/L hydrochloric acid TS and 40 mL of isopropanol, and dissolve by warming on a steam bath. After cooling, add isopropanol to make exactly 100 mL. Pipet 5 mL of this solution and add 10 mL of 0.1 mol/L hydrochloric acid TS. Then, add isopropanol to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and standard solution, respectively, at 252 nm as directed under the Ultraviolet-visible Spectroscopy, using isopropanol as a control solution.

Amount (mg) of flunarizine dihydrochloride ($C_{26}H_{26}F_2N_2 \cdot 2HCl$)
= Amount (mg) of flunarizine dihydrochloride RS
$\times (A_T / A_S) \times 0.5$

Packaging and storage Preserve in well-closed containers.

Flunitrazepam
플루니트라제팜



Flunitrazepam $C_{16}H_{12}FN_3O_3$: 313.28
5-(2-Fluorophenyl)-1-methyl-7-nitro-1*H*-benzo[e][1,4]diazepin-2(3*H*)-one [*1622-62-4*]

Flunitrazepam, when dried, contains NLT 99.0% and NMT 101.0% of flunitrazepam ($C_{16}H_{12}FN_3O_3$).

Description Flunitrazepam occurs as a white to pale yellow crystalline powder.
It is freely soluble in acetic acid(100), soluble in acetic anhydride or acetone, slightly soluble in ethanol(99.5) or ether and practically insoluble in water.

Identification (1) Determine the absorption spectra of solutions of Flunitrazepam and flunitrazepam RS in ethanol(99.5) (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Flunitrazepam and flunitrazepam RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Melting point Between 168 and 172 °C.

Purity (1) ***Chloride***—To 1.0 g of Flunitrazepam, add 50 mL of water, allow to stand for 1 hour with occasional shaking, and filter. Take 20 mL of the filtrate, add 6 mL of dilute nitric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare

the control solution with 0.25 mL of 0.01 mol/L hydrochloric acid solution (NMT 0.022%).

(2) ***Heavy metals***—Proceed with 2.0 g of Flunitrazepam in a platinum crucible according to Method 4 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Related substances***—Dissolve 50.0 mg of Flunitrazepam in 10 mL of acetone and use this solution as the test solution. Pipet 2 mL of this solution and add acetone to make exactly 20 mL. Pipet 1 mL of this solution, add acetone to make exactly 25 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on a thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of 1,2-dichloroethane, ether and ammonia water(28) (200 : 100 : 3) as the developing solvent to a distance of about 12 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the number of spots other than the principal spot from the test solution is NMT 2 and they are not more intense than the spot from the standard solution.

Loss on drying NMT 0.5% (1 g, 105 °C, 4 hours).

Residue on ignition NMT 0.1% (1 g, platinum crucible).

Assay Weigh accurately about 0.5 g of Flunitrazepam, previously dried, dissolve in 20 mL of acetic acid(100), add 50 mL of acetic anhydride, and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 31.33 mg of $C_{16}H_{12}FN_3O_3$

Packaging and storage Preserve in light-resistant, tight containers.

Flunitrazepam Tablets
플루니트라제팜 정

Flunitrazepam Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of flunitrazepam ($C_{16}H_{12}FN_3O_3$: 313.28).

Method of preparation Prepare as directed under Tablets, with Flunitrazepam.

Identification Weigh an amount of Flunitrazepam Tablets, equivalent to 10 mg of flunitrazepam according to the labeled amount, add 5 mL of chloroform, shake to mix, centrifuge, and use the clear supernatant as the test solution. Separately, dissolve 20 mg of flunitrazepam RS in 10 mL of chloroform, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Develop the plate with a mixture of ether, nitromethane, heptane and ammonia water(28) (60 : 30 : 15 : 2) (as the developing solvent) to a distance of about 15 cm, and air-dry the plate. Spray evenly 2 mol/L sodium hydroxide TS on the plate; the spots obtained from the standard solution exhibits R_f values corresponding to that of the test solution.

Disintegration Meets the requirements.

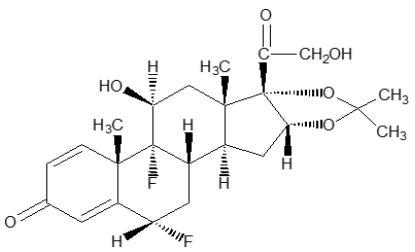
Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 tablets of Flunitrazepam Tablets, and powder. Weigh accurately an amount of the powder equivalent to about 5 mg of flunitrazepam ($C_{16}H_{12}FN_3O_3$), add 2 mL of water, and allow to stand for 2 minutes. Then, add 95% ethanol to make 100 mL. Centrifuge this solution, pipet 10 mL of the clear supernatant, add ethanol(95) to make exactly 50 mL, and use this solution as the test solution. Weigh accurately about 50 mg of flunitrazepam RS, add 2 mL of water, allow to stand for 2 minutes, and add ethanol(95) to make exactly 100 mL. Pipet 1 mL of this solution, add ethanol(95) to make exactly 50 mL, and use this solution as the standard solution. Determine the absorbances, A_T and A_S of the test solution and the standard solution, at the wavelength of 309 nm as directed under the Ultraviolet-visible Spectroscopy, using ethanol(95) as a control solution.

Amount (mg) flunitrazepam ($C_{16}H_{12}FN_3O_3$)
= Amount (mg) of flunitrazepam RS × (A_T / A_S)× 0.1

Packaging and storage Preserve in tight containers.

Fluocinolone Acetonide
플루오시놀론아세토니드



Fluocinolone Acetonide $C_{24}H_{30}F_2O_6$: 452.49
2-{(6*S*,8*S*,9*R*,10*S*,11*S*,13*S*,14*S*,16*R*,17*S*)-6,9-difluoro-11-ihydroxy-16,17-[(2-propylidene) *bis*(oxy)]-10,13-dimethyl-3-oxo-6,7,8,9,10,11,12,13,14,15,16,17-dodecahydro-3*H*-cyclopenta[a] phenanthren-17-yl)}-2-

oxoethanol [*67-73-2*]

Fluocinolone Acetonide, when dried, contains NLT 97.0% and NMT 102.0% of fluocinolone acetonide ($C_{24}H_{30}F_2O_6$).

Description Fluocinolone Acetonide occurs as white crystals or a crystalline powder. It is odorless.
It is freely soluble in acetic acid(100) and acetone, soluble in ethanol(99.5), sparingly soluble in methanol or chloroform, slightly soluble in acetonitrile, very slightly soluble in ether and practically insoluble in water.

Melting point—266 to 274 °C (with decomposition).

Identification (1) To 2 mg of Fluocinolone Acetonide, and add 2 mL of dilute nitric acid; the solution turns yellow.

(2) Dissolve 0.01 g of Fluocinolone Acetonide in 1 mL of methanol, add 1 mL of Fehling's TS, and heat; a red precipitate is produced.

(3) Weigh 10 mg of Fluocinolone Acetonide, and prepare the test solution as directed under the Oxygen Flask Combustion with a mixture of 0.5 mL of 0.01 mol/L sodium hydroxide TS and 20 mL of water as an absorbent; the test solution responds to the Qualitative Analysis for fluoride.

(4) Determine the infrared spectra of Fluocinolone Acetonide and fluocinolone acetonide RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers. If any difference appears between the spectra, dissolve Fluocinolone Acetonide and fluocinolone acetonide RS in acetone, respectively, then evaporate the acetone to dryness, and repeat the test with the residues.

Optical rotation $[\alpha]_D^{20}$ Between +98° and +108° (after drying, 0.1 g, methanol, 10 mL, 100 mm).

Purity ***Related substance***—Dissolve 15 mg of Fluocinolone Acetonide in 25 mL of the mobile phase, and use this solution as the test solution. Pipet 2 mL of this solution, add the mobile phase to it make exactly 100 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak areas in each solution as directed in the automatic integration method; the total area of peaks other than the major peak from the test solution is not greater than the major peak area from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 to 25 cm in length, packed with silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 30 °C.

Mobile phase: A mixture of water-saturated chloroform, methanol and acetic acid(100) (200 : 3 : 2).

Flow rate: Adjust the flow rate so that the retention time of fluocinolone acetonide is about 12 minutes.

System suitability

Test for required detectability: Take exactly 5 mL of the standard solution, and add the mobile phase to make exactly 100 mL. Confirm that the major peak area of obtained from 20 mL of this solution is equivalent to 4% to 6% of that obtained from 20 μL of the standard solution.

System performance: Dissolve 15 mg each of Fluocinolone Acetonide and triamcinolone acetonide in 25 mL of the mobile phase. To 5 mL of this solution, add the mobile phase to make 20 mL. Proceed with 20 μL of this solution according to the above operating conditions; triamcinolone acetonide and fluocinolone acetonide are eluted in this order with the resolution being NLT 1.9.

System repeatability: Repeat the test 6 times with 20 μL of the standard solution according to the above operating conditions; the relative standard deviation of the peak area ratios of fluocinolone acetonide is NMT 1.0%.

Time span of measurement: A range of about 2 times the retention time of fluocinolone acetonide after the solvent peak.

Loss on drying NMT 1.0% (0.2 g, in vacuum, 105 °C, 3 hours).

Residue on ignition NMT 0.1% (0.2 g, platinum crucible).

Assay Weigh accurately about 20 mg each of Fluocinolone Acetonide and fluocinolone acetonide RS, previously dried, dissolve in 40 mL of the mobile phase, add exactly 10 mL of the internal standard solution each, and add the mobile phase to make 100 mL. Use these solutions as the test solution and standard solution, respectively. Perform the test with 20 μL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the ratios of the peak area, Q_T and Q_S, of fluocinolone acetonide to that of internal standard, respectively.

$$\text{Amount (mg) of fluocinolone acetonide } (C_{24}H_{30}F_2O_6) = \text{amount (mg) of fluocinolone acetonide RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of ethylparaben in methanol (1 in 2500).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octa-

decylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: A mixture of water and acetonitrile (7 : 3).

Flow rate: Adjust the flow rate so that the retention time of fluocinolone acetonide is about 20 minutes.

System suitability

System performance: Dissolve 5 mg each of isopropyl p-hydroxybenzoate and propyl p-hydroxybenzoate in 50 mL of acetonitrile, and add water to make 100 mL. Proceed with 20 μL of this solution according to the above operating conditions; isopropyl p-hydroxybenzoate and propyl p-hydroxybenzoate are eluted in this order with the resolution being NLT 1.9.

System repeatability: Repeat the test 6 times with 20 μL of the standard solution according to the above operating conditions; the relative standard deviation of the peak area ratios of fluocinolone acetonide is NMT 1.0%.

Packaging and storage Preserve in light-resistant, tight containers.

Fluocinolone Acetonide Cream
플루오시놀론아세토니드 크림

Fluocinolone Acetonide Cream contains NLT 90.0% and NMT 110.0% of the labeled amount of fluocinolone acetonide ($C_{24}H_{30}F_2O_6$: 452.49).

Method of preparation Prepare as directed under Creams, with Fluocinolone Acetonide.

Identification Weigh an amount of Fluocinolone Acetonide Cream, equivalent to about 0.5 mg of fluocinolone acetonide, according to the labeled amount, put in a centrifuge tube, disperse in 5 mL of water, and add 10 mL of chloroform. Shake to mix, and then centrifuge. Discard the water layer, add 10 mL of water, shake, and then centrifuge. Dehydrate 2 mL of the chloroform extract by adding about 0.2 g of anhydrous sodium sulfate, and use this solution as the test solution. Separately, dissolve 5 mg of fluocinolone acetonide RS in 100 mL of chloroform, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 50 μL each of the test solution and the standard solution onto a thin-layer chromatographic plate made of silica gel with fluorescence indicator for thin-layer chromatography. Next, develop the plate with a mixture of chloroform and diethylamine (2 : 1) as the developing solvent to a distance of about 12 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the color and R_f values of the principal spots from the test solution and standard solution are the same.

Assay Weigh accurately an amount of Fluocinolone Acetonide Cream, equivalent to about 0.75 mg of fluocinolone acetonide ($C_{24}H_{30}F_2O_6$), according to the labeled amount, add about 10 mL of acetonitrile, and dissolve by warming on a steam bath. Transfer to a 25-mL volumetric flask, using 2 mL each of acetonitrile 3 times. Add 3.0 mL of the internal standard solution and 5.0 mL of water to mix, then add acetonitrile to the gauge line, cool in iced water, and centrifuge. Use the clear supernatant as the test solution. Separately, weigh accurately an appropriate amount of fluocinolone acetonide RS, previously dried at 105 ℃ for 3 hours, and dissolve in acetonitrile to prepare a solution containing 300 μg per mL. Pipet 5 mL each of this solutions, add 6.0 mL of the internal standard solution and 15.0 mL of water, and then add acetonitrile to make exactly 50 mL. Use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak area ratios, Q_T and Q_S, of fluocinolone acetonide to that of the internal standard, respectively.

$$\text{Amount (mg) of fluocinolone acetonide } (C_{24}H_{30}F_2O_6) = \text{Amount (mg) of fluocinolone acetonide RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of norethindrone in acetonitrile (2 in 10000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm to 10 μm in particle diameter).

Mobile phase: A mixture of water and acetonitrile (5 : 3).

Flow rate: 2 mL/min

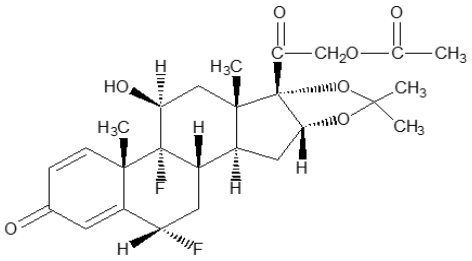
System suitability

System performance: Proceed with 10 μL of the standard solution according to the above conditions; the resolution between the peak of the internal standard and the peak of fluocinolone acetonide is NLT 2.0.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area ratio of fluocinolone acetonide to the peak area of the internal standard is NMT 1.5%.

Packaging and storage Preserve in tight containers.

Fluocinonide
플루오시노니드



Fluocinonide $C_{26}H_{32}F_2O_7$: 494.53
2-{(6*S*,8*S*,9*R*,10*S*,11*S*,13*S*,14*S*,16*R*,17*S*)-6,9-difluoro-11-hydroxy-16,17-[(2-propylidene)*bis*(oxy)]-10,13-dimethyl-3-oxo-6,7,8,9,10,11,12,13,14,15,16,17-dodecahydro-3*H*-cyclopenta[a]phenanthren-17-yl)}-2-oxoethyl acetate [*356-12-7*]

Fluocinonide, when dried, contains NLT 97.0% and NMT 103.0% of fluocinonide ($C_{26}H_{32}F_2O_7$).

Description Fluocinonide occurs as white crystals or a crystalline powder.
It is sparingly soluble in chloroform, slightly soluble in acetonitrile, methanol, ethanol(95) or ethyl acetate, very slightly soluble in ether, and practically insoluble in water.

Identification (1) To 10 mg of Fluocinonide, add 4 mL of water and 1 mL of Fehling's TS, and heat; a red precipitate is produced.

(2) Weigh 10 mg of Fluocinonide, and prepare the test solution as directed under the Oxygen Flask Combustion with a mixture of 0.5 mL of 0.01 mol/L sodium hydroxide TS and 20 mL of water as an absorbent; the test solution responds to the Qualitative Analysis for fluoride.

(3) Determine the absorption spectra of solutions of Fluocinonide and fluocinonide RS in methanol (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(4) Determine the infrared spectra of Fluocinonide and fluocinonide RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers. If any difference appears between the absorption spectra, dissolve Fluocinonide and fluocinonide RS in ethyl acetate, respectively, evaporate ethyl acetate to dryness, and perform the test with the residue in the same manner.

Optical rotation $[\alpha]_D^{20}$: Between -81° and +89° (0.2 g after drying, chloroform, 20 mL, 100 mm).

Purity ***Related substance***—Dissolve 10 mg of Fluocinonide in 2 mL of chloroform, and use this solution as the test solution. Pipet 1.0 mL of this solution, add chloroform to make exactly 100 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and standard solution on a thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Develop the plate with a mixture of chloroform and methanol (97 : 3) as the developing solvent to a distance of about 12 cm, and air-dry the plate. Spray evenly alkaline blue tetrazolium TS on the plate; the spots other than the principal spot obtained from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 1.0% (5 g, 105 °C, 3 hours).

Residue on ignition NMT 0.1% (0.5 g, platinum crucible).

Assay Weigh accurately about 20 mg each of Fluocinonide and fluocinonide RS, previously dried, dissolve each in 50 mL of acetonitrile, add 8.0 mL of the internal standard solution, respectively, and add the water to make exactly 100 mL. Use these solutions as the test solution and standard solution, respectively. Perform the test with 20 μL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the ratios of the peak area, Q_T and Q_S, of fluocinonide to that of internal standard, respectively.

$$\text{Amount (mg) of fluocinonide } (C_{26}H_{32}F_2O_7) = \text{amount (mg) of fluocinonide RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of propyl benzoate in acetonitrile (1 in 100).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: A mixture of acetonitrile and water (1: 1).

Flow rate: Adjust the flow rate so that the retention time of fluocinonide is about 8 minutes.

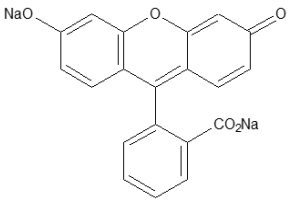
System suitability

System performance: Proceed with 20 μL of the standard solution according to the above operating conditions; fluocinonide and the internal standard are eluted in this order with the resolution being NLT 6.

System repeatability: Repeat the test 6 times with 20 μL of the standard solution according to the above conditions; the relative standard deviation of the ratios of the peak area of fluocinonide to that of the internal standard is NMT 1.0%.

Packaging and storage Preserve in well-closed containers.

Fluorescein Sodium
플루오레세인나트륨



Fluorescein Sodium $C_{20}H_{10}Na_2O_5$: 376.27
2-(6-Hydroxy-3-oxo-3*H*-xanthen-9-yl)benzoic acid [*518-47-8*]

Fluorescein Sodium contains NLT 98.5% and NMT 101.0% of fluorescein sodium ($C_{20}H_{10}Na_2O_5$), calculated on the dried basis.

Description Fluorescein Sodium is an orange powder, and is odorless and tasteless.
It is freely soluble in water, methanol or ethanol(95), and practically insoluble in ether.
It is hygroscopic.

Identification (1) An aqueous solution of Fluorescein Sodium (1 in 100) has a strong green fluorescence. Add a large quantity of water but the fluorescence remains. Acidify the solution with hydrochloric acid, and the fluorescence disappears. Then render the solution alkaline with sodium hydroxide TS; the fluorescence reappears.

(2) Place an aqueous solution of Fluorescein Sodium (1 in 2000) dropwise on a piece of filter paper; a yellow spot develops. Expose the filter paper, while moist, to the bromine gas for 1 minute and then to ammonia gas; the spot exhibits a red color.

(3) Ignite 0.5 g of Fluorescein Sodium to carbonize. After cooling, add 20 mL of water to the residue, shake to mix, and filter; the filtrate responds to the Qualitative Analysis for sodium salt.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Fluorescein Sodium in 10 mL of water; the resulting solution is clear and exhibits a red color.

(2) ***Chloride***—Dissolve 0.15 g of Fluorescein Sodium in 20 mL of water, add 6 mL of dilute nitric acid and water to make 30 mL, and filter. To 20 mL of the filtrate, add 2 mL of dilute nitric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 1.0 mL of 0.01 mol/L hydrochloric acid (NMT 0.355%).

(3) ***Sulfate***—Dissolve 0.20 g of Fluorescein Sodium in 30 mL of water, add 2.5 mL of dilute nitric acid and water to make 40 mL, and filter. Add water to 20 mL of the filtrate to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 1.0 mL of 0.005 mol/L sulfuric acid (NMT 0.480%).

(4) ***Zinc***—Dissolve 0.1 g of Fluorescein Sodium in 10 mL of water, add 2 mL of hydrochloric acid, and filter. To the filtrate, add 0.1 mL of potassium hexacyanoferrate(II) TS; no turbidity is produced immediately.

(5) ***Related substances***—Weigh 0.20 g of Fluorescein Sodium, dissolve in exactly 10 mL of methanol and use this solution as the test solution. With this solution, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL of the test solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Develop the plate with a mixture of chloroform, methanol and ammonia water(28) (30 : 15 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate; any colored spot other than the principal spot does not appear.

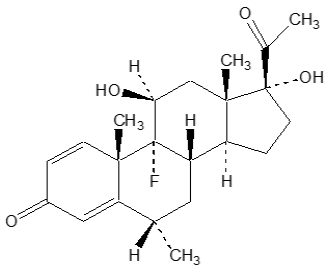
Loss on drying NMT 10.0% (1 g, 105 ℃, constant mass).

Assay Weigh accurately about 0.5 g of Fluorescein Sodium, transfer to a separatory funnel, dissolve in 20 mL of water, and add 5 mL of dilute hydrochloric acid. Extract 4 times with 20 mL of a mixture of 2-methyl-1-propanol and chloroform (1 : 1). Wash each extract successively with 10 mL of water. Evaporate the combined extracts on a steam bath with the aid of a current of air. Dissolve the residue in 10 mL of ethanol(99.5), evaporate the solution to dryness on a steam bath, dry the residue at 105 ℃ for 1 hour, and weigh as fluorescein ($C_{20}H_{12}O_5$: 332.31).

Amount (mg) of fluorescein sodium ($C_{20}H_{10}Na_2O_5$)
= Amount (mg) of fluorescein ($C_{20}H_{12}O_5$) × 1.1323

Packaging and storage Preserve in tight containers.

Fluorometholone
플루오로메톨론



Fluorometholone $C_{22}H_{29}FO_4$: 376.46
(6*S*,8*S*,9*R*,10*S*,11*S*,13*S*,14*S*,17*R*)-17-Acetyl-9-fluoro-11,17-dihydroxy-6,10,13-trimethyl-6,7,8,9,10,11,12,13,14,15,16,17-dodecahydro-3*H*-cyclopenta[a]phenanthren-3-one [*426-13-1*]

Fluorometholone, when dried, contains NLT 97.0% and NMT 103.0% of fluorometholone ($C_{22}H_{29}FO_4$).

Description Fluorometholone occurs as a white to pale yellowish white crystalline powder, and is odorless.
It is freely soluble in pyridine, slightly soluble in methanol, ethanol(95) or tetrahydrofuran, and practically insoluble in water or ether.

Identification (1) Proceed with 7 mg of Fluorometholone as directed under the Oxygen Flask Combustion, using a mixture of 0.5 mL of 0.01 mol/L sodium hydroxide TS and 20 mL of water as the absorbent; the resulting test solution responds to the Qualitative Analysis (2) for fluoride.

(2) Determine the absorption spectra of solutions of Fluorometholone and fluorometholone RS (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared spectra of Fluorometholone and fluorometholone RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Optical rotation $[\alpha]_D^{20}$: Between +52° and +60° (0.1 g after drying, pyridine, 10 mL, 100 mm).

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Fluorometholone according to Method 3 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Related substances***—Dissolve 20 mg of Fluorometholone in 10 mL of tetrahydrofuran and use this solution as the test solution. Pipet 1 mL of this solution, add tetrahydrofuran to make exactly 100 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 25 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of dichloromethane, acetone and methanol (45 : 5 : 1) as the developing solvent to a distance of about 12 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 1.0% (0.2 g, in vacuum, phosphorus pentoxide, 60 ℃, 3 hours).

Residue on ignition NMT 0.2% (0.2 g, platinum crucible).

Assay Weigh accurately about 0.10 g each of Fluorometholone and fluorometholone RS, previously dried, and dissolve each in methanol to make exactly 100 mL. Pipet 5 mL each of these solutions, and add diluted methanol (7 in 10) to make exactly 50 mL. Pipet 10 mL each of these solutions, add exactly 10 mL of the internal standard solution each, add again diluted methanol (7 in 10) to make 100 mL, and use these solutions as the test solution and the standard solution. Perform the test with 25 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the ratios, Q_T and Q_S, of the peak area of fluorometholone to that of the internal standard.

$$\text{Amount (mg) of fluorometholone } (C_{22}H_{29}FO_4) = \text{amount (mg) of fluorometholone RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of butyl p-hydroxybenzoate in methanol (1 in 10000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column, about 4 mm in internal diameter and 25 cm to 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 35 ℃.

Mobile phase: Diluted methanol (7 in 10).

Flow rate: Adjust the flow rate so that the retention time of fluorometholone is about 8 minutes.

System suitability

System performance: Proceed with 20 μL of the standard solution according to the above conditions; fluorometholone and the internal standard are eluted in this order with the resolution between their peaks being NLT 4.

Packaging and storage Preserve in light-resistant, well-closed containers.

Fluorometholone and Tetrahydrozoline Hydrochloride Ophthalmic Suspension
플루오로메톨론·테트라히드로졸린염산염 점안현탁액

Fluorometholone and Tetrahydrozoline Hydrochloride Ophthalmic Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of fluorometholone ($C_{22}H_{29}FO_4$: 376.47) and tetrahydrozoline hydrochloride ($C_{13}H_{16}N_2 \cdot HCl$: 236.75).

Method of preparation Prepare as directed under Ophthalmic Solutions, with Fluorometholone and Tetrahydrozoline Hydrochloride.

Identification (1) ***Fluorometholone***—Shake Fluorometholone and Tetrahydrozoline Hydrochloride Ophthalmic Suspension vigorously to mix, put 4 mL in a sep-

aratory funnel, add 1 g of sodium chloride, and shake vigorously until the sodium chloride is dissolved. Add 2 mL of 1 mol/L hydrochloric acid, extract 5 times with 20 mL of ethyl acetate, add the extract to a 250-mL round flask, and evaporate to dryness in an evaporator. Dissolve the residue in 4 mL of methanol, and use this solution as the test solution. Separately, weigh 20 mg of fluorometholone RS, dissolve in methanol to make 20 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 25 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescence indicator for thin-layer chromatography. Next, develop the plate with a mixture of toluene, methanol and ethyl acetate (4 : 1 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm) or spray evenly a coloring agent onto the plate, and heat at 110 °C for 10 minutes; the R_f value and color of the spots obtained from the test solution and the standard solution are the same.

Coloring agent: While cooling with iced water, add carefully 10 mL of sulfuric acid into a beaker containing 10 mL of methanol. This test solution can be stored in a tight container for 1 week.

(2) ***Tetrahydrozoline hydrochloride***—Take 10 mL of Fluorometholone and Tetrahydrozoline Hydrochloride Ophthalmic Suspension, filter through a filter paper, and then take 8.0 mL of the filtrate to put in a separatory funnel. Add 2 mL of 2 mol/L sodium hydroxide solution and 2 g of sodium chloride, and shake vigorously until the sodium chloride is dissolved. Extract this 5 times with 10 mL of ethyl acetate, add the extracts to a 100-mL round flask, and evaporate to dryness in an evaporation concentrator. Dissolve the residue in 2 mL of ethanol, and use this solution as the test solution. Separately, weigh accurately about 50 mg of tetrahydrozoline hydrochloride RS, dissolve in ethanol to make exactly 50 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 25 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescence indicator for thin-layer chromatography. Next, develop the plate using a mixture of methanol, acetic acid and water (8 : 1 : 1) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm) or spray evenly Dragendorff's TS onto the plate; the R_f values and color of the spots obtained from the test solution and the standard solution are the same.

pH Between 5.8 and 7.8.

Sterility Meets the requirements.

Particulate contamination: Visible particles Meets the requirements.

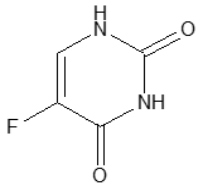
Particulate matter in Ophthalmic solutions Meets the requirements.

Assay (1) ***Fluorometholone***—Perform the test as directed under the section on Fluorometholone ophthalmic suspension in the US Pharmacopeia (USP).

(2) ***Tetrahydrozoline hydrochloride***—Perform the test as directed under the section on tetrahydrozoline hydrochloride ophthalmic solution in the US Pharmacopeia (USP).

Packaging and storage Preserve in tight containers.

Fluorouracil
플루오로우라실



Fluorouracil $C_4H_3FN_2O_2$: 130.08
5-Fluoropyrimidine-2,4(1*H*,3*H*)-dione [*51-21-8*]

Fluorouracil, when dried, contains NLT 98.5% and NMT 101.0% of fluorouracil ($C_4H_3FN_2O_2$). It also contains NLT 13.1% and NMT 16.1% of fluorine (F: 19.00).

Description Fluorouracil occurs as white crystals or a crystalline powder, which is odorless.
It is freely soluble in *N*,*N*-dimethylformamide, sparingly soluble in water, slightly soluble in ethanol(95) and practically insoluble in ether.

Melting point—About 282°C (with decomposition).

Identification (1) To 5 mL of an aqueous solution of Fluorouracil (1 in 500), add 0.2 mL of bromine TS; the color of the test solution disappears. Again, add 2 mL of barium hydroxide TS; a purple precipitate is formed.

(2) Weigh 10 mg of Fluorouracil, and prepare the test solution as directed under the Oxygen Flask Combustion with a mixture of 0.5 mL of 0.01 mol/L sodium hydroxide TS and 20 mL of water as an absorbent; the test solution responds to the Qualitative Analysis for fluoride.

(3) Determine the absorption spectra of solutions of solutions of Fluorouracil and fluorouracil RS in 0.1 mol/L hydrochloric acid TS (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

Purity (1) ***Clarity and color of solution***—Dissolve 0.20 g of Fluorouracil in 20 mL of water by warming; the so-

lution is clear and colorless.

(2) ***Fluoride***—Weigh 1.10 g of Fluorouracil and dissolve in 10.0 mL of 0.1 mol/L dilute sodium hydroxide (1 in 20). To 5.0 mL of this solution, add 10 mL of a mixture of alizarin complexone TS, acetic acid-potassium acetate buffer solution (pH 4.3) and cerium(III) nitrate TS (1 : 1 : 1), add water to make exactly 20 mL, allow to stand for 1 hour, and use this solution as the test solution. Separately, add 5.0 mL of 0.01 mol/L dilute sodium hydroxide TS (1 in 20) to 1.0 mL of standard fluorine solution, add 10 mL of a mixture of alizarin complexone TS, acetic acid-potassium acetate buffer solution (pH 4.3) and cerium(III) nitrate TS (1 : 1 : 1), and proceed in the same manner as the test solution. Use this solution as the standard solution. Determine the absorbance of these solutions as directed under the Ultraviolet-visible Spectroscopy using a solution obtained by proceeding with 5.0 mL of 0.01 mol/L dilute sodium hydroxide TS (1 in 20) in the same manner as the standard solution as a control; the absorbance of the test solution at 600 nm not greater than that of the standard solution (NMT 0.012%).

(3) ***Heavy metals***—Proceed with 1.0 g of Fluorouracil according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(4) ***Arsenic***—Put 1.0 g of Fluorouracil into a crucible, add 10 mL of a solution of magnesium nitrate in ethanol(95) (1 in 10), ignite with ethanol(95) to combust, and then incinerate by heating at 750 to 850 °C. If a carbonized substance remains in this method, moisten with a small amount of nitric acid, and incinerate by ignition. Cool, add 10 mL of dilute hydrochloric acid to the residue, dissolve by warming on a steam bath, use this solution as the test solution, and perform the test (NMT 2 ppm).

(5) ***Related substances***—Weigh 0.10 g of Fluorouracil, dissolve in 10 mL of water, and use this solution as the test solution. Pipet 1 mL of this solution, add water to make exactly 200 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, acetone and water (7 : 4 : 1) as the developing solvent to a distance of about 12 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 0.5% (1 g, in vacuum, 80 °C, 4 hours).

Residue on ignition NMT 0.1% (1 g).

Assay (1) ***Fluorouracil***—Weigh accurately about 0.2 g of Fluorouracil, previously dried, dissolve in 20 mL of *N*,*N*-dimethylformamide, and titrate with 0.1 mol/L tetramethylammonium hydroxide VS (indicator: 3 drops of thymol blue-dimethylformamide TS). However, the endpoint of the titration is when this solution changes from yellow to bluish green and then finally to blue. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L tetramethylammonium hydroxide
= 13.008 mg of $C_4H_3FN_2O_2$

(2) ***Fluorine***—Weigh accurately about 4 mg of Fluorouracil, previously dried, and perform the test as directed under the Assay of fluorine under the Oxygen Flask Combustion, using a mixture of 0.5 mL of 0.01 mol/L sodium hydroxide TS and 20 mL of water as an absorbent.

Packaging and storage Preserve in tight containers.

Fluorouracil Cream
플루오로우라실 크림

Fluorouracil Cream contains NLT 90.0% and NMT 110.0% of the labeled amount of fluorouracil ($C_4H_3FN_2O_2$: 130.08).

Method of preparation Prepare as directed under Creams, with Fluorouracil. Sodium hydroxide may be added to adjust the pH of Fluorouracil Cream.

Identification Weigh an amount of Fluorouracil Cream, equivalent to 5 mg of fluorouracil, according to the labeled amount, put in an Erlenmeyer flask with a stopper, add 50 mL of ethanol(95), and shake to mix. Use this solution as the test solution. Separately, weigh 5 mg of fluorouracil RS, dissolve in 50 mL of ethanol(95), and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Using 100 μL each of the test solution and the standard solution, spot 20 μL each of the solution 5 times at the line 3 cm from the bottom end of a thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, methanol and ammonia water(28) (75 : 25 : 1) as the developing solvent to a distance of about 15 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the R_f value and the color of the spots obtained from the test solution and the standard solution are the same.

Assay Weigh accurately an amount of Fluorouracil Cream, equivalent to about 10 mg of fluorouracil ($C_4H_3FN_2O_2$), add 20 mL of methanol, shake to mix, and add water to make 100 mL. Pipet 1 mL of this solution, add water to make 10 mL, filter, and use the filtrate as the test solution. Separately, weigh accurately about 10 mg of

fluorouracil RS, previously dried, dissolve in water to make 100 mL, pipet 1 mL of this solution, and add water to make 10 mL. Use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the operating conditions under Fluorouracil injection, and determine the peak areas, A_T and A_S, of fluorouracil.

$$\text{Amount (mg) of fluorouracil } (C_4H_3FN_2O_2) = \text{Amount (mg) of fluorouracil RS} \times \frac{A_T}{A_S}$$

Packaging and storage Preserve in tight containers.

Fluorouracil Injection
플루오로우라실 주사액

Fluorouracil Injection is an aqueous solution for injection and contains NLT 90.0% and NMT 110.0% of the labeled amount of fluorouracil ($C_4H_3FN_2O_2$: 130.08).

Method of preparation Prepare as directed under Injections, with Fluorouracil by adding sodium hydroxide.

Description Fluorouracil Injection occurs as a clear, colorless liquid.

Identification (1) The retention times of the major peaks from the test solution and the standard solution obtained under the Assay are the same.

(2) Take an amount of Fluorouracil Injection equivalent to about 0.1 g of fluorouracil according to the labeled amount, carefully acidify with acetic acid(100), and shake the solution to precipitate fluorouracil. Collect the precipitate, wash with 1 mL of water, and dry at 80 ℃ for 4 hours in a desiccator (phosphorus pentoxide). Determine the infrared spectra of the precipitate and Fluorouracil RS, respectively, as directed in the paste method under Infrared Spectrophotometry: both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) Proceed as directed under the Identification (1) under Fluorouracil.

pH Between 8.6 and 9.4.

Sterility Meets the requirements.

Bacterial endotoxins Less than 0.33 EU per mg of fluorouracil.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Extractable volume of injections Meets the requirements.

Assay Pipet an amount of fluorouracil injection equivalent to about 50 mg of fluorouracil ($C_4H_3FN_2O_2$) according to the labeled amount, and add water to make exactly 100 mL. Take 5 mL of this solution, add water to make 250 mL, and use this solution as the test solution. Separately, weigh accurately about 10 mg of fluorouracil RS, previously dried, dissolve in water to make 100 mL, pipet 5 mL of this solution, add water to make 50 mL and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions and determine the peak areas, A_T and A_S, of fluorouracil for the test solution and the standard solution, respectively.

$$\text{Amount (mg) of fluorouracil } (C_4H_3FN_2O_2) = \text{Amount (mg) of fluorouracil RS} \times \frac{A_T}{A_S} \times 5$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 to 10 μm in particle diameter).

Mobile phase: Water

Flow rate: 1.0 mL/min

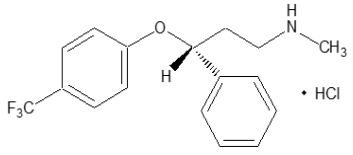
System suitability

System performance: Proceed with 10 μL of the standard solution according to the above conditions; the number of theoretical plates of the fluorouracil peak is NLT 2500.

System repeatability: Repeat the test 6 times with 10 μL of the standard solution according to the above conditions; the relative standard deviation of the peak area of fluorouracil is NMT 2.0%.

Packaging and storage Preserve in light-resistant hermetic containers in a dark place, avoiding freezing.

Fluoxetine Hydrochloride
플루옥세틴염산염



and enantiomer

$C_{17}H_{18}F_3NO \cdot HCl$: 345.79

N-Methyl-3-phenyl-3-[4-

(trifluoromethyl)phenoxy]propan-1-aminehydrochloride [*56296-78-7*]

Fluoxetine Hydrochloride contains NLT 98.0% and NMT 102.0% of fluoxetine hydrochloride ($C_{17}H_{18}F_3NO \cdot HCl$), calculated on the anhydrous basis.

Description Fluoxetine Hydrochloride occurs as a white crystalline powder.
It is freely soluble in ethanol(95) or methanol, sparingly soluble in water or dichloromethane, and practically insoluble in ether.

Identification (1) Determine the infrared spectra of Fluoxetine Hydrochloride and fluoxetine hydrochloride RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) An aqueous solution of Fluoxetine Hydrochloride (1 in 50) responds to the Qualitative Analysis for chloride.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Fluoxetine Hydrochloride as directed under Method 2 and perform the test. Prepare the control solution with 3.0 mL of lead standard solution (NMT 30 ppm).

(2) ***Related substances***—Weigh accurately about 56 mg of Fluoxetine Hydrochloride, dissolve in the mobile phase to make exactly 10 mL, and use this solution as the test solution (1). To 2.0 mL of the test solution (1), add the mobile phase to make exactly 10 mL, and use this solution as the test solution (2). Perform the test with exactly 10 μL each of the test solutions (1) and (2) as directed under the Liquid Chromatography according to the following operating conditions, and determine the peak area of fluoxetine related substance I, i.e. [(α,α,α-(trifluoro-*m*-tolyl)oxy]propylamine hydrochloride}, A_T, and the peak area of fluoxetine, A_U, obtained from the test solution (2). Determine the peak area of individual related substance, A_i, and the total area of related substance peaks other than the major peak, A_S, obtained from the test solution (1). The amount of related substance I is NMT 0.15%, the amount of α-[2-(methylamino)ethyl]benzene methanol is NMT 0.25%, the amount of fluoxetine related substance II (*N*-methyl-3-phenylpropylamine) is NMT 0.25%, the amount of each related substance is NMT 0.1%, and the total amount of related substances is NMT 0.5%.

$$\text{Content (\%) of fluoxetine related substance I} = 100 \times \frac{A_T}{A_T + A_U}$$

$$\text{Content (\%) of individual related substances} = 100 \times \frac{A_T}{A_T + 5A_U}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 215 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with base-deactivated octylsilyl silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of triethylamine buffer solution, stabilizer-free tetrahydrofuran, and methanol (6 : 3 : 1).

Flow rate: 1 mL/min

System suitability

System performance: Dissolve about 22 mg of fluoxetine hydrochloride in 10 mL of 1 mol/L sulfuric acid TS, heat at 80 °C for 3 hours, cool it, put 0.4 mL of this solution into the 25 mL volumetric flask, weigh and add 28 mg of fluoxetine hydrochloride RS, 1 mg of fluoxetine related substance I RS and 1 mg of fluoxetine related substance II RS, then add the mobile phase to make exactly 25 mL. Proceed with 10 μL of this solution according to the above operation conditions; the relative retention times of peaks of α-[2-(methylamino)ethyl]benzene methanol, related substance II, related substance I, fluoxetine and 4-trifluoromethylphenyl are about 0.24, 0.27, 0.94, 1.0 and 2.17, respectively, while the peak height ratio of the related substance I to the valley depth between the fluoxetine peak and the related substance I peak, measured from the related substance I peak, is NMT 1.1.

Time span of measurement: At least 2 times the retention time of fluoxetine.

Triethylamine buffer solution—Add 980 mL of water to 10 mL of triethylamine, then add phosphoric acid to adjust the pH to 6.0.

Water NMT 0.5% (1 g, volumetric titration, direct titration).

Assay Weigh accurately about 10 mg each of Fluoxetine Hydrochloride and fluoxetine hydrochloride RS, dissolve in the mobile phase to make exactly 100 mL each, and use these solutions as the test solution and standard solution, respectively. Perform the test with 10 μL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the major peak areas from each solution, A_T and A_S, respectively.

$$\text{Amount (mg) of fluoxetine hydrochloride } (C_{17}H_{17}F_3NO \cdot HCl) = \text{amount (mg) of fluoxetine hydrochloride RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 215 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with base-deactivated octylsilyl silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of triethylamine buffer solution, stabilizer-free tetrahydrofuran, and methanol (6 : 3 : 1).

Flow rate: 1 mL/min

System suitability

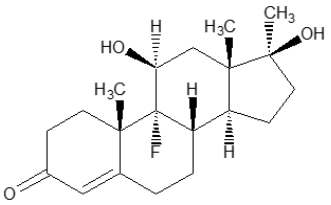
System performance: Proceed with 10 μL of the standard solution according to the above operating conditions; the symmetry factor for fluoxetine peak is NMT 2.0.

System repeatability: Repeat the test 5 times with 10 μL of the standard solution according to the above operating conditions; the relative standard deviation of the peak area of fluoxetine is NMT 2.0%.

Triethylamine buffer solution—Add 980 mL of water to 10 mL of triethylamine, then add phosphoric acid to adjust the pH to 6.0.

Packaging and storage Preserve in tight containers.

Fluoxymesterone
플루옥시메스테론



Fluoxymesterone $C_{20}H_{29}FO_3$: 336.44
(8*S*,9*R*,10*S*,11*S*,13*S*,14*S*,17*R*)-17-Acetyl-9-fluoro-11,17-dihydroxy-10,13-dimethyl-1,2,6,7,8,9,10,11,12,13,14,15,16,17-tetradecahydro-3*H*-cyclopenta[a]phenanthren-3-one [*76-43-7*]

Fluoxymesterone, when dried, contains NLT 97.0% and not more then 102.0% of fluoxymesterone ($C_{20}H_{29}FO_3$).

Description Fluoxymesterone occurs as white crystals or a crystalline powder. It is odorless.
It is sparingly soluble in methanol, slightly soluble in ethanol(95) or chloroform, very slightly soluble in ether, and practically insoluble in water.

Identification (1) Dissolve 5mL of Fluoxymesterone; the solution exhibits a yellow color.

(2) Prepare the test solution with 10 mg of Fluoxymesterone as directed under the Oxygen Flask Combustion, using a mixture of 0.5 mL of 0.01 mol/L sodium hydroxide TS and 20 mL of water as an absorbent; the test solution responds to the Qualitative Analysis (2) for fluoride.

(3) Determine the absorption spectra of solution of Fluoxymesterone and fluoxymesterone RS in ethanol(95) (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(4) Determine the infrared spectra of Fluoxymesterone and fluoxymesterone RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit the similar intensity of absorption at the same wavenumbers. If there is any difference in these spectra, perform the test in the same manner with the residue prepared by dissolving each in ethanol(99.5) to evaporate.

Optical rotation $[\alpha]_D^{20}$: Between +104° and +112° (0.1 g after drying, ethanol(95), 10 mL, 100 mm).

Purity (1) ***Heavy metals***—Proceed with 0.5g of Fluoxymesterone as directed under Method 2 and perform the test. Prepare the control solution with 1.5 mL of lead standard solution (NMT 30 ppm).

(2) ***Related substances***—Dissolve 30 mg of Fluoxymesterone in 10 mL of methanol and use this solution as the test solution. Pipet 1 mL of this solution, add methanol to make exactly 100 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on a plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of toluene, ethanol(95) and acetate acid (3 : 1 : 1) as the developing solvent to a distance of about 12 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 366 nm); any spot other than the principal spot obtained from the test solution is not more intense than the spot from the standard solution.

Loss on drying NMT 1.0% (1 g, 105 ℃, 3 hours).

Residue on ignition NMT 0.2% (0.5 g, platinum crucible).

Assay Weigh accurately about 25 mg each of Fluoxymesterone and fluoxymesterone RS, previously dried, dissolve each in the internal standard solution to make exactly 100 mL and use these solutions as the test solution and the standard solution, respectively. With 10 μL each of the test solution and the standard solution, perform the test according to the Liquid Chromatograph under the following conditions to calculate the peak area ratios, Q_T and Q_S, of fluoxymesterone to the peak area of the internal standard.

$$\text{Amount (mg) of fluoxymesterone } (C_{20}H_{29}FO_3) = \text{Amount of fluoxymesterone RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of methylprednisolone in a mixture of chloroform and methanol (19 : 1) (1 in 5000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 30 cm in length, packed with silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: A mixture of chloride *n*-butyl, water saturated *n*-butyl, tetrahydrofuran, methanol and acetic acid(100).

Flow rate: Adjust the flow rate so that the retention time of fluoxymesterone is about 9 minutes.

System suitability

System performance: Proceed with 10 μL of the standard solution under the above operating conditions; fluoxymesterone and the internal standard are eluted in this order with the resolution being NLT 6.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution according to the above operating conditions; the relative standard deviation of the ratios of the peak area of fluoxymesterone to that of the internal standard is NMT 1.5%.

Packaging and storage Preserve in light-resistant, well-closed containers.

Fluoxymesterone Tablets
플루옥시메스테론 정

Fluoxymesterone Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of fluoxymesterone ($C_{20}H_{29}FO_3$: 336.44).

Method of preparation Prepare as directed under Tablets, with Fluoxymesterone.

Identification Weigh an amount of Fluoxymesterone Tablets, previously powdered, equivalent to 20 mg of fluoxymesterone, add 20 mL of warm chloroform, and shake to mix. Then filter the clear supernatant by tilting the flask to the side. Extract two more times with 20 mL of warm chloroform each, collect the extracts, and evaporate to dryness on a steam bath. Then dissolve the residue in 5 mL of acetone, and filter the clear supernatant by tilting the flask to the side. Add 20 mL of water and filter the resulting precipitate. Dissolve the precipitate in 5 mL of acetone, add 20 mL of water, and filter the resulting precipitate. Dry the precipitate at 105 °C for 3 hours and perform the test with this precipitate as directed under the Identification (4) of Fluoxymesterone.

Dissolution Perform the test with 1 tablet of Fluoxymesterone Tablets at 75 revolutions per minute according to Method 2, using 900 mL of 0.01 mol/L hydrochloric acid TS as the dissolution medium. Take the dissolved solution after 60 minutes from starting of the test, filter, take 20 mL of the filtrate, add 2.0 mL of the internal standard solution and 0.01 mol/L hydrochloric acid TS to make exactly 25 mL, and use this solution as the test solution. Separately, weigh accurately about 28 mg of fluoxymesterone RS, and dissolve in ethanol(95) to make exactly 25 mL. Pipet 5 mL of this solution, and add 0.01 mol/L hydrochloric acid TS to make exactly 250 mL. Take exactly 5 mL of this solution and 2.0 mL of internal standard solution, add 0.01 mol/L hydrochloric acid TS to make exactly 25 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the ratios, Q_T and Q_S, of the peak areas of fluoxymesterone to that of internal standard, respectively.

Meets the requirements if the dissolution rate of Fluoxymesterone Tablets in 60 minutes is NLT 70%.

Internal standard solution—A solution of norethisterone in ethanol(95) (4.6 in 100000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm to 10 μm in particle diameter).

Mobile phase: A mixture of water and acetonitrile (58 : 42).

Flow rate: 3 mL/min

System suitability

System performance: Perform the test with 20 μL of the standard solution as directed under the above operating conditions; fluoxymesterone and norethindrone are eluted in this order with the resolution between their peaks being NLT 2.0.

System repeatability: Repeat the test 6 times with 20 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area ratios of fluoxymesterone to the internal standard is NMT 2.0%.

Uniformity of dosage units It meets the requirements when the procedure for content uniformity is performed according to the following method.

Take 1 tablet of Fluoxymesterone Tablets, place it in an appropriate container, add 2 mL of water, sonicate, and dissolve for about 30 minutes until completely disintegrated. Add the internal standard solution to obtain a solution containing about 250 μg of fluoxymesterone ($C_{20}H_{29}FO_3$) per mL. Shake to mix for 15 minutes, filter the chloroform layer, use the clear supernatant as the test solution, and perform the test as directed under the Assay of Fluoxymesterone.

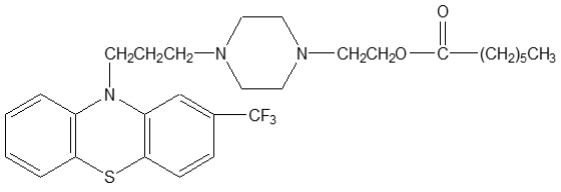
Assay Weigh accurately the mass of NLT 20 tablets of

Fluoxymesterone Tablets and powder them. Weigh accurately an amount of the powder equivalent to about 5 mg of fluoxymesterone ($C_{20}H_{29}FO_3$), add exactly 20 mL of internal standard solution, sonicate for 10 minutes, and shake for 15 minutes to mix. Filter this solution, use the clear supernatant as the test solution, and perform the test as directed under the Assay of Fluoxymesterone.

$$\text{Amount (mg) of fluoxymesterone } (C_{20}H_{29}FO_3) = \text{Amount (mg) of fluoxymesterone RS} \times \frac{Q_T}{Q_S}$$

Packaging and storage Preserve in light-resistant, well-closed containers.

Fluphenazine Enanthate
플루페나진에난테이트



$C_{29}H_{38}F_3N_3O_2S$: 549.69

2-[4-[3-[2-(Trifluoromethyl)phenothiazin-10-yl] propyl]piperazin-1-yl]ethylheptanoate [*2746-81-8*]

Fluphenazine Enanthate, when dried, contains NLT 98.5% and NMT 101.0% of fuphenazine eanthate ($C_{29}H_{38}F_3N_3O_2S$).

Description Fluphenazine Enanthate occurs as a pale yellow to yellowish orange viscous liquid. It is usually clear but becomes opaque by producing crystals.
It is freely soluble in methanol or ether, soluble in ethanol(95) or acetic acid(100), and practically insoluble in water.

Identification (1) Proceed with 10 mg of Fluphenazine Enanthate as directed under the Oxygen Flask Combustion, using a mixture of 0.5 mL of 0.01 mol/L sodium hydroxide TS and 20 mL of water as the absorbent; the resulting test solution responds to the Qualitative Analysis for fluoride.

(2) Determine the absorption spectra of solutions of 2 mg each of Fluphenazine Enanthate and fluphenazine enanthate RS dissolved in 200 mL of a solution of 0.01 mol/L hydrochloric acid in methanol (17 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared spectra of Fluphenazine Enanthate and fluphenazine enanthate RS as directed under the liquid film method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Acetylspiramycin according to Method 2 and perform the test. Prepare the control solution with 3.0 mL of lead standard solution (NMT 30 ppm).

(2) ***Related substances***—Dissolve 0.25 g of Fluphenazine Enanthate in 10 mL of methanol, and use this solution as the test solution. Pipet 1 mL of this solution, add methanol to make exactly 100 mL, and use it as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 20 μL each of the test solution and the standard solution on a plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of acetone, hexane, and ammonia water(28) (16 : 6 : 1) as the developing solvent to a distance of about 15 cm and air-dry the plate. Expose the plate to ultraviolet light (main wavelength: 254 nm), and any spot other than the principal spot obtained from the test solution is not more intense than those from the standard solutions. Also, spray evenly diluted sulfuric acid (1 in 2) on the plate; the spots other than the principal spot from the test solution are not more intense than those from the standard solution.

Loss on drying NMT 1.0% (1 g, in vacuum, 60 ℃, 3 hours).

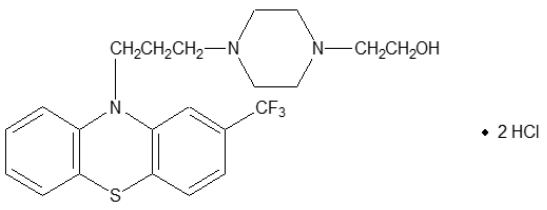
Residue on ignition NMT 0.2% (1 g).

Assay Weigh accurately about 0.5 g of Fluphenazine Enanthate, previously dried, dissolve in 50 mL of acetic acid(100), and titrate with 0.1 mol/L perchloric acid (indicator: 2 drop of methylrosanilinium chloride TS). Perform a blank test in the same manner and make any necessary correction.

$$\text{Each mL of 1 mol/L perchloric acid VS} = 27.485 \text{ mg of } C_{29}H_{38}F_3N_3O_2S$$

Packaging and storage Preserve in light-resistant, tight containers.

Fluphenazine Hydrochloride
플루페나진염산염



$C_{22}H_{26}F_3N_3Cl \cdot 2HCl$: 510.44

2-(4-{3-[2-(Trifluoromethyl)phenothiazin-10-yl]propy}piperazin-1-yl)ethanol dihydrochloride

[*146-56-5*]

Fluphenazine Hydrochloride contains NLT 97.0% and NMT 103.0% of fluphenazine hydrochloride ($C_{22}H_{26}F_3N_3Cl2HCl$), calculated on the dried basis.

Description Fluphenazine Hydrochloride occurs as a white crystalline powder and is odorless.
It is freely soluble in water, slightly soluble in ethanol or chloroform, and practically insoluble in benzene or ether.

Melting point—About 225 °C.

Identification (1) Determine the absorption spectra of solutions of Fluphenazine Hydrochloride and fluphenazine hydrochloride RS in methanol (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both exhibit an absorption maximum and minimum at the same wavelengths, and the difference in absorbances of the solutions, calculated on the dried basis, at the absorption maximum wavelength around 259 nm is NMT 2.5%.

(2) Determine the infrared spectra of Fluphenazine Hydrochloride and fluphenazine hydrochloride RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit maxima at the same wavenumbers.

(3) An aqueous solution of Fluphenazine Hydrochloride responds to the Qualitative Analysis for chloride.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Fluphenazine Hydrochloride according to Method 2 and perform the test. Prepare the control solution with 3.0 mL of lead standard solution (NMT 30 ppm).

(2) ***Related substances*—**Weigh accurately 0.1 g of Fluphenazine Hydrochloride, dissolve in the sodium hydroxide-methanol TS to make 10 mL, and use this solution as the test solution. Separately, dissolve 10 mg of fluphenazine hydrochloride RS in sodium hydroxide-methanol TS to make exactly 10 mL. Pipet 0.1 mL, 0.5 mL, 1 mL and 2 mL each of the resulting solution, add sodium hydroxide-methanol TS to make exactly 10 mL, and use these solutions as the standard solutions (1), (2), (3) and (4), respectively. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 20 μL each of the test solution and the standard solutions (1), (2), (3) and (4) on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Develop the plate with a mixture of acetone, cyclohexane and diethylamine (40 : 15 : 1) as a developing solvent to a distance of about 15 cm, and air-dry the plate. Expose the plate to ultraviolet light (main wavelength: 254 nm), and total intensity of all spots other than the principal spot obtained from each of the test solutions are NMT 2.0% of that of the spots from each of the standard solutions.

Loss on drying NMT 1.0% (1 g, 65 ℃, 3 hours).

Residue on ignition NMT 0.5% (1 g).

Assay Weigh accurately about 0.12 g of Fluphenazine Hydrochloride, and dissolve in the mobile phase without triethylamine to make exactly 100 mL. Pipet accurately 5 mL of this solution, dilute with the mobile phase without triethylamine to make 100 mL, filter the resulting solution, and use the filtrate as the test solution. Separately, weigh accurately about 0.12 g of the fluphenazine hydrochloride RS and dissolve in the mobile phase without triethylamine to make exactly 100 mL. Pipet 5 mL of the solution, add the mobile phase without triethylamine to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 25 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions and determine the peak areas, A_T and A_S, of fluphenazine from the test solution and the standard solution, respectively.

$$\text{Amount (mg) of fluphenazine hydrochloride } (C_{22}H_{26}F_3N_3OS\cdot 2HCl) = \text{amount (mg) of fluphenazine hydrochloride RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 12.5 cm in length, packed with octylsilyl silica gel for chromatography (3 μm ~ 10 μm in particle diameter).

Mobile phase: Filter a mixture of 0.05 mol/L potassium dihydrogen phosphate (adjusted to pH 2.5 with phosphoric acid), acetonitrile and methanol. To the filtrate, add triethylamine to be its concentration of 0.2%.

Flow rate: 1 mL/min

System suitability

System performance: Proceed with 25 μL of the standard solution according to the above conditions; the symmetry factor is NMT 2.0.

System repeatability: Repeat the test 6 times with 25 μL of the standard solution according to the above conditions; the relative standard deviation is NMT 2.0%.

Packaging and storage Preserve in light-resistant, tight containers.

Fluphenazine Hydrochloride Tablets
플루페나진염산염 정

Fluphenazine Hydrochloride Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of fluphenazine hydrochloride ($C_{22}H_{26}F_3N_3OS\cdot 2HCl$: 510.44).

Method of preparation Prepare as directed under Tablets, with Fluphenazine Hydrochloride.

Identification Weigh an amount of Fluphenazine Hy-

drochloride Tablets, previously powdered, equivalent to 10 mg of fluphenazine hydrochloride according to the labeled amount and also weigh about 10 mg of fluphenazine hydrochloride RS. Place each in a separatory funnel, add 5 mL of water and 20 mL of diluted hydrochloric acid (1 in 120), shake to mix for 10 minutes, add 20 mL each of sodium carbonate solution (1 in 10) saturated with chloroform, and extract 5 times with 20 mL each of chloroform while shaking gently. Filter through an absorbent cotton, previously washed with chloroform, into a 150-mL beaker. Evaporate the extracts on a steam-bath to dryness and dissolve the residues separately in 0.5 mL of a mixture of methanol and water (4 : 1) and use the solutions as the test solution and the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Develop the plate with a mixture of acetone, cyclohexane and diethylamine (40 : 15 : 1) as the developing solvent to a distance of about 15 cm, and air-dry the plate. Spray sulfuric acid-methanol solution (2 in 5) evenly on the plate; the R_f values and the colors of the spots obtained from the test solution and the standard solution are the same.

Dissolution Perform the test with 1 tablet of Fluphenazine Hydrochloride Tablets at 100 revolutions per minute according to Method 1, using 900 mL of 0.01 mol/L hydrochloric acid as the dissolution medium. Take the dissolved solution after 45 minutes from the start of the test and perform the Assay with following differences. Dilute the amount of the dissolved solution to be withdrawn with an equal volume of mobile phase without triethylamine; inject a volume of 100 μL, in the preparation of the standard solution. The standard solution should have a similar concentration and composition compared to the test solution. The mobile phase should have a triethylamine concentration of 0.3%. in the chromatographic system, use a flow rate of about 2.0 mL per minute. It meets the requirements if the dissolution rate of Fluphenazine Hydrochloride Tablets in 45 minutes is NLT 75%.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 tablets of Fluphenazine Hydrochloride Tablets, and powder them. Weigh accurately an amount of the powder equivalent to about 6 mg of fluphenazine hydrochloride ($C_{22}H_{26}F_3N_3OS \cdot 2HCl$), add 80 mL of mobile phase without triethylamine, shake for 1 hour, and sonicate for 10 minutes to form a fine suspension. Add the mobile phase without triethylamine to make exactly 100 mL, and shake to mix. Filter this solution, and use the filtrate as the test solution. Separately, weigh accurately about 6 mg of Fluphenazine Hydrochloride RS, dissolve in the mobile phase without triethylamine to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 25 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions, and determine the peak areas of fluphenazine, A_T and A_S, in each solution.

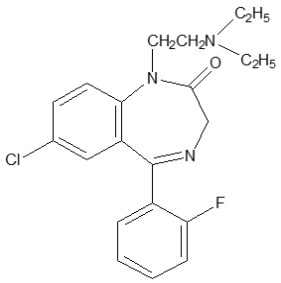
$$\text{Amount (mg) of fluphenazine hydrochloride } (C_{22}H_{26}F_3N_3OS \cdot 2HCl) = \text{Amount (mg) of fluphenazine hydrochloride RS} \times \frac{A_T}{A_S}$$

Operating conditions

For the detector, column, column temperature, mobile phase and system suitability, proceed as directed in the operating conditions under the Assay of Fluphenazine Hydrochloride.

Packaging and storage Preserve in tight containers.

Flurazepam
플루라제팜



Flurazepam $C_{21}H_{23}ClFN_3O$: 387.88
7-Chloro-1-[2-(diethylamino)ethyl]-5-(2-fluoro-phenyl)-1*H*-benzo[e][1,4]diazepin-2(3*H*)-one [*17617-23-1*]

Flurazepam, when dried, contains NLT 99.0% and NMT 101.0% of flurazepam ($C_{21}H_{23}ClFN_3O$).

Description Flurazepam occurs as white to pale yellow crystals or crystalline powder.
It is very soluble in chloroform, freely soluble in methanol, ethanol(95), acetic anhydride or ether, and practically insoluble in water.

Identification (1) Dissolve 10 mg of Flurazepam in 3 mL of sulfuric acid and examine the solution under ultraviolet light (main wavelength: 365 nm); the resulting solution exhibits a greenish yellow fluorescence.

(2) Dissolve 10 mg of Flurazepam in 3 mL of citric acid-acetic acid TS, and heat for 4 minutes on a steam bath; the resulting solution exhibits a dark red color.

(3) Proceed with 10 mg of Flurazepam as directed under the Oxygen Flask Combustion, using a mixture of 0.5 mL of 0.01 mol/L sodium hydroxide TS and 20 mL of water as the absorbent; the resulting test solution responds to the Qualitative Analysis (2) for fluoride.

(4) Determine the absorption spectra of solutions of Flurazepam and flurazepam RS in methanol (1 in

100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths. Further, determine the absorption spectra of solutions of Flurazepam and flurazepam RS in methanol (1 in 10000); both spectra exhibit similar intensities of absorption at the same wavelengths.

(5) Perform the test with Flurazepam as directed under the Flame Coloration (2); it exhibits a green color.

Melting point Between 79 and 83 ℃.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Flurazepam in 10 mL of ethanol(95); the resulting solution is colorless to pale yellow and clear.

(2) ***Chloride***—Dissolve 1.0 g of Flurazepam in 50 mL of ether, add 46 mL of water and 4 mL of sodium carbonate TS, shake to mix, and collect the water layer. Wash the water layer twice each time with 20 mL of ether and filter the water layer. Pipet 20 mL of the filtrate, add dilute nitric acid to neutralize, then add another 6 mL of dilute nitric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 0.40 mL of 0.01 mol/L hydrochloric acid (NMT 0.036%).

(3) ***Sulfate***—Take 20 mL of the filtrate in (2), add dilute hydrochloric acid to neutralize, then add 1 mL of dilute hydrochloric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 0.40 mL of 0.005 mol/L sulfuric acid VS (NMT 0.048%).

(4) ***Heavy metals***—Proceed with 2.0 g of Flurazepam according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(5) ***Arsenic***—Proceed with 1.0 g of Flurazepam according to Method 3 and perform the test (NMT 2 ppm).

(6) ***Related substances***—Dissolve 0.20 g of Flurazepam in 20 mL of chloroform and use this solution as the test solution. Pipet 1 mL of this solution and add chloroform to make exactly 20 mL. Pipet 3 mL of this solution, add chloroform to make exactly 50 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of cyclohexane, acetone and ammonia water(28) (60 : 40 : 1) as the developing solvent to a distance of about 12 cm and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot obtained from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 0.2% (1 g, in vacuum, 60 ℃, 2 hours).

Residue on ignition NMT 0.1% (1 g, platinum crucible).

Assay Weigh accurately about 0.3 g of Flurazepam, previously dried, dissolve in 50 mL of acetic anhydride, and titrate with 0.1 mol/L perchloric acid VS up to the second equivalence point (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid
= 19.394 mg of $C_{21}H_{23}ClFN_3O$

Packaging and storage Preserve in light-resistant, well-closed containers.

Flurazepam Capsules
플루라제팜 캡슐

Flurazepam Capsules contain NLT 93.0% and NMT 107.0% of the labeled amount of flurazepam ($C_{21}H_{23}ClFN_3O$: 387.88).

Method of preparation Prepare as directed under Capsules, with Flurazepam.

Identification (1) Take out the contents of Flurazepam Capsules and powder. Weigh an amount equivalent to 0.1 g of flurazepam according to the labeled amount. add 100 mL of 0.1 mol/L hydrochloric acid TS, shake to mix and filter. To 40 mL of the filtrate, add 80 mL of sodium hydroxide solution (1 in 250) and 100 mL of hexane, shake well to mix, and extract. Take the hexane layer and use this solution as the test solution. Take 25 mL of the test solution, and evaporate on a steam bath to dryness. Dissolve the residue in 3 mL of sulfuric acid and examine the solution under ultraviolet light; the solution exhibits a greenish yellow fluorescence.

(2) Take 25 mL of the test solution obtained from (1) and evaporate on a steam bath to dryness. Dissolve the residue in 3 mL of citric acid-acetic acid TS and heat on a steam bath for 4 minutes: the solution exhibits a dark red color.

(3) Determine the absorption spectrum of the test solution obtained in the Assay as directed under Ultraviolet-visible Spectroscopy: it exhibits a maximum between 315 nm and 319 nm and a minimum between 297 nm and 301 nm.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

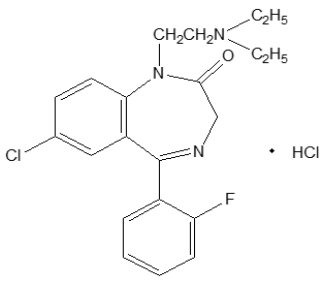
Assay Weigh accurately the mass of the contents of NLT 20 capsules of Flurazepam Capsules and powder. Weigh accurately an amount equivalent to about 50 mg of flurazepam ($C_{21}H_{23}ClFN_3O$), add about 30 mL of methanol, shake well to mix for about 30 minutes, and add metha-

nol to make exactly 50 mL. Filter this solution, discard the first 10 mL of the filtrate, take exactly 10 mL of the subsequent filtrate, add methanol to make exactly 50 mL, and use this solution as the test solution. Separately, weigh accurately about 50 mg of flurazepam RS, previously dried in vacuum at 60 ℃ for 2 hours, and dissolve in methanol to make exactly 50 mL. Pipet 6 mL of this solution, add methanol to make exactly 50 mL, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at the wavelength of 317 nm as directed under the Ultraviolet-visible Spectroscopy.

$$\text{Amount (mg) of flurazepam } (C_{21}H_{23}ClFN_3O) = \text{Amount (mg) of flurazepam RS} \times \frac{A_T}{A_S}$$

Packaging and storage Preserve in tight containers.

Flurazepam Hydrochloride
플루라제팜염산염



$C_{21}H_{23}ClFN_3O \cdot HCl$: 424.34

7-Chloro-1-[2-(diethylamino)ethyl]-5-(2-fluorophenyl)-1*H*-benzo[e][1,4]diazepin-2(3*H*)-one hydrochloride [*36105-20-1*]

Flurazepam Hydrochloride, when dried, contains NLT 99.0% and NMT 101.0% of flurazepam hydrochloride ($C_{21}H_{23}ClFN_3O \cdot HCl$).

Description Flurazepam Hydrochloride occurs as white to yellowish-white crystals or crystalline powder.
It is freely soluble in water, ethanol(95), ethanol(99.5) or acetic acid(100).

Melting point—About 197 ℃ (with decomposition).

Identification (1) Determine the absorption spectra of solutions of Flurazepam Hydrochloride and flurazepam hydrochloride RS in sulfuric acid-ethanol TS (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Flurazepam Hydrochloride and flurazepam hydrochloride RS, previously dried, as directed in the potassium chloride disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) An aqueous solution of Flurazepam Hydrochloride (1 in 20) responds to the Qualitative Analysis for chloride.

pH Dissolve 1.0 g of Flurazepam Hydrochloride in 20 mL of water; the pH of this solution is between 5.0 and 6.0.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Flurazepam Hydrochloride in 10 mL of water; the resulting solution is colorless to pale yellow and clear.

(2) ***Sulfate***—Perform the test with 1.5 g of Flurazepam Hydrochloride. Prepare the control solution with 0.35 mL of 0.005 mol/L sulfuric acid VS (NMT 0.011%).

(3) ***Heavy metals***—Proceed with 1.0 g of Flurazepam Hydrochloride in a platinum crucible according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(4) ***Related substances***—Dissolve 50 mg of Flurazepam Hydrochloride in 5 mL of ethanol(95) and use this solution as the test solution. Pipet 1 mL of this solution and add ethanol(95) to make exactly 50 mL. Pipet 1 mL of this solution, add ethanol(95) to make exactly 10 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 20 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Place the plate in a chamber filled with ammonia vapor, allow to stand for about 15 minutes, and immediately develop the plate with a mixture of ether and diethylamine (39 : 1) as the developing solvent to a distance of about 12 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm); the number of spots other than the principal spot and the spot on the original point obtained from the test solution is NMT 3, and the spots are not more intense than the spots from the standard solution.

Loss on drying NMT 0.5% (1 g, 105 ℃, 4 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.3 g of Flurazepam Hydrochloride, previously dried, dissolve in 10 mL of acetic acid(100), add 40 mL of acetic anhydride, and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

$$\text{Each mL of 0.1 mol/L perchloric acid VS} = 21.22 \text{ mg of } C_{21}H_{23}ClFN_3O \cdot HCl$$

Packaging and storage Preserve in tight containers.

Flurazepam Hydrochloride Tablets
플루라제팜염산염 정

Flurazepam Hydrochloride Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of flurazepam hydrochloride ($C_{21}H_{23}ClFN_3O \cdot HCl$: 424.34).

Method of preparation Prepare as directed under Tablets, with Flurazepam Hydrochloride.

Identification Weigh an amount of Flurazepam Hydrochloride Tablets, previously powdered, equivalent to 30 mg of flurazepam hydrochloride, dissolve in 2 mL of methanol, centrifuge, and use the clear supernatant as the test solution. Separately, dissolve 30 mg of flurazepam hydrochloride RS in 2 mL of methanol, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of diethyl ether, dichloromethane, methanol and ammonia water(28) (90: 60 : 2 : 1) (as the developing solvent), and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots obtained from the standard solution exhibits R_f values and colors corresponding to that of the test solution.

Dissolution Perform the test with 1 tablet of Benproperine Phosphate Tablets at 50 revolutions per minute according to Method 2 under the Dissolution, using 900 mL of Solution 2 as the dissolution medium. Take the dissolved solution 45 minutes after starting the dissolution test, and filter. Discard the first 10 mL of the filtrate, pipet *V* mL of the subsequent filtrate, add the dissolution medium to obtain exactly *V*' mL of a solution containing about 15 μg of flurazepam hydrochloride according to the labeled amount, and use this solution as the test solution. Separately, weigh accurately about 15 mg of flurazepam hydrochloride RS, and add the dissolution medium to make exactly 100 mL. Pipet 10 mL of this solution, add the dissolution medium to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution according to the Assay, and determine the peak areas, A_T and A_S, of flurazepam hydrochloride ($C_{21}H_{23}ClFN_3O \cdot HCl$) in each solution. Meets the requirements if the dissolution rate of Flurazepam Hydrochloride Tablets in 45 minutes is NLT 80%.

Dissolution rate (%) of the labeled amount of flurazepam hydrochloride ($C_{21}H_{23}ClFN_3O \cdot HCl$)
$= W_S \times (V' / V) \times (A_T / A_S) \times (1 / C) \times 90$

W_S: Amount (mg) of flurazepam hydrochloride RS
C: Labeled amount (mg) of flurazepam hydrochloride ($C_{21}H_{23}ClFN_3O \cdot HCl$) per tablet

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 tablets of Flurazepam Hydrochloride Tablets, and powder. Weigh accurately an amount of the powder, equivalent to about 15 mg of flurazepam hydrochloride ($C_{21}H_{23}ClFN_3O \cdot HCl$), and add the mobile phase to make exactly 100 mL. Filter this solution, pipet 10 mL of the filtrate, add the mobile phase to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 15 mg of the flurazepam hydrochloride RS, and dissolve in the mobile phase to make exactly 100 mL. Pipet 10 mL of this solution, add the mobile phase to it make exactly 100 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution according to the Liquid Chromatography under the following conditions, and determine the peak areas, A_T and A_S, of flurazepam hydrochloride ($C_{21}H_{23}ClFN_3O \cdot HCl$) in each solution.

Amount (mg) of flurazepam hydrochloride ($C_{21}H_{23}ClFN_3O \cdot HCl$)
= Amount (mg) of flurazepam hydrochloride RS × (A_T / A_S)

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 239 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 30 °C.

Mobile phase: A mixture of methanol and 1% ammonium acetate solution (4 : 1).

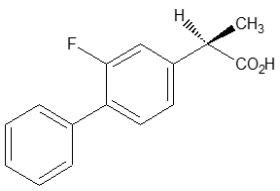
Flow rate: 1.0 mL/min

System suitability

System repeatability: Repeat the test 6 times with 20 μL each of the standard solution according to the above operating conditions; the relative standard deviation of the peak areas of flurazepam hydrochloride is NMT 2.0%.

Packaging and storage Preserve in tight containers.

Flurbiprofen
플루르비프로펜



and enantiomer

Flurbiprofen $C_{15}H_{13}FO_2$: 244.26
(*RS*)-2-(2-fluorobiphenyl-4-yl)propanoic acid [*5104-49-4*]

Flurbiprofen, when dried, contains NLT 98.0% and NMT 101.0% of flurbiprofen ($C_{15}H_{13}FO_2$).

Description Flurbiprofen occurs as a white crystalline powder and has a slightly pungent odor.
It is freely soluble in methanol, ethanol(95), acetone or ether, soluble in acetonitrile, and practically insoluble in water.
A solution of Flurbiprofen in ethanol(95) (1 in 50) shows no optical rotation.

Identification (1) Determine the absorption spectra of solutions of Flurbiprofen and flurbiprofen RS in methanol (1 in 200000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Flurbiprofen and flurbiprofen RS, previously dried, as directed in the potassium bromide disk method under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Melting point Between 114 and 117 ℃.

Purity (1) ***Chloride***—Dissolve 0.6 g of Flurbiprofen in 40 mL of acetone and add 6 mL of dilute nitric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution by adding 40 mL of acetone, 6 mL of dilute nitric acid and water to 0.25 mL of 0.01 mol/L hydrochloric acid to make 50 mL (NMT 0.015%).

(2) ***Heavy metals***—Dissolve 2.0 g of Flurbiprofen in 30 mL of acetone and add 2 mL of dilute acetic acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution by adding 30 mL of acetone, 2 mL of dilute acetic acid and water to 2.0 mL of lead standard solution to make 50 mL (NMT 10 ppm).

(3) ***Related substances***—Dissolve 20 mg of Flurbiprofen in 10 mL of a mixture of water and acetonitrile (11 : 9), and use this solution as the test solution. Pipet 1 mL of this solution, add a mixture of water and acetonitrile (11 : 9) to make exactly 200 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak area from each solution as directed in the automatic integration method; the area of each peak other than flurbiprofen from the test solution is not greater than the major peak area from the standard solution, and the total area of other peaks from the test solution is not greater than 2 times the major peak area from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column, about 4 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm to 10 μm in particle diameter).

Column temperature: A constant temperature of about 30 ℃.

Mobile phase: A mixture of water, acetonitrile and acetic acid(100) (12 : 7 : 1).

Flow rate: Adjust the flow rate so that the retention time of flurbiprofen is about 20 minutes.

System suitability

Test for required detectability: Pipet 5 mL of the standard solution, and add a mixture of water and acetonitrile (11 : 9) to make exactly 25 mL. Confirm that the peak area of flurbiprofen obtained from 20 μL of this solution is equivalent to 16% to 24% of the peak area of flurbiprofen obtained from the standard solution.

System performance: Dissolve 0.04 g of Flurbiprofen and 0.02 g of butyl p-hydroxybenzoate in 100 mL of a mixture of water and acetonitrile (11 : 9). To 5 mL of this solution, add a mixture of water and acetonitrile (11 : 9) to make 50 mL. Proceed with 20 μL of this solution according to the above conditions; butyl p-hydroxybenzoate and flurbiprofen are eluted in this order with the resolution being NLT 12.

System repeatability: Repeat the test 6 times with 20 μL of the standard solution according to the above conditions; the relative standard deviation of the peak area of flurbiprofen is NMT 2.0%.

Time span of measurement: About 2 times the retention time of flurbiprofen.

Loss on drying NMT 0.1% (1 g, NMT 0.67 kPa, silica gel, 4 hours).

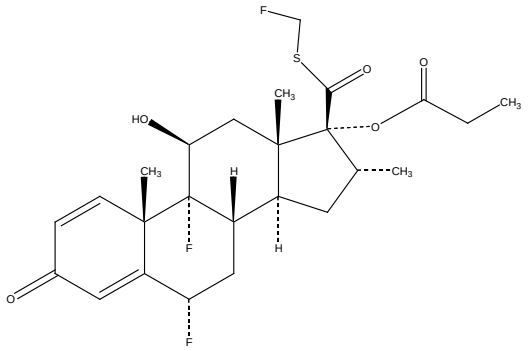
Residue on ignition NMT 0.1% (1 g, platinum crucible).

Assay Weigh accurately about 0.6 g of Flurbiprofen, previously dried, dissolve in 50 mL of ethanol(95), and titrate with 0.1 mol/L sodium hydroxide VS (indicator: 3 drops of phenolphthalein TS). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS
= 24.43 mg of $C_{15}H_{13}FO_2$

Packaging and storage Preserve in well-closed containers.

Fluticasone Propionate
플루티카손프로피오네이트



$C_{25}H_{31}F_3O_5S$: 500.57

(6*S*,8*S*,9*R*,10*S*,11*S*,13*S*,14*S*,16*R*,17*R*)-6,9-Difluoro-17-(((fluoromethyl)thio)carbonyl)-11-hydroxy-10,13,16-trimethyl-3-oxo-6,7,8,9,10,11,12,13,14,15,16,17-dodecahydro-3*H*-cyclopenta[a]phenanthren-17-yl propanoate [*80474-14-2*]

Fluticasone Propionate contains NLT 98.0% and NMT 100.5% of fluticasone propionate, calculated on the anhydrous and solvent-free basis.

Description Fluticasone Propionate occurs as a white, fine powder.

It is sparingly soluble in dichloromethane, slightly soluble in ethanol(95) and practically insoluble in water.

Identification (1) Determine the infrared spectra of Fluticasone Propionate and fluticasone propionate RS as directed in the paste method under Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

Optical rotation $[\alpha]_D^{20}$: Between +32° and +36° (on the anhydrous and solvent-free basis, 0.1 g, dichloromethane, 20 mL, 100 mm).

Purity (1) ***Related substances***—Weigh accurately about 20 mg of Fluticasone Propionate, dissolve in 5.0 mL of the mobile phase A by sonication, add 5.0 mL of the mobile phase C to mix, and use this solution as the test solution. Perform the test with 50 μL of the test solution by the percentage peak area method under the Liquid Chromatography according to the following conditions, and measure the area of each related substance and the total area of each peak, A_i and A_S; the amounts of each related substance are as shown in Table 1.

Table 1

Related substance	Relative retention time	Limit (%)
Fluticasone propionate related substance I	0.5	0.2
Fluticasone propionate related substance II	0.75	0.1
Fluticasone propionate related substance III	0.8	0.1
Fluticasone propionate related substance IV	0.95	0.3
Fluticasone propionate	1.0	-
Fluticasone propionate related substance V	1.3	0.3
Other related substances	-	0.1
Total related substances	-	1.0

If the total amount of the related substances is less than 0.05%, the amount is excluded.

$$\text{Content (\%) of each related substance} = 100 \times \frac{A_i}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 239 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: Control the mixing ratio of mobile phase A and mobile phase B stepwise or via the gradient elution as follows.

Mobile phase A: Mix 0.5 mL of phosphate with 1000 mL of acetonitrile.

Mobile phase B: Mix 0.5 mL of phosphor with 1000 mL of methanol.

Mobile phase C: Mix 0.5 mL of phosphor with 1000 mL of water.

Table 2

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)	Mobile phase C (vol%)
0	42	3	55
0 - 40	42 → 53	3	55 → 44
40 - 60	53 → 47	3	44 → 10
60 - 70	87	3	10
70 - 75	87 → 42	3	10 → 55

Flow rate: 1.5 mL/min

System suitability

System performance: Weigh about 2.0 mg of fluticason propionate RS, dissolve in 5.0 mL of the mobile phase A by sonication, add 5.0 mL of the mobile phase C to mix, and use this solution as the system suitability solution. Perform the test with 50 μL of this solution according to the above conditions; the resolution between peaks of fluticasone propionate related substance

II and fluticasone propionate related substance III is NLT 1.5 and the relative retention times are as shown in Table 1.

(2) ***Bromofluoromethan***—Dissolve 0.2 of Fluticasone Propionate in 1 mL of *N*,*N*-dimethylformamide, and use this solution as the test solution. Separately, take 20 uL of bromofluoromethane and add *N*,*N*-dimethylformamide to make 10 mL. To 10 μL of this solution, add *N*,*N*-dimethylformamide to make 1 mL. Put *N*,*N*-dimethylformamide in 10 μL of this solution to make 1 mL, and use this solution as the standard solution. Perform the test with 5 μL each of the test solution and the standard solution as directed under the Gas Chromatography according to the following conditions; the peak height of bromofluoromethane obtained from the test solution is less than the peak height of bromofluoromethane obtained from the standard solution.

Operating conditions

Detector: An electron capture detector

Column: A capillary column about 0.32 mm in internal diameter and about 25 m in length, coated with 5% phenyl-95% methylpolysiloxane with the thickness of 5 μm.

Column temperature: Maintain at 40 ℃ for the first 3.5 minutes, and increase by 30 ℃ each minute up to 200 ℃, and then keep the temperature for 10 minutes.

Carrier gas: Nitrogen

Flow rate: 2.8 mL/min

Sample injection port temperature: 85 ℃

Split ratio: About 70 : 1.

Detector temperature: 250 °C

(3) ***Acetone***—Weigh accurately 0.5 of Fluticasone Propionate, dissolve in the internal standard solution to make exactly 10 mL, and use this solution as the test solution. Take exactly 50 μL of acetone, add the inner standard solution to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 0.1 μL each of the test solution and the standard solution as directed under the Gas Chromatography according to the following conditions, and calculate the peak height ratios, Q_T and Q_S, of acetone to the internal standard for each solution, respectively (NMT 1.0%).

$$\text{Content (\%) of acetone} = 0.05\times \frac{D}{C}\times \frac{Q_T}{Q_S}$$

D: Density of Acetone at 20 ℃

C: Concentration (g/mL) of Fluticasone Propionate in the test solution

Internal standard solution—Put *N*,*N*-dimethylformamide in 50 μL of tetrahydrofuran to make 100 mL.

Operating conditions

Detector: A flame ionization detector

Column: A capillary column about 0.53 mm in internal diameter and about 25 m in length, the inside coated with polyethylene glycol (mean molecular mass is between 3000 and 3700) with the thickness of 2 μm.

Column temperature: Maintain 60 ℃ for the first 3.5 minutes, and then increase by 30 ℃ each minute until 180 ℃, and then keep the temperature for three minutes.

Carrier gas: Nitrogen or helium

Flow rate: 5.5 mL/min

Sample injection port temperature: 150 ℃

Detector temperature: 250 ℃

System suitability

System repeatability: Repeat the test 6 times with 0.1 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak height ratios of acetone to the internal standard is NMT 5.0%.

Water NMT 0.2% (1 g, volumetric titration, direct titration).

Assay Weigh accurately about 40 mg each of Fluticasone Propionate and fluticasone propionate RS, and dissolve in the mobile phase to make exactly 100 mL. To 5.0 mL of this solution, add the mobile phase to make exactly 50 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and measure the peak areas of fluticasone propionate, A_T and A_S, for each solutions.

$$\text{Amount (mg) of fluticasone propionate } (C_{25}H_{31}F_3O_5S) = \text{Amount (mg) of fluticasone propionate RS}\times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 239 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: A mixture of methanol, 0.01 mol/L ammonium dihydrogen phosphate buffer solution and acetonitrile (50: 13: 15).

Flow rate: 1.5 mL/min

System suitability

System performance: Dissolve 2.0 mg of fluticasone propionate related substance IV RS in 50 mL of the mobile phase. Proceed with 20 μL each of this solution and the standard solution according to the above conditions; the relative retention times of peaks are about 1.1 for fluticasone propionate related substance IV and 1.0 for fluticasone propionate with the resolution being

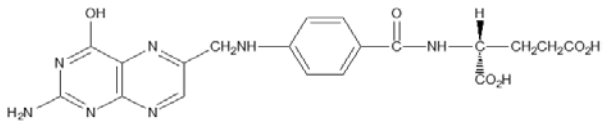
NLT 1.5.

System repeatability: Repeat the test 5 times with 20 μL each of the standard solution according to the above operating conditions; the relative standard deviation of the peak area of fluticasone propionate is NMT 2.0%.

0.01 mol/L ammonium dihydrogen phosphate buffer solution—Dissolve 11.5g of ammonium dihydrogen phosphate in 1000 mL of water, add phosphoric acid to adjust the pH to 3.5 ± 0.05.

Packaging and storage Preserved in light-resistant, tight containers below 30 ℃.

Folic Acid
폴산



$C_{19}H_{19}N_7O_6$: 441.40

(2*S*)-2-[(4-{[(2-Amino-4-hydroxypteridin-6-yl)methyl]amino}phenyl)formamido]pentanedioic acid [*59-30-3*]

Folic Acid contains NLT 98.0% and NMT 102.0% of folic acid ($C_{19}H_{19}N_7O_6$), calculated on the anhydrous basis.

Description Folic Acid occurs as a yellow to orange crystalline powder, and is odorless.
It is practically insoluble in water, methanol, ethanol(95), pyridine or ether.
It dissolves in hydrochloric acid, sulfuric acid, dilute sodium hydroxide TS, or sodium carbonate TS (1 in 100), and the solution exhibits a yellow color.
It is gradually affected by light.

Identification (1) Dissolve 1.5 mg of Folic Acid and folic acid RS in dilute sodium hydroxide TS to make 100 mL. Determine the absorption spectra of these solutions as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Add 1 drop of potassium permanganate TS to 10 mL of the solution in (1), shake until the solution turns blue, and examine the solution immediately under ultraviolet light (main wavelength: 365 nm); it exhibits a blue fluorescence.

Purity (1) ***Clarity and color of solution*—**Dissolve 0.10 g of Folic Acid in 10 mL of dilute sodium hydroxide TS; the solution is yellow and clear.

(2) ***Free amine*—**Pipet 30 mL of the test solution from the Assay, add 20 mL of dilute hydrochloric acid and water to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 50 mg of p-aminobenzoylglutamic acid RS, previously dried in a desiccator (in vacuum, silica gel) for 4 hours, and dissolve in diluted ethanol (2 in 5) to make exactly 100 mL. Pipet 3 mL of this solution again, add water to make exactly 1000 mL, and use this solution as the standard solution. Pipet 4 mL each of the test solution and the standard solution, perform in the same manner as the Assay below, and perform the test as directed under the Ultraviolet-visible Spectroscopy. Determine the absorbances, A_T and A_S, of each solution made from the test solution and standard solution at a wavelength of 550 nm; the amount of free amine is NMT 1.0%.

$$\text{Content (\%) of free amine} = \frac{A_T}{A_S} \times \frac{W'}{W}$$

W: Amount (mg) of Folic Acid calculated on the anhydrous basis

W′: Amount (mg) of p-aminobenzoylglutamic acid RS

Water NMT 8.5% (10 mg, coulometric titration).

Residue on ignition NMT 0.5% (1 g).

Assay Weigh accurately about 50 mg each of Folic Acid and folic acid RS, add 50 mL of dilute sodium hydroxide TS to each, shake well to dissolve, and then add dilute sodium hydroxide TS again to make exactly 100 mL. Use these solutions as the test solution and the standard solution, respectively. Pipet 30 mL of the test solution and standard solution, and add 20 mL of dilute hydrochloric acid and water to each to make exactly 100 mL. To 50 mL of these solutions, add 0.5 g of zinc powder, shake occasionally to mix, and allow to stand for 20 minutes. Next, filter this solution through a dried filter paper, discard the first 10 mL of the filtrate, take exactly 10 mL of the next filtrate, and add water to make exactly 100 mL. Pipet 4 mL each of these solutions, add 1 mL of water, 1 mL of dilute hydrochloric acid, and 1 mL of sodium nitrite solution (1 in 1000), mix, and allow to stand for 2 minutes. Then, add 1 mL of ammonium amidosulfate solution (1 in 200), shake to mix, and allow to stand for 2 minutes. Add 1 mL of oxalic acid *N*-(1-naphthyl)-*N*′-diethylethylenediamine solution (1 in 1000) to these solutions, shake to mix, allow to stand for 10 minutes, and add water to make exactly 20 mL. Separately, pipet 30 mL of the test solution, and add 20 mL of dilute hydrochloric acid and water to make exactly 100 mL. Pipet 10 mL of this solution, and add 18 mL of dilute hydrochloric acid and water to make exactly 100 mL. Proceed in the same manner as in the preparation of the test solution with exactly 4 mL of this solution, and use this solution as the blank test solution. Perform the test with these solutions using the solution prepared in the same manner with 4 mL of water as the control solution as directed

under the Ultraviolet-visible Spectroscopy, and determine the absorbances A_T, A_S and A_C of the test solution, standard solution, and blank test solution at a wavelength of 550 nm.

$$\text{Amount (mg) of folic acid } (C_{19}H_{19}N_7O_6) = \text{Amount (mg) of folic acid RS, as calculated on the anhydrous basis} \times \frac{A_T - A_C}{A_S}$$

Packaging and storage Preserve in light-resistant, tight containers.

Folic Acid Tablets
폴산 정

Folic Acid Tablets contain NLT 90.0% and NMT 115.0% of the labeled amount of folic acid ($C_{19}H_{19}N_7O_6$: 441.40).

Method of preparation Prepare as directed under Tablets, with Folic Acid.

Identification (1) Weigh an amount of Folic Acid Tablets, previously powdered, equivalent to 1.5 mg of folic acid according to the labeled amount, add 100 mL of dilute sodium hydroxide TS, shake to mix, and filter. Discard the first 10 mL of the filtrate, and perform the test with the subsequent filtrate as directed under the Identification (2) of Folic Acid.

(2) Determine the absorption spectrum of the filtrate from (1) as directed under the Ultraviolet-visible Spectroscopy; it exhibits maxima between 255 nm and 257 nm, between 281 nm and 285 nm, and between 361 nm and 369 nm. And when A1 is the absorbance at the absorption maximum between 255 nm and 257 nm, and A2 is the absorbance at the absorption maximum between 361 nm and 369 nm, the ratio, A2/A1, is between 2.80 and 3.00.

Dissolution Perform the test with 1 tablet of Folic Acid Tablets at 50 revolutions per minute according to Method 2, using 500 mL of water as the dissolution medium. Take the dissolved solution after 45 minutes from the start of the test and filter. Discard the first 10 mL of the filtrate, pipet *V* mL of the subsequent filtrate, add diluent to make exactly *V′* mL, and use this solution as the test solution. Separately, weigh accurately an appropriate amount of folic acid RS (previously determined water content), dissolve in the diluent to make a solution having the same concentration as the test solution, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of folic acid in each solution. The acceptable dissolution criterion of Folic Acid Tablets is NLT 75% (Q) dissolved in 45 minutes.

$$\text{Dissolution rate (\%) of the labeled amount of folic acid } (C_{19}H_{19}N_7O_6) = C_S \times \frac{A_T}{A_S} \times \frac{1}{C} \times 50000$$

C_S: Concentration (mg/mL) of the standard solution

C: Labeled amount (mg) of folic acid ($C_{19}H_{19}N_7O_6$) in 1 tablet

Diluent—Weigh 2 mL of ammonium hydroxide and 1 g of sodium perchlorate, and add water to make 100 mL.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column, about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (1.5 to 10 μm in particle diameter).

Mobile phase: Weigh 35.1 g of sodium perchlorate and 1.40 g of potassium dihydrogen phosphate, add 7.0 mL of 1 mol/L potassium hydroxide and 40 mL of methanol, and add water to make 1000 mL. Adjust the pH to 7.2 with 1 mol/L potassium hydroxide or phosphoric acid.

Flow rate: 1 mL/min

System suitability

System repeatability: Repeat the test 5 times each with 25 μL of the standard solution according to the above conditions; the relative standard deviation of the peak areas of folic acid is NMT 2.0%.

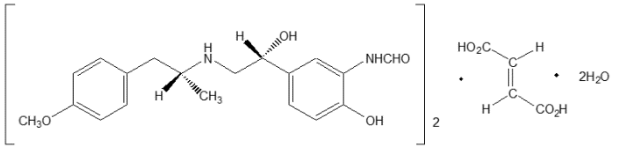
Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 tablets of Folic Acid Tablets, and powder. Weigh accurately a portion of the powder, equivalent to about 50 mg of folic acid ($C_{19}H_{19}N_7O_6$: 441.40). Add 50 mL of dilute sodium hydroxide TS, shake frequently, then filter into a volumetric flask and wash with dilute sodium hydroxide TS. Take the combined filtrate and washings, add dilute sodium hydroxide TS to make exactly 100 mL and use this solution as the test solution. Separately, weigh accurately about 50 mg of folic acid RS, dissolve in sodium hydroxide TS to make exactly 100 mL, and use this solution as the standard solution. Pipet 30 mL each of the test solution and standard solution, and perform the test as directed under the Assay of Folic Acid.

$$\text{Amount (mg) of folic acid } (C_{19}H_{19}N_7O_6) = \text{Amount (mg) of folic acid RS, calculated on the anhydrous basis} \times \frac{A_T - A_C}{A_S}$$

Packaging and storage Preserve in light-resistant, well-closed containers.

Formoterol Fumarate Hydrate
포르모테롤푸마르산염수화물



Formoterol Fumarate
$(C_{19}H_{24}N_2O_4)_2 \cdot C_4H_4O_4 \cdot 2H_2O$: 840.91
N-{2-Hydroxy-5-{(*RS*)-1-hydroxy-2-{[(*RS*)-1-(4-methoxyphenyl)propan-2-yl]amino}ethyl}phenyl}formamide (*E*)-but-2-enedioate [*43229-80-7*, anhydrous]

Formoterol Fumarate Hydrate contains NLT 98.5% and NMT 101.0% of formoterol fumarate [$(C_{19}H_{24}N_2O_4)_2 \cdot C_4H_4O_4$: 804.882], calculated on the anhydrous basis.

Description Formoterol Fumarate Hydrate occurs as a white to yellowish white crystalline powder.
It is freely soluble in acetic acid(100), soluble in methanol, very slightly soluble in water or ethanol(95), and practically insoluble in ether.
A solution of Formoterol Fumarate Hydrate in methanol (1 in 100) exhibits no optical rotation.

Melting point—About 138 ℃ (with decomposition).

Identification Determine the infrared spectra of Formoterol Fumarate Hydrate and formoterol fumarate hydrate RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Formoterol Fumarate Hydrate according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Related substances***—Dissolve 0.20 g of Formoterol Fumarate Hydrate in 10 mL of methanol, and use this solution as the test solution. Pipet 1 mL of this solution, add methanol to make exactly 200 mL, and use it as the standard solution. Perform the test with these solutions as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of toluene, acetone, ethanol(99.5) ammonia water(28) (5 : 20 : 10 : 3) as a developing solvent to a distance of about 12 cm, and air-dry the plate. Allow the plate to stand for 5 minutes in iodine vapor; the spots other than the principal spot from the test solution are not more intense than the spots from the standard solution.

Water Between 4.0% and 5.0% (0.5 g, volumetric titration, direct titration).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.7 g of Formoterol Fumarate Hydrate, dissolve in 50 mL of acetic acid(100), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 40.24 mg of $(C_{19}H_{24}N_2O_4)_2 \cdot C_4H_4O_4$

Packaging and storage Preserve in tight containers.

Formoterol Fumarate Tablets
포르모테롤푸마르산염 정

Formoterol Fumarate Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of formoterol fumarate [$(C_{19}H_{24}N_2O_4)_2 \cdot C_4H_4O_4$: 804.88].

Method of preparation Prepare as directed under Tablets, with Formoterol Fumarate Hydrate.

Identification The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

Purity (1) Weigh an amount of Formoterol Fumarate Tablets, previously powdered, equivalent to 0.24 mg of formoterol fumarate, add 10 mL of anhydrous ethanol, shake well to mix, and then cool in cold water. Then, centrifuge. Take 5 mL of the clear supernatant, add 2 mL of water, then add 1 drop of sodium bicarbonate TS and 1 drop of 4-aminoantipyrine solution (1 in 100), and shake to mix. Then add 1 drop of potassium ferricyanide TS and shake to mix; the resulting solution exhibits a reddish orange color.

(2) Determine the absorption spectrum of the clear supernatant from (1) as directed under the Ultraviolet-visible Spectroscopy; it exhibits maxima between 242 nm and 248 nm and between 282 nm and 286 nm.

Disintegration Meets the requirements.

Uniformity of dosage units It meets the requirements when the procedure for content uniformity is performed according to the following procedure. Take 1 tablet of Formoterol Fumarate Tablets, transfer into a glass stoppered centrifuge tube, add 5.0 mL of a mixture of ethanol and water (1 : 1), and dissolve by sonicating for 15 minutes. Then, filter through a Millipore filter paper, and use the filtrate as the test solution. Separately, weigh accurately about 50 mg of formoterol fumarate hydrate RS (with water content previously determined), and dissolve

to make 50 mL. Pipet 2.0 mL of this solution, add a mixture of ethanol and water (1 : 1) to make exactly 50 mL. To 2.0 mL of this solution, add a mixture of ethanol and water (1 : 1) to make 10 mL, and use this solution as the standard solution. Perform the test with 50 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of formoterol fumarate in each solution.

$$\text{Amount (mg) of formoterol fumarate } [(C_{19}H_{24}N_2O_4)_2 \cdot C_4H_4O_4] = \text{Amount (mg) of formoterol fumarate hydrate RS} \times \frac{A_T}{A_S} \times \frac{804.88}{840.91} \times \frac{1}{1250}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 280 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (about 5 μm in particle diameter).

Mobile phase: A mixture of acetonitrile, water, triethanolamine, phosphoric acid and octanesulfonate (500 : 500 : 1 : 1 : 0.5).

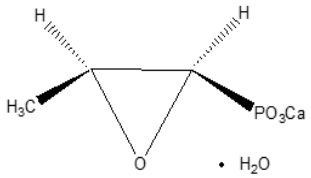
Flow rate: 0.7 mL/min

Assay Weigh accurately the mass of NLT 20 Formoterol Fumarate Tablets and powder. Weigh accurately an amount equivalent to about 0.08 mg of formoterol fumarate $[(C_{19}H_{24}N_2O_4)_2 \cdot C_4H_4O_4]$, transfer into a centrifuge tube, dissolve in a mixture of ethanol and water (1 : 1) by sonicating for 15 minutes, and then add a mixture of ethanol and water (1 : 1) to make 10.0 mL. Then, filter through a Millipore filter paper, and use the filtrate as the test solution. Separately, weigh accurately about 50 mg of formoterol fumarate hydrate RS (with water content previously determined), and prepare as directed under the preparation of the standard solution under the Uniformity of dosage units. Perform the test with 50 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the operating conditions of content uniformity test, and determine the peak areas, A_T and A_S, of formoterol fumarate in each solution.

$$\text{Amount (mg) of formoterol fumarate } [(C_{19}H_{24}N_2O_4)_2 \cdot C_4H_4O_4] = \text{Amount (mg) of formoterol fumarate hydrate RS} \times \frac{A_T}{A_S} \times \frac{804.88}{840.91} \times \frac{1}{625}$$

Packaging and storage Preserve in tight containers.

Fosfomycin Calcium Hydrate
포스포마이신칼슘수화물



Fosfomycin Calcium Hydrate

$C_3H_5CaO_4P \cdot H_2O$: 194.14

Calcium [(2*R*,3*S*)-3-methyloxiran-2-yl] phosphonate [*26016-98-8*]

Fosfomycin Calcium Hydrate is the calcium salt of a compound having antibacterial activity obtained by *Streptomyces fradiae* culture or synthesis.

Fosfomycin Calcium Hydrate contains NLT 725 μg (potency) and NMT 805 μg (potency) of fosfomycin ($C_3H_7O_4P$: 138.06) per mg, calculated on the anhydrous basis.

Description Fosfomycin Calcium Hydrate occurs as a white crystalline powder.
It is slightly soluble in water and practically insoluble in methanol or ethanol(99.5).

Identification (1) Determine the infrared spectra of Fosfomycin Calcium Hydrate and fosfomycin calcium RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) Determine the ^1H spectrum of a solution of Fosfomycin Calcium Hydrate in deuterium oxide for nuclear magnetic resonance spectroscopy (1 in 300), using sodium 3-trimethylsilyl propane sulfate for nuclear magnetic resonance spectroscopy as the internal standard, as directed under the Nuclear Magnetic Resonance Spectroscopy; it exhibits a doublet signal at around δ 1.5 ppm, a double doublet signal at around δ 2.9 ppm, a multiplet signal at around δ 3.3 ppm, and no signal around δ 1.4 ppm.

(3) An aqueous solution of Fosfomycin Calcium Hydrate (1 in 500) responds to the Qualitative Analysis (3) for calcium salt.

Optical rotation $[\alpha]_D^{20}$: Between -2.5° and -5.4° (0.5 g calculated on the anhydrous basis, 0.4 mol/L disodium dihydrogen ethylenediaminetetraacetate TS, pH 8.5, 10 mL, 100 mm).

pH Suspend 40 mg of Fosfomycin Calcium Hydrate in 10 mL of water, dissolve by cooling to about 5 ℃, and make the solution back to room temperature; the pH of the solution is between 8.0 and 10.0.

Purity (1) ***Heavy metals***—To 1.0 g of Fosfomycin Cal-

cium Hydrate, add 40 mL of 0.25 mol/L acetic acid and water to make 50 mL. Use this solution as the test solution, proceed according to Method 1, and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Arsenic***—Proceed with 1.0 g of Fosfomycin Calcium Hydrate according to Method 3 and perform the test (NMT 2 ppm).

Water NMT 12.0% (0.1g, volumetric titration, direct titration). However, use a mixture of formamide for water determination and methanol for water determination (2 : 1) instead of methanol for water determination.

Phosphorus content Weigh accurately about 0.1 g of Fosfomycin Calcium Hydrate, add exactly 40 mL of sodium periodate solution (107 in 10000) and 2 mL of perchloric acid, and heat on a steam bath for 1 hour. After cooling, add water to make exactly 200 mL. Pipet 10 mL of this solution, and add exactly 1 mL of potassium iodide TS. Add sodium thiosulfate TS until this solution becomes colorless, add water to make exactly 100 mL, and use this solution as the test stock solution. Separately, weigh accurately about 70 mg of potassium dihydrogen phosphate, proceed in the same manner as the test solution, and use this solution as the standard stock solution. Proceed in the same manner as the test stock solution, and use this solution as the blank test stock solution. Pipet 5 mL each of the test stock solution, the standard stock solution and the blank test stock solution, transfer each into 25 mL volumetric flasks, and add 2.5 mL of ammonium molybdate-sulfuric acid TS and 1 mL of 1-amino-2-naphthol-4-sulfonic acid TS, respectively. Shake to mix, add water to make exactly 25 mL, and use these solutions as the test solution, the standard solution, and the blank test solution. Allow to stand these solutions at 20 ± 1 ℃ for 30 minutes, and determine the absorbances, A_T, A_S and A_B, as directed under the Ultraviolet-visible Spectrophotometry at the wavelength of 740 nm using water as a control solution (between 15.2% and 16.7%).

$$= \text{Amount (mg) of phosphorus}$$
$$= W \times \frac{A_T - A_B}{A_S - A_B} \times 0.22760$$

W: Amount (mg) of potassium dihydrogen phosphate taken

0.22760: Ratio of phosphorus in potassium dihydrogen phosphate

Calcium content Weigh accurately 0.2 g of Fosfomycin Calcium Hydrate, add exactly 4 mL of 1 mol/L hydrochloric acid TS, shake until completely dissolved, add exactly 100 mL of water, 9 mL of sodium hydroxide TS and 0.1 g of methylthymol blue sodium chloride indicator, and titrate with 0.05 mol/L disodium dihydrogen ethylenediaminetetraacetate VS. The endpoint of the titration is when the color of the solution changes from clear blue to gray or grayish purple. Perform a blank test in the same manner and make any necessary correction (between 19.6% and 21.7%).

Each mL of 0.05 mol/L disodium dihydrogen ethylenediaminetetraacetate VS
= 2.004 mg of Ca

Assay ***Cylinder plate method***—(1) Medium: Use the culture medium in the Assay (1) of Fosfomycin.

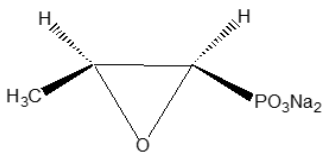
(2) Test organism: Use *Proteus sp* MB 838 as the test organism.

(3) Test microbial suspension: Proceed as directed under the Assay (3) of Fosfomycin Sodium.

(4) Weigh accurately an appropriate amount of Fosfomycin Calcium Hydrate, equivalent to about 20 mg (potency), and dissolve in 0.05 mol/L tris buffer solution, pH 7.0, to make exactly 50 mL. Pipet an appropriate amount of this solution, dilute with 0.05 mol/L tris buffer solution, pH 7.0, to make the solutions containing 10.0 μg (potency) and 5.0 μg (potency) per mL, and use these solutions as the high-concentration test solution and low-concentration test solution, respectively. Separately, weigh accurately about 20 mg (potency) of fosfomycin phenethylammonium RS, dissolve in 0.05 mol/L tris buffer solution, pH 7.0, to make exactly 50 mL, and use this solution as the standard stock solution. Store the standard stock solution at below 5 °C, and use within 7 days. Take exactly an appropriate amount of the standard stock solution, dilute with 0.05 mol/L tris buffer solution, pH 7.0, to make solutions containing 10.0 μg (potency) and 5.0 μg (potency) per mL, and use these solutions as the high-concentration standard solution and the low-concentration standard solution, respectively. Perform the test with these solutions as directed under the Microbial Assays for Antibiotics (A) (8).

Packaging and storage Preserve in tight containers.

Fosfomycin Sodium
포스포마이신나트륨



Fosfomycin Sodium $C_3H_5Na_2O_4P$: 182.02
Sodium [(2*R*,3*S*)-3-methyloxiran-2-yl] phosphonate [*26016-99-9*, anhydrous]

Fosfomycin Sodium is the sodium salt of a compound having antibacterial activity obtained by *Streptomyces fradiae* culture or synthesis.

Fosfomycin Sodium contains NLT 725 μg (potency) and NMT 770 μg (potency) of fosfomycin ($C_3H_7O_4P$: 138.06) per mg, calculated on the anhydrous basis.

Description Fosfomycin Sodium occurs as a white crystalline powder.
It is very freely soluble in water, sparingly soluble in methanol, and practically insoluble in ethanol(99.5).

Identification (1) Determine the infrared spectra of Fosfomycin Sodium and fosfomycin sodium RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) Determine the ^{1}H spectrum of a solution of Fosfomycin Sodium in deuterium oxide for nuclear magnetic resonance spectroscopy (1 in 300), using sodium 3-trimethylsilyl propane sulfonate for nuclear magnetic resonance spectroscopy as the internal standard, as directed under the Nuclear Magnetic Resonance Spectroscopy; it exhibits a doublet signal at around δ 1.5 ppm, a double doublet signal at around δ 2.8 ppm, a multiplet signals at around δ 3.3 ppm and no signal around δ 1.3 ppm.

(3) An aqueous solution of Fosfomycin Sodium (1 in 500) responds to the Qualitative Analysis (1) for sodium salt.

Optical rotation $[\alpha]_D^{20}$: Between -3.5° and -5.5° (0.5 g calculated on the anhydrous basis, water, 10 mL, 100 mm).

pH Dissolve 0.70 g of Fosfomycin Sodium in 10 mL of water; the pH of this solution is between 8.5 and 10.5.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Fosfomycin Sodium in 10 mL of water; the resulting solution is clear and colorless.

(2) ***Heavy metals***—Proceed with 1.0 g of Fosfomycin Sodium according to Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Arsenic***—Proceed with 1.0 g of Fosfomycin Sodium according to Method 3 and perform the test (NMT 2 ppm).

Water NMT 3.0% (0.2g, volumetric titration, direct titration).

Sterility It meets the requirements when used in the manufacturing of a sterile preparation. However, it is excluded in cases where there is a final sterilization process in the manufacturing of sterile preparations.

Bacterial endotoxins Less than 0.125 EU per mg (potency) of fosfomycin when used in the manufacturing of sterile preparations.

Phosphorus content Weigh accurately about 0.1 g of Fosfomycin Sodium, add exactly 40 mL of sodium periodate solution (107 in 10000) and 2 mL of perchloric acid, and heat on a steam bath for 1 hour. After cooling, add water to make exactly 200 mL. Pipet 10 mL of this solution, and add exactly 1 mL of potassium iodide TS. Add sodium thiosulfate TS until this solution becomes colorless, add water to make exactly 100 mL, and use this solution as the test stock solution. Separately, weigh accurately about 70 mg of potassium dihydrogen phosphate, proceed in the same manner as the test solution, and use this solution as the standard stock solution. Without taking Fosfomycin Sodium, proceed in the same manner as the test stock solution, and use this solution as the blank test stock solution. Pipet 5 mL each of the test stock solution, the standard stock solution, and the blank test stock solution, transfer each into 25 mL volumetric flasks, and add 2.5 mL of ammonium molybdate-sulfuric acid TS and 1 mL of 1-amino-2-naphthol-4-sulfonic acid TS, respectively. Shake to mix, add water to make exactly 25 mL, and use these solutions as the test solution, the standard solution and the blank test solution. Allow to stand these solutions at 20 ± 1 ℃ for 30 minutes, and determine the absorbances, A_T, A_S, and A_B, as directed under the Ultraviolet-visible Spectroscopy at the wavelength of 740 nm using water as a control solution (between 16.2% and 17.9%).

$$\text{= Amount (mg) of phosphorus} = W \times \frac{A_T - A_B}{A_S - A_B} \times 0.22760$$

W: Amount (mg) of potassium dihydrogen phosphate taken

0.22760: Ratio of phosphorus in potassium dihydrogen phosphate

Assay ***Cylinder plate method***—(1) Medium: Agar medium for seed and base layer

Peptone	5.0 g	Yeast extract	2.0 g
Meat extract	3.0 g	Agar	15 g

Weigh the above ingredients, dissolve in purified water to make 1000mL, and make the pH between 6.5 and 6.6 after sterilization.

(2) Test organism: Use *Proteus sp* MB 838 as the test organism.

(3) Test microbial suspension: Inoculate the test organism in a slanted agar medium for transplantation of test organism, culture at 37 ℃ for 40 - 48 hours, and perform subculture at least 3 times. Inoculate this bacteria at the surface of 300 mL of the agar medium for transplantation of the test organism in a culture bottle, culture at 37 ℃ for 40 - 48 hours, and suspend this bacteria solution in about 30 mL of water. Dilute this solution 10-fold with water, and adjust the transmission rate to 17% as directed under the Ultraviolet-visible Spectroscopy at a wavelength of 560 nm. Store the microbial suspension at below 10 °C, and use it within 7 days. Dissolve 1 mL to 2 mL of this microbial suspension, mix with 100 mL of agar medium for see maintained at 48°C, and use this solution as the test microbial suspension.

(4) Weigh accurately an appropriate amount of Fosfomycin Sodium, equivalent to about 20 mg (poten-

cy), and add the 0.05 mol/L tris buffer solution, pH 7.0, to make exactly 50 mL. Pipet an appropriate amount of this solution, dilute with 0.05 mol/L tris buffer solution, pH 7.0, to make the solutions containing 10.0 μg (potency) and 5.0 μg (potency), and use these solutions as the high-concentration test solution and low-concentration test solution, respectively. Separately, weigh accurately about 20 mg (potency) of fosfomycin phenethylammonium RS, dissolve in 0.05 mol/L tris buffer solution, pH 7.0, to make exactly 50 mL, and use this solution as the standard stock solution. Store the standard stock solution at below 5 °C, and use within 7 days. Pipet an appropriate amount of this standard stock solution, dilute with 0.05 mol/L tris buffer solution, pH 7.0, to make the solutions containing each 10.0 μg and 5.0 μg (potency) per mL, and use these solutions as the high-concentration standard solution and the low-concentration standard solution, respectively. Perform the test with these solutions as directed under the Microbial Assays for Antibiotics (A) (8).

Packaging and storage Preserve in hermetic containers.

Fosfomycin Sodium for Injection
주사용 포스포마이신나트륨

Fosfomycin Sodium for Injection is an injection dissolved before use and contains NLT 90.0% and NMT 110.0% of the labeled amount of fosfomycin ($C_3H_7O_4P$: 138.06).

Method of preparation Prepare as directed under Injections, with Fosfomycin Sodium.

Description Fosfomycin Sodium for Injection occurs as a white crystalline powder.

Identification (1) Dissolve about 0.1 g of Fosfomycin Sodium for Injection in 3 mL of perchloric acid solution (1 in 4), add 1 mL of 0.1 mol/L sodium periodate solution, and warm for 30 minutes on a steam bath at 60 °C. After cooling, add 50 mL of water, and neutralize by adding a saturated solution of sodium bicarbonate. To this solution, add 1 mL of potassium iodide TS; the blank test sample exhibits a red color, but the test sample does not exhibit red.

(2) To 2 mL of aqueous solution of Fosfomycin Sodium for Injection (1 in 250), add 1 mL of perchloric acid and 2 mL of 0.1 mol/L sodium periodate solution, and warm for 10 minutes on a steam bath. After cooling, add 1 mL of ammonium molybdate-sulfuric acid TS and 1 mL of 1-amino-2-naphthol-4-5-sulfonic acid TS and allow to stand for 30 minutes; the solution exhibits a blue color.

(3) Dissolve an amount of Fosfomycin Sodium for Injection equivalent to 0.1 g (potency) of fosfomycin sodium according to the labeled amount in 50 mL of water; the resulting solution responds to Chemical identification reaction (1) for sodium salt.

pH Dissolve an amount of Fosfomycin Sodium for Injection, equivalent to 1.0 g (potency) of fosfomycin sodium, in 20 mL of water; the pH of this solution is between 6.5 and 8.5.

Purity ***Clarity and color of solution***—Dissolve an amount of Fosfomycin Sodium for Injection equivalent to 1.0 g (potency) of fosfomycin sodium according to the labeled amount in 10 mL of water; the solution is clear and colorless.

Sterility Meets the requirements.

Bacterial endotoxins Less than 0.025 EU per mg (potency) of fosfomycin.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

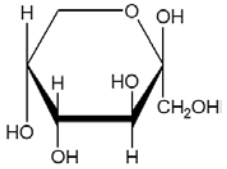
Uniformity of dosage units Meets the requirements.

Water NMT 4.0% (0.1 g, coulometric titration).

Assay Perform the test according to the Assay under Fosfomycin Sodium. Weigh accurately the mass of NLT 10 units of Fosfomycin Sodium for Injection. Weight accurately an amount equivalent to about 20 mg (potency) of fosfomycin sodium according to the labeled amount, and dissolve in 0.05 mol/L tris buffer solution (pH 7.0) to make exactly 50 mL. Pipet an appropriate amount of the resulting solution, add 0.05 mol/L tris buffer solution (pH 7.0), dilute to contain 10 μg (potency) and 5 μg (potency) per mL, and use these solutions as the high-concentration test solution and the low-concentration test solution, respectively.

Packaging and storage Preserve in hermetic containers. Plastic containers for aqueous injections may be used.

Fructose
과당



Fructose $C_6H_{12}O_6$: 180.16
(3*S*,4*R*,5*R*)-1,3,4,5,6-Pentahydroxyhexan-2-one [*57-48-7*]

Fructose, when dried, contains NLT 98.0% and

NMT 101.0% of fructose ($C_6H_{12}O_6$).

Description Fructose occurs as a colorless to white crystals or crystalline powder, is odorless and has a sweet taste.
It is very soluble in water, sparingly soluble in ethanol(95) and practically insoluble in ether.
It is hygroscopic.

Identification (1) Add 2 to 3 drops of an aqueous solution of Fructose (1 in 20) to 5 mL of boiling Fehling's TS; a red precipitate is produced.

(2) Determine the infrared spectra of Fructose and Fructose RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

pH Dissolve 4.0 g of Fructose in 20 mL of water; the pH of the solution is between 4.0 and 6.5.

Purity (1) ***Clarity and color of solution***—Dissolve 25.0 g of Fructose in 50 mL of water; the solution is clear and the color is not more intense than the following control solution.

Control Solution—Add water to a mixture of 3.0 mL of control stock solution of the color of iron(III) chloride hexahydrate, 1.0 mL of control stock solution of the color of cobalt(II) chloride hexahydrate, and 2.0 mL of control stock solution of the color of copper(II) sulfate pentahydrate, make 10.0 mL of solution, take 3.0 mL of the solution, and add water to make 50 mL.

(2) ***Acid***—Dissolve 5.0 g of Fructose in 50 mL of freshly boiled and cooled water, and add 3 drops of phenolphthalein TS and 0.60 mL of 0.01 mol/L sodium hydroxide TS; the color of the solution is red.

(3) ***Sulfite***—Dissolve 0.5 g of Fructose in 5 mL of water and add 0.25 mL of 0.01 mol/L iodine TS; the solution is yellow.

(4) ***Chloride***—Weigh 2.0 g of Fructose and perform the test. Prepare the control solution with 1.0 mL of 0.01 mol/L hydrochloric acid (NMT 0.018%).

(5) ***Sulfate***—Weigh 2.0 g of Fructose and perform the test. Prepare the control solution with 1.0 mL of 0.005 mol/L sulfuric acid (NMT 0.024%).

(6) ***Heavy metals***—Weigh 5.0 g of Fructose and perform the test according to Method 2. Prepare the control solution with 2.0 mL of lead standard solution (NMT 4 ppm).

(7) ***Calcium***—Dissolve 0.5 g of Fructose in 5 mL of water, add 2 to 3 drops of ammonia TS and 1 mL of ammonium oxalate TS, and allow to stand for 1 minute; the solution is clear.

(8) ***Arsenic***—Dissolve 1.5 g of Fructose in 5 mL of water, add 5 mL of dilute sulfuric acid and 1 mL of bromine TS, heat on a steam bath for 5 minutes, concentrate again to make 5 mL, cool, and perform the test using this solution as the test solution (NMT 1.3 ppm).

(9) ***5-Hydroxymethylfurfural***—Dissolve 5.0 g of Fructose in 100 mL of water. Perform the test with this solution as directed under the Ultraviolet-visible Spectroscopy; the absorbance at a wavelength of 284 nm is NMT 0.32.

Loss on drying NMT 0.5% (1 g, in vacuum, silica gel, 3 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 4 g of Fructose, previously dried, dissolve in 0.2 mL of ammonia TS and 80 mL of water, allow to stand for 30 minutes, and add water to make exactly 100 mL. Measure the optical rotation α_D in 100 mm of layer length at 20 ± 1 ℃ as directed under the Optical Rotation.

Amount (mg) of fructose ($C_6H_{12}O_6$) = $|\alpha_D| \times 1087.0$

Packaging and storage Preserve in tight containers.

Fructose Injection
과당 주사액

Fructose Injection is an aqueous injection and contains NLT 95.0% and NMT 105.0% of the labeled amount of fructose ($C_6H_{12}O_6$: 180.16).

Method of preparation Prepare as directed under Injections, with Fructose.
No preservative is added.

Description Fructose Injection occurs as a clear, colorless liquid with a sweet taste.

Identification (1) Weigh an amount of Fructose Injection, equivalent to 1 g of fructose, according to the labeled amount, add water or concentrate on a steam bath, if necessary, to make 20 mL, and use it as the test solution. Add 2 - 3 drops of the test solution to 5 mL of boiling Fehling's TS; red precipitates are formed.

(2) Take 10 mL of the test solution obtained in (1), add 0.1 g of resorcinol and 1 mL of hydrochloric acid, and heat on a steam bath for 3 minutes; the resulting solution exhibits a red color.

pH Between 3.0 and 6.5. However, if the labeled concentration exceeds 5%, add water to prepare a 5% solution, and perform the test.

Purity (1) ***Heavy metals***—Weigh an amount of Fructose Injection, equivalent to 5.0 g of fructose, according to the labeled amount, and evaporate to dryness on a steam bath. Proceed with the residue according to Method 2 and perform the test. Prepare the control solution with 2.0 mL

of lead standard solution.

(2) ***Arsenic***—Weigh an amount of Fructose Injection, equivalent to 1.5 g of fructose, according to the labeled amount, and add water or concentrate on a steam bath, if necessary, to make 5 mL. Then, add 5 mL of dilute sulfuric acid and 1 mL of bromine TS, and perform the test as directed under the Purity (8) under Fructose.

(3) ***5-Hydroxymethylfurfurals***—Weigh an amount of Fructose Injection, equivalent to 5.0 g, and evaporate or add water to make 100 mL. Determine the absorbance of this solution as directed under the Ultraviolet-visible Spectroscopy; the absorbance is NMT 0.32 at a wavelength of 284 nm.

Residue on ignition Take exactly an amount of Fructose Injection, equivalent to 2.0 g of fructose, according to the labeled amount, evaporate to dryness on a steam bath, and perform the test; the residue is NMT 2.0 mg.

Sterility Meets the requirements.

Bacterial endotoxins Less than 0.5 EU/mL.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Extractable volume of injections Meets the requirements.

Assay Weigh exactly an amount of Fructose Injection, equivalent to about 4 g of fructose ($C_6H_{12}O_6$), add 0.2 mL of ammonia TS and water to make exactly 100 mL, and shake well to mix, and allow to stand for 30 minutes. Measure the optical rotation α_D at 20 ± 1 °C with a layer length of 100 mm as directed under the Optical Rotation.

Amount (mg) of fructose ($C_6H_{12}O_6$) = $|\ \alpha_D\ | \times 1087.0$

Packaging and storage Preserve in hermetic containers. Plastic containers for aqueous injections may be used.

Fructose and Concentrated Glycerin Injection
과당·농글리세린 주사액

Fructose and Concentrated Glycerin Injection contains NLT 90.0% and NMT 110.0% of fructose (C6H12O6 : 180.16) and concentrated glycerin ($C_6H_{12}O_6$: 180.16).

Method of preparation Prepare as directed under Injections, with Fructose and Concentrated Glycerin

Injection (1) ***Fructose***—Weigh the amount equivalent to 0.5 g of fructose according to the labeled amount of Fructose and Concentrated Glycerin Injection, add 0.1 g of resorcin and 1 mL of hydrochloric acid, and warm it on a steam bath for 3 minutes; the solution exhibits a red color.

(2) ***Concentrated glycerin***—Perform the test with Fructose and Concentrated Glycerin Injection as directed under the assay of concentrated glycerin; the test solution shows the peak at the same retention time as the standard solution.

(3) According to the labeled amount of Fructose and Concentrated Glycerin Injection, pipet an amount equivalent to 0.1 g of concentrated glycerin, add ethanol to make 10 mL, and use it as the test solution. Separately, weigh 50 mg of fructose, dissolve it in 1 mL of water, add 0.1 g of concentrated glycerin and ethanol to make 10 mL, and use it as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on a thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of acetone, n-butanol and water (5:4:1) to a distance of about 10 cm, and air-dry the plate. Dissolve 1 g of potassium permanganate in water to make 50 mL and then dissolve 2 g of sodium carbonate in water to make 50 mL. When using, mix the two solutions in equal amounts and spray evenly. The R_f value and color of spots in the standard solution and test solution are the same.

pH Between 3.0 and 5.0.

Purity (1) ***Heavy Metals***—Take 10 mL of Fructose and Concentrated Glycerin Injection and perform the test according to Method 1. Prepare the control solution with 2.5 mL of lead standard solution (NMT 2.5 ppm).

(2) ***Arsenic***—Take 4 mL of Fructose and Concentrated Glycerin Injection and test it according to Method 1 under the Arsenic (NMT 0.5 ppm).

(3) ***5-Hydroxymethylfurfurals***—Determine the absorption spectrum directed under the Ultraviolet-visible Spectroscopy by taking 5 mL of Fructose and Concentrated Glycerin Injection and adding water to make 20 mL; it is NMT 0.8 at a wavelength of 284 nm (NMT 0.0024%).

(4) ***Acrolein***—Use Fructose and Concentrated Glycerin Injection directly as the test solution. Separately, weigh accurately about 0.1 g of acrolein RS and dissolve in water to make 100 mL. Take 5.0 mL of this solution and add water to make 100 mL. Again, take 4.0 mL of this solution, add water to make 100 mL, and use it as the standard solution. Perform the test according to the Gas Chromatography with 5.0 μL each of the test solution and standard solution under the following conditions; the peak height at the acrolein position in the chromatogram obtained from Fructose and Concentrated Glycerin Injection should be smaller than the peak height of acro-

lein obtained from the standard solution (NMT 2 ppm).

Operating conditions

Detector: Flame ionization detector

Column: A glass column, about 3 mm in internal diameter and about 1.5 m in length, is filled with 150 and 180 μm of porous ethylvinylbenzene-divinylbenzene copolymer for gas chromatography (average pore diameter of 0.0075 μm, 500 to 600 m^2/g).

Column temperature: A constant temperature of about 150 °C.

Sample injection port temperature: 180 °C

Carrier gas: Nitrogen

Flow rate: Between 35 and 45 mL/min.

Sterility Meets the requirements.

Bacterial endotoxins Fructose and Concentrated Glycerin Injection is NMT 0.6 EU per mL of fructose and concentrated glycerin.

Particulate contamination: Visible particles in injections and ophthalmic solutions Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Extractable volume of injections Meets the requirements.

Assay (1) ***Fructose*—**Pipet the amount equivalent to 1 g of fructose ($C_6H_{12}O_6$) according to the labeled amount, add 0.1 mL of ammonia TS and water to make 25 mL, and shake well to mix. Allow to stand for 30 minutes, and measure the optical rotation with a layer length of 100 mm.

$$\text{Amount (mg) of fructose } (C_6H_{12}O_6) = [\alpha]_D^{20} \times 271.74$$

(2) ***Concentrated glycerin*—**Pipet the amount equivalent to 0.2 g of concentrated glycerin ($C_3H_8O_3$) according to the labeled amount of Fructose and Concentrated Glycerin Injection, and add water to make 100 mL. Take 2.0 mL of this solution, add 2.0 mL of the internal standard solution, dry it under reduced pressure in a 35 °C water bath, and dry it again in a desiccator (reduced pressure, silica gel) for 1 hour. Dissolve in 6 drops of anhydrous pyridine, add 5 to 6 drops of 1,1,1,3,3,3-hexamethyldisilaic acid and 3 drops of trimethylchlorosilane, stopper, and warm it in a 60 °C water bath for 30 minutes while shaking occasionally to mix. After cooling it down, put 4.0 mL of hexane, add 1 mL of water, shake well, and allow it to stand. Use the clear solution above as the test solution.

Separately, weigh accurately about 0.2 g of concentrated glycerin RS, dissolve it by adding to make 100.0 mL. Take 2.0 mL of this solution and proceed in the same as the test solution to use it as the standard solution. Take 2 μL each of the test solution and the standard solution and perform the test according to the following conditions as directed under the Gas Chromatography to obtain the peak area ratio Q_T and Q of concentrated glycerin to the internal standard of each solution.

$$\text{Amount (mg) of concentrated glycerin } (C_3H_8O_3) = \text{Amount (mg) of concentrated glycerin RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—0.1% mesoerythritol solution

Operating Conditions

Detector: Flame ionization detector

Column: A stainless steel column, about 3 mm in internal diameter and about 2 m in length, is filled with diatomaceous earth for gas chromatography (177 to 250 μm) coated with 3% polydimethylsiloxane.

Column temperature: Raise the temperature from 100 °C by 20 °C every minute.

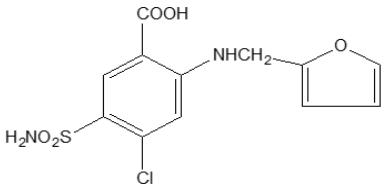
Sample injection port temperature: 220 °C

Carrier gas: Nitrogen

Flow rate: Between 20 to 30 mL/min.

Packaging and storage Preserve in tight containers.

Furosemide
푸로세미드



Furosemide $C_{12}H_{11}ClN_2O_5S$: 330.74

4-Chloro-2-(furan-2-ylmethylamino)-5-sulfamoylbenzoic acid [*54-31-9*]

Furosemide, when dried, contains NLT 98.0% and NMT 101.0% of furosemide ($C_{12}H_{11}ClN_2O_5S$).

Description Furosemide occurs as white crystals or a crystalline powder.

It is freely soluble in *N*,*N*-dimethylformamide, soluble in methanol, sparingly soluble in ethanol(95), slightly soluble in acetonitrile or acetic acid(100) and practically insoluble in water.

It is soluble in dilute sodium hydroxide TS.

It is gradually colored by light.

Melting point—About 205 °C (with decomposition).

Identification (1) Dissolve 25 mg of Furosemide in 10 mL of methanol. To 1 mL of this solution, add 10 mL of 2 mol/L hydrochloric acid TS, heat for 15 minutes on a steam bath with a reflux condenser. After cooling, make the solution weakly acidic with 18 mL of sodium hydrox-

ide TS; it responds to the Qualitative Analysis for primary aromatic amine. However, the solution exhibits a red to purple color.

(2) Determine the absorption spectra of the solutions of Furosemide and furosemide RS in dilute sodium hydroxide TS (1 in 125000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) Determine the infrared spectra of Furosemide and furosemide RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Purity (1) ***Clarity and color of solution***—Dissolve 0.5 g of Furosemide in 10 mL of sodium hydroxide solution (1 in 50); the solution is colorless and clear.

(2) ***Chloride***—Dissolve 2.6 g of Furosemide in 90 mL of dilute sodium hydroxide TS, add 2 mL of nitric acid, and filter. To 25 mL of the filtrate, add 6 mL of dilute nitric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution by adding 6 mL of dilute nitric acid and water to 0.40 mL of 0.01 mol/L hydrochloric acid to make 50 mL (NMT 0.020%).

(3) ***Sulfate***—To 20 mL of the filtrate obtained from (2), add 1 mL of dilute hydrochloric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution by adding 1 mL of dilute hydrochloric acid and water to 0.35 mL of 0.005 mol/L sulfuric acid to make 50 mL (NMT 0.030%).

(4) ***Heavy metal***—Proceed with 2.0 of Furosemide according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(5) ***Related substances***—Dissolve 25 mg of Furosemide in 25 mL of the solvent, and use this solution as the test solution. Weigh accurately 1 mL of this solution, add the solvent to make exactly 200 mL, and use this solution as the standard solution. Weigh accurately 20 μL each of the test solution and the standard solution, and perform the test as directed under the Liquid Chromatography according to the following conditions. Determine the peak area of each solution by the automatic integration method; the peak area of each peak that appears before the peak of furosemide obtained from the test solution is not greater than 2/5 times the peak area of furosemide from the standard solution; the peak area of each peak that appears after the peak of furosemide is not greater than 1/4 the peak area of furosemide from the standard solution. Also, the sum of each peak area is not greater than 2 times the peak area of furosemide from the standard solution.

Solvent—Add a mixture of water and acetonitrile (1:1) to 22 mL of solvent-acetic acid(100) to make 1000 mL.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 272 nm).

Column: A stainless steel column 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silical gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: A mixture of water, tetrahydrofuran and acetic acid(100) (70 : 30 : 1).

Flow rate: Adjust the flow rate so that the retention time of furosemide is about 18 minutes.

System suitability

Test for required detectability: Weigh accurately 2 mL of the standard solution and add the solvent to make exactly 50 mL. Confirm that the peak area of furosemide obtained from 20 μL of this solution is 3.2% to 4.8% of that of furosemide obtained from the standard solution.

System performance: Proceed with 20 μL of the standard solution under the above operating conditions; the number of theoretical plates and symmetry factor of furosemide peak are NLT 7000 plates and NMT 1.5, respectively.

System repeatability: Repeat the test 6 times with 20 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area of furosemide is NMT 2.0%.

Time span of measurement: About 2.5 times the retention time of furosemide after the solvent peak.

Loss on drying NMT 0.5% (1 g, 105 ℃, 4 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately 0.5 g of Furosemide, previously dried, dissolve in 50 mL of *N*,*N*-dimethylformamide, and titrate the solution with 0.1 mol/L sodium hydroxide VS (indicator: 3 drops of bromothymol blue TS). However, the endpoint of titration is when the color of the solution changes from yellow to blue. Separately, perform a blank test in the same manner with a solution prepared by adding 15 mL of water to 50 mL of *N*,*N*-dimethylformamide, and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS
= 33.07 mg of $C_{12}H_{11}ClN_2O_5S$

Packaging and storage Preserve in light-resistant, tight containers.

Furosemide Tablets
푸로세미드 정

Furosemide Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of furosemide ($C_{12}H_{11}ClN_2O_5S$: 330.74).

Method of preparation Prepare as directed under Tablets, with Furosemide.

Identification (1) Weigh an amount of Furosemide Tablets, previously powdered, equivalent to 0.2 g of furosemide according to the labeled amount, add 40 mL of acetone, shake well to mix, and then filter. To 0.5 mL of the filtrate, add 10 mL of 2 mol/L hydrochloric acid TS, and heat on a steam bath for 15 minutes under a reflux condenser. After cooling, add 18 mL of sodium hydroxide TS to make weak acid; the resulting solution responds to the Qualitative Analysis for primary aromatic amine. However, the resulting solution exhibits a red to purple color.

(2) Determine the absorption spectrum of the test solution obtained in the Assay as directed under Ultraviolet-visible Spectrophotometry; it exhibits maxima between 227 nm and 231 nm, between 269 nm and 273 nm, and between 330 nm and 336 nm.

Purity Weigh an amount of Furosemide Tablets, previously powdered, equivalent to about 40 mg of furosemide according to the labeled amount, add 30 mL of acetone, shake well to mix, and then add acetone to make exactly 50 mL. Centrifuge this solution, add 3.0 mL of water to 1.0 mL of the clear supernatant, cool with ice, and then add 3.0 mL of dilute hydrochloric acid and 0.15 mL of sodium nitrite TS. Shake to mix, and allow to stand for 1 minute. To this solution, add 1.0 mL of ammonium amidosulfate TS, shake well to mix, allow to stand for 3 minutes, and then add 1.0 mL of *N*,*N*-diethyl-*N'*-1-naphthylethylenediamine oxalate TS. Allow to stand for 5 minutes. Perform the test with this solution as directed under Ultraviolet-visible Spectrophotometry, using a solution prepared in the same manner with 1.0 mL of acetone as the blank: the absorbance at 530 nm is NMT 0.10.

Dissolution Perform the test with 1 tablet of Definition of Zaltoprofen Tablets at 50 revolutions per minute according to Method 2 under the Dissolution, using 900 mL of the solution 2 for the dissolution test as the dissolution medium. Take 20 mL each of the dissolved solution 15 minutes after starting the test for 20 mg of tablet and 30 minutes after starting the test for 40 mg of tablet, and filter through a membrane filter with a pore size of NMT 0.45 μm. Discard the first 10 mL of the filtrate, pipet *V* mL of the subsequent filtrate, add Solution 2 for dissolution test to make exactly *V'* mL of a solution containing about 10 μg of furosemide ($C_{12}H_{11}ClN_2O_5S$) per mL according to the labeled amount, and use this solution as the test solution. Separately, weigh accurately about 20 mg of furosemide RS, previously dried at 105 ℃ for 4 hours, dissolve in 5 mL of methanol, and add Solution 2 for dissolution test to make exactly 100 mL. Pipet 5 mL of this solution, add Solution 2 for dissolution test to make exactly 100 mL, and use this solution as the standard solution. With the test solution and the standard solution, perform the test as directed under the Ultraviolet-visible Spectroscopy using the dissolution medium as a control solution, and determine the absorbances, A_T and A_S, at the wavelength of 277 nm. The acceptable dissolution criterion is NLT 80% of Furosemide Tablets dissolved in 60 minutes.

Dissolution rate (%) of the labeled amount of furosemide ($C_{12}H_{11}ClN_2O_5S$)

$$= \text{Amount (mg) of furosemide RS} \times \frac{A_T}{A_S} \times \frac{V'}{V} \times \frac{1}{C} \times 45$$

C: Labeled amount (mg) of furosemide ($C_{12}H_{11}ClN_2O_5S$) in 1 tablet

Uniformity of dosage units It meets the requirements when the procedure for content uniformity is performed according to the following method.

Take 1 tablet of Furosemide Tablets, add 0.05 mol/L sodium hydroxide TS, disintegrate by shaking well to mix, and add 0.05 mol/L sodium hydroxide TS to make exactly *V* mL of a solution containing about 0.4 mg of furosemide ($C_{12}H_{11}ClN_2O_5S$) per mL. Filter the solution, discard the first 10 mL of the filtrate, pipet the subsequent 2 mL of the filtrate, add 0.05 mol/L sodium hydroxide TS to make exactly 100 mL, and use this solution as the test solution. Perform the test as directed under the Assay.

Amount (mg) of furosemide ($C_{12}H_{11}ClN_2O_5S$)

$$= \text{Amount (mg) of furosemide RS} \times \frac{A_T}{A_S} \times \frac{V}{50}$$

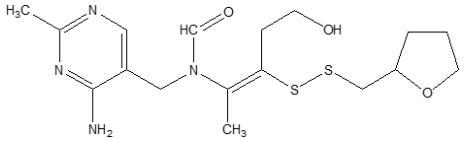
Assay Weigh accurately the mass of NLT 20 tablets of Furosemide Tablets, and powder. Weigh accurately a portion of the powder, equivalent to about 40 mg of furoscmide (C12H11ClN2O5S), add about 70 mL of 0.05 mol/L sodium hydroxide TS, shake well, and add 0.05 mol/L sodium hydroxide TS to make exactly 100 mL. Filter, discard the first 10 mL of the filtrate, pipet 2 mL of the subsequent filtrate, add 0.05 mol/L sodium hydroxide TS to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 20 mg of furosemide RS, previously dried at 105 ℃ for 4 hours, and dissolve in 0.05 mol/L sodium hydroxide TS to make exactly 50 mL. Pipet 2 mL of this solution, add 0.05 mol/L sodium hydroxide TS to make exactly 100 mL, and use it as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at the wavelength of 271 nm as directed under the Ultraviolet-visible Spectroscopy.

Amount (mg) of furosemide ($C_{12}H_{11}ClN_2O_5S$)

$$= \text{Amount (mg) of furosemide RS} \times \frac{A_T}{A_S}$$

Packaging and storage Preserve in light-resistant, well-closed containers.

Fursultiamine
푸르설티아민



Fursultiamine $C_{17}H_{26}N_4O_3S_2$: 398.54
N-[(4-Amino-2-methyl-5-pyrimi dinyl)methyl]-*N*-[4-hydroxy-1-methyl-2-[[(tetrahydro-2-furanyl)methyl]dithio]-1-butenyl]formamide, [*804-30-8*]

Fursultiamine, when dried, contains NLT 98.0% and NMT 102.0% of fursultiamine ($C_{17}H_{26}N_4O_3S_2$).

Description Fursultiamine occurs as white to yellowish white crystals or a crystalline powder, which is odorless or has a slight characteristic odor.
It is freely soluble in methanol, ethanol or chloroform, and sparingly soluble in water and soluble in dilute hydrochloric acid.

Melting point—About 130 °C (with decomposition).

Identification (1) Dissolve 5 mg of Fursultiamine in 6 mL of 0.1 mol/L hydrochloric acid, and add 0.1 g of zinc powder and allow to stand; it has a slight characteristic odor.

(2) To 3 mL of the solution obtained from (1), add 3 mL of sodium hydroxide TS and 0.5 mL of potassium ferricyanide TS, and shake vigorously to mix. Then, add 5 mL of isobutanol, shake vigorously to mix for 2 minutes, and examine the solution under ultraviolet light (main wavelength: 365 nm); the isobutanol layer exhibits a bluish violet fluorescence. This fluorescence disappears when the solution is acidified and reappears when it is alkalized.

Purity (1) ***Clarity and color of solution***—Dissolve 20 mL of 0.5 mol/L hydrochloric acid in 1.0 g of Fursultiamine; the resulting solution is clear and its color should not be more intense than that of the control solution.

Control solution—Take 1.5 mL of 1/60 mol/L potassium dichromate VS, and add water to make 1.0 L.

(2) ***Sulfate***—Dissolve 1.5 g of Fursultiamine with 3 mL of dilute hydrochloric acid, dissolve to 50 mL with water, and test according to the Sulfate. Prepare the control solution with 0.35 mL of 0.005 mol/L sulfuric acid and 3 mL of dilute hydrochloric acid, and add water to make 50 mL (NMT 0.011%).

(3) ***Heavy metals***—Proceed with 1.0 g of Fursultiamine according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(4) ***Related substances***—(i) Thiamine: Weigh accurately about 0.1 g of Fursultiamine, dissolve in the mobile phase to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 0.1 g of thiamine hydrochloride RS, dissolve in 0.1 mol/L hydrochloric acid TS, and make exactly 100 mL with 0.1 mol/L hydrochloric acid TS. Pipet 1 mL of this solution and add 0.1 mol/L hydrochloric acid TS to make exactly 50 mL. Pipet 2 mL of this solution, add the mobile phase to make exactly 20 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak area of thiamine hydrochloride, A_T and A_S, in each solution. The amount of thiamine hydrochloride in the test solution is NMT 0.2%.

Operating conditions

For the detector, column, mobile phase and flow rate, proceed as directed in the operating conditions under the Assay.

System suitability

System performance: Proceed with 10 μL of the standard solution according to the above operating conditions; the number of theoretical plates for thiamine hydrochloride peak is NLT 2,000 and the symmetry factor is NMT 2.0.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution according to the above operating conditions; the relative standard deviation of the peak areas of thiamine hydrochloride is NMT 2.0%.

(ii) Total related substances: Weigh accurately about 0.1 g of Fursultiamine, dissolve in the mobile phase to make exactly 100 mL, and use this solution as the test solution. Pipet 1 mL of the test solution and add the mobile phase to make exactly 100 mL. Use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak area of each solution by the automatic integration method; the total peak area other than the major peak of the test solution is smaller than the peak area of the standard solution.

Operating conditions

For the detector, column, mobile phase and flow rate, proceed as directed in the operating conditions under the Assay.

System suitability

System performance: Proceed with 10 μL of the standard solution according to the above operating conditions; the number of theoretical plates for fursultiamine peak is NLT 2,000 and the symmetry factor is NMT 2.0.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution according to the above operating conditions; the relative standard deviation of the peak areas of fursultiamine is NMT 2.0%.

Time span of measurement: A range of about 3 times the retention time of fursultiamine after the solvent peak

Loss on drying NMT 1.0% (1 g, in vacuum, phosphorus pentoxide, 5 hours).

Residue on ignition NMT 0.20% (1 g)

Assay Weigh accurately about 60 mg of Fursultiamine, previously dried, put it in a flask with a volume of 100 mL, and add the mobile phase to make exactly 100 mL. Pipet 10 mL of this solution, put it in a 100-mL volumetric flask, and add the mobile phase to make exactly 100 mL. Use this solution as the test solution. Separately, weigh accurately about 60 mg fursultiamine RS, proceed in the same manner as the test solution, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of fursultiamine in each solution.

Amount (mg) of fursultiamine ($C_{17}H_{26}N_4O_3S_2$)
= Amount (mg) of fursultiamine RS × (A_T / A_S)

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 50 ℃.

Mobile phase: Dissolve 1.01 g of sodium 1-heptanesulfonate in 1000 mL of dilute acetic acid(100) (1 in 100). To 675 mL of this solution, add 325 ml of a mixture of methanol and acetonitrile (3 : 2).

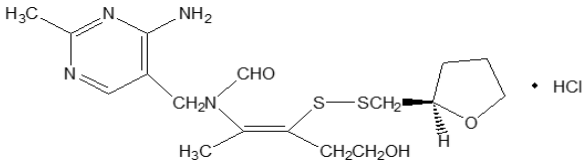
Flow rate: 1.0 mL/min

System suitability

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution according to the above operating conditions; the relative standard deviation of the peak areas of fursultiamine is NMT 2.0%.

Packaging and storage Preserve in well-closed containers.

Fursultiamine Hydrochloride
푸르설티아민염산염



and enantiomer

$C_{17}H_{26}N_4O_3S_2$·HCl: 435.00

N-[(4-Amino-2-methylpyrimidin-5-yl)methyl]-*N*-{(1*E*)-4-hydroxy-1-methyl-2-[((2*R*)-tetrahydrofuran-2-ylmethyl)disulfanyl]but-1-en-1-yl}formamide hydrochloride [*2105-43-3*]

Fursultiamine Hydrochloride contains NLT 98.5% and NMT 101.0% of fursultiamine hydrochloride ($C_{17}H_{26}N_4O_3S_2$·HCl), calculated on the anhydrous basis.

Description Fursultiamine Hydrochloride occurs as white crystals or a crystalline powder. It is odorless or has a slight characteristic odor and a bitter taste.
It is freely soluble in water, methanol or ethanol(95) and practically insoluble in ether.

Identification (1) Dissolve about 5 mg of Fursultiamine Hydrochloride in 6 mL of 0.1 mol/L hydrochloric acid TS, add 0.1 g of zinc powder, allow to stand for several minutes, and then filter. To 3 mL of the filtrate, add 3 mL of sodium hydroxide TS and 0.5 mL of potassium hexacyanoferrate(III) TS. Then, add 5 mL of 2-methyl-1-propanol, shake vigorously for 2 minutes to mix, allow to stand, and examine the solution under ultraviolet light (main wavelength: 365 nm); the 2-methyl-1-propanol layer exhibits a bluish violet fluorescence. This fluorescence disappears when it is acidified and reappears when alkalized.

(2) Determine the infrared spectra of Fursultiamine Hydrochloride and fursultiamine hydrochloride RS, previously dried in a desiccator (in vacuum, phosphorus pentoxide) for 24 hours, as directed the potassium bromide disk method under the Mid-infrared Spectroscopy; both exhibits similar intensities of absorption at the same wavenumbers. If there is a difference between the two spectra, dissolve Fursultiamine Hydrochloride in water, evaporate the water, and dry the residue in a desiccator (in vacuum, phosphorus pentoxide) for 24 hours, and perform the test with the residue in the same manner.

(3) Perform the test with an aqueous solution (1 in 50) of Fursultiamine Hydrochloride according to the Qualitative Analysis (2) for chloride.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Fursultiamine Hydrochloride in 20 mL of water; the solution is colorless and clear.

(2) ***Sulfate***—Perform the test with 1.5 g of Fursultiamine Hydrochloride. Prepare the control solution with 0.35 mL of 0.005 mol/L sulfuric acid (NMT 0.011%).

(3) ***Heavy metal***—Weigh 1.0 g of Fursultiamine Hydrochloride according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(4) ***Related substances***—Dissolve 0.10 g of Fursultiamine Hydrochloride in the mobile phase to make 100 mL, and use this solution as the test solution. Pipet 1 mL of this solution, add the mobile phase to it make exactly 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak area of each solution by the automatic integration method; the total area of peaks other than fursultiamine from the test solution is smaller than the peak area of fursultiamine from the standard solution.

Operating conditions

For the detector, column, column temperature, mobile phase, flow rate and system suitability, proceed as directed in the operating conditions under the Assay.

Detection sensitivity: Adjust the detection sensitivity so that the peak height of fursultiamine obtained from 10 μL of the standard solution is 20 mm to 30 mm.

Time span of measurement: A range of about 3 times the retention time of fursultiamine.

Water NMT 5.0% (0.3 g, volumetric titration, direct titration).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 55 mg each of Fursultiamine Hydrochloride and fursultiamine hydrochloride RS (Separately, determine the water before use, in the same manner as for Fursultiamine Hydrochloride), dissolve each in 50 mL of water, add exactly 10 mL each of internal standard solution, and add water to make exactly 100 mL. Pipet 8 mL each of this solution, add water to make exactly 50 mL, and use these solutions as the test solutions and the standard solutions, respectively. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the ratios, Q_T and Q_S, of the peak area of fursultiamine to that of internal standard substance of each solution, respectively.

Amount (mg) of fursultiamine hydrochloride ($C_{17}H_{26}N_4O_3S_2$.HCl)
= Amount (mg) of fursultiamine hydrochloride RS, calculated on the anhydrous basis × (Q_T / Q_S)

Internal standard solution—4 A solution of isopropyl 4-aminobenzoate in ethanol(95) (3 in 400).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 50 °C.

Mobile phase: Dissolve 1.01 g of sodium 1-heptanesulfonate in 1000 mL of diluted acetic acid(100) (1 in 100). To 675 mL of this solution, add 325 ml of a mixture of methanol and acetonitrile (3 : 2).

Flow rate: Adjust the flow rate so that the retention time of fursultiamine is about 9 minutes.

System suitability

Selection of column: Proceed with 10 μL of the standard solution under the above conditions; fursultiamine and the internal standard substance are eluted in this order with the resolution being NLT 10.

Packaging and storage Preserve in tight containers.

Fursultiamin Hydrochloride Injection
푸르설티아민염산염 주사액

Fursultiamin Hydrochloride Injection contains NLT 90.0% and NMT 130.0% of the labeled amount of fursultiamine hydrochloride ($C_{17}H_{26}N_4O_3S_2$·HCl : 435.00).

Method of preparation Prepare as directed under Injections, with Fursultiamine Hydrochloride.

Identification Perform the test with Fursultiamin Hydrochloride Injection as directed under the Analysis for Vitamins.

pH Between 2.8 and 4.0.

Bacterial endotoxins Less than 3 EU per mg of fursultiamine.

Sterility Meets the requirements.

Particulate contamination: Visible particles Meets the requirements.

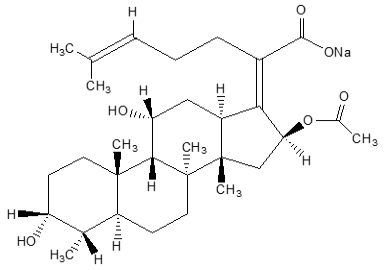
Insoluble particulate matter in injections Meets the requirements.

Extractable volume of injections Meets the requirements.

Assay Perform the test with Fursultiamin Hydrochloride Injection as directed under the Analysis for Vitamins.

Packaging and storage Preserve in hermetic containers.

Fusidate Sodium
퓨시드산나트륨



Fusidate Sodium $C_{31}H_{47}NaO_6$: 538.69
Sodium(2*Z*)-2-[(3*R*,4*S*,5*S*,8*S*,9*S*,10*S*,11*R*,13*R*,14*S*,16*S*)-16-acetyloxy-3,11-dihydroxy-4,8,10,14-tetra-methyl-2,3,4,5,6,7,9,11,12,13,15,16-dodecahydro-1*H*-cyclopenta[a]phenanthren-17-ylidene]-6-methylhept-5-enoate [*751-94-0*]

Fusidate Sodium is a sodium salt compound having antibacterial activity produced by the growth of *Fusidium coccineum*.
Fusidate Sodium contains NLT 935 μg and NMT 969 μg (potency) of fusidic acid ($C_{31}H_{48}NO_6$: 516.71) per mg, calculated on the anhydrous basis.

Description Fusidate Sodium occurs as white crystals or a crystalline powder.
It is freely soluble in water, methanol or ethanol(99.5).

Identification (1) Weigh accurately about 0.10 g of Fusidate Sodium, dissolve in methanol to make exactly 10 mL, and use this solution as the test solution. Separately, weigh accurately 0.25 g each of diethanolamine fusidate RS, dissolve in methanol to make exactly 100 mL, and use this solution as the standard solution. Perform the test with the test solution and the standard solution as directed under the Thin Layer Chromatography. Take appropriate amounts of the test solution and the standard solution, and drop each solution on a thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Then, develop the plate with a mixture of chloroform, cyclohexane, acetic acid(100), and methanol (80 : 10 : 10 : 2.5) as a developing solvent. After air-drying the plate, spray saturated antimony(III) chloride TS, dry at 105 ℃ for 20 minutes, cool to room temperature, and examine the plate under ultraviolet light. The R_f values of the spots obtained from the test and standard solutions are the same.

(2) Perform the test as directed under the Assay; the retention time of the major peak in the chromatogram of the test solution corresponds to that in the chromatogram of the standard solution.

(3) Fusidate Sodium responds to the Qualitative Analysis (1) for sodium salt.

Optical rotation $[a]_D^{20}$: Between -5° and +8° (3% aqueous solution with a few drops of ammonia TS, 100 mm).

pH Dissolve 125 mg (potency) of Fusidate Sodium in 10 mL of water; the pH of this solution is between 7.5 and 9.0.

Purity (1) ***Heavy metals***—Proceed with 2.0 g of Fusidate Sodium according to Method 4 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Related substances***—Perform the test as directed under the Purity of Fusidic Acid Hydrate (total related substances: NMT 2.0%).

Water NMT 2.0% (1 g, volumetric titration, direct titration).

Assay Perform the test as directed under the Assay of Fusidic Acid Hydrate.

Packaging and storage Preserve in light-resistant, tight containers (at 2 to 8 ℃).

Fusidate Sodium Ointment
퓨시드산나트륨 연고

Fusidate Sodium Ointment contains NLT 90.0% and NMT 120.0% of the labeled amount of fusidic acid ($C_{31}H_{48}O_6$: 516.71).

Method of preparation Prepare as directed under Ointments, with Fusidate Sodium.

Identification (1) Perform the test as directed under the Identification (1) under Fusidate Sodium. Take about 2 g of Fusidate Sodium Ointment, place it in a separatory funnel, add 25 mL of petroleum ether, and shake to mix. Add 5 mL of 70% ethanol solution, shake vigorously to extract, and take the ethanol layer. Use the ethanol layer as the test solution.

(2) The retention times of the major peaks obtained from the test solution and the standard solution in the Assay are the same.

Purity ***Related substances***—Perform the test as directed in Purity under Fusidic Acid Hydrate (total related substances NMT 4.0%). Weigh accurately about 50 mg (potency) of Fusidate Sodium Ointment according to the labeled potency, add 25 mL of *n*-heptane and 10 mL of the mobile phase, place in a separatory funnel, and mix until it is equalized. Take the lower layer, filter, and use this solution as the test solution. Exclude the areas of peaks identified to be derived from a diluent.

Assay Perform the test as directed in the Assay under Fusidic Acid Hydrate. Weigh accurately about 30 mg (potency) of Fusidate Sodium Ointment according to the labeled potency, place in a separatory funnel, add 10 mL

of *n*-heptane, and shake to mix until it is equalized. Extract with 25 mL of the mobile phase, add the mobile phase to make exactly 50 mL, and use this solution as the test solution. Separately, weigh accurately about 30 mg (potency) of diethanolamine fusidate RS and dissolve in the mobile phase to make exactly 50 mL. Use this solution as the standard solution.

Packaging and storage Preserve in tight containers.

Fusidate Sodium Tablets
퓨시드산나트륨 정

Fusidate Sodium Tablets contain NLT 90.0% and NMT 120.0% of the labeled amount of fusidic acid ($C_{31}H_{48}O_6$: 516.71).

Method of preparation Prepare as directed under Tablets, with Fusidate Sodium.

Identification Weigh an amount of Fusidate Sodium Tablets, equivalent to about 0.1 g (potency), if necessary, and previously remove the sugar coating of Fusidate Sodium Tablets, and powder. Add 10 mL of methanol, shake well to dissolve, filter, and use the filtrate as the test solution. Separately, prepare a solution of fusidic acid RS in 2.5% methanol as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot an appropriate amount each of the test solution and the standard solution on a thin-layer chromatographic plate made using silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of chloroform, cyclohexane, acetic acid(100) and methanol (80 : 10 : 10 : 2.5) as the developing solvent, and air-dry the plate. Spray a saturated chloroform solution of antimony(V) chloride on the plate, dry at 105 ℃ for 20 minutes, cool to room temperature, and examine the plate under the ultraviolet light; the Rf values obtained from the test solution and the standard solution are the same.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the contents of NLT 20 tablets of Fusidate Sodium Tablets. If necessary, and previously remove the sugar coating of Fusidate Sodium Tablets, and powder. Weigh accurately an amount, equivalent to about 250 mg (potency) according to the labeled potency, dissolve in the mobile phase to make exactly 250 mL. Take 4 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the test solution. Separately, weigh accurately about 20 mg (potency) of fusidic acid RS, and add the mobile phase to make exactly 50 mL. Pipet 5 mL of this solution, add the mobile phase to make exactly 50 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of fusidic acid in each solution.

$$\text{Potency (μg) of fusidic acid } (C_{31}H_{48}O_6) = \text{Potency (μg) of fusidic acid RS} \times \frac{A_T}{A_S} \times 12.5$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 235 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of acetonitrile, 0.05 mol/L phosphoric acid solution and methanol (5 : 4 : 1).

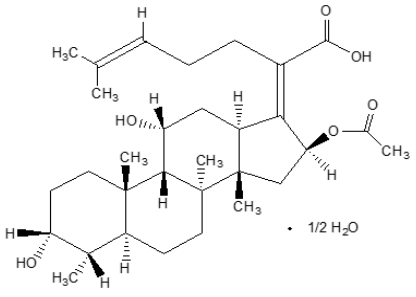
Flow rate: 1.2 mL/min

System suitability

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution according to the above operating conditions; the relative standard deviation of the peak areas of fusidic acid is NMT 2.0%.

Packaging and storage Preserve in tight containers.

Fusidic Acid Hydrate
퓨시드산수화물



$C_{31}H_{48}O_6 \cdot 1/2H_2O$: 525.72

(2*Z*)-2-[(3*R*,4*S*,5*S*,8*S*,9*S*,10*S*,11*R*,13*R*,14*S*,16*S*)-16-Acetyloxy-3,11-dihydroxy-4,8,10,14-tetramethyl-2,3,4,5,6,7,9,11,12,13,15,16-dodeca-hydro-1*H*-cyclopenta[a]phenanthren-17-ylidene]-6-methylhept-5-enoic acid [*6990-06-3*]

Fusidic Acid Hydrate contains NLT 975 μg (potency) as fusidic acid ($C_{31}H_{48}O_6$: 516.71) per mg, calculated on the anhydrous basis.

Description Fusidic Acid Hydrate occurs as a white crystalline powder.
It is freely soluble in ethanol(95) or chloroform, sparingly soluble in ether and practically insoluble in water.

Identification (1) Weigh 50 mg (potency) of Fusidic

Acid Hydrate and fusidic acid hydrate RS, and dissolve in 1 mL of chloroform, respectively. Determine the infrared spectra of these solutions as directed under the liquid film method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) Dissolve 20 mg (potency) of Fusidic Acid Hydrate in 10 mL of ethanol(99.5), and use this solution as the test solution. Separately, dissolve 20 mg (potency) of diethanolamine fusidate RS in 10 mL of ethanol(99.5) and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot an appropriate amount each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography (with a fluorescent indicator). Develop the plate with a mixture of chloroform, cyclohexane, acetic acid(100) and methanol (80 : 10 : 10 : 2.5) as the developing solvent, and air-dry the plate. Spray 10% sulfuric acid-ethanol solution on the plate, and dry at 110 ℃ for 10 minutes. Examine under ultraviolet light (main wavelength: 366 nm); the R_f values of the spots obtained from the test solution and the standard solution are the same.

(3) The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

Purity ***Related substances*—**Perform the test as directed as directed under the Assay, determine the area of each peak from the test solution according to the automatic integration method and calculate the content (%) of related substances; the total amount of the related substances is NMT 2.0%. However, weigh accurately about 50 mg (potency) of Fusidic Acid Hydrate, dissolve in the mobile phase to make 10 mL, and use this solution as the test solution.

$$\text{Content (\%) of each related substance} = 100 \times \frac{A_i}{A_S}$$

A_i: Peak area of each related substance with relative retention time between 0.3 and 3.5, other than the major peak

A_S: Total area of all peaks

Exclude peak areas NMT 0.01% of the fusidic acid peak area.

Detection sensitivity: Pipet 1 mL of the standard solution as directed under the Assay and add the mobile phase to make 100 mL. Proceed with 10 μL of this solution according to the above conditions; adjust the detection sensitivity so that the peak height of fusidic acid is about 5 mm.

Water Between 1.4% and 2.0% (0.5 g, volumetric titration, direct titration).

Residue on ignition NMT 0.2% (1.0 g).

Assay Weigh accurately about 50 mg (potency) each of Fusidic Acid Hydrate and diethanolamine fusidate RS, dissolve in the mobile phase to make exactly 50 mL, respectively, and use these solutions as the test solution and the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S, of fusidic acid of each solution.

$$\text{Potency (μg) of fusidic acid } (C_{31}H_{43}O_6) = \text{Potency (μg) of fusidic acid RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 235 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 125 mm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of acetonitrile, 0.05 mol/L phosphoric acid solution and methanol (5 : 4 : 1).

Flow rate: 1.2 mL/min

Packaging and storage Preserve in light-resistant, tight containers (2 to 8 ℃).

Fusidic Acid Cream
퓨시드산 크림

Fusidic Acid Cream contains NLT 90.0% and NMT 120.0% of the labeled amount of fusidic acid ($C_{31}H_{48}O_6$: 516.71).

Method of preparation Prepare as directed under Creams, with Fusidic Acid Hydrate.

Identification (1) Perform the test according to Identification (2) under Fusidic acid hydrate. Weigh 10 mg (potency) each of Fusidic Acid Cream and fusidic acid diethanolamine RS, dissolve in 10 mL of water, and use these solutions as the test solution and the standard solution, respectively.

(2) The retention times of the major peaks obtained from the test solution and the standard solution in the Assay are the same.

pH Dissolve an amount of Fusidic Acid Cream, equivalent to 1.0 g (potency) of fusidic acid, in 10 mL of water; the pH of this solution is 4.5 to 6.0.

Purity ***Related substances***—Perform the test as directed under the Purity under Fusidic acid hydrate (total related

substances are NMT 5.0%). Weigh accurately an amount, equivalent to about 15 mg (potency) of Fusidic Acid Cream, add 25 mL of the mobile phase, warm on a steam bath until the cream dissolves, and shake vigorously for 15 minutes. Cool to below 10 ℃, filter, discard the first 4 to 5 mL of filtrate, bring the subsequent filtrate to room temperature, and use this solution as the test solution.

Assay Proceed as directed under the Assay under Fusidic acid hydrate. Weigh an amount, equivalent to about 15 mg (potency) of the labeled potency of Fusidic Acid Cream, add 50 mL of the mobile phase, warm on a steam bath until the cream dissolves, and shake vigorously. Cool to below 10 ℃, filter, discard the first 4 to 5 mL of filtrate, bring the subsequent filtrate to room temperature, and use this solution as the test solution. Separately, weigh accurately about 15 mg (potency) of fusidic acid diethanolamine RS, dissolve in the mobile phase to make exactly 50 mL, and use this solution as the standard solution.

Packaging and storage Preserve in tight containers.

Fusidic Acid Gel
퓨시드산 겔

Fusidic Acid Gel contains NLT 90.0% and NMT 120.0% of the labeled amount of fusidic acid ($C_{31}H_{48}O_6$: 516.71).

Method of preparation Prepare as directed under Gels, with Fusidic Acid.

Identification The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

pH Between 4.5 and 6.0.

Purity ***Related substances***—Perform the test according to the Assay, and determine each peak area to calculate the amount of related substances; the sum of the related substances is NMT 2.0%. However, weigh accurately about 30 mg (potency) according to the labeled potency of Fusidic Acid Gel, add 20 mL of the mobile phase, and shake vigorously for 5 minutes. Then add 0.5 g of potassium nitrate, and shake vigorously again for 1 minute. Use a syringe to pass this solution through a solid-phase extraction cartridge, followed by eluting it with 15 mL of diluent. Discard 10 mL of the first filtrate, use the subsequent 10 mL of the filtrate. Add 1% acetic acid(100) to 8.0 mL of the above filtrate to make 10 mL, and use this solution as the test solution.

$$\text{Content (\%) of related substances} = \frac{A_i}{A_S} \times 100$$

A_i: The sum of peak areas with 0.3 to 3.5 of the relative retention time for fusidic acid other than the major peak

A_S: The sum of peak areas

However, exclude peak areas NMT 0.01% of the fusidic acid area.

Detection sensitivity Weigh accurately about 50 mg (potency) of fusidic acid RS, dissolve in the mobile phase to make 50 mL, take 1 mL of this solution, and add the mobile phase to make 100 mL. Perform the test with 10 μL of this solution according to the operating conditions under the Assay; adjust so that the peak height of fusidic acid is about 5 mm.

Assay Weigh accurately an amount of Fusidic Acid Gel, equivalent to about 20 mg (potency), according to the labeled potency, and add 50 mL of the mobile phase. Warm on a steam bath until the gel dissolves, and shake vigorously. Cool to below 10 °C, and filter. Discard 4 to 5 mL of the first filtrate, bring the next filtrate to room temperature, and use this solution as the test solution. Separately, weigh accurately about 20 mg (potency) of fusidic acid RS, add the mobile phase make exactly 50 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak area of fusidic acid, A_T and A_S, in each solution.

$$\text{Potency (μg) of fusidic acid } (C_{31}H_{48}O_6) = \text{Potency (μg) of fusidic acid RS} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 235 nm).

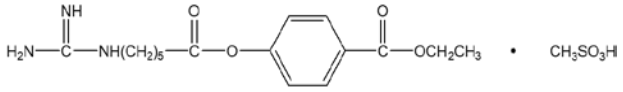
Column: A stainless steel column about 4 mm in internal diameter and 12.5 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of acetonitrile, 0.05 mol/L phosphoric acid solution and methanol (50 : 50 : 40).

Flow rate: 1.2 mL/min

Packaging and storage Preserve in tight containers.

Gabexate Mesilate
가벡세이트메실산염



$C_{16}H_{23}N_3O_4 \cdot CH_4O_3S$: 417.48

Ethyl 4-[6-(diaminomethylideneamino)hexanoyloxy] benzoate;methanesulfonic acid [*56974-61-9*]

Gabexate Mesilate, when dried, contains NLT 98.5% and NMT 101.0% of gabexate mesilate ($C_{16}H_{23}N_3O_4 \cdot CH_4O_3S$).

Method of preparation If there is any possibility of alkyl methanesulfonate esters (methyl, ethyl, isopropyl, etc.) to be contained as the potential impurities by the manufacturing process of Gabexate Mesilate, take caution with starting material, manufacturing process, and intermediate material control to minimize the residue of impurities in consideration of risk assessment results. If needed, the manufacturing process can be justified by the test data proving that there is no quality risk in final drug substances.

Description Gabexate Mesilate occurs as white crystals or a crystalline powder. It is very soluble in water, freely soluble in ethanol(95) and practically insoluble in ether.

Identification (1) Take 4 mL of a solution of Gabexate Mesilate (1 in 2000), add 2 mL of 1-naphthol TS and 1 mL of diacetyl TS, and allow to stand for 10 minutes; the resulting solution exhibits a red color.

(2) Dissolve 1 g of Gabexate Mesilate in 5 mL of water, add 2 mL of sodium hydroxide TS, and heat in the water bath for 5 minutes. After cooling, add 2 mL of dilute nitric acid and 5 mL of ethanol(95), shake, put 5 drops of iron(III) chloride TS, and shake to mix; the resulting solution exhibits a violet color.

(3) Determine the absorption spectra of solutions of Gabexate Mesilate and gabexate mesilate RS (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(4) Gabexate Mesilate responds to the Qualitative Analysis for mesylate.

Melting point Between 90 and 93 °C.

pH Dissolve 1.0 g of Gabexate Mesilate in 10 mL of water; the pH of this solution is between 4.5 and 5.5.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Gabexate Mesilate in 10 mL of water; the solution is clear and colorless.

(2) ***Heavy metals***—Proceed with 2.0 g of Gabexate Mesilate as directed under the Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Arsenic***—Weigh 2.0 g of Gabexate Mesilate, dissolve in 20 mL of 1 mol/L hydrochloric acid TS by heating in the water bath, and continue to heat for 20 minutes. After cooling it down, centrifuge and take 10 mL of the clear supernatant. Use this solution as the test solution and perform the test (NMT 2 ppm).

(4) ***Ethyl p-hydroxybenzoate***—Weigh 50 mg of Gabexate Mesilate, previously dried, and dissolve in dilute ethanol to make exactly 100 mL. Pipet 5.0 mL of this solution, add exactly 5 mL of the internal standard solution, and use this solution as the test solution. Separately, weigh 5.0 mg of ethyl p-hydroxybenzoate and dilute in dilute ethanol to make exactly 100 mL. Pipet 1.0 mL of this solution and add dilute ethanol to make exactly 20 mL. Pipet 5 mL of this solution, add exactly 5 mL of the internal standard solution, and use this solution as the standard solution. Perform the test with 3 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the operating conditions in the Assay and calculate the peak area ratios, Q_T and Q_S, of ethyl p-hydroxybenzoate to internal standard, respectively; Q_T is not larger than Q_S.

Internal standard solution—A solution of butyl parahydroxybenzoate in diluted ethanol (1 in 5000).

(5) ***Related substances***—Dissolve 0.20 g of Gabexate Mesilate in 5 mL of ethanol(95) and use this solution as the test solution. Pipet 1 mL of the test solution, add ethanol(95) to make exactly 100 mL, and use this solution as the standard solution. With the solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, water and acetic acid(100) (3 : 1 : 1) to a distance of about 10 cm and air-dry the plate until it has no acetic odor. Spray evenly a solution of 8-quinolinol in acetone (1 in 1000) on the plate and after air-drying, spray evenly bromine-sodium hydroxide TS; the spots other than the principal spot from the test solution are not darker than the spots from the standard solution.

Loss on drying NMT 0.3% (1 g, in vacuum, silica gel, 4 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 50 mg of Gabexate Mesilate and gabexate mesilate RS, previously dried, and dissolve each in dilute ethanol to make exactly 100 mL. Pipet 5.0 mL each of these solutions, add exactly 5 mL each of the internal standard solution and use these solutions as the test solution and the standard solution, respectively. Perform the test with 3 μL each of these solutions as directed under Liquid Chromatography according to the following conditions and calculate the peak area

ratios, Q_T and Q_S, of gabexate to internal standard, respectively.

$$\text{Amount of Gabexate Mesilate } (C_{16}H_{23}N_3O_4\cdot CH_4O_3S)\text{ (mg)} = \text{Amount of gabexate mesilate RS} \times \frac{Q_T}{Q_S}\text{ (mg)}$$

Internal standard solution—A solution of butyl parahydroxybenzoate in diluted ethanol (1 in 5000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 245 nm).

Column: A stainless steel column about 5 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silical gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: A mixture of methanol, sodium lauryl sulfate (1 in 1000), sodium 1-heptanesulfonate (1 in 200) and acetic acid(100) (540 : 200 : 20 : 1).

Flow rate: Adjust the flow rate so that the retention time of gabexate is about 13 minutes.

System suitability

System performance: Proceed with 3 μL of the standard solution according to the above conditions; the internal standard and gabexate are eluted in this order with the resolution being NLT 5.

System repeatability: Repeat the test 6 times with 3 μL each of the standard solution according to the above conditions; the relative standard deviation of the ratios of the peak area of gabexate to that of the internal standard is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Gabexate Mesilate for Injection
주사용 가벡세이트메실산염

Gabexate Mesilate for Injection is a preparation for injection which is dissolved before use, and contains NLT 95.0% and NMT 105.0% of labeled amount of gabexate mesilate ($C_{16}H_{23}N_3O_4\cdot CH_3SO_3H$: 417.48).

Method of preparation Prepare as directed under Injections, with Gabexate Mesilate.

Description Gabexate Mesilate for Injection occurs as a white mass or a powder.

Identification (1) Weigh about 1 g of Gabexate Mesilate for Injection, add 20 mL of acetone, dissolve, and filter. Evaporate the filtrate in the water bath, pipet about 10 mg of the residue, and dissolve in 10 mL of water. Add 1 mL of 1 mol/L Sodium hydroxide TS, heat for 5 minutes in the water bath, cool it down, and add 1 mL of dilute nitric acid. Put 5 drops of Iron(III) chloride TS in it, and heat for 2 minutes in the water bath; the resulting solution exhibits a violet color.

(2) Dissolve 0.1 g of the residue from (1) to make 20 mL, put 2 mL of 1-naphthol TS, 1 mL of diacetyl TS and 15 mL of water in 4 mL of the solution, and allow to stand for 30 minutes; the resulting solution exhibits a red color.

(3) Add 0.2 g of powdered sodium hydroxide to 0.1 g of the residue from (1), shake, melt by heating, and continue to heat for 20 to 30 seconds. After adding 0.5 mL of water, put a slight excessive amount of dilute hydrochloric acid and heat; the resulting gas changes the color of potassium Iodide starch paper to blue.

(4) Gabexate Mesilate for Injection responds to the Qualitative Analysis for mesylate.

pH Between 4.0 and 5.0 (10% solution).

Sterility Meets the requirements.

Bacterial endotoxins Less than 1 EU/mg of gabexate mesilate. Weigh accurately 10 mg of Gabexate Mesilate for Injection, dissolve in water for endotoxin assay, add 5 mL of 0.1 mol/L sodium hydroxide TS for endotoxin assay, and add water for endotoxin assay again to make exactly 50 mL of solution. Pipet a certain amount of this solution, add water for endotoxin assay to reach an appropriate concentration, and use it as the test solution.

Particulate contamination: Visible particles in injections and ophthalmic solutions Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Uniformity of dosage units Meets the requirements.

Purity (1) ***Guanidino chromic acid***—Weigh a volume of Gabexate Mesilate for Injection, equivalent to 40 mg of gabexate mesilate according to the labeled amount, add 10 mL of ethanol, and dissolve by shaking for 10 minutes Transfer to a centrifuge tube, centrifuge, and use the supernatant as the test solution. Spot 5 μL of the test solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, water and acetic acid(100) (3 : 1 : 1) to a distance of about 10 cm, and air-dry the plate. Spray evenly a solution of 8-quinolinol in acetone (1 in 1000) on the plate, and spray sodium hypobromate TS; a single spot appears at an Rf value of 0.7.

(2) ***Ethyl p-hydroxybenzoate***—Weigh a volume of Gabexate Mesilate for Injection, equivalent to 0.2 g of gabexate mesilate according to the labeled amount, add 30 mL of water, dissolve, and extract 3 times by 50 mL of ether. Combine the ether extracts, wash twice with 30 mL of water, filter through the absorbent cotton, and

wash the absorbent cotton with a small amount of ether. Collect the ether layers, and evaporate ether in the water bath. Add ethanol to the residue to make 250 mL, and use this solution as the test solution. Separately, weigh 10 mg of ethyl p-hydroxybenzoate RS, and add ethanol to make 250 mL. Pipet 10 mL of the resulting solution, add ethanol to make 100 mL, and use this solution as the standard solution. With the test and standard solutions, and ethanol as the control solution, determine the absorbances A_T and A_S at 258 mm of wavelength as directed under the Ultraviolet-visible Spectroscopy; A_T is not greater than A_S.

Loss on drying NMT 0.3% (1 g, in vacuum, silica gel, 4 hours).

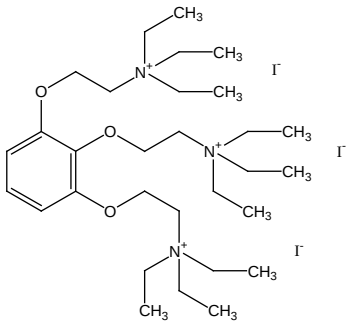
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately the mass of NLT 20 samples of Gabexate Mesilate for Injection. Weigh accurately about 0.1 g of gabexate mesilate ($C_{16}H_{23}N_3O_4 \cdot CH_3SO_3H$), and add water to make 100 mL. Pipet 2.0 mL of the resulting solution, add water to make 200 mL, and use this solution as the test solution. Separately, weigh accurately about 0.1 g of gabexate mesilate RS, proceed the same manner used in the test solution with Phytonadione RS, and use this solution as the standard solution. With the test solution and standard solutions, determine the absorbances AT and AS at 236 nm as directed under the Ultraviolet-visible Spectroscopy.

$$\text{Amount (mg) of Gabexate Mesilate } (C_{16}H_{23}N_3O_4 \cdot CH_3SO_3H) = \text{Amount (mg) of gabexate mesilate RS} \times \frac{A_T}{A_S}$$

Packaging and storage Preserved in hermetic containers.

Gallamine Triethiodide
갈라민트리에티오디드



Gallamine Triethiodide $C_{30}H_{60}I_3N_3O_3$: 891.53
2-[2,3-*bis*[2-(Triethylazaniumyl)ethoxy]phenoxy]ethyltriethylazanium triiodide [*65-29-2*]

Gallamine Triethiodide contains NLT 98.0% and NMT 101.0% of gallamine triethiodide ($C_{30}H_{60}I_3N_3O_3$), calculated on the dried basis.

Description Gallamine Triethiodide occurs as a white, amorphous power and is odorless.
It is very soluble in water, sparingly soluble in ethanol(95) and very slightly soluble in chloroform.
It is hygroscopic.

Identification (1) Determine the infrared spectra of Gallamine Triethiodide and gallamine triethiodide RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) A solution of Gallamine Triethiodide (1 in 100) responds to the Qualitative Analysis for iodide.

pH Dissolve 1 g of Gallamine Triethiodide in 50 mL of water; the pH of this solution is between 5.3 and 7.0.

Purity (1) ***Clarity and color of solution***—A solution of Gallamine Triethiodide (1 in 100) is colorless and clear.

(2) ***Heavy metals***—Perform the test with 1.0 g of Gallamine Triethiodide as directed under the Method 1. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

Loss on drying NMT 1.5% (1 g, 100 °C, 4 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 25 mg each of Gallamine Triethiodide and gallamine triethiodide RS, dissolve in the mobile phase to make exactly 25 mL each, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas A_T and A_S of gallamine triethiodide for the test solution and the standard solution, respectively.

$$\text{Amount of gallamine triethiodide } (C_{30}H_{60}I_3N_3O_3) \text{ (mg)} = 25 \times C \times (A_T / A_S)$$

C: Concentration of gallamine triethiodide in the standard solution (mg/mL)

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 200 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 - 10 μm in particle diameter).

Mobile phase: A mixture of sodium perchlorate buffer and acetonitrile (69 : 31).

Flow rate: 1.0 mL/min

System suitability

System performance: Proceed with 10 μL of the standard solution according to the above conditions; the number of theoretical plates is NLT 5000 with the symmetry factor being NMT 1.4.

System repeatability: Repeat the test 5 times with 10 μL each of the standard solution under the above conditions; the relative standard deviation of peak areas of gallamine triethiodide is NMT 2.0%.

Sodium perchlorate buffer—Dissolve sodium perchlorate in water to reach the concentration of 0.14 mol/L and add 10 mol/L sodium hydroxide TS or 0.05 mol phosphoric acid to adjust pH to 3.0.

Packaging and storage Preserve in light-resistant, tight containers.

Garlic Oil and Tocopherol Capsules
마늘유·토코페롤 캡슐

Garlic Oil and Tocopherol Capsules contain NLT 90.0% of the labeled amount of allicin ($C_6H_{10}OS_2$: 162.27) and NLT 90.0% and NMT 150.0% of the labeled amount of tocopherol ($C_{29}H_{50}O_2$: 430.71).

Method of preparation Prepare as directed under Capsules, with Garlic Oil and Tocopherol.

Identification (1) ***Garlic oil*—**(i) Weigh an amount of Garlic Oil and Tocopherol Capsules equivalent to 0.1 g of garlic oil, dissolve in 10 mL of methanol, and use this solution as the test solution. Separately, dissolve 0.1 g of Garlic Oil in 10 mL of methanol, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, develop the plate with a mixture of ethanol(95) and 6 mol/L ammonia water (160 : 20) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Spray evenly 0.5% p-anisaldehyde TS on the plate and heat at 105 ℃; the R_f values and colors of the spots from the test solution and the standard solution are the same.

(ii) Perform the test as directed under the Assay; diallyl disulfide, 144-I (3-vinyl-1,2-dithi-5-ene) and 144-II (3-vinyl-1,2-dithi-4-ene) are confirmed.

(2) ***Tocopherol*—**Take an amount of Garlic Oil and Tocopherol Capsules equivalent to 0.1 g of tocopherol ($C_{29}H_{50}O_2$: 430.71), add 3 mL of a solution of ethanol(95) and potassium hydroxide (1 : 2), attach the reflux condenser and saponify at 90 ℃ for 30 minutes, and cool it down. Transfer to a separatory funnel, add 50 mL of water, and extract NLT 3 times of 30 mL of ether each. Collect the previous extract, transfer to a separatory funnel, and wash with 30 mL of water. Wash until the washing neutralizes, dehydrate with anhydrous sodium sulfate, evaporate to dryness in the nitrogen atmosphere, and dissolve the residue in 50 mL of ethanol. Use this solution as the test solution. Separately, make in the same procedure as the test solution with 0.1 g of tocopherol RS and use this solution as the standard solution. With the test solution and the standard solution, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Develop the plate with a mixture of cyclohexane and ether (4 : 1) as the developing solvent to a distance of about 10 cm and air-dry the plate. Spray evenly sulfuric acid or perchloric acid TS on the plate, heat at 100 ℃ for 10 minutes; the R_f values and colors of the spots from the test solution and the standard solution are the same.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay (1) ***Allicin from Garlic oil***—Weigh accurately the mass of NLT 20 capsules of Garlic Oil and Tocopherol Capsules. Weigh accurately the amount equivalent to about 2.0 mg of allicin ($C_6H_{10}OS_2$: 162.27), transfer to a centrifuge tube, add 5 mL of the internal standard solution, and sonicate on a steam bath for 3 minutes. Centrifuge, take the clear supernatant, and use this solution as the test solution. Separately, weigh accurately about 5 mg of diallyl disulfide, dissolve in acetonitrile to make 100 mL, and use this solution as the standard solution. Separately, weigh accurately about 10 mg of dipropyl disulfide and dissolve in acetonitrile to make 100 mL, and use this solution as the internal standard solution. Pipet 10 mL of this solution, add acetonitrile to make exactly 100 mL, and use the solution as the internal standard solution. Perform the test with the test solution and the standard solution as directed under the Gas Chromatography according to the following conditions, check the peaks of 144-I and 144-II of the following relative retention time, determine the peak areas, Q_T and Q_S, of the test solution and the standard solution, and calculate the content of diallyl disulfide, 144-I and 144-II. Add them and use as the content of allicin.

Relative retention time
1. Dipyridyl disulfide: 1.00
2. 144-I: 1.47
3. 144-II: 1.62

(1) Content (%) of 144-I and 144-II $= \frac{Q_T \times C_S \times 5}{Q_S \times S_a} \times 100$

Q_T: Sum of peak areas of 144-I and 144-II from the test solution

Q_S: Peak area of the internal standard solution (dipropyl disulfide)

C_S: Concentration (mg/mL) of the internal standard solution

S_a: Amount (mg) of sample taken

(2) Content (%) of diallyl disulfide $= \frac{Q_T \times C_S \times 5}{Q_S \times S_a} \times 100$

Q_T: Peak area of diallyl disulfide from the test solution

Q_S: Peak area of diallyl disulfide from the standard solution

C_S: Concentration (mg/mL) of the internal standard solution

S_a: Amount (mg) of sample taken

144-I: 3-Vinyl-1,2-dithi-5-ene
144-II: 3-Vinyl-1,2-dithi-4-ene

Operating conditions

Detector: A hydrogen flame ionization detector

Column: A capillary steel column about 0.32 mm in internal diameter and about 30 m in length, packed with diatomaceous earth for gas chromatography, covered with polyethylene glycol for gas chromatography (0.25 μm in particle diameter).

Column temperature: A constant temperature of about 120 °C.

Sample injection port temperature: A constant temperature of about 200 °C.

Detector temperature: A constant temperature of about 300 °C.

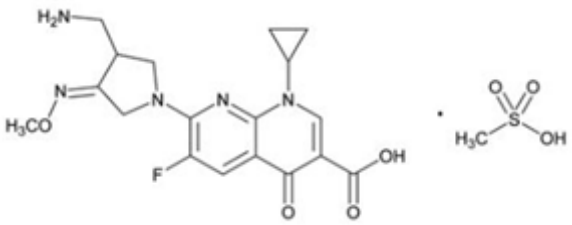
Carrier gas: Helium

Flow rate: 25 mL/min

(2) ***Tocopherol***—Weigh accurately the mass of NLT 20 capsules of Garlic Oil and Tocopherol Capsules and perform the test as directed under the Analysis for Vitamins.

Packaging and storage Preserve in tight containers.

Gemifloxacin Mesilate
제미플록사신메실산염



Gemifloxacin Mesilate

$C_{18}H_{20}FN_5O_4 \cdot CH_4O_3S$: 485.49

(*Z*)-7-[3-(Aminomethyl)-4-(methoxyimino)-1-pyrrolidinyl]-1-cyclopropyl-6-fluor o-1,4-dihydro-4-oxo-1,8-naphthyridine-3-carboxylic acid monomethanesulfonate;
(±)-7-[3-(Aminomethyl)-4-oxo-1-pyrrolidinyl]-1-cyclopropyl-6-fluoro-1,4-dihydro-4-oxo-1,8-naphthyridine-3-carboxylic acid, 74-(*Z*)-(O-methyloxime),monomethanesulfonate; (*Z*)-7-[3-(Aminomethyl)-4-(methoxyimino)pyrrolidin-1-yl]-1-cyclopropyl-6-fluoro-4-oxo-1,4-dihydro-1,8-naphthyridine-3-carboxylic acid methanesulfonate
[*210353-53-0*]

Gemifloxacin Mesilate contains NLT 98.0% and NMT 102.0% of gemifloxacin mesilate ($C_{18}H_{20}FN_5O_4 \cdot CH_4O_3S$), calculated on the anhydrous and solvent-free basis.

Method of preparation If there is a possibility that alkyl (e.g., methyl, ethyl and isopropyl) methanesulfonate esters may be introduced during the manufacturing process of Gemifloxacin Mesilate as potential impurities, pay attention to the control of starting materials, manufacturing processes, and intermediates to minimize the amount of residual impurities by considering the results of the risk assessment. If necessary, the manufacturing process may be verified by the test data that proves there is no quality risk in the final drug substance.

Description Gemifloxacin Mesilate occurs as a white or light brown powder.
It is freely soluble in water, very slightly soluble in methanol or ethanol(99.5), and practically insoluble in acetone and chloroform.
It is hygroscopic.

Melting point—Between 200 and 205 °C (with decomposition).

Identification (1) Determine the infrared spectra of Gemifloxacin Mesilate and gemifloxacin mesilate RS as directed in the paste method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) The retention time of major peak of the test solution and the standard solution for Assay is the same.

(3) Gemifloxacin Mesilate responds to the Qualitative Analysis (1) for mesylate.

Purity ***Related substances***—Perform the test without exposure to light, using a light-resistant container. To Gemifloxacin Mesilate, add the diluent to make 0.5 mg/mL, and use this solution as the test solution Separately, add the diluent to gemifloxacin mesilate RS to make 0.0005 mg/mL, and use this solution as the standard solution. Perform the test with 5 μL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak area of each solution according to the automatic integration method to calculate the amount of related substances; the amount of each related substance is NMT the acceptance criteria (%).

Content (%) of related substances
$$= \frac{C_S}{C_T} \times \frac{A_i}{A_S} \times \frac{1}{F} \times 100$$

C_S: Concentration (mg/mL) of gemifloxacin mesilate RS in the standard solution

C_T: Concentration (mg/mL) of Gemifloxacin mesilate in the test solution

A_I: Peak area of each related substance obtained from the test solution

A_S: Peak area of gemifloxacin obtained from the standard solution

F: Relative response factor

Compound	Relative retention time	Wavelengths (nm)	Relative response factor	Acceptance criteria (%)
Gemifloxacin related substance A*	0.16	207	0.43	0.15
Gemifloxacin related substance B	0.33	272	1.0	0.2
Gemifloxacin related substance C	0.37	272	1.0	0.1
Gemifloxacin *E*-isomer	0.77	272	1.0	0.7
Gemifloxacin	1.0	272	-	-
Naphthyridine carboxylic acid analog	1.79	272	0.45	0.15
Gemifloxacin dimers	1.97	272	0.90	0.15
Individual related substances	-	272	1.0	0.1
Total related substances	-	-	-	1.5

* Applicable when there is a possibility of producing the related substance depending on the manufacturing process.

Diluent—A mixture of water and acetonitrile (80 : 20).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 0 min to 5 min 207 nm, 5.1 min to 37 min 272 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: Use mobile phases A and B to control stepwise or based on the gradient elution as follows.

Mobile phase A: A mixture of water, acetonitrile and trifluoroacetic acid (80 : 20 : 0.1).

Mobile phase B: A mixture of acetonitrile, water and trifluoroacetic acid (80 : 20 : 0.1).

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 - 15	100	0
15 - 35	100 → 0	0 → 100
35 - 37	0 → 100	100 → 0

Flow rate: 1.0 mL/min

System suitability

System performance: Add diluent to gemifloxacin mesilate RS to make 0.5 mg/mL, and use this solution as the system suitability solution. Proceed with 5 μL of this solution according to the above operating conditions; the resolution between the peaks of gemifloxacin E-isomer and gemifloxacin is NLT 5.0. Add diluent to gemifloxacin mesilate RS to make 0.25 μg/mL, and use this solution as the sensibility test solution. Proceed with 5 μL of this solution according to the above operating conditions; the signal-to-noise ratio is NLT 10.

System repeatability: Repeat the test 6 times with 5 μL each of standard solution according to the above operating conditions; the relative standard deviation of the peak areas of gemifloxacin is NMT 10%.

Water Between 4.0% and 7.0% (0.1 g, volumetric titration, direct titration).

Residue on ignition NMT 0.1% (1 g).

Assay Proceed with light-resistant containers, away from the light. Dissolve Gemifloxacin Mesilate in water to make 0.5 mg/mL, and use this solution as the test solution. Separately, dissolve gemifloxacin mesilate RS in water to make 0.5 mg/mL, and use this solution as the standard solution. Perform the test with 5 mL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions; determine the peak areas of gemifloxacin in each solution, r_U and r_S.

Content (%) of gemifloxacin mesilate

$$(C_{18}H_{20}FN_5O_4 \cdot CH_4O_3S) = \left(\frac{r_U}{r_S}\right) \times \left(\frac{C_S}{C_U}\right) \times 100(\%)$$

r_U: Peak area of gemifloxacin in the test solution

r_S: Peak area of gemifloxacin in the standard solution

C_S: Concentration (mg/mL) of gemifloxacin mesilate RS in the standard solution
C_U: Concentration (mg/mL) of gemifloxacin mesilate in the test solution

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 272 nm).

Column: A stainless steel column, about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: A mixture of water, acetonitrile, and trifluoroacetic acid (80 : 20 : 0.1).

Flow rate: 1 mL/min

Time span of measurement: NLT 1.2 times the retention time of gemifloxacin.

System suitability

System performance: Proceed with 5 μL of the standard solution according to the above operating conditions; the resolution between the peaks of gemifloxacin E-isomer and gemifloxacin is NLT 5.0, and the symmetry factor of the gemifloxacin peak is NMT 1.5.

System repeatability: Repeat the test 6 times with 5 μL each of standard solution according to the above operating conditions; the relative standard deviation of the peak areas of gemifloxacin is NMT 1.0%.

Packaging and storage Preserve in light-resistant, well-closed containers.

Note

Gemifloxacin related substance A: (Z)-4-(Aminomethyl)pyrrolidin-3-one O-methyl oxime Dimethanesulfonate

Gemifloxacin related substance B: (*R,S*)-7-[3-(Aminomethyl)-4-hydroxy-1-pyrrolidinyl]-1-cyclopropyl-6-fluoro-1,4-dihydro-4-oxo-1,8-naphthyridine-3-carboxylic acid monomethanesulfonate

Gemifloxacin related substance C: 7-[3-(Aminomethyl)-4-oxo-1-pyrrolidinyl]-1-cyclopropyl-6-fluoro-1,4-dihydro-4-oxo-1,8-naphthyridine-3-carboxylic acid monomethanesulfonate

Gemifloxacin *E*-isomer: (E)-7-[3-(Aminomethyl)-4-(methoxyimino)pyrrolidin-1-yl]-1-cyclopropyl-6-fluoro-4-oxo-1,4-dihydro-1,8-naphthyridine-3-carboxylic acid monomethanesulfonate

Naphthyridine carboxylic acid analog: 7-Chloro-1-cyclopropyl-6-fluoro-4-oxo-1,4-dihydro-1,8-naphthyridine-3-carboxylic acid

Gemifloxacin dimer: (Z)-7-({[1-(6-Carboxy-8-cyclopropyl-3-fluoro-5-oxo-5,8-dihydro-1,8-naphthyridin-2-yl)-4-(methoxyimino)pyrrolidin-3-yl]methyl}amino)-1-cyclopropyl-6-fluoro-4-oxo-1,4-dihydro-1,8-naphthyridine-3-carboxylic acid

Gemifloxacin Mesilate Tablets
제미플록사신메실산염 정

Gemifloxacin Mesilate Tablets contains NLT 90.0% and NMT 110.0% of labeled amount of gemifloxacin ($C_{18}H_{20}FN_5O_4$: 389.38).

Method of preparation Prepare as directed under Tablets, with Gemifloxacin Mesilate.

Identification (1) Determine the infrared spectra of Gemifloxacin Mesilate Tablets and gemifloxacin mesilate RS as directed in the paste method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) The retention time of major peak of the test solution and the standard solution for Assay is the same.

Purity ***Related substances***—Perform the test without exposure to light using light-resistant vessels.
Perform the test with 20 μL each of the test solution and the standard solution obtained from Assay as directed under the Liquid Chromatography according to the following conditions. Determine the peak area of each solution by the automatic integration method; the amount of each related substance is NMT acceptance criteria (%).

$$\text{Amounts (\%) of related substances} = (C_S / C_T) \times (A_i / A_S) \times 0.802 \times 100$$

C_S: Concentration (mg/mL) of gemifloxacin mesilate in the standard solution

C_T: Concentration (mg/mL) according to labeled amount of gemifloxacin ($C_{18}H_{20}FN_5O_4$) in the test solution

A_i: Peak area of each related substance obtained from the test solution

A_S: peak area of gemifloxacin obtained from the standard solution

0.802: Conversion factor from gemifloxacin mesilate ($C_{18}H_{20}FN_5O_4 \cdot CH_4O_3S$) to gemifloxacin ($C_{18}H_{20}FN_5O_4$)

Compound	Relative retention time	Acceptance criteria(%)
Gemifloxacin *E*-isomer	0.78	1.0
Gemifloxacin	1.0	-
Each related substance	-	0.2
Total related substances	-	1.5

Operating conditions

For diluent, detector, column, column temperature, mobile phase and flow rate, proceed as directed under the operating conditions under Assay.

Time span of measurement: About 1.3 times the retention time of gemifloxacin.

System suitability

Test for required detectability: Add diluent to gemifloxacin mesilate RS to make 0.06 μg/mL, and use this solution as a sensitivity confirmation solution. Proceed with 20 μL of this solution according to the above operating conditions; the signal-to-noise ratio is NLT 10.

System performance: Add diluent to gemifloxacin mesilate RS to make 0.5 mg/mL, and use this solution as a system suitability solution. Proceed with 20 μL of this solution as directed under the above operating conditions; the resolution between gemifloxacin *E*-isomer peak and gemifloxacin peak is NLT 5.0. Proceed with 20 μL of the system suitability solution according to the above conditions; the symmetry factor for the gemifloxacin peak is NMT 2.0.

System repeatability: Repeat the test 6 times with 20 μL each of the standard solution under the above operating conditions; the relative standard deviation of the peak areas of gemifloxacin is NMT 1.0%.

Dissolution Perform the test with 1 tablet of Gemifloxacin Mesilate Tablets at 50 revolutions per minute according to Method 2 under the Dissolution, using 900 mL of 0.01 mol/L hydrochloric acid TS as the dissolution medium. Take the medium30 minutes after starting the test and filter through a membrane filter with a pore size not exceeding 0.45 μm. Pipet V mL of the filtrate, add the medium to make exactly V' mL, and use this solution as the test solution. Separately, dissolve gemifloxacin mesilate RS in the medium to make 0.01 mg/mL, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at the wavelength of 343 nm as directed under the Ultraviolet-visible Spectroscopy. The dissolution rate in 30 minutes is NLT 70% (Q).

Dissolution rate (%) of the labeled amount of gemifloxacin ($C_{18}H_{20}$ FN $_5O_4$)

$$= C_S \times (A_T / A_S) \times (V'/ V) \times (1 / C) \times 0.802 \times 90000$$

C_S: Concentration (mg/mL) of gemifloxacin mesilate in the standard solution

A_T: Absorbance of the test solution

A_S: Absorbance of the standard solution

C: The labeled amount (mg) of gemifloxacin ($C_{18}H_{20}FN_5O_4$) in 1 tablet

0.802: Conversion factor from gemifloxacin mesilate ($C_{18}H_{20}FN_5O_4 \cdot CH_4O_3S$) to gemifloxacin ($C_{18}H_{20}FN_5O_4$)

Uniformity of dosage units Meets the requirements.

Assay Perform the test without exposure to light using light-resistant vessels.

Weigh accurately the mass of NLT 20 tablets of Gemifloxacin Mesilate Tablets, and power. Weigh accurately a portion of the powder, equivalent to about 320 mg of gemifloxacin ($C_{18}H_{20}FN_5O_4$), add about 350 mL of diluent, shake to mix for about 15 minutes, and sonicate for about 30 minutes. Add diluent to the resulting solution to make exactly 500 mL. Take this solution, add diluent to make 0.13 mg/mL gemifloxacin ($C_{18}H_{20}FN_5O_4$), and use this solution as the test solution. Separately, dissolve gemifloxacin mesilate RS in diluent to make 0.17 mg/mL, and use this solution as the standard solution.

Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak area, A_T and A_S, of gemifloxacin in each solution.

Amount (mg) of gemifloxacin ($C_{18}H_{20}FN_5O_4$)

$$= \text{Amount (mg) of gemifloxacin mesylate RS} \times (A_T / A_S) \times 0.802$$

A_T: Peak area of gemifloxacin obtained from the test solution

A_S: Peak area of gemifloxacin obtained from the standard solution

0.802: Conversion factor from gemifloxacin mesilate ($C_{18}H_{20}FN_5O_4 \cdot CH_4O_3S$) to gemifloxacin ($C_{18}H_{20}FN_5O_4$)

diluent—A mixture of water, acetonitrile and 1 mol/L phosphate buffer solution (18 : 5 : 2).

1 mol/L phosphate buffer solution—Dissolve 138 g of sodium dihydrogen phosphate monohydrate in water to make 1000 mL.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 272 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 30 °C.

Mobile phase: A mixture of water, acetonitrile and trifluoroacetic acid (80 : 20 : 0.1).

Flow rate: 1.0 mL/min

Time span of measurement: About 1.3 times the retention time of gemifloxacin.

System suitability

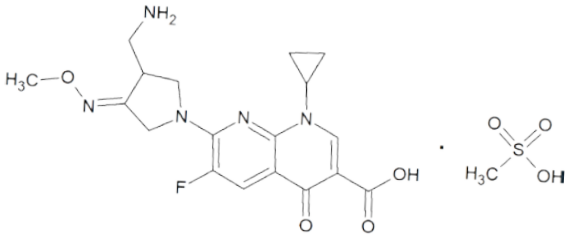
System performance: Proceed with 20 μL of the standard solution according to the above conditions; the symmetry factor of the gemifloxacin peak is NMT 2.0.

System repeatability: Repeat the test 6 times with 20 μL each of the standard solution; the relative standard deviation of the peak areas of gemifloxacin is NMT 1.0%.

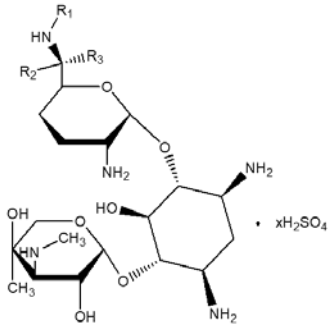
Packaging and storage Preserve in light-resistant, tight containers.

Note

gemifloxacin *E*-isomer: (E)-7-[3-(aminomethyll)-4-(methoxyimino)pyrrolidin-1-yl]-1-cyclopropyl-6-fluoro-4-oxo-1,4-di Hydro-1,8-naphthyridine-3-carboxylic acid monomethanesulfonate



Gentamicin Sulfate
겐타마이신황산염



Gentamicin C_1: $R_1 = CH_3$ $R_2 = CH_3$ $R_3 = H$
Gentamicin C_{1a}: $R_1 = H$ $R_2 = H$ $R_3 = H$
Gentamicin C_2: $R_1 = H$ $R_2 = CH_3$ $R_3 = H$
Gentamicin C_{2a}: $R_1 = H$ $R_2 = H$ $R_3 = CH_3$
Gentamicin C_{2b}: $R_1 = CH_3$ $R_2 = H$ $R_3 = H$
Gentamicin Sulfate
(3*R*,4*R*,5*R*)-2-{[(1*S*,2*S*,3*R*,4*S*,6*R*)-4,6-Diamino-3-{[(2*R*,3*R*,6*S*)-3-amino-6-[(1*R*)-1-(methylamino)ethyl]oxan-2-yl]oxy}-2-hydroxycyclohexyl]oxy}-5-methyl-4-(methylamino)oxane-3,5-diol; sulfuric acid [*1405-41-0*]

Gentamicin Sulfate is the sulfate of a mixture of aminoglycoside compounds having antibacterial activity produced by the growth of *Micromonospora purpurea* or *Micromonospora echinospora*.

Gentamicin Sulfate contains NLT 590 μg and NMT 775 μg (potency) per mg of gentamicin C1 ($C_{21}H_{43}N_5O_7$: 477.60), calculated on the dried basis.

Description Gentamicin Sulfate occurs as a white to pale yellow powder.
It is very soluble in water and practically insoluble in ethanol(99.5).
It is hygroscopic.

Identification (1) Dissolve 50 mg of Gentamicin Sulfate in 1 mL of water and add 2 drops of the solution of 1-naphthol in ethanol(95) (1 in 500). Inject slowly this solution into 1 mL of sulfuric acid along the inner wall; a bluish purple color develops at the boundary layer.

(2) Pipet 50 mg each of Gentamicin Sulfate and gentamicin sulfate RS, dissolve in 10 mL of water, and use these solutions as the test solution and the standard solution, respectively. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 20 μL each of the test solutions and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, put a mixture of chloroform, ammonia water(28) and methanol (2 : 1 : 1) into a separatory funnel, shake to mix, and allow to stand for over 1 hour at room temperature. Take 20 mL from the bottom layer of this solution, add 0.5 mL of methanol, develop the plate to a distance of about 17 cm with the developing chamber cover open about 20 mm^2 and without placing filter paper inside the container, and air-dry the plate. Expose the plate to iodine steam, cover the plate with the glass sheet, and compare the spots; the R_f value and the color of the three spots obtained from the test solution are identical to that of each spot from the standard solution.

(3) Put 50 mg of Gentamicin Sulfate in 5 mL of water, dissolve, and add 5 mL of barium chloride TS; a white precipitate develops.

Optical rotation $[\alpha]_D^{20}$: Between +107° and +121° (0.25 g calculated on the dried basis, water, 25 mL, 100 mm).

pH Dissolve 0.20 g of Gentamicin Sulfate in 5 mL of water; the pH of this solution is between 3.5 and 5.5.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Gentamicin Sulfate in 10 mL of water; the solution is clear and colorless to pale yellow color.

(2) ***Heavy metals***—Proceed with 2.0 g of Gentamicin Sulfate as directed under Method 4 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Related substances***—Dissolve 50 mg of Gentamicin Sulfate in 10 mL of water and use this solution as the test solution. Pipet 1 mL of this solution, add water to make exactly 50 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 20 μL each of the test solutions and the standard solution on a plate made of silica gel for thin-layer chromatography. Separately, put a mixture of chloroform, ammonia water(28) and methanol (2 : 1 : 1) into a separatory funnel, shake to mix, and allow to stand for over 1 hour at room temperature. Take 20 mL from the bottom layer of this solution, add 0.5 mL of methanol, develop the plate to a distance of about 17 cm with the developing chamber cover open about 20 mm^2 and without placing filter paper inside the container, and air-dry the plate. Expose the plate to iodine steam, cover the plate with the glass sheet, and compare the spots; the spots, other than that of Gentamicin C_1 (R_f = about 0.3), Gentamicin C_2 (R_f = about

0.2) and Gentamicin C_{1a} (R_f = about 0.1) from the test solution, are not darker than the spots of Gentamicin C_2 from the standard solution.

Sterility It meets the requirements when Gentamicin Sulfate is used in aseptic preparations. However, the manufacturing process of aseptic preparations, which include the final sterile process, is exceptional.

Bacterial endotoxins Less than 0.50 EU/mg per mg (potency) of gentamicin when used in the manufacturing of aseptic preparations.

Loss on drying NMT 18.0% (0.15 g, in vacuum, NMT·0.67 kPa, 110 ℃, 3 hours). Avoid moisture absorption upon sampling.

Content ratio of Gentamicin Weigh accurately an appropriate amount of Gentamicin Sulfate and gentamicin sulfate RS, dissolve in water, and make a solution so that each mL contains 0.65 mg (potency). Pipet 10 mL each of these solutions, add 5 mL of 2-propanol and 4 mL of *o*-phthaldehyde, shake to mix, and add 2-propanol to make exactly 25 mL. Heat for 15 minutes in the water bath at 60℃, cool down, and use these solutions as the test solution and the standard solution, respectively. Perform the test with these solutions as directed under the Liquid Chromatography according to the following conditions, and determine each peak area of the test solution and the standard solution, respectively (Gentamicin C_1: 25 to 50%, Gentamicin C_{1a}: 10 to 35%, and Gentamicin C_2 and C_{2a}: 25 to 55%).

$$\text{Each content of Gentamicin } C_1\text{, Gentamicin } C_{1a}\text{, and Gentamicin } C_2 \text{ and } C_{2a\,(\%)} = \frac{A_F}{A_S} \times 100$$

A_F: Each peak area of gentamicin
A_S: Sum of peak areas of gentamicin

Operating Conditions

Detector: An ultraviolet absorption photometer (wavelength: 330 nm).

Column: A stainless steel column about 5 mm in internal diameter and about 100 mm in length, packed with octadecylsilanized silica gel for liquid chromatography or fine ceramic particles (5 to 10 μm in particle diameter).

Mobile phase: Add 250 mL of water and 50 mL of acetic acid(100) to 700 mL of methanol, shake to mix, and dissolve 5 g of sodium 1-heptanesulfonate in this solution.

Flow rate: About 1.5 mL/min.

System suitability

System performance: Proceed with 10 μL of the standard solution according to the above conditions; the distribution factor k for the Gentamicin C_1 peak is 2 to 7, the number of theoretical plates for the Gentamicin C_2 peak is NLT 1200, and the resolution R between any two peaks is NLT 1.25. The elution order is Gentanicin C_1, Gentanicin C_{1a}, Gentamicin C_{2a} and Gentamicin C_2.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solutions under the above operating conditions; the relative standard deviation of any peak is NMT 2.0%.

o-phthaldehyde—Dissolve 1.0 g of o-phthaldehyde in 5 mL of methanol, add 95 mL of 0.4 mol/L boric acid previously adjusted by a solution of 8 mol/L potassium hydroxide to pH 10.4, add 2 mL of thioglycolic acid, and add a solution of 8 mol/L potassium hydroxide again to adjust pH to 10.4.

Assay ***Cylinder-plate method*** (1) Medium: (i) Agar medium for strata and base layers

Peptone	6.0 g	Glucose	1.0 g
Yeast extract	3.0 g	Sodium chloride	10.0 g
Meat extract	1.5 g	Agar	15.0 g

Weigh the above amount of substances, add purified water to make 1000 mL, sterilize, and adjust pH to between 7.8 and 8.0.

(ii) Agar medium for transferring test organisms: Use the medium in (i) (2) (ii) ②b under the Microbial Assays for Antibiotics.

(2) Test organism: *Staphylococcus epidermidis* ATCC 12228.

(3) Weigh accurately about 25 mg (potency) of Gentamicin Sulfate, dissolve in 0.1 mol/L phosphate buffer solution, pH 8.0 to make the solution containing 1 mg per mL (potency), and use this solution as the test stock solution. Take exactly an appropriate amount of the test stock solution, add 0.1 mol/L phosphate buffer solution, pH 8.0 to make solutions that contain 4 μg (potency) and 1 μg (potency) per mL, and use these solutions as the high concentration test solution and low concentration test solution, respectively. Separately, weigh accurately about 25 mg (potency) of gentamicin sulfate RS, previously dried, add 0.1 mol/L phosphate buffer solution, pH 8.0, and dissolve to make the standard stock solution containing 1 mg per mL (potency). Keep the standard stock solution below 15 °C, and use it within 30 days. Take exactly an appropriate amount of the standard stock solution, add 0.1 mol/L phosphate buffer solution, pH 8.0 to make solutions that contain 4.0 μg and 1.0 μg (potency) per mL, and use these solutions as the high concentration standard solution and low concentration standard solution, respectively. Perform the test with these solutions as directed in (A) (8) under the Microbial Assays for Antibiotics.

Packaging and storage Preserve in tight containers.

Gentamicin Sulfate Cream
겐타마이신황산염 크림

Gentamicin Sulfate Cream contains NLT 90.0% and NMT 120.0% of the labeled amount of gentamicin.

Method of preparation Prepare as directed under Creams, with Gentamicin Sulfate.

Identification Weigh an appropriate amount of Gentamicin Sulfate Cream, put it in a blender, add an appropriate amount of 0.1 mol/L phosphate buffer solution, pH 8.0, previously warmed at 70 - 85 ℃, and mix at a high speed for 3 - 5 minutes. Perform the test as directed under the Identification (2) under Gentamicin Sulfate.

Assay Perform the test as directed under the Assay under Gentamicin Sulfate.

Packaging and storage Preserve in tight containers.

Gentamicin Sulfate Injection
겐타마이신황산염 주사액

Gentamicin Sulfate Injection contains NLT 90.0% and NMT 120.0% of the labeled amount of gentamicin.

Method of preparation Prepare as directed under Injections, with Gentamicin Sulfate.

Description Gentamicin Sulfate Injection occurs as a clear and colorless to pale yellow liquid.

Identification Weigh an amount equivalent to 0.1 g (potency) of gentamicin sulfate and 0.1 g (potency) of gentamicin sulfate RS according to the labeled amount of Gentamicin Sulfate Injection, and perform the test as directed under the Identification (2) of Gentamicin Sulfate.

pH Between 3.0 and 5.5.

Sterility Meets the requirements.

Bacterial endotoxins Less than 0.50 EU per mg (potency) of gentamicin.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Extractable volume of injections Meets the requirements.

Assay ***Cylindrical plate method***—Perform the test according to the Assay of Gentamicin Sulfate. However, take accurately an appropriate amount according to the labeled potency of Gentamicin Sulfate Injection, and add 0.1 mol/L phosphate buffer (pH 8.0) to make a solution with a suitable concentration. Then, take an appropriate amount of this solution, dilute it with 0.1 mol/L phosphate buffer (pH 8.0), make the same concentration as in (3), and use this solution as the test solution.

Packaging and storage Preserve in hermetic containers.

Gentamicin Sulfate Ophthalmic Ointment
겐타마이신황산염 안연고

Gentamicin Sulfate Ophthalmic Ointment contains NLT 90.0% and NMT 120.0% of the labeled amount of gentamicin.

Method of preparation Prepared as directed under ophthalmic ointments, with Gentamicin Sulfate.

Identification Weigh an appropriate amount of Gentamicin Sulfate Ophthalmic Ointment, add an appropriate amount of 0.1 mol/L phosphate buffer (pH 8.0), previously warmed to 70 - 85 ℃, disperse well, and centrifuge it. Decant the supernatant and perform the test according to the Identification (2) under Gentamicin Sulfate.

Sterility Meets the requirements.

Foreign metallic matter in ophthalmic ointments Meets the requirements.

Assay ***Cylinder plate method***—Perform the test according to the Assay of Gentamicin Sulfate. However, weigh accurately this drug equivalent to about 1.0 mg (potency) according to the labeled potency, put it into a separatory funnel, add 50 mL of ether, and mix by shaking until it becomes uniform. Extract three times with 25 mL of 0.1 mol/L phosphate buffer (pH 8.0), combine the extracted solution, and add 0.1 mol/L phosphate buffer (pH 8.0) to make 100 mL. Take exactly an appropriate amount of this solution and dilute it with 0.1 mol/L phosphate buffer (pH 8.0) to make the concentration of (3) and use this solution as the test solution.

Packaging and storage Preserve in tight containers.

Gentamicin Sulfate Ophthalmic Solution
겐타마이신황산염 점안액

Gentamicin Sulfate Ophthalmic Solution is an aqueous ophthalmic solution and contains NLT 90.0% and NMT 110.0% of the labeled amount of gentamicin.

Method of preparation Prepare as directed under Ophthalmic Solutions, with Gentamicin Sulfate.

Identification Weigh an amount of Gentamicin Sulfate

Ophthalmic Solution, equivalent to 10 mg (potency) of Gentamicin Sulfate, according to the labeled amount, add water to make 5 mL, and use this solution as the test solution. Separately, weigh about 10 mg (potency) of gentamicin sulfate RS, dissolve it in 5 mL of water, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on a thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Next, Develop the plate with a mixture of chloroform, ammonia water(28) and methanol (2 : 1 : 1) to a distance of about 15 cm, and air-dry the plate. Spray evenly 0.2% ninhydrin-water saturated 1-butanol TS on the plate and heat the plate at 100 ℃ for 5 minutes; the three spots from the test solution have the same color and R_f value as each spot from the standard solution.

pH Between 5.5 and 7.5.

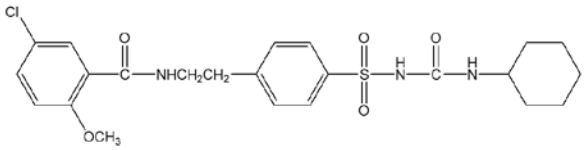
Sterility Meets the requirements.

Particulate contamination: Visible particles Meets the requirements.

Assay Perform the test as directed under the Assay under Gentamicin Sulfate. Take exactly an amount of Gentamicin Sulfate Ophthalmic Solution, equivalent to about 12 mg (potency) of gentamicin, and dissolve it in 0.1 mol/L phosphate buffer solution, pH 8.0 to prepare a solution containing about 1 mg (potency) of gentamicin in 1 mL. Take exactly a suitable amount of this solution, and dilute it with 0.1 mol/L phosphate buffer solution, pH 8.0 to prepare two solutions containing each 4.0 and 1.0 μg (potency) of gentamicin in 1 mL, and use them as the high-concentration test solution and the low-concentration test solution, respectively.

Packaging and storage Preserve in tight containers.

Glibenclamide
글리벤클라미드



Glibenclamide $C_{23}H_{28}ClN_3O_5S$: 494.00
5-Chloro-*N*-[2-[4-(cyclohexylcarbamoylsulfamoyl)phenyl]ethyl]-2-methoxybenzamide [*10238-21-8*]

Glibenclamide, when dried, contains NLT 98.5% and NMT 101.0% of glibenclamide ($C_{23}H_{28}ClN_3O_5S$).

Description Glibenclamide occurs as a pale yellow (white to almost yellow) crystalline powder.
It is freely soluble in *N*,*N*-dimethylformamide, sparingly soluble in chloroform, slightly soluble in methanol or ethanol(95), and practically insoluble in water or ether.

Identification (1) Determine the absorption spectra as directed under the Ultraviolet-visible Spectroscopy with methanol VS of Glibenclamide and Glibenclamide RS (1 in 10000); both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Glibenclamide and Glibenclamide RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) Perform the Flame Coloration 2) with Glibenclamide; it exhibits a green color.

Melting point Between 169 and 174 ℃.

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Glibenclamide and perform the test according to Method 2. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Related substances***—Dissolve 0.20 g of Glibenclamide in 20 mL of chloroform and use this solution as the test solution. Pipet 1 mL of this solution and add the chloroform to make exactly 20 mL. Pipet 1.0 mL of this solution, add chloroform to make exactly 10 mL, and use this solution as the standard solution. With these solutions, perform the test according to the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on a plate made of silica gel with fluorescent indicator for thin-layer chromatography. Next, develop the plate with a mixture of 1-propanol, chloroform and diluted ammonia TS (4 in 5) (11 : 7 : 2) to a distance of about 12 cm, and air-dry the plate. Observe the plate under ultraviolet light (main wavelength: 366 nm); any spot other than the principal spot obtained from the test solution is not darker than the spot from the standard solutions.

Loss on drying NMT 0.5% (1 g, 105 ℃, 4 h.).

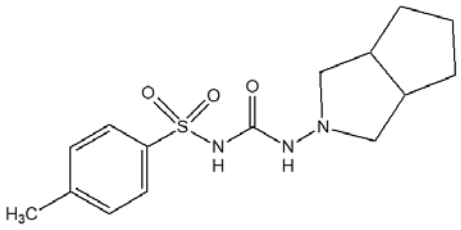
Residue on ignition NMT 0.5% (1 g).

Assay Weigh accurately about 0.9 g of Glibenclamide, previously dried, dissolve in 50 mL of *N*,*N*-dimethylformamide, and titrate the solution with 0.1 mol/L sodium hydroxide solution (Indicator: 3 drops of phenolphthalein TS). Perform a blank test with a solution prepared by adding 18 mL of water to 50 mL of *N*,*N*-dimethylformamide and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS
= 49.40 mg of $C_{23}H_{28}ClN_3O_5S$

Packaging and storage Preserve in tight containers.

Gliclazide
글리클라지드



Gliclazide $C_{15}H_{21}N_3O_3S$: 323.41
N-((Hexahydrocyclopenta[c]pyrrol-2(1*H*)-yl)carbamoyl)-4-methylbenzenesulfonamide [*21187-98-4*]

Gliclazide, when dried, contains NLT 99.0% and NMT 101.0% of gliclazide ($C_{15}H_{21}N_3O_3S$).

Description Gliclazide occurs as a white crystalline powder.
It is freely soluble in dichloromethane, sparingly soluble in acetone, slightly soluble in ethanol(95) and practically insoluble in water.

Identification Determine the infrared spectra of Gliclazide and gliclazide RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Melting point Between 165 and 169 ℃.

Purity (1) ***Heavy metals***—Weigh 1.5 g of Gliclazide according to Method 2 and perform the test. Prepare the control solution with 1.5 mL of lead standard solution (NMT 10 ppm).

(2) ***Related substances I—***Weigh accurately 0.4 g of Gliclazide, dissolve in 2.5 mL of dimethylsulfoxide, and add water to make exactly 10mL. Shake the mixture for 10 minutes to mix and allow to stand for 30 minutes at 4 ℃, and then filter it to use this solution as the test solution. Weigh 20.0 mg of gliclazide related substance I RS [2-nitroso-octahydrocyclopenta[c]pyrrole] and add dimethylsulfoxide to make exactly 100 mL. To 1.0 mL of this solution, add 12 mL of dimethylsulfoxide and water to make exactly 50 mL, and use this solution as the standard solution (1). To 1.0 mL of the standard solution (1), add 12 mL of dimethylsulfoxide and water to make exactly 50 mL, and use this solution as the standard solution (2). Perform the test with 50 μL each of the test solution and the standard solution (2) as directed under the Liquid Chromatography according to the operating conditions of the related substances test; the area of the related substance I peak, obtained from the test solution, is not greater than that from the standard solution (2) (2 ppm).

(3) ***Related substances—***Weigh accurately 50 g of Gliclazide, dissolve in 23 mL of acetonitrile, and then add water to make exactly 50 mL. Use this solution as the test solution. To 1.0 mL of the test solution, add a mixture of water and acetonitrile (55 : 45) to make exactly 100 mL. Next, add a mixture of water andacetonitrile (55 : 45) to 10.0 mL of this solution to make exactly 100 mL, and use this solution as the standard solution (1). Dissolve 5 mg of Gliclazide and 15 mg of gliclazide related substance II RS [1-(hexahydrocyclopenta[c]pyrrol-2(1H)-yl)-3-[(2-methylphenyl) sulfonyl]urea] in 23 mL of acetonitrile, add water to make exactly 50 mL, and then add a mixture of water and acetonitrile (55 : 45) to 1.0 mL of this solution to make exactly 20 mL. Use this solution as the standard solution (2). Dissolve 10.0 mg of gliclazide related substance II RS in 45 mL of acetonitrile and add water to make exactly 100 mL, add a mixture of water and acetonitrile (55 : 45) to 1.0 mL of this solution to make exactly 100 mL, and then use this solution as the standard solution (3). Perform the test with 20 μL each of the test solution, the standard solutions (1) and (3) as directed under the Liquid Chromatography according to the following operating conditions. The peak area corresponding to the related substance II obtained from the test solution is not greater than the area of the major peak obtained from the standard solution (3) (0.1%), the area of any peak other than the major peak or the related substance II peak is not greater than the area of the major peak from the standard solution (1) (0.1%), and the total area of these other peaks is not more than twice the area of the major peak from the standard solution (1) (0.2%). Disregard any peak having an area smaller than 0.2 times the area of the major peak from the standard solution (1).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 235 nm).

Column: A stainless-steel column about 4 mm in internal diameter and about 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of water, acetonitrile, trifluoroacetic acid and triethylamine (55 : 45 : 0.1 : 0.1).

Flow rate: 0.9 mL/min

System suitability

System performance: Proceed with 20 μL of the standard solution (2) under the above operating conditions to determine the performance; the heights of the two major peaks are adjusted to be NLT 50% of the full scale of the data collection device. The resolution between the two peaks is NLT 1.8.

Loss on drying NMT 0.25% (1 g, 105 ℃, 2 h.).

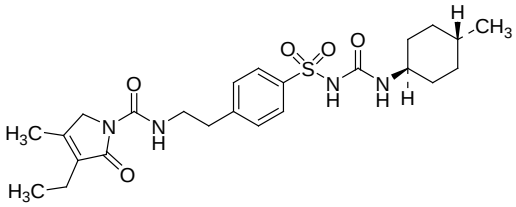
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.3 g of Gliclazide, dissolve in 50 mL of acetic acid(100) and titrate with 1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Separately, perform a blank test, and make any necessary correction.

Each mL of perchloric acid VS
= 32.34 mg of $C_{15}H_{21}N_3O_3S$

Packaging and storage Preserve in well-closed containers.

Glimepiride
글리메피리드



Glimepiride $C_{24}H_{34}N_4O_5S$: 490.62
3-Ethyl-4-methyl-*N*-(4-(*N*-(((1r,4r)-4-methylcyclohexyl)carbamoyl)sulfamoyl)phenethyl)-2-oxo-2,5-dihydro-1*H*-pyrrole-1-carboxamide [*93479-97-1*]

Glimepiride contains NLT 98.0% and NMT 102.0% of glimepiride ($C_{24}H_{34}N_4O_5S$), calculated on the anhydrous basis.

Description Glimepiride occurs as a white crystalline powder. It is slightly soluble in dichloromethane, very slightly soluble in methanol and ethanol(99.5), and practically insoluble in water.

Melting point—About 202 °C (with decomposition).

Identification (1) Determine the absorption spectra as directed under the Ultraviolet-visible Spectroscopy with methanol VS (1 in 125,000) of Glimepiride and glimepiride RS; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the absorption spectra of Glimepiride and glimepiride RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both exhibit similar intensities of absorption at the same wavenumbers.

Purity (1) ***Heavy metals***—Proceed with 2.0 g of Glimepiride according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(2) ***Glimepiride isomer***—Dissolve 10 mg of Glimepiride in 5 mL of dichloromethane, add the mobile phase to make 20.0 mL, and use this solution as the test solution. Pipet 1.0 mL of this solution, add the mobile phase to it make exactly 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak area from each of the solutions according to the automatic integration method; the peak area of glimepiride isomer obtained from the test solution with the relative retention time to the Glimepiride of about 0.9 is not greater than 3/4 of the peak area of Glimepiride from the standard solution.

Operating conditions

Detector: An ultraviolet absorption spectrophotometer (wavelength: 228 nm).

Column: A stainless steel column of about 3 mm in internal diameter and 15 cm in length, packed with dihydropropane silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: A mixture of heptane, 2-propanol and acetic acid(100) (900 : 100 : 1).

Flow rate: Adjust the flow rate to ensure that the retention time of Glimepiride is about 14 minutes.

System suitability

Detection sensitivity: Weigh accurately 5 mL of the standard solution and add the mobile phase to make exactly 10 mL. Confirm that the peak area of Glimepiride obtained from 10 μL of this solution is equivalent to between 33% and 65% of the peak area of Glimepiride obtained from the standard solution.

System performance: Proceed with 10 μL of the standard solution according to the above conditions; the number of theoretical plates for the peak of Glimepiride is NLT 3000 with the symmetry factor being NMT 1.5.

System repeatability: Repeated the test 6 times with 10 mL of the standard solution according to the above conditions; the relative standard deviation of the peak area of Glimepiride is NMT 2.0%.

(3) ***Related substances*—**Prepare the test solution and the standard solution and store them at NMT 4 ℃. Dissolve 20 mg of Glimepiride in 100 mL of a mixture of acetonitrile and water (4 : 1) and use this solution as the test solution. Pipet 1 mL of this solution, and add the mobile phase to make exactly 100 mL. Pipet 1 mL of this solution, add the mobile phase to it make exactly 10 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak area of each solution according to the automatic integration method: the peak area for the test solution with the relative retention time to the Glimepiride of about 0.25 is NMT 4 times the peak area of Glimepiride for the standard solution; the peak area with the relative retention time of about 1.1 is not than twice the peak area of Glimepiride for the standard solution; the peak area with the relative retention time of about 0.32 is NMT 1.5 times the peak area of Glimepiride for the standard solution. Also, the sum of peak areas other than the peak of Glimepiride and peak with the relative retention time to Glimepiride of about 0.25 in the test solution is NMT 5 times the peak area of Glimepiride in the standard solution.

Operating conditions

For the detector, column, column temperature, mobile phase and flow rate, follow the operating conditions under the Assay.

System suitability

Detection sensitivity: Pipet 5 mL of the standard solution and add the mobile phase to make exactly 10 mL. Confirm that the peak area of Glimepiride obtained from 20 μL of this solution is equivalent to between 35% and 65% of the peak area of Glimepiride obtained from the standard solution.

System performance: Proceed with 20 μL of the standard solution according to the above conditions; the number of theoretical plates for the Glimepiride peak is NLT 9,000 with the symmetry factor being NMT 1.5.

System repeatability: Repeat the test 6 times with 20 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area of Glimepiride is NMT 2.0%.

Water NMT 0.5% (0.25 g, coulometric titration).

Residue on ignition NMT 0.2% (1 g).

Assay Weigh accurately 20 mg each of Glimepiride and Glimepiride RS (water previously measured), dissolve each in a mixture containing acetonitrile and water (4 : 1) to make exactly 100 mL, and use each as the test solution and the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak area of Glimepiride, A_T, and A_S, in each solution.

$$\text{Amount (mg) of Glimepiride } (C_{24}H_{34}N_4O_5S) = \text{Amount (mg) of glimepiride RS as calculated on the anhydrous basis} \times \frac{A_T}{A_S}$$

Operating conditions

Detector: An ultraviolet absorption spectrophotometer (wavelength: 228 nm).

Column: A stainless steel column of about 4 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (4 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: Dissolve 0.5 g of sodium dihydrogen phosphate dihydrate in 500 mL of water, adjust the pH to 2.5 by adding phosphoric acid, and add 500 mL of acetonitrile.

Flow rate: Adjust the flow rate to ensure that the retention time of Glimepiride is about 17 minutes.

System suitability

System performance: Proceed with 20 μL of the standard solution according to the above conditions; the number of theoretical plates for the peak of Glimepiride is NLT 9,000 with the symmetry factor being NMT 1.5.

System repeatability: Repeat the test 6 times with 20 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area of Glimepiride is NMT 1.0%.

Packaging and storage Preserve in well-closed containers.

Glimepiride Tablets
글리메피리드 정

Glimepiride Tablets contain NLT 93.0% and NMT 107.0% of glimepiride ($C_{24}H_{34}N_4O_5S$: 490.62) of the labeled amount.

Method of preparation Glimepiride Tablets are prepared as directed under Tablets, with Glimepiride.

Identification Weigh a portion of powdered Glimepiride Tablets, equivalent to 20 mg of glimepiride according to the labeled amount, add 40 mL of acetonitrile, shake to mix for 15 minutes, and then perform centrifugation. Allow to dry the clear supernatant in a vacuum on a steam bath, add 1 mL of water to the residue to suspend, and then filter it in a vacuum. Wash the residue with 1 mL of water, allow to dry at 105 °C for 1 hour, and determine the absorption as directed in the potassium bromide disk method of the Mid-infrared Spectroscopy; it exhibits absorption at the wavenumbers of about 3370 cm^{-1}, 3290 cm^{-1}, 2930 cm^{-1}, 1708 cm^{-1}, 1674 cm^{-1}, 1347 cm^{-1}, 1156 cm^{-1} and 618 cm^{-1}.

Purity ***Related substances***—After preparing the test solution and the standard solution, preserve them at below 4℃. Weigh a portion of powdered Glimepiride Tablets, equivalent to 9 mg of Glimepiride according to the labeled amount, put 0.5 mL of water, and add 80% acetonitrile to make 50 mL. After shaking to mix, perform centrifugation, and use the clear supernatant as the test solution. Take exactly 1 mL of this solution and add 80% acetonitrile to make 100 mL, and use this solution as the standard solution. Take exactly each 5 μL of the test solution and the standard solution and perform the test under the following conditions as directed under the Liquid Chromatography. Determine each peak area of each solution by the automatic integration method: the peak area in the test solution with the relative retention time to the Glimepiride of about 0.3 is NMT 2.6 times the peak area of Glimepiride in the standard solution; the peak area other than the peak in the test solution with the relative retention time of about 0.3 is NMT 3/10 than the peak area of Glimepiride in the standard solution; the sum of peak areas is not greater than the peak area of Glimepiride in the standard solution. Additionally, the sum of the peaks other than Glimepiride's in the test solution is not three times more than the peak area of Glimepiride in the standard solution.

Operating conditions

For the detector, column, column temperature and mobile phase, comply with the operating conditions as directed under the Assay.

Flow rate: Adjust the flow rate to achieve a retention time of about 12 minutes for Glimepiride.

System suitability

Test for required detectability: Take exactly 2 mL of the standard solution, and add the mobile phase to make exactly 20 mL. Confirm that the peak area of Glimepiride obtained from 5 μL of this solution is within the range between 7% and 13% of the peak area of Glimepiride in the standard solution.

System performance: Proceed with 5 μL of the standard solution under the above conditions; the number of theoretical plates of the Glimepiride's peak is NLT 6,000, and the symmetry factor is NMT 1.5.

System repeatability: Repeat the test six times with 5 μL each of the standard solution under the conditions specified above; the relative standard deviation of the peak area of Glimepiride is NMT 2.0%.

Time span of measurement: About 2 times the retention time of Glimepiride.

Dissolution Take one Glimepiride Tablet and perform the test at 50 revolutions per minute according to Method 2 under the Dissolution using 900 mL of phosphate-citrate buffer solution, pH 6.0 as the dissolution medium. Take NLT 20 mL of the dissolved solution after 15 minutes from the start of the Dissolution, and filter through a membrane filter with a pore size of NMT 0.45 μm. Discard the first 10 mL of the filtrate, take exactly the subsequent filtrate of *V* mL, add the dissolution medium to make exactly *V'* mL, containing about 1.1 μg of glimepiride ($C_{24}H_{34}N_4O_5S$) per mL, according to the labeled amount, and then use this solution as the test solution. Separately, weigh accurately about 20 mg of glimepiride RS (previously measure the water) and add acetonitrile to make exactly 100 mL. Weigh exactly 2 mL of this solution, add 8 mL of acetonitrile and then the dissolution medium to make exactly 200 mL. Take exactly 10 mL of this solution, add the dissolution medium to make exactly 20 mL, and use this as the standard solution. Pipet 50 μL each of the test solution and the standard solution, and perform the test as directed under the Liquid Chromatography according to the following conditions, and determine the peak areas, A_T and A_S of Glimepiride of each solution. Meets the requirements if the dissolution rate of Glimepiride Tablets in 15 minutes is NLT 75%.

Dissolution rate (%) with respect to the labeled amount of glimepiride ($C_{24}H_{34}N_4O_5S$)
= Amount (mg) of glimepiride RS, calculated on the anhydrous basis
$$\times \frac{A_T}{A_S} \times \frac{V'}{V} \times \frac{1}{C} \times \frac{9}{2}$$

C: Labeled amount (mg) of glimepiride ($C_{24}H_{34}N_4O_5S$) in 1 tablet

Operating conditions

For the detector, column temperature, mobile phase and flow rate, comply with the operating conditions as directed under the Assay.

Column: A stainless-steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

System suitability

System performance: Proceed with 50 μL of the standard solution according to the above conditions; the number of theoretical plates of the glimepiride peak is NLT 3,000, and the symmetry factor is NMT 1.5.

System repeatability: Repeat the test six times with 50 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area of glimepiride is NMT 1.5%.

Uniformity of dosage units It meets the requirements when the procedure for content uniformity is performed according to following method.

With one Glimepiride Tablet, put *V* / 20 mL of water to disintegrate, add *V* / 2 mL of 80% acetonitrile, and shake to mix. To this solution, put exactly *V* / 10 mL of the internal standard solution, and add 80% acetonitrile to make *V* mL, containing about 50 μg of glimepiride ($C_{24}H_{34}N_4O_5S$) per mL. Centrifuge this solution, and use the clear supernatant as the test solution. Separately, weigh exactly about 20 mg of glimepiride RS (previously measure the water) and dissolve in a 80% acetonitrile to make exactly 100 mL. Weigh exactly 5 mL of this solution, put exactly 2 mL of the internal standard solution, and add a mixture of acetonitrile and water (4 : 1) to make 20 mL, and use this solution as the standard solution. Perform the test as directed under the Assay below.

Amount (mg) of glimepiride ($C_{24}H_{34}N_4O_5S$)
= Amount (mg) of glimepiride RS, calculated on the anhydrous basis
$$\times \frac{Q_T}{Q_S} \times \frac{V}{400}$$

Internal standard solution— A mixture of acetonitrile and water (4 : 1) of butyl p-hydroxybenzoate VS (1 in 1000).

Assay Weigh accurately the mass of NLT 20 Glimepiride Tablets, and powder. Weigh accurately an amount, equivalent to about 3 mg of glimepiride ($C_{24}H_{34}N_4O_5S$), put 3 mL of water, add 30 mL of 80% acetonitrile, and shake to mix. Add exactly 6 mL of the internal standard solution, put 80% acetonitrile to make 50 mL, perform centrifugation, and use the clear supernatant as the test solution. Separately, weigh accurately about 20 mg of glimepiride RS (previously measure the water), and dissolve in 80% acetonitrile to make exactly 100 mL. Weigh exactly 15 mL of this solution, put exactly 6 mL of the internal standard solution, add 80% ace-

tonitrile to make 50 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operating conditions, and determine the peak area ratios, Q_T and Q_S of glimepiride to the internal standard.

Amount (mg) of glimepiride ($C_{24}H_{34}N_4O_5S$) = Amount (mg) of glimepiride RS, calculated on the anhydrous basis $\times \frac{Q_T}{Q_S} \times \frac{3}{20}$

Internal standard solution— A mixture of acetonitrile and water (4 : 1) of butyl p-hydroxybenzoate VS (1 in 1000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 228 nm).

Column: A stainless-steel column about 4 mm in internal diameter and about 12.5 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25 °C.

Mobile phase: Dissolve 0.5 g of sodium dihydrogen phosphate dihydrate in 500 mL of water, put 500 mL of acetonitrile, and add diluted phosphoric acid (1 in 5) to adjust the pH to 3.5.

Flow Rate: Adjust the flow rate to achieve a retention time of about 10 minutes for glimepiride.

System suitability

System performance: Proceed with 10 μL of the standard solution under the above conditions; the internal standard and glimepiride are eluted in this order with the resolution being NLT 6.

System repeatability: Repeat the test six times with 10 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area of glimepiride is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Crystallized Glucosamine Sulfate
결정글루코사민황산염

Crystallized Glucosamine Sulfate, when stabilized by adsorbing sodium chloride to the crystal spacing of glucosamine sulfate, contains NLT 76.0% and NMT 84.0% of glucosamine sulfate ($C_{12}H_{26}N_2O_{14}S$).

Description Crystallized Glucosamine Sulfate occurs as a white to light brown crystalline powder that is odorless and has a strong salty taste.
It is soluble in water and slightly soluble in methanol.

Identification (1) ***Glucosamine aldehyde group***—Dissolve 0.5 g of Crystallized Glucosamine Sulfate in 10 mL of water, adjust the pH to neutral or slightly alkaline, add several mL of Fehling's TS, and warm slowly to form a red precipitate of cuprous oxide.

(2) ***Glucosamine***—To 1 mL of Crystallized Glucosamine Sulfate aqueous solution, add 1 mL of 2% acetylacetone·0.5 mol/L sodium bicarbonate solution, heat on a steam bath for 20 minutes, cool, and then add 4 mL of ethanol and 1 mL of p-dimethylaminobenzaldehyde TS in order. When heated at 65 to 70 °C for 10 minutes, it exhibits a violet color (absorbance maximum wavelength: 535 ± 5 nm).

(3) ***Sulfate***—(i) To Crystallized Glucosamine Sulfate aqueous solution acidified with hydrochloric acid, add barium chloride TS; a white precipitate is formed. This precipitate is insoluble in hydrochloric acid or nitric acid.

(ii) To Crystallized Glucosamine Sulfate aqueous solution, add lead acetate solution (9.5 in 100); a white precipitate is formed, which is soluble in ammonium acetate TS.

(4) ***Sodium***—To Crystallized Glucosamine Sulfate aqueous solution, add 5 mL of cobalt/uranyl acetate TS and shake to form a golden precipitate.

(5) ***Chlorine***—To Crystallized Glucosamine Sulfate aqueous solution acidified with dilute nitric acid, add silver nitrate solution; a white precipitate is formed, which is soluble in ammonia water.

(6) Weigh 20 mg of Crystallized Glucosamine Sulfate and dissolve it in 2 mL of water to use as the test solution. Separately weigh about 20 mg of silver nitrate TS and dissolve it in 2 mL of water to use as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on a thin-layer chromatographic plate made using silica gel with fluorescent indicator for thin-layer chromatography (fluorescent indicator added). Next, develop the plate by about 10 cm using a mixture of ethanol and ammonia (8:2) as a developing solvent, and air-dry the plate. After drying at 105 ℃ for 10 minutes, check according to the following method.

(i) Add 2 mol/L potassium permanganate solution and 4 mol/L hydrochloric acid mixture (1:1), put the thin-layer plate in a developing tank saturated with chlorine vapor, blow off excess chlorine, and spray solution (I). Glucosamine exhibits goldish blue spots at an R_f value of 0.4, and chlorine exhibits white spots at an R_f value of 0.74.

Solution (I)—A solution obtained by adding 3 mL of acetic acid(100) to 150 mL of water, dissolving 1 g of potassium iodide and 100 mg of *o*-tolidine, and filtering the solution.

(ii) Spray ninhydrin ethanol solution evenly on the thin-layer chromatographic plate and heat it at 110 ℃ for several minutes. Glucosamine shows violet spots on a pink background, and sulfate shows yellow spots, but

chlorine is not detected.

(7) When measured according to the potassium bromide purification method under the Mid-infrared Spectroscopy with Crystallized Glucosamine Sulfate and glucosamine sulfate RS, absorption of the same intensity is shown at the same wavenumber.

Optical rotation $[\alpha]_D^{20}$: Between +53 ± 1° and +65 ± 1° (3 hours) (10% aqueous solution, 200 mm, 25 °C).

pH Between 4.0 and 4.4 (5% aqueous solution, 25 °C).

Purity ***Heavy metals***—Weigh about 2.0 g of this solution and perform the test according to Method 1. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

Water NMT 0.5%.

Residue on ignition NMT 0.2% (1 g). Perform the test according to the residue on ignition test method and subtract 24.78% equivalent to sodium from the result.

Assay Weigh accurately about 0.3 g of Crystallized Glucosamine Sulfate aqueous solution and dissolve it in water to make 250 mL. Take 10.0 mL of this solution, add water to make 250 mL, and use it as the test solution. Separately, weigh accurately about 0.25 g of the glucosamine sulfate RS, put it into a 250-mL volumetric flask, bring it to the gauge line with water, take 10.0 mL of this solution, add water to make 250 mL, and use it as the standard solution. Take 5 mL each of the test solution, standard solution, and water in a test tube, add 2 mL of acetylacetone solution (prepared before use) in which 2% acetylacetone is dissolved in 0.5 mol/L sodium bicarbonate solution, mix well, and heat on a steam bath for exactly 20 minutes. Cool with cold water, sequentially add 2 mL of a dimethylaminobenzaldehyde solution in which 12 mL of anhydrous ethanol and 3.2 g of dimethylaminobenzaldehyde are dissolved in a mixture of 120 mL of hydrochloric acid and 120 mL of methanol, mix well, and warm on a steam bath at between 65 and 70 °C for exactly 10 minutes. Cool with cold water and when using the blank test solution as a control and testing according to the UV-visible spectrophotometry, measure the absorbance A_T and A_S at a wavelength of 530 nm.

Amount (mg) of glucosamine sulfate ($C_{12}H_{26}N_2O_{14}S$)
= Amount (mg) of glucosamine sulfate RS × $\frac{A_T}{A_S}$

Packaging and storage Preserve in tight containers.

Crystallized Glucosamine Sulfate Capsules
결정글루코사민황산염 캡슐

Crystallized Glucosamine Sulfate Capsules contain NLT 95.0% and NMT 105.0% of the labeled amount of glucosamine sulfate [$(C_6H_{13}NO_5)_2 \cdot H_2SO_4$: 456.42].

Method of preparation Prepare as directed under Capsules, with Crystallized Glucosamine Sulfate.

Identification Weigh an amount equivalent to 20 mg of glucosamine sulfate according to the labeled amount of Crystallized Glucosamine Sulfate Capsules, dissolve it in 2 mL of water, and use this solution as the test solution. Separately, weigh 20 mg of glucosamine sulfate RS, dissolve it in 2 mL of water, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on a thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography(fluorescent indicator added). Next, develop the plate with a mixture of ethanol and ammonia (8 : 2) to a distance of about 10 cm, and air-dry the plate. After drying at 105 °C for 10 minutes, (i) expose to chlorine vapor as Solution (I) and evaporate excess chlorine, and spray Solution (II); Glucosamine shows golden blue spots at R_f value of about 0.4, and chlorine shows white spots at an R_f value of about 0.74.

Solution (I)—A mixture of 2 mol/L potassium permanganate solution and 4 mol/L hydrochloric acid TS (1 : 1).

Solution (II)—A solution obtained by adding 3 mL of acetic acid(100) to 150 mL of water, dissolving 1 g of potassium iodide and 100 mg of *o*-tolidine, and filtering.

(ii) Spray 0.2% ninhydrin-ethanol solution evenly and heat it at 110 °C for several minutes; Glucosamine shows violet spots on a pink background, and sulfate shows yellow spots, but chlorine is not detected.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

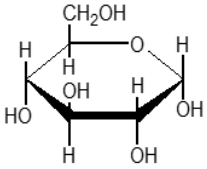
Assay Weigh accurately the mass of NLT 20 Crystallized Glucosamine Sulfate Capsules. Weigh accurately an amount equivalent to about 0.25 g of glucosamine sulfate ($(C_6H_{13}NO_5)_2 \cdot H_2SO_4$), put it into a 250-mL volumetric flask, and bring it to the gauge line with water. Take 10.0 mL of this solution, transfer it to a 250-mL volumetric flask, fill it up to the gauge line with water, and use this solution as the test solution. Separately, weigh accurately about 0.25 g of the glucosamine sulfate RS, put it in a 250-mL volumetric flask and bring it to the gauge line with water. Transfer 10.0 mL of this solution into a 250-mL volumetric flask, fill it up to the gauge line with water, and use this solution as the standard solution. Take 5 mL each of the test solution, the standard solution and water (blank test) in a blank test tube, add 2 mL of acetylacetone solution (prepared before use) in which 2%

acetylacetone is dissolved in 0.5 mol/L sodium bicarbonate solution, mix well and heat on a steam bath for exactly 20 minutes. Cool it with cold water, add 12 mL of anhydrous ethanol and 2 mL of 4-dimethylaminobenzaldehyde TS in order, mix well, warm it on a steam bath at 65 °C - 70 °C for exactly 10 minutes, and then cool. With the test and standard solutions using the blank test solution as a reference, measure the absorbance A_T and A_S at a wavelength of 530 nm as directed under the Ultraviolet-visible Spectroscopy.

$$\text{Amount (mg) of glucosamine sulfate } ((C_6H_{13}NO_5)_2 \cdot H_2SO_4) = \text{Amount (mg) of glucosamine sulfate RS} \times \frac{A_T}{A_S}$$

Packaging and storage Preserve in well-closed containers.

Glucose
포도당



$C_6H_{12}O_6$: 180.16

(2*R*,3*S*,4*R*,5*R*)-2,3,4,5,6-pentahydroxyhexanal [*50-99-7*]

Glucose is *D*-glucopyranose obtained from starch.

Glucose contains NLT 97.5% and NMT 102.0% of glucose [*D*-glucopyranose ($C_6H_{12}O_6$)], calculated on the anhydrous basis.

Description Glucose occurs as white crystals or a crystalline powder. It is odorless and has a sweet taste.
It is freely soluble in water and slightly soluble in ethanol(95).

Identification (1) Determine the infrared spectra of Glucose and glucose RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) Perform the test as directed under the Assay; the major peaks obtained from the test solution and the standard solution exhibit same peaks at the same retention time.

Purity (1) ***Clarity and color of solution***—To 10.0 g of Glucose, add 15 mL of water, dissolve by heating on a steam bath, and cool. Use this as the test solution and perform the test as directed under the Turbidity; the solution is clear. Transfer the test solution, the control solution and water into the colorless and transparent glass columns with a flat bottom and an internal diameter of 15 mm to 25 mm to make 40 mm of a liquid layer, and observe from the above using scattered light against a white background; the solutions are not more intense than the control solution.

Control solution—Mix 2.4 mL of iron(III) chloride hexahydrate colorimetric stock solution, 1.0 mL of cobalt(II) chloride hexahydrate colorimetric stock solution, 0.4 mL of copper(II) sulfate pentahydrate colorimetric stock solution and 6.2 mL of diluted hydrochloric acid (1 in 10). To 2.5 mL of this solution, add 97.5 mL of diluted dilute hydrochloric acid (1 in 10).

(2) ***Related substances***—Weigh accurately an amount of Glucose, equivalent to 0.300 g of glucose calculated on the dried basis, dissolve in water to make exactly 10 mL, and use this solution as the test solution. Pipet 1 mL of this solution, add water to make exactly 250 mL, and use this solution as the standard solution (1). Pipet 25 mL of this solution, add water to make exactly 200 mL, and use this solution as the standard solution (2). Pipet 20 μL each of the test solution, the standard solution (1) and the standard solution (2) and perform the test as directed under the Liquid Chromatography according to the following conditions. Determine the each peak area as directed in the automatic integration method; the sum of the peak areas of maltose and isomaltose is not greater than the peak area of glucose from standard solution (1) (NMT 0.4%), the peak area of maltotriose is not greater than half of the peak area of glucose from standard solution (1) (NMT 0.2%), and the peak area of fructose is NMT 3 times the peak area of glucose from the standard solution (2) (NMT 0.15%). The peak area of glucose from the test solution and each peak area are NMT 2 times the peak area of glucose from standard solution (2) (NMT 0.1%). Also, the sum of peak areas other than glucose from the test solution is NMT 1.25 times the peak area of glucose from the standard solution (1) (NMT 0.5%). However, peaks having the area NMT the peak area of glucose from standard solution (2) are not included in the calculation (NMT 0.05%).

Operating conditions

For the detector, column, column temperature, mobile phase and flow rate, proceed as directed under the test conditions under the Assay.

Time span of measurement: About 1.5 times the retention time of glucose.

System suitability

For system suitability solution and the system performance, proceed as directed under the Assay.

(3) ***Dextrin***—To 1.0 g of Glucose, previously powdered, add 20 mL of ethanol(95), and boil under a reflux condenser; the resulting solution is clear.

(4) ***Soluble starch or sulfite***—Dissolve 6.7 g of Glucose in 15 mL of water by heating on a steam bath. After cooling, add 25 μL of 0.05 mol/L iodine; the resulting solution exhibits a yellow color (NMT 15 ppm as

SO_3)

Conductivity Dissolve 20.0 g of Glucose in freshly boiled and cooled water to make 100 mL, and use it as the test solution. Determine the conductivity of the test solution while gently stirring with the magnetic stirrer; it is NMT 20 $\mu S \cdot cm^{-1}$.

Water NMT 1.0% (0.5 g, volumetric titration, direct titration).

Assay Weigh accurately an amount of Glucose and glucose RS, equivalent to 0.300 g of glucose calculated on the anhydrous basis, dissolve each in water to make exactly 10 mL, and use these solutions as the test solution and the standard solution, respectively. Pipet 20 μL each of the test solution and the standard solution, perform the test as directed under the Liquid Chromatography according to the following operating conditions, and determine the peak areas, A_T and A_S, of glucose from the test solution and the standard solution, respectively.

Amount (g) of glucose ($C_6H_{12}O_6$)
= Amount (mg) of glucose RS, calculated on the anhydrous basis × (A_T / A_S)

Operating conditions

Detector: A constant-temperature differential refractometer (e.g., at 40 ℃).

Column: A stainless steel column about 7.8 mm in internal diameter and about 30 cm in length, packed with strongly acidic ion exchange resin for liquid chromatography composed of a sulfonated styrene-divinylbenzene copolymer (cross-linking rate: 8%) (Ca form).

Column temperature: 85 ± 1 ℃

Mobile phase: Water

Flow rate: 0.3 mL/min (adjust the flow rate so that the retention time of glucose is about 21 minutes).

System suitability

System performance: Dissolve 5 mg of maltose, 5 mg of maltotriose and 5 mg of fructose in 50 mL of water, and use this solution as the system suitability solution. Perform the test with 20 mL each of the system suitability solution and the standard solution (2); the relative retention times of maltotriose, maltose, isomaltose and fructose to that of glucose is about 0.7, about 0.8, about 0.8 and about 1.3, respectively. Also, the resolution between maltotriose and maltose is NLT 1.3.

Packaging and storage Preserve in tight containers.

Glucose Injection
포도당 주사액

Glucose Injection is an aqueous solution for injection. Glucose Injection contains NLT 95.0% and NMT 105.0% of the labeled amount of glucose ($C_6H_{12}O_6$: 180.16).

Method of preparation Prepare as directed under Injections, with Glucose.
No preservative is added.

Description Glucose Injection occurs as a clear, colorless liquid and has a sweet taste. When the labeled concentration is NLT 40%, it is a clear, colorless to pale yellow liquid.

Identification Take an amount of Glucose Injection equivalent to 0.1 g of glucose according to the labeled amount, add water or concentrate on a steam bath as needed to make 2 mL, and add 2 to 3 drops of this solution to 5 mL of boiling Fehling's TS; a red precipitate is formed.

pH Between 3.5 and 6.5. In the case where the labeled concentration of the injection exceeds 5%, dilute to 5% with water before the test.

Purity ***5-Hydroxymethylfurural***—Take an amount of glucose injection equivalent to 2.5 g of glucose according to the labeled amount, and add water to make exactly 100 mL. Perform the test with this solution as directed under the Ultraviolet-visible Spectroscopy; the absorbance at a wavelength of 284 nm is NMT 0.80.

Sterility Meets the requirements.

Bacterial endotoxins Less than 0.50 EU per mL of glucose injection.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

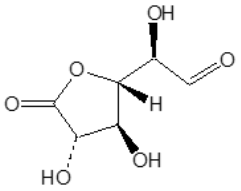
Extractable volume of injections Meets the requirements.

Assay Pipet an amount of glucose injection equivalent to about 4 g of glucose ($C_6H_{12}O_6$), add 0.2 mL of ammonia TS and water to make exactly 100 mL, shake well to mix and allow to stand for 30 minutes, and measure optical rotation α_D at 20 ± 1 ℃ and layer length 100 mm.

Amount (mg) of glucose ($C_6H_{12}O_6$)
= α_D × 1895.4

Packaging and storage Preserve in hermetic containers. Plastic containers for aqueous injections may be used.

Glucuronolactone
글루쿠로노락톤



$C_6H_8O_6$: 176.12
D-Glucuronic acid *γ*-lactone; *D*-Glucofuranurono-6,3-lactone, [*32449-92-6*]

Glucuronolactone, when dried, contains NLT 99.0% and NMT 101.0% of glucuronolactone ($C_6H_8O_6$).

Description Glucuronolactone occurs as odorless, white crystals or crystalline powder, with a bitter taste.
It is freely soluble in water, sparingly soluble in methanol and slightly soluble in ethanol or acetic acid.

Identification (1) Add 2 or 3 drops of boiling Fehling's TS to the 10% aqueous solution of Glucuronolactone; a red precipitate is generated.

(2) Add 1 mL of the orcine-ferric chloride TS to 1 mL of the 10% aqueous solution of Glucuronolactone and heat for 10 minutes on a steam bath; the resulting solution appears green.

Optical rotation $[\alpha]_D^{20}$: Between +19° and +20° (5.19 g as dried, water, 100 mL, 100 mm).

Melting point Between 176 and 178 ℃ (Ethanol recrystalization).

Purity (1) ***Chloride***—Proceed with 1.0 g of Glucuronolactone according to the Chloride and perform the test. Prepare the control solution with 0.12 mL of 0.02 mol/L hydrochloric acid VS (NMT 0.011%).

(2) ***Sulfate***—Proceed with 1.0 g of Glucuronolactone according to the Sulfate and perform the test. Prepare the control solution with 0.15 mL of 0.01 mol/L sulfuric acid VS (NMT 0.015%).

Loss on drying NMT 0.5% (1 g, sulfuric acid desiccator, 4 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.3 g of Glucuronolactone, previous dried, dissolve in 5 mL of water and cool it in cold water. While shaking it well to mix, add 30.0 mL of 0.1 mol/L sodium hydroxide solution, pass nitrogen gas through it in cold water, and allow it to stand for 30 minutes. Reversely titrate the excess of the sodium hydroxide with 0.05 mol/L sulfuric acid VS (indicator: 3 drops of phenolphthalein TS) The endpoint is reached when the solution turns colorless. At this point, add 3 drops of the indicator again and warm until the solution shows no color. Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS
= 17.610 mg of $C_6H_8O_6$

Packaging and storage Preserve in tight containers.

L-Glutamic Acid, L-Alanine and Glycine Capsules
L-글루탐산·L-알라닌·글리신 캡슐

L-Glutamic Acid, L-Alanine and Glycine Capsules contain NLT 90.0% and NMT 130.0% L-glutamic acid ($C_5H_9NO_4$: 147.13), L-alanine ($C_3H_7NO_2$: 89.09) and glycine ($C_2H_5NO_2$: 75.07).

Method of preparation Prepared as directed under Capsules, with L-Glutamic Acid, L-Alanine and Glycine.

Identification Perform the test with the content of NLT 20 L-Glutamic Acid, L-Alanine and Glycine Capsules as directed under the Identification and Assay for Amino Acids.

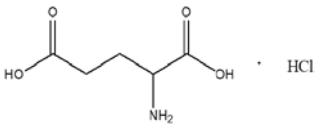
Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 L-Glutamic Acid, L-Alanine and Glycine Capsules and perform the test as directed under the Identification and Assay for Amino Acids.

Packaging and storage Preserve in tight containers.

Glutamic Acid Hydrochloride
글루탐산염산염



$C_5H_9NO_4 \cdot HCl$: 183.59
Glutamic acid hydrochloride, [*138-15-8*]

Glutamic Acid Hydrochloride, when dried, contains NLT 99.0% and NMT 101.0% of glutamic acid hydrochloride ($C_5H_9NO_4 \cdot HCl$: 183.59).

Description Glutamic Acid Hydrochloride occurs as a white, crystalline powder and its aqueous solution is acidic.

Identification (1) Dissolve 1 mL of the aqueous solution (1 in 3) of Glutamic Acid Hydrochloride in 1 mL of barium hydroxide solution (1 in 50), filter, add 10 mL of ethanol(95), and allow to stand; a crystalline precipitate of barium glutamate appears.

(2) Add 1 mL of ninhydrin TS and 0.1 g of sodium acetate to 1 mL of the aqueous solution (1 in 30) of Glutamic Acid Hydrochloride and boil for 10 minutes; the solution appears bluish purple.

Optical rotation $[\alpha]_D^{20}$: Between +23.5° and +25.5° (After drying, 3.125 g, 25 mL of 3 mol/L hydrochloric acid).

Purity (1) ***Sulfate***—Proceed with 0.5 g of Glutamic Acid Hydrochloride according to the Sulfate and perform the test. Prepare the control solution with 1 mL of 0.005 mol/L sulfuric acid VS (NMT 0.096%).

(2) ***Heavy metals***—Proceed with 1.0 g of Glutamic Acid Hydrochloride according to Method 1 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

Loss on drying NMT 0.5% (1 g, 80 °C, 4 hours).

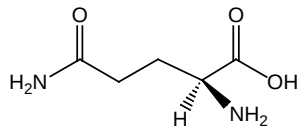
Residue on ignition NMT 0.25% (1 g).

Assay Weigh accurately about 0.2 g of Glutamic Acid Hydrochloride, previously dried, dissolve in 50 mL of water, and titrate with 0.1 mol/L sodium hydroxide VS (indicator: Bromothymol blue TS). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS
= 9.180 mg of $C_5H_9NO_4 \cdot HCl$

Packaging and storage Preserve in tight containers.

Glutamine
글루타민



L-glutamine $C_5H_{10}N_2O_3$: 146.15
(*S*)-2,5-Diamino-5-oxopentanoic acid [*56-85-9*]

Glutamine, when dried, contains NLT 99.0% and NMT 101.0% of L-glutamine ($C_5H_{10}N_2O_3$).

Description Glutamine is white crystals or crystalline powder, with a characteristic taste.
It is freely soluble in formic acid, soluble in water, and practically insoluble in ethanol(95).

Identification Perform the test with Glutamine and L-glutamine RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Optical rotation $[\alpha]_D^{20}$: Between +6.3° and +7.3° (Weigh accurately 2 g of Glutamine, previously dried, and dissolve in 45 mL of water by warming at 40 ℃. After cooling, add water to make exactly 50 mL. Use this for measurement at the layer length of 100 mm within 60 minutes.)

pH Dissolve 1.0 g of Glutamine in 50 mL of water; the pH of this solution is between 4.5 and 6.0.

Purity (1) ***Clarity and color of solution***—Dissolve 0.5 g of Glutamine in 20 mL of water; the resulting solution is clear and colorless.

(2) ***Chloride***—Perform the test with 0.5 g of Glutamine. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid VS (NMT 0.021%).

(3) ***Sulfate***—Perform the test with 0.6 g of Glutamine. Prepare the control solution with 0.35 mL of 0.005 mol/L sulfuric acid VS (NMT 0.028%).

(4) ***Ammonium***—Perform the test with 0.10 g of Glutamine. Use 10.0 mL of ammonium standard solution as the control solution (NMT 0.1%). However, perform the test as directed under the vacuum distillation method and set the water bath temperature to 45 ℃.

(5) ***Heavy metals***—Proceed with 1.0 g of Glutamine according to Method 1 and perform the test. Prepare the control solution with 1.0 mL of lead standard solution (NMT 10 ppm).

(6) ***Iron***—Prepare the test solution with 1.0 g of Glutamine according to Method 1 and perform the test according to Method A. Prepare the control solution with 1.0 mL of iron standard solution (NMT 10 ppm).

(7) ***Related substances***—Dissolve 0.10 g of Glutamine in 10 mL of water and use this solution as the test solution. Pipet 1 mL of this solution and add water to make exactly 10 mL. Pipet 1 mL of this solution, add water to make exactly 50 mL, and use this solution as the standard solution. With the solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on a plate made of silica gel for thin-layer chromatography. Develop the plate with a mixture of 1-butanol, water and acetic acid(100) (3 : 1 : 1) to a distance of about 10 cm, and dry the plate at 80 °C for 30 minutes. Evenly spray a mixture of methanol in ninhydrin, and acetic acid(100) (97 : 3) (1 in 100) to this and heat at 80 ℃ for 10 minutes; the spots other than the principal spot from the test solution are not darker than the spot from the standard solution (NMT 0.2%).

Loss on drying NMT 0.3% (1 g, 105 °C, 3 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.15 g of Glutamine, dissolve in 3 mL of formic acid and 50 mL of acetic acid(100), and titrate with 0.1 mol/L of perchloric acid VS (potentiometric titration method under the Titrimetry). Separately, perform a blank test and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 14.615 mg of $C_5H_{10}N_2O_3$

Packaging and storage Preserve in tight containers.

Glutamine, Cyanocobalamin and DL-Phosphoserine Capsules
글루타민·시아노코발라민·DL-포스포세린 캡슐

Glutamine, Cyanocobalamin and DL-Phosphoserine Capsules contain NLT 90.0% and NMT 130.0% of Glutamine ($C_5H_{10}N_2O_3$: 146.15) and DL-phosphoserine ($C_3H_8NO_6P$: 185.08), and NLT 90.0% and NMT 150.0% of Cyanocobalamin ($C_{63}H_{88}CoN_{14}O_{14}P$: 1355.37).

Method of preparation Prepare as directed under Capsules, with Glutamine, Cyanocobalamin and DL-Phosphoserine.

Identification (1) ***Glutamine*—**Weigh the content of Glutamine, Cyanocobalamin and DL-Phosphoserine Capsules to the amount equivalent to 30 mg of glutamine according to the labeled amount, dissolve it in acetic acid(100) to make 20.0 mL, and filter it. Use the filtrate as the test solution. Separately, weigh accurately about 30 mg of glutamine RS, dissolve it in 10 mL of acetic acid(100) and use it as the standard solution. With the solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Then, develop the plate with a mixture of benzene, methanol, acetic acid(100) and acetone (70 : 20 : 5 : 5) to a distance of about 10 cm and air-dry the plate. Spray ninhydrin TS evenly onto the plate; the spots from the test solution and the standard solution are the same in the R_f value and color tone.

(2) ***DL-Phosphoserine*—**Weigh accurately the content of Glutamine, Cyanocobalamin and DL-Phosphoserine Capsules to the amount equivalent to about 30 mg of DL-Phosphoserine according to the labeled amount, mix it with 10 mL of water by shaking well, and filter it. Use the filtrate as the test solution. Separately, weigh accurately about 30 mg of DL-phosphoserine RS, dissolve it in 10 mL of water and use it as the standard solution. With the solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and the standard solution on the thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Then, develop the plate with a mixture of ammonia, ethanol and water (125 : 100 : 25) to a distance of about 10 cm and air-dry the plate. Spray ninhydrin TS evenly onto the plate; the spots from the test solution and the standard solution are the same in the R_f value and color.

(3) ***Cyanocobalamin*—**Perform the test with the content of Glutamine, Cyanocobalamin and DL-Phosphoserine Capsules as directed under the Analysis for Vitamins.

Disintegration Meets the requirements.

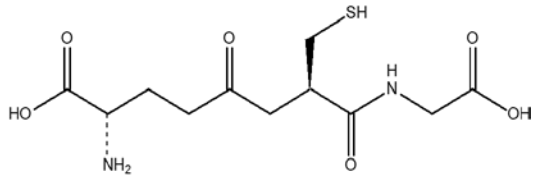
Uniformity of dosage units Meets the requirements.

Assay (1) ***Glutamine and DL-Phosphoserine*—**Weigh accurately the mass of the content of NLT 20 Glutamine, Cyanocobalamin and DL-Phosphoserine Capsules and perform the test as directed under the Identification and Assay for Amino Acids.

(2) ***Cyanocobalamin*—**Weigh accurately the mass of NLT 20 Glutamine, Cyanocobalamin and DL-Phosphoserine Capsules and perform the test as directed under the Analysis for Vitamins.

Packaging and storage Preserve in tight containers.

Glutathione (Reduced)
글루타티온(환원형)



$C_{10}H_{17}O_6N_3S$: 307.32
(2*S*)-2-Amino-4-[1-(carboxymethyl) carbamoyl-(2*R*)-2-sulfanylethylcarbamoyl]butanoic acid [*70-18-8*]

Glutathione (Reduced), when dried, contains NLT 98.0% and NMT 101.0% of glutathione ($C_{10}H_{17}O_6N_3S$).

Description Glutathione (Reduced) occurs as white crystals or a crystalline powder, with a characteristic odor and bitter taste.

Identification (1) Add 1 mL of ninhydrin TS to 5 mL of the aqueous solution (1 in 500) of Glutathione (Reduced) and heat; the solution appears bluish purple.

(2) Dry Glutathione (Reduced) and determine its absorption spectrum as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; it exhibits a maximum and a minimum at the same wavelength as in the RS.

Optical rotation $[\alpha]_D^{20}$: Between -15.5° and -17.5° (after drying, 2.0 g, water, 100 mL, 100 mm).

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Glutathione (Reduced) in 10 mL of water; the solution is clear and colorless.

(2) ***Heavy metals***—Proceed with 1.0 g of Glutathione (Reduced) according to Method 2 and perform the test. Prepare the control solution with 1.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Ammonium***—Proceed with 0.25 g of Glutathione (Reduced) according to the Ammonium and perform the test. Prepare the control solution with 5.0 mL of ammonium standard solution (NMT 0.020%).

(4) ***Sulfate***—Proceed with 0.5 g of Glutathione (Reduced) according to the Sulfate and perform the test. Prepare the control solution with 0.50 mL of 0.005 mol/L sulfuric acid VS (NMT 0.50%).

(5) ***Iron***—Place 1.0 g of Glutathione (Reduced) in a separatory funnel and dissolve in 10 mL of diluted hydrochloric acid. Shake 10 mL of each of methyl isobutyl ketone for 3 minutes. Repeat the above procedure 3 times. Take the organic solvent layer, add 10 mL of water to it and shake for 3 minutes. It meets the requirement, when the test is performed with the water layer according to Method A under the Iron (NMT 10 ppm).

(6) ***Arsenic***—Proceed with 2.0 g of Glutathione (Reduced) according to Method 1 under the Arsenic and perform the test (NMT 1 ppm).

(7) ***Related substances***—Weigh accurately 50 mg of Glutathione (Reduced), dissolve in 100 mL of the mobile phase, and use this solution as the test solution. Pipet 2 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following operation conditions, and determine the peak area of each solution according to the automatic integration method; the peak area for the test solution with the relative retention time to the glutathione of about 4 is not greater than 3/4 of the peak area of glutathione for the standard solution, and the sum of peak areas other than glutathione for the test solution is not greater than the peak area of glutathione for the standard solution.

Operating conditions

Detector: An Ultraviolet absorption spectrophotometer (wavelength: 210 nm).

Column: A stainless steel column of about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 30 °C.

Mobile phase: Dissolve 6.8 g of potassium dihydrogen phosphate and 2.02 g of sodium 1-heptanesulfonate in 980 mL of water and add phosphoric acid to adjust the pH to 3.0. Add water to make 1000 mL. To 970 mL of this solution, add 30 mL of methanol.

Flow rate: Adjust the flow rate to ensure that the retention time of glutathione is about 5 minutes.

Time span of measurement: About 6 times the retention time of glutathione after the solvent peak.

System suitability

Test for required detectability: Pipet 10 mL of the standard solution and add the mobile phase to make exactly 100 mL. Confirm that the peak area of glutathione obtained from 10 μL of this solution is equivalent to between 8 and 12% of the peak area of glutathione obtained from 10 μL of the standard solution.

System performance: Dissolve 50 mg of glutathione, 10 mg of D-phenylglycine and 50 mg of ascorbic acid in 100 mL of water, and proceed with 10 μL of this solution according to the above conditions; the ascorbic acid, glutathione and D-phenylglycine peaks are eluted in the mentioned order with the resolution of NLT 5.

System repeatability: Repeat the test 6 times with 10 μL of the standard solution according to the above conditions; the relative standard deviation of the peak areas of glutathione is NMT 1.5%.

Loss on drying NMT 0.50% (1.0 g, 105 ℃, 3 hours).

Residue on ignition 0.1% (2 g).

Assay Weigh accurately about 0.5 g of Glutathione (Reduced), previously dried, dissolve in 50 mL of water, and titrate with 0.05 mol/L iodine VS (indicator: 3 mL of starch solution TS).

Each mL of 0.05 mol/L iodine VS
= 30.73 mg of $C_{10}H_{17}O_6N_3S$

Packaging and storage Preserve in tight containers.

Glutathione for Injection
주사용 글루타티온

Glutathione for Injection, as an injection that is dissolved upon use, contains NLT 95.0% and NMT 105.0% of glutathione ($C_{10}H_{17}N_3O_6S$: 307.32).

Method of preparation Prepare as directed under Injections, with Glutathione (reduced).

Description Glutathione for Injection occurs as a white, porous solid material.

pH Between 6.0 and 7.5 (2% aqueous solution).

Identification (1) Add 1 mL of ninhydrin TS to 5 mL of the 0.2% aqueous solution of Glutathione for Injection and heat; the solution appears bluish purple.

(2) Add 10 mL of ethanol to Glutathione for Injection that is in the amount equivalent to about 0.1 g of

glutathione, shake for 5 minutes for mixing, and filter it. Wash the residue and container with 5 mL of ethanol 3 times, combine it with the filtrate, carefully evaporate this solution to dryness on a steam bath by passing the nitrogen gas, and dissolve it in 100 mL of water. To 5 mL of this solution, add 10 mL of pH 7.6 phosphate buffer and 10 mL of alloxan solution (1 in 500), mix by occasional shaking, and allow to stand for 10 minutes. Add 10 mL of 1 mol/L sodium hydroxide TS and 15 mL of water to this and determine the absorption spectrum of the solution as directed under the Ultraviolet-visible Spectroscopy; it exhibits maximum absorption between 303 nm and 307 nm.

Sterility Meets the requirements.

Bacterial endotoxins Less than 1.5 EU/mg per mg of glutathione.

Particulate contamination: Visible particles in injections and ophthalmic solutions Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately an amount equivalent to about 2.5 mg of glutathione ($C_{10}H_{17}N_3O_6S$) according to the labeled amount of Glutathione for Injection, dissolve it in 0.005 mol/L tetrabutylammonium salt solution (pH 7.0), sonicate to make 50 mL, and use this solution as the test solution. Separately, weigh accurately about 50 mg of glutathione RS and add 60 mL of 0.005 mol/L tetrabutylammonium salt solution (pH 7.0) to make exactly 100 mL. Take 5.0 mL of this solution, add 0.005 mol/L tetrabutylammonium salt solution (pH 7.0) to make exactly 50 mL and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution according to the following conditions under the Liquid Chromatography and determine the peak area, A_T and A_S, of glutathione in each solution.

$$\text{Amount of glutathione } (C_{10}H_{17}N_3O_6S) \text{ (mg)} = \text{Amount of glutathione RS (mg)} \times \frac{A_T}{A_S} \times \frac{1}{20}$$

Operating conditions

Detector: An Ultraviolet absorption spectrophotometer (wavelength: 215 nm).

Column: A stainless steel column of about 4 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: 0.005 mol/L tetrabutylammonium salt solution (pH 7.0).

Flow rate: 1.0 mL/min

Packaging and storage Preserve in well-closed containers.

Glutathione Tablets
글루타티온 정

Glutathione Tablets contain NLT 95.0% and NMT 105.0% of glutathione ($C_{10}H_{17}O_6N_3S$: 307.32).

Method of preparation Prepared as directed under Tablets, with Glutathione (reduced).

Identification (1) Weigh about 0.2 g of glutathione according to the labeled amount of Glutathione Tablets, add 100 mL of water, shake for 5 minutes to mix, and filter it. Add 1 mL of ninhydrin TS to 5 mL of the filtrate and heat; the solution appears bluish purple.

(2) Weigh about 0.1 g of glutathione according to the labeled amount of Glutathione Tablets, add 10 mL of ethanol, shake for 5 minutes to mix, and filter it. Wash the residue and container with 5 mL of ethanol 3 times, combine it with the filtrate, carefully evaporate this solution to dryness on a steam bath by passing the nitrogen gas, and dissolve it in 100 mL of water. To 5 mL of this solution, add 10 mL of phosphate buffer (pH 7.6) and 10 mL of alloxan solution (1 in 500), mix by occasional shaking, and allow to stand for 10 minutes. Add 10 mL of 1 mol/L sodium hydroxide TS and 15 mL of water to this and determine the absorption spectrum of the solution as directed under the Ultraviolet-visible Spectroscopy; it exhibits maximum absorption between 303 nm and 307 nm.

Disintegration Meets the requirements.

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 Glutathione Tablets and powder it. Weigh accurately the powder to the amount equivalent to about 2.5 mg of glutathione ($C_{10}H_{17}O_6N_3S$), dissolve it in 0.005 mol/L tetrabutylammonium salt solution (pH 7.0), sonicate to 50 mL, and use this solution as the test solution. Separately, weigh accurately about 50 mg of glutathione RS, dissolve it in about 60 mL of 0.005 mol/L tetrabutylammonium salt solution (pH 7.0) to make 100 mL, dilute it 10-fold, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution according to the following conditions under the Liquid Chromatography and determine the peak area, A_T and A_S, of glutathione in each solution.

$$\text{Amount (mg) of glutathione } (C_{10}H_{17}O_6N_3S) = \text{Amount (mg) of glutathione RS} \times \frac{A_T}{A_S} \times \frac{1}{20}$$

Operating conditions

Detector: An Ultraviolet absorption spectrophotometer (wavelength: 215 nm).

Column: A stainless steel column of about 4 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: 0.005 mol/L tetrabutylammonium phosphate solution (pH 7.0)

Flow rate: 1.0 mL/min

Packaging and storage Preserve in well-closed containers.

Glycerin
글리세린

Glycerol $C_3H_8O_3$: 92.09
Propane-1,2,3-triol [*56-81-5*]

Glycerin contains NLT 84.0% and NMT 87.0% of glycerol ($C_3H_8O_3$).

Description Glycerin occurs as a colorless, clear and viscous liquid with no odor and has a sweet taste.
It is miscible with water or ethanol.
It is hygroscopic.

Identification Perform the test as directed under the Identification of Concentrated Glycerin.

Refractive index n_D^{20}: Between 1.449 and 1.454.

Specific gravity d_{20}^{20}: Between 1.221 and 1.230.

Purity Perform the test as directed under the Purity of Concentrated Glycerin.

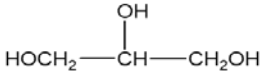
Water Between 13% and 17% (0.1 g, volumetric titration, direct titration).

Residue on ignition Perform the test as directed under the Residue on ignition of Concentrated Glycerin.

Assay Perform the test as directed under the Purity of Concentrated Glycerin.

Packaging and storage Preserve in tight containers.

Concentrated Glycerin
농글리세린



Concentrated Glycerol $C_3H_8O_3$: 92.09

Concentrated Glycerin contains NLT 98.0% and NMT 101.0% of glycerin ($C_3H_8O_3$), calculated on the anhydrous basis.

Description Concentrated Glycerin occurs as a colorless, clear and viscous liquid with a sweet taste.
It is miscible with water or ethanol(95).
It is hygroscopic.

Identification (1) Determine the absorption spectrum of Concentrated Glycerin and glycerin RS as directed under the liquid film method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) The retention time of glycerin obtained from the test solution in the Purity (10) is the same as that of glycerin obtained from the standard solution.

Refractive index n_D^{20}: NLT 1.470.

Specific gravity d_{20}^{20}: NLT1.258.

Purity (1) ***Color*—**Put 50 mL of this solution into a Nessler tube and observe it from above. The color of the solution is not darker than that of the control solution below.

Control solution—Put 0.40 mL of iron(III) chloride hexahydrate colorimetric stock solution into a Nessler tube and add water to make 50 mL.

(2) ***Acidity or alkalinity*—**Mix 2 mL of Concentrated Glycerin with 8 mL of water. The resulting solution is neutral.

(3) ***Chloride*—**Weigh 10.0 g of Concentrated Glycerin and perform the test. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid VS (NMT 0.001%).

(4) ***Sulfate*—**Weigh 10.0 g of Concentrated Glycerin and perform the test. Prepare the control solution with 0.40 mL of 0.005 mol/L sulfuric acid VS (NMT 0.002%).

(5) ***Ammonium*—**Add 5 mL of sodium hydroxide VS (1 in 10) to 5 mL of Concentrated Glycerin, and boil it. The evolving gas does not change the moistened red litmus paper to blue.

(6) ***Heavy metals*—**Weigh 5.0 g of Concentrated Glycerin and perform the test according to Method 1. Prepare the control solution with 2.5 mL of lead standard solution (NMT 5 ppm).

(7) ***Calcium*—**Add 3 drops of ammonium oxalate TS to 5 mL of the (2) solution; the resulting solution does not change.

(8) ***Arsenic*—**Weigh 1.0 g of Concentrated Glycerin and perform the test according to Method 1 (NMT 2 ppm).

(9) ***Acrolein, glucose or other reducing substances*—**Mix 1.0 g of Concentrated Glycerin with 1 mL of ammonia TS and warmed at 60 °C on a steam bath for 5 minutes; the resulting solution does not exhibit yellow. In

addition, add 3 drops of silver nitrate TS immediately after taking it out of the water bath, and allow to stand in the dark for 5 minutes. The resulting solution does not change color or become turbid.

(10) ***Ethylene glycol and diethylene glycol—***Weigh accurately an appropriate amount of Concentrated Glycerin and the internal standard, dissolve by adding methanol, and prepare a solution containing 50 mg of glycerin and 0.10 mg of the internal standard in 1 mL, Use this solution as the test solution. Separately, weigh appropriate amounts of each of glycerin RS, ethylene glycol RS, diethylene glycol RS and internal standard, dissolve in methanol, and prepare a solution containing 2.0 mg, 0.050 mg, 0.050 mg and 0.10 mg of the respective RS and internal standard in 1 mL. Use these solutions as standard solutions. Measure the peak area of each of the solutions by the automatic integration method with 1.0 μL of the test solution and test solution, respectively. The peak area ratio for the internal standard of diethylene glycol obtained from the test solution is not greater than the peak area ratio for the internal standard of diethylene glycol obtained from the standard solution (0.10%), and the peak area ratio for the internal standard of ethylene glycol obtained from the test solution is not greater than the peak area ratio for the internal standard of ethylene glycol obtained from the standard solution (0.10%).

Internal standard—2,2,2-trichloroethanol

Operating conditions

Detector: Flame ionization detector

Column: Coat the inside of a quartz glass column 0.53 mm in internal diameter and about 30 m in length with 3.0 μm thick cyanopropylphenyl dimethylpolysiloxane for gas chromatography (6:94).

Column temperature: Maintain the temperature at 100 °C for 4 minutes, then raise to 120 °C at a rate of 50 °C per minute, and maintain it for 10 minutes. Raise the temperature again to 220 °C at a rate of 50 °C per minute and maintain it at 220 °C for 6 minutes.

Sample injection port temperature: A constant temperature of about 220 °C.

Detector temperature: A constant temperature of about 250 °C.

Carrier gas: Helium

Flow rate: 4.5 mL/min

Split ratio: About 1:10.

System suitability

System performance: Perform the test under the above conditions with 1 μL of the standard solution; the resolution of diethylene glycol and glycerin is NLT 1.5. The relative retention time is 0.3 for ethylene glycol, 0.6 for 2,2,2-trichloroethanol (95), 0.8 for diethylene glycol and 1.0 for glycerin.

(11) ***Related substance—***Weigh accurately an appropriate amount of Concentrated Glycerin and dissolve in water to make a solution containing 50 mg of glycerin in 1 mL, and use this solution as the test solution. Perform the test according to the Gas Chromatography with 0.5 μL of the test solution under the following conditions, and measure the amount of related substances. The amount of each related substance is NMT 0.1% and the total amount of related substances is NMT 1.0%.

$$\text{Amount of related substances (\%)} = \frac{A_i}{A_S} \times 100$$

A_i: Peak area of each related substance obtained from the test solution (except for solvent and diethylene glycol peaks)

A_S: Sum area of all peaks obtained from the test solution

Operating Conditions

Detector: Flame ionization detector

Column: Coat the inside of a quartz glass column 0.53 mm in internal diameter and about 30 m in length with 3.0 μm thick cyanopropylphenyl dimethylpolysiloxane for gas chromatography (6:94).

Column temperature: Maintain a constant temperature of about 100 °C until injection, raise the temperature at a rate of 7.5 °C per minute until it reaches 220 °C, and keep the temperature for 4 minutes.

Sample injection port temperature: A constant temperature of about 220 °C.

Detector temperature: A constant temperature of about 250 °C.

Carrier gas: Helium

Flow rate: 38 cm/sec

Split ratio: About 1:10.

System suitability

System performance: Weigh accurately appropriate amounts of diethylene glycol RS and glycerin RS and dissolve in water to make a solution containing 0.5 mg of each RS in 1 mL, and use this solution as the system suitability solution. Perform the test with 0.5 μL of this solution under the above conditions; the resolution of diethylene glycol and glycerin is NLT 7.0.

(12) ***Chlorine compounds—***Weigh accurately about 5 g of glycerin, put it in a dry 100 mL round-bottom flask, add 15 mL of morpholine, connect the flask to a reflux condenser, and reflux quietly for 3 hours. Rinse the condenser with 10 mL of water, add the washings to the flask, and carefully acidify it with nitric acid. Put this solution in an appropriate colorimetric tube, add 0.50 mL of silver nitrate TS and water to make 50.0 mL, mix, and use this solution as the test solution. Separately, take 0.20 mL of 0.020 mol/L hydrochloric acid, omit the reflux procedure, proceed in the same manner as the test solution, and use this solution as the control solution. The turbidity of the test solution is not thicker than that of the control solution (NMT 0.003%).

(13) ***Fatty acid or fatty acid ester—***To 50 g of Concentrated Glycerin, exactly add 50 mL of freshly boiled and cooled water and 10 mL of 0.1 mol/L sodium hydroxide VS, boil for 15 minutes, cool, and then titrate the

excess sodium hydroxide with 0.1 mol/L hydrochloric acid. The consumption of 0.1 mol/L sodium hydroxide VS is NMT 3.0 mL (indicator: 3 drops of phenolphthalein TS). Perform a blank test in the same manner.

(14) ***Sulfuric acid for readily carbonizable substances***—Carefully add 5mL of sulfuric acid for readily carbonizable substances test to 5mL of Concentrated Glycerin, mix slowly at 18 – 20 ℃ and allow to stand at ordinary temperature for 1 hour. The color of the solution is not darker than that of the matching fluid H.

Water NMT 2.0% (6 g, volumetric titration, direct titration).

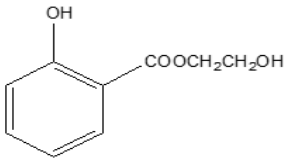
Residue on ignition Weigh accurately about 10 g of Concentrated Glycerin by putting in the crucible, heat to boiling, ignite immediately after boiling, and cool it down. Moisten the residue with 1 - 2 drops of sulfuric acid, and carefully ignite it until it reaches a constant weight. The remaining amount is NMT 0.01%.

Assay Weigh accurately about 0.2 g of Concentrated Glycerin, put it in an Erlenmeyer flask, and add 50 mL of water to mix. Add exactly 50 mL of sodium periodate TS, shake to mix, and allow to stand in a dark place at room temperature for about 30 minutes. Add 10 mL of a mixture of water and ethylene glycol (1:1) to this solution, allow to stand for about 20 minutes, put 100 mL of water, and titrate with 0.1 mol/L sodium hydroxide VS (indicator: 2 drops of phenolphthalein TS). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS
= 9.209 mg of $C_3H_8O_3$

Packaging and storage Preserve in tight containers.

Glycol Salicylate
살리실산글리콜



$C_9H_{10}O_4$: 182.17
2-Hydroxybenxoic acid 2-hydroxy ethyl ester, [*87-28-5*]

Glycol Salicylate contains NLT 98.5% and NMT 101.0% of glycol salicylate ($C_9H_{10}O_4$), calculated on the anhydrous basis.

Description Glycol Salicylate occurs as a colorless, transparent and viscous liquid.
It is odorless.
It is miscible with methanol, ethanol(95), ether, or chloroform.
It is practically insoluble in water.

Identification (1) Add a drop of Glycol Salicylate to 5 mL of water, shake well to mix for 1 minute, and add a drop of ferric chloride TS; the resulting solution shows a purple color.

(2) Dissolve about 3 drops of Glycol Salicylate in 5 mL of methanol, add 0.5 mL of hydroxylamine TS and 0.4 mL of potassium hydroxide-ethanol TS, and heat on a steam bath until boiling. After cooling, add 0.7 mL of 2 mol/L hydrochloric acid TS to the resulting solution to make it acid, and add a drop of ferric chloride TS; the solution shows a purple color.

(3) Dissolve about 3 drops of Glycol Salicylate in 5 mL of methanol and 0.4 mL of potassium hydroxide-ethanol TS and heat on a steam bath until boiling. After cooling, neutralize it with 0.7 mL of dilute sulfuric acid. Add 10 mL of potassium periodate TS and 1 drop of nitric acid to the resulting solution, shake well to mix, and filter it. Add 1 to 2 drops of silver nitrate TS to the filtrate; a white precipitate is formed immediately.

(4) Determine the absorption spectrum of a solution of Glycol Salicylate in methanol (3 in 250000) as directed under the Ultraviolet-visible Spectroscopy; it exhibits maxima between 235 nm and 239 nm and between 304 nm and 308 nm.

Refractive index n_D^{20}: Between 1.546 and 1.550.

Specific gravity d_{20}^{20}: Between 1.240 and 1.255.

Purity (1) ***Acidity***—To 5.0 mL of Glycol Salicylate, add 25 mL of freshly boiled and cooled water and 1.0 mL of 0.1 mol/L sodium hydroxide solution, and shake well to mix for 1 minute. Add 2 drops of phenol red TS, and titrate the resulting solution with 0.1 mol/L hydrochloric acid VS until the red color of the solution turns to yellow (NMT 0.45 mL of 0.1 mol/L sodium hydroxide consumed).

(2) ***Heavy metals***—Proceed with 2.0 g of Glycol Salicylate according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Related substances***—Dissolve 0.1 g of Glycol Salicylate in 100 mL of ethanol(95) and use this solution as the test solution. Pipet 1 mL of the resulting solution, add ethanol(95) to make 50 mL, and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on the plate made of silica gel for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate and n-hexane (27 : 20) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Allow the plate to stand for 2 hours in a container full of iodine vapor; the spots other than the principal spot obtained from the test solution are not more intense than the spots from the standard solution.

Water NMT 0.20% (5 g).

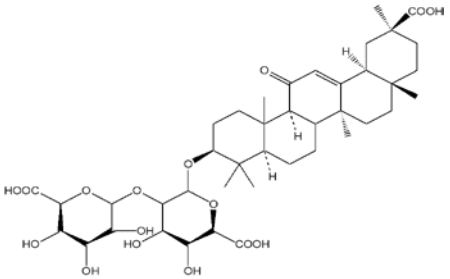
Residue on ignition NMT 0.1% (1.0 g).

Assay Weigh accurately about 2 g of Glycol Salicylate, add 50.0 mL of 0.5 mol/L potassium hydroxide-ethanol, and heat on a steam bath for 90 minutes under a reflux condenser. After cooling, titrate the resulting solution with 0.5 mol/L hydrochloric acid VS (indicator: 3 drops of phenolphthalein TS). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.5 mol/L potassium hydroxide-ethanol VS
= 91.085 mg of $C_9H_{10}O_4$

Packaging and storage Preserve in tight containers.

Glycyrrhizic Acid
글리시리진산



$C_{42}H_{62}O_{16}$: 822.93
(3β,20β)-20-Carboxy-11-oxo-30-norolean-12-en-3-yl-2-*O*-β-D-glucopyranuronosyl-α-D-glucopyranosiduronic acid, [*1405-86-3*]

Glycyrrhizic Acid, when dried, contains NLT 98.0% and NMT 101.0% of glycyrrhizic acid ($C_{42}H_{62}O_{16}$: 822.93).

Description Glycyrrhizic Acid occurs as a white crystalline or crystalline powder with a sweet taste.
It is practically insoluble in ethanol(95) and practically insoluble in chloroform or ether.

Melting point—Between 219 and 230 °C.

Identification Dissolve 0.2 g of Glycyrrhizic Acid in 5 mL of water and 3 mL of hydrochloric acid, and add 2 to 3 drops of 2,4-dinitrophenylhydrazine TS; an orange or reddish orange precipitate forms upon boiling on a steam bath.

Purity (1) ***Clarity and color of solution***—Dissolve 0.5 g of Glycyrrhizic Acid in 10 mL of ethanol(95); the solution appears almost colorless, clear, or slightly yellow.

(2) ***Heavy metals***—Proceed with the residue obtained from the Residue on Ignition and perform the test according to Method 1. Prepare the control solution with 1.0 mL of the lead standard solution (NMT 10 ppm).

(3) ***Arsenic***—Proceed with 1.0 g of Glycyrrhizic Acid and perform the test according to Method 4 (NMT 4 ppm).

Loss on drying NMT 6.0% (1 g, 105 ℃, 4 hours).

Residue on ignition NMT 0.1% (1 g).

Assay After drying Glycyrrhizic Acid and glycyrrhizic acid RS under reduced pressure in a vacuum desiccator at 80 ℃ for 15 hours, weigh accurately about 20 mg and dissolve it by 50% to make exactly 100 mL. Pipet 10 mL of this solution, add 50% ethanol to make 25 mL, and use this as the test solution and standard solution. Perform the test using the test solution and the standard solution according to the Ultraviolet-visible Spectroscopy, and measure the absorbance A_T and A_S at a wavelength of 252 nm.

Amount of glycyrrhizic acid ($C_{42}H_{62}O_{16}$) (mg)
= Amount of glycyrrhizic Acid RS (mg) × (A_T / A_S)

Packaging and storage Preserve in tight containers.

Gramicidin
그라미시딘

[*1405-97-6*]

Gramicidin is a mixture of peptide compounds with antibacterial activity, which is obtained by culturing *Bacillus brevis Dubos*.

Gramicidin contains NLT 900 μg (potency) per mg of gramicidin, calculated on the dried basis.

Description Gramicidin occurs as a white to pale yellow crystalline powder.
It is freely soluble in methanol, ethanol(99.5) and practically insoluble in water.

Identification (1) To 10 mg of gramicidin, add 2 mL of 6 mol/L hydrochloric acid TS and heat on a steam bath for 30 minutes while shaking occasionally. After cooling, neutralize with 6 mol/L sodium hydroxide TS, add 1 mL of ninhydrin-acetic acid TS and 0.5 mL of pyridine, and heat for 2 minutes; the resulting solution turns bluish violet to purple.

(2) Determine the absorption spectra of solutions of Gramicidin and gramicidin RS in methanol (1 in 20000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

Crystallinity Meets the requirements.

Melting point NLT 229 ℃ (after drying).

Loss on drying NMT 3.0% (0.1 g, in vacuum, 60 ℃, 3

hours).

Ignition residue NMT 1.0% (1 g).

Assay ***Turbidmetry***—(1) Medium: (i) Agar medium for transferring test organisms.

Peptone, casein	5.0 g
Monobasic potassium phosphate	2.0 g
Yeast extract	20.0 g
Polysorbate 80	0.1 g
Glucose	10.0 g
Agar	15.0 g

Weigh the above, mix all the components, add purified water to make 1000 mL, sterilize, and adjust the pH to 6.7 - 6.8.

(ii) Liquid medium for suspending the test organism: Use the culture medium described in (iii) (2) (ii) under the Microbial Assays for Antibiotics.

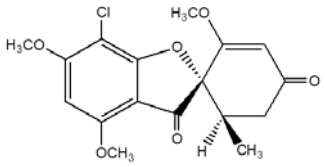
(2) Test organism and preparation of test organism suspension: Use *Enterococcus hirae* ATCC 10541 as the test organism. Stab-culture the test organism in an agar medium made deep enough for transferring the test organism, subculture NLT 3 times at 36.5 - 37.5 ℃ for 20 to 24 hours, and keep at 1 - 5 ℃. Transfer this organism into 10 mL of the liquid medium for suspending the test organism and incubate at 36.5 - 37.5 ° C for 20 to 24 hours, and use this as the stock suspension. Before use, add the liquid medium for suspending the test organism to this stock suspension so that the transmittance becomes 50 - 60% at the wavelength of 580 nm, and to 1 mL of this solution, add 200 mL of the liquid medium for suspending the test organism to prepare the test suspension.

(3) Weigh accurately an appropriate amount of Gramicidin equivalent to about 10 mg (potency) of Gramicidin and dissolve it in ethanol(99.5) to make exactly 100 mL. Take an appropriate amount of this solution and dilute it with a solvent so that each mL contains 0.02 μg (potency), and use this solution as the test solution. Separately, weigh accurately an appropriate amount of gramicidin RS (previously dried at 60 ° C for 3 hours in vacuum at a pressure not exceeding 0.67 kPa), equivalent to about 10 mg (potency) of Gramicidin and dissolve it in ethanol(99.5) to make exactly 100 mL, and use it as the standard stock solution. Keep the standard solution at a temperature not exceeding 5 °C and use it within 30 days. Before use, take a suitable amount of this solution and dilute it with a solvent so that each mL contains 0.02 μg (potency), and use this solution as the standard solution. Take 0.155 mL, 0.125 mL, 0.100 mL, 0.080 mL, 0.065 mL of the standard solution, 0.100 mL of the test solution, and 0.100 mL of the solvent for dilution, put them into test tubes, add 10 mL of the test suspension to each test tube, and stopper the test tubes. Then, incubate them at 37.5 ° C for 180 to 270 minutes and add 0.5 mL of formaldehyde solution (1 in 3) to each test tube. Perform the test according to (C) (6) under the Microbial Assays for Antibiotics. In this case, use the wavelength of 530 nm for measurement.

Diluted solvent—Add 210 mL of a mixture of ethanol(99.5) and acetone (9 : 1) to 390 mL of propylene glycol, and put distilled water to make 1000 mL.

Packaging and storage Preserve in tight containers.

Griseofulvin
그리세오풀빈



$C_{17}H_{17}ClO_6$: 352.77

(1′*S*,6′*R*)-7-Chloro-2',4,6-trimethoxy-6'-methyl-3*H*-spiro[benzofuran-2,1'-cyclohex[2]ene]-3,4'-dione [*126-07-8*]

Griseofulvin is a compound with an antifungal activity, which is obtained by culturing *Penicillium griseofulvum* or *Penicillium janczewskii*.

Griseofulvin contains NLT 960 μg and NMT 1020 μg (potency) of griseofulvin ($C_{17}H_{17}ClO_6$) per mg, calculated on the dried basis.

Description Griseofulvin occurs as white crystals or a crystalline powder.
It is soluble in *N*,*N*-dimethylformamide, sparingly soluble in acetone, slightly soluble in methanol or ethanol(95) and practically insoluble in water.

Identification (1) Determine the absorption spectra of Griseofulvin and griseofulvin RS in ethanol(95) solution (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Griseofulvin and griseofulvin RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Crystallinity Meets the requirements.

Optical rotation $[\alpha]_D^{25}$: Between +350° and +364° (0.25 g, calculated on the dried basis, 25 mL of *N*,*N*-dimethylformamide, 200 mm).

Melting point Between 218 and 222 ℃.

Purity (1) ***Acid***—Dissolve about 0.25 g of Griseofulvin in 20 mL of neutralized ethanol, and add 2 drops of phenolphthalein TS and 1.0 mL of 0.02 mol/L sodium hydroxide solution; the resulting solution exhibits red.

(2) ***Heavy metal***—Proceed with 1.0 g of Griseoful-

vin according to Method 2 and perform the test. Prepare the control solution with 2.5 mL of lead standard solution (NMT 25 ppm).

(3) ***Arsenic***—Prepare the test solution with 1.0 g of Griseofulvin according to Method 3 and perform the test. (NMT 2 ppm).

(4) ***Petroleum ether soluble body***—Add about 1.0 g of Griseofulvin to 20 mL of petroleum ether, shake to mix, and boil for 10 minutes with a reflux condenser. After cooling, filter with a dry filter paper, wash the filter paper twice with 15 mL of petroleum ether each time, combine the filtrate and the solution used for washing, transfer the combined solution on a steam bath to evaporate petroleum ether, and dry the residue at 105 ° C for 1 hour; the residue is NMT 0.2%.

(5) ***Related substances***—Add exactly 1 mL of internal standard solution to about 0.10 g of Griseofulvin, dissolve in acetone to make exactly 10 mL, and use this solution as the test solution. Separately, weigh accurately 5.0 mg of griseofulvin RS, add 1 mL of internal standard solution, dissolve in acetone to make 10 mL, and use this solution as the standard solution. Perform the test with 2 μL each of the test solution and the standard solution as directed under the Gas Chromatography according to the following conditions, measure the peak area of each solution according to the automatic integration method, and determine Q_1, which is the ratio of the peak area of dechlorogriseofulvin to that of the internal standard from the test solution, Q_2, which is the ratio of the peak area of dechlorogriseofulvin to that of the internal standard from the standard solution, and Q_S, which is the ratio of the peak area of Griseofulvin to that of the internal standard from the standard solution: Q_1/Q_S is NMT 0.6 (NMT 3.0%) and Q_2/Q_S is NMT 0.15 (NMT 0.75%).

Internal standard solution—9,10-diphenylanthracene solution in acetone (1 in 500).

Operating conditions

Detector: A flame ionization detector

Column: A glass column about 4 mm in internal diameter and about 1 m in length, packed with 25% phenyl - 25% cyanopropylmethyl silicone polymer for gas chromatography coated with 150 μm to 180 μm diatomaceous earth for gas chromatography at a rate of 1%.

Column temperature: A constant temperature of about 250 °C.

Sample injection port temperature: A constant temperature of about 270 °C.

Detector temperature: A constant temperature of about 300 °C.

Carrier gas: Nitrogen

Flow rate: Adjust the flow rate so that the retention time of Griseofulvin is about 10 minutes.

System suitability

Test for required detectability: Take exactly 1 mL of the standard solution and add the acetone solution (1 in 10) of the internal standard solution to make exactly 10 mL. Confirm that the ratio of the peak area of Griseofulvin to that of the internal standard substance obtained from 2 μL of this solution is equivalent to 7 to 13% of the ratio of the peak area of Griseofulvin to that of the internal standard substance obtained from 2 mL of the standard solution.

System performance: Proceed with 2 μL of the standard solution under the above conditions; the internal standard and Griseofulvin are eluted in this order with the resolution between these peaks being NLT 5.

System reproducibility: Repeat the test 6 times with 2 μL each of the standard solutions under the above conditions; the relative standard deviation of the ratio of the peak area of Griseofulvin to that of the internal standard is NMT 5.0%.

Relative retention time: The relative retention times of dechlorogriseofulvin and dehydrogriseofulvin relative to griseofulvin are about 0.6 and 1.2, respectively.

Abnormal toxicity Dissolve 0.1 g of Griseofulvin in 0.5 mL to 1 mL of distilled water and administer orally to 5 healthy mice weighing 17 to 22 g. Use animals in which no abnormalities are observed for NLT 5 days prior to the test. No animal dies during the 48-hour post-dosage observation. If one animal dies, repeat the test with 5 animals; no animal dies during the 24-hour post-dosage observation.

Loss on drying NMT 1.0% (1.0 g, in vacuum at the pressure not exceeding·0.67 kPa, 60 °C, 3 hours).

Residue on ignition NMT 0.2% (1 g).

Assay Weigh accurately about 50 mg (potency) each of Griseofulvin and griseofulvin RS, dissolve in 50 mL of *N*,*N*-dimethylformamide, add exactly 20 mL of the internal standard solution to each, and add water to make exactly 250 mL. Use these solutions as the test solution and the standard solution. Perform the test with 10 μL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the ratio of the peak area of Griseofulvin to that of the internal standard, Q_T and Q_S.

$$\text{Potency (μg) of griseofulvin } (C_{17}H_{17}ClO_6) = \text{Potency (μg) of griseofulvin RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of butylparaben in acetonitrile (1 in 400).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 μm in particle diameter).

Column temperature: A constant temperature of

about 25 °C.

Mobile phase: A mixture of water and acetonitrile (3 : 2).

Flow rate: Adjust the flow rate so that the retention time of Griseofulvin is about 6 minutes.

System suitability

System performance: Proceed with 10 μL of the standard solution under the above conditions; Griseofulvin and the internal standard are eluted in this order with the resolution between these peaks being NLT 4.

System reproducibility: Repeat the test 6 times with 10 μL of the standard solution under the above conditions; the relative standard deviation of the ratio of the peak area of Griseofulvin to that of the internal standard is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Griseofulvin Tablets
그리세오풀빈 정

Griseofulvin Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of griseofulvin ($C_{17}H_{17}ClO_6$: 352.77).

Method of preparation Prepare as directed under Tablets, with Griseofulvin.

Identification Powder Griseofulvin Tablets, weigh an appropriate amount, equivalent to 15 mg (potency) of griseofulvin, according to the labeled amount, add 100 mL of ethanol(95), vigorously shake to mix, and filter. Add ethanol(95) to 1 mL of the filtrate to make 10 mL. Determine the absorption spectrum of this solution as directed under the Ultraviolet-visible Spectroscopy; it exhibits maxima between 250 nm and 254 nm, between 255 nm and 259 nm, and between 261 nm and 265 nm.

Loss on drying NMT 5.0% (0.1 g (as very fine powder), 0.7 kPa, 60 ℃, 3 hours).

Dissolution Perform the test with 1 tablet of Griseofulvin Tablets at 75 revolutions per minute according to Method 2 under the Dissolution using 1000 mL of a solution containing 40.0 mg of sodium lauryl sulfate per mL. Take the dissolved solution after 90 minutes from the start of the test and filter. Discard the first 10 mL of the filtrate, take exactly *V* mL of the subsequent filtrate, add methanol-water (4 : 1) solution to make exactly *V ′* mL, and use this solution as the test solution. Separately, weigh accurately an appropriate amount of griseofulvin RS, dissolve in the dissolution medium, make it as the same concentration as the test solution, and use this solution as the standard solution. Perform the test with the test solution and the standard solution using the dissolution medium as the control as directed under the Liquid Chromatography and determine absorption A_T and A_S at the absorbance maximum wavelength around 291 nm. It meets the requirements when the dissolution rate in 90 minutes is NLT 75% (Q).

Dissolution rate (%) with respect to the labeled amount of griseofulvin ($C_{17}H_{17}ClO_6$)

$$= Cs \times \frac{A_T}{A_S} \times \frac{V'}{V} \times \frac{1}{C} \times 100000$$

Cs: Concentration [mg (potency)/mL] of the standard solution

C: Labeled amount [mg (potency)] of griseofulvin ($C_{17}H_{17}ClO_6$) in 1 tablet

Uniformity of dosage units It meets the requirements when the procedure for content uniformity is performed according to the following method. Take 1 tablet of Griseofulvin Tablets, add *V*/5 mL of water to disintegrate using ultrasonic wave, add 50 mL of *N*,*N*-dimethylformamide to 5*V*/8 mL, shake vigorously for 20 minutes, add *N*,*N*-dimethylformamide to make *V* mL of a solution containing exactly 1.25 mg (potency) of griseofulvin in each mL, and centrifuge. Take exactly 8 mL of the supernatant, add exactly 20 mL of the internal standard solution, add water to make 100 mL, and filter through a membrane filter with a pore size of NMT 0.5 μm. Discard the first 5 mL of the filtrate and use the subsequent filtrate as the test solution. Hereinafter, proceed as directed under the Assay.

Amount [mg (potency)] of griseofulvin ($C_{17}H_{17}ClO_6$)

$$= Ws \times \frac{Q_T}{Q_S} \times \frac{V}{32}$$

W_S: Amount [mg (potency)] of Griseofulvin RS

Internal standard solution—A solution of butylparaben in acetonitrile (1 in 2000).

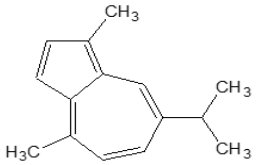
Assay Weigh accurately NLT 20 Griseofulvin Tablets and powder them. Weigh accurately an appropriate amount, equivalent to about 0.5 g (potency) of griseofulvin, according to the labeled potency, add water, sonicate, and add 100 mL of *N*,*N*-dimethylformamide. Then shake the resulting solution vigorously for 20 minutes, add *N*,*N*-dimethylformamide to make exactly 250 mL, and filter. Take exactly 5 mL of this filtrate, add exactly 20 mL of internal standard solution, add water to make exactly 100 mL, and filter through a membrane filter with a pore size of NMT 0.5 μm. Discard the first 5 mL of the filtrate and use the subsequent filtrate as the test solution. Separately, weigh accurately about 40 mg (potency) of griseofulvin RS and dissolve in *N*,*N*-dimethylformamide to make exactly 20 mL. Take exactly 5 mL of this solution, add exactly 20 mL of the internal standard solution, add water to make exactly 100 mL, and use this solution as the standard solution. Hereinafter, proceed as directed under the Assay of Griseofulvin.

Potency (μg) of griseofulvin ($C_{17}H_{17}ClO_6$)
= Potency (μg) of griseofulvin RS $\times \frac{Q_T}{Q_S} \times \frac{25}{2}$

Internal standard solution—A solution of butylparaben in acetonitrile (1 in 2000).

Packaging and storage Preserve in tight containers.

Guaiazulene
구아야줄렌



$C_{15}H_{18}$: 198.30
1,4-Dimethyl-7-(1-methylethyl)azulene; 7-Isopropyl-1,4-dimethylazulene, [*489-84-9*]

Guaiazulene contains NLT 97.0% and NMT 102.5% of guaiazulene ($C_{15}H_{18}$), calculated on the anhydrous basis.

Description Guaiazulene is dark blue crystals and liquids. It has a slight characteristic odor.
It is freely soluble in ethanol, ether and chloroform, sparingly soluble in petroleum benzene and practically insoluble in water.
It is gradually decomposes by light.

Identification (1) Dissolve about 0.1 g of Guaiazulene in 10 mL of ethanol, add 6 mL of ethanol solution of picric acid (1 in 50) (1 in 50) of picric acid, concentrate by evaporation on a steam bath, and allow to stand. Filter the created bluish purple crystals, wash with a small amount of ethanol, and dry in a desiccator (in vacuum, silica gel) for 2 hours; the melting point is NLT 121 ℃ and NMT 125 ℃ (with decomposition).

(2) Determine the absorption spectrum of petroleum benzene solution of Guaiazulene (1 in 2000) as directed under the Ultraviolet-visible Spectroscopy; it exhibits maximum between 604 nm and 608 nm.

Melting point Between 29 and 32 ℃ (Method 2).

Purity (1) ***Heavy metals***—Proceed with about 1.0 g of Guaiazulene according to Method 2 and perform the test. Add 2.0 mL of lead standard solution in the control solution (NMT 20 ppm).

(2) ***Arsenic***—Prepare the test solution with 1.0 g of Guaiazulene according to Method 3 and perform the test (NMT 2 ppm).

(3) ***Related substances***—Weigh 0.2 g of Guaiazulene, dissolve in ether to make 5.0 mL, and use this solution as the test solution. Proceed with 3 μL of the test solution and perform the test as directed under the Gas Chromatography according to the following conditions, and measure the peak area as directed in the automatic integration method; the sum of peak area other than the solvent and major peak is NMT 2% for the major peak area.

Operating conditions

Detector: A flame-ionization detector (FID)

Column: A stainless steel column with an inside diameter of about 3 mm to 4 mm and a length of about 1.5 m, filled with diatomaceous earth for gas chromatography (177 to 250 μm) coated with 5% polyethylene glycol 6000.

Column temperature: A constant temperature of about 180 °C.

Carrier gas: Nitrogen

Flow rate: Adjust the flow rate of nitrogen so that the peak of Guaiazulene shows about 17 minutes.

Detection sensitivity: Adjust the sensitivity so that the peak height of Guaiazulene chromatogram measured with diluted test solution (1 in 100) is about 1/2 of the total marking of the data collection device.

Water NMT 0.5% (2 g, volumetric titration, direct titration).

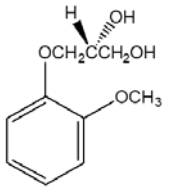
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 20 mg of Guaiazulene, dissolve in ethanol to make 100 mL. Determine the absorbance *A* of this solution at a wavelength 605 nm with ethanol as a contrast as directed under the Ultraviolet-visible Spectroscopy.

Amount (mg) of guaiazulene ($C_{15}H_{18}$)
$= \frac{A}{22.10} \times 1000$

Packaging and storage Preserve in light-resistant, tight containers.

Guaifenesin
구아이페네신



and enantiomer

Guaiacol Glyceryl Ether $C_{10}H_{14}O_4$: 198.22
(*RS*)-3-(2-Methoxyphenoxy)propane-1,2-diol [*93-14-1*]

Guaifenesin, when dried, contains NLT 98.0% and NMT 102.0% of guaifenesin ($C_{10}H_{14}O_4$).

Description Guaifenesin occurs as white crystals or a crystalline powder.
It is freely soluble in hot water or ethanol(95), soluble in chloroform, sparingly soluble in water and slightly soluble in ether.
Its solution in ethanol(95) (1 in 20) shows no optical rotation.

Identification (1) Pipet 5 mL of Guaifenesin, add 1 mL of formaldehyde solution-sulfuric acid TS; a purple color develops.

(2) Determine the absorption spectra of solutions of Guaifenesin and guaifenesin RS (1 in 50000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared spectra of Guaifenesin and guaifenesin RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Melting point Between 80 and 83 °C.

pH The pH of a solution obtained by dissolving 1.0 g of Guaifenesin in 100 mL of water is between 5.0 and 7.0.

Purity (1) ***Solubilized state***—Dissolve about 0.20 g of Guaifenesin in 10 mL of water; the solution is clear and colorless.

(2) ***Chloride***—Weigh about 0.7 g of Guaifenesin, dissolve in 25 mL of water, and warm the solution. After cooling it down, add 6 mL of dilute nitric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 0.40 mL of 0.01 mol/L hydrochloric acid (NMT 0.020%).

(3) ***Heavy metals***—Weigh about 2.0 g of Guaifenesin, dissolve in 25 mL of water, and warm the solution. After cooling it down, add 2 mL of dilute acetic acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(4) ***Arsenic***—Proceed with 1.0 g of Guaifenesin according to Method 3 and perform the test (NMT 2 ppm).

(5) ***Free guaiacol***—Weigh 1.0 g of Guaifenesin, add exactly 25 mL of water, dissolve by waring, and cool. Use this solution as the test solution. Separately, dissolve 0.10 g of guaiacol in water to make exactly 1000 mL. Pipet 3 mL of the solution, add water to make exactly 25 mL, and use this solution as the standard solution. Add 1.0 mL of Potassium hexacyanoferrate trihydrate(III) TS and 5.0 mL of aminoantipyrine VS (1 in 200) respectively and mix by shaking for exactly 5 seconds. Add sodium bicarbonate VS (1 in 1200) to make exactly 100 mL. Determine the absorbances of the test solution and the standard solution at wavelength 500 nm exactly 15 minutes after adding 4-aminoantipyrine VS as directed under the Ultraviolet-visible Spectroscopy, using a solution prepared in the same manner with 25 mL of water as the control solution; the absorbance of the solution obtained from the test solution is not greater than that from the standard solution.

(6) ***Related substances***—Dissolve 1.0 g of Guaifenesin in 100 mL of ethanol(95) and use this solution as the test solution. Pipet 1 mL of the solution, add water to make exactly 200 mL, and use this solution as the standard solution. With the solutions, perform the test as directed under the Thin Layer Chromatography. Spot 10 μL each of the test and the standard solutions on a thin-layer chromatographic plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of ether, ethanol(95) and ammonia water(28) (40 : 10 : 1) to a distance of about 10 cm and air-dry the plate. Spray evenly 4-dimethylaminobenzaldehyde TS for spray on the plate and heat the plate at 110 ℃ for 10 minutes; the spots other than the main spot from the test solution are not more concentrated than the spot from the standard solution.

Loss on drying NMT 0.5% (1 g, in vacuum, 60 ºC, 3 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 60 mg of Guaifenesin and guaifenesin RS, previously dried, and dissolve by adding water to make exactly 100 mL. Pipet 5 mL of the solution, add water to make exactly 100 mL, and use these solutions as the test and standard solutions. Immediately determine the absorbance, A_T and A_S, of the test solution and the standard solution, at the absorbance maximum wavelength around 273 nm as directed under the Ultraviolet-visible Spectroscopy.

$$\text{Amount of guaifenesin } (C_{10}H_{14}O_4)\text{ (mg)} = \frac{A_T}{A_S} \times W_S$$

W_S: Amount of guaifenesin RS (mg)

Packaging and storage Preserve in tight containers.

Guaifenesin, Dextromethorphan Hydrobromide and Pseudoephedrine Hydrochloride Syrup
구아이페네신·덱스트로메토르판 브롬화수소산염·슈도에페드린염산염 시럽

Guaifenesin, Dextromethorphan Hydrobromide and Pseudoephedrine Hydrochloride Syrup contains NLT 90.0% and NMT 110.0% of the labeled amount of guaifenesin ($C_{10}H_{14}O_4$: 198.22), dextromethorphan hydrobromide ($C_{18}H_{25}NO \cdot HBr$: 352.31) and pseudoephedrine hydrochloride ($C_{10}H_{15}NO \cdot HCl$: 201.70).

Method of preparation Prepared as directed under Syrups, with Guaifenesin, Dextromethorphan Hydrobromide and Pseudoephedrine Hydrochloride.

Identification The retention time of the major peak of the test solution corresponds to that of the standard solution, as obtained in the Assay.

pH Between 3.5 and 5.5.

Assay With Guaifenesin, Dextromethorphan Hydrobromide and Pseudoephedrine Hydrochloride Syrup, weigh accurately an amount, equivalent to about 100 mg of guaifenesin ($C_{10}H_{14}O_4$) [about 10 mg of dextromethorphan hydrobromide ($C_{18}H_{25}NO \cdot HBr$) and about 30 mg of pseudoephedrine hydrochloride ($C_{10}H_{15}$], add 50% methanol to make exactly 100 mL. Then, sonicate for 5 minutes, pass through a 0.45 μm membrane filter, and use this solution as the test solution. Separately, weigh accurately about 100 mg of guaifenesin RS, about 10 mg of dextromethorphan hydrobromide hydrate RS (previously measure water) and about 30 mg of pseudoephedrine hydrochloride RS, add 50% methanol to make exactly 100 mL, and use this solution as the standard solution. With 10 μL each of the test and standard solution, calculate the peak areas of test and standard solutions A_{T1}, A_{T2}, A_{T3}, A_{S1}, A_{S2} and *AS3 by* performing the test according to the following conditions as directed under the Liquid Chromatography.

Amount (mg) of guaifenesin ($C_{10}H_{14}O_4$)
= Amount (mg) of guaifenesin RS × (A_{T1} / A_{S1})

Amount (mg) of dextromethorphan hydrobromide ($C_{18}H_{25}NO \cdot HBr$) (mg)
= Amount of dextromethorphan hydrobromide RS, calculated on the anhydrous basis (mg) × (A_{T2} / A_{S2})

Amount (mg) of pseudoephedrine hydrochloride ($C_{10}H_{15}NO \cdot HCl$) (mg)
= Amount (mg) of pseudoephedrine hydrochloride RS (mg) × (A_{T3} / A_{S3})

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4.6 mm in inside diameter and about 15 cm in length, packed with 5 μm of octadecylsilanized silica gel for liquid chromatography.

Column temperature: A constant temperature of about 30 °C.

Mobile phase: Control the gradient by mixing the mobile phases A and B as directed under the following table.

Mobile phase A: Put water into a 1000-mL volumetric flask, add 1 mL of trifluoroacetic acid, and adjust the volume with water.

Mobile B: Put methanol into a 1000-mL volumetric flask, add 1 mL of trifluoroacetic acid, and adjust the volume with methanol.

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0.0 - 3.0	95	5
3.0 - 15.0	95 → 30	5 → 70
15.0 - 16.0	30 → 0	70 → 100
16.0 - 16.1	0 → 95	100 → 5
16.1 - 26.0	95	5

Flow rate: 1.0 mL/min

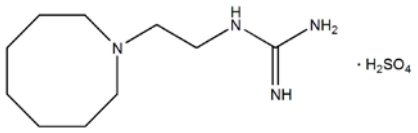
System suitability

System performance: Proceed with 10 μL of the standard solution according to the above operation conditions; pseudoephedrine hydrochloride, guaifenesin, and dextromethorphan hydrobromide are eluted in this order with the resolution between the peaks of guaifenesin and dextromethorphan hydrobromide being NLT 9.2.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solution under the above operating conditions; the relative standard deviation of the peak area of guaifenesin is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Guanethidine Sulfate
구아네티딘황산염



$C_{10}H_{22}N_4 \cdot H_2SO_4$: 296.39

2-[2-(Azocan-1-yl)ethyl]guanidine;sulfuric acid [*645-43-2*]

Guanethidine Sulfate, when dried, contains NLT 98.5% and NMT 101.0% of guanethidine sulfate ($C_{10}H_{22}N_4 \cdot H_2SO_4$).

Description Guanethidine Sulfate is white crystals or crystalline powder. It is odorless or has a slight characteristic odor and a bitter taste.

It is very soluble in formic acid, freely soluble in water, and practically insoluble in ethanol(95) or ether.

Melting point—Between 251 and 256 °C (a capillary tube in vacuum, decomposition).

Identification (1) Pipet 4 mL of Guanethidine Sulfate aqueous solution (1 in 4000), add 2 mL of 1-naphthol TS, 1 mL of diacetyl TS and 15 mL of water and allow to stand for 30 minutes. The resulting solution exhibits a red color.

(2) Determine the infrared spectra of Guanethidine Sulfate and guanethidine sulfate RS, previously dried, as directed in the potassium bromide disk method under

Mid-infrared Spectroscopy. Both exhibits similar intensities of absorption at the same wavenumbers.

(3) A solution of Guanethidine Sulfate (1 in 10) responds to the Qualitative Analysis for sulfate.

pH Dissolve 1.0 g of Guanethidine Sulfate in 50 mL of water. The pH of the solution is between 4.7 and 5.7.

Purity (1) ***Clarity and color of solution*—**Dissolve 1.0 g of Guanethidine Sulfate in 50 mL of water. The resulting solution is clear and colorless.

(2) ***Heavy metals*—**Proceed with 2.0 g of Guanethidine Sulfate according to Method 4 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(3) ***Methylisothiourea sulfate*—**Dissolve 2.0 g of Guanethidine Sulfate in 80 mL of sodium hydroxide TS and allow to stand for 10 minutes. Then dissolve 60 mL of hydrochloric acid, 2 g of sodium bromide, and water to make 200 mL. To this solution, add 0.70 mL of 1/60 mol/L potassium bromate VS and 2 mL of zinc iodide-starch TS: a blue color is observed.

Loss on drying NMT 0.5% (1 g, 105 °C, 4 hours).

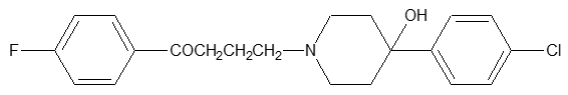
Residue on ignition NMT 0.2% (1 g).

Assay Weigh accurately about 0.5 g of Guanethidine Sulfate, previously dried, dissolve in 2 mL of formic acid, add 70 mL of a mixture of acetic anhydride and acetic acid(100) (6 : 1), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration, Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid
= 29.639 mg of $C_{10}H_{22}N_4 \cdot H_2SO_4$

Packaging and storage Preserve in light-resistant, tight containers.

Haloperidol
할로페리돌



Haloperidol $C_{21}H_{23}ClFNO_2$: 375.86
4-[4-(4-Chlorophenyl)-4-hydroxy-1-piperidyl]-1-(4-fluorophenyl)-butan-1-one [*151-67-7*]

Haloperidol, when dried, contains NLT 99.0% and NMT 101.0% of haloperidol ($C_{21}H_{23}ClFNO_2$).

Description Haloperidol occurs as white to pale yellow crystals or a powder.
It is freely soluble in acetic acid(100), sparingly soluble in methanol, slightly soluble in 2-propanol or ethanol(99.5), and practically insoluble in water.

Identification (1) Dissolve 30 mg each of Haloperidol and haloperidol RS in 100 mL of 2-propanol. To 5 mL of these solutions, add 10 mL of 0.1 mol/L hydrochloric acid TS and 2-propanol to make 100 mL. Determine the absorption spectra of these solutions as directed under the Ultraviolet-visible Spectroscopy: both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) Determine the infrared spectra of Haloperidol and haloperidol RS as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Melting point Between 149 and 153 °C.

Purity (1) ***Sulfate*—**To 1.0 g of Haloperidol, add 50 mL of water, shake to mix, and filter. To 25 mL of the filtrate, add 1 mL of dilute hydrochloric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 0.50 mL of 0.005 mol/L sulfuric acid (NMT 0.048%).

(2) ***Heavy metals***—Proceed with 1.0 g of Haloperidol according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Related substances***—Dissolve 25 mg of Haloperidol in 50 mL of mobile phase, and use this solution as the test solution. Pipet 1 mL of this solution, add the mobile phase to make exactly 200 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak area of each solution by the automatic integration method; the peak area other than haloperidol obtained from the test solution is not greater than 2 times the peak area of haloperidol from the standard solution. However, the peak area with a relative retention time to haloperidol of about 0.5, the peak area with a relative retention time of about 1.2, and the peak area with a relative retention time of about 2.6 are determined by multiplying the area determined as directed in the automatic integration method by correction factors of 0.75, 1.47, and 0.76, respectively.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40 °C.

Mobile phase: Dissolve 2.95 g of sodium citrate hydrate in 900 mL of water, add dilute hydrochloric acid

to adjust the pH to 3.5, and add water to make 1000 mL. To 300 mL of this solution, add 700 mL of methanol, and dissolve in 1.0 g of sodium lauryl sulfate.

Flow rate: Adjust the flow rate so that the retention time of haloperidol is about 9 minutes.

System suitability

Test for required detectability: Weigh exactly 5 mL of the standard solution, and add the mobile phase to make 25 mL. Confirm that the peak area of haloperidol obtained from 10 μL of this solution is equivalent to 15% to 25% of the peak area of haloperidol obtained from the standard solution.

System performance: Proceed with 10 μL of the standard solution under the above conditions; the number of theoretical plates and the symmetry factor of the peak of haloperidol are NLT 4000 and NMT 2.0, respectively.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solutions according to the above conditions; the relative standard deviation of the peak area of haloperidol is NMT 2.0%.

Time span of measurement: A range of about 3 times the retention time of the peak area of haloperidol after the solvent peak.

Loss on drying NMT 0.5% (1 g, in vacuum, 60 ℃, phosphorus pentoxide, 3 hours).

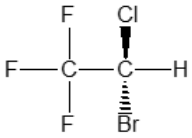
Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.6 g of Haloperidol, previously dried, dissolve in 40 mL of acetic acid(100), and titrate with 0.1 mol/L perchloric acid VS (indicator: 1 drop of methylrosanilinium chloride TS). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 37.587 mg of $C_{21}H_{23}ClFNO_2$

Packaging and storage Preserve in light-resistant, tight containers.

Halothane
할로탄



and enantiomer

Halothane $C_2HBrClF_3$: 197.38
2-Bromo-2-chloro-1,1,1-trifluoroethane [*151-67-7*]

Halothane contains NLT 0.008% and NMT 0.012% of Thimerosal as a stabilizer.

Description Halothane occurs as a colorless, clear, and fluid liquid.
It is miscible with ethanol(95), ether or isooctane.
It is slightly soluble in water.
It is volatile, non-flammable, and does not burn when its heated gas is ignited.
It is affected by light.

Refractive index n_D^{20}: Between 1.369 and 1.371.

Identification Transfer 3 μL each of Halothane and halothane RS into a gas cell with the optical path of 10 cm, and determine as directed under the gas sampling method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Specific Gravity d_{20}^{20}: Between 1.872 and 1.877.

Purity (1) ***Acid or alkali***—To 60 mL of Halothane, add 60 mL of freshly boiled and cooled water, shake vigorously for 3 minutes to mix, take the water layer separately, and use this solution as the test solution. To 20 mL of the test solution, add 1 drop of bromocresol purple TS and 0.10 mL of 0.01 mol/L sodium hydroxide TS; the resulting solution exhibits a purple color. Also, to 20 mL of the test solution, add 1 drop of bromocresol purple TS and 0.6 mL of 0.01 mol/L hydrochloric acid; the resulting solution exhibits a yellow color.

(2) ***Halide and halogen***—To 5 mL of the test solution from (1), add 1 drop of nitric acid and 0.20 mL of silver nitrate TS; the resulting solution is not turbid. Also, to 10 mL of the test solution from (1), add 1 mL of potassium iodide TS and 2 drops of starch TS, and allow to stand for 5 minutes; the resulting solution does not exhibit a blue color.

(3) ***Phosgen***—Transfer 50 mL of Halothane to a dried 300-mL Erlenmeyer flask, stopper the flask, lower a phosgene paper strip vertically from the stopper, and suspend the tip 10 mm above the surface of the liquid. Allow to stand in a dark place for 20 to 24 hours; the test paper does not change to yellow.

(4) ***Residue on evaporation***—Take exactly 50 mL of Halothane to evaporate on a steam bath, and dry the residue at 105 ºC for 2 hours; the weight of the residue is NMT 1.0 mg.

(5) ***Volatile related substances***—Take 100 mL of Halothane, add exactly 5.0 μL of internal standard, and use this solution as the test solution. Perform the test with 5 μL of the test solution as directed under the Gas Chromatography according to the following conditions, and determine the peak areas from the respective solutions according to the automatic integration method; the sum of the peak areas other than halothane and the internal standard is not greater than the peak area of the internal standard.

Internal standard—1,1,2-Trichloro-1,2,2-trifluoroethane

Operating conditions

Detector: A flame ionization detector

Column: A column about 3 mm in inside diameter, 3 m in length, packed with diatomaceous earth for gas chromatography (180 μm to 250 μm in particle diameter), coated with polyethylene glycol 400 for gas chromatography at the ratio of 30% in 2 m of the injection site. The remaining 1 m is packed with diatomaceous earth for gas chromatography (180 μm to 250 μm in particle diameter), coated with dinonyl phthalate at the ratio of 30%.

Column temperature: A constant temperature of about 50 °C.

Carrier gas: Nitrogen

Flow rate: Adjust the flow rate so that the retention time of the internal standard is between 2 and 3 minutes.

System suitability

System performance: Mix 3 mL of Halothane with 1 mL of the internal standard. Proceed with 1 μL of this solution under the above conditions; the internal standard and halothane are eluted in this order with the resolution being NLT 10.

Detection sensitivity: Adjust the sensitivity so that the peak height of the internal standard from 5 μL of the test solution is between 30% and 70% of the full scale.

Time span of measurement: About 3 times the retention time of halothane.

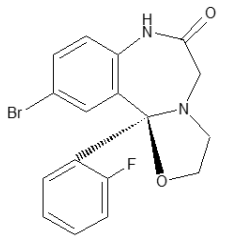
Distilling range Between 49 and 51 ℃ ± 1 ℃, NLT 95 vol%.

Thimerosal content To 0.50 mL of Halothane, add 5.0 mL of isooctane and 5.0 mL of titanium(IV) oxide TS, shake vigorously for 30 seconds to mix, and allow to stand; the color of the upper layer is more intense than the control solution A and not more intense than the control solution B.

Control solution—Dissolve 0.225g of thimerosal RS in isooctane to make exactly 100 mL. Pipet 10 mL each of these solutions, and add isooctane to make 150 mL and 100 mL. Proceed with 0.50 mL each of these solutions in the same manner as Halothane, and use the upper layer as the control solution A, and the control solution B.

Packaging and storage Preserve in light-resistant, tight containers below 30 ℃.

Haloxazolam
할록사졸람



and enantiomer

Haloxazolam $C_{17}H_{14}BrFN_2O_2$: 377.21

10-Bromo-11*b*-(2-fluorophenyl)-2,3,7,11*b*-tetrahydrobenzo[f]oxazolo[3,2-d][1,4]diazepin-6(5*H*)-one [*59128-97-1*]

Haloxazolam, when dried, contains NLT 99.0% and NMT 101.0% of haloxazolam ($C_{17}H_{14}BrFN_2O_2$).

Description Haloxazolam occurs as white crystals or a crystalline powder. It is odorless and tasteless.

It is freely soluble in acetic acid(100), sparingly soluble in acetonitrile, methanol, or anhydrous ethanol, slightly soluble in ether, and practically insoluble in water.

Melting point—About 183 °C (with decomposition).

Identification (1) Dissolve 10 mg of Haloxazolam in 10 mL of methanol, add 1 drop of hydrochloric acid, and examine under ultraviolet light (main wavelength: 365 nm); the resulting solution exhibits a yellowish green fluorescent. To this solution, add 1 mL of sodium hydroxide TS; the fluorescence of the solution immediately disappears.

(2) Weigh 50 mg of Haloxazolam, and burn as directed under the Oxygen Flask Combustion, using a mixture of 20 mL of dilute sodium hydroxide TS and 1 mL of strong hydrogen peroxide water as the absorbent to obtain the test solution. The test solution responds to the Qualitative Analysis for bromide and fluoride.

(3) Determine the absorption spectra of solutions of Haloxazolam and haloxazolam RS in methanol (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(4) Determine the infrared spectra of Haloxazolam and biperiden haloxazolam RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Absorbance $E_{1cm}^{1\%}$ (247 nm): Between 390 and 410 (10 mg, methanol, 1000 mL).

Purity (1) ***Clarity and color of solution***—Dissolve 0.10 g of Haloxazolam in 20 mL of anhydrous ethanol; the resulting solution is colorless and clear.

(2) ***Soluble halide***—Take 1.0 g of Haloxazolam,

add 50 mL of water, allow to stand for 1 hour with occasional shaking to mix, and filter. Pipet 25 mL of the filtrate, and add 6 mL of dilute nitric acid and water to make 50 mL. Use this as the test solution and perform the test as directed under Chloride. Prepare the control solution with 0.10 mL of 0.01 mol/L hydrochloric acid (Cl: NMT 0.0071%).

(3) ***Heavy metals***—Proceed with 1.0 g of Haloxazolam according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(4) ***Arsenic***—Transfer 1.0 g of Haloxazolam into a decomposition flask, add 5 mL of nitric acid and 2 mL of sulfuric acid, put a small funnel in on top of the flask, and heat carefully until the white smoke is produced. After cooling, add another 2 mL of nitric acid, and heat. Repeat the procedure 2 times, add 2 mL of strong hydrogen peroxide water several times, and heat until the solution changes to a colorless to pale yellow color. After cooling, add 2 mL of saturated ammonium oxalate solution, and heat again until the white smoke is produced. After cooling, add water to make 5 mL. Use this solution as the test solution and perform the test; it is not more intense than the following reference color (NMT 2 ppm).

Reference color—Proceed in the same manner without using Haloxazolam, add 2.0 mL of arsenic standard solution and water to make 5 mL, and proceed in the same manner as the test with test solution.

(5) ***Related substances***—Dissolve 0.10 g of Haloxazolam in 100 mL of acetonitrile, and use this solution as the test solution. Pipet 1 mL of this solution, add acetonitrile to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak areas in each solution as directed in the automatic integration method; the sum of peak areas other than the major peak from the test solution is not greater than that of the major peak areas from the standard solution.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 250 nm).

Column: A stainless steel column about 4 mm in internal diameter and 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm to 10 μm in particle diameter).

Mobile phase: Dissolve 6.2 g of boric acid and 7.5 g of potassium chloride in 900 mL of water, adjust pH to 8.5 with triethylamine, and add water to make 1000 mL. To 3 volumes of this solution, add 2 volumes of acetonitrile.

Flow rate: Adjust the flow rate so that the retention time of haloxazolam is about 10 minutes.

System suitability

Test for required detectability: Weigh accurately 5 mL of the standard solution and add the acetonitrile to make exactly 50 mL. Confirm that the peak area of haloxazolam obtained from 10 μL of this solution is equivalent to 8 to 12% of the peak area of haloxazolam obtained from the standard solution.

System performance: Dissolve 10 mg each of Haloxazolam and cloxazolam in 200 mL of acetonitrile. Proceed with 10 μL of this solution according to the above conditions; haloxazolam and cloxazolam are eluted in this order with the resolution being NLT 1.5.

System repeatability: Repeat the test 6 times with 10 μL each of the standard solutions according to the above conditions; the relative standard deviation of the peak area of haloxazolam is NMT 1.0%.

Loss on drying NMT 0.5% (1 g, 105 ℃, 3 hours).

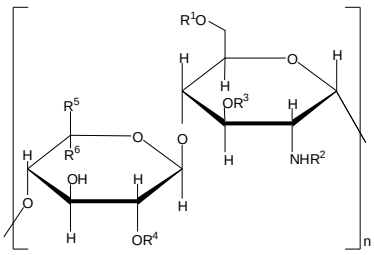
Residue on ignition NMT 0.1% (1 g, platinum crucible).

Assay Weigh accurately about 0.5 g of Haloxazolam, previously dried, and dissolve in 50 mL of acetic acid(100). Titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 37.721 mg of $C_{17}H_{14}BrFN_2O_2$

Packaging and storage Preserve in light-resistant, tight containers.

Heparin Sodium
헤파린나트륨



R^1, R^3, R^4=SO_3Na, or H

R^2=SO_3Na or 

R^5=CO_2Na, R6 = H or R^5 = H, R^6 = CO_2Na

Heparin Sodium

Sodum (3*S*,4*S*,5*R*,6*R*)-6-(((2*R*,3*S*,4*R*,5*R*)-4,6-dihydroxy-5-(sulfonatoamino)-2-((sulfonatooxy)methyl)tetrahydro-2*H*-pyran-3-yl)oxy)-3,4-dihydroxy-5-(sulfonatooxy) tetrahydro-2*H*-pyran-2-carboxylate [*9041-08-1*]

Heparin Sodium is obtained from the liver, lungs, or intestinal mucous membranes of healthy edible animals and has the effect of delaying blood coagulation. Heparin

Sodium is the sodium salt of heparin, composed of sulfated glycosaminoglycans in disaccharide units of D-glucosamine and uronic acid (L-iduronic acid or D-glucuronic acid). Plasma protein antithrombin and heparin cofactor II form a complex that inactivates thrombin (blood coagulation factor IIa), thereby delaying blood coagulation, and also inhibits the activity of other coagulation factors such as activated blood clotting factor X (blood coagulation factor Xa). The ratio of the anticoagulant potency against blood coagulation factor IIa to the anticoagulant potency against blood coagulation factor Xa is between 0.9 and 1.1. Heparin Sodium contains NLT 180 heparin units (international unit) per mg, calculated on the dried basis.

Heparin Sodium should be labeled with the species of animals used as raw materials and the organs involved.

Description Heparin Sodium occurs as a white to grayish brown powder or grain and is odorless.
It is soluble in water and practically insoluble in ethanol(95) or ether.
It is hygroscopic.

Identification (1) Perform the test as directed under the Assay; it meets the requirements.

(2) Dissolve 20 mg each of Heparin Sodium and heparin sodium RS in 0.60 mL of a solution of 3-(trimethylsilyl)propionic acid-d4 sodium salt for nuclear magnetic resonance spectroscopy in deuterium oxide for nuclear magnetic resonance spectroscopy (1 in 10000), and use these solutions as the test solution and the standard solution. Perform the test with the test solution and the standard solution according to the operating conditions in Purity (6) as directed under the Nuclear Magnetic Resonance Spectroscopy (^{1}H), using the 3-(trimethylsilyl)propionic acid-d4 sodium salt for nuclear magnetic resonance spectroscopy as the reference material; the test solution and the standard solution exhibit signals of equal area intensity at δ 2.03 ppm to 2.07 ppm, δ 3.25 ppm to 3.31 ppm, δ 5.20 ppm to 5.26 ppm, and δ 5.39 ppm to 5.45 ppm.

(3) Dissolve 1 mg each of Heparin Sodium and heparin sodium RS in 1 mL of water, and use these solutions as the test solution and the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions; the retention times of major peaks obtained from each solution are the same.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 202 nm).

Column: A stainless steel column, 2.0 mm in internal diameter and 7.5 cm in length, packed with synthetic polymer with diethylaminoethyl groups for liquid chromatography (10 μm in particle diameter).

Column temperature: A constant temperature of about 35 °C.

Mobile phase: Control the mixing ratio of mobile phase A and mobile phase B stepwise or via the gradient elution as follows.

Mobile phase A: Dissolve 0.4 g of sodium dihydrogen phosphate dihydrate in 1000 mL of water, and add diluted phosphoric acid (1 in 10) to adjust the pH to 3.0.

Mobile phase B: Dissolve 0.4 g of sodium dihydrogen phosphate dihydrate and 106.4 g of lithium perchlorate in 1000 mL of water, and add diluted phosphoric acid (1 in 10) to adjust the pH to 3.0.

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 - 3	90	10
3 - 15	90 → 0	10 → 100

Flow rate: 0.2 mL/min

System suitability

System performance: Dissolve 0.10 mg of oversulfated chondroitin sulfate RS in 0.20 mL of water, and use this solution as the standard oversulfated chondroitin sulfate solution. Dissolve 1.0 mg of dermatan sulfate in 2.0 mL of water, and use this solution as the standard dermatan sulfate solution. Dissolve 1.0 mg of heparin sodium RS in 0.60 mL of water, and use this solution as the standard heparin sodium solution. Mix 90 μL of standard heparin sodium solution, 30 μL of standard oversulfated chondroitin sulfate solution, and 30 μL of standard dermatan sulfate solution, and use this solution as the system suitability solution. Perform the test with 20 μL of this solution according to the above conditions; dermatan sulfate, heparin, and over-sulfated chondroitin sulfate are eluted in this order, with the resolution between dermatan sulfate and heparin being NLT 1.0 and the resolution between heparin and oversulfated chondroitin sulfate being NLT 1.5.

(4) The ratio of the anticoagulant potency against blood coagulation factor IIa to the anticoagulant potency against blood coagulation factor Xa Anticoagulant potency against blood coagulation factor Xa

(i) Substrate solution: Dissolve *N*-benzoyl-*L*-isoleucyl-*L*-glutamyl (γ-OR)-glycyl-*L*-arginine-*p*-nitroanilide hydrochloride in water to make a 1 mmol/L solution.

(ii) Antithrombin solution: Dissolve human antithrombin III in pH 8.4 buffer solution to make a solution containing 1.0 international units of antithrombin per mL.

(iii) Blood coagulation factor Xa solution: Dissolve bovine blood coagulation factor Xa in pH 8.4 buffer solution. Instead of using a standard solution or a test solution, take 30 mL of pH 8.4 buffer solution, and determine the absorbance at a wavelength of 405 nm according to the Assay to make the absorbance between 0.65 and 1.25.

(iv) pH 8.4 buffer solution: Dissolve 2-amino-2-hydroxymethyl-1,3-propanediol, disodium dihydrogen

ethylenediaminetetraacetate and sodium chloride each in water containing 0.1% polyethylene glycol 6000 to make solutions having 0.050 mol/L, 0.0075 mol/L, and 0.175 mol/L of concentration, respectively. If necessary, add hydrochloric acid or sodium hydroxide solution to adjust the pH to 8.4.

(v) Reaction stop solution: To 20 mL of acetic acid(100), add water to make 100 mL.

(vi) Standard heparin solution: Dissolve heparin sodium RS in an appropriate amount of water, and use this solution as the standard stock solution. Pipet a certain volume of the standard stock solution, and add pH 8.4 buffer solution to make at least 5 solutions with each concentration between 0.03 units and 0.375 units per mL. Prepare at least 2 of each standard solution with the same concentration to use.

(vii) Test solution: Pipet an appropriate amount of Heparin Sodium according to the labeling unit, dissolve in pH 8.4 buffer solution to make the solution with the same concentration as the standard solution, and use this solution as the test solution. Prepare at least 2 of each test solution with the same concentration to use.

(viii) Procedure: Prepare the test tubes on a steam bath at 37 °C to maintain a constant temperature, add 120 μL of pH 8.4 buffer solution to each test tube, and add 30 μL each of the test solution or the standard solution of each concentration, respectively. Add 150 μL each of antithrombin solution, previously warmed at 37°C for 15 minutes, to each test tube, and allow to stand for 2 minutes. Add 300 μL each of blood coagulation factor Xa solution, previously warmed at 37°C for 15 minutes, to each test tube, mix, and allow to stand for 2 minutes. Add 300 μL each of the substrate solution, previously warmed at 37°C for 15 minutes, to each test tube, mix, and allow to stand for 2 minutes. Add 150 μL each of the reaction stop solution to each test tube, and shake each test tube to mix. Separately prepare the control solution by previously adding 150 μL of the reaction stop solution in the test tube and mixing each of the above solutions in the reverse order. Determine the absorbance of the test solution and the standard solution at the wavelength of 405 nm as directed under the Ultraviolet-visible Spectroscopy using the control solution.

(ix) Calculation: Plot log absorbance in the y-axis and plot heparin concentration, calculated on the dried basis, of the standard heparin solution or the test solution in the x-axis to prepare the graph. Calculate the anticoagulant potency against blood coagulation factor Xa of Heparin Sodium according to the following equation. Calculate the ratio (r) of the anticoagulant potency against blood coagulation factor IIa to the anticoagulant potency against blood coagulation factor Xa of Heparin Sodium obtained from the Assay; it is between 0.9 and 1.1.

$$\text{Anticoagulant potency against blood coagulation factor Xa (heparin unit/mg) of Heparin Sodium} = \text{Potency of Heparin sodium RS (heparin unit/mg)} \times \frac{S_T}{S_S}$$

S_T: Slope of the test solution
S_S: Slope of the standard solution

$$r = \frac{\text{Anticoagulant potency (heparin unit/mg) against blood coagulation factor Xa}}{\text{Anticoagulant potency (heparin unit/mg) against blood coagulation factor IIa}}$$

(5) Heparin Sodium responds to the Qualitative Analysis (1) for sodium salt.

pH Dissolve 1.0 g of Heparin Sodium in 100 mL of water; the pH of this solution is between 5.0 and 7.5.

Purity (1) ***Clarity and color of solution***—Dissolve 0.5 g of Heparin Sodium in 20 mL of water; the resulting solution is colorless to pale yellow and is clear.

(2) ***Heavy metals***—Proceed with 1.0 g of Heparin Sodium according to Method 2 and perform the test. Prepare the control solution with 3.0 mL of lead standard solution (NMT 30 ppm).

(3) ***Barium***—Dissolve 30 mg of Heparin Sodium in 3.0 mL of water, and use this solution as the test solution. To 1.0 mL of the test solution, add 3 drops of sulfuric acid, and allow to stand for 10 minutes; the solution does not become turbid.

(4) ***Total nitrogen***—Weigh accurately about 100 mg of Heparin Sodium, previously dried in vacuum at 60 °C for 3 hours, and perform the test according to the Nitrogen Determination; the amount of nitrogen (N : 14.01) is 1.3% to 2.5%.

(5) ***Protein***—Weigh accurately an appropriate amount of Heparin Sodium, dissolve in water to make a solution containing 5 mg per mL, and use this solution as the test solution (prepare 3 identical test solutions, and use these solutions as the test solutions (1), (2) and (3), respectively). Separately, weigh an appropriate amount of bovine serum albumin, dissolve in water to make a solution containing 0.100 mg per mL, take an appropriate amount of this solution, and dilute with water to make at least 5 solutions with each concentration between 0.005 mg and 0.100 mg per mL. Use these solutions as the standard solutions. To 1 mL of each concentration standard solutions, the test solutions (1), (2), (3) and water (blank test solution), add 5 mL each of the reaction solution, and allow to stand at room temperature for 10 minutes. To these solutions, add 0.5 mL each of diluted Folin TS, immediately mix, and allow to stand at room temperature for 30 minutes. Determine the absorption of these solutions at the wavelength of 750 nm as directed under the Ultraviolet-visible Spectroscopy using the blank test solution as the blank, and calculate the protein content of the test solution from the calibration curve created using the absorbance of the standard solution.

Reaction solution—Weigh accurately an appropriate amount of sodium hydroxide, and dissolve in water to make a solution containing 10 g in 1000 mL. Separately,

dissolve sodium carbonate decahydrate in water to make a solution containing 50 g in 1000 mL. Take the same amounts of each 2 solutions, and mix them. Mix 4 volumes of this solution and 1 volume of water, and use this solution as the solution A. Dissolve an appropriate amount of sodium tartrate dihydrate in water to make a solution containing 29.8 g in 1000 mL. Separately, dissolve an appropriate amount of copper(II) sulfate pentahydrate in water to make a solution containing 12.5 g in 1000 mL. Take the same amounts of each 2 solutions, and mix them. Mix 4 volumes of this solution and 1 volume of water, and use this solution as the solution B. Mix 50 volumes of the solution A and 1 volume of the solution B proportionately.

Diluted Folin TS—Add water to the Folin TS to be diluted about 2 to 4 times to make the pH 10.25 ± 0.25 after adding the reaction solution and Folin TS to the test solution and the standard solution in the above procedure.

(6) ***Oversulfated chondroitin sulfate***—(i) Nuclear magnetic resonance spectrum: Dissolve 20 mg each of Heparin Sodium and heparin sodium RS in 0.60 mL of a solution of 3-(trimethylsilyl)propionic acid-d4 sodium salt for nuclear magnetic resonance spectroscopy in deuterium oxide for nuclear magnetic resonance spectroscopy (1 in 10000), and use these solutions as the test solution and the standard solution. Perform the test with the test solution and the standard solution as directed under the Nuclear Magnetic Resonance Spectroscopy (^{1}H) according to the following conditions, using the 3-(trimethylsilyl)propionic acid-d4 sodium salt for nuclear magnetic resonance spectroscopy as the reference material; it exhibits no signal of over-sulfated chondroitin sulfate at δ 2.13 ppm to 2.17 ppm (it exhibits the hydrogen signal of the *N*-acetyl group of oversulfated chondroitin sulfate at δ 2.13 ppm to 2.17 ppm).

Operating conditions

Device: ^{1}H-pulse Fourier transform nuclear magnetic resonance spectrum measurement device.

Device frequency: NLT 400 MHz

Measurement temperature: 25 ℃

Spectrum Range: ± 6.0 ppm focusing on the signal of DHO.

Pulse angle: 90°

Pulse repetition time: 20 seconds

Number of repetitions: 4 times

Signal-to-noise ratio: NLT 1000 at the hydrogen signal (around 2 ppm) of the *N*-acetyl group of heparin.

Window function: Exponential function (linewidth broadening factor = 0.2 Hz).

System suitability

Dissolve 0.10 mg of oversulfated chondroitin sulfate RS in 1.0 mL of a solution of 3-(trimethylsilyl)propionic acid-d4 sodium salt for nuclear magnetic resonance spectroscopy in deuterium oxide for nuclear magnetic resonance spectroscopy (1 in 10000), and use this solution as the oversulfated chondroitin sulfate standard solution. Separately, dissolve 20 mg of heparin sodium RS in 0.40 mL of deuterium oxide for nuclear magnetic resonance spectroscopy solution, add 0.20 mL of oversulfated chondroitin sulfate standard solution to the solution, and use this solution as the system suitability solution. Perform the test with this solution according to the above conditions; it exhibits the signal of the *N*-acetyl group of heparin at δ 2.02 ppm to 2.06 ppm, and the signal of the *N*-acetyl group of oversulfated chondroitin sulfate at δ 2.13 ppm to 2.17 ppm.

(ii) Liquid Chromatography: Perform the test according to the Identification (3); it exhibits no oversulfated chondroitin sulfate peak.

(7) ***Galactosamine***—Weigh accurately about 2.4 mg of Heparin Sodium, dissolve in 1.0 mL of diluted hydrochloric (5 in 12), and use this solution as the test stock solution. Separately, weigh accurately 8.0 mg each of *D*-glucosamine hydrochloride and *D*-galactosamine hydrochloride, dissolve in diluted hydrochloric acid (5 in 12) to make exactly 10 mL, and use these solutions as standard glucosamine solution and galactosamine standard solution, respectively. To 99 volumes of standard glucosamine solution, add 1 volume of galactosamine standard solution, and use this solution as the standard stock solution. Transfer 500 μL each of the test stock solution and the standard stock solution into two stoppered test tubes, close the stopper, and heat at 100 ℃ for 6 hours. Cool this solution to room temperature, take 100 μL each, and dry in vacuum. To each residue, add 50 μL each of methanol, dry in vacuum at room temperature, and dissolve each residue in 10 μL of water. To each of the solutions, add 40 μL each of aminobenzoic acid derivatization TS, mix well, and heat at 80 ℃ for 1 hour. Cool these solutions to room temperature, and dry in vacuum. To each residue, add 200 μL each of water and ethyl acetate, shake vigorously, and centrifuge for 1 minute. After removing the upper layer, to each lower layer, add 200 μL each of ethyl acetate, shake vigorously, and centrifuge for 1 minute. Use the obtained lower layers as the test solution and the standard solution, respectively. Perform the test with 5 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions; The ratio of the peak area of glucosamine to the peak area of galactosamine in the test solution is not greater than the ratio of the peak area of glucosamine to the peak area of galactosamine in the standard solution.

Operating conditions

Detector: A fluorometer (excitation wavelength: 305 nm, fluorescence wavelength: 360 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 μm in particle diameter).

Column temperature: A constant temperature of about 45 ℃.

Mobile phase: To a mixture of water and trifluoroa-

cetic acid (1000 : 1), add 100 mL of acetonitrile. To 140 mL of this solution, add 860 mL of a mixture of water and trifluoroacetic acid (1000 : 1).

Flow rate: 1.0 mL/min

System suitability

Test for required detectability: Dissolve 8.0 mg of D-mannosamine hydrochloride in 10 mL of diluted hydrochloric acid (5 in 12), and use this solution as the standard mannosamine solution. Transfer 500 μL of a mixture of the standard stock solution and the standard mannosamine solution (100 : 1) into a stoppered test tube, close the stopper, heat at 100 ℃ for 6 hours, and cool to room temperature. Take 100 μL of this solution, and dry in vacuum. To the residue, add 50 μL of methanol, dry in vacuum at room temperature, dissolve the residue in 10 μL of water, and mix with 40 μL of aminobenzoic acid derivatization TS. Heat this solution at 80 ℃ for 1 hour, cool to room temperature, and dry in vacuum. To the residue, add 200 μL each of water and ethyl acetate, shake vigorously, and centrifuge for 1 minute. After removing the upper layer, take the lower layer, add 200 μL of ethyl acetate, shake vigorously, and centrifuge for 1 minute. Use the obtained lower layer as the system suitability solution. Proceed with 5 μL of this solution according to the above conditions; confirm that the ratio of the peak area of glucosamine to the peak area of galactosamine is between 0.7% and 2.0%.

System performance: Perform the test with 5 μL of the system suitability solution according to the above conditions; glucosamine, mannoseamine, and galactosamine are eluted in this order, and the resolution between glucosamine and mannoseamine, and between mannoseamine and galactosamine, is NLT 1.5, respectively.

System repeatability: Repeat the test 6 times with 5 μL each of the system suitability solutions according to the above conditions, the relative standard deviation of peak area ratios of galactosamine to glucosamine is NMT 4.0%.

Time span of measurement: 50 minutes

(8) ***Hexane related substances***—Weigh accurately 40 mg of Heparin Sodium, dissolve in 10 mL of water, and perform the test with this solution as directed under the Ultraviolet-visible Spectroscopy; the absorbance at the wavelength of 260 nm is NMT 0.20.

Loss on drying NMT 5.0% (in vacuum, 60 ℃, 3 hours).

Residue on ignition Between 28.0% and 41.0% (20 mg after drying).

Bacterial endotoxins Less than 0.03 EU per heparin unit of Heparin Sodium.

Sterility It meets the requirements when used in the manufacturing of sterile preparations.

Assay ***Anticoagulant potency against blood coagulation factor IIa***—(i) Substrate solution: Dissolve *D*-phenylalanyl-*L*-pipecolinic-*L*-arginine-*p*-nitroanilide dihydrochloride in water to make a 1.25 mmol/L solution.

(ii) Antithrombin solution: Dissolve human antithrombin III in an appropriate amount of water to make a solution containing 5 international units of antithrombin per mL, take a certain amount of this solution, and dissolve in pH 8.4 buffer solution to make a solution containing 0.125 international units of antithrombin per mL.

(iii) Human antithrombin solution: To human antithrombin (blood coagulation factor IIa), add water to make a solution containing 20 international units of thrombin per mL, take a certain amount of this solution, and dilute in pH 8.4 buffer solution to make a solution containing 5 international units of thrombin per mL. Use this solution as the human antithrombin solution.

(iv) pH 8.4 buffer solution: Weigh 6.10 g of 2-amino-2-hydroxymethyl-1,3-propanediol, 2.80 g of disodium dihydrogen ethylenediaminetetraacetate, 10.20 g of sodium chloride, and NMT 10.00 g of polyethylene glycol 6000 and (or) 2.00 g of bovine serum albumin, dissolve in 800 mL of water, adjust the pH to 8.4 with hydrochloric acid, and add water to make 1000 mL.

(v) Reaction stop solution: Add water to 20 mL of acetic acid(100) to make 100 mL.

(vi) Standard heparin solution: Dissolve heparin sodium RS in an appropriate amount of water, and use this solution as the standard stock solution. Pipet a certain volume of the standard stock solution, and add pH 8.4 buffer solution to make at least 4 solutions with each concentration between 0.005 units to 0.03 units per mL. Use these solutions as the standard solutions. Prepare NLT 2 of each standard solution with the same concentration.

(vii) Test solution: Take an appropriate amount of Heparin Sodium according to the labeling unit, dissolve in pH 8.4 buffer solution to make the solution with the same concentration as the standard solution, and use this solution as the test solution. Prepare NLT 2 of each test solution with the same concentration.

(viii) Procedure: Prepare test tubes on a steam bath at 37°C to maintain a constant temperature. Transfer each of a certain amount (50 μL to 100 μL) of pH 8.4 buffer solution (blank test solution), previously warmed at 37 ℃ to maintain the constant temperature, test solutions of each concentration, and standard solutions into each test tube. To each solution, add 2 times the above volume (100 μL to 200 μL) of antithrombin, previously warmed at 37 ℃, carefully mix the solutions to prevent foaming, and allow to stand at 37 ℃ for at least 1 minute. Add 25 μL to 50 μL each of human thrombin solutions, previously warmed at 37 ℃, and allow to stand for at least 1 minute. To each solution, add 50 μL to 100 μL of substrate solution, previously warmed at 37 ℃, mix, and allow to stand for at least 1 minute. Add 50 μL to 100 μL of the reaction stop solution, shake each test tube to mix, and complete the test after at least 1 minute. With these solutions, determine the absorbance of the test solution and the standard solution at the wavelength of 405 nm as directed under the Ultraviolet-visible Spectroscopy using

the blank test solution as the control solution. However, prepare an appropriate amount of blank test solutions and measure just before measuring the absorbance of each test solution and standard solution in the dilutions, and the relative standard deviation of the measured values for the blank test solution at this point is NMT 10%.

(ix) Calculation: Plot log absorbance in the y-axis and plot heparin concentration, calculated on the dried basis, of the standard heparin solution or the test solution in the x-axis to prepare the graph. Calculate the heparin unit (international unit) per mg of Heparin Sodium according to the following equation.

$$\text{Heparin unit in each mg of Heparin Sodium} = \text{Potency (heparin unit/mg) of heparin sodium RS} \times \frac{S_T}{S_S}$$

S_T: Slope of the test solution
S_S: Slope of the standard solution

Packaging and storage Preserve in tight containers.

Heparin Sodium Injection
헤파린나트륨 주사액

Heparin Sodium Injection, as an aqueous injection, contains NLT 90.0% and NMT 110.0% of the labeled heparin unit.

Heparin Sodium Injection is labeled to indicate the animal species and organ from which Heparin Sodium used for manufacturing is derived.

Method of preparation Prepare as directed under Injections, with a solution of Heparin Sodium dissolved in Isotonic Sodium Chloride Injection.

Description Heparin Sodium Injection occurs as colorless to pale yellow, clear liquid.

pH Between 5.5 and 8.0.

Purity (1) ***Barium***—Measure exactly a volume of Heparin Sodium Injection, equivalent to 3000 units of Heparin Sodium according to the labeled unit. Add water to make 3.0 mL and use this solution as the test solution. To 1.0 mL of the test solution, add 3 drops of dilute sulfuric acid and allow to stand for 10 minutes: no turbidity is produced.

(2) ***Protein***—Perform the test as directed under the Purity (5) under Heparin Sodium.

Sterility Meets the requirements.

Bacterial endotoxins Less than 0.0030 EU per heparin unit of Heparin Sodium Injection.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Extractable volume of injections Meets the requirements.

Assay Perform the test as directed under the Assay under Heparin sodium. For (vii) Test solution and (ix) Calculation, proceed as below:

(vii) Test solution*:* Pipet Heparin Sodium Injection in a suitable quantity according to the labeling unit, add pH 8.4 buffer solution to make a solution having the same concentration as the standard stock solution, and use this solution as the test stock solution. Pipet suitable quantities of this solution, add pH 8.4 buffer solution to each, dilute in the same manner as its respective standard solution, and use each as the respective test solution. Prepare at least 2 test solutions having the same concentration for use.

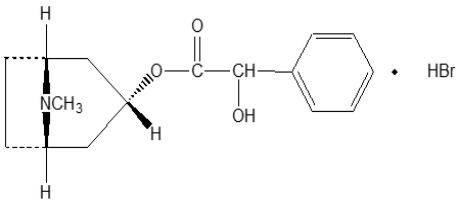
(ix) Calculation: Prepare a graph having the x axis for the log absorbance and the y axis for the concentration of heparin, calculated on the dried basis, contained in each standard heparin solution or test solution, for each solution. Determine the heparin unit (international unit) contained in 1 mL of Heparin Sodium Injection according to the following formula:

$$\text{Heparin unit contained in 1 mL of Heparin Sodium Injection} = \text{Concentration (heparin unit/mL) of the standard stock solution} \times \frac{S_T}{S_S} \times \frac{b}{a}$$

S_T: Gradient of the test solution
S_S: Slope of the standard solution
a: Amount (mL) of Heparin Sodium Injection taken
b: Total volume (mL) when the test stock solution was prepared

Packaging and storage Preserve in light-resistant, hermetic containers.

Homatropine Hydrobromide
호마트로핀브롬화수소산염



$C_{16}H_{21}NO_3 \cdot HBr$: 356.26
(1*R*,3*R*,5*S*)-8-Methyl-8-azabicyclo[3.2.1]octan-3-yl 2-

hydroxy-2-phenylacetate hydrobromide [*51-56-9*]

Homatropine Hydrobromide contains NLT 99.0% and NMT 101.0% of homatropine hydrobromide ($C_{16}H_{21}NO_3 \cdot HBr$), calculated on the dried basis.

Description Homatropine Hydrobromide occurs as white crystals or a crystalline powder. It is odorless.
It is freely soluble in water, sparingly soluble in ethanol(95), slightly soluble in acetic anhydride, and practically insoluble in ether.
It is affected by light.

Melting point—About 214 °C (with decomposition).

Identification (1) Determine the infrared spectra of Homatropine Hydrobromide and homatropine hydrobromide RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(2) An aqueous solution of Homatropine Hydrobromide (1 in 20) responds to the Qualitative Analysis for bromide.

pH Dissolve 1.0 g of Homatropine Hydrobromide in 50 mL of water; the pH of this solution is between 5.7 and 7.0.

Purity (1) ***Acid***—Dissolve 1.0 g of Homatropine Hydrobromide in 20 mL of water, and add 0.40 mL of 0.01 mol/L sodium hydroxide TS and 1 drop of methyl red-methylene blue TS; the resulting solution exhibits a green color.

(2) ***Atropine, hyoscyamine, or scopolamine***—To 10 mg of Homatropine Hydrobromide, add 5 drops of nitric acid, and evaporate to dryness on a steam bath. After cooling, dissolve the residue in 1 mL of *N*,*N*-dimethylformamide, and add 5 to 6 drops of tetrabutylammonium hydroxide TS; the resulting solution does not exhibit a purple color.

(3) ***Other alkaloid***—Dissolve 0.15 g of Homatropine Hydrobromide in 3 mL of water, and use this solution as the test solution.

(i) To 1 mL of the test solution, add 2 to 3 drops of tannic acid TS; a precipitate does not form.

(ii) To 1 mL of the test solution, add 2 to 3 drops each of dilute hydrochloric acid and hexachloroplatinic(IV) acid TS; a precipitate does not form.

Loss on drying NMT 1.5% (0.5 g, 105 ℃, 2 hours).

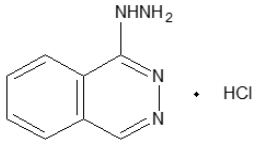
Residue on ignition NMT 0.2% (0.2 g).

Assay Weigh accurately about 0.4 g of Homatropine Hydrobromide, and dissolve in 60 mL of a mixture of acetic anhydride and acetic acid(100)(7:3) by warming. After cooling, titrate with 0.1 mol/L perchloric acid VS (potentiometric titration under the Titrimetry). Perform a blank test in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 35.626 mg of $C_{16}H_{21}NO_3 \cdot HBr$

Packaging and storage Preserve in light-resistant, tight containers.

Hydralazine Hydrochloride
히드랄라진염산염



$C_8H_8N_4 \cdot HCl$: 196.64
1-Hydrazinylphthalazine hydrochloride [*304-20-1*]

Hydralazine Hydrochloride, when dried, contains NLT 98.0% and NMT 101.0% of hydralazine hydrochloride ($C_8H_8N_4 \cdot HCl$).

Description Hydralazine Hydrochloride occurs as a white crystalline powder, which is odorless and has a bitter taste.
It is soluble in water, slightly solution in ethanol(95) and practically insoluble in ether.

Melting point—About 275 °C (with decomposition).

Identification (1) Determine the absorption spectra of aqueous solutions of Hydralazine Hydrochloride and hydralazine hydrochloride RS (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectra of Hydralazine Hydrochloride and hydralazine hydrochloride RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) An aqueous solution of Hydralazine Hydrochloride (1 in 50) responds to the Qualitative Analysis for chloride.

pH Dissolve 1.0 g of Hydralazine Hydrochloride in 50 mL of water; the pH of this solution is between 3.5 and 4.5.

Purity (1) ***Clarity and color of solution***—Dissolve 1.0 g of Hydralazine Hydrochloride in 50 mL of water; the resulting solution is clear, and colorless to pale yellow.

(2) ***Heavy metals***—Proceed with 1.0 g of Hydralazine Hydrochloride according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(3) ***Related substances***—Weigh accurately about 25

mg of Hydralazine Hydrochloride, add 30 mL of 0.1 mol/L acetic acid, sonicate to dissolve, cool it, and add 0.1 mol/L acetic acid to make 50 mL. Use this solution as the test solution. Perform the test with 20 μL of the test solution as directed under the Liquid Chromatography according to the following operating conditions. Determine the area of each peak other than solvent as directed in the automatic integration method and calculate each amount as directed under the percentage peak area method; the total amount of related substances is NMT 1.0%.

$$\text{Content (\%) of each related substance} = 100 \times \frac{A_\text{i}}{A_\text{S}}$$

A_i: Peak area of each related substance obtained from the test solution

A_S: Total area of all peaks other than the solvent peak from the test solution

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 230 nm).

Column: A stainless steel column about 4 mm in internal diameter and 25 cm in length, packed with cyanopropylsilyl silica gel for liquid chromatography (10 μm in particle diameter).

Mobile phase: Dissolve 1.44 g of sodium dodecyl sulfate and 0.75 g of tetra n-butylammonium bromide in 770 mL of water and add 230 mL of acetonitrile. To this solution, add 0.1 mol/L sulfuric acid to adjust the pH to 3.0.

Flow rate: About 1 mL/min.

System suitability

System performance: Dissolve 25 mg of hydralazine hydrochloride RS and 5 mg of phthalazine in 100 mL of 0.1 mol/L acetic acid. Pipet 5 mL of this solution, add 0.1 mol/L acetic acid to make 50 mL, and use it as the system suitability solution. Proceed the system suitability solution according to the above operating conditions; the relative retention time of phthalazine with respect to hydralazine hydrochloride is about 0.65 with the resolution between these peaks being NLT 4.0.

(4) ***Hydrazine***—Weigh accurately about 20 mg of Hydralazine Hydrochloride, dissolve in 1.0 mL of water, add 4 mL of benzaldehyde solution, and shake for 20 minutes with a suitable instrument. Pipet 2.0 mL of this solution and pass through the solid-phase extraction (SPE) column to put into a 5 mL volumetric flask. Wash the column twice with 1.5 mL of a mixture of water and acetonitrile (3 : 7), add the washings to the effluent, add a mixture of water and acetonitrile (3 : 7) to make 5 mL, and use this solution as the test solution. Separately, weigh accurately about 65 mg of hydrazine dihydrochloride and add water to make 100 mL. To 1 mL of this solution, add water to make 100 mL. To 1 mL of this solution, add water again to make 20 mL. Pipet 1.0 mL of this solution, add 4 mL of benzaldehyde solution, and shake for 20 minutes with a suitable instrument. Pipet 2.0 mL of this solution, add a mixture of water and acetonitrile (3 : 7) to make 5 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions. Determine the peak areas from the solutions as directed in the automatic integration method to obtain the peak areas of hydrazine, A_T and A_S.

$$\text{Amount (ppm) of hydrazine} = 1000 \times \frac{32.05}{104.97} \times \frac{C_\text{S}}{C_\text{T}} \times \frac{A_\text{T}}{A_\text{S}}$$

32.05: Molecular weight of hydrazine

104.97: Molecular weight of hydrazine dihydrochloride

C_S: Concentration (μg/mL) of hydrazine dihydrochloride $(NH_2)_2 \cdot 2HCl$ in the standard solution

C_T: Concentration (mg/mL) of hydralazine hydrochloride in the test solution

A_T: Peak area of hydrazine obtained from the test solution

A_S: Peak area of hydrazine obtained from the standard solution

Benzaldehyde solution—Pipet 1.0 mL of benzaldehyde and dilute in a mixture of methanol and water (9 : 1) to make 100 mL.

Solid-phase extraction (SPE) column—Fill the column with a benzenesulfonic acid-based strong acidic cation exchange cartridge having the ratio of absorbent mass to column volume of 0.5 g/3 mL or equivalent. Wash the column twice with 2.0 mL of hexane in advance, immediately dry in vacuum for 2 minutes, then wash twice each with 2.0 mL of methanol, 2.0 mL of water, and 2.0 mL of phosphate buffer solution (pH 7.0) before use.

Phosphate buffer solution (pH 7.0)—Dissolve 5.82 g of sodium hydrogen phosphate and 3.81 g of potassium dihydrogen phosphate in 1000 mL of water, and adjust to the pH to 7.0±0.1 with 1 mol/L sodium hydroxide solution or 1 mol/L phosphoric acid.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 310 nm).

Column: A stainless steel column about 4 mm in internal diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 μm in particle diameter).

Mobile phase: Dissolve 0.3 g of ethylenediaminetetraacetic acid disodium salt dihydrate in 300 mL of water and add acetonitrile to make 1000 mL.

Flow rate: About 1.0 mL/min.

System suitability

System performance: Proceed with 20 μL of the standard solution according to the above operating condi-

tions; the relative retention time of hydrazine derivative with respect to hydralazine derivative is about 1.5.

System repeatability: Repeat the test 6 times with 20 μL each of the standard solution according to the above conditions; the relative standard deviation is NMT 2.0%.

Loss on drying NMT 0.5% (0.5 g, in vacuum, phosphorus pentoxide, 8 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 0.15 g of Hydralazine Hydrochloride, previously dried, place in a stoppered flask, and dissolve in 25 mL of water. Add 25 mL of hydrochloric acid, cool to room temperature, add 5 mL of chloroform, shake to mix, and titrate with 0.05 mol/L potassium iodate VS until the purple color of the chloroform layer disappears. The endpoint is when the purple color of the chloroform layer does not reappear within 5 minutes after it is decolorized.

Each mL of 0.05 mol/L potassium iodate VS
= 9.832 mg of $C_8H_8N_4 \cdot HCl$

Packaging and storage Preserve in tight containers.

Hydralazine Hydrochloride for Injection
주사용 히드랄라진염산염

Hydralazine Hydrochloride for Injection is a preparation for injection which is reconstituted before use. Hydralazine Hydrochloride contains NLT 99.0% and NMT 113.0% of the labeled amount of hydralazine hydrochloride ($C_8H_8N_4 \cdot HCl$: 196.64).

Method of preparation Prepare as directed under Injections, with Hydralazine Hydrochloride.

Description Hydralazine Hydrochloride for Injection occurs as a white to pale yellow powder or a mass. It is odorless and has a bitter taste.

Identification Determine the absorption spectrum of an aqueous solution of Hydralazine Hydrochloride for Injection (1 in 100000) as directed under the Ultraviolet-visible Spectroscopy; it exhibits maxima at the wavelengths of 238 nm to 242 nm, 258 nm to 262 nm, 301 nm to 305 nm and 313 nm to 317 nm.

pH Dissolve 1.0 g of Hydralazine Hydrochloride for Injection in 50 mL of water; the pH of the solution is 3.5 to 4.5.

Sterility Meets the requirements.

Bacterial endotoxins Less than 5.0 EU per mg of hydralazine hydrochloride.

Particulate contamination: Visible particles Meets the requirements.

Insoluble particulate matter in injections Meets the requirements.

Uniformity of dosage units Meets the requirements of the mass variation test.

Assay Take NLT 10 samples of Hydralazine Hydrochloride for Injection and weigh accurately the mass. Weigh accurately about 0.15 g of Hydralazine Hydrochloride for Injection, place in a stoppered flask, dissolve in 25 mL of water, and add 25 mL of hydrochloric acid. Cool to the room temperature, add 5 mL of chloroform, and shake to mix. While mixing, titrate with 0.05 mol/L potassium iodate VS until the violet color of the chloroform layer disappears. The endpoint is when the purple color of the chloroform layer does not reappear within 5 minutes after it is decolorized.

Each mL of 0.05 mol/L potassium iodate VS
= 9.832 mg of $C_8H_8N_4 \cdot HCl$

Packaging and storage Preserve in hermetic containers.

Hydralazine Hydrochloride Tablets
히드랄라진염산염 정

Hydralazine Hydrochloride Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of hydralazine hydrochloride ($C_8H_8N_4HCl$: 196.64).

Method of preparation Prepare as directed under Tablets, with Hydralazine Hydrochloride.

Identification Powder Hydralazine Hydrochloride Tablets, weigh an amount of the powder equivalent to 25 mg of Hydralazine Hydrochloride according to the labeled amount, add 100 mL of water, mix, and filter it, if necessary. Add water to 2 mL of the filtrate to make 50 mL. Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry; it exhibits maxima between 238 nm and 242 nm, between 258 nm and 262 nm, between 301 nm and 305 nm and between 313 nm and 317 nm.

Dissolution Perform the test with 1 tablet of Hydralazine Hydrochloride Tablets at 50 revolutions per minute according to Method 2, using 900 mL of water as the dissolution medium. Take NLT 30 mL of the dissolution medium 45 minutes after starting the test, and filter through a membrane filter with a pore size of NMT 0.8 μm. Discard the first 10 mL of the filtrate, pipet the subsequent V mL, add water to make exactly V' mL, so that Each mL

of the filtrate contains about 11 μg of hydralazine hydrochloride ($C_8H_8N_4$·HCl) according to the labeled amount and use this solution as the test solution. Separately, weigh accurately about 50 mg of Hydralazine Hydrochloride RS, previously dried at 105 ℃ for 3 hours and dissolve in water to make exactly 50 mL. Pipet 1 mL of the resulting solution, add water to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the test solution and the standard solution, respectively, at the wavelength of 260 nm as directed under the Ultraviolet-visible Spectroscopy. Meets the requirements if the dissolution rate of Hydralazine Hydrochloride Tablets in 45 minutes is NLT 80%.

Dissolution rate (%) for the labeled amount of hydralazine hydrochloride (C_8H_8 N $_4$·HCl)

$$= W_S \times \frac{A_T}{A_S} \times \frac{V'}{V} \times \frac{1}{C} \times 18$$

*W*s: Amount (mg) of reference standards
C: Labeled amount (mg) of hydralazine hydrochloride ($C_8H_8N_4$·HCl) per tablet

Uniformity of dosage units Meets the requirements.

Assay Weigh accurately the mass of NLT 20 tablets of Hydralazine Hydrochloride Tablets, and powder. Weigh accurately an amount of the powder, equivalent to about 0.15 g of hydralazine hydrochloride ($C_8H_8N_4$·HCl), put into a stoppered flask, and perform the test according to the Assay of Hydralazine Hydrochloride.

Each mL of 0.05 mol/L potassium iodate VS
= 9.832 mg of $C_8H_8N_4$·HCl

Packaging and storage Preserve in tight containers.

Hydrochloric Acid
염산

Chlorane [*7647-01-0*]

Hydrochloric Acid contains NLT 35.0% and NMT 38.0% of hydrogen chloride (HCl: 36.46).

Description Hydrochloric Acid occurs as a colorless fluid having a pungent odor.
It is fuming but ceases to fume when it is diluted with 2 volumes of water.

Specific gravity—d_{20}^{20}: About 1.18.

Identification (1) Allow a glass stick wet with ammonia TS to come near the surface of Hydrochloric Acid; remarkable white fumes evolves.

(2) An aqueous solution of Hydrochloric Acid (1 in 100) changes blue litmus paper to red, and responds to the Qualitative Analysis for chloride.

Purity (1) ***Sulfates***—To 15 mL of Hydrochloric Acid, add water to make 50 mL, and use this solution as the test solution. To 3.0 mL of the test solution, add 5 mL of water and 5 drops of barium chloride TS, and allow to stand for 1 hour; the solution does not become turbid.

(2) ***Sulfite***—To 3.0 mL of the test solution obtained in (1), add 5 ml of water and 1 drop of iodine TS; the color of iodine TS does not disappear.

(3) ***Bromide and iodide***—Place 0.10 g of Hydrochloric Acid in a stoppered test tube, add 1 mL of chloroform and 1 drop of 0.002 mol/L potassium permanganate solution, and shake well to mix; the chloroform layer remains colorless.

(4) ***Bromine and chlorine***—Place 0.10 g of Hydrochloric Acid in a stoppered test tube, add 5 drops of potassium iodide TS and 1 drop of 1 mL of chloroform, and shake for 1 minute to mix; the chloroform layer does not exhibit a purple color.

(5) ***Heavy metals***—Evaporate 5 mL of Hydrochloric Acid on a steam bath to dryness, and add 2mL of dilute acetic acid and water to the residue to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 3.0 mL of lead standard solution, 2 mL of dilute acetic acid and water to make 50 mL (NMT 20 ppm).

(6) ***Mercury***—Dilute 20 mL of Hydrochloric Acid with water to make exactly 100 mL, and use the solution as the test solution. Perform the test with the test solution as directed under the Atomic Absorption Spectroscopy (cold vapor method). Place the test solution in a sample bottle of the atomic absorption spectrophotometer, add 10 mL of tin(II) chloride-sulfuric acid TS, connect the bottle immediately to the spectrophotometer, and circulate air. Measure the absorbance when the reading of the data collection device has risen rapidly and indicate a constant value at a wavelength of 253.7 nm, and determine this absorbance as A_T. Separately, take 8 mL of standard mercury solution, and add water to make 100 mL. Determine the absorbance A_S of a solution obtained by proceeding with this solution by the same procedure as in the test solution; A_T is smaller than A_S (NMT 0.04 ppm).

(7) ***Arsenic***—Take 1.7 mL of Hydrochloric Acid, proceed according to Method 1, and perform the test (NMT 1 ppm).

Residue on ignition Pipet 10 mL of Hydrochloric Acid, add 2 drops of sulfuric acid, evaporate to dryness, and ignite; the reside is NMT 1.0 mg.

Assay Add 20 mL of water to a glass-stoppered flask and weigh accurately its mass. Add about 3 mL of Hydrochloric Acid, weigh accurately again, add 25 mL of water, and titrate with 1 mol/L sodium hydroxide VS (indicator: 2 to 3 drops of methyl red TS).

Each mL of 1 mol/L sodium hydroxide VS
= 36.461 mg of HCl

Packaging and storage Preserve in tight containers.

Dilute Hydrochloric Acid
묽은염산

Dilute Hydrochloric Acid contains NLT 9.5 w/v% and NMT 10.5 w/v% of hydrogen chloride (HCl: 36.46).

Description Dilute Hydrochloric Acid occurs as a colorless liquid, which is odorless and has a strong acid taste.

Specific gravity—d_{20}^{20} : About 1.05.

Identification An aqueous solution of Dilute Hydrochloric Acid (1 in 30) changes blue litmus paper to red and responds to the Qualitative Analysis for chloride.

Purity (1) ***Bromide or iodide***—Take 10 mL of Dilute Hydrochloric Acid into a test tube with a stopper, add 1 mL of chloroform and 1 drop of 0.002 mol/L potassium permanganate TS and shake well to mix; the chloroform layer remains colorless.

(2) ***Bromine or chlorine***—Take 10 mL of Dilute Hydrochloric Acid into a test tube with a stopper, add 5 drops of potassium iodide TS and 1 mL of chloroform, and shake for 1 minute to mix; the chloroform layer does not exhibit a violet color.

(3) ***Sulfite***—Add 5 mL of water and 1 drop of iodine TS to 3.0 mL of Dilute Hydrochloric Acid; the color of the test solution does not disappear.

(4) ***Sulfate***—Add 5 mL of water and 5 drops of barium chloride TS to 3.0 mL of Dilute Hydrochloric Acid and allow to stand for 1 hour; the solution has no turbidity.

(5) ***Heavy metals***—Evaporate 9.5 mL of Dilute Hydrochloric Acid on a steam bath to dryness, add 2 mL of dilute acetic acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution as follows; to 3.0 mL of the lead standard solution, add 2 mL of dilute acetic acid and water to make 50 mL (NMT 3 ppm).

(6) ***Mercury***—Proceed 80 mL of Dilute Hydrochloric Acid, add water to make exactly 100 mL and use this solution as the test solution. Perform the test with this test solution as directed under the Atomic Absorption Spectroscopy (cold vapor type). Put the test solution into the sample bottle for the atomic absorption spectrophotometer, add 10 mL of tin(II) chloride-sulfuric acid TS, then immediately connect it to the atomic absorption spectrophotometer, and circulate air. Measure the absorbance when the reading of the data collection device rises rapidly and reaches a constant value at a wavelength of 253.7 nm, and determine this absorbance as A_T. Separately, pipet 8 mL of standard mercury solution and add water to make exactly 100 mL. With this solution, determine the absorbance, A_S, of the solution obtained by proceeding in the same manner as in the preparation of the test solution; A_T is smaller than A_S (NMT 0.01 ppm).

(7) ***Arsenic***—Proceed with 4.0 mL of Dilute Hydrochloric Acid as directed under Method 1 and perform the test (NMT 0.5 ppm).

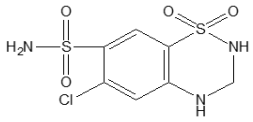
Residue on ignition Pipet 10 mL of Dilute Hydrochloric Acid, add 2 drops of sulfuric acid, evaporate it to dryness, and ignite; the weight of the residue is NMT 1.0 mg.

Assay Pipet 10 mL of Dilute Hydrochloric Acid and add 20 mL of water. Titrate with 1 mol/L sodium hydroxide VS (indicator: 2 to 3 drops of methyl red TS).

Each mL of 1 mol/L sodium hydroxide VS
= 36.461 mg of HCl

Packaging and storage Preserve in tight containers.

Hydrochlorothiazide
히드로클로로티아지드



$C_7H_8ClN_3O_4S_2$: 297.74

6-Chloro-1,1-dioxo-3,4-dihydro-2*H*-benzo[1,2,4]thiadiazine-7-sulfonamide [*58-93-5*]

Hydrochlorothiazide contains NLT 99.0% and NMT 101.0% of hydrochlorothiazide ($C_7H_8ClN_3O_4S_2$), calculated on the dried basis.

Description Hydrochlorothiazide occurs as white crystals or a crystalline powder, which is odorless and has a slightly bitter taste.

It is freely soluble in acetone, sparingly soluble in acetonitrile, very slightly soluble in water or ethanol(95) and practically insoluble in ether.

It dissolves in sodium hydroxide TS.

Melting point—About 267 °C (with decomposition).

Identification (1) Add 5 mL of Chromotropic acid TS to 5 mg of Hydrochlorothiazide and stand for 5 minutes; the resulting solution exhibits a violet color.

(2) Add 0.5 g of sodium carbonate decahydrate to 0.1 g of Hydrochlorothiazide and mix carefully to liquefy; the gas produced changes the moistened red litmus paper to blue. Crush the cooled fused mass with a glass rod, add 10 mL of water, stir to mix, and filter. Take 4 mL of the filtrate and add 2 drops of hydrogen peroxide(30), 5 mL of diluted hydrochloric acid (1 in 5) and 2 to 3 drops of barium chloride TS; a white precipitate is formed.

(3) Take 4 mL of the filtrate of (2) and add 5 mL of dilute nitric acid and 3 drops of silver nitrate TS; a white precipitate is formed.

(4) Dissolve 12 mg of Hydrochlorothiazide and hy-

drochlorothiazide RS in 100 mL of sodium hydroxide TS. To 10 mL each of these solutions, add water to make 100 mL respectively, and determine the absorption spectra of the solutions as directed under the Ultraviolet-visible Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavelengths.

Purity (1) ***Chloride***—Dissolve 1.0 g of Hydrochlorothiazide in 30 mL of acetone, add 6 mL of dilute nitric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Add 30 mL of acetone, 6 mL of dilute nitric acid and water to 1.0 mL of 0.01 mol/L hydrochloric acid to make 50 mL (NMT 0.036%), and use this solution as the control solution.

(2) ***Sulfate***—Dissolve 1.0 g of Hydrochlorothiazide in 30 mL of acetone and add 1 mL of dilute hydrochloric acid and water to make 50 mL. Use this solution as the test solution and perform the test. Prepare the control solution with 1.0 mL of 0.005 mol/L sulfuric acid, add 30 mL of acetone, 1 mL of dilute hydrochloric acid and water to 50 mL (NMT 0.048%).

(3) ***Heavy metals***—Proceed with 2.0 g of Hydrochlorothiazide according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 10 ppm).

(4) ***Primary aromatic amine***—Weigh 80 mg of Hydrochlorothiazide and dissolve in acetone to make exactly 100 mL. Pipet 1 mL of this solution, add 3.0 mL of dilute hydrochloric acid, 3.0 mL of water and 0.15 mL of sodium nitrite TS, shake to mix, and allow to stand for 1 minute. To this solution, add 1.0 mL of ammonium sulfamate, shake to mix, allow to stand for 3 minutes, add 1.0 mL of N-(1-naphthyl)-N'-diethyl-ethylenediamine oxalate TS, shake to mix, and allow to stand for 5 minutes. Perform the test as directed under the Ultraviolet-visible Spectroscopy using the solution prepared with 1.0 mL of acetone in the same manner as the control solution; the absorbance at 525 nm is NMT 0.10.

(5) ***Related substances***—Weigh accurately 32 mg of Hydrochlorothiazide, add 70 mL of diluent, sonicate for 10 minutes, cool at the room temperature, add the diluent to make exactly 100 mL, filter through a filter with pore size of NMT 0.45 μm, and use the filtrate as the test solution. Take 10 μL of the test solution and perform the test as directed under the Liquid Chromatography according to the following conditions. Determine the peak area of each solution as directed in the automatic integration method, and calculate the amount of related substances; hydrochlorothiazide related substance I RS {4-amino-6-Chloro-1,3-benzenedesulfoneamide} is NMT 1.0%, and the amount of each related substance is NMT 0.5%. The sum of all related substances except hydrochlorothiazide related substance I is NMT 0.9%. However, the peak areas of hydrochlorothiazide related substance I and chlorothiazide are determined by dividing the peak areas obtained from the automatic integration method by the correction factors 0.54 and 0.63, respectively.

$$\text{Content (\%) of each related substance} = 100 \times \frac{A_i}{A_S}$$

A_i: Peak area of each related substance obtained from the test solution

A_S: Peak area of all substances from the test solution

Diluent—A mixture of sodium phosphate solution and acetonitrile (7 : 3).

Sodium phosphate solution—Dissolve 2.76 g of sodium dihydrogen phosphate monohydrate in 990 mL of water, adjust the pH to 2.7 with phosphoric acid, and add water to make 1000 mL.

Operating conditions

Proceed as directed under the operating conditions under the Assay.

System suitability

System performance: Weigh an appropriate amount of hydrochlorothiazide RS, chlorothiazide RS and hydrochlorothiazide related substances I and dissolve in chloroform to make the solution containing 0.32 mg, 0.0032 mg and 0.0032 mg per mL respectively, filter through 0.45 μm filters, and use these solutions as the system suitability solutions. Proceed with 10 μL of the system suitability solution according to the above conditions; the resolution between the peak of hydrochlorothiazide related substances I and the peak of chlorothiazide is NLT 2.0; the resolution between the peak of chlorothiazide and the peak of hydrochlorothiazide is NLT 1.5; the symmetry factor for each peak is NMT 1.5.

System repeatability: Repeat the test 6 times with 10 μL each of the system suitability solution according to the above conditions; the relative standard deviation of hydrochlorothiazide related substances I and chlorothiazide is NMT 5.0% Also, dissolve a suitable amount of hydrochlorothiazide RS in diluent to prepare the solution containing 0.16 μg per mL, and repeat the test 6 times with 10 μL of this solution under the above operating conditions; the relative standard deviation of the peak area is NMT 2.5%.

Loss on drying NMT 1.0% (1 g, 105 ℃, 2 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 32 mg of Hydrochlorothiazide and hydrochlorothiazide RS, add 70 mL of diluent, sonicate for 10 minutes, cool at the room temperature, add the diluent to make exactly 100 mL, filter through a filter with pore size of 0.45 μm, and use the filtrate as the test solution and the standard solution respectively. Perform the test with 10 μL each of the test solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and determine the peak area of hydrochlorothiazide, A_T and A_S, in each solution.

Amount (mg) of hydrochlorothiazide ($C_7H_8ClN_3O_4S_2$)
= Amount (mg) of hydrochlorothiazide RS× $\frac{A_T}{A_S}$

Diluent—A mixture of sodium phosphate solution and acetonitrile (7 : 3).

Sodium phosphate solution—Dissolve 2.76 g of sodium dihydrogen phosphate monohydrate in 990 mL of water, adjust the pH to 2.7 with phosphoric acid, and add water to make 1000 mL.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 275 nm).

Column: A stainless steel column about 4.6 mm in internal diameter and 5 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3.5 μm in particle diameter).

Mobile phase: Control the mixing ratio of mobile phase A and mobile phase B stepwise or via the gradient elution as follows.

Mobile phase A: A mixture of acetonitrile and methanol (3 : 1).

Mobile phase B: An anhydrous formic acid aqueous solution (5 in 1000).

Time (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 - 5	3	97
5 - 14	3 → 36	97 → 64
14 - 18	36 → 3	64 → 97
18 - 20	3	97

Flow rate: About 1.0 mL/min.

Column temperature: A constant temperature of about 35 °C.

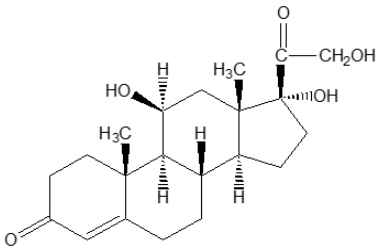
System suitability

System performance: Weigh an appropriate amount of hydrochlorothiazide RS, chlorothiazide RS and hydrochlorothiazide related substances I and dissolve in chloroform to make the solution containing 0.32 mg, 0.0032 mg and 0.0032 mg per mL respectively, filter through 0.45 μm filters, and use these solutions as the system suitability solutions. Proceed with 10 μL of the system suitability solution according to the above conditions; the relative retention time of hydrochlorothiazide related substances I and chlorothiazide to hydrochlorothiazide is about 0.5 and 0.8 respectively. The resolution between the peak of hydrochlorothiazide related substances I and the peak of chlorothiazide is NLT 2.0; the resolution between the peak of chlorothiazide and the peak of hydrochlorothiazide is NLT 1.5; the symmetry factor for each peak is NMT 1.5.

System repeatability: Repeat the test 5 times with 10 μL each of the standard solution according to the above conditions; the relative standard deviation is NMT 1.0%.

Packaging and storage Preserve in well-closed containers.

Hydrocortisone
히드로코르티손



Hydrocortisone $C_{21}H_{30}O_5$: 362.46
(8*S*,9*S*,10*R*,11*S*,13*S*,14*S*,17*R*)-11,17-Dihydroxy-17-(2-hydroxyacetyl)-10,13-dimethyl-6,7,8,9,10,11,12,13,14,15,16,17-dodecahydro-1*H*-cyclopenta[a]phenanthren-3(2*H*)-one [*50-23-7*]

Hydrocortisone, when dried, contains NLT 97.0% and NMT 102.0% of hydrocortisone ($C_{21}H_{30}O_5$).

Description Hydrocortisone occurs as a white crystalline powder, which is odorless.
It is sparingly soluble in methanol, ethanol(95) or 1.4-dioxane, slightly soluble in chloroform, and practically insoluble in water or ether.

Melting point—Between 212 and 220 °C (with decomposition).

Identification (1) To 2 mg of Hydrocortisone, add 2 mL of sulfuric acid; the resulting solution exhibits a yellowish green fluorescence immediately, and changes gradually from orange to dark red. Add carefully 10 mL of water to this solution; the color changes from yellow to orange-yellow with a green fluorescence, and a small amount of flocculent precipitate is produced.

(2) Dissolve 0.01 g of Hydrocortisone in 1 mL of methanol, add 1 mL of Fehling's TS, and heat; a red precipitate is produced.

(3) Determine the infrared spectra of Hydrocortisone and hydrocortisone RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit similar intensities of absorption at the same wavenumbers. If any difference appears between the spectra, dissolve Hydrocortisone and hydrocortisone RS in ethanol(95), respectively, then evaporate the ethanol to dryness, and perform the test with the residues in the same manner.

Optical rotation $[\alpha]_D^{20}$: Between +162° and +168° (after drying, 0.2 g, methanol, 25 mL, 100 mm).

Purity ***Related substances***—Dissolve 20 mg of Hydro-

cortisone in 10 mL of a mixture of chloroform and methanol (9 : 1), and use this solution as the test solution. Pipet 1 mL of this solution, add a mixture of chloroform and methanol (9 : 1) to make exactly 50 mL and use this solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot10 μL each of the test solution and the standard solution on a thin-layer chromatographic plate made of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of chloroform and ethanol(95) (17 : 3) as the developing solvent to a distance of about 10 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 1.0% (0.5 g, 105 °C, 3 hours).

Residue on ignition NMT 0.1% (0.5 g).

Assay Weigh accurately about 50 mg of Hydrocortisone and hydrocortisone RS, dissolve each in 20 mL of a mixture of chloroform and methanol (9 : 1), add exactly 10 mL of the internal standard solution to each, and add a mixture of chloroform and methanol (9 : 1) to each to make exactly 50 mL. Use these solutions as the test solution and the standard solution, respectively. Perform the test with 5 μL each of the test solution and standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the ratios of the peak area, Q_T and Q_S, of hydrocortisone that of internal standard, respectively.

$$\text{Amount (mg) of hydrocortisone } (C_{21}H_{30}O_5) = \text{Amount (mg) of hydrocortisone RS} \times \frac{Q_T}{Q_S}$$

Internal standard solution—A solution of prednisone in a mixture of chloroform and methanol (9 : 1) (9 in 10000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 25 cm in length, packed with silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 20 °C.

Mobile phase: A mixture of chloroform, methanol and acetic acid(100) (1000 : 20 : 1).

Flow rate: Adjust the flow rate so that the retention time of hydrocortisone is about 15 minutes.

System suitability

System performance: Proceed with 5 μL of the standard solution according to the above operating conditions; the internal standard and hydrocortisone are eluted in this order with the resolution being NLT 7.

System repeatability: Repeat the test 6 times with 5 μL of the standard solution according to the above operating conditions; the relative standard deviation of the ratios of the peak area of hydrocortisone to that of the internal standard is NMT 1.0.

Packaging and storage Preserve in tight containers.

Hydrocortisone Tablets
히드로코르티손 정

Hydrocortisone Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of hydrocortisone ($C_{21}H_{30}O_5$: 362.46).

Method of preparation Prepare as directed under Tablets, with Hydrocortisone.

Identification Powder Hydrocortisone Tablets, weigh the amount of powder equivalent to 50 mg of hydrocortisone according to the labeled amount, add 15 mL of hexane, shake to mix for 15 minutes, and then remove the hexane. To the residue, add 10 mL of hexane again, and shake to mix for 15 minutes. Remove the hexane, add 10 mL of ether without peroxide, and shake to mix for 15 minutes. Remove the ether, add 25 mL of ethanol(99.5), shake to mix for 15 minutes. Then, filter the resulting solution, evaporate to dryness on a steam bath. Perform the test with the residue according to the Identification (3) of Hydrocortisone.

Dissolution Perform the test with 1 tablet of Hydrocortisone Tablets at 50 revolutions per minute according to Method 2, using 900 mL of water as the dissolution medium. Take the dissolved solution after 30 minutes from starting of the test, filter, dilute with the dissolution solution, if necessary and use this solution as the test solution. Separately, weigh accurately a portion of Hydrocortisone RS, previously dried at 105 ºC for 3 hours, add the dissolution solution to make the same concentration as the test solution and use this solution as the standard solution. Perform the test with the test solution and the standard solution as directed under the Ultraviolet-visible Spectroscopy, using the dissolution medium as a control solution, and determine the absorbances at the absorbance maximum wavelength of about 248 nm.

It meets the requirements if the dissolution rate of Hydrocortisone Tablets in 30 minutes is NLT 70%.

Uniformity of dosage units It meets the requirements when the procedure for content uniformity is performed according to the following method.

Transfer 1 tablet of Hydrocortisone Tablets to a suitable container and add about 0.3 mL of water directly on the tablet. Allow the tablet to stand for about 5 minutes. Shake the container to break up the tablet and sonicate to

ensure complete disintegration. Add 4 to 5 small glass beads and 50.0 mL of the internal standard solution to the container. After shaking the container for about 30 minutes, pipet *V* mL of the clear supernatant, add exactly a certain amount of the internal standard solution to make a solution containing 0.1 mg of hydrocortisone per mL, and use this solution as the test solution. Separately, weigh accurately a portion of Hydrocortisone RS, previously dried at 105 ºC for 3 hours, dissolve in the internal standard solution to obtain a solution having a known concentration of 0.1 mg per mL and use this solution as the standard solution. Perform the test with 10 µL each of the test solution and the standard solution as directed under Liquid Chromatography according to the following conditions and calculate the ratios, Q_T and Q_S, of the peak area of Hydrocortisone to that of the internal standard for the test solution and the standard solution, respectively.

$$\text{Amount (mg) of hydrocortisone } (C_{21}H_{30}O_5) = 50 \times \frac{V'}{V} \times C \times \frac{Q_T}{Q_S}$$

V': Final amount (mL) of the test solution
C: Concentration (mg/mL) of the standard solution

Internal standard solution—A solution of prednisone in a saturated chloroform in water (6 in 100000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and about 30 cm in length, having porous silica gel for liquid chromatography (3 µm to 10 µm in particle diameter).

Mobile phase: A mixture of butyl chloride, water saturated butyl chloride, ethanol, acetic acid(100) and tetrahydrofuran (95 : 95 : 7 : 6 : 4).

System suitability

System performance: Proceed with 10 µL of the standard solution according to the above operating conditions; the resolution between peaks of hydrocortisone and the internal standard is NLT 3.0.

System repeatability: Repeat the test 6 times with 10 µL of the standard solution under the above operating conditions; the relative standard deviation of the ratios of the peak areas of hydrocortisone to those of the internal standard is NMT 2.0%.

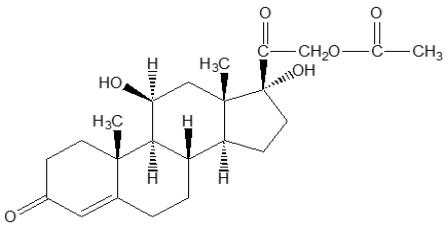
Assay Weigh accurately the mass of NLT 20 tablets of Hydrocortisone Tablets, and reduce to powder. Equivalent to about 5 mg of hydrocortisone ($C_{21}H_{30}O_5$), transfer to a centrifuge and add 50 mL of the internal standard solution. Shake vigorously to mix for 30 minutes, centrifuge the solution, and use the clear supernatant as the test solution. Proceed as directed under the Uniformity of Dosage Units under Hydrocortisone

$$\text{Amount (mg) of hydrocortisone } (C_{21}H_{30}O_5) = 50 \times C \times \frac{Q_T}{Q_S}$$

C: Concentration (mg/mL) of the standard solution

Packaging and storage Preserve in well-closed containers.

Hydrocortisone Acetate
히드로코르티손아세테이트



$C_{23}H_{32}O_6$: 404.50

2-((8*S*,9*S*,10*R*,11*S*,13*S*,14*S*,17*R*)-11,17-dihydroxy-10,13-dimethyl-3-oxo-2,3,6,7,8,9,10,11,12,13,14,15,16,17-tetradecahydro-1*H*-cyclopenta[a]phenanthren-17-yl)-2-oxoethyl acetate [*50-03-3*]

Hydrocortisone Acetate, when dried, contains NLT 97.0% and NMT 102.0% of hydrocortisone acetate ($C_{23}H_{32}O_6$).

Description Hydrocortisone Acetate occurs as white crystals or a crystalline powder and is odorless.
It is sparingly soluble in 1,4-dioxane, slightly soluble in methanol, ethanol(95) or acetone, very slightly soluble in ether and practically insoluble in water.

Melting point—About 220 °C (with decomposition).

Identification (1) Dissolve 2 mg of Hydrocortisone Acetate in 2 mL of sulfuric acid; the solution exhibits a yellowish green fluorescence initially, and the color gradually turns orange to dark red. Under the ultraviolet rays, the solution exhibits a intense pale green fluorescence. Add carefully 10 mL of water to this solution; the solution changes yellow to orange-yellow color and shows pale green fluorescence, and a amber cotton-shaped precipitate is formed.

(2) Dissolve about 10 mg of Hydrocortisone Acetate in 1 mL of methanol by warming, add 1 mL of Fehling's TS, and heat; the resulting solution exhibits a orange to red color and precipitate.

(3) Add 2 mL of potassium hydroxide-ethanol TS to 50 mg of Hydrocortisone Acetate and heat on a steam bath for 5 minutes. After cooling, add 2 mL of diluted sulfuric acid (2 in 7) and heat gently for 1 minute; it gives the odor of ethyl acetate.

(4) Determine the infrared spectra of Hydrocortisone Acetate and hydrocortisone acetate RS, previously dried, as directed in the potassium bromide disk method under the Mid-infrared Spectroscopy; both spectra exhibit

similar intensities of absorption at the same wavenumbers. If any difference appears between the two spectra, dissolve each in ethanol(95), evaporate, and perform the test with the residue in the same manner.

Optical rotation $[\alpha]_D^{20}$: Between +144° and +151° (25 mg after drying, acetone, 10 mL, 100 mm).

Purity ***Related substances***—Weigh about 40 mg of Hydrocortisone Acetate, dissolve in 25 mL of the mixture of chloroform and methanol (9 : 1), and use this solution as the test solution. Pipet 2 mL of this solution, add a mixture of chloroform and methanol (9 : 1) to make exactly 100 mL, and use the solution as the standard solution. With these solutions, perform the test as directed under the Thin Layer Chromatography. Spot 5 μL each of the test solution and the standard solution on a plate made of silica gel for thin-layer chromatography. Develop the plate with the mixture of dichloromethane, ether, methanol, and water (160 : 30 : 8 : 1) as the developing solvent to a distance of about 12 cm and air-dry the plate. Spray evenly alkaline blue tetrazolium TS on the plate; the spots other than the principal spot from the test solution are not more intense than the spots from the standard solution.

Loss on drying NMT 1.0% (0.5 g, 105 ℃, 3 hours).

Residue on ignition NMT 0.1% (0.5 g).

Assay Dissolve about 20 mg each of Hydrocortisone Acetate and hydrocortisone acetate RS, previously dried and accurately weighed, in methanol, add exactly 10 mL each of the internal standard solution, add methanol to make exactly 100 mL, and use these solutions as the test solution and the standard solution, respectively. Perform the test with 20 μL each of the test solution and the standard solution as directed under Liquid Chromatography according to the following conditions and calculate the ratios, Q_T and Q_S, of the peak area of hydrocortisone acetate to that of the internal standard, for the test solution and the standard solution, respectively.

$$\text{Amount (mg) hydrocortisone acetate } (C_{23}H_{32}O_6) = \text{Amount (mg) of hydrocortisone acetate RS} \times \frac{A_T}{A_S}$$

Internal standard solution—A solution of benzyl p-hydroxybenzoate in methanol (1 in 1000).

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in internal diameter and 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 μm in particle diameter).

Mobile phase: A mixture of water and acetonitrile (13 : 7).

Flow rate: Adjust the flow rate so that the retention time of hydrocortisone acetate is about 8 minutes.

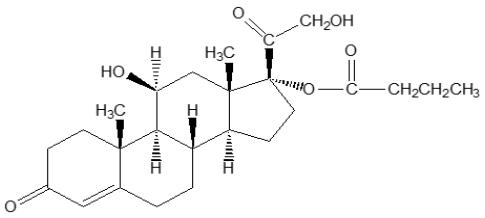
System suitability

System performance: Proceed with 20 μL of the standard solution according to the above operating conditions; hydrocortisone acetate and the internal standard are eluted in this order with the resolution between their peaks being NLT 4.

System repeatability: Repeat the test 6 times with 20 μL each of the standard solution according to the above conditions; the relative standard deviation of the peak area ratio of hydrocortisone acetate to the internal standard is NMT 1.0%.

Packaging and storage Preserve in tight containers.

Hydrocortisone Butyrate
히드로코르티손부티레이트



$C_{25}H_{36}O_6$: 432.55

(8*S*,9*S*,10*R*,11*S*,13*S*,14*S*,17*R*)-11-hydroxy-17-(2-hydroxyacetyl)-10,13-dimethyl-3-oxo-2,3,6,7,8,9,10,11,12,13,14,15,16,17-tetradecahydro-1*H*-cyclopenta[a]phenanthren-17-yl butanoate [*13609-67-1*]

Hydrocortisone, when dried, contains NLT 96.0% and NMT 104.0% of hydrocortisone ($C_{25}H_{36}O_6$).

Description Hydrocortisone Butyrate occurs as a white powder, which is odorless.

It is freely soluble in tetrahydrofuran, chloroform or 1,2-dichloroethane, soluble in methanol, sparingly soluble in ethanol(99.5), slightly soluble in ether, and practically insoluble in water.

Melting point—About 200 °C (with decomposition).

Identification (1) Dissolve 2 mg of Hydrocortisone Butyrate in 2 mL of sulfuric acid; the resulting solution exhibits a yellowish green fluorescence initially, and changes gradually to orange to dark red. Examine this solution under ultraviolet light (main wavelength: 254 nm); the solution shows a strong pale green fluorescence. Add carefully 10 mL of water to this solution; the color changes from yellow to orange-yellow with a pale green fluorescence, and a yellowish brown flocculent precipitate is produced.

(2) To 10 mg of Hydrocortisone Butyrate, add 1 mL of methanol, dissolve by warming, add 1 mL of Fehling's TS, and heat; an orange to red precipitate is produced.

(3) To 50 mg of Hydrocortisone Butyrate, add 2 mL

of potassium hydroxide-ethanol TS, and heat on a steam bath for 5 minutes. After cooling, add 2 mL of dilute sulfuric acid (2 in 7), and boil gently for 1 minute; the odor of ethyl butyrate is perceptible.

(4) Determine the infrared spectrum of Hydrocortisone Butyrate and hydrocortisone Butyrate RS, previously dried, as directed in the potassium bromide disk method under Mid Infrared Spectrophotometry; both spectra exhibit similar intensities of absorption at the same wavenumbers.

Optical rotation $[\alpha]_D^{20}$: Between +48° and +52° (after drying, 0.1 g, chloroform, 10 mL, 100 mm).

Purity (1) ***Heavy metals***—Proceed with 1.0 g of Hydrocortisone Butyrate according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of lead standard solution (NMT 20 ppm).

(2) ***Related substances***—Weigh and dissolve 25 mg of Hydrocortisone Butyrate in 5 mL of tetrahydrofuran and use this solution as the test solution. Pipet 2 mL of this solution and add tetrahydrofuran to make exactly 50 mL. Pipet 5 mL of this solution, add tetrahydrofuran to make exactly 20 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under the Thin Layer Chromatography. Spot 10 μL each of the test solution and standard solution on a thin-layer chromatographic plate made of silica gel for thin-layer chromatography. Develop the plate with a mixture of toluene, acetic acid(95) and water (200 : 30 : 1) as the developing solvent to a distance of about 15 cm, and air-dry the plate. Spray evenly alkaline blue tetrazolium TS on the plate; the number of the spot other than the principal spot from the test solution is NMT one and it is not more intense than the spot from the standard solution.

Loss on drying NMT 1.0% (1 g, 105 °C, 3 hours).

Residue on ignition NMT 0.1% (1 g).

Assay Weigh accurately about 50 mg of Hydrocortisone Butyrate and dissolve in ethanol(99.5) to make exactly 100 mL. Pipet 2 mL of this solution and add ethanol(99.5) to make exactly 50 mL. Perform the test with this solution as directed under the Ultraviolet-visible Spectroscopy, and determine the absorbance of this solution, *A*, at the absorbance maximum wavelength (λmax) of about 241 nm.

$$\text{Amount (mg) of hydrocortisone butyrate } (C_{25}H_{36}O_6) = \frac{A}{375} \times 25000$$
